NURSING IMPLICATIONS

Assessment

- Assess for signs of bleeding and hemorrhage (bleeding gums; nosebleed; unusual bruising; tarry, black stools; hematuria; fall in hematocrit or BP; guaiac-positive stools, urine, or nasogastric aspirate).
- Assess for evidence of additional or increased thrombosis. Symptoms depend on area of involvement.
- ***Lab Test Considerations:*** Monitor PT, INR and other clotting factors frequently during therapy; monitor more frequently in patients with renal impairment. Therapeutic PT ranges 1.3–1.5 times greater than control; however, the INR, a standardized system that provides a common basis for communicating and interpreting PT results, is usually referenced. Normal INR (not on anticoagulants) is 0.8–1.2. An INR of 2.5–3.5 is recommended for patients at very high risk of embolization (for example, patients with mitral valve replacement and ventricular hypertrophy). Lower levels are acceptable when risk is lower. Heparin may affect the PT/INR; draw blood for PT/INR in patients receiving both heparin and warfarin at least 5 hr after the IV bolus dose, 4 hr after cessation of IV infusion, or 24 hr after subcut heparin injection. Asian patients and those who carry the CYP2C9*2 allele and/or the CYP2C9*3 allele, or those with VKORC1 AA genotype may require more frequent monitoring and lower doses.
- Geri: Patients over 60 yr exhibit greater than expected PT/INR response. Monitor for side effects at lower therapeutic ranges.
- Pedi: Achieving and maintaining therapeutic PT/INR ranges may be more difficult in pediatric patients. Assess PT/INR levels more frequently.
- Monitor hepatic function and CBC before and periodically throughout therapy.
- Monitor stool and urine for occult blood before and periodically during therapy.
- ***Toxicity and Overdose:*** Withholding 1 or more doses of warfarin is usually sufficient if INR is excessively elevated or if minor bleeding occurs. If overdose occurs or anticoagulation needs to be immediately reversed, the antidote is vitamin K (phytonadione, Aquamephyton). Administration of whole blood or plasma also may be required in severe bleeding because of the delayed onset of vitamin K.

Implementation

- ***High Alert:*** Do not confuse Coumadin (warfarin) with Avandia (rosiglitazone) or Cardura (doxazosin). Do not confuse Jantoven (warfarin) with Janumet (sitagliptin/metformin) or Januvia (sitagliptin).
- Because of the large number of medications capable of significantly altering warfarin's effects, careful monitoring is recommended when new agents are started or other agents are discontinued. Interactive potential should be evaluated for all new medications (Rx, OTC, and herbal products).
- **PO:** Administer medication at same time each day. Medication requires 3–5 days to reach effective levels; usually begun while patient is still on heparin.
- Do not interchange brands; potencies may not be equivalent.

Patient/Family Teaching

- Instruct patient to take medication as directed. Take missed doses as soon as remembered that day; do not double doses. Inform health care professional of missed doses at time of checkup or lab tests. Inform patients that anticoagulant effect may persist for 2–5 days following discontinuation. Advise patient to read *Medication Guide* before starting therapy and with each Rx refill in case of changes.
- Review foods high in vitamin K (see Appendix K). Patient should have consistent limited intake of these foods, as vitamin K is the antidote for warfarin, and alternating intake of these foods will cause PT levels to fluctuate. Advise patient to avoid cranberry juice or products during therapy.
- Caution patient to avoid IM injections and activities leading to injury. Instruct patient to use a soft toothbrush, not to floss, and to shave with an electric razor during warfarin therapy. Advise patient that venipunctures and injection sites require application of pressure to prevent bleeding or hematoma formation.
- Advise patient to report any symptoms of unusual bleeding or bruising (bleeding gums; nosebleed; black, tarry stools; hematuria; excessive menstrual flow) and pain, color, or temperature change to any area of your body to health care professional immediately. Patients with a deficiency in protein C and/or S mediated anticoagulant response may be at greater risk for tissue necrosis.
- Instruct patient not to drink alcohol or take other Rx, OTC, or herbal products, especially those containing aspirin or NSAIDs, or to start or stop any new medications during warfarin therapy without advice of health care professional.
- Advise patient to notify health care professional if pregnancy is planned or suspected or if breast feeding.
- Instruct patient to carry identification describing medication regimen at all times and to inform all health care personnel caring for patient on anticoagulant therapy before lab tests, treatment, or surgery.
- Emphasize the importance of frequent lab tests to monitor coagulation factors.

Evaluation/Desired Outcomes

- Prolonged PT (1.3–2.0 times the control; may vary with indication) or INR of 2–4.5 without signs of hemorrhage.

= Canadian drug name. = Genetic implication. ~~Strikethrough~~ = Discontinued.
*CAPITALS indicates life-threatening; underlines indicate most frequent.

Clearly defined nursing responsibilities and priorities

In-depth guidance for patient and family education

More patient safety information than any other drug guide

DEDICATION

To my son, Ben, whose sensitivity and sense of humor make even the toughest day easier.
To my daughter, Katharine, whose dedication and passion in seeking her goals I admire.
Watching you both grow to become wonderful young adults gives me such pride and joy. Your support of my work inspires me. Thank you for sharing so much of your lives with me. I love you.

AHV

To my wonderful mother and best friend, Geraldine, who has provided her continual love, support, and wisdom as I continue to pursue all of my personal and professional goals.

CAS

ACKNOWLEDGMENTS

We offer our thanks to the students and nurses who have used our book for more than 35 years. We hope our book provides you with the current knowledge of pharmacotherapeutics you need to continue to give quality care in our rapidly changing health care environment.

April and Cindy

HOW TO USE *DAVIS'S DRUG GUIDE FOR NURSES*

Davis's Drug Guide for Nurses provides comprehensive, up-to-date drug information in well-organized, nursing-focused monographs. It also includes extensive supplemental material in 14 appendices, thoroughly addresses the issue of safe medication administration, and educates the reader about 50 different therapeutic classes of drugs. In this 18th edition, we have continued the tradition of focusing on safe medication administration by including **Medication Safety Tools** and even more information about health care's most vulnerable patients: children, the elderly, pregnant women, and breast feeding mothers. Look for more Pedi, Geri, OB, Lactation, and Rep headings in the monographs. We have also included a BEERS label at the top of applicable drug monographs for those medications listed in the Beers Criteria developed by the American Geriatrics Society. These medications are considered to be potentially inappropriate for use in older adults because they are associated with more risk than benefit in this patient population. In addition, we've included information relevant to Canadian students and nurses. You'll find an appendix comparing Canadian and U.S. pharmaceutical practices, more Canada-only combination drugs in the Combination Drugs appendix, and additional Canadian brand names in the drug monographs. To help you find this information quickly, we've also added a maple leaf icon (🍁) in the index next to each Canadian entry. We have added pharmacogenomic information throughout numerous monographs to guide the nurse in selecting and monitoring various drug therapies. To help you find this information quickly, we've added a double helix icon (⛓) to denote this information as it applies to specific drugs. Use this book to enhance your competence in implementing and evaluating medication therapies. The following sections describe the organization of *Davis's Drug Guide for Nurses* and explain how to quickly find the information you need.

Safe Medication Use Articles

"Medication Errors: Improving Practices and Patient Safety," "Detecting and Managing Adverse Drug Reactions," "Overview of Risk Evaluation and Mitigation Systems (REMS)," "Special Dosing Considerations," and "Educating Patients About Safe Medication Use" comprise the safe medication use articles and provide an overview of the medication safety issues that confront practitioners and patients. Leading off this series, the medication errors article familiarizes you with the systems issues and clinical situations repeatedly implicated in medication errors and suggests practical means to avoid them. It also teaches you about *high alert* medications, which have a greater potential to cause patient harm than other medications. "Detecting and Managing Adverse Drug Reactions" explains the different types of adverse reactions and provides guidance on how to detect and manage them. "Risk Evaluation and Mitigation Strategies (REMS)" explains strategies developed by the pharmaceutical industry and required by the Food and Drug Administration (FDA) to minimize adverse drug reactions from potentially dangerous drugs. We have highlighted the drugs that currently have approved REMS programs associated with their use by adding a REMS label at the top of applicable drug monographs. "Special Dosing Considerations" identifies the patient populations, such as neonates and patients with renal impairment, who require careful dose adjustments to ensure optimal therapeutic outcomes. "Educating Patients About Medication Use" reviews the most important teaching points for nurses to discuss with their patients and their families. In addition to these safety articles, other critical information is highlighted in red throughout the drug monographs. This allows the reader to quickly identify important information and to see how nursing practice, including assessment, implementation, and patient teaching, relates to it.

Classifications Profile

Medications in the same therapeutic class often share similar mechanisms of action, assessment guidelines, precautions, and interactions. The Classifications Profile provides summaries of the major

© F.A. Davis Publishing

therapeutic classifications used in *Davis's Drug Guide for Nurses*. It also provides patient teaching information common to all agents within the class and a list of drugs within each class.

Medication Safety Tools

Updated for this edition is a section with tables and charts that nurses can use for a quick but thorough reference to information that will help them avoid making medication errors. It includes lists of drugs that are associated with adverse reactions and falls in the elderly; proper dosing for pediatric intravenous medications; confused drug names; FDA-approved Tall Man letters and more.

Drug Monographs

Drug monographs are organized in the following manner:

High Alert Status: Some medications, such as chemotherapeutic agents, anticoagulants, and insulins, have a greater potential for harm than others. These medications have been identified by the *Institute for Safe Medication Practices* as **high alert drugs**. *Davis's Drug Guide for Nurses* includes a high alert tab in the upper right corner of the monograph header in appropriate medications to alert the nurse to the medication's risk. The term "high alert" is used in other parts of the monograph as well, to help the nurse administer these medications safely. See the article "Medication Errors: Improving Practices and Patient Safety" for a complete list of high alert medications in *Davis's Drug Guide for Nurses*. Refer to www.ISMP.org for all solutions, groups, and individual high alert drugs.

Generic/Brand Name: The generic name appears first, with a pronunciation key, followed by an alphabetical list of trade names. Canadian trade names are preceded by a maple leaf (🍁). Many brand names have been discontinued by the manufacturer requiring nurses to know the generic names of drugs. Brand names that have been discontinued have a slash through them (~~Decadron~~). Common names, abbreviations, and selected foreign names are also included.

Classification: The therapeutic classification, which categorizes drugs by the disease state they are used to treat, appears first, followed by the pharmacologic classification, which is based on the drug's mechanism of action.

Controlled Substance Schedule: All drugs regulated by federal law are placed into one of five schedules, based on the drug's medicinal value, harmfulness, and potential for abuse or addiction. Schedule I drugs, the most dangerous and having no medicinal value, are not included in *Davis's Drug Guide for Nurses*. (See Appendix H for a description of the Schedule of Controlled Substances.)

Pregnancy Category: The FDA recently recommended discontinuation of the Pregnancy Category system (A, B, C, D, and X) since this categorization may not appropriately communicate the risk that a drug may have during pregnancy or breast feeding. Based on this guidance, the Pregnancy Categories have been removed from each of the drug monographs. These pregnancy letter categories have been replaced in drug prescribing information and Patient/Family Teaching with a narrative summary that describes the potential risk of using the drug during pregnancy and breast feeding, as well as the potential impairment of fertility in women and men of reproductive potential. The drug monographs have been enhanced with this detailed information in these patient populations and highlighted by a *Rep* tag to call the user's attention to reproductive information.

Indications: Medications are approved by the FDA for specific disease states. This section identifies the diseases or conditions for which the drug is commonly used and includes significant unlabeled uses as well.

Action: This section contains a concise description of how the drug produces the desired therapeutic effect.

© F.A. Davis Publishing

Pharmacokinetics: Pharmacokinetics refers to the way the body processes a medication by absorption, distribution, metabolism, and excretion. This section also includes information on the drug's half-life.

Absorption: Absorption describes the process that follows drug administration and its subsequent delivery to systemic circulation. If only a small fraction is absorbed following oral administration (diminished bioavailability), then the oral dose must be much greater than the parenteral dose. Absorption into systemic circulation also follows other routes of administration such as topical, transdermal, intramuscular, subcutaneous, rectal, and ophthalmic routes. Drugs administered intravenously are 100% bioavailable.

Distribution: This section comments on the drug's distribution in body tissues and fluids. Distribution becomes important in choosing one drug over another, as in selecting an antibiotic that will penetrate the central nervous system to treat meningitis or in avoiding drugs that cross the placenta or concentrate in breast milk. Information on protein binding is included for drugs that are >95% bound to plasma proteins, which has implications for drug-drug interactions.

Metabolism and Excretion: Drugs are primarily eliminated from the body either by hepatic conversion to active or inactive compounds (metabolism or biotransformation) and subsequent excretion by the kidneys, or by renal elimination of unchanged drug. Therefore, drug metabolism and excretion information is important in determining dosage regimens and intervals for patients with impaired renal or hepatic function. The creatinine clearance (CCr) helps quantify renal function and guides dosage adjustments. Formulas to estimate CCr are included in Appendix E.

Half-Life: The half-life of a drug is the amount of time it takes for the drug concentration to decrease by 50% and roughly correlates with the drug's duration of action. Half-lives are given for drugs assuming the patient has normal renal or hepatic function. Conditions that alter the half-life are noted.

Time/Action Profile: The time/action profile table provides the drug's onset of action, peak effect, and duration of activity. This information can aid in planning administration schedules and allows the reader to appreciate differences in choosing one route over another.

Contraindications and Precautions: Situations in which drug use should be avoided are listed as contraindications. In general, most drugs are contraindicated in pregnancy or lactation, unless the potential benefits outweigh the possible risks to the mother or baby (e.g., anticonvulsants, antihypertensives, and antiretrovirals). Contraindications may be absolute (i.e., the drug in question should be avoided completely) or relative, in which certain clinical situations may allow cautious use of the drug. The precautions portion includes disease states or clinical situations in which drug use involves particular risks or in which dose modification may be necessary. Extreme cautions are noted separately to draw attention to conditions under which use of the drug results in serious, potentially life-threatening consequences.

Adverse Reactions and Side Effects: Although it is not possible to include all reported reactions, major side effects for all drugs are included. Life-threatening adverse reactions or side effects are **CAPITALIZED**, and the most frequent side effects are underlined. Those underlined generally have an incidence of 10% or greater. Those not underlined occur in fewer than 10% but more than 1% of patients. Although life-threatening reactions may be rare (fewer than 1%), they are included because of their significance. The following abbreviations are used for body systems:

CV: cardiovascular
Derm: dermatologic
EENT: eye, ear, nose, and throat
Endo: endocrinologic
F and E: fluid and electrolyte
GI: gastrointestinal
GU: genitourinary
Hemat: hematologic
Local: local
Metab: metabolic
MS: musculoskeletal
Neuro: neurologic
Resp: respiratory
Misc: miscellaneous

© F.A. Davis Publishing

Interactions: Drug interactions are a significant risk for patients. As the number of medications a patient receives increases, so does the likelihood of drug-drug interactions. This section provides the most important drug-drug interactions and their physiological effects. Significant drug-food and drug-natural product interactions are also noted as are recommendations for avoiding or minimizing these interactions.

Route and Dosage: Routes of administration are grouped together and include recommended doses for adults, children, and other more specific age groups (such as geriatric patients). Dose units are expressed in the terms in which they are usually prescribed. For example, penicillin G dosage is given in units rather than in milligrams. Dosing intervals also are provided in the manner in which they are frequently ordered. If a specific clinical situation (indication) requires a different dose or interval, this is listed separately for clarity. Specific dosing regimens for hepatic or renal impairment are also included.

Availability: This section lists the strengths and concentrations of available dose forms. Such information is useful in planning more convenient regimens (fewer tablets/capsules, less injection volume) and in determining whether certain dose forms are available (suppositories, oral concentrates, sustained- or extended-release forms). Flavors of oral liquids and chewable tablets have been included to improve compliance and adherence in pediatric patients. General availability and average wholesale prices of commonly prescribed drugs have also been added as an aid to nurses with prescriptive authority.

Nursing Implications: This section helps the nurse apply the nursing process to pharmacotherapeutics. The subsections provide a step-by-step guide to clinical assessment, implementation (drug administration), and evaluation of the outcomes of pharmacologic therapy.

Assessment: This section includes guidelines for assessing patient history and physical data before, during, and following drug therapy. Assessments specific to the drug's various indications are also included. The **Lab Test Considerations** section provides the nurse with information regarding which laboratory tests to monitor and how the results may be affected by the medication. It also includes dose modifications required for changes in lab values. **Toxicity and Overdose** alerts the nurse to therapeutic serum drug concentrations that must be monitored and signs and symptoms of toxicity. The antidote and treatment for toxicity or overdose of appropriate medications also are included.

Implementation: Guidelines specific for medication administration are discussed in this subsection. **High Alert** information, i.e., information that directly relates to preventing medication errors with inherently dangerous drugs, is included first if applicable. Sound-alike look-alike name confusion alerts are also included here. Other headings in this section provide data regarding routes of administration. Dose modifications for side effects are included for those drugs that include this information. **PO** describes when and how to administer the drug, whether tablets may be crushed or capsules opened, and when to administer the medication in relation to food. The Do Not Crush (DNC) tag identifies drugs that should be swallowed whole. In addition, we have identified which opioids have *abuse deterrent* properties and describe the mechanism of these properties within the monograph. The **IV Administration** section includes specific information about administering the medication intravenously. This section has been thoroughly updated and contains a prominent IV Administration heading that introduces this section. Bold, red headings are included to highlight the recommended **reconstitution**, **dilution** and **concentrations**. These headings complement the **rate** heading and make this critical information easy to find. Several subsections comprise the IV Administration section. The first section, **IV Push**, which refers to administering medications from a syringe directly into a saline lock, Y-site of IV tubing, or a 3-way stopcock, provides details for reconstitution, concentration, dilution, and rate. **Rate** is also included for other methods of IV administration, intermittent or continuous infusion. **Intermittent Infusion** and **Continuous Infusion** specify standard dilution solutions and amounts, stability information, and rates. In

© F.A. Davis Publishing

addition, a quick reference for information about dilution amounts in neonates and infants, who are extremely sensitive to excess fluids, is contained in the new **Medication Safety Tools** section. **Y-Site Compatibility/Incompatibility** identifies medications compatible or incompatible with each drug when administered via Y-site injection or 3-way stopcock in IV tubing. Information for drugs not included in these lists is conflicting or unavailable. Compatibility information is compiled from *Micromedex* and the manufacturer's package insert.

Patient/Family Teaching: This section includes information that should be taught to patients and/or families of patients. Side effects that should be reported, information on minimizing and managing side effects, details on administration, and follow-up requirements are presented. The nurse also should refer to the **Implementation** section for specific information to teach to the patient and family about taking the medication. The **Rep** tag identifies information on contraception, breast feeding, monitoring parameters for infants exposed to the drug, and fertility data. **Home Care Issues** discusses aspects to be considered for medications taken in the home setting.

Evaluation: Outcome criteria for determination of the effectiveness of the medication are provided.

© F.A. Davis Publishing

EVIDENCE-BASED PRACTICE AND PHARMACOTHERAPEUTICS: Implications for Nurses

The purpose of evidence-based practice (EBP) is to use the best available evidence to make informed patient-care decisions that ultimately improve the treatment outcomes and safety of treatment for patients. How pharmacologic agents affect patients is often the subject of research; such research is required by the Food and Drug Administration (FDA) before and after drug approval. Any medication can be the subject of an evidence-based clinical review article. But what does "evidence-based" mean and how does it relate to nursing?

Evidence-based nursing practice can be viewed as a foundation of professional practice. It is an approach to making decisions, providing nursing care, and improving clinical practice based upon personal clinical expertise in combination with the most current and relevant research evidence. Still subject to debate are questions about the sufficiency and quality of evidence. For example, what kind of evidence is needed? How much evidence is necessary to support, modify, or change clinical practice? And, were the studies reviewed of "good" quality and are their results valid?

In general, clinicians use **hierarchy of evidence** to rank types of research reports from the most valuable and scientifically rigorous to the least useful. The hierarchy makes clear that some level of evidence about the effect of a particular treatment or condition exists, even if the evidence is considered weak. Figure 1 illustrates a hierarchy of evidence pyramid with widely accepted rankings: the most scientifically rigorous at the top, the least scientifically rigorous at the bottom. Practitioners and clinicians should look for the highest level of available evidence to answer their clinical questions. However, it is important that clinicians also apply the second fundamental principle of EBP, which is that evidence alone is not sufficient to make clinical decisions. Decision makers must always trade off the benefits and risks, and the costs associated with alternative treatment options, and by doing so, consider the patients' values and preferences.

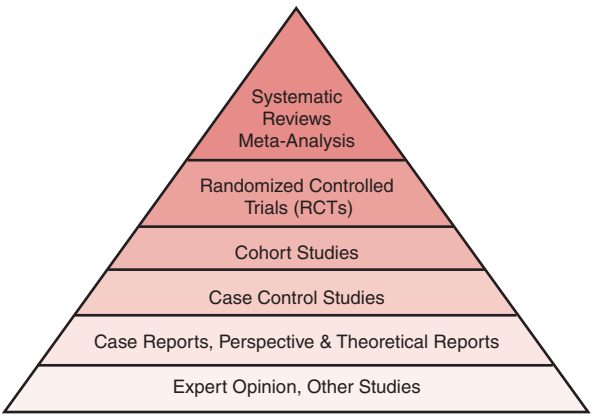

Figure 1: Hierarchy of Scientific Evidence Pyramid

© F.A. Davis Publishing

Evidence-Based Practice and Its Importance in Pharmacology

Evidence-based practices in pharmacology generally are derived from well-designed randomized controlled trials (RCTs) or other experimental designs that investigate drugs' therapeutic and non-therapeutic effects. However, although FDA-approved pharmacologic agents have undergone rigorous testing through RCTs, nurses have the responsibility to evaluate the findings for the best scientific evidence available and to recognize the most appropriate, safest, and efficacious drugs for their patients. The Web address for FDA drug information is https://www.fda.gov/drugs/.

While numerous databases are available through Internet searches, one valuable and quickly accessible resource for evaluating the current highest level of pharmacologic evidence is the Cochrane Database of Systematic Reviews. The Cochrane library and databases provide full text of high-quality, regularly updated systematic reviews, protocols, and clinical trials. The Web address is https://www.cochranelibrary.com/.

AHRQ's Evidence-Based Practice Centers (EPCs) provide evidence reports and technology assessments that can assist nurses in their efforts to provide the highest quality and safest pharmacologic health care available. The EPCs systematically review the relevant scientific literature, conduct additional analyses (when appropriate) prior to developing their reports and assessments, and provide guideline comparisons. The Web address is https://effectivehealthcare.ahrq.gov/products.

Evidence-based systematic reports and guidelines provide nurses with instantaneous access to the most current knowledge, enabling them to critically appraise the scientific evidence and its appropriateness to their patient population. This is especially important given the need for nurses to keep abreast of the rapidly changing pharmacologic agents in use. New drugs are approved each month, compelling nurses to know these drugs' intended uses, therapeutic effects, interactions, and adverse effects.

Evidence-based practice requires a shift from the traditional paradigm of clinical practice—grounded in intuition, clinical experience, and pathophysiologic rationale—to a paradigm in which nurses must combine clinical expertise, patient values and preferences, and clinical circumstances with the integration of the best scientific evidence in order to make conscientious, well-informed, research-based decisions that affect nursing patient care.

PHARMACOGENOMICS

Introduction

Multiple variables influence the selection and optimization of drug therapy for each individual patient. Pharmacogenomics, the study of the influence of individual genetic variations on drug response in patients, may yield additional information to further enhance safe and effective medication use. Originally the field focused on the effects of specific variants within individual genes on drug response (i.e., pharmaco *genetics*), however more recent research has focused on the role of multiple variants across the genome (i.e., pharmaco *genomics*) and their combined potential to modify and alter drug therapy outcomes.

The understanding of pharmacogenomics has increased considerably. Most emerging research has fallen into one of three domains:

- Gene variants that influence the function of drug transporter proteins (how efficiently drugs are delivered to their site(s) of activity)
- Gene variants that cause differences in the function of drug metabolizing enzymes (how quickly or slowly drugs are utilized and broken down in the body)
- Gene variants that alter a drugs' "target" proteins (Variations in the genes coding for a target protein may alter the protein's three-dimensional shape, changing the binding affinity for drugs to that protein)

As the biological relevance of specific genetic variants has increased, it is understood that multiple variations across the genome can contribute to significant, yet *relatively predictable* treatment outcomes. Virtually every therapeutic area involving medication use includes a drug for which documented genetic variability has the potential to affect drug response. Some of this information is included in the FDA-approved package insert prescribing information. For some agents, the suitability of a specific drug or the determination of an appropriate initial dose for an individual patient based on pharmacogenetic information has been incorporated into dosing algorithms and patient care. As such, it is essential that health care professionals can interpret and utilize this information to facilitate safer and more effective use of medications for individual patients.

Genetic Variation Within the Human Genome

The human genome is comprised of approximately 3 billion nucleotide base pair sequences that encode for molecular DNA with each individual having his/her own unique human genome sequence (except for identical twins). Four nucleotide bases (adenine, guanine, cytosine, and thymine) for the sequence of each single strand of DNA. Variations in nucleotide sequences can occur and contribute to alterations in the expression and activities of certain genes as well as their protein products. The location of these variations within a DNA sequence on a particular chromosome can have a profound impact on the biological activity of that gene, however it should also be understood that some gene variants may lead to little or no discernable change to biologic activity at all. As new gene variants are discovered, the process of understanding the *degree of impact* becomes a focus for investigators.

Proteins are involved in most enzymatic, structural, and biologic functions associated with drug disposition and effects. The processes involved in DNA replication, RNA transcription, and translation to synthesized proteins are complex. Each of these processes is potentially susceptible to consequences of DNA sequence variations.

Genetic variations can take many forms, but most fall into three general categories:

- single nucleotide base substitutions (e.g., a cytosine substituted for an adenine)
- insertions or deletions of a nucleotide base within a sequence
- deletions or extra copies of entire DNA sequences (e.g., trisomy 21, in which an extra copy of *all* genes on the 21st chromosome are present)

© F.A. Davis Publishing

Variations in DNA that occur at a frequency of greater than 1% in the population are called polymorphisms. The most common gene varients in humans are single nucleotide polymorphisms (SNPs), pronounced as the word "snips" in dialogue). SNPs result from the substitution of one nucleotide base for another. The location of a SNP within a gene is important, as the location may or may not elicit a downstream effect on protein made from the gene. It is helpful to recall the importance of introns and exons for mRNA manufacturing when considering how SNPs can impact protein function. An important point to keep in mind is that *any* gene variant may have a spectrum-like impact on protein manufacture ranging from zero clinical consequences (no discernible effect on proteins) to complete lack of functional proteins associated with significant alterations in drug response. Also, pharmacogenomic clinical effects must always be considered within the larger sphere of environmental influences on drugs and drug responses. Finally, due to the commonality of polymorphisms, multiple gene variants may be present within one patient, making prediction of drug response particularly challenging.

Clinical Significance of Genetic Polymorphisms

SNPs and other genetic variations influence drug response at different levels through alterations in the activities of enzymes or proteins involved in drug absorption, transport, metabolism, elimination, or at the drug target receptor (site of drug action). Clinically relevant polymorphisms have been identified for genes that encode for most of the common enzymes involved in drug metabolism. Most enzymes are localized intracellularly throughout a wide variety of tissues in the body, including the enterocytes that line the intestine and within hepatocytes. Variants that cause diminished or absent enzyme activity decrease drug metabolism processes. In this case, if the drug is metabolized to an inactive product, then the prolonged persistence of the parent drug in the body could result in excessive pharmacologic effects and potential toxicities may occur. If the drug requires enzymatic conversion to a pharmacologically active metabolite, drug response may be reduced or absent. In contrast, if the variation is due to extra copies of a gene that results in increased enzymatic activity, opposite effects on drug metabolism and response can occur.

Similar outcomes can be associated with polymorphisms in genes that encode for membrane transporter proteins that are responsible for drug transport into cells (influx), as well as proteins that participate in energy-dependent processes that export drugs out of cells (efflux transporters). Polymorphisms in drug transport proteins can influence drug response by altering drug gastrointestinal absorption, uptake and distribution in tissues, exposure to intracellular drug metabolizing enzymes, and elimination via the bile or urine. Finally, some genes that encode for certain drug receptors are highly polymorphic, resulting in attenuated or exaggerated drug responses. The number of polymorphic genes responsible for variations in drug response at drug receptors is relatively small compared to those associated with drug metabolizing enzymes or transport proteins; however, this area has undergone the least amount of study to date.

Incorporating Pharmacogenomic Information into Clinical Practice

Most drugs are initiated in individual patients based on knowledge about their safety and effectiveness within the general population. Information regarding patient characteristics (e.g., age, ethnicity, renal/hepatic function, concomitant disease, etc.) known to contribute to variability in drug response, when available, is considered at this time. It is becoming more and more common, however, to consider gene variants as well when initiating drugs, as interindividual gene factors are thought to contribute to drug response variability in 15-30% of patients. Currently, there are more than 122 with pharmacogenomic information included in the package insert. For selected agents, dosing recommendations based on an individual's genetic information (i.e., genotype) for specific drugs and drug classes are also considered. Genomic biomarkers can play an important role in identifying responders and non-responders, avoiding drug toxicity, and adjusting the dose of drugs to optimize their efficacy and safety. However, the typical strategy for most drug therapy is to monitor the patient's response to treatment and modify regimens as necessary. Patients who develop exaggerated pharmacologic responses or elicit no pharmacologic effect may be expressing a phenotype suggestive

© F.A. Davis Publishing

of altered drug disposition or target receptor effect that could be associated with an underlying genetic polymorphism. As we continue to learn more about these associations and can incorporate pharmacogenomic information into decisions regarding drug therapy for individual patients, the ultimate goal is to improve therapeutic outcomes by limiting drug exposure to patients that are most likely to derive no therapeutic benefit and/or experience toxic drug effects.

For example, some genetic variants are associated with hypersensitivity reactions to a specific drug. A prescriber who is contemplating initiating that drug for a patient may need to determine whether the patient possesses that variant in their DNA. If that specific variant is present, the prescriber might select an alternate agent, thereby avoiding a potentially life-threatening hypersensitivity reaction. In another example, patients who are determined to have a genetic variant that results in an inactive metabolizing enzyme would not be appropriate candidates for an analgesic drug that requires that enzyme to convert the drug to the active analgesia-producing form. On the other hand, if that metabolizing enzyme is responsible for conversion of an active parent drug to an inactive metabolite, the starting dose of the drug may be reduced or perhaps an alternate drug might be selected.

Several Clinical Laboratory Improvement Amendment (CLIA)-approved laboratories offer pharmacogenetic testing to identify relevant genetic polymorphisms that predict drug response and can be used to initiate appropriate drugs and dosing regimens for individual patients. Some of these tests, while recommended in drug prescribing information, are costly and may not be covered by insurance. Patients may not fully understand the utility of undergoing genetic testing and providing a specimen for DNA analysis, which is typically performed on a blood, saliva, buccal swab, or other tissue collection. On the other hand, patients who are engaged in their medical care may be familiar with the concept of "personalized medicine" and seek information about available tests to "individualize" their own drug therapy. Many drugs are now required to have pharmacogenetic testing performed before they are prescribed. Other drugs have labeling that includes "test recommended" or "for information only." Health care professionals will need to be familiar with pharmacogenetic tests that are recommended for specific drug therapies, how to interpret the results of those tests, and how to incorporate pharmacogenetic data with other clinical information to optimize patient drug therapy and health care outcomes.

MEDICATION ERRORS: Improving Practices and Patient Safety

It is widely acknowledged that medication errors result in thousands of adverse drug events, preventable reactions, and deaths per year. Nurses, physicians, pharmacists, patient safety organizations, the Food and Drug Administration, the pharmaceutical industry, Health Canada, and other parties share in the responsibility for determining how medication errors occur and designing strategies to reduce error.

One impediment to understanding the scope and nature of the problem has been the reactive "blaming, shaming, training" culture that singled out one individual as the cause of the error. Also historically, medication errors that did not result in patient harm—near-miss situations in which an error could have but didn't happen—or errors that did not result in serious harm were not reported. In contrast, serious errors often instigated a powerful punitive response in which one or a few persons were deemed to be at fault and, as a result, lost their jobs and sometimes their licenses.

In 1999, the Institute of Medicine (IOM) published *To Err Is Human: Building a Safer Health System*, which drew attention to the problem of medication errors. It pointed out that excellent health care providers do make medication errors, that many of the traditional processes involved in the medication-use system were error-prone, and that other factors, notably drug labeling and packaging, contributed to error. Furthermore, the IOM report, in conjunction with other groups such as the United States Pharmacopeia (USP) and the Institute for Safe Medication Practices (ISMP), called for the redesign of error-prone systems to include processes that anticipated the fallibility of humans working within the system. This initiative is helping shift the way the health care industry addresses medication errors from a single person/bad apple cause to a systems issue.

The National Coordinating Council for Medication Error Reporting and Prevention (NCC-MERP) developed the definition of a medication error that reflects this shift and captures the scope and breadth of the issue:

> "A medication error is any preventable event that may cause or lead to inappropriate medication use or patient harm while the medication is in the control of the health care professional, patient, or consumer. Such events may be related to professional practice, health care products, procedures, and systems, including prescribing; order communication; product labeling, packaging, and nomenclature; compounding; dispensing; distribution; administration; education; monitoring; and use."

Inherent in this definition's mention of related factors are the human factors that are part of the medication use system. For example, a nurse or pharmacist may automatically reach into the bin where dobutamine is usually kept, see "do" and "amine" but select dopamine instead of dobutamine. Working amidst distractions, working long hours or shorthanded, and working in a culture where perfection is expected and questioning is discouraged are other examples of the human factors and environmental conditions that contribute to error.

The goal for the design of any individual or hospital-wide medication use system is to determine where systems are likely to fail and to build in safeguards that minimize the potential for error. One way to begin that process is to become familiar with medications or practices that have historically been shown to be involved in serious errors.

High Alert Medications

Some medications, because of a narrow therapeutic range or inherent toxic nature, have a high risk of causing devastating injury or death if improperly ordered, prepared, stocked, dispensed, administered, or monitored. Although these medications may not be involved in more errors, they require special attention due to the potential for serious, possibly fatal consequences. These have been termed **high-alert medications**, to communicate the need for extra care and safeguards. Many of

© F.A. Davis Publishing

these drugs are used commonly in the general population or are used frequently in urgent clinical situations. The Joint Commission (TJC) monitors the use of frequently prescribed high-alert medications, which include insulin, opiates and narcotics, injectable potassium chloride (or phosphate) concentrate, intravenous anticoagulants (such as heparin), sodium chloride solutions above 0.9 percent, and others. See the High Alert Drugs table in the **Medication Safety Tools** section, and Table 1 in this article for a complete list of the high alert meds found in *Davis's Drug Guide for Nurses*. (Visit the Institute for Safe Medication Practices at www.ismp.org for more information on high alert drugs.)

Causes of Medication Errors

Many contributing factors and discrete causes of error have been identified, including failed communication, poor pharmaceutical supply chain distribution practices, dose miscalculations, drug packaging and drug-device related problems, incorrect drug administration, and lack of patient education.

Failed Communication: Failed communication covers many of the errors made in the ordering phase, and although ordering is performed by the prescriber, the nurse, the clerk, and the pharmacist who interpret that order are also involved in the communication process.

- ***Poorly handwritten or verbal orders.*** Handwriting is a major source of error and has led to inaccurate interpretations of the drug intended, the route of administration, the frequency, and dose. Telephone and verbal orders are likewise prone to misinterpretation. The current use of electronic drug order entry within hospitals and electronic prescribing to pharmacies contributes to increased legibility and consistency of medication orders and prescriptions.
- ***Drugs with similar-sounding or similar-looking names.*** Similar sounding names, or names that look similar when handwritten, are frequently confused. Doxorubicin hydrochloride and doxorubicin liposome, or Zebeta® and Diabeta® are two examples. The USP has identified over 700 "sound-alike, look-alike" drugs. Mix-ups are more likely when each drug has similar dose ranges and frequencies.

Several of the sound-alike/look-alike drugs were targeted for labeling intervention by the FDA, which requested manufacturers of 33 drugs with look-alike names to voluntarily revise the appearance of the established names. The revision visually differentiates the drug names by using "tall man" letters (capitals) to highlight distinguishing syllables (ex.: buPROPrion versus busPIRone or DACTINomycin versus DAPTOmycin. See theTALL MAN Lettering table in the **Medication Safety Tools** section for the list of the pairs of drugs that are commonly confused, often with serious consequences.

- ***Misuse of zeroes in decimal numbers.*** Massive, ten-fold overdoses are traceable to not using a leading zero (.2 mg instead of 0.2 mg) or adding an unnecessary trailing zero (2.0 mg instead of 2 mg) in decimal expressions of dose. Similar overdoses are found in decimal expressions in which the decimal point is obscured by poor handwriting, stray marks, or lined orders sheets (e.g., reading 3.1 grams as 31 grams). Under-dosing also may occur by the same mechanism and prevent a desired, perhaps life-saving effect.
- ***Use of apothecary measures (grains, drams) or package units (amps, vials, tablets) instead of metric measures (grams, milligrams, milliequivalents).*** Apothecary measurements are poorly understood and their abbreviations are easily confused with other units of measurement. Use of such measures should be abandoned. Errors also occur when dose units are used instead of metric weight. For example, orders for 2 tablets, 1 1/2 vials, or 2 ampules can result in overdose or underdose when the medications ordered come in various strengths.

© F.A. Davis Publishing

- ***Misinterpreted abbreviations.*** Abbreviations can be misinterpreted or, when used in the dose part of the order, can result in incorrect dose of the correct medication. For example, lower or uppercase "U" for units has been read as a zero, making 10 u of insulin look like 100 units when handwritten. The Latin abbreviation "QOD" for every other day has been misinterpreted as QID (4 times per day). Current widespread use of electronic drug ordering and prescriptions increases legibility; frequency choices are often in plain language such as "every other day" instead of "QOD". See Table 2 for a list of confusing abbreviations and safer alternatives.
- ***Ambiguous or incomplete orders.*** Orders that do not clearly specify dose, route, frequency, or indication do not communicate complete information and are open to misinterpretation.

Poor Distribution Practices: Poor distribution includes error-prone storing practices such as keeping similar-looking products next to each other. Dispensing multidose floor stock vials of potentially dangerous drugs instead of unit (single) dose vials is also associated with error, as is allowing non-pharmacists to dispense medications in the absence of the pharmacist.

Dose Miscalculations: Dose miscalculations are a prime source of medication error. Also, many medications need to be dose-adjusted for renal or hepatic impairment, age, height and weight, and body composition (i.e., correct for obesity). Complicated dosing formulas provide many opportunities to introduce error. Often vulnerable populations, such as premature infants, children, the elderly, and those with serious underlying illnesses, are at greatest risk.

Drug Packaging: Similar packaging or poorly designed packaging encourages error. Drug companies may use the same design for different formulations, or fail to highlight information about concentration or strength. Lettering, type size, color, and packaging methods can either help or hinder drug identification.

Drug Delivery Systems: Drug delivery systems include infusion pumps and drip rate controllers. Some models do not prevent free flow of medication, leading to sudden high dose infusion of potent and dangerous medications. The lack of safeguards preventing free flow and programming errors are among the problems encountered with infusion control devices. Newer models, which are integrated with the medication administration record (MAR) via scanned barcodes to match the patient with drug, dose, and timing, contribute to increased dosing safety; however, it is a nursing responsibility to verify the dose and determine that the infusion pump is delivering properly at the point of drug administration.

Incorrect Drug Administration: Incorrect drug administration covers many problems. Misidentification of a patient, incorrect route of administration, missed doses, or improper drug preparation are types of errors that occur during the administration phase. Barcode scanning to identify the patient and correlate with the correct MAR decreases the likelihood of incorrect drug administration.

Lack of Patient Education: Safe medication use is enhanced in the hospital and the home when the patient is well informed. The knowledgeable patient can recognize when something has changed in his or her medication regimen and can question the health care professional. At the same time, many issues related to medication errors, such as ambiguous directions, unfamiliarity with a drug, and confusing packaging, affect the patient as well as the health care professional, underscoring the need for careful education. Patient education also enhances adherence, which is a factor in proper medication use.

© F.A. Davis Publishing

Prevention Strategies

Since medication use systems are complex and involve many steps and people, they are error-prone. On an individual basis, nurses can help reduce the incidence of error by implementing the following strategies:

- Clarify any order that is not obviously and clearly legible. Ask the prescriber to print orders using block style letters if handwritten.
- Do not accept orders with the abbreviation "u" or "IU" for units. Clarify the dosage and ask the prescriber to write out the word units.
- Clarify any abbreviated drug name or the abbreviated dosing frequencies q.d., QD, q.o.d., QOD, and q.i.d or QID. Suggest abandoning Latin abbreviations in favor of spelling out dosing frequency.
- Do not accept doses expressed in package units or volume instead of metric weight. Clarify any order written for number of ampules, vials, or tablets (e.g., calcium chloride, 1 ampule or tiotropium, 1 Handihaler).
- Decimal point errors can be hard to see. Suspect a missed decimal point and clarify any order if the dose requires more than 3 dosing units.
- If dose ordered requires use of multiple dosage units or very small fractions of a dose unit, review the dose, have another health care provider check the original order and recalculate formulas, and confirm the dose with the prescriber.
- If taking a verbal order, ask prescriber to spell out the drug name and dosage to avoid sound-alike confusion (e.g., hearing Cerebyx for Celebrex, or fifty for fifteen). Read back the order to the prescriber after you have written it in the chart. Confirm and document the indication to further enhance accurate communication.
- Clarify any order that does not include metric weight, dosing frequency, or route of administration.
- Check the nurse's/clerk's transcription against the original order. Make sure stray marks or initials do not obscure the original order if orders are handwritten.
- Do not start a patient on new medication by borrowing medications from another patient. This action bypasses the double check provided by the pharmacist's review of the order.
- Always check the patient's name band before administering medications. Verbally addressing a patient by name does not provide sufficient identification. If available, use of barcode scanning per institutional policy recommended.
- Use the facility's standard drug administration times to reduce the chance of an omission error.
- Be sure to fully understand any drug administration device before using it. This includes infusion pumps, inhalers, and transdermal patches.
- Have a second practitioner independently check original order, dose calculations, and infusion pump settings for high alert medications.
- Realize that the printing on packaging boxes, vials, ampules, prefilled syringes, or any container in which a medication is stored can be misleading. Be sure to differentiate clearly the medication and the number of milligrams per milliliter versus the total number of milligrams contained within. Massive overdoses have been administered by assuming that the number of milligrams per ml is all that is contained within the vial or ampule. Read the label when obtaining the medication, before preparing or pouring the medication, and after preparing or pouring the medication.
- Educate patients about the medications they take. Provide verbal and written instructions and ask the patient to restate important points. Refer to Educating Patients about Safe Medication Use on page 29 for recommendations on what patients should understand about their medications.

As stated previously, errors are a result of problems within the medication use system and cannot be eliminated by the vigilance of any one group of health care providers. System redesign involves strong leadership from administration and all involved departments. Health care facilities should consider the following when addressing the issue of medication errors:

- Do not provide unit stock of critical, high alert medications. If eliminating these medications from floor stock is not feasible, consider reducing the number available and standardizing the concentrations or forms in which the medication is available.

© F.A. Davis Publishing

- Create committees that address safety issues.
- Install a computer physician order entry (CPOE) system to help reduce handwritten prescribing orders. Link order entry to pertinent lab, allergy, and medication data.
- Implement bar code technology to ensure the right drug reaches the right patient.
- Develop policies that discourage error-prone prescribing practices such as inappropriate use of verbal orders, use of confusing dosing symbols, and use of abbreviations.
- Develop policies that encourage better communication of medication information such as requiring block-style printing of medications, including indication in prescription, and using both the trade and generic name in prescriptions.
- Ensure a reasonable workload for pharmacists and nurses, and provide a well-designed work area.
- Limit the availability of varying concentrations of high alert medications.
- Provide standard concentrations and infusion rate tables and make them easily accessible.
- Supply pharmacy and patient care areas with current reference material.
- Cultivate a culture that does not assign blame when medication errors occur but looks for root causes instead.
- Encourage staff to participate in the USP-ISMP-MERP error reporting program.

Table 1: High Alert Medications in Davis's Drug Guide for Nurses

aldesleukin	eptifibatide	mitomycin
alemtuzumab	erlotinib	mitoxantrone
alitretinoin	esmolol	morphine
amiodarone	etoposides	nalbuphine
amphotericin B deoxycholate/lipid complex/liposome	fentanyl (buccal, transmucosal)	nateglinide
argatroban	fentanyl (parenteral)	nilotinib
arsenic trioxide	fentanyl (transdermal)	nitroprusside
asparaginase Erwinia chrysanthemi	fludarabine	norepinephrine
bendamustine	fluorouracil	oxaliplatin
bevacizumab	fondaparinux	oxycodone compound
bivalirudin	gefitinib	oxymorphone
bleomycin	gemcitabine	oxytocin
bortezomib	gemtuzumab ozogamicin	paclitaxel
buprenorphine	heparin	pancuronium
busulfan	heparins (low molecular weight)	panitumumab
butorphanol	hydrocodone	pazopanib
capecitabine	hydromorphone	pegaspargase
carboplatin	hydroxyurea	pemetrexed
carmustine	hypoglycemic agents, oral	potassium phosphates
cetuximab	idarubicin	potassium supplements
chlorambucil	ifosfamide	pramlintide
cisplatin	imatinib	procarbazine
cladribine	insulin mixtures	promethazine (IV)
clofarabine	insulins (intermediate-acting)	propofol
codeine	insulins (long-acting)	propranolol
cyclophosphamide	insulins (rapid-acting)	repaglinide
cytarabine	insulins (short-acting)	rituximab
dacarbazine	irinotecan	sodium chloride (hypertonic)
DAUNOrubicin hydrochloride	ixabepilone	sunitinib
decitabine	labetalol	temsirolimus
digoxin	lapatinib	thalidomide
DOBUTamine	lidocaine	thioguanine
docetaxel	magnesium sulfate (IV, parenteral)	thrombolytic agents
DOPamine	melphalan	tirofiban
DOXOrubicin hydrochloride	meperidine	topotecan
DOXOrubicin liposome	methadone	trastuzumab
epinephrine	methotrexate	vinBLAStine
epirubicin	metoprolol	vinCRIStine
	midazolam	vinorelbine
	milrinone	warfarin

Table 2: Abbreviations and Symbols Associated with Medication Errors

Abbreviation/Symbol	Intended Meaning	Mistaken For	Recommendation
APAP	Acetaminophen	Not recognized as acetaminophen	Use full drug name
AZT	Zidovudine	Azathioprine	Use full drug name
CPZ	Compazine (prochlorperazine)	Thorazine (chlorpromazine)	Use full drug name
HCl	Hydrochloric acid	KCl (potassium chloride)	Use full drug name
HCT	Hydrocortisone	Hydrochlorothiazide	Use full drug name
HCTZ	Hydrochlorothiazide	Hydrocortisone	Use full drug name
IV Vanc	Intravenous vancomycin	Invanz (ertapenem)	Use full drug name
$MgSO_4$*	Magnesium sulfate	Morphine sulfate	Use full drug name
MS, MSO_4*	Morphine sulfate	Magnesium sulfate	Use full drug name
MTX	Methotrexate	Mitoxantrone	Use full drug name
"Nitro" drip	Nitroglycerin infusion	Nitroprusside infusion	Use full drug name
NoAC	Novel/new oral anticoagulant	No anticoagulant	Use full drug name
PCA	Procainamide	Patient controlled analgesia	Use full drug name

© F.A. Davis Publishing

PTU	Propylthiouracil	Mercaptopurine	Use full drug name
T3	Tylenol with codeine no. 3	Liothyronine	Use full drug name
TAC	Triamcinolone	Tetracaine, Adrenalin, or Cocaine	Use full drug name
TNK	TNKase	tPA	Use full drug name
TPA or tPA	Tissue plasminogen activator (alteplase)	TNKase (tenecteplase)	Use full drug name
$ZnSO_4$	Zinc sulfate	Morphine sulfate	Use full drug name
μg	Microgram	Mg (milligram)	Use "mcg"
AD, AS, AU	Right ear, left ear, both ears	Right eye, left eye, both eyes	Spell out "right ear," "left ear," or "both ears"
BT	Bedtime	BID (twice daily)	Spell out "bedtime"
cc	cubic centimeters	u (units)	Use "ml"
D/C	Discharge or discontinue	One mistaken for the other	Spell out "discharge" or "discontinue"
HS or hs	Half strength or hour of sleep (at bedtime)	One mistaken for the other	Spell out "half strength" or "at bedtime"
IN	Intranasal	IM or IV	Spell out "intranasal" or use "NAS"
I.U.*	International Units	IV or 10	Spell out "units"
"Nitro" drip	Nitroglycerin infusion	Nitroprusside infusion	
OD, OS, OU	Right eye, left eye, both eyes	Right ear, left ear, both ears	Spell out "right eye," "left eye," or "both eyes"
o.d. or OD	Every day	Right eye	Spell out "daily"
q.d. or QD*	Every day	q.i.d. (4 times per day)	Spell out "daily"
qhs	Nightly at bedtime	qhr (every hour)	Spell out "at bedtime"
q.o.d. or QOD*	Every other day	q.i.d. (4 times per day) or qd (daily)	Spell out "every other day"
SC, SQ, sub q	Subcutaneously	SC mistaken as SL (sublingual); SQ as "5 every"; q in sub q as "every"	Use subcut or write out "subcutaneously"
SSRI	Sliding scale regular insulin	Selective serotonin reuptake inhibitor	Spell out "sliding scale insulin"
TIW	3 times a week	3 times a day or twice a week	Spell out "3 times weekly"
u or U*	units	0 (zero), 4 (four) or cc	Spell out "units"
/ (slash mark)	Per"	1 (numeral one)	Spell out "per"
+	Plus sign	"4" (numeral four)	Spell out "and"
Zero **after** a decimal point (e.g., 1.0 mg)*	1 mg	10 mg	DO NOT USE zero after a decimal point
No zero **before** a decimal point (e.g., .1 mg)*	.1 mg	1 mg	ALWAYS USE zero before a decimal point
@	At	2	Use "at"
>	Greater than	7 or <	Spell out "greater than"
<	Less than	L or >	Spell out "less than"
&	And	2	Use "and"
°	Hour	Zero (q 1° seen as q 10)	Use "hr," "h," or "hour"
Drug name and dose run together. Example: Inderal 40 mg	Inderal 40 mg	Inderal 140 mg	Leave space between drug name, dose, and unit of measure
Numerical dose and unit of measure run together. Example: 10 mg	10 mg	100 mg	Leave space between drug dose and unit of measure

DETECTING AND MANAGING ADVERSE DRUG REACTIONS

An *adverse drug reaction* (ADR) is any unexpected, undesired, or excessive response to a medication that results in:

- temporary or permanent serious harm or disability
- admission to a hospital, transfer to a higher level of care, or prolonged stay
- death.

Adverse drug reactions are distinguished from adverse drug events, in which causality is uncertain, and side effects, which may be bothersome to the patient and necessitate a change in therapy but are not considered serious. Although some ADRs are the result of medication errors, many are not.

Types of ADRs

The Food and Drug Administration (FDA) classifies ADRs into 2 broad categories: Type A and Type B. Type A reactions are predictable reactions based on the primary or secondary pharmacologic effect of the drug. Dose-related reactions and drug-drug interactions are examples of Type A reactions. Type B reactions are unpredictable, are not related to dose, and are not the result of the drug's primary or secondary pharmacologic effect. Idiosyncratic and hypersensitivity reactions are examples of Type B reactions.

Dose-Related Reactions (Toxic Reactions): In dose related reactions, the dose prescribed for the patient is excessive. Although a variety of mechanisms may interact, reasons for this type of reaction include:

- renal or hepatic impairment
- extremes in age (neonates and frail elderly)
- drug-drug or drug-food interactions
- underlying illness.

Dose-related reactions are often the result of preventable errors in prescribing in which physiologic factors such as age, renal impairment, and weight were not considered sufficiently, or in inadequate therapeutic monitoring. Medications with narrow therapeutic ranges (digoxin, aminoglycosides, antiepileptic drugs) and those that require careful monitoring or laboratory testing (anticoagulants, nephrotoxic drugs) are most frequently implicated in dose-related reactions. Dose-related reactions usually are managed successfully by temporarily discontinuing the drug and then reducing the dose or increasing the dosing interval. In some instances, the toxic effects need to be treated with another agent (e.g., Digibind for digoxin toxicity or Kayexalate for drug-induced hyperkalemia). Appropriately timed therapeutic drug level monitoring, review of new drugs added to an existing regimen that may affect the drug level, and frequent assessment of relevant laboratory values are critical to safe medical management and prevention of dose-related reactions.

Drug-Drug Interactions: Drug-drug interactions occur when the pharmacokinetic or pharmacodynamic properties of an individual drug affect another drug. Pharmacokinetics refers to the way the body processes a medication (absorption, distribution, metabolism, and elimination). In a drug-drug interaction, the pharmacokinetic properties of one drug can cause a change in drug concentration of another drug and an altered response. For example, one drug may block enzymes that metabolize a second drug. The concentration of the second drug is then increased and may become toxic or cause adverse reactions. Pharmacodynamic drug-drug interactions involve the known effects and side-effects of the drugs. For example, two drugs with similar therapeutic effects may act together in a synergistic way. The increased anticoagulant effects that occur when warfarin and aspirin are taken together, or the increased central nervous system (CNS) depression that results

© F.A. Davis Publishing

when two drugs with CNS depressant effects potentiate each other, are examples of pharmacodynamic drug-drug interactions. Certain classes of drugs are more likely to result in serious drug-drug interactions, and patients receiving these agents should be monitored carefully. The medication classes include anticoagulants, oral hypoglycemic agents, nonsteroidal anti-inflammatory agents, monoamine oxidase inhibitors, antihypertensives, antiepileptics, and antiretrovirals. In addition, specific drugs such as theophylline, cimetidine, lithium, and digoxin may result in serious ADRs.

Idiosyncratic Reactions: Idiosyncratic reactions occur without relation to dose and are unpredictable and sporadic. Reactions of this type may manifest in many different ways, including fever, blood dyscrasias, cardiovascular effects, or mental status changes. The time frame between the occurrence of a problem and initiation of therapy is sometimes the only clue linking drug to symptom. Some idiosyncratic reactions may be explained by genetic differences in drug-metabolizing enzymes.

Hypersensitivity Reactions: Hypersensitivity reactions are usually allergic responses. Manifestations of hypersensitivity reactions range from mild rashes, to nephritis, pneumonitis, hemolytic anemia, and anaphylaxis. Protein drugs (vaccines, enzymes) are frequently associated with hypersensitivity reactions. In most instances, antibody formation is involved in the process and therefore cross-sensitivity may occur. An example of this is hypersensitivity to penicillin and cross-sensitivity with other penicillins and/or cephalosporins. Documenting drugs to which the patient is allergic and the specific hypersensitivity reaction is very important. If the reaction to an agent is anaphylaxis the nurse should monitor the patient during administration of a cross-hypersensitive agent, especially during the initial dose, and ensure ready access to emergency resuscitative equipment.

Recognizing an ADR

Adverse drug reactions should be suspected whenever there is a negative change in a patient's condition, particularly when a new drug has been introduced. Strategies that can enhance recognition include knowing the side effect/adverse reaction profile of medications. Nurses should be familiar with a drug's most commonly encountered side effects and adverse reactions before administering it. (In *Davis's Drug Guide for Nurses*, most frequent adverse drug reactions are underlined, and life-threatening adverse reactions are CAPITALIZED and appear in second color in the **Adverse Reactions and Side Effects** section.) As always, monitoring the patient's response to a medication and ongoing assessment are key nursing actions. Learn to recognize patient findings that suggest an ADR has occurred. These include:

- rash
- change in respiratory rate, heart rate, blood pressure, or mental state
- seizure
- anaphylaxis
- diarrhea
- fever.

Any of these findings can suggest an ADR and should be reported and documented promptly so that appropriate interventions, including discontinuation of suspect medications, can occur. Prompt intervention can prevent a mild adverse reaction from escalating into a serious health problem. Other steps taken by the health care team when identifying and treating an ADR include:

1. Determining that the drug ordered was the drug given and intended.
2. Determining that the drug was given in the correct dosage by the correct route.
3. Establishing the chronology of events: time drug was taken and onset of symptoms.
4. Stopping the drug and monitoring patient status for improvement (dechallenge).
5. Restarting the drug, if appropriate, and monitoring closely for adverse reactions (rechallenge).

© F.A. Davis Publishing

Prevention

Health care organizations have responded to consumer, regulator, and insurer pressures by developing programs that aim to eliminate preventable ADRs. In the inpatient setting, computer systems can display the patient's age, height, weight, and creatinine clearance or serum creatinine concentration and send an alert to the clinician if a prescribed dose is out of range for any of the displayed parameters. Allergy alerts and drug-drug interactions can be presented to the clinician at the time an order is entered.

In the outpatient setting, strategies that increase the patient's knowledge base and access to pharmacists and nurses may help prevent adverse reactions. Outpatient pharmacy computer systems that are linked within a chain of pharmacies may allow the pharmacist to view the patient's profile if the patient is filling a prescription in a pharmacy other than the usual one. Many pharmacy computers have dose limits and drug-drug reaction verification to assist pharmacists filling orders.

Such strategies are a valuable auxiliary to, but cannot replace, conscientious history taking, careful patient assessment, and ongoing monitoring. A thorough medication history including all prescription and nonprescription drugs, all side effects and adverse reactions encountered, allergies, and all pertinent physical data should be available to the prescriber. The prescriber is responsible for reviewing this data, along with current medications, laboratory values, and any other variable that affects drug response.

It is not expected that practitioners will remember all relevant information when prescribing. In fact, reliance on memory is error-fraught, and clinicians need to use available resources to verify drug interactions whenever adding a new drug to the regimen. Setting expectations that clinicians use evidence-based information rather than their memories when prescribing, dispensing, administering, or monitoring patients has the potential to reduce the incidence of preventable ADRs.

Reporting Adverse Drug Reactions in the U.S.:

Food and Drug Administration MedWatch Program: To monitor and assess the incidence of adverse reactions, the FDA sponsors MedWatch, a program that allows health care practitioners and consumers the opportunity to report serious adverse reactions or product defects encountered from medications, medical devices, special nutritional products, or other FDA-regulated items. The FDA considers serious those reactions that result in death, life-threatening illness or injury, hospitalization, disability, congenital anomaly, or those that require medical/surgical intervention.

In addition to reporting serious adverse reactions, health care providers should also report problems related to suspected contamination, questionable stability, defective components, or poor packaging/labeling. Reports should be submitted even if there is some uncertainty about the cause/effect relationship or if some details are missing. This reporting form may be accessed at https://www.fda.gov/safety/medwatch-fda-safety-information-and-adverse-event-reporting-program. Reports also may be faxed to the FDA (1-800-FDA-0178). Reactions to vaccines should be reported to the Vaccine Adverse Event Reporting System (VAERS; https://vaers.hhs.gov/ or fax 1-877-721-0366). Nurses share with other health care providers an obligation to report adverse reactions to the MedWatch program so that all significant data can be analyzed for opportunities to improve patient care.

Reporting Adverse Drug Reactions in Canada:

The Marketed Health Products Directorate of Health Canada coordinates adverse reaction reporting activities, and analyzes reports submitted from regional centers in each province. MedEffect Canada encourages health professionals, patients and regulatory authorities to report adverse reactions as they occur, either by email, mail, or the Health Canada website. Health care professionals reporting adverse reactions are required to supply information regarding patient characteristics, details about the reaction(s), current treatment, and outcomes. Information identifying the patient or health care provider remains confidential.

© F.A. Davis Publishing

Adverse reaction reports are analyzed to investigate any associations with the health product. Based on the outcome, regulatory bodies decide on a course of action, which may include performing additional post-marketing studies, re-assessment of the risk versus benefit of the product, packaging modification, addition of warnings in patient information leaflets, or issuing public alerts or market withdrawals. Updates regarding adverse reactions are published in the Health Product InfoWatch every month.

Access the following link for the Side Effect Reporting Form for consumers and health professionals: https://www.canada.ca/en/health-canada/services/drugs-health-products/medeffect-canada/adverse-reaction-reporting.html.

OVERVIEW OF RISK EVALUATION AND MITIGATION SYSTEMS (REMS)

Over the past several decades, the Food and Drug Administration (FDA) has employed a number of "risk management" programs designed to detect, evaluate, prevent, and mitigate drug adverse events for drugs with the potential for serious adverse drug reactions. Some of the risk management plans used by the FDA over the years have included the use of patient package inserts, medication guides, restricted access programs, and classification of drugs as controlled substances. These programs were acknowledged by the FDA as Risk Minimization Action Plans (RiskMAPS) in 2005. With these programs, the FDA only had the authority to mandate postmarketing commitments from drug manufacturers before the drug was approved; however, these requirements could not be enforced after the drug was approved.

The Food and Drug Administration Amendments Act of 2007 gave the FDA the authority to subject drugs to new risk identification and communication strategies in the postmarketing period. These new strategies, called Risk Evaluation and Mitigation Strategies (REMS), can be required for any drug or drug class that is associated with serious risks. The FDA can require a REMS if it believes that this program is necessary to ensure that the benefits outweigh the potential risks of the drug. The FDA can require a REMS either as part of the drug approval process or during the postmarketing period if new information becomes available regarding potentially harmful effects that are associated with the use of the drug.

Components of the REMS may include a medication guide, a patient package insert, and/or a communication plan. A REMS for New Drug Applications or Biologics License Applications requires a timetable for submission of assessment of the REMS. A variety of elements to ensure safe use of drugs can be required as part of the REMS if it is believed that a medication guide, patient package insert, or communication plan are not adequate to mitigate the serious risks associated with a particular drug. These elements may include the following:

- Health care providers who prescribe the drug are specifically trained and/or certified.
- Pharmacies, practitioners, or health care settings that dispense the drug are specifically trained and/or certified.
- The drug is dispensed to patients only in certain health care settings, such as hospitals.
- The drug is dispensed only to patients with evidence or other documentation of safe-use conditions, such as laboratory test results.
- Patients using the drug are subject to certain monitoring.
- Patients using the drug are enrolled in a registry.

The FDA maintains an updated list of these REMS programs at https://www.accessdata.fda.gov/scripts/cder/rems/index.cfm. A REMS tag has been added at the top of and within the monographs of drugs associated with these programs.

SPECIAL DOSING CONSIDERATIONS

For many patients the average dose range for a given drug can be toxic. The purpose of this section is to describe vulnerable patient populations for which special dosing considerations must be made to protect the patient and improve clinical outcomes.

The Pediatric Patient

Most drugs prescribed to children are not approved by the Food and Drug Administration (FDA) for use in pediatric populations. This does not mean it's wrong to prescribe these drugs to children, rather it means that the medications were not tested in children. The lack of pediatric drug information can result in patient harm or death, such as what occurred with the drug chloramphenicol. When given to very young children, chloramphenicol caused toxicity and multiple deaths. Referred to as "gray baby syndrome," this toxic reaction was eventually found to be dose dependent. The FDA now requires that new drugs that may be used in children include information for safe pediatric use.

The main reason for adjusting doses in pediatric patients is body size, which is measured by body weight or body surface area (BSA). Weight-based pediatric drug doses are expressed in number of milligrams per kilogram of body weight (mg/kg) while doses calculated on BSA are expressed in number of milligrams per meter squared (mg/m^2). BSA is determined using a BSA nomogram or calculated by using formulas (Appendix E).

The neonate and the premature infant require additional adjustments secondary to immature function of body systems. For example, absorption may be incomplete or altered secondary to differences in gastric pH or motility. Distribution may be altered because of varying amounts of total body water, and metabolism and excretion can be delayed due to immature liver and kidney function. Furthermore, rapid weight changes and progressive maturation of hepatic and renal function require frequent monitoring and careful dosage adjustments. Gestational age, as well as weight, may be needed to properly dose some drugs in the neonate.

The Older Adult Patient

Absorption, distribution, metabolism, and excretion are altered in adults over 65 years of age, putting the older patient at risk for toxic reactions. Pharmacokinetic properties in older adults are affected by

1. diminished gastrointestinal (GI) motility and blood flow, which delays absorption
2. changes in ratios of percentage of body fat, lean muscle mass, and total body water, which alters distribution
3. decreased plasma proteins, especially in the malnourished patient, which alters distribution by allowing a larger proportion of free or unbound drug to circulate and exert effects
4. diminshed hepatic function, which slows metabolism, and
5. diminished renal function, which delays excretion.

Older adults should be prescribed the lowest possible effective dose at the initiation of therapy followed by careful titration of doses as needed. Just as importantly, they should be monitored very carefully for signs and symptoms of adverse drug reactions.

Another concern is that many older adult patients are prescribed multiple drugs and are at risk for polypharmacy. As the number of medications a patient takes increases, so does the risk for an adverse drug reaction. One drug may negate or potentiate the effects of another drug (drug-drug interaction). This situation is compounded by concurrent use of nonprescription or over-the-counter (OTC) drugs, herbal supplements, and vitamins. In general, doses of most medications (especially

© F.A. Davis Publishing

digoxin, sedative/hypnotics, anticoagulants, nonsteroidal anti-inflammatory agents, antibiotics, and antihypertensives) should be decreased in the older adult population. The Beers List/Criteria, which appears in the *Medication Safety Tools* section, is a list of drugs to be used with caution in older adults, and is based on these concerns.

The Patient of Reproductive Age

Generally, pregnant women should avoid medications, except when absolutely necessary. Both the mother and the fetus must be considered. The placenta is a membrane which allows rapid and complete diffusion of lipid soluble drugs and protects the fetus only from extremely large molecules. The fetus is particularly vulnerable during the first and the last trimesters of pregnancy. During the first trimester, vital organs are forming and ingestion of teratogenic drugs may lead to fetal malformation or miscarriage. Unfortunately, this is the time when a woman is least likely to know that she is pregnant. In the third trimester, drugs administered to the mother and transferred to the fetus may not be safely metabolized and excreted by the fetus. This is especially true of drugs administered near term. After the infant is delivered, he or she no longer has the placenta to help with drug excretion, and drugs administered before delivery may result in toxicity.

Of course, many conditions, such as asthma, diabetes, gastrointestinal disorders, and mental illness affect pregnant women and require long-term medication use. When the medications are used, whether over-the-counter or prescription, prescribing the lowest effective dose for the shortest period of time necessary is the rule. The Centers for Disease Control and Prevention (CDC) has a variety of resources and treatment guidelines called Treating for Two: Medicine and Pregnancy. The Web address is https://www.cdc.gov/pregnancy/meds/treatingfortwo/.

The possibility of a medication altering sperm quality and quantity in a potential father also is an area of concern. Male patients should be informed of this risk when taking any medications known to have this potential.

Renal Impairment

The kidneys are the major organ of drug elimination. Failure to account for decreased renal function is a preventable source of adverse drug reactions. Renal function is measured by the creatinine clearance (CCr), which can be approximated in the absence of a 24-hour urine collection (Appendix E). In addition, dosages in the patients with renal impairment can be optimized by measuring blood levels of certain drugs (e.g., digoxin, aminoglycosides).

Patients with underlying renal impairment, premature infants with immature renal function, and older adults with an age-related decrease in renal function require careful dose adjustments. Renal function may fluctuate over time and should be re-assessed periodically.

Hepatic Impairment

The liver is the major organ of drug metabolism. The cytochrome P-450 (CYP450) system changes a drug from a relatively fat-soluble compound to a more water-soluble substance, which means that the drug can then be excreted by the kidneys. Liver function is not as easily quantified as renal function, and it therefore is difficult to predict the correct dosage for a patient with hepatic impairment based on laboratory tests.

A patient who is severely jaundiced or who has very low serum proteins (particularly albumin) can be expected to have some problems metabolizing drugs. In advanced liver disease, portal vascular congestion also impairs drug absorption. Examples of drugs that should be carefully dosed in patients with hepatic impairment include theophylline, diuretics, phenytoin, and sedatives. Some drugs (e.g., enalapril, carisoprodol) must be activated in the liver to exert their effect and are known as prodrugs. In patients with hepatic impairment, these drugs may not be converted to the active component, thereby resulting in decreased efficacy.

Heart Failure

Heart failure results in passive congestion of blood vessels in the gastrointestinal tract, which impairs drug absorption. Heart failure also slows drug delivery to the liver, delaying metabolism. Renal

© F.A. Davis Publishing

function is frequently compromised as well, adding to delayed elimination and prolonged drug action. Dosages of drugs metabolized mainly by the liver or excreted mainly by the kidneys should be decreased in patients with chronic heart failure.

Body Size

Drug dosing is often based on total body weight. However, some drugs selectively penetrate fatty tissues. If the drug does not penetrate fatty tissues (e.g., digoxin, gentamicin), dosages for the obese patient should be determined by ideal body weight or estimated lean body mass. Ideal body weight may be determined from tables of optimal weights or may be estimated using formulas for lean body mass when the patient's height and weight are known (Appendix E). If such adjustments are not made, considerable toxicity can result.

Body size is also a factor in patients who are grossly underweight. Older adults, chronic alcoholics, patients with acquired immune deficiency, and patients who are terminally ill from cancer or other debilitating illnesses need careful attention to dosing. Patients who have had a limb amputated also need to have this change in body size taken into account.

Drug Interactions

Use of multiple drugs, especially those known to interact with other drugs, may necessitate dosage adjustments. Drugs highly bound to plasma proteins, such as warfarin and phenytoin, may be displaced by other highly protein-bound drugs. When this phenomenon occurs, the drug that has been displaced exhibits an increase in its activity because the free or unbound drug is thus available to be active.

Some drugs decrease the liver's ability to metabolize other drugs by inhibiting the CYP450 system. Drugs capable of doing this include cimetidine and ketoconazole. Co-administered drugs that are also highly metabolized by the liver may need to be administered in decreased doses. Other agents such as phenobarbital, other barbiturates, and rifampin are capable of stimulating the liver to metabolize drugs more rapidly by inducing the CYP450 system, requiring larger doses to be administered. Co-administered drugs that are also highly metabolized by the liver may need to be administered in higher doses.

Drugs that significantly alter urine pH can affect excretion of drugs for which the excretory process is pH dependent. Alkalinizing the urine will hasten the excretion of acidic drugs. An example of this is administering sodium bicarbonate in cases of aspirin overdose to promote the renal excretion of aspirin. Alkalinizing the urine will increase reabsorption of alkaline drugs, which prolongs and enhances drug action. Acidification of the urine will hasten the excretion of alkaline drugs. Acidification of the urine will also enhance reabsorption of acidic drugs, prolonging and enhancing drug action.

Some drugs compete for enzyme systems with other drugs. Allopurinol inhibits the enzyme involved in uric acid production, but it also inhibits metabolism (inactivation) of 6-mercaptopurine, greatly increasing its toxicity. The dose of mercaptopurine needs to be significantly reduced when co-administered with allopurinol.

The same potential for interactions exists for some foods. Dietary calcium, found in high concentrations in dairy products, combines with tetracycline or fluoroquinolones and prevents their absorption. Foods high in pyridoxine (vitamin B_6) can negate the anti-Parkinsonian effect of levodopa. Grapefruit juice inhibits the enzyme that breaks down some drugs, and concurrent ingestion may significantly increase drug levels and the risk for toxicity.

Many commonly taken natural products interact with pharmaceutical drugs. St. John's wort, garlic, ephedra, and other natural products can interact with medications and cause known or unpredictable reactions.

Nurses and prescribers should consult drug references and remember that the average dosing range for drugs is intended for an average patient. However, every patient is an individual with specific drug-handling capabilities. Taking these special dosing considerations into account allows for an individualized drug regimen that promotes the desired therapeutic outcome and minimizes the risk of toxicity.

THE CYTOCHROME P450 SYSTEM: What Is It and Why Should I Care?[1]

Looking beyond the obvious takes time, energy, insight, and fortitude; yet this is what we are called to do. We are nurses—tireless care providers. Yet, when the subject of the liver's enzyme system, also called the cytochrome P450 system, is discussed, we feel the urge to run the other way . . . or better yet, to just ignore the conversation. Yet, can we do this as the tireless care provider? The answer to this question is clear and simple: no, we cannot. This is because numerous medications, nutrients, and herbal therapies are metabolized through the cytochrome P450 (CYP450) enzyme system. This system can be inhibited or induced by drugs, and once altered can be clinically significant in the development of drug-drug interactions that may cause unanticipated adverse reactions or therapeutic failures. This article will review the basic concepts of the CYP450 system and relate these concepts to clinically significant altered responses.

The CYP450 enzymes are essential for the production of numerous agents including cholesterol and steroids. Additionally, these enzymes are necessary for the detoxification of foreign chemicals and the metabolism of drugs. CYP450 enzymes are so named because they are bound to membranes within a cell (cyto) and contain a heme pigment (chrome and P) that absorbs light at a wavelength of 450 nm when exposed to carbon monoxide. There are more than 50 CYP450 enzymes, but the CYP1A2, CYP2C19, CYP2D6, CYP1A2, CYP3A4, and CYP3A5 enzymes are responsible for metabolizing 45% of drug metabolism. The CYP2D6 (20–30%), the CYP2C9 (10%), and the CYP2E1 and CYP1A2 (5%) complete this enzyme system.

Drugs that cause CYP450 drug interactions are referred to as either inhibitors or inducers. An inducing agent can increase the rate of another drug's metabolism by as much as two- to threefold that develops over a period of a week. When an inducing agent is prescribed with another medication, the dose of the other medication may need to be adjusted since the rate of metabolism is increased and the effect of the medication reduced. This can lead to a therapeutic failure of the medication. Conversely, if a medication is taken with an agent that inhibits its metabolism, then the drug level can rise and possibly result in a harmful or adverse effect. Information regarding a drug's CYP450 metabolism and its potential for inhibition or induction can be found on the drug label and accessed through the U.S. Food and Drug Administration (FDA) or manufacturer's websites.

When we assess our patients and provide management modalities, these are implemented within a framework of the patient's heritage, race, and culture. This is also true in pharmacology as well (i.e., "pharmacogenetics"). This concept is important to examine since we know that there exists genetic variability, which may influence a patient's response to commonly prescribed drug classes. This genetic variability can be defined as polymorphism. Seven percent of Caucasians and 2–7% of African Americans are poor metabolizers of drugs dependent on CYP2D6, which metabolizes many beta blockers, antidepressants, and opioids. This is because the drug's metabolism via CYP450 enzymes exhibits genetic variability.

Recently, researchers have studied the genetic variability in metabolism among women who were prescribed tamoxifen and medications that inhibit the CYP2D6 enzyme. To review, tamoxifen is biotransformed to the potent antiestrogen, endoxifen, by this enzyme. CYP2D6 genetic variation (individuals considered extensive metabolizers versus poor metabolizers) and inhibitors of the enzyme markedly reduce endoxifen plasma concentrations in tamoxifen-treated patients.

The researchers concluded that CYP2D6 metabolism is an "independent predictor of breast cancer outcome in post-menopausal women receiving tamoxifen for early breast cancer. Determination of CYP2D6 genotype may be of value in selecting adjuvant hormonal therapy and it appears CYP2D6 inhibitors should be avoided in tamoxifen-treated women." Do oncology patients come to us with only their cancer and its treatment? No, they come with multifaceted dimensions and co-morbid conditions such as hypertension, dyslipidemia, depression, seizure disorders, etc. For

© F.A. Davis Publishing

example, several antidepressants (paroxetine [Paxil] and fluoxetine [Prozac]) are inhibitors of metabolism when given with drugs metabolized through the CYP2D6 enzyme, such as haloperidol (Haldol), metoprolol (Lopressor), and hydrocodone. Thus, the therapeutic response can be accentuated. Medications that inhibit the CYP3A4 enzyme, such as amiodarone and antifungals, can affect the therapeutic response of fentanyl, alprazolam (Xanax), and numerous statins; as a result, the effect of these drugs can be enhanced leading to potential toxic levels.

At times, these CYP450 inducers and inhibitors are commonly ingested items such as grapefruit juice and tobacco. In the case of grapefruit juice, there are numerous medications known to interact with grapefruit juice including statins, antiarrhythmic agents, immunosuppressive agents, and calcium channel blockers. Furthermore, the inhibition of the enzyme system seems to be dose dependent; thus, the more a patient drinks, the more the inhibition that occurs. Additionally, the effects can last for several days if grapefruit juice is consumed on a regular basis. Luckily, the effect of this is not seen with other citrus juices.

Hopefully, this brief review has opened the door to your inquisitive nature on how the liver's enzyme system is affected by numerous medications and why some patients experience clinically significant unanticipated adverse reactions or therapeutic failures.

CYP1A2		
Substrates	**Inhibitors**	**Inducers**
alosetron, amitriptyline, clozapine, cyclobenzaprine, desipramine, diazepam, duloxetine, fluvoxamine, imipramine, mexiletine, mirtazapine, olanzapine, propranolol, ropinirole, theophylline, warfarin	cimetidine, ciprofloxacin, fluvoxamine, ketoconazole, lidocaine, mexiletine	carbamazepine, cigarette smoke, phenobarbital, rifampin

EDUCATING PATIENTS ABOUT SAFE MEDICATION USE

Research has shown that patients need information about several medication-related topics, no matter what the medication. A well-informed patient and/or family can help prevent medication errors by hospital staff and is less likely to make medication errors at home. Adherence to the medication regimen is another goal achieved through patient education.

Before beginning any teaching, however, always assess the patient's current knowledge by asking if he or she is familiar with the medication, how it is taken at home, what precautions or follow-up care is required, and other questions specific to each drug. Based on the patient's current knowledge level and taking into consideration factors such as readiness to learn, environmental and social barriers to learning or adherence, and cultural factors, discuss the following:

1. **Generic and brand names of the medication.** Patients should know both the brand and generic names of each medication for two reasons. It helps them identify their medications when a generic equivalent is substituted for a brand name version, and it prevents patients or health care providers from making sound-alike confusion errors when giving or documenting a medication history. An example of this is saying Celebrex but meaning or hearing Cerebyx.

2. **Purpose of the medication.** Patients have a right to know what the therapeutic benefit of the medication will be but also should be told the consequences of not taking the prescribed medication. This may enhance adherence. For example, a patient may be more likely to take blood pressure medication if told lowering high blood pressure will prevent heart attack, kidney disease, or stroke, rather than saying only that it will lower blood pressure.

3. **Dose and how to take the medication.** To derive benefit and avoid adverse reactions or other poor outcomes, the patient must know how much of the medication to take and when to take it. Refer to doses in metric weight (i.e., milligram, gram) rather than dosage unit (tablet) or volume (1 teaspoon). The patient must also be informed of the best time to take the medication, for example, on an empty or a full stomach, before bedtime, or with or without other medications. If possible, help the patient fit the medication schedule into his or her own schedule, so that taking the medication is not difficult or forgotten.

4. **What to do if a dose is missed.** Always explain to patients what to do if a dose is missed. Patients have reported taking a double dose of medication when a missed dose occurs, putting themselves at risk for side effects and adverse reactions.

5. **Duration of therapy.** It is not uncommon for patients to stop taking a medication when they feel better or to discontinue a medication when they cannot perceive a benefit. For very long term, even lifelong therapy, the patient may need to be reminded that the medication helps maintain the current level of wellness. Patients may need to be reminded to finish short-term courses of medications even though they frequently will feel much better before the prescription runs out. Some medications cannot be discontinued abruptly, and patients should be warned to consult a health care professional before discontinuing such agents. Patients will need to know to refill prescriptions several days before running out or to take extra medication if traveling.

6. **Minor side effects and what to do if they occur.** Inform the patient that all medications have potential side effects. Explain the most common side effects associated with the medication and how to avoid or manage them if they occur. An informed patient is less likely to stop taking a medication because of a minor and potentially avoidable side effect.

7. **Serious side effects and what to do if they occur.** Inform the patient of the possibility of serious side effects. Describe signs and symptoms associated with serious side effects, and tell the

© F.A. Davis Publishing

patient to immediately inform a health care professional should they occur. Tell the patient to call before the next dose of the medication is scheduled and to not assume that the medication is the source of the symptom and prematurely discontinue it.

8. **Medications to avoid.** Drug-drug interactions can dampen drug effects, enhance drug effects, or cause life-threatening adverse events such as cardiac dysrhythmias, hepatitis, renal failure, or internal bleeding. The patient and family need to know which other medications, including which over-the-counter medications, to avoid.

9. **Foods to avoid and other precautions.** Food-drug interactions are not uncommon and can have effects similar to drug-drug interactions. Excessive sun exposure resulting in severe dermal reactions is not uncommon and represents an environmental-drug interaction. Likewise, the patient should be informed of what activities to avoid, in case the medication affects alertness or coordination, for example.

10. **How to store the medication:** Medications must be stored properly to maintain potency. Most medications should not be stored in the bathroom medicine cabinet because of excess heat and humidity. In addition, thoughtful storage practices, such as separating two family members' medications, can prevent mix-ups and inadvertent accessibility by children (or pets). Some medications, such as those with potential for abuse, must be kept in a safe/locked container away from children or others. Review storage with patients and ask about current methods for storing medications.

11. **Follow-up care.** Anyone taking medication requires ongoing care to assess effectiveness and appropriateness of medications. Many medications require invasive and noninvasive testing to monitor blood levels; hematopoietic, hepatic, or renal function; or other effects on other body systems. Ongoing medical evaluation may result in dosage adjustments, change in medication, or discontinuation of medication.

12. **What not to take.** Inform patients not to take expired medications or someone else's medication. Warn them not to self-medicate with older, no-longer-used prescriptions even if the remaining supply is not expired. Tell patients to keep a current record of all medications taken and to ask health care providers if new medications are meant to replace a current medication.

As you teach, encourage the patient and the family to ask questions. Providing feedback about medication questions will increase their understanding and help you identify areas that need reinforcement. Also, ask patients to repeat what you have said and return to demonstrate application or administration techniques.

Stress the importance of concurrent therapies. Medications often are only a part of a recommended therapy. Review with the patient and family other measures that will enhance or maintain health. Always consider the cultural context in which health information is provided and plan accordingly. This might include obtaining a same-gender translator or adjusting dosing times to avoid conflict with traditional rituals.

Finally, provide written instructions in a simple and easy-to-read format. Keep in mind that most health care information is written at a 10th grade reading level, while many patients read at a 5th grade level. Tell patients to keep the written instructions, so that they can be reviewed at home, when stress levels are lower and practical difficulties in maintaining the medication plan are known.

© F.A. Davis Publishing

CLASSIFICATIONS

• ANTI-ALZHEIMER'S AGENTS

PHARMACOLOGIC PROFILE

General Use

Management of Alzheimer's dementia.

General Action and Information

All agents act by ↑ the amount of acetylcholine in the CNS by inhibiting cholinesterase. No agents to date can slow the progression of Alzheimer's dementia. Current agents may temporarily improve cognitive function and therefore improve quality of life.

Contraindications

Hypersensitivity.

Precautions

Use cautiously in patients with a history of "sick sinus syndrome" or other supraventricular cardiac conduction abnormalities (may cause bradycardia). Cholinergic effects may result in adverse GI effects (nausea, vomiting, diarrhea, weight loss) and may also ↑ gastric acid secretion resulting in GI bleeding, especially during concurrent NSAID therapy. Other cholinergic effects may include urinary tract obstruction, seizures, or bronchospasm.

Interactions

Additive effects with other drugs having cholinergic properties. May exaggerate the effects of succinylcholine-type muscle relaxation during anesthesia. May ↓ therapeutic effects of anticholinergics.

NURSING IMPLICATIONS

Assessment

- Assess cognitive function (memory, attention, reasoning, language, ability to perform simple tasks) throughout therapy.
- Monitor nausea, vomiting, anorexia, and weight loss. Notify health care professional if these side effects occur.

Implementation

Patient/Family Teaching

- Instruct patient and caregiver that medication should be taken as directed.
- Advise patient and caregiver to notify health care professional if nausea, vomiting, anorexia, and weight loss occur.

Evaluation/Desired Outcomes

- Temporary improvement in cognitive function (memory, attention, reasoning, language, ability to perform simple tasks) in patients with Alzheimer's disease.

• ANTIANEMICS

PHARMACOLOGIC PROFILE

General Use

Prevention and treatment of anemias.

© F.A. Davis Publishing

General Action and Information

Iron (ferric carboxymaltose, ferric pyrophosphate citrate, ferrous fumarate, ferrous gluconate, ferrous sulfate, ferumoxytol, iron dextran, iron sucrose, polysaccharide-iron complex, sodium ferric gluconate complex) is required for production of hemoglobin, which is necessary for oxygen transport to cells. Cyanocobalamin and hydroxocobalamin (vitamin B_{12}) and folic acid are water-soluble vitamins that are required for red blood cell production. Darbepoetin, epoetin, and methoxy polyethylene glycol-epoetin beta stimulate production of red blood cells.

Contraindications

Undiagnosed anemias. Hemochromatosis, hemosiderosis, hemolytic anemia (Iron). Uncontrolled hypertension (darbepoetin, epoetin, and methoxy polyethylene glycol-epoetin beta).

Precautions

Use parenteral iron (ferric carboxymaltose, ferric pyrophosphate citrate, ferumoxytol, iron dextran, iron sucrose, sodium ferric gluconate complex) cautiously in patients with a history of allergy or hypersensitivity reactions.

Interactions

Oral iron can ↓ the absorption of tetracyclines, fluoroquinolones, or penicillamine. Vitamin E may impair the therapeutic response to iron. Phenytoin and other anticonvulsants may ↓ the absorption of folic acid. Darbepoetin and epoetin may ↑ the requirement for heparin during hemodialysis.

NURSING IMPLICATIONS

Assessment

- Assess patient's nutritional status and dietary history to determine possible causes for anemia and need for patient teaching.

Implementation

- Iron salts are available in combination with many vitamins and minerals (see Appendix N).

Patient/Family Teaching

- Encourage patients to comply with diet recommendations of health care professional. Explain that the best source of vitamins and minerals is a well-balanced diet with foods from the four basic food groups.
- Patients self-medicating with vitamin and mineral supplements should be cautioned not to exceed RDA. The effectiveness of mega doses for treatment of various medical conditions is unproven and may cause side effects.

Evaluation/Desired Outcomes

- Resolution of anemia.

• ANTIANGINALS

PHARMACOLOGIC PROFILE

General Use

Nitrates are used to treat and prevent attacks of angina. Only nitrates (sublingual, lingual spray, topical, or intravenous) may be used in the acute treatment of attacks of angina pectoris. Calcium channel blockers, beta blockers, and ranolazine are used prophylactically in long-term management of angina.

General Action and Information

Several different groups of medications are used in the treatment of angina pectoris. The nitrates (isosorbide dinitrate, isosorbide mononitrate, and nitroglycerin) are available as a translingual

© F.A. Davis Publishing

spray, sublingual tablets, sublingual powder, intravenous solution, transdermal patch, topical ointment, and sustained-release oral dosage forms. Nitrates dilate coronary arteries and cause systemic vasodilation (↓ preload). Calcium channel blockers dilate coronary arteries (some also slow heart rate). Beta blockers ↓ myocardial oxygen consumption via a ↓ in heart rate. Ranolazine ↓ myocardial oxygen consumption.

Contraindications
Hypersensitivity. Avoid use of beta blockers or calcium channel blockers in advanced heart block, cardiogenic shock, or decompensated HF.

Precautions
Beta blockers should be used cautiously in patients with diabetes mellitus, pulmonary disease, or hypothyroidism.

Interactions
Nitrates, calcium channel blockers, and beta blockers may cause hypotension with other antihypertensives or acute ingestion of alcohol. Verapamil, diltiazem, and beta blockers may have additive myocardial depressant effects when used with other agents that affect cardiac function. Verapamil, diltiazem, and ranolazine have a number of other significant drug-drug interactions.

NURSING IMPLICATIONS

Assessment
- Assess location, duration, intensity, and precipitating factors of patient's anginal pain.
- Monitor BP and pulse periodically throughout therapy.

Implementation
- Available in various dose forms. See specific drugs for information on administration.

Patient/Family Teaching
- Instruct patient on concurrent nitrate therapy and prophylactic antianginals to continue taking both medications as ordered and to use sublingual/translingual nitroglycerin as needed for anginal attacks.
- Advise patient to contact health care professional immediately if chest pain does not improve; worsens after therapy; is accompanied by diaphoresis or shortness of breath; or if severe, persistent headache occurs.
- Caution patient to make position changes slowly to minimize orthostatic hypotension.
- Advise patient to avoid concurrent use of alcohol with these medications.

Evaluation/Desired Outcomes
- Decrease in frequency and severity of anginal attacks.
- Increase in activity tolerance.

• ANTIANXIETY AGENTS

PHARMACOLOGIC PROFILE

General Use
Antianxiety agents are used in the management of various forms of anxiety, including generalized anxiety disorder (GAD). Some agents are more suitable for intermittent or short-term use (benzodiazepines) while others are more useful long-term (buspirone, doxepin, fluoxetine, paroxetine, sertraline, venlafaxine).

General Action and Information
Most agents cause generalized CNS depression. Benzodiazepines may produce tolerance with long-term use and have potential for psychological or physical dependence. These agents have NO analgesic properties.

© F.A. Davis Publishing

Contraindications
Hypersensitivity. Should not be used in comatose patients or in those with pre-existing CNS depression. Should not be used in patients with uncontrolled severe pain. Avoid use during pregnancy or lactation.

Precautions
Use cautiously in patients with hepatic impairment, severe renal impairment, or severe underlying pulmonary disease (benzodiazepines only). Use with caution in patients who may be suicidal or who may have had previous drug addictions. Patients may be more sensitive to CNS depressant effects; dosage ↓ may be required.

Interactions
Mainly for benzodiazepines; additive CNS depression with alcohol, antihistamines, some antidepressants, opioid analgesics, or phenothiazines may occur. Most agents should not be used with MAO inhibitors.

NURSING IMPLICATIONS

Assessment
- Monitor BP, pulse, and respiratory status frequently throughout IV administration.
- Prolonged high-dose therapy may lead to psychological or physical dependence. Restrict the amount of drug available to patient, especially if patient is depressed, suicidal, or has a history of addiction.
- **Anxiety:** Assess degree of anxiety and level of sedation (ataxia, dizziness, slurred speech) before and periodically throughout therapy.

Implementation
- Patients changing to buspirone from other antianxiety agents should receive gradually ↓ doses. Buspirone will not prevent withdrawal symptoms.

Patient/Family Teaching
- May cause daytime drowsiness. Caution patient to avoid driving and other activities requiring alertness until response to medication is known.
- Advise patient to avoid the use of alcohol and other CNS depressants concurrently with these medications.
- Advise patient to inform health care professional if pregnancy is planned or suspected.

Evaluation/Desired Outcomes
- Decrease in anxiety level.

• ANTIARRHYTHMICS

PHARMACOLOGIC PROFILE

General Use
Suppression of cardiac arrhythmias.

General Action and Information
Correct cardiac arrhythmias by a variety of mechanisms, depending on the group used. The therapeutic goal is ↓ symptomatology and ↑ hemodynamic performance. Choice of agent depends on etiology of arrhythmia and individual patient characteristics. Treatable causes of arrhythmias should be corrected before therapy is initiated (e.g., electrolyte disturbances, other drugs). Antiarrhythmics are generally classified by their effects on cardiac conduction tissue (see the following table). Adenosine, atropine, and digoxin are also used as antiarrhythmics.

© F.A. Davis Publishing

MECHANISM OF ACTION OF MAJOR ANTIARRHYTHMIC DRUGS

CLASS	DRUGS	MECHANISM
IA	quinidine, procainamide, disopyramide	Na channel blockers, ↑ APD and ERP, ↓ membrane responsiveness
IB	lidocaine, phenytoin, mexiletine	Na channel blockers, ↓ APD and ERP
IC	flecainide, propafenone	Profound slowing of conduction by blocking Na channels, markedly depress phase 0; propafenone also has beta-blocking properties
II	esmolol, propranolol, metoprolol	Beta-blockers; ↓ AV nodal conduction, ↓ automaticity
III	amiodarone, dofetilide, dronedarone, ibutilide, sotalol	K channel blockers; amiodarone and dronedarone also have Na channel, beta-receptor, and Ca-channel blocking properties; sotalol also has beta-blocking properties
IV	diltiazem, verapamil	Non-dihydropyridine Ca channel blockers; ↓ AV nodal conduction

APD = action-potential duration; AV = atrioventricular; Ca = calcium; ERP = effective refractory period; K = potassium; Na = sodium.

Contraindications
Differ greatly among various agents. See individual drugs.

Precautions
Differ greatly among agents used. Appropriate dosage adjustments should be made in elderly patients and those with renal or hepatic impairment, depending on agent chosen. Correctable causes (electrolyte abnormalities, drug toxicity) should be evaluated. See individual drugs.

Interactions
Differ greatly among agents used. See individual drugs.

NURSING IMPLICATIONS

Assessment
- Monitor ECG, pulse, and BP continuously throughout IV administration and periodically throughout oral administration.

Implementation
- Take apical pulse before administration of oral doses. Withhold dose and notify physician or other health care professional if heart rate is <50 bpm.

Patient/Family Teaching
- Instruct patient to take oral doses around the clock, as directed, even if feeling better.
- Instruct patient or family member on how to take pulse. Advise patient to report changes in pulse rate or rhythm to health care professional.
- Caution patient to avoid taking OTC medications without consulting health care professional.
- Advise patient to carry identification describing disease process and medication regimen at all times.
- Emphasize the importance of follow-up exams to monitor progress.

Evaluation/Desired Outcomes
- Resolution of cardiac arrhythmias without detrimental side effects.

• ANTIASTHMATICS

PHARMACOLOGIC PROFILE

General Use
Management of acute and chronic episodes of reversible bronchoconstriction. Goal of therapy is to treat acute attacks (short-term control) and to ↓ incidence and intensity of future attacks (long-term control). The choice of modalities depends on the continued requirement for short term control agents.

© F.A. Davis Publishing

General Action and Information

Adrenergic bronchodilators and phosphodiesterase inhibitors both work by ↑ intracellular levels of cyclic-3', 5'-adenosine monophosphate (cAMP); adrenergics by ↑ production and phosphodiesterase inhibitors by ↓ breakdown. ↑ levels of cAMP produce bronchodilation. Corticosteroids act by ↓ airway inflammation. Anticholinergics (ipratropium) produce bronchodilation by ↓ intracellular levels of cyclic guanosine monophosphate (cGMP). Leukotriene receptor antagonists and mast cell stabilizers ↓ the release of substances that can contribute to bronchospasm.

Contraindications

Inhaled corticosteroids, long-acting adrenergic agents, and mast cell stabilizers should not be used during acute attacks of asthma.

Precautions

Adrenergic bronchodilators and anticholinergics should be used cautiously in patients with cardiovascular disease. Chronic use of systemic corticosteroids should be avoided in children or during pregnancy or lactation. Patients with diabetes may experience loss of glycemic control during corticosteroid therapy. Corticosteroids should never be abruptly discontinued.

Interactions

Adrenergic bronchodilators and phosphodiesterase inhibitors may have additive CNS and cardiovascular effects with other adrenergic agents. Cimetidine ↑ theophylline levels and the risk of toxicity. Corticosteroids may ↓ the effectiveness of antidiabetics. Corticosteroids may cause hypokalemia which may be additive with potassium-losing diuretics and may also ↑ the risk of digoxin toxicity.

NURSING IMPLICATIONS

Assessment

- Assess lung sounds and respiratory function prior to and periodically throughout therapy.
- Assess cardiovascular status of patients taking adrenergic bronchodilators or anticholinergics. Monitor for ECG changes and chest pain.

Implementation

- **Inhaln:** Shake inhaler well, and allow at least 1 min between inhalations of aerosol medication. Prime the inhaler before first use. Use of spacer recommended for children.

Patient/Family Teaching

- Instruct patient to take antiasthmatics as directed. Do not take more than prescribed or discontinue without discussing with health care professional.
- Advise patient to avoid smoking and other respiratory irritants.
- Instruct patient in correct use of metered-dose inhaler or other administration devices (see Appendix C).
- Advise patient to contact health care professional promptly if the usual dose of medication fails to produce the desired results, if symptoms worsen after treatment, or if toxic effects occur.
- Patients using inhalation medications and bronchodilators should be advised to use the bronchodilator first and allow 5 min to elapse before administering other medications, unless otherwise directed by health care professional.

Evaluation/Desired Outcomes

- Prevention of and reduction in symptoms of asthma.

© F.A. Davis Publishing

• ANTICHOLINERGICS

PHARMACOLOGIC PROFILE

General Use

Atropine—Bradyarrhythmias. **Ipratropium—**bronchospasm (inhalation) and rhinorrhea (intranasal). **Scopolamine—**Nausea and vomiting related to motion sickness and vertigo. **Propantheline and glycopyrrolate—** ↓ gastric secretory activity and ↑ esophageal sphincter tone. Atropine and scopolamine are also used as ophthalmic mydriatics. **Benztropine and trihexyphenidyl—**Parkinson's disease. **Oxybutynin and tolterodine—**Overactive bladder.

General Action and Information

Competitively inhibit the action of acetylcholine. In addition, atropine, glycopyrrolate, propantheline, and scopolamine are antimuscarinic in that they inhibit the action of acetylcholine at sites innervated by postganglionic cholinergic nerves.

Contraindications

Hypersensitivity, narrow-angle glaucoma, severe hemorrhage, tachycardia (due to thyrotoxicosis or cardiac insufficiency), or myasthenia gravis.

Precautions

Geriatric and pediatric patients are more susceptible to adverse effects. Use cautiously in patients with urinary tract pathology; those at risk for GI obstruction; and those with chronic renal, hepatic, pulmonary, or cardiac disease.

Interactions

Additive anticholinergic effects (dry mouth, dry eyes, blurred vision, constipation) with other agents possessing anticholinergic activity, including antihistamines, antidepressants, quinidine, and disopyramide. May alter GI absorption of other drugs by inhibiting GI motility and ↑ transit time. Antacids may ↓ absorption of orally administered anticholinergics.

NURSING IMPLICATIONS

Assessment

- Assess vital signs and ECG frequently during IV drug therapy. Report any significant changes in heart rate or BP or increase in ventricular ectopy or angina promptly.
- Monitor intake and output ratios in elderly or surgical patients; may cause urinary retention.
- Assess patient regularly for abdominal distention and auscultate for bowel sounds. Constipation may become a problem. Increasing fluids and adding bulk to the diet may help alleviate constipation.

Implementation

- **PO:** Administer oral doses of glycopyrrolate, propantheline, or scopolamine 30 min before meals.
- Scopolamine transdermal patch should be applied at least 4 hr before travel.

Patient/Family Teaching

- Instruct patient that frequent rinses, sugarless gum or candy, and good oral hygiene may help relieve dry mouth.
- May cause drowsiness. Caution patient to avoid driving or other activities requiring alertness until response to medication is known.
- **Ophth:** Advise patients that ophthalmic preparations may temporarily blur vision and impair ability to judge distances. Dark glasses may be needed to protect eyes from bright light.

Evaluation/Desired Outcomes

- Increase in heart rate.
- Decrease in nausea and vomiting related to motion sickness or vertigo.

© F.A. Davis Publishing

- Dryness of mouth.
- Dilation of pupils.
- Decrease in GI motility.
- Resolution of signs and symptoms of Parkinson's disease.
- Decreased urinary frequency, urgency, and urge incontinence.

• ANTICOAGULANTS

PHARMACOLOGIC PROFILE

General Use

Prevention and treatment of thromboembolic disorders including deep vein thrombosis, pulmonary embolism, and atrial fibrillation. Also used in the management of myocardial infarction (MI) sequentially or in combination with thrombolytics and/or antiplatelet agents.

General Action and Information

Anticoagulants are used to prevent clot extension and formation. They do not dissolve clots. The main types of anticoagulants in common use are parenteral heparins, oral warfarin, oral/parenteral direct thrombin inhibitors, and oral/parenteral factor Xa inhibitors. When initiating warfarin, unfractionated heparin or a low-molecular weight heparin is usually administered concomitantly initially since warfarin takes several days to produce therapeutic anticoagulation. Once a therapeutic anticoagulant effect is achieved with warfarin, the unfractionated heparin or low-molecular weight heparin will be discontinued. Unfractionated heparin (at lower doses), a low-molecular weight heparin (at lower doses), or fondaparinux are mostly used to prevent deep vein thrombosis after certain surgical procedures or situations in which prolonged bedrest increases the risk of thromboembolism. Argatroban is used to provide anticoagulation in patients who have developed thrombocytopenia during heparin therapy.

Contraindications

Underlying coagulation disorders, ulcer disease, malignancy, recent surgery, or active bleeding.

Precautions

Anticoagulation should be undertaken cautiously in any patient with a potential site for bleeding. Pregnant or lactating patients should not receive warfarin. Heparin does not cross the placenta. All anticoagulants should be used cautiously in patients receiving epidural analgesia.

Interactions

Warfarin is highly protein bound and may displace or be displaced by other highly protein-bound drugs. The resultant interactions depend on which drug is displaced. Bleeding may be potentiated by aspirin or large doses of penicillins or penicillin-like drugs, cefotetan, cefoperazone, valproic acid, or NSAIDs.

NURSING IMPLICATIONS

Assessment

- Assess patient taking anticoagulants for signs of bleeding and hemorrhage (bleeding gums; nosebleed; unusual bruising; tarry, black stools; hematuria; fall in hematocrit or BP; guaiac-positive stools; urine; or NG aspirate).
- Assess patient for evidence of additional or increased thrombosis. Symptoms will depend on area of involvement.
- **Lab Test Considerations:** Monitor prothrombin time (PT) or international normalized ratio (INR) with warfarin therapy, activated partial thromboplastin time (aPTT) with full-dose heparin therapy and hematocrit, and other clotting factors frequently during therapy.
- **Toxicity and Overdose:** If overdose occurs or anticoagulation needs to be immediately reversed, the antidote for heparins is protamine sulfate; for warfarin, the antidote is vitamin K

© F.A. Davis Publishing

(phytonadione); for dabigatran, the antidote is idarucizumab; for rivaroxaban and apixaban, the antidote is andexanet alfa. Administration of fresh frozen plasma or prothrombin complex concentrate may also be required in severe bleeding due to warfarin, the oral direct thrombin inhibitors, or the oral factor Xa inhibitors.

Implementation

- Inform all health care professionals caring for patient of anticoagulant therapy. Venipunctures and injection sites require application of pressure to prevent bleeding or hematoma formation.
- Use an infusion pump with continuous infusions to ensure accurate dosage.

Patient/Family Teaching

- Caution patient to avoid activities leading to injury, to use a soft toothbrush and electric razor, and to report any symptoms of unusual bleeding or bruising to health care professional immediately.
- Instruct patient not to take OTC medications, especially those containing aspirin, NSAIDs, or alcohol, without advice of health care professional.
- Review foods high in vitamin K (see Appendix J) with patients on warfarin. Patient should have consistent limited intake of these foods, as vitamin K is the antidote for warfarin and greatly alternating intake of these foods will cause the INR to fluctuate.
- Emphasize the importance of frequent lab tests to monitor the degree of anticoagulation with unfractionated heparin or warfarin.
- Instruct patient to carry identification describing medication regimen at all times and to inform all health care professionals caring for patient of anticoagulant therapy before laboratory tests, treatment, or surgery.

Evaluation/Desired Outcomes

- Prevention of undesired clotting and its sequelae without signs of hemorrhage. Prevention of stroke, MI, and death in patients at risk.

• ANTICONVULSANTS

PHARMACOLOGIC PROFILE

General Use

Anticonvulsants are used to ↓ the incidence and severity of seizures due to various etiologies. Some anticonvulsants are used parenterally in the immediate treatment of seizures. It is not uncommon for patients to require more than one anticonvulsant to control seizures on a long-term basis. Several anticonvulsants are evaluated with serum level monitoring. Several anticonvulsants also are used to treat neuropathic pain.

General Action and Information

Anticonvulsants include a variety of agents, all capable of depressing abnormal neuronal discharges in the CNS that may result in seizures. They may work by preventing the spread of seizure activity, depressing the motor cortex, raising seizure threshold, or altering levels of neurotransmitters, depending on the group. See individual drugs.

Contraindications

Previous hypersensitivity.

Precautions

Use cautiously in patients with severe hepatic or renal impairment; dose adjustment may be required. Choose agents carefully in pregnant and lactating women. Fetal hydantoin syndrome may occur in offspring of patients who receive phenytoin during pregnancy.

© F.A. Davis Publishing

Interactions

Barbiturates stimulate the metabolism of other drugs that are metabolized by the liver, ↓ their effectiveness. Phenytoin is highly protein-bound and may displace or be displaced by other highly protein-bound drugs. Lamotrigine, tiagabine, and topiramate are capable of interacting with several other anticonvulsants. Many drugs are capable of lowering seizure threshold and may ↓ the effectiveness of anticonvulsants, including tricyclic antidepressants and phenothiazines. For more specific interactions, see individual drugs.

NURSING IMPLICATIONS

Assessment

- Assess location, duration, and characteristics of seizure activity.
- **Toxicity and Overdose:** Monitor serum drug levels routinely throughout anticonvulsant therapy, especially when adding or discontinuing other medications.

Implementation

- Administer anticonvulsants around the clock. Abrupt discontinuation may precipitate status epilepticus.
- Implement seizure precautions.

Patient/Family Teaching

- Instruct patient to take medication every day, exactly as directed.
- May cause drowsiness. Caution patient to avoid driving or other activities requiring alertness until response to medication is known. Do not resume driving until physician gives clearance based on control of seizures.
- Advise patient to avoid taking alcohol or other CNS depressants concurrently with these medications.
- Advise patient to carry identification describing disease process and medication regimen at all times.

Evaluation/Desired Outcomes

- Decrease or cessation of seizures without excessive sedation.
- Decreased neuropathic pain.

• ANTIDEPRESSANTS

PHARMACOLOGIC PROFILE

General Use

Used in the treatment of various forms of endogenous depression, often in conjunction with psychotherapy. Other uses include: Treatment of anxiety (doxepin, duloxetine, fluoxetine, paroxetine, sertraline, venlafaxine); Enuresis (imipramine); Chronic pain syndromes (amitriptyline, doxepin, duloxetine, imipramine, nortriptyline); Smoking cessation (bupropion); Bulimia (fluoxetine); Obsessive-compulsive disorder (fluoxetine, fluvoxamine, paroxetine, sertraline); Social anxiety disorder (paroxetine, sertraline, venlafaxine).

General Action and Information

Antidepressant activity is most likely due to preventing the reuptake of dopamine, norepinephrine, and serotonin by presynaptic neurons, resulting in accumulation of these neurotransmitters. The major classes of antidepressants are the tricyclic antidepressants, the selective serotonin reuptake inhibitors (SSRIs), and the serotonin/norepinephrine reuptake inhibitors (SNRIs). Most tricyclic agents possess significant anticholinergic and sedative properties, which explains many of their side effects (amitriptyline, amoxapine, desipramine, doxepin, imipramine, nortriptyline, trimipramine). The SSRIs are more likely to cause insomnia (citalopram,

© F.A. Davis Publishing

escitalopram, fluoxetine, fluvoxamine, paroxetine, sertraline, vortioxetine, vilazodone). The SNRIs include desvenlafaxine, duloxetine, levomilnacipran, milnacipran, and venlafaxine.

Contraindications

Hypersensitivity. Should not be used in narrow-angle glaucoma. Should not be used in pregnancy or lactation or immediately after MI.

Precautions

Use cautiously in older patients and those with pre-existing cardiovascular disease. Elderly men with prostatic enlargement may be more susceptible to urinary retention. Anticholinergic side effects of tricyclic antidepressants (dry eyes, dry mouth, blurred vision, and constipation) may require dosage modification or drug discontinuation. Dosage requires slow titration; onset of therapeutic response may be 2–4 wk. May ↓ seizure threshold, especially bupropion.

Interactions

Tricyclic antidepressants— May cause hypertension, tachycardia, and convulsions when used with MAO inhibitors. May prevent therapeutic response to some antihypertensives. Additive CNS depression with other CNS depressants. Sympathomimetic activity may be enhanced when used with other sympathomimetics. Additive anticholinergic effects with other drugs possessing anticholinergic properties. **MAO inhibitors—** Hypertensive crisis may occur with concurrent use of MAO inhibitors and amphetamines, methyldopa, levodopa, dopamine, epinephrine, norepinephrine, desipramine, imipramine, vasoconstrictors, or ingestion of tyramine-containing foods. Hypertension or hypotension, coma, convulsions, and death may occur with use of meperidine or other opioid analgesics and MAO inhibitors. Additive hypotension with antihypertensives or spinal anesthesia and MAO inhibitors. Additive hypoglycemia with insulin or oral hypoglycemic agents and MAO inhibitors. SSRIs, bupropion, or venlafaxine should not be used in combination with or within weeks of MAO inhibitors (see individual monographs). Risk of adverse reactions with MAO inhibitors may be ↑ by almotriptan, frovatriptan, rizatriptan, naratriptan, sumatriptan, or zolmitriptan.

NURSING IMPLICATIONS

Assessment

- Monitor mental status and affect. Assess for suicidal tendencies, especially during early therapy. Restrict amount of drug available to patient.
- **Toxicity and Overdose:** Concurrent ingestion of MAO inhibitors and tyramine-containing foods may lead to hypertensive crisis. Symptoms include chest pain, severe headache, nuchal rigidity, nausea and vomiting, photosensitivity, and enlarged pupils. Treatment includes IV phentolamine.

Implementation

- Administer drugs that are sedating at bedtime to avoid excessive drowsiness during waking hours, and administer drugs that cause insomnia in the morning.

Patient/Family Teaching

- Caution patient to avoid alcohol and other CNS depressants. Patients receiving MAO inhibitors should also avoid OTC drugs and foods or beverages containing tyramine (see Appendix J) during and for at least 2 wk after therapy has been discontinued, as they may precipitate a hypertensive crisis. A health care professional should be contacted immediately if symptoms of hypertensive crisis develop.
- Inform patient that dizziness or drowsiness may occur. Caution patient to avoid driving and other activities requiring alertness until response to the drug is known.
- Caution patient to make position changes slowly to minimize orthostatic hypotension.
- Advise patient to notify health care professional if dry mouth, urinary retention, or constipation occurs. Frequent rinses, good oral hygiene, and sugarless candy or gum may diminish dry mouth. An increase in fluid intake, fiber, and exercise may prevent constipation.

© F.A. Davis Publishing

- Advise patient to notify health care professional of medication regimen and any herbal alternative therapies before treatment or surgery. MAO inhibitor therapy usually needs to be withdrawn at least 2 wk before use of anesthetic agents.
- Emphasize the importance of participation in psychotherapy and follow-up exams to evaluate progress.

Evaluation/Desired Outcomes

- Resolution of depression.
- Decrease in anxiety.
- Control of bedwetting in children over 6 yr of age.
- Management of chronic neurogenic pain.

• ANTIDIABETICS

PHARMACOLOGIC PROFILE

General Use

Insulin is used in the management of type 1 diabetes mellitus. It may also be used in type 2 diabetes mellitus when diet and/or oral medications fail to adequately control blood sugar. The choice of insulin preparation (rapid-acting, intermediate-acting, long-acting) depends on the degree of control desired, daily blood glucose fluctuations, and history of previous reactions. Oral agents non-insulin injectable agents are used primarily in type 2 diabetes mellitus. Oral agents are used when diet therapy alone fails to control blood glucose or symptoms or when patients are not amenable to using insulin or another injectable agent. Some oral agents may be used with insulin.

General Action and Information

Insulin, a hormone produced by the pancreas, lowers blood glucose by ↑ transport of glucose into cells and promotes the conversion of glucose to glycogen. It also promotes the conversion of amino acids to proteins in muscle, stimulates triglyceride formation, and inhibits the release of free fatty acids. Sulfonylureas, nateglinide, repaglinide, the dipeptidyl peptidase 4 (DPP-4) inhibitors (e.g. sitagliptin), and the glucagon-like peptide-1 (GLP-1) receptor agonists (e.g. exenatide) ↓ blood glucose by stimulating endogenous insulin secretion by beta cells of the pancreas and by ↑ sensitivity to insulin at intracellular receptor sites. Intact pancreatic function is required. Acarbose and miglitol delay digestion of ingested carbohydrates, thus ↓ blood glucose, especially after meals. The thiazolidinediones (e.g. pioglitazone) and metformin ↑ insulin sensitivity. The sodium-glucose transporter 2 (SGLT2) inhibitors (e.g. empagliflozin) inhibit the reabsorption of glucose in the proximal renal tubule, thereby ↑ the excretion of glucose in the urine.

Contraindications

Insulin— Hypoglycemia. **Oral hypoglycemic agents—** Hypersensitivity (cross-sensitivity with other sulfonylureas and sulfonamides may exist). Hypoglycemia. Type 1 diabetes. Avoid use in patients with severe kidney, liver, thyroid, and other endocrine dysfunction. Should not be used in pregnancy or lactation. **DPP–4 inhibitors—** Type 1 diabetes. **GLP-1 agonists—** Personal or family history of medullary thyroid carcinoma. Multiple Endocrine Neoplasia syndrome type 2. **SGLT2 inhibitors—** Severe renal impairment.

Precautions

Insulin— Infection, stress, or changes in diet may alter requirements. **Oral hypoglycemic agents—** Use cautiously in geriatric patients. Dose ↓ may be necessary. Infection, stress, or changes in diet may alter requirements. Use sulfonylureas with caution in patients with a history of cardiovascular disease. Metformin may cause lactic acidosis. **DPP–4 inhibitors—** Use cautiously in patients with renal impairment, history of pancreatitis, or history of angioedema to another DPP-4 inhibitor. **GLP-1 agonists—** Use cautiously in patients with a history of pancreatitis or history of angioedema to another GLP-1 agonist. **SGLT2 inhibitors—** Use cautiously in

© F.A. Davis Publishing

patients with moderate renal impairment or history of pancreatitis. Hypovolemia, chronic kidney disease, HF, concurrent use of diuretics, NSAIDs, ACE inhibitors, or ARBs may ↑ risk of acute kidney injury. Previous amputation, peripheral vascular disease, neuropathy, or diabetic foot infection may ↑ risk of lower limb amputation.

Interactions

Insulin— Additive hypoglycemic effects with oral hypoglycemic agents. **Oral hypoglycemic agents—** Ingestion of alcohol may result in disulfiram-like reaction with some agents. Alcohol, corticosteroids, rifampin, glucagon, and thiazide and loop diuretics may ↓ effectiveness. Anabolic steroids, chloramphenicol, MAO inhibitors, most NSAIDs, salicylates, sulfonamides, and warfarin may ↑ hypoglycemic effect. Beta blockers may produce hypoglycemia and mask signs and symptoms of hypoglycemia. **DPP–4 inhibitors—** Use with insulin or sulfonylureas may ↑ hypoglycemic effect. **GLP-1 agonists—** Use with sulfonylureas may ↑ hypoglycemic effect. **SGLT2 inhibitors—** Use with insulin or sulfonylureas may ↑ hypoglycemic effect. NSAIDs, diuretics, ACE inhibitors, or ARBs may ↑ risk of acute kidney injury.

NURSING IMPLICATIONS

Assessment

- Observe patient for signs and symptoms of hypoglycemic reactions.
- Metformin, acarbose, miglitol, and the thiazolidinediones do not cause hypoglycemia when taken alone but may ↑ the hypoglycemic effect of other hypoglycemic agents.
- Patients who have been well controlled on metformin but develop illness or laboratory abnormalities should be assessed for ketoacidosis or lactic acidosis. Assess serum electrolytes, renal function, ketones, glucose, and, if indicated, blood pH and lactate and pyruvate levels. If either form of acidosis is present, discontinue metformin immediately and treat acidosis.
- **Lab Test Considerations:** Serum glucose and glycosylated hemoglobin should be monitored periodically throughout therapy to evaluate effectiveness of treatment.

Implementation

- Patients stabilized on a diabetic regimen who are exposed to stress, fever, trauma, infection, or surgery may require sliding scale insulin. Withhold oral hypoglycemic agents and reinstitute after resolution of acute illness.
- **Insulin:** Available in different types and strengths and from different species. Check type, species, source, dose, and expiration date with another licensed nurse. Do not interchange insulins without physician's order. Use only insulin syringes to draw up dose. Use only U100 syringes to draw up insulin lispro dose.

Patient/Family Teaching

- Explain to patient that medication controls hyperglycemia but does not cure diabetes. Therapy is long-term.
- Review signs of hypoglycemia and hyperglycemia with patient. If hypoglycemia occurs, advise patient to take a glass of orange juice or 2–3 tsp of sugar, honey, or corn syrup dissolved in water (glucose, not table sugar, if taking miglitol), and notify health care professional.
- Encourage patient to follow prescribed diet, medication, and exercise regimen to prevent hypoglycemic or hyperglycemic episodes.
- Instruct patient in proper testing of serum glucose and ketones.
- Advise patient to notify health care professional if nausea, vomiting, or fever develops; if unable to eat usual diet; or if blood glucose levels are not controlled.
- Advise patient to carry sugar or a form of glucose and identification describing medication regimen at all times.
- Insulin is the recommended method of controlling blood glucose during pregnancy. Counsel female patients to use a form of contraception other than oral contraceptives and to notify health care professional promptly if pregnancy is planned or suspected.

© F.A. Davis Publishing

- **Insulin:** Instruct patient on proper technique for administration; include type of insulin, equipment (syringe and cartridge pens), storage, and syringe disposal. Discuss the importance of not changing brands of insulin or syringes, selection and rotation of injection sites, and compliance with therapeutic regimen.
- **Sulfonylureas:** Advise patient that concurrent use of alcohol may cause a disulfiram-like reaction (abdominal cramps, nausea, flushing, headache, and hypoglycemia).
- **Metformin:** Explain to patient the risk of lactic acidosis and the potential need for discontinuation of metformin therapy if a severe infection, dehydration, or severe or continuing diarrhea occurs or if medical tests or surgery is required.

Evaluation/Desired Outcomes

- Control of blood glucose levels without the appearance of hypoglycemic or hyperglycemic episodes.

• ANTIDIARRHEALS

PHARMACOLOGIC PROFILE

General Use

For the control and symptomatic relief of acute and chronic nonspecific diarrhea.

General Action and Information

Diphenoxylate/atropine, difenoxin/atropine, and loperamide slow intestinal motility and propulsion. Bismuth subsalicylate affects fluid content of the stool. Bismuth subsalicylate is also used as part of the management of peptic ulcer disease due to *Helicobacter pylori*. Polycarbophil acts as an antidiarrheal by taking on water within the bowel lumen to create a formed stool. Polycarbophil may also be used to treat constipation. Octreotide is used specifically for diarrhea associated with GI endocrine tumors.

Contraindications

Previous hypersensitivity. Severe abdominal pain of unknown cause, especially when associated with fever.

Precautions

Use cautiously in patients with severe liver disease or inflammatory bowel disease. Safety in pregnancy and lactation not established (diphenoxylate/atropine and loperamide). Octreotide may aggravate gallbladder disease.

Interactions

Polycarbophil ↓ the absorption of tetracycline. Octreotide may alter the response to insulin or oral hypoglycemic agents.

NURSING IMPLICATIONS

Assessment

- Assess the frequency and consistency of stools and bowel sounds before and throughout therapy.
- Assess patient's fluid and electrolyte status and skin turgor for dehydration.

Implementation

- Shake liquid preparations before administration.

Patient/Family Teaching

- Instruct patient to notify health care professional if diarrhea persists; or if fever, abdominal pain, or palpitations occur.

Evaluation/Desired Outcomes

- Decrease in diarrhea.

© F.A. Davis Publishing

• ANTIEMETICS

PHARMACOLOGIC PROFILE

General Use

Phenothiazines, dolasetron, granisetron, metoclopramide, ondansetron, and palonosetron are used to manage nausea and vomiting of many causes, including surgery, anesthesia, and antineoplastic and radiation therapy. Aprepitant, fosaprepitant, netupitant, and rolapitant are used specifically with emetogenic chemotherapy. Dimenhydrinate, scopolamine, and meclizine are used almost exclusively to prevent motion sickness.

General Action and Information

Phenothiazines act on the chemoreceptor trigger zone to inhibit nausea and vomiting. Dimenhydrinate, scopolamine, and meclizine act as antiemetics mainly by diminishing motion sickness. Metoclopramide ↓ nausea and vomiting by its effects on gastric emptying. Dolasetron, granisetron, palonosetron, and ondansetron block the effects of serotonin at 5-HT_3 receptor sites. Aprepitant, fosaprepitant, netupitant, and rolapitant act as selective antagonists at substance P/neurokinin 1 receptors in the brain.

Contraindications

Previous hypersensitivity.

Precautions

Use phenothiazines cautiously in children who may have viral illnesses. Use dolasetron, granisetron, palonosetron, and ondansetron with caution in patients with QT interval prolongation. Choose agents carefully in pregnant patients (no agents are approved for safe use).

Interactions

Additive CNS depression with other CNS depressants including antidepressants, antihistamines, opioid analgesics, and sedative/hypnotics. Phenothiazines may produce hypotension when used with antihypertensives, nitrates, or acute ingestion of alcohol.

NURSING IMPLICATIONS

Assessment

- Assess nausea, vomiting, bowel sounds, and abdominal pain before and following administration.
- Monitor hydration status and intake and output. Patients with severe nausea and vomiting may require IV fluids in addition to antiemetics.

Implementation

- For prophylactic administration, follow directions for specific drugs so that peak effect corresponds to time of anticipated nausea.

Patient/Family Teaching

- Advise patient and family to use general measures to decrease nausea (begin with sips of liquids and small, nongreasy meals; provide oral hygiene; and remove noxious stimuli from environment).
- May cause drowsiness. Advise patient to call for assistance when ambulating and to avoid driving or other activities requiring alertness until response to medication is known.
- Advise patient to make position changes slowly to minimize orthostatic hypotension.

Evaluation/Desired Outcomes

- Prevention of, or decrease in, nausea and vomiting.

© F.A. Davis Publishing

• ANTIFUNGALS

PHARMACOLOGIC PROFILE

General Use

Treatment of fungal infections. Infections of skin or mucous membranes may be treated with topical or vaginal preparations. Deep-seated or systemic infections require oral or parenteral therapy. Lipid-based formulations of amphotericin employ lipid encapsulation technology designed to ↓ nephrotoxicity.

General Action and Information

Kill (fungicidal) or stop growth of (fungistatic) susceptible fungi by affecting the permeability of the fungal cell membrane or protein synthesis within the fungal cell itself.

Contraindications

Previous hypersensitivity.

Precautions

Because most systemic antifungals may have adverse effects on bone marrow function, use cautiously in patients with depressed bone marrow reserve. Amphotericin B commonly causes renal impairment. Fluconazole requires dosage adjustment in the presence of renal impairment. Adverse reactions to fluconazole may be more severe in HIV-positive patients. The IV formulation of voriconazole should be avoided in patients with renal impairment.

Interactions

Differ greatly among various agents. See individual drugs.

NURSING IMPLICATIONS

Assessment

- Assess patient for signs of infection and assess involved areas of skin and mucous membranes before and throughout therapy. Increased skin irritation may indicate need to discontinue medication.

Implementation

- Available in various dosage forms. Refer to specific drugs for directions for administration.
- **Topical:** Consult physician or other health care professional for cleansing technique before applying medication. Wear gloves during application. Do not use occlusive dressings unless specified by physician or other health care professional.

Patient/Family Teaching

- Instruct patient on proper use of medication form.
- Instruct patient to continue medication as directed for full course of therapy, even if feeling better.
- Advise patient to report increased skin irritation or lack of therapeutic response to health care professional.

Evaluation/Desired Outcomes

- Resolution of signs and symptoms of infection. Length of time for complete resolution depends on organism and site of infection. Deep-seated fungal infections may require prolonged therapy (weeks–months). Recurrent fungal infections may be a sign of serious systemic illness.

© F.A. Davis Publishing

• ANTIHISTAMINES

PHARMACOLOGIC PROFILE

General Use

Relief of symptoms associated with allergies, including rhinitis, urticaria, and angioedema, and as adjunctive therapy in anaphylactic reactions. Some antihistamines are used to treat motion sickness (dimenhydrinate and meclizine), insomnia (diphenhydramine), Parkinson-like reactions (diphenhydramine), and other nonallergic conditions.

General Action and Information

Antihistamines block the effects of histamine at the H_1 receptor. They do not block histamine release, antibody production, or antigen-antibody reactions. Most antihistamines have anticholinergic properties and may cause constipation, dry eyes, dry mouth, and blurred vision. In addition, many antihistamines cause sedation. Some phenothiazines have strong antihistaminic properties (hydroxyzine and promethazine).

Contraindications

Hypersensitivity and angle-closure glaucoma. Should not be used in premature or newborn infants.

Precautions

Elderly patients may be more susceptible to adverse anticholinergic effects of antihistamines. Use cautiously in patients with pyloric obstruction, prostatic hypertrophy, hyperthyroidism, cardiovascular disease, or severe liver disease. Use cautiously in pregnancy and lactation.

Interactions

Additive sedation when used with other CNS depressants, including alcohol, antidepressants, opioid analgesics, and sedative/hypnotics. MAO inhibitors prolong and intensify the anticholinergic properties of antihistamines.

NURSING IMPLICATIONS

Assessment

- Assess allergy symptoms (rhinitis, conjunctivitis, hives) before and periodically throughout therapy.
- Monitor pulse and BP before initiating and throughout IV therapy.
- Assess lung sounds and character of bronchial secretions. Maintain fluid intake of 1500–2000 mL/day to decrease viscosity of secretions.
- **Nausea and Vomiting:** Assess degree of nausea and frequency and amount of emesis when administering for nausea and vomiting.
- **Anxiety:** Assess mental status, mood, and behavior when administering for anxiety.
- **Pruritus:** Observe the character, location, and size of affected area when administering for pruritic skin conditions.

Implementation

- When used for prophylaxis of motion sickness, administer at least 30 min and preferably 1–2 hr before exposure to conditions that may precipitate motion sickness.
- When administering concurrently with opioid analgesics (hydroxyzine, promethazine), supervise ambulation closely to prevent injury secondary to increased sedation.

Patient/Family Teaching

- Inform patient that drowsiness may occur. Avoid driving or other activities requiring alertness until response to drug is known.
- Caution patient to avoid using concurrent alcohol or CNS depressants.
- Advise patient that good oral hygiene, frequent rinsing of mouth with water, and sugarless gum or candy may help relieve dryness of mouth.
- Instruct patient to contact health care professional if symptoms persist.

© F.A. Davis Publishing

Evaluation/Desired Outcomes

- Decrease in allergic symptoms.
- Prevention or decreased severity of nausea and vomiting.
- Relief of pruritus.
- Sedation when used as a hypnotic.

• ANTIHYPERTENSIVES

PHARMACOLOGIC PROFILE

General Use

Treatment of hypertension of many causes, most commonly essential hypertension. Parenteral products are used in the treatment of hypertensive emergencies. Oral treatment should be initiated as soon as possible and individualized to ensure adherence and compliance for long-term therapy. Therapy is initiated with agents having minimal side effects. When such therapy fails, more potent drugs with different side effects are added in an effort to control BP while causing minimal patient discomfort.

General Action and Information

As a group, the antihypertensives are used to lower BP to a normal level (<130–140 systolic and <80–90 mm Hg diastolic) or to the lowest level tolerated. The goal of antihypertensive therapy is prevention of end-organ damage. Antihypertensives are classified into groups according to their site of action. These include alpha-1 receptor antagonists, centrally-acting alpha-adrenergic agonists; beta blockers; vasodilators; ACE inhibitors; angiotensin II receptor blockers (ARBs); calcium channel blockers; renin inhibitors; and diuretics. Hypertensive emergencies may be managed with parenteral agents, such as nitroprusside, nicardipine, or beta blockers (e.g. esmolol, labetalol).

Contraindications

Hypersensitivity to individual agents.

Precautions

Choose agents carefully in pregnancy and during lactation. ACE inhibitors, ARBs, and aliskiren should be avoided during pregnancy. Centrally acting alpha-adrenergic agonists and beta blockers should be used only in patients who are compliant with their medications because abrupt discontinuation of these agents may result in rapid and excessive ↑ in BP (rebound phenomenon). Thiazide and loop diuretics may ↑ the risk of hyperglycemia. Vasodilators may cause tachycardia if used alone and are commonly used in combination with beta blockers. Some antihypertensives (e.g. hydralazine, minoxidil) cause sodium and water retention and are usually combined with a diuretic.

Interactions

Many drugs can negate the therapeutic effectiveness of antihypertensives, including NSAIDs, sympathomimetics, decongestants, appetite suppressants, SNRIs, and MAO inhibitors. Hypokalemia from diuretics may ↑ the risk of digoxin toxicity. Potassium supplements and potassium-sparing diuretics may cause hyperkalemia when used with ACE inhibitors, ARBs, or aliskiren.

NURSING IMPLICATIONS

Assessment

- Monitor BP and pulse frequently during dosage adjustment and periodically throughout therapy.
- Monitor intake and output ratios and daily weight with use of diuretics.
- Monitor frequency of prescription refills to determine compliance.

© F.A. Davis Publishing

Implementation
- Many antihypertensives are available as combination products to enhance compliance (see Appendix N).

Patient/Family Teaching
- Instruct patient to continue taking medication, even if feeling well. Abrupt withdrawal may cause rebound hypertension. Medication controls, but does not cure, hypertension.
- Encourage patient to comply with additional interventions for hypertension (weight reduction, low-sodium diet, regular exercise, discontinuation of smoking, moderation of alcohol consumption, and stress management).
- Instruct patient and family on proper technique for monitoring BP. Advise them to check BP weekly and report significant changes.
- Caution patient to make position changes slowly to minimize orthostatic hypotension. Advise patient that exercise or hot weather may enhance hypotensive effects.
- Advise patient to consult health care professional before taking any OTC medications, especially cold remedies.
- Advise patient to inform health care professional of medication regimen before treatment or surgery.
- Patients taking ACE inhibitors, ARBs, or aliskiren should notify health care professional if pregnancy is planned or suspected.
- Emphasize the importance of follow-up exams to monitor progress.

Evaluation/Desired Outcomes
- Decrease in BP.

• ANTI-INFECTIVES

PHARMACOLOGIC PROFILE

General Use
Treatment and prophylaxis of various bacterial infections. See specific drugs for spectrum and indications. Some infections may require additional surgical intervention and supportive therapy.

General Action and Information
Kill (bactericidal) or inhibit the growth of (bacteriostatic) susceptible pathogenic bacteria. Not active against viruses or fungi. Anti-infectives are subdivided into categories depending on chemical similarities and antimicrobial spectrum.

Contraindications
Known hypersensitivity to individual agents. Cross-sensitivity among related agents may occur.

Precautions
Culture and susceptibility testing are desirable to optimize therapy. Dosage modification may be required in patients with hepatic or renal insufficiency. Use cautiously in pregnant and lactating women. Prolonged inappropriate use of broad spectrum anti-infective agents may lead to superinfection with fungi or resistant bacteria.

Interactions
Penicillins and aminoglycosides chemically inactivate each other and should not be physically admixed. Erythromycin and clarithromycin may ↓ hepatic metabolism of other drugs. Probenecid ↑ serum levels of penicillins and related compounds. Highly protein-bound anti-infectives such as sulfonamides may displace or be displaced by other highly bound drugs. See individual drugs. Extended-spectrum penicillins (piperacillin/tazobactam) and some cephalosporins (cef-

© F.A. Davis Publishing

operazone, cefotetan) may ↑ the risk of bleeding with anticoagulants, thrombolytic agents, antiplatelet agents, or NSAIDs. Fluoroquinolone absorption may be ↓ by antacids, bismuth subsalicylate, calcium, iron salts, sucralfate, and zinc salts.

NURSING IMPLICATIONS

Assessment

- Assess patient for signs and symptoms of infection prior to and throughout therapy.
- Determine previous hypersensitivities in patients receiving penicillins or cephalosporins.
- Obtain specimens for culture and sensitivity prior to initiating therapy. First dose may be given before receiving results.
- Monitor bowel function. Diarrhea, abdominal cramping, fever, and bloody stools should be reported to health care professional promptly as a sign of *Clostridioides difficile*-associated diarrhea (CDAD).

Implementation

- Most anti-infectives should be administered around the clock to maintain therapeutic serum drug levels.

Patient/Family Teaching

- Instruct patient to continue taking medication around the clock until finished completely, even if feeling better.
- Advise patient to report the signs of superinfection (black, furry overgrowth on the tongue; vaginal itching or discharge; loose or foul-smelling stools) and allergy to health care professional.
- Instruct patient to notify health care professional if fever and diarrhea develop, especially if stool contains pus, blood, or mucus. Advise patient not to treat diarrhea without consulting health care professional.
- Instruct patient to notify health care professional if symptoms do not improve.

Evaluation/Desired Outcomes

- Resolution of the signs and symptoms of infection. Length of time for complete resolution depends on organism and site of infection.

• ANTINEOPLASTICS

PHARMACOLOGIC PROFILE

General Use

Used in the treatment of various solid tumors, lymphomas, and leukemias. Also used in some autoimmune disorders such as rheumatoid arthritis (cyclophosphamide, methotrexate). Often used in combinations to minimize individual toxicities and ↑ response. Chemotherapy may be combined with other treatment modalities such as surgery and radiation therapy. Dosages vary greatly, depending on extent of disease, other agents used, and patient's condition. Some agents (doxorubicin, irinotecan) are available in lipid-based formulations that have less toxicity with greater efficacy.

General Action and Information

Act by many different mechanisms (see the following table). Many affect DNA synthesis or function; others alter immune function or affect hormonal status of sensitive tumors. Action may not be limited to neoplastic cells.

© F.A. Davis Publishing

MECHANISM OF ACTION OF SELECTED ANTINEOPLASTICS

MECHANISM OF ACTION	AGENT	EFFECTS ON CELL CYCLE
ALKYLATING AGENTS	busulfan	Cell cycle–nonspecific
Cause cross-linking of DNA	carboplatin	
	chlorambucil	
	cisplatin	
	cyclophosphamide	
	ifosfamide	
	melphalan	
	procarbazine	
	temozolamide	
ANTHRACYCLINES	daunorubicin	Cell cycle–nonspecific
Interfere with DNA and RNA synthesis	doxorubicin	
	epirubicin	
	idarubicin	
ANTITUMOR ANTIBIOTIC	bleomycin	Cell cycle–nonspecific (except bleomycin)
Interfere with DNA and RNA synthesis	mitomycin	
	mitoxantrone	
ANTIMETABOLITES	cytarabine	Cell cycle–specific, work mostly in S phase (DNA synthesis)
Take the place of normal proteins	fluorouracil	
	hydroxyurea	
	methotrexate	
ENZYMES	asparaginase	Cell-cycle phase–specific
Deplete asparagine	pegaspargase	
ENZYME INHIBITORS	irinotecan	Cell-cycle phase–specific
Inhibits topoisomerase	topotecan	
Inhibits kinase	imatinib	Unknown
HORMONAL AGENTS	bicalutamide	Unknown
Alter hormonal status in tumors that are sensitive	estramustine	
	flutamide	
	leuprolide	
	megestrol	
	nilutamide	
	tamoxifen	
	testosterone (androgens)	
	triptorelin	
HORMONAL AGENTS—AROMATASE INHIBITORS	anastrozole	Unknown
Inhibit enzyme responsible for activating estrogen	letrozole	
IMMUNE MODULATORS	aldesleukin	Unknown
	alemtuzumab	
	gemtuzumab	
	toremifene	
	trastuzumab	
PODOPHYLLOTOXIN DERIVATIVES	etoposide	Cell-cycle phase–specific
Damages DNA before mitosis		
TAXOIDS	docetaxel	Cell-cycle phase–specific
Interrupt interphase and mitosis	paclitaxel	
VINCA ALKALOIDS	vinblastine	Cell cycle–specific, work during M phase (mitosis)
Interfere with mitosis	vincristine	
	vinorelbine	

Contraindications

Previous bone marrow depression or hypersensitivity. Contraindicated in pregnancy and lactation.

Precautions

Use cautiously in patients with active infections, ↓ bone marrow reserve, radiation therapy, or other debilitating illnesses. Use cautiously in patients with childbearing potential.

© F.A. Davis Publishing

Interactions

Allopurinol ↓ metabolism of mercaptopurine. Toxicity from methotrexate may be ↑ by other nephrotoxic drugs or larger doses of aspirin or NSAIDs. Bone marrow depression is additive. See individual drugs.

NURSING IMPLICATIONS

Assessment

- Monitor for bone marrow depression. Assess for bleeding (bleeding gums, bruising, petechiae, guaiac stools, urine, and emesis) and avoid IM injections and rectal temperatures if platelet count is low. Apply pressure to venipuncture sites for 10 min. Assess for signs of infection during neutropenia. Anemia may occur. Monitor for ↑ fatigue, dyspnea, and orthostatic hypotension.
- Monitor intake and output ratios, appetite, and nutritional intake. Prophylactic antiemetics may be used. Adjusting diet as tolerated may help maintain fluid and electrolyte balance and nutritional status.
- Monitor IV site carefully and ensure patency. Discontinue infusion immediately if discomfort, erythema along vein, or infiltration occurs. Tissue ulceration and necrosis may result from infiltration.
- Monitor for symptoms of gout (↑ uric acid, joint pain, and edema). Encourage patient to drink at least 2 L of fluid each day. Allopurinol may be given to ↓ uric acid levels. Alkalinization of urine may be ordered to ↑ excretion of uric acid.

Implementation

- Solutions for injection should be prepared in a biologic cabinet. Wear gloves, gown, and mask while handling medication. Discard equipment in designated containers.
- Check dose carefully. Fatalities have resulted from dosing errors.

Patient/Family Teaching

- Caution patient to avoid crowds and persons with known infections. Health care professional should be informed immediately if symptoms of infection occur.
- Instruct patient to report unusual bleeding. Advise patient of thrombocytopenia precautions.
- These drugs may cause gonadal suppression; however, patient should still use birth control, as most antineoplastics are teratogenic. Advise patient to inform health care professional immediately if pregnancy is suspected.
- Discuss with patient the possibility of hair loss. Explore methods of coping.
- Instruct patient to inspect oral mucosa for erythema and ulceration. If ulceration occurs, advise patient to use sponge brush and to rinse mouth with water after eating and drinking. Topical agents may be used if mouth pain interferes with eating. Stomatitis pain may require treatment with opioid analgesics.
- Instruct patient not to receive any vaccinations without advice of health care professional. Antineoplastics may ↓ antibody response and ↑ risk of adverse reactions.
- Advise patient of need for medical follow-up and frequent lab tests.

Evaluation/Desired Outcomes

- Decrease in size and spread of tumor.
- Improvement in hematologic status in patients with leukemia.

• ANTIPARKINSON AGENTS

PHARMACOLOGIC PROFILE

General Use

Treatment of Parkinson's disease.

© F.A. Davis Publishing

General Action and Information

Drugs used in the treatment of Parkinson's disease and other dyskinesias are aimed at restoring the natural balance of two major neurotransmitters in the CNS: acetylcholine and dopamine. The imbalance is a deficiency in dopamine that results in excessive cholinergic activity. Many of the drugs used are either anticholinergics (benztropine and trihexyphenidyl) or dopaminergic agonists (apomorphine, bromocriptine, levodopa/carbidopa, pramipexole, ropinirole, rotigotine). Entacapone and tolcapone inhibit the enzyme that breaks down levodopa, thereby enhancing its effects. Rasagiline and selegiline are MAO-B inhibitors that lead to ↑ concentrations of dopamine in the CNS.

Contraindications

Anticholinergics should be avoided in patients with angle-closure glaucoma.

Precautions

Use cautiously in patients with severe cardiac disease, pyloric obstruction, or prostatic enlargement.

Interactions

Pyridoxine, MAO inhibitors, benzodiazepines, phenytoin, phenothiazines, and haloperidol may antagonize the effects of levodopa. Agents that antagonize dopamine (phenothiazines, metoclopramide) may ↓ effectiveness of dopamine agonists.

NURSING IMPLICATIONS

Assessment

- Assess parkinsonian and extrapyramidal symptoms (akinesia, rigidity, tremors, pill rolling, mask facies, shuffling gait, muscle spasms, twisting motions, and drooling) before and throughout course of therapy. On-off phenomenon may cause symptoms to appear or improve suddenly.
- Monitor BP frequently during therapy. Instruct patient to remain supine during and for several hours after first dose of bromocriptine, as severe hypotension may occur.

Implementation

- In the carbidopa/levodopa combination, the number following the drug name represents the milligram of each respective drug.

Patient/Family Teaching

- May cause drowsiness or dizziness. Advise patient to avoid driving or other activities that require alertness until response to medication is known.
- Caution patient to make position changes slowly to minimize orthostatic hypotension.
- Instruct patient that frequent rinsing of mouth, good oral hygiene, and sugarless gum or candy may decrease dry mouth. Patient should notify health care professional if dryness persists (saliva substitutes may be used). Also notify the dentist if dryness interferes with use of dentures.
- Advise patient to confer with health care professional before taking OTC medications, especially cold remedies, or drinking alcoholic beverages. Patients receiving levodopa should avoid multivitamins. Vitamin B_6 (pyridoxine) may interfere with levodopa's action.
- Caution patient that decreased perspiration may occur. Overheating may occur during hot weather. Patients should remain indoors in an air-conditioned environment during hot weather.
- Advise patient to increase activity, bulk, and fluid in diet to minimize constipating effects of medication.
- Advise patient to notify health care professional if confusion, rash, urinary retention, severe constipation, visual changes, or worsening of parkinsonian symptoms occur.

© F.A. Davis Publishing

Evaluation/Desired Outcomes
- Resolution of parkinsonian signs and symptoms
- Resolution of drug-induced extrapyramidal symptoms.

• ANTIPLATELET AGENTS

PHARMACOLOGIC PROFILE

General Use
Used to treat and prevent thromboembolic events such as stroke and MI.

General Action and Information
Inhibit platelet aggregation, prolong bleeding time, and are used to prevent MI or stroke (aspirin, clopidogrel, dipyridamole, ticlopidine, prasugrel, ticagrelor). Eptifibatide and tirofiban are used in the management of acute coronary syndromes. These agents are often used concurrently/sequentially with anticoagulants and thrombolytics.

Contraindications
Hypersensitivity, ulcer disease, active bleeding, and recent surgery.

Precautions
Use cautiously in patients at risk for bleeding (trauma, surgery). History of GI bleeding or ulcer disease. Safety not established in pregnancy, lactation, or children.

Interactions
Concurrent use with NSAIDs, heparin, thrombolytics, or warfarin, dabigatran, rivaroxaban, apixaban, edoxaban, or betrixaban may ↑ the risk of bleeding.

NURSING IMPLICATIONS

Assessment
- Assess patient for evidence of additional or ↑ thrombosis. Symptoms will depend on area of involvement.
- Assess patient taking antiplatelet agents for symptoms of stroke, peripheral arterial disease, or MI periodically throughout therapy.

Implementation
- Use an infusion pump with continuous infusions to ensure accurate dosage.

Patient/Family Teaching
- Instruct patient to notify health care professional immediately if any bleeding is noted.

Evaluation/Desired Outcomes
- Prevention of stroke, MI, and vascular death in patients at risk.

• ANTIPSYCHOTICS

PHARMACOLOGIC PROFILE

General Use
Treatment of acute and chronic psychoses, particularly when accompanied by ↑ psychomotor activity. Use of clozapine is limited to schizophrenia unresponsive to conventional therapy. Selected agents are also used as antihistamines or antiemetics. Chlorpromazine is also used in the treatment of intractable hiccups.

© F.A. Davis Publishing

General Action and Information

Block dopamine receptors in the brain; also alter dopamine release and turnover. Peripheral effects include anticholinergic properties and alpha-adrenergic blockade. Typical antipsychotics include the phenothiazines and haloperidol. Atypical antipsychotics may have fewer adverse reactions compared to the typical antipsychotics and include aripiprazole, asenapine, brexpiprazole, cariprazine, clozapine, iloperidone, lurasidone, paliperidone, olanzapine, paliperidone, pimavanserin, quetiapine, risperidone, and ziprasidone. Phenothiazines differ in their ability to produce sedation (greatest with chlorpromazine and thioridazine), extrapyramidal reactions (greatest with prochlorperazine and trifluoperazine), and anticholinergic effects (greatest with chlorpromazine).

Contraindications

Hypersensitivity. Cross-sensitivity may exist among phenothiazines. Should not be used in angle-closure glaucoma. Should not be used in patients who have CNS depression.

Precautions

Safety in pregnancy and lactation not established. Use cautiously in patients with symptomatic cardiac disease. Avoid exposure to extremes in temperature. Use cautiously in severely ill or debilitated patients and patients with respiratory insufficiency, diabetes, prostatic hypertrophy, or intestinal obstruction. May ↓ seizure threshold. Clozapine may cause agranulocytosis. Most agents are capable of causing neuroleptic malignant syndrome. Should not be used routinely for anxiety or agitation not related to psychoses.

Interactions

Additive hypotension with acute ingestion of alcohol, antihypertensives, or nitrates. Antacids may ↓ absorption. Phenobarbital may ↑ metabolism and ↓ effectiveness. Additive CNS depression with other CNS depressants, including alcohol, antihistamines, antidepressants, opioid analgesics, or sedative/hypnotics. Lithium may ↓ blood levels and effectiveness of phenothiazines. May ↓ the therapeutic response to levodopa. May ↑ the risk of agranulocytosis with antithyroid agents.

NURSING IMPLICATIONS

Assessment

- Assess patient's mental status (orientation, mood, behavior) before and periodically throughout therapy.
- Monitor BP (sitting, standing, lying), pulse, and respiratory rate before and frequently during the period of dosage adjustment.
- Observe patient carefully when administering medication to ensure medication is actually taken and not hoarded.
- Monitor patient for onset of *akathisia*—restlessness or desire to keep moving—and extrapyramidal side effects; *parkinsonian effects*—difficulty speaking or swallowing, loss of balance control, pill rolling, mask-like face, shuffling gait, rigidity, tremors; and *dystonia*—muscle spasms, twisting motions, twitching, inability to move eyes, weakness of arms or legs—every 2 mo during therapy and 8–12 wk after therapy has been discontinued. Parkinsonian effects are more common in geriatric patients and dystonias are more common in younger patients. Notify health care professional if these symptoms occur, as ↓ in dosage or discontinuation of medication may be necessary. Trihexyphenidyl, benztropine, or diphenhydramine may be used to control these symptoms.
- Monitor for *tardive dyskinesia*—uncontrolled rhythmic movement of mouth, face, and extremities; lip smacking or puckering; puffing of cheeks; uncontrolled chewing; rapid or worm-like movements of tongue. Notify health care professional immediately if these symptoms occur; these side effects may be irreversible.

© F.A. Davis Publishing

- Monitor for development of *neuroleptic malignant syndrome*—fever, respiratory distress, tachycardia, convulsions, diaphoresis, hypertension or hypotension, pallor, tiredness, severe muscle stiffness, loss of bladder control. Notify health care professional immediately if these symptoms occur.

Implementation

- Keep patient recumbent for at least 30 min following parenteral administration to minimize hypotensive effects.
- **PO:** Administer with **food**, **milk**, or a full glass of **water** to minimize gastric irritation.
- Dilute most concentrates in 120 mL of distilled or acidified tap water or **fruit juice** just before administration.

Patient/Family Teaching

- Advise patient to take medication exactly as directed and not to skip doses or double up on missed doses. Abrupt withdrawal may lead to gastritis, nausea, vomiting, dizziness, headache, tachycardia, and insomnia.
- Advise patient to make position changes slowly to minimize orthostatic hypotension.
- Medication may cause drowsiness. Caution patient to avoid driving or other activities requiring alertness until response to the medication is known.
- Caution patient to avoid taking alcohol or other CNS depressants concurrently with this medication.
- Advise patient to use sunscreen and protective clothing when exposed to the sun to prevent photosensitivity reactions. Extremes of temperature should also be avoided, as these drugs impair body temperature regulation.
- Advise patient that ↑ activity, bulk, and fluids in the diet helps minimize the constipating effects of this medication.
- Instruct patient to use frequent mouth rinses, good oral hygiene, and sugarless gum or candy to minimize dry mouth.
- Advise patient to notify health care professional of medication regimen before treatment or surgery.
- Emphasize the importance of routine follow-up exams and continued participation in psychotherapy as indicated.

Evaluation/Desired Outcomes

- Decrease in excitable, paranoic, or withdrawn behavior. Relief of nausea and vomiting. Relief of intractable hiccups.

• ANTIPYRETICS

PHARMACOLOGIC PROFILE

General Use

Used to lower fever of many causes (infection and inflammation).

General Action and Information

Antipyretics lower fever by affecting thermoregulation in the CNS and by inhibiting the action of prostaglandins peripherally. Many antipyretics affect platelet function; of these, aspirin has the most profound effect as compared with other salicylates or NSAIDs.

Contraindications

Avoid aspirin or NSAIDs in patients with bleeding disorders (risk of bleeding is less with other salicylates). Aspirin and other salicylates should be avoided in children and adolescents.

© F.A. Davis Publishing

Precautions
Use aspirin or NSAIDs cautiously in patients with peptic ulcer disease. Avoid chronic use of large doses of acetaminophen.

Interactions
Large doses of aspirin may displace other highly protein-bound drugs. Additive GI irritation with aspirin and other NSAIDs or corticosteroids. Aspirin or NSAIDs may ↑ the risk of bleeding with other agents affecting hemostasis (anticoagulants, thrombolytic agents, antiplatelets, and antineoplastics).

NURSING IMPLICATIONS
Assessment
- Assess fever; note presence of associated symptoms (diaphoresis, tachycardia, and malaise).

Implementation
- Administration with food or antacids may minimize GI irritation.
- Available in oral and rectal dosage forms and in combination with other drugs.

Patient/Family Teaching
- Advise patient to consult health care professional if fever is not relieved by routine doses or if greater than 39.5°C (103°F) or lasts longer than 3 days.
- Centers for Disease Control and Prevention warns against giving aspirin to children or adolescents with varicella (chickenpox) or influenza-like or viral illnesses because of a possible association with Reye's syndrome.

Evaluation/Desired Outcomes
- Reduction of fever.

• ANTIRETROVIRALS

PHARMACOLOGIC PROFILE
General Use
The goal of antiretroviral therapy in the management of HIV infection is to improve CD4 cell counts and ↓ viral load. If accomplished, this generally results in slowed progression of the disease, improved quality of life, and ↓ opportunistic infections. Perinatal use of agents also prevents transmission of the virus to the fetus. Post-exposure and pre-exposure prophylaxis with certain antiretrovirals is also recommended.

General Action and Information
Because of the rapid emergence of resistance and toxicities of individual agents, HIV infection is almost always managed by a combination of agents. Selections and doses are based on individual toxicities, underlying organ system disease, concurrent drug therapy, and severity of illness.

Contraindications
Hypersensitivity. Because of highly varying toxicities among agents, see individual monographs for more specific information.

Precautions
Many agents require modification for renal impairment. Protease inhibitors may cause hyperglycemia and hyperlipidemia and should be used cautiously in patients with diabetes and patients at increased risk for cardiovascular disease. Hemophiliacs may also be at risk of bleeding when taking protease inhibitors. See individual monographs for specific information.

© F.A. Davis Publishing

Interactions

There are many significant and potentially serious drug-drug interactions among the antiretrovirals. They are affected by drugs that alter metabolism; some agents themselves affect metabolism. See individual agents.

NURSING IMPLICATIONS

Assessment

- Assess patient for change in severity of symptoms of HIV and for symptoms of opportunistic infections throughout therapy.
- **Lab Test Considerations:** Monitor viral load and CD4 counts prior to and periodically during therapy.

Implementation

- Administer doses around the clock.

Patient/Family Teaching

- Instruct patient to take medication exactly as directed, around the clock, even if sleep is interrupted. Emphasize the importance of complying with therapy, not taking more than prescribed amount, and not discontinuing without consulting health care professional. Missed doses should be taken as soon as remembered unless almost time for next dose; patient should not double doses. Inform patient that long-term effects are unknown at this time.
- Instruct patient that antiretrovirals should not be shared with others.
- Inform patient that antiretroviral therapy does not cure HIV and does not ↓ the risk of transmission of HIV to others through sexual contact or blood contamination. Caution patient to use a condom during sexual contact and to avoid sharing needles or donating blood to prevent spreading the AIDS virus to others.
- Advise patient to avoid taking any Rx, OTC, or herbal products without consulting health care professional.
- Emphasize the importance of regular follow-up exams and blood counts to determine progress and to monitor for side effects.

Evaluation/Desired Outcomes

- Decrease in viral load and increase in CD4 counts in patients with HIV.

• ANTIRHEUMATICS

PHARMACOLOGIC PROFILE

General Use

Antirheumatics are used to manage symptoms of rheumatoid arthritis (pain, swelling) and in more severe cases to slow down joint destruction and preserve joint function. NSAIDs, aspirin, and other salicylates are used to manage symptoms such as pain and swelling, allowing continued motility and improved quality of life. Corticosteroids are reserved for more advanced swelling and discomfort, primarily because of their ↑ side effects, especially with chronic use. They can be used to control acute flares of disease. Neither NSAIDs nor corticosteroids prevent disease progression or joint destruction. Disease-modifying antirheumatics drugs (DMARDs) slow the progression of rheumatoid arthritis and delay joint destruction. DMARDs are reserved for severe cases because of their toxicity. Several months of therapy may be required before benefit is noted and maintained. Serious and frequent adverse reactions may require discontinuation of therapy, despite initial benefit.

© F.A. Davis Publishing

General Action and Information
Both NSAIDs and corticosteroids have potent anti-inflammatory properties. DMARDs work by a variety of mechanisms. See individual agents, but most work by suppressing the autoimmune response thought to be responsible for joint destruction.

Contraindications
Hypersensitivity. Patients who are allergic to aspirin should not receive other NSAIDs. Corticosteroids should not be used in patients with active untreated infections.

Precautions
NSAIDs and corticosteroids should be used cautiously in patients with a history of GI bleeding. Corticosteroids should be used with caution in patients with diabetes. Many DMARDs have immunosuppressive properties and should be avoided in patients for whom immunosuppression poses a serious risk, including patients with active infections, underlying malignancy, and transplant recipients.

Interactions
NSAIDs may diminish the response to diuretics and other antihypertensives. Corticosteroids may augment hypokalemia from other medications and ↑ the risk of digoxin toxicity. DMARDs ↑ the risk of serious immunosuppression with other immunosuppressants. Live vaccines should not be given concurrently with DMARDs.

NURSING IMPLICATIONS

Assessment
- Assess patient monthly for pain, swelling, and range of motion.

Implementation
- Most agents require regular administration to obtain maximum effects.

Patient/Family Teaching
- Instruct patient to contact health care professional if no improvement is noticed within a few days.

Evaluation/Desired Outcomes
- Improvement in signs and symptoms of rheumatoid arthritis.

• ANTITUBERCULARS

PHARMACOLOGIC PROFILE

General Use
Used in the treatment and prevention of tuberculosis. Combinations are used in the treatment of active tuberculosis to rapidly ↓ the infectious state and delay or prevent the emergence of resistant strains. In selected situations, intermittent (twice weekly) regimens may be employed. Streptomycin is also used as an antitubercular. Rifampin is also used in the prevention of meningococcal meningitis and *Haemophilus influenzae* type B.

General Action and Information
Kill (tuberculocidal) or inhibit the growth of (tuberculostatic) mycobacteria responsible for causing tuberculosis. Combination therapy with two or more agents is required, unless used as prophylaxis (isoniazid alone).

Contraindications
Hypersensitivity. Severe liver disease.

© F.A. Davis Publishing

Precautions
Use cautiously in patients with a history of liver disease or in elderly or debilitated patients. Ethambutol requires ophthalmologic follow-up. Safety in pregnancy and lactation not established, although selected agents have been used without adverse effects on the fetus. Compliance is required for optimal response.

Interactions
Isoniazid inhibits the metabolism of phenytoin. Rifampin significantly ↓ levels of many drugs.

NURSING IMPLICATIONS

Assessment
- Mycobacterial studies and susceptibility tests should be performed prior to and periodically throughout therapy to detect possible resistance.
- Assess lung sounds and character and amount of sputum periodically throughout therapy.

Implementation
- Most medications can be administered with food if GI irritation occurs.

Patient/Family Teaching
- Advise patient of the importance of continuing therapy even after symptoms have subsided.
- Emphasize the importance of regular follow-up exams to monitor progress and check for side effects.
- Inform patients taking rifampin that saliva, sputum, sweat, tears, urine, and feces may become red-orange to red-brown and that soft contact lenses may become permanently discolored.

Evaluation/Desired Outcomes
- Resolution of the signs and symptoms of tuberculosis. Negative sputum cultures.

• ANTIULCER AGENTS

PHARMACOLOGIC PROFILE

General Use
Treatment and prophylaxis of peptic ulcer and gastric hypersecretory conditions such as Zollinger-Ellison syndrome. Histamine H_2-receptor antagonists (blockers) and proton pump inhibitors are also used in the management of gastroesophageal reflux disease (GERD).

General Action and Information
Because a great majority of peptic ulcer disease may be traced to GI infection with the organism *Helicobacter pylori*, eradication of the organism ↓ symptomatology and recurrence. Anti-infectives with significant activity against the organism include amoxicillin, clarithromycin, metronidazole, and tetracycline. Bismuth also has anti-infective activity against *H. pylori*. *H. pylori* treatment regimens usually include: a proton pump inhibitor, and 2 anti-infectives with or without bismuth subsalicylate for 10–14 days. Other medications used in the management of gastric/duodenal ulcer disease are aimed at neutralizing gastric acid (antacids), ↓ acid secretion (histamine H_2 antagonists, proton pump inhibitors, misoprostol), or protecting the ulcer surface from further damage (misoprostol, sucralfate). Histamine H_2-receptor antagonists competitively inhibit the action of histamine at the H_2 receptor, located primarily in gastric parietal cells, resulting in inhibition of gastric acid secretion. Misoprostol ↓ gastric acid secretion and ↑ production of protective mucus. Proton pump inhibitors prevent the transport of hydrogen ions into the gastric lumen.

Contraindications
Hypersensitivity. Pregnancy.

© F.A. Davis Publishing

Precautions

Most histamine H_2 antagonists require dose reduction in renal impairment and in elderly patients. Magnesium-containing antacids should be used cautiously in patients with renal impairment. Misoprostol should be used cautiously in women of reproductive potential.

Interactions

Calcium- and magnesium-containing antacids ↓ the absorption of tetracycline and fluoroquinolones. Cimetidine inhibits the ability of the liver to metabolize several drugs, ↑ the risk of toxicity from warfarin, tricyclic antidepressants, theophylline, metoprolol, phenytoin, propranolol, and lidocaine. Omeprazole ↓ metabolism of phenytoin, diazepam, and warfarin. All agents that ↑ gastric pH will ↓ the absorption of itraconazole, ketoconazole, iron salts, erlotinib, nilotinib, atazanavir, nelfinavir, rilpivirine, and mycophenolate mofetil.

NURSING IMPLICATIONS

Assessment

- Assess patient routinely for epigastric or abdominal pain and frank or occult blood in the stool, emesis, or gastric aspirate.
- **Antacids:** Assess for heartburn and indigestion as well as the location, duration, character, and precipitating factors of gastric pain.
- **Histamine H_2 Antagonists:** Assess elderly and severely ill patients for confusion routinely. Notify health care professional promptly should this occur.
- **Misoprostol:** Assess women of reproductive potential for pregnancy. Medication is usually begun on 2nd or 3rd day of menstrual period following a negative serum pregnancy test within 2 wk of beginning therapy.

Implementation

- **Antacids:** Antacids cause premature dissolution and absorption of enteric-coated tablets and may interfere with absorption of other oral medications. Separate administration of antacids and other oral medications by at least 1 hr.
- Shake liquid preparations well before pouring. Follow administration with water to ensure passage to stomach. Liquid and powder dosage forms are considered to be more effective than chewable tablets.
- Chewable tablets must be chewed thoroughly before swallowing. Follow with half a glass of water.
- Administer 1 and 3 hr after meals and at bedtime for maximum antacid effect.
- **Misoprostol:** Administer with meals and at bedtime to reduce the severity of diarrhea.
- **Proton Pump Inhibitors:** Administer before meals, preferably in the morning. Capsules should be swallowed whole; do not open, crush, or chew.
- May be administered concurrently with antacids.
- **Sucralfate:** Administer on an empty stomach 1 hr before meals and at bedtime. Do not crush or chew tablets. Shake suspension well prior to administration. If nasogastric administration is required, consult pharmacist, as protein-binding properties of sucralfate have resulted in formation of a bezoar when administered with enteral feedings and other medications.

Patient/Family Teaching

- Instruct patient to take medication as directed for the full course of therapy, even if feeling better. If a dose is missed, it should be taken as soon as remembered but not if almost time for next dose. Do not double doses.
- Advise patient to avoid alcohol, products containing aspirin, NSAIDs, and foods that may cause an ↑ in GI irritation.
- Advise patient to report onset of black, tarry stools to health care professional promptly.
- Inform patient that cessation of smoking may help prevent the recurrence of duodenal ulcers.
- **Antacids:** Caution patient to consult health care professional before taking antacids for more than 2 wk or if problem is recurring. Advise patient to consult health care professional if relief

© F.A. Davis Publishing

is not obtained or if symptoms of gastric bleeding (black, tarry stools; coffee-ground emesis) occur.
- **Misoprostol:** Emphasize that sharing of this medication may be dangerous.
- Inform patient that misoprostol may cause spontaneous abortion. Women of reproductive potential must be informed of this effect through verbal and written information and must use contraception throughout therapy. If pregnancy is suspected, the woman should stop taking misoprostol and immediately notify her health care professional.
- **Sucralfate:** Advise patient to continue with course of therapy for 4–8 wk, even if feeling better, to ensure ulcer healing.
- Advise patient that an ↑ in fluid intake, dietary bulk, and exercise may prevent drug-induced constipation.

Evaluation/Desired Outcomes
- Decrease in GI pain and irritation. Prevention of gastric irritation and bleeding. Healing of duodenal ulcers can be seen by x-rays or endoscopy. Therapy with histamine H_2 antagonists is continued for at least 6 wk after initial episode. Decreased symptoms of GERD. Increase in the pH of gastric secretions (antacids). Prevention of gastric ulcers in patients receiving chronic NSAID therapy (misoprostol only).

• ANTIVIRALS

PHARMACOLOGIC PROFILE

General Use
Acyclovir, famciclovir, and valacyclovir are used in the management of herpes virus infections. Acyclovir and valacyclovir are also used in the management of chickenpox. Baloxavir, oseltamivir, peramivir, and zanamivir are used primarily in the prevention and/or treatment of influenza infection. Cidofovir, ganciclovir, valganciclovir, and foscarnet are used in the prevention and/or treatment of cytomegalovirus (CMV) infection. Penciclovir, famciclovir, valacyclovir, and docosanol are used in the treatment and prevention of oral-facial herpes simplex.

General Action and Information
Most agents inhibit viral replication.

Contraindications
Previous hypersensitivity.

Precautions
All except zanamivir require dose adjustment in renal impairment. Acyclovir may cause renal impairment. Acyclovir may cause CNS toxicity. Foscarnet ↑ risk of seizures.

Interactions
Acyclovir may have additive CNS and nephrotoxicity with drugs causing similar adverse reactions.

NURSING IMPLICATIONS

Assessment
- Assess patient for signs and symptoms of infection before and throughout therapy.
- **Ophth:** Assess eye lesions before and daily during therapy.
- **Topical:** Assess lesions before and daily during therapy.

Implementation
- Most systemic antiviral agents should be administered around the clock to maintain therapeutic serum drug levels.

© F.A. Davis Publishing

Patient/Family Teaching

- Instruct patient to continue taking medication around the clock for full course of therapy, even if feeling better.
- Advise patient that antivirals do not prevent transmission to others. Precautions should be taken to prevent spread of virus.
- Instruct patient in correct technique for topical or ophthalmic preparations.
- Instruct patient to notify health care professional if symptoms do not improve.

Evaluation/Desired Outcomes

- Prevention or resolution of the signs and symptoms of viral infection. Length of time for complete resolution depends on organism and site of infection.

• BETA BLOCKERS

PHARMACOLOGIC PROFILE

General Use

Management of hypertension, angina pectoris, tachyarrhythmias, migraine headache (prophylaxis), MI, glaucoma (ophthalmic use), heart failure (HF) (bisoprolol, carvedilol, and sustained-release metoprolol only) and hyperthyroidism (management of symptoms only).

General Action and Information

Beta blockers compete with adrenergic (sympathetic) neurotransmitters (epinephrine and norepinephrine) for adrenergic receptor sites. $Beta_1$-adrenergic receptor sites are located chiefly in the heart where stimulation results in increased heart rate and myocardial contractility. $Beta_2$-adrenergic receptors are found mainly in bronchial and vascular smooth muscle and the uterus. Stimulation of $beta_2$-adrenergic receptors produces vasodilation, bronchodilation, and uterine relaxation. Beta blockers may be relatively selective for $beta_1$-adrenergic receptors (acebutolol, atenolol, betaxolol, bisoprolol, esmolol, and metoprolol) or nonselective (carvedilol, labetalol, nadolol, pindolol, propranolol, and timolol) blocking both $beta_1$- and $beta_2$-adrenergic receptors. Carvedilol and labetalol have additional alpha-adrenergic blocking properties. Ophthalmic beta blockers ↓ production of aqueous humor.

Contraindications

Decompensated HF, acute bronchospasm, some forms of valvular heart disease, bradyarrhythmias, and heart block.

Precautions

Use cautiously in pregnant and lactating women (may cause fetal bradycardia and hypoglycemia). Use cautiously in any form of lung disease. Use with caution in patients with diabetes or severe liver disease. Beta blockers should not be abruptly discontinued in patients with cardiovascular disease.

Interactions

May cause additive myocardial depression and bradycardia when used with other agents having these effects (digoxin, diltiazem, verapamil, clonidine, and ivabradine). May antagonize the therapeutic effects of bronchodilators. May alter the requirements for insulin or hypoglycemic agents in patients with diabetes. Cimetidine may ↓ the metabolism and ↑ the effects of some beta blockers.

NURSING IMPLICATIONS

Assessment

- Monitor BP and pulse frequently during dosage adjustment and periodically throughout therapy.

© F.A. Davis Publishing

- Monitor intake and output ratios and daily weight. Assess patient routinely for signs and symptoms of HF (dyspnea, rales/crackles, weight gain, peripheral edema, jugular venous distention).
- **Angina:** Assess frequency and severity of episodes of chest pain periodically throughout therapy.
- **Migraine Prophylaxis:** Assess frequency and severity of migraine headaches periodically throughout therapy.

Implementation

- Take apical pulse prior to administering. If heart rate is <50 bpm or if arrhythmias occur, hold medication and notify health care professional.

Patient/Family Teaching

- Instruct patient to continue taking medication, even if feeling well. Abrupt withdrawal may cause life-threatening arrhythmias, hypertension, or myocardial ischemia. Medication controls, but does not cure, hypertension.
- Encourage patient to comply with additional interventions for hypertension (weight reduction, low-sodium diet, regular exercise, smoking cessation, moderation of alcohol consumption, and stress management).
- Instruct patient and family on proper technique for monitoring BP. Advise them to check BP weekly and report significant changes to health care professional.
- Caution patient to make position changes slowly to minimize orthostatic hypotension. Advise patient that exercising or hot weather may enhance hypotensive effects.
- Advise patient to consult health care professional before taking any OTC medications or herbal/alternative therapies, especially cold remedies.
- Patients with diabetes should monitor blood glucose closely, especially if weakness, malaise, irritability, or fatigue occurs.
- Advise patient to advise health care professional of medication regimen prior to treatment or surgery.
- Advise patient to carry identification describing disease process and medication regimen at all times.
- Emphasize the importance of follow-up exams to monitor progress.
- **Ophth:** Instruct patient in correct technique for administration of ophthalmic preparations.

Evaluation/Desired Outcomes

- Decrease in BP.
- Decrease in frequency and severity of anginal attacks.
- Control of arrhythmias.
- Prevention of myocardial reinfarction.
- Prevention of migraine headaches.
- Decrease in tremors.
- Lowering of intraocular pressure.

• BONE RESORPTION INHIBITORS

PHARMACOLOGIC PROFILE

General Use

Bone resorption inhibitors are primarily used to treat and prevent osteoporosis in postmenopausal women. Other uses include treatment of osteoporosis due to other causes, including corticosteroid therapy, treatment of Paget's disease of the bone, and management of hypercalcemia.

© F.A. Davis Publishing

General Action and Information

Bisphosphonates (alendronate, etidronate, ibandronate, pamidronate, risedronate, and zoledronic acid) inhibit resorption of bone by inhibiting hydroxyapatite crystal dissolution and osteoclast activity. Raloxifene binds to estrogen receptors, producing estrogen-like effects on bone including ↓ bone resorption and ↓ bone turnover.

Contraindications

Hypersensitivity. Bisphosphonates should not be used in patients with hypocalcemia. Raloxifene should not be used in women of reproductive potential or a history of thromboembolic disease.

Precautions

Use cautiously in patients with renal impairment; some agents should be avoided in moderate to severe renal impairment.

Interactions

Calcium supplements ↓ absorption of bisphosphonates. Aspirin may ↑ GI adverse reactions with bisphosphonates. Cholestyramine ↓ absorption of raloxifene (concurrent use is contraindicated).

NURSING IMPLICATIONS

Assessment

- Assess patients for low bone density before and periodically during therapy.
- Assess for symptoms of Paget's disease (bone pain, headache, decreased visual and auditory acuity, ↑ skull size).
- **Lab Test Considerations:** Monitor serum calcium in patients with osteoporosis. Monitor alkaline phosphatase in patients with Paget's disease.

Implementation

Patient/Family Teaching

- Instruct patient to take medication exactly as directed.
- Encourage patient to participate in regular exercise and to modify behaviors that ↑ the risk of osteoporosis.

Evaluation/Desired Outcomes

- Prevention of, or decrease in, the progression of osteoporosis in postmenopausal women. Decrease in the progression of Paget's disease.

• BRONCHODILATORS

PHARMACOLOGIC PROFILE

General Use

Used in the treatment of reversible airway obstruction due to asthma or chronic obstructive pulmonary disease (COPD). Recommendations for management of asthma recommend that rapid-acting inhaled beta-agonist bronchodilators (not salmeterol, formoterol, arformoterol, indacaterol, olodaterol, or vilanterol) be reserved as acute relievers of bronchospasm; repeated or chronic use indicates the need for additional long-term control agents, including inhaled corticosteroids, mast cell stabilizers, long-acting bronchodilators (oral theophylline, beta$_2$-agonists, or anticholinergics), and leukotriene modifiers (montelukast, zafirlukast).

General Action and Information

Beta$_2$-adrenergic agonists (albuterol, arformoterol, epinephrine, formoterol, indacaterol, levalbuterol, metaproterenol, olodaterol, salmeterol, terbutaline, and vilanterol) produce bronchodilation by stimulating the production of cyclic adenosine monophosphate (cAMP). Onset of ac-

© F.A. Davis Publishing

tion allows use in management of acute attacks except for arformoterol, formoterol, indacaterol, olodaterol, salmeterol, and vilanterol, which have delayed onset. Phosphodiesterase inhibitors (aminophylline and theophylline) inhibit the breakdown of cAMP. Aclidinium, glycopyrrolate, ipratropium and tiotropium are anticholinergic compounds that produce bronchodilation by blocking the action of acetylcholine in the respiratory tract.

Contraindications

Hypersensitivity to agents or preservatives (bisulfites) used in their formulation. Avoid use in uncontrolled cardiac arrhythmias.

Precautions

Use cautiously in patients with diabetes, cardiovascular disease, or hyperthyroidism.

Interactions

Therapeutic effectiveness may be antagonized by concurrent use of beta blockers. Additive sympathomimetic effects with other adrenergic (sympathetic) drugs, including vasopressors and decongestants. Cardiovascular effects may be potentiated by antidepressants and MAO inhibitors.

NURSING IMPLICATIONS

Assessment

- Assess BP, pulse, respiration, lung sounds, and character of secretions before and throughout therapy.
- Patients with a history of cardiovascular problems should be monitored for ECG changes and chest pain.

Implementation

- Administer around the clock to maintain therapeutic plasma levels.

Patient/Family Teaching

- Emphasize the importance of taking only the prescribed dose at the prescribed time intervals.
- Encourage the patient to drink adequate liquids (2000 mL/day minimum) to ↓ the viscosity of the airway secretions.
- Advise patient to avoid OTC cough, cold, or breathing preparations without consulting health care professional and to minimize intake of xanthine-containing foods or beverages (colas, coffee, and chocolate), as these may ↑ side effects of theophylline.
- Caution patient to avoid smoking and other respiratory irritants.
- Instruct patient on proper use of metered-dose inhaler (see Appendix C).
- Advise patient to contact health care professional promptly if the usual dose of medication fails to produce the desired results, symptoms worsen after treatment, or toxic effects occur.
- Patients using other inhalation medications and bronchodilators should be advised to use bronchodilator first and allow 5 min to elapse before administering the other medication, unless otherwise directed by health care professional.

Evaluation/Desired Outcomes

- Decreased bronchospasm. Increased ease of breathing.

• CALCIUM CHANNEL BLOCKERS

PHARMACOLOGIC PROFILE

General Use

Used in the treatment of hypertension (amlodipine, diltiazem, felodipine, isradipine, nicardipine, nifedipine, nisoldipine, verapamil) or in the treatment and prophylaxis of angina pectoris

© F.A. Davis Publishing

or coronary artery spasm (amlodipine, diltiazem, felodipine, nicardipine, verapamil). Verapamil and diltiazem are also used as antiarrhythmics. Nimodipine is used to prevent neurologic damage due to certain types of cerebral vasospasm.

General Action and Information

Block calcium entry into cells of vascular smooth muscle and myocardium. Dilate coronary arteries in both normal and ischemic myocardium and inhibit coronary artery spasm. Diltiazem and verapamil also ↓ AV nodal conduction. Nimodipine has a relatively selective effect on cerebral blood vessels.

Contraindications

Hypersensitivity. Contraindicated in bradycardia, 2nd- or 3rd-degree heart block, or decompensated HF (all except for amlodipine and felodipine).

Precautions

Safety in pregnancy and lactation not established. Use cautiously in patients with liver disease or uncontrolled arrhythmias.

Interactions

May cause additive bradycardia when used with other agents having these effects (beta blockers, digoxin, clonidine, and ivabradine). Effectiveness may be ↓ by phenobarbital or phenytoin and ↑ by propranolol or cimetidine. Verapamil and diltiazem may ↑ serum digoxin levels and cause toxicity.

NURSING IMPLICATIONS

Assessment

- Monitor BP and pulse frequently during dosage adjustment and periodically throughout therapy.
- Monitor intake and output ratios and daily weight. Assess patient routinely for signs and symptoms of HF (dyspnea, rales/crackles, weight gain, peripheral edema, jugular venous distention).
- **Angina:** Assess frequency and severity of episodes of chest pain periodically throughout therapy.
- **Arrhythmias:** ECG should be monitored continuously during IV therapy and periodically during long-term therapy with verapamil or diltiazem.
- **Cerebral Vasospasm:** Assess patient's neurological status (level of consciousness, movement) before and periodically during therapy with nimodipine.

Implementation

- May be administered without regard to meals.
- Do not open, crush, or chew sustained-release capsules.

Patient/Family Teaching

- Instruct patient to continue taking medication, even if feeling well.
- Caution patient to make position changes slowly to minimize orthostatic hypotension. Advise patient that exercising or hot weather may enhance hypotensive effects.
- Instruct patient on the importance of maintaining good dental hygiene and seeing dentist frequently for teeth cleaning to prevent tenderness, bleeding, and gingival hyperplasia (gum enlargement).
- Advise patient to consult health care professional before taking any OTC medications or herbal/alternative therapies, especially cold remedies.
- Advise patient to advise health care professional of medication regimen prior to treatment or surgery.

© F.A. Davis Publishing

- Advise patient to carry identification describing disease process and medication regimen at all times.
- Emphasize the importance of follow-up exams to monitor progress.
- **Angina:** Instruct patients on concurrent nitrate therapy to continue taking both medications as directed and using SL nitroglycerin as needed for anginal attacks. Advise patient to contact health care professional if chest pain worsens or does not improve after therapy, or is accompanied by diaphoresis or shortness of breath, or if severe, persistent headache occurs. Caution patient to discuss exercise precautions with health care professional prior to exertion.
- **Hypertension:** Encourage patient to comply with additional interventions for hypertension (weight reduction, low-sodium diet, regular exercise, smoking cessation, moderation of alcohol consumption, and stress management). Medication controls, but does not cure, hypertension.
- Instruct patient and family on proper technique for monitoring BP. Advise them to check BP weekly and report significant changes to health care professional.

Evaluation/Desired Outcomes

- Decrease in BP.
- Decrease in frequency and severity of anginal attacks.
- Decrease need for nitrate therapy.
- Increase in activity tolerance and sense of well-being.
- Suppression and prevention of supraventricular tachyarrhythmias.
- Improvement in neurological deficits due to vasospasm following subarachnoid hemorrhage.

• CENTRAL NERVOUS SYSTEM STIMULANTS

PHARMACOLOGIC PROFILE

General Use

Used in the treatment of narcolepsy and as adjunctive treatment in the management of attention deficit hyperactivity disorder (ADHD).

General Action and Information

Produce CNS stimulation by ↑ levels of neurotransmitters in the CNS. Produce CNS and respiratory stimulation, dilated pupils, ↑ motor activity and mental alertness, and a diminished sense of fatigue. In children with ADHD, these agents ↓ restlessness and ↑ attention span.

Contraindications

Hypersensitivity. Should not be used in pregnant or lactating women. Should not be used in hyperexcitable states. Avoid using in patients with psychotic personalities or suicidal/homicidal tendencies. Contraindicated in glaucoma and severe cardiovascular disease.

Precautions

Use cautiously in patients with a history of cardiovascular disease, hypertension, diabetes mellitus, or in elderly or debilitated patients. Continual use may result in psychological dependence or addiction.

Interactions

Additive sympathomimetic (adrenergic) effects. Use with MAO inhibitors can result in hypertensive crises. Alkalinizing the urine (sodium bicarbonate, acetazolamide) ↓ excretion and enhances effects of amphetamines. Acidification of the urine (ammonium chloride, large doses of ascorbic acid) ↓ effect of amphetamines. Phenothiazines may also ↓ effects. Methylphenidate may ↓ the metabolism and ↑ effects of other drugs (warfarin, anticonvulsants, tricyclic antidepressants).

© F.A. Davis Publishing

NURSING IMPLICATIONS

Assessment

- Monitor BP, pulse, and respiration before administering and periodically during therapy.
- Monitor weight biweekly and inform health care professional of significant weight loss.
- Monitor height periodically in children; inform health care professional if growth inhibition occurs.
- May produce false sense of euphoria and well-being. Provide frequent rest periods and observe patient for rebound depression after the effects of the medication have worn off.
- **ADHD:** Assess attention span, impulse control, and interactions with others in children. Therapy may be interrupted at intervals to determine if symptoms are sufficient to warrant continued therapy.
- **Narcolepsy:** Observe and document frequency of episodes.

Implementation

Patient/Family Teaching

- Instruct patient not to alter dose without consulting health care professional. These medications have high dependence and abuse potential. Abrupt cessation with high doses may cause extreme fatigue and mental depression.
- Advise patient to avoid intake of large amounts of caffeine.
- Advise patient that many of these medications have known abuse potential. Caution patient to protect the medications from theft, and never give them to anyone other than the individual for whom it was prescribed. Store the medications out of sight and reach of children, and in a location not accessible by others.
- Medication may impair judgment. Caution patient to avoid driving or other activities requiring judgment until response to medication is known.
- Inform patient that periodic holidays from the drug may be used to assess progress and decrease dependence.

Evaluation/Desired Outcomes

- Decreased frequency of narcoleptic episodes.
- Improved attention span and social interactions.

• CORTICOSTEROIDS

PHARMACOLOGIC PROFILE

General Use

Used in replacement doses (20 mg of hydrocortisone or equivalent) systemically to treat adrenocortical insufficiency. Larger doses are usually used for their anti-inflammatory, immunosuppressive, or antineoplastic activity. Used adjunctively in many other situations, including autoimmune diseases. Topical corticosteroids are used in a variety of inflammatory and allergic conditions. Inhaled corticosteroids are used in the chronic management of reversible airway disease (asthma); intranasal and ophthalmic corticosteroids are used in the management of chronic allergic and inflammatory conditions.

General Action and Information

Produce profound and varied metabolic effects, in addition to modifying the normal immune response and suppressing inflammation. Available in a variety of dosage forms, including oral, injectable, topical, ophthalmic, intranasal, and inhalation. Prolonged used of large amounts of topical, ophthalmic, intranasal, or inhaled agent may result in systemic absorption and/or adrenal suppression.

© F.A. Davis Publishing

Contraindications
Serious infections (except for certain forms of meningitis). Do not administer live vaccines to patients on larger doses.

Precautions
Prolonged treatment will result in adrenal suppression. Do not discontinue abruptly. Additional doses may be needed during stress (surgery and infection). Safety in pregnancy and lactation not established. Long-term use in children will result in ↓ growth. May mask signs of infection. Use lowest dose possible for shortest time possible. Alternate-day therapy is preferable during long-term treatment.

Interactions
Additive hypokalemia with amphotericin B and potassium-losing diuretics. Hypokalemia may ↑ the risk of digoxin toxicity. May ↑ requirements for insulin or oral hypoglycemic agents. Phenytoin, phenobarbital, and rifampin stimulate metabolism and may ↓ effectiveness. Oral contraceptives may block metabolism. Cholestyramine and colestipol may ↓ absorption.

NURSING IMPLICATIONS

Assessment
- These drugs are indicated for many conditions. Assess involved systems prior to and periodically throughout course of therapy.
- Assess patient for signs of adrenal insufficiency (hypotension, weight loss, weakness, nausea, vomiting, anorexia, lethargy, confusion, restlessness) prior to and periodically throughout course of therapy.
- Children should have periodic evaluations of growth during chronic therapy.

Implementation
- If dose is ordered daily or every other day, administer in the morning to coincide with the body's normal secretion of cortisol.
- **PO:** Administer with meals to minimize gastric irritation.

Patient/Family Teaching
- Emphasize need to take medication exactly as directed. Review symptoms of adrenal insufficiency that may occur when stopping the medication and that may be life-threatening.
- Encourage patients on long-term therapy to eat a diet high in protein, calcium, and potassium and low in sodium and carbohydrates.
- These drugs cause immunosuppression and may mask symptoms of infection. Instruct patient to avoid people with known contagious illnesses and to report possible infections. Advise patient to consult health care professional before receiving any vaccinations.
- Discuss possible effects on body image. Explore coping mechanisms.
- Advise patient to carry identification in the event of an emergency in which patient cannot relate medical history.

Evaluation/Desired Outcomes
- Suppression of the inflammatory and immune responses in autoimmune disorders, allergic reactions, and organ transplants.
- Replacement therapy in adrenal insufficiency.
- Resolution of skin inflammation, pruritus, or other dermatologic conditions.

© F.A. Davis Publishing

• DIURETICS

PHARMACOLOGIC PROFILE

General Use

Thiazide diuretics and loop diuretics are used alone or in combination in the treatment of hypertension or edema due to HF or other causes. Potassium-sparing diuretics have weak diuretic and antihypertensive properties and are used mainly to conserve potassium in patients receiving thiazide or loop diuretics. Osmotic diuretics are often used in the management of cerebral edema.

General Action and Information

Enhance the selective excretion of various electrolytes and water by affecting renal mechanisms for tubular secretion and reabsorption. Groups commonly used are thiazide diuretics and thiazide-like diuretics (chlorothiazide, chlorthalidone, hydrochlorothiazide, indapamide, and metolazone), loop diuretics (bumetanide, furosemide, and torsemide), potassium-sparing diuretics (amiloride, spironolactone, and triamterene), and osmotic diuretics (mannitol). Mechanisms vary, depending on agent.

Contraindications

Hypersensitivity. Thiazide and loop diuretics may exhibit cross-sensitivity with other sulfonamides.

Precautions

Use with caution in patients with renal or hepatic disease. Safety in pregnancy and lactation not established.

Interactions

Additive hypokalemia with corticosteroids, amphotericin B, and piperacillin/tazobactam. Hypokalemia may ↑ the risk of digoxin toxicity. Potassium-losing diuretics ↓ lithium excretion and may cause toxicity. Additive hypotension with other antihypertensives or nitrates. Potassium-sparing diuretics may cause hyperkalemia when used with potassium supplements, ACE inhibitors, angiotensin II receptor antagonists, and aliskiren.

NURSING IMPLICATIONS

Assessment

- Assess fluid status throughout therapy. Monitor daily weight, intake and output ratios, amount and location of edema, lung sounds, skin turgor, and mucous membranes.
- Assess patient for anorexia, muscle weakness, numbness, tingling, paresthesia, confusion, and excessive thirst. Notify health care professional promptly if these signs of electrolyte imbalance occur.
- **Hypertension:** Monitor BP and pulse before and during administration. Monitor frequency of prescription refills to determine compliance in patients treated for hypertension.
- **Increased Intracranial Pressure:** Monitor neurologic status and intracranial pressure readings in patients receiving osmotic diuretics to decrease cerebral edema.
- **Increased Intraocular Pressure:** Monitor for persistent or increased eye pain or decreased visual acuity.
- **Lab Test Considerations:** Monitor electrolytes (especially potassium), blood glucose, BUN, and serum uric acid levels before and periodically throughout course of therapy.
- Thiazide and loop diuretics may cause ↑ serum cholesterol, low-density lipoprotein (LDL) cholesterol, and triglyceride concentrations.

Implementation

- Administer oral diuretics in the morning to prevent disruption of sleep cycle.
- Many diuretics are available in combination with other antihypertensives or potassium-sparing diuretics.

© F.A. Davis Publishing

Patient/Family Teaching

- Instruct patient to take medication exactly as directed. Advise patients on antihypertensive regimen to continue taking medication, even if feeling better. Medication controls, but does not cure, hypertension.
- Caution patient to make position changes slowly to minimize orthostatic hypotension. Caution patient that the use of alcohol, exercise during hot weather, or standing for long periods during therapy may enhance orthostatic hypotension.
- Instruct patient to consult health care professional regarding dietary potassium guidelines.
- Instruct patient to monitor weight weekly and report significant changes.
- Caution patient to use sunscreen and protective clothing to prevent photosensitivity reactions.
- Advise patient to consult health care professional before taking OTC medication concurrently with this therapy.
- Instruct patient to notify health care professional of medication regimen before treatment or surgery.
- Advise patient to contact health care professional immediately if muscle weakness, cramps, nausea, dizziness, or numbness or tingling of extremities occurs.
- Emphasize the importance of routine follow-up.
- **Hypertension:** Reinforce the need to continue additional therapies for hypertension (weight loss, regular exercise, restricted sodium intake, stress reduction, moderation of alcohol consumption, and cessation of smoking).
- Instruct patients with hypertension in the correct technique for monitoring weekly BP.

Evaluation/Desired Outcomes

- Decreased BP.
- Increased urine output.
- Decreased edema.
- Reduced intracranial pressure.
- Prevention of hypokalemia in patients taking diuretics.
- Treatment of hyperaldosteronism.

• HORMONES

PHARMACOLOGIC PROFILE

General Use

Used in the treatment of deficiency states including diabetes mellitus (insulin), diabetes insipidus (desmopressin), hypothyroidism (thyroid hormones), and menopause (estrogens or estrogens/progestins). Estrogenic and progestational hormones are used as contraceptive agents in various combinations and sequences. Hormones may be used to treat hormonally sensitive tumors (androgens, estrogens) and in other selected situations. See individual drugs.

General Action and Information

Natural or synthetic substances that have a specific effect on target tissue. Differ greatly in their effects, depending on individual agent and function of target tissue.

Contraindications

Differ greatly among individual agents; see individual entries.

Precautions

Differ greatly among individual agents; see individual entries.

Interactions

Differ greatly among individual agents; see individual entries.

© F.A. Davis Publishing

NURSING IMPLICATIONS

Assessment

- Monitor patient for symptoms of hormonal excess or insufficiency.
- **Sex Hormones:** BP and hepatic function tests should be monitored periodically throughout therapy.

Implementation

- **Sex Hormones:** During hospitalization, continue to administer according to schedule followed prior to hospitalization.

Patient/Family Teaching

- Explain dose schedule (and withdrawal bleeding with female sex hormones).
- Emphasize the importance of follow-up exams to monitor effectiveness of therapy and to ensure proper development of children and early detection of possible side effects.
- **Female Sex Hormones:** Advise patient to report signs and symptoms of fluid retention, thromboembolic disorders, mental depression, or hepatic dysfunction to health care professional.

Evaluation/Desired Outcomes

- Resolution of clinical symptoms of hormone imbalance including menopause symptoms and contraception.
- Correction of fluid and electrolyte imbalances.
- Control of the spread of advanced metastatic breast or prostate cancer.
- Slowed progression of postmenopausal osteoporosis.

• IMMUNOSUPPRESSANTS

PHARMACOLOGIC PROFILE

General Use

Azathioprine, basiliximab, cyclosporine, everolimus, mycophenolate, sirolimus, and tacrolimus are used with corticosteroids in the prevention of transplantation rejection reactions. Muromonab-CD3 is used to manage rejection reactions not controlled by other agents. Azathioprine, cyclosporine, cyclophosphamide, and methotrexate are used in the management of selected autoimmune diseases (nephrotic syndrome of childhood and severe rheumatoid arthritis).

General Action and Information

Inhibit cell-mediated immune responses by different mechanisms. In addition to azathioprine and cyclosporine, which are used primarily for their immunomodulating properties, cyclophosphamide and methotrexate are used to suppress the immune responses in certain disease states (nephrotic syndrome of childhood and severe rheumatoid arthritis). Muromonab-CD3 is a recombinant immunoglobulin antibody that alters T-cell function. Basiliximab is a monoclonal antibody.

Contraindications

Hypersensitivity to drug or vehicle.

Precautions

Use cautiously in patients with infections. Safety in pregnancy and lactation not established.

Interactions

Allopurinol inhibits the metabolism of azathioprine. Drugs that alter liver-metabolizing processes may change the effect of cyclosporine, tacrolimus, or sirolimus. The risk of toxicity with methotrexate may be ↑ by other nephrotoxic drugs, large doses of aspirin, or NSAIDs. Muro-

© F.A. Davis Publishing

monab-CD3 has additive immunosuppressive properties; concurrent immunosuppressive doses should be ↓ or eliminated.

NURSING IMPLICATIONS

Assessment

- Monitor for infection (vital signs, sputum, urine, stool, WBC). Notify physician or other health care professional immediately if symptoms occur.
- **Organ Transplant:** Assess for symptoms of organ rejection throughout therapy.
- **Lab Test Consideration:** Monitor CBC and differential throughout therapy.

Implementation

- Protect transplant patients from staff and visitors who may carry infection.
- Maintain protective isolation as indicated.

Patient/Family Teaching

- Reinforce the need for lifelong therapy to prevent transplant rejection. Review symptoms of rejection for transplanted organ and stress the need for patient to notify health care professional immediately if they occur.
- Advise patient to avoid contact with contagious persons. Patients should not receive vaccinations without first consulting with health care professional.
- Emphasize the importance of follow-up exams and lab tests.

Evaluation/Desired Outcomes

- Prevention or reversal of rejection of organ transplants or decrease in symptoms of autoimmune disorders.

• LAXATIVES

PHARMACOLOGIC PROFILE

General Use

Used to treat or prevent constipation or to prepare the bowel for radiologic or endoscopic procedures.

General Action and Information

Induce one or more bowel movements per day. Groups include stimulants (bisacodyl, sennosides), saline laxatives (magnesium salts and phosphates), stool softeners (docusate), bulk-forming agents (polycarbophil and psyllium), and osmotic cathartics (lactulose, polyethylene glycol/electrolyte). ↑ fluid intake, exercising, and adding more dietary fiber are also useful in the management of chronic constipation.

Contraindications

Hypersensitivity. Contraindicated in persistent abdominal pain, nausea, or vomiting of unknown cause, especially if accompanied by fever or other signs of an acute abdomen.

Precautions

Excessive or prolonged use may lead to dependence. Should not be used in children unless advised by a physician or other health care professional.

Interactions

Theoretically may ↓ the absorption of other orally administered drugs by ↓ transit time.

© F.A. Davis Publishing

NURSING IMPLICATIONS

Assessment

- Assess patient for abdominal distention, presence of bowel sounds, and usual pattern of bowel function.
- Assess color, consistency, and amount of stool produced.

Implementation

- May be administered at bedtime for morning results.
- Taking oral doses on an empty stomach will usually produce more rapid results.
- Do not crush or chew enteric-coated tablets. Take with a full glass of water or juice.
- Stool softeners and bulk laxatives may take several days for results.

Patient/Family Teaching

- Advise patients, other than those with spinal cord injuries, that laxatives should be used only for short-term therapy. Long-term therapy may cause electrolyte imbalance and dependence.
- Advise patient to ↑ fluid intake to a minimum of 1500–2000 mL/day during therapy to prevent dehydration.
- Encourage patients to use other forms of bowel regulation: ↑ bulk in the diet, ↑ fluid intake, and ↑ mobility. Normal bowel habits are individualized and may vary from 3 times/day to 3 times/wk.
- Instruct patients with cardiac disease to avoid straining during bowel movements (Valsalva maneuver).
- Advise patient that laxatives should not be used when constipation is accompanied by abdominal pain, fever, nausea, or vomiting.

Evaluation/Desired Outcomes

- A soft, formed bowel movement.
- Evacuation of the colon.

• LIPID-LOWERING AGENTS

PHARMACOLOGIC PROFILE

General Use

Used as a part of a total plan including diet and exercise to ↓ blood lipids in an effort to ↓ the morbidity and mortality of atherosclerotic cardiovascular disease and its sequelae.

General Action and Information

HMG-CoA reductase inhibitors (atorvastatin, fluvastatin, lovastatin, pitavastatin, pravastatin, rosuvastatin, simvastatin) inhibit an enzyme involved in cholesterol synthesis. The PCSK9 inhibitors (alirocumab, evolocumab) facilitate clearing of LDL from the blood. Bile acid sequestrants (cholestyramine, colestipol, colesevelam) bind cholesterol in the GI tract. Ezetimibe inhibits the absorption of cholesterol in the small intestine. Fenofibrate, gemfibrozil, and niacin act by other mechanisms (see individual monographs).

Contraindications

Hypersensitivity. HMG-CoA reductase inhibitors are contraindicated in pregnancy.

Precautions

Safety of other drugs in pregnancy, lactation, and children not established. See individual drugs. Dietary therapy should be given a 2–3 mo trial before drug therapy is initiated.

Interactions

Bile acid sequestrants (cholestyramine and colestipol) may bind lipid-soluble vitamins (A, D, E, and K) and other concurrently administered drugs in the GI tract. The risk of myopathy from HMG-CoA reductase inhibitors is ↑ by niacin, erythromycin, gemfibrozil, and cyclosporine.

© F.A. Davis Publishing

NURSING IMPLICATIONS

Assessment

- Obtain a diet history, especially in regard to **fat** and alcohol consumption.
- **Lab Test Considerations:** Serum cholesterol, LDL, HDL, and triglyceride levels should be evaluated before initiating and periodically throughout therapy. Medication should be discontinued if paradoxical increase in cholesterol level occurs.
- Liver function tests should be assessed before and periodically throughout therapy with HMG Co-A reductase inhibitors, niacin, and fibric acid derivatives. May cause an ↑ in levels.

Implementation

- See specific medications to determine timing of doses in relation to meals.

Patient/Family Teaching

- Advise patient that these medications should be used in conjunction with diet restrictions (**fat**, **cholesterol**, **carbohydrates**, and alcohol), exercise, and cessation of smoking.

Evaluation/Desired Outcomes

- Decreased serum cholesterol, triglyceride, and LDL levels and improved HDL levels.

• MINERALS/ELECTROLYTES/pH MODIFIERS

PHARMACOLOGIC PROFILE

General Use

Prevention and treatment of deficiencies or excesses of electrolytes and maintenance of optimal acid/base balance for homeostasis. Acidifiers and alkalinizers are also used to promote urinary excretion of substances that accumulate in certain disease states (kidney stones, uric acid).

General Action and Information

Electrolytes and minerals are necessary for many body processes. Maintenance of electrolyte levels within normal limits is required for many physiological processes such as cardiac, nerve, and muscle function; bone growth and stability; and a number of other activities. Minerals and electrolytes may also serve as catalysts in many enzymatic reactions. Acid/base balance allows for normal transfer of substances at the cellular and intracellular level.

Contraindications

Contraindicated in situations in which replacement would cause excess or when risk factors for retention are present.

Precautions

Use cautiously in disease states in which electrolyte imbalances are common such as significant hepatic or renal disease, adrenal or pituitary disorders.

Interactions

Depend on individual agents. Alkalinizers and acidifiers can alter the excretion of drugs for which elimination is pH dependent. See specific entries.

NURSING IMPLICATIONS

Assessment

- Observe patient carefully for evidence of electrolyte excess or insufficiency. Monitor lab values before and periodically throughout therapy.

Implementation

- **Potassium Chloride:** Do not administer potassium chloride undiluted.

© F.A. Davis Publishing

Patient/Family Teaching
- Review diet modifications with patients with chronic electrolyte disturbances.

Evaluation/Desired Outcomes
- Return to normal serum electrolyte concentrations and resolution of clinical symptoms of electrolyte imbalance.
- Changes in pH or composition of urine, which prevent formation of renal calculi.

• NATURAL/HERBAL PRODUCTS

PHARMACOLOGIC PROFILE

General Use
These remedies are used for a wide variety of conditions. Prescriptions are not required and consumers have the choice of many products.

General Action and Information
Use of these agents is based on historical and sometimes anecdotal evidence. The FDA has little control over these agents, so currently there is little standardization among products.

Contraindications
Hypersensitivity. Most products are plant extracts that may contain a variety of impurities.

Precautions
Elderly, pediatric, and pregnant or lactating patients should be aware that these agents carry many of the same risks as prescription medications. Patients with serious chronic medical conditions should consult their health care professional before use.

Interactions
These agents have the ability to interact with prescription medications and may prevent or augment a desired therapeutic outcome. St. John's wort and kava-kava have the greatest risk for serious interactions.

NURSING IMPLICATIONS

Assessment
- Assess the condition for which the patient is taking the product.

Implementation
- **PO:** Administer with food if product associated with gastric irritation.

Patient/Family Teaching
- Discuss with patient the reason for using the product. Encourage patient to choose products with USP label, if possible, to guarantee content and purity of medication.
- Inform patient of known side effects and interactions with other medications.

Evaluation/Desired Outcomes
- Improvement in condition for which medication was taken.

• NONOPIOID ANALGESICS

PHARMACOLOGIC PROFILE

General Use
Used to control mild to moderate pain and/or fever. Phenazopyridine is used only to treat urinary tract pain, and capsaicin is used topically for a variety of painful syndromes.

© F.A. Davis Publishing

General Action and Information
Most nonopioid analgesics inhibit prostaglandin synthesis peripherally for analgesic effect and centrally for antipyretic effect.

Contraindications
Hypersensitivity and cross-sensitivity among NSAIDs may occur.

Precautions
Use cautiously in patients with severe hepatic or renal disease, chronic alcohol use/abuse, or malnutrition.

Interactions
Long-term use of acetaminophen with NSAIDs may ↑ the risk of adverse renal effects. Prolonged high-dose acetaminophen may ↑ the risk of bleeding with warfarin. Hepatotoxicity may be additive with other hepatotoxic agents, including alcohol. NSAIDs ↑ the risk of bleeding with warfarin, thrombolytic agents, antiplatelet agents, some cephalosporins, and valproate (effect is greatest with aspirin). NSAIDs may also ↓ the effectiveness of diuretics and antihypertensives.

NURSING IMPLICATIONS

Assessment
- Patients who have asthma, allergies, and nasal polyps or who are allergic to tartrazine are at an ↑ risk for developing hypersensitivity reactions.
- **Pain:** Assess pain and limitation of movement; note type, location, and intensity prior to and at the peak (see Time/Action Profile) following administration.
- **Fever:** Assess fever and note associated signs (diaphoresis, tachycardia, malaise, chills).
- **Lab Test Considerations:** Hepatic, hematologic, and renal function should be evaluated periodically throughout prolonged high-dose therapy. Aspirin and most NSAIDs prolong bleeding time due to suppressed platelet aggregation and, in large doses, may cause prolonged prothrombin time. Monitor hematocrit periodically in prolonged high-dose therapy to assess for GI blood loss.

Implementation
- **PO:** Administer salicylates and NSAIDs after meals or with food to minimize gastric irritation.

Patient/Family Teaching
- Instruct patient to take salicylates and NSAIDs with a full glass of water and to remain in an upright position for 15–30 min after administration.
- Adults should not take acetaminophen longer than 10 days and children not longer than 5 days unless directed by health care professional. Short-term doses of acetaminophen with salicylates or NSAIDs should not exceed the recommended daily dose of either drug alone.
- Caution patient to avoid concurrent use of alcohol with this medication to minimize possible gastric irritation; 3 or more glasses of alcohol per day may ↑ the risk of GI bleeding with salicylates or NSAIDs. Caution patient to avoid taking acetaminophen, salicylates, or NSAIDs concurrently for more than a few days, unless directed by health care professional to prevent analgesic nephropathy.
- Advise patients on long-term therapy to inform health care professional of medication regimen prior to surgery. Aspirin, salicylates, and NSAIDs may need to be withheld prior to surgery.

Evaluation/Desired Outcomes
- Relief of mild to moderate discomfort.
- Reduction of fever.

© F.A. Davis Publishing

• NONSTEROIDAL ANTI-INFLAMMATORY DRUGS (NSAIDS)

PHARMACOLOGIC PROFILE

General Use

NSAIDs are used to control mild to moderate pain, fever, and various inflammatory conditions, such as rheumatoid arthritis and osteoarthritis. Ophthalmic NSAIDs are used to ↓ postoperative ocular inflammation, to inhibit perioperative miosis, and to ↓ inflammation due to allergies.

General Action and Information

NSAIDs have analgesic, antipyretic, and anti-inflammatory properties. Analgesic and anti-inflammatory effects are due to inhibition of prostaglandin synthesis. Antipyretic action is due to vasodilation and inhibition of prostaglandin synthesis in the CNS. COX-2 inhibitors (celecoxib) may cause less GI bleeding.

Contraindications

Hypersensitivity to aspirin is a contraindication for the whole group of NSAIDs. Cross-sensitivity may occur.

Precautions

Use cautiously in patients with a history of bleeding disorders, GI bleeding, and severe hepatic, renal, or cardiovascular disease. Safe use in pregnancy is not established and, in general, should be avoided during the second half of pregnancy.

Interactions

NSAIDs prolong bleeding time and potentiate the effect of warfarin, thrombolytic agents, some cephalosporins, antiplatelet agents, and valproates. Prolonged use with aspirin may result in ↑ GI side effects and ↓ effectiveness. NSAIDs may also ↓ response to diuretics or antihypertensive therapy. COX-2 inhibitors do not negate the cardioprotective effect of low-dose aspirin.

NURSING IMPLICATIONS

Assessment

- Patients who have asthma, allergies, and nasal polyps or who are allergic to tartrazine are at an ↑ risk for developing hypersensitivity reactions.
- **Pain:** Assess pain and limitation of movement; note type, location, and intensity prior to and at the peak (see Time/Action Profile) following administration.
- **Fever:** Assess fever and note associated signs (diaphoresis, tachycardia, malaise, chills).
- **Lab Test Considerations:** Most NSAIDs prolong bleeding time due to suppressed platelet aggregation and, in large doses, may cause prolonged PT. Monitor periodically in prolonged high-dose therapy to assess for GI blood loss.

Implementation

- **PO:** Administer NSAIDs after meals or with food to minimize gastric irritation.

Patient/Family Teaching

- Instruct patient to take NSAIDs with a full glass of water and to remain in an upright position for 15–30 min after administration.
- Caution patient to avoid concurrent use of alcohol with this medication to minimize possible gastric irritation; 3 or more glasses of alcohol per day may ↑ the risk of GI bleeding with salicylates or NSAIDs. Caution patient to avoid taking acetaminophen, salicylates, or NSAIDs concurrently for more than a few days, unless directed by health care professional to prevent analgesic nephropathy.
- Advise patient on long-term therapy to inform health care professional of medication regimen prior to surgery. NSAIDs may need to be withheld prior to surgery.

© F.A. Davis Publishing

Evaluation/Desired Outcomes

- Relief of mild to moderate discomfort
- Reduction of fever.

• OPIOID ANALGESICS

PHARMACOLOGIC PROFILE

General Use

Management of moderate to severe pain. Fentanyl is also used as a general anesthetic adjunct.

General Action and Information

Opioids bind to opiate receptors in the CNS, where they act as agonists of endogenously occurring opioid peptides (eukephalins and endorphins). The result is alteration to the perception of and response to pain.

Contraindications

Hypersensitivity to individual agents.

Precautions

Use cautiously in patients with undiagnosed abdominal pain, head trauma or pathology, liver disease, or history of addiction to opioids. Use smaller doses initially in the elderly and those with respiratory diseases. Prolonged use may result in tolerance and the need for larger doses to relieve pain. Psychological or physical dependence may occur.

Interactions

↑ the CNS depressant properties of other drugs, including alcohol, antihistamines, antidepressants, sedative/hypnotics, phenothiazines, and MAO inhibitors. Use of partial-antagonist opioid analgesics (buprenorphine, butorphanol, and nalbuphine) may precipitate opioid withdrawal in physically dependent patients. Use with MAO inhibitors or procarbazine may result in severe paradoxical reactions (especially with meperidine). Nalbuphine may ↓ the analgesic effects of other concurrently administered opioid analgesics.

NURSING IMPLICATIONS

Assessment

- Assess type, location, and intensity of pain prior to and at peak following administration. When titrating opioid doses, ↑ of 25–50% should be administered until there is either a 50% ↓ in the patient's pain rating on a numerical or visual analogue scale or the patient reports satisfactory pain relief. A repeat dose can be safely administered at the time of the peak if previous dose is ineffective and side effects are minimal. Patients requiring higher doses of opioid agonist-antagonists should be converted to an opioid agonist.
- Opioid agonist-antagonists are not recommended for prolonged use or as first-line therapy for acute or cancer pain.
- An equianalgesic chart (see Appendix I) should be used when changing routes or when changing from one opioid to another.
- Assess BP, pulse, and respirations before and periodically during administration. If respiratory rate is <10/min, assess level of sedation. Physical stimulation may be sufficient to prevent significant hypoventilation. Dose may need to be ↓ by 25–50%. Initial drowsiness will diminish with continued use.
- Assess prior analgesic history. Antagonistic properties of agonist-antagonists may induce withdrawal symptoms (vomiting, restlessness, abdominal cramps, and ↑ BP and temperature) in patients physically dependent on opioids.
- Prolonged use may lead to physical and psychological dependence and tolerance. This should not prevent patient from receiving adequate analgesia. Most patients who receive opioid anal-

© F.A. Davis Publishing

gesics for pain do not develop psychological dependence. Progressively higher doses may be required to relieve pain with chronic therapy.

- Assess bowel function routinely. Prevention of constipation should be instituted with ↑ intake of fluids and bulk, stool softeners, and laxatives to minimize constipating effects. Stimulant laxatives should be administered routinely if opioid use exceeds 2–3 days, unless contraindicated.
- Monitor intake and output ratios. If significant discrepancies occur, assess for urinary retention and inform physician or other health care professional.
- **Toxicity and Overdose:** If an opioid antagonist is required to reverse respiratory depression or coma, naloxone is the antidote. Dilute the 0.4-mg ampule of naloxone in 10 mL of 0.9% NaCl and administer 0.5 mL (0.02 mg) by IV push every 2 min. For children and patients weighing <40 kg, dilute 0.1 mg of naloxone in 10 mL of 0.9% NaCl for a concentration of 10 mcg/mL and administer 0.5 mcg/kg every 1–2 min. Naloxone may also be administered intranasally to reverse opioid-induced respiratory depression or coma. Administer 1 spray (2 mg or 4 mg) in one nostril; may repeat dose every 2–3 min (with each subsequent dose being administered in alternate nostril). Titrate dose to avoid withdrawal, seizures, and severe pain.

Implementation

- Do not confuse morphine with hydromorphone or meperidine; errors have resulted in fatalities.
- Explain therapeutic value of medication before administration to enhance the analgesic effect.
- Regularly administered doses may be more effective than prn ("as needed") administration. Analgesic is more effective if given before pain becomes severe.
- Coadministration with nonopioid analgesics may have additive analgesic effects and may permit lower doses.
- Medication should be discontinued gradually after long-term use to prevent withdrawal symptoms.

Patient/Family Teaching

- Instruct patient on how and when to ask for pain medication.
- Advise patient that opioid analgesics have known abuse potential. Advise the patient to protect these medications from theft, and never give them to anyone other than the individual for whom it was prescribed. Store out of sight and reach of children, and in a location not accessible by others.
- Medication may cause drowsiness or dizziness. Caution patient to call for assistance when ambulating or smoking and to avoid driving or other activities requiring alertness until response to medication is known.
- Advise patient to make position changes slowly to minimize orthostatic hypotension.
- Caution patient to avoid concurrent use of alcohol or other CNS depressants with this medication.
- Encourage patient to turn, cough, and breathe deeply every 2 hr to prevent atelectasis.

Evaluation/Desired Outcomes

- Decreased severity of pain without a significant alteration in level of consciousness or respiratory status.

• SEDATIVE/HYPNOTICS

PHARMACOLOGIC PROFILE

General Use

Sedatives are used to provide sedation, usually prior to procedures. Hypnotics are used to manage insomnia. Selected agents are useful as anticonvulsants (clorazepate, diazepam, phenobar-

© F.A. Davis Publishing

bital), skeletal muscle relaxants (diazepam), adjuncts in the management of alcohol withdrawal syndrome (chlordiazepoxide, diazepam, oxazepam), adjuncts in general anesthesia (droperidol), or as amnestics (midazolam, diazepam).

General Action and Information

Cause generalized CNS depression. May produce tolerance with chronic use and have potential for psychological or physical dependence. These agents have NO analgesic properties.

Contraindications

Hypersensitivity. Should not be used in comatose patients or in those with pre-existing CNS depression. Should not be used in patients with uncontrolled severe pain. Avoid use during pregnancy or lactation.

Precautions

Use cautiously in patients with hepatic impairment, severe renal impairment, or severe underlying pulmonary disease. Use with caution in patients who may be suicidal or who may have had previous drug addictions. Hypnotic use should be short-term. Geriatric patients may be more sensitive to CNS depressant effects; dosage ↓ may be required.

Interactions

Additive CNS depression with alcohol, antihistamines, some antidepressants, opioid analgesics, or phenothiazines. Barbiturates induce hepatic drug-metabolizing enzymes and can ↓ the effectiveness of drugs metabolized by the liver, including oral contraceptives. Should not be used with MAO inhibitors.

NURSING IMPLICATIONS

Assessment

- Monitor BP, pulse, and respiratory status frequently throughout IV administration. Prolonged high-dose therapy may lead to psychological or physical dependence. Restrict the amount of drug available to patient, especially if patient is depressed, suicidal, or has a history of addiction.
- **Insomnia:** Assess sleep patterns before and periodically throughout course of therapy.
- **Seizures:** Observe and record intensity, duration, and characteristics of seizure activity. Institute seizure precautions.
- **Muscle Spasms:** Assess muscle spasms, associated pain, and limitation of movement before and throughout therapy.
- **Alcohol Withdrawal:** Assess patient experiencing alcohol withdrawal for tremors, agitation, delirium, and hallucinations. Protect patient from injury.

Implementation

- Supervise ambulation and transfer of patients following administration of hypnotic doses. Remove cigarettes. Side rails should be raised and call bell within reach at all times. Keep bed in low position.

Patient/Family Teaching

- Discuss the importance of preparing the environment for sleep (dark room, quiet, avoidance of nicotine and caffeine). If less effective after a few weeks, consult health care professional; do not ↑ dose. Gradual withdrawal may be required to prevent reactions following prolonged therapy.
- May cause daytime drowsiness. Caution patient to avoid driving and other activities requiring alertness until response to medication is known.
- Advise patient to avoid the use of alcohol and other CNS depressants concurrently with these medications.
- Advise patient to inform health care professional if pregnancy is planned or suspected.

© F.A. Davis Publishing

Evaluation/Desired Outcomes
- Improvement in sleep patterns.
- Control of seizures.
- Decrease in muscle spasms.
- Decreased tremulousness.
- More rational ideation when used for alcohol withdrawal.

• SKELETAL MUSCLE RELAXANTS

PHARMACOLOGIC PROFILE

General Use
Two major uses are spasticity associated with spinal cord diseases or lesions (baclofen and dantrolene) or adjunctive therapy in the symptomatic relief of acute painful musculoskeletal conditions (carisoprodol, chlorzoxazone, cyclobenzaprine, diazepam, and methocarbamol). IV dantrolene is also used to treat and prevent malignant hyperthermia.

General Action and Information
Act either centrally (baclofen, carisoprodol, cyclobenzaprine, metaxolone, and methocarbamol) or directly (dantrolene).

Contraindications
Baclofen and oral dantrolene should not be used in patients in whom spasticity is used to maintain posture and balance.

Precautions
Safety in pregnancy and lactation not established. Use cautiously in patients with a history of previous liver disease.

Interactions
Additive CNS depression with other CNS depressants, including alcohol, antihistamines, antidepressants, opioid analgesics, and sedative/hypnotics.

NURSING IMPLICATIONS

Assessment
- Assess patient for pain, muscle stiffness, and range of motion before and periodically throughout therapy.

Implementation
- Provide safety measures as indicated. Supervise ambulation and transfer of patients.

Patient/Family Teaching
- Encourage patient to comply with additional therapies prescribed for muscle spasm (rest, physical therapy, heat).
- Medication may cause drowsiness. Caution patient to avoid driving or other activities requiring alertness until response to drug is known.
- Advise patient to avoid concurrent use of alcohol or other CNS depressants with these medications.

Evaluation/Desired Outcomes
- Decreased musculoskeletal pain
- Decreased muscle spasticity
- Increased range of motion
- Prevention or decrease in temperature and skeletal rigidity in malignant hyperthermia.

© F.A. Davis Publishing

• THROMBOLYTICS

PHARMACOLOGIC PROFILE

General Use

Acute management of ST-segment-elevation MI. Alteplase is also used in the management of acute pulmonary embolism and acute ischemic stroke.

General Action and Information

Converts plasminogen to plasmin, which then degrades fibrin in clots. Alteplase, reteplase, and tenecteplase directly activate plasminogen. Results in lysis of blood clots.

Contraindications

Hypersensitivity. Active internal bleeding, history of cerebrovascular accident, recent CNS trauma or surgery, neoplasm, or arteriovenous malformation, severe uncontrolled hypertension, and known bleeding tendencies.

Precautions

Recent (within 10 days) major surgery, trauma, GI or GU bleeding. Severe hepatic or renal disease. Subacute bacterial endocarditis or acute pericarditis. Use cautiously in geriatric patients. Safety not established in pregnancy, lactation, or children.

Interactions

Concurrent use with antiplatelet agents, NSAIDs, warfarin, dabigatran, rivaroxaban, apixaban, edoxaban, betrixaban, or heparins may ↑ the risk of bleeding, although these agents are frequently used together or in sequence. Risk of bleeding may also be ↑ by concurrent use with cefotetan, cefoperazone, and valproic acid.

NURSING IMPLICATIONS

Assessment

- Begin therapy as soon as possible after the onset of symptoms.
- Monitor vital signs, including temperature, continuously for coronary thrombosis and at least every 4 hr during therapy for other indications. Do not use lower extremities to monitor BP.
- Assess patient carefully for bleeding every 15 min during the 1st hr of therapy, every 15–30 min during the next 8 hr, and at least every 4 hr for the duration of therapy. Frank bleeding may occur from sites of invasive procedures or from body orifices. Internal bleeding may also occur (↓ neurologic status; abdominal pain with coffee-ground emesis or black, tarry stools; hematuria; joint pain). If uncontrolled bleeding occurs, stop medication and notify physician immediately.
- Assess neurologic status throughout therapy.
- Altered sensorium or neurologic changes may be indicative of intracranial bleeding.
- **Coronary Thrombosis:** Monitor ECG continuously. Notify physician if significant arrhythmias occur. IV lidocaine or procainamide may be ordered prophylactically. Cardiac enzymes should be monitored. Coronary angiography may be ordered following therapy to monitor effectiveness of therapy.
- Monitor heart sounds and breath sounds frequently. Inform physician if signs of HF occur (rales/crackles, dyspnea, S3 heart sound, jugular venous distention).
- **Pulmonary Embolism:** Monitor pulse, BP, hemodynamics, and respiratory status (rate, degree of dyspnea, arterial blood gases).
- **Cannula/Catheter Occlusion:** Monitor ability to aspirate blood as indicator of patency. Ensure that patient exhales and holds breath when connecting and disconnecting IV syringe to prevent air embolism.
- **Acute Ischemic Stroke:** Assess neurologic status. Determine time of onset of stroke symptoms. Alteplase must be administered within 3–4.5 hr of onset (within 3 hr in patients >80

© F.A. Davis Publishing

years, those taking oral anticoagulants, those with a baseline National Institutes of Health Stroke Scale score >25, or those with both a history of stroke and diabetes).

- **Lab Test Considerations:** Hematocrit, hemoglobin, platelet count, fibrin/fibrin degradation product (FDP/fdp) titer, fibrinogen concentration, prothrombin time, thrombin time, and activated partial thromboplastin time may be evaluated prior to and frequently throughout therapy. Bleeding time may be assessed prior to therapy if patient has received platelet aggregation inhibitors. Obtain type and cross match and have blood available at all times in case of hemorrhage. Stools should be tested for occult blood loss and urine for hematuria periodically during therapy.
- **Toxicity and Overdose:** If local bleeding occurs, apply pressure to site. If severe or internal bleeding occurs, discontinue infusion. Clotting factors and/or blood volume may be restored through infusions of whole blood, packed RBCs, fresh frozen plasma, or cryoprecipitate. Do not administer dextran, as it has antiplatelet activity. Aminocaproic acid may be used as an antidote.

Implementation

- This medication should be used only in settings in which hematologic function and clinical response can be adequately monitored.
- Starting two IV lines prior to therapy is recommended: one for the thrombolytic agent, the other for any additional infusions.
- Avoid invasive procedures, such as IM injections or arterial punctures, with this therapy. If such procedures must be performed, apply pressure to all arterial and venous puncture sites for at least 30 min. Avoid venipunctures at noncompressible sites (jugular vein, subclavian site).
- Systemic anticoagulation with heparin is usually begun several hours after the completion of thrombolytic therapy.
- Acetaminophen may be ordered to control fever.

Patient/Family Teaching

- Explain purpose of medication and the need for close monitoring to patient and family. Instruct patient to report hypersensitivity reactions (rash, dyspnea) and bleeding or bruising.
- Explain need for bedrest and minimal handling during therapy to avoid injury. Avoid all unnecessary procedures such as shaving and vigorous tooth brushing.

Evaluation/Desired Outcomes

- Lysis of thrombi and restoration of blood flow
- Prevention of neurologic sequelae in acute ischemic stroke
- Cannula or catheter patency.

• VACCINES/IMMUNIZING AGENTS

PHARMACOLOGIC PROFILE

General Use

Immune globulins provide passive immunization to infectious diseases by providing antibodies. Immunization with vaccines and toxoids containing bacterial or viral antigenic material results in endogenous production of antibodies.

General Action and Information

Immunity from immune globulins is rapid, but short-lived (up to 3 months). Active immunization with vaccine or toxoids produces prolonged immunity (years).

© F.A. Davis Publishing

Contraindications
Hypersensitivity to product, preservatives, or other additives. Some products contain thimerisol, neomycin, and/or **egg protein**.

Precautions
Severe bleeding problems (IM injections).

Interactions
↓ antibody response to vaccine/toxoids and ↑ risk of adverse reactions in patients receiving concurrent antineoplastic, immunosuppressive, or radiation therapy.

NURSING IMPLICATIONS

Assessment
- Assess previous immunization history and history of hypersensitivity.

Implementation
- Measles, mumps, and rubella vaccine, trivalent oral polio virus vaccine, and diphtheria toxoid, tetanus toxoid, and pertussis vaccine may be given concurrently.
- Administer each immunization by appropriate route.

Patient/Family Teaching
- Inform patient/parent of potential and reportable side effects of immunization. Health care professional should be notified if patient develops fever over 39.4°C (103°F); difficulty breathing; hives; itching; swelling of the eyes, face, or inside of nose; sudden severe tiredness or weakness; or convulsions occur.
- Review next scheduled immunization with parent. Emphasize the importance of keeping a record of immunizations and dates given.

Evaluation/Desired Outcomes
- Prevention of diseases through active immunity.

• VASCULAR HEADACHE SUPPRESSANTS

PHARMACOLOGIC PROFILE

General Use
Used for acute treatment of vascular headaches (migraine, cluster headaches, migraine variants). Other agents such as some beta blockers and some calcium channel blockers are used for suppression of frequently occurring vascular headaches.

General Action and Information
Ergot derivatives (ergotamine, dihydroergotamine) directly stimulate alpha-adrenergic and serotonergic receptors, producing vascular smooth muscle vasoconstriction. Almotriptan, eletriptan, frovatriptan, naratriptan, rizatriptan, sumatriptan, and zolmitriptan produce vasoconstriction by acting as serotonin ($5\text{-}HT_1$) agonists.

Contraindications
Avoid using these agents in patients with ischemic cardiovascular disease.

Precautions
Use cautiously in patients who have a history of, or at risk for, cardiovascular disease.

Interactions
Avoid concurrent use of ergot derivative agents with serotonin agonist agents; see also individual agents.

© F.A. Davis Publishing

NURSING IMPLICATIONS

Assessment

- Assess pain location, intensity, duration, and associated symptoms (photophobia, phonophobia, nausea, vomiting) during migraine attack and frequency of attacks.

Implementation

- Medication should be administered at the first sign of a headache.

Patient/Family Teaching

- Inform patient that medication should be used only during a migraine attack. It is meant to be used for relief of migraine attacks but not to prevent or reduce the number of attacks.
- Advise patient that lying down in a darkened room following medication administration may further help relieve headache.
- May cause dizziness or drowsiness. Caution patient to avoid driving or other activities requiring alertness until response to medication is known.
- Advise patient to avoid alcohol, which aggravates headaches.

Evaluation/Desired Outcomes

- Relief of migraine attack.

• VITAMINS

PHARMACOLOGIC PROFILE

General Use

Used in the prevention and treatment of vitamin deficiencies and as supplements in various metabolic disorders.

General Action and Information

Serve as components of enzyme systems that catalyze numerous varied metabolic reactions. Necessary for homeostasis. Water-soluble vitamins (B-vitamins and vitamin C) rarely cause toxicity. Fat-soluble vitamins (vitamins D and E) may accumulate and cause toxicity.

Contraindications

Hypersensitivity to additives, preservatives, or colorants.

Precautions

Dose should be adjusted to avoid toxicity, especially for fat-soluble vitamins.

Interactions

Pyridoxine in large amounts may interfere with the effectiveness of levodopa. Cholestyramine, colestipol, and mineral oil ↓ absorption of fat-soluble vitamins.

NURSING IMPLICATIONS

Assessment

- Assess patient for signs of vitamin deficiency before and periodically throughout therapy.
- Assess nutritional status through 24-hr diet recall. Determine frequency of consumption of vitamin-rich foods.

Implementation

- Because of infrequency of single vitamin deficiencies, combinations are commonly administered.

Patient/Family Teaching

- Encourage patients to comply with diet recommendations of physician or other health care professional. Explain that the best source of vitamins is a well-balanced diet with foods from the four basic food groups.

© F.A. Davis Publishing

- Patients self-medicating with vitamin supplements should be cautioned not to exceed RDAs. The effectiveness of megadoses for treatment of various medical conditions is unproved and may cause side effects and toxicity.

Evaluation/Desired Outcomes

- Prevention of, or decrease in, the symptoms of vitamin deficiencies.

• WEIGHT CONTROL AGENTS

PHARMACOLOGIC PROFILE

General Use

These agents are used in the management of exogenous obesity as part of a regimen including a reduced-calorie diet. They are especially useful in the presence of other risk factors including hypertension, diabetes, or dyslipidemias.

General Action and Information

Phentermine is an anorexiant designed to ↓ appetite via its action in the CNS. Orlistat is a lipase inhibitor that ↓ absorption of dietary fat.

Contraindications

None of these agents should be used during pregnancy or lactation. Phentermine should not be used in patients with severe hepatic or renal disease, uncontrolled hypertension, known HF, or cardiovascular disease. Orlistat should not be used in patients with chronic malabsorption.

Precautions

Phentermine should be used cautiously in patients with a history of seizures, or angle-closure glaucoma and in geriatric patients.

Interactions

Phentermine may have additive, adverse effects with CNS stimulants, some vascular headache suppressants, MAO inhibitors, and some opioids (concurrent use should be avoided). Orlistat ↓ absorption of some fat-soluble vitamins and beta-carotene.

NURSING IMPLICATIONS

Assessment

- Monitor weight and dietary intake prior to and periodically during therapy. Adjust concurrent medications (antihypertensives, antidiabetics, lipid-lowering agents) as needed.

Implementation

Patient/Family Teaching

- Advise patient that regular physical activity, approved by healthcare professional, should be used in conjunction with medication and diet.

Evaluation/Desired Outcomes

- Slow, consistent weight loss when combined with a reduced-calorie diet.

© F.A. Davis Publishing

A

abacavir/dolutegravir/lamivudine

(ah-**back**-ah-veer/doe-loo-**teg**-ravir/la-**mi**-vyoo-deen)

Triumeq

Classification

Therapeutic: antiretrovirals (combination)
Pharmacologic: integrase strand transfer inhibitors (INSTI) (dolutegravir), nucleoside reverse transcriptase inhibitors (abacavir, lamivudine)

Indications

HIV-1 infection.

Action

Abacavir—Converted inside cells to carbovir triphosphate, its active metabolite. Carbovir triphosphate inhibits the activity of HIV-1 reverse transcriptase, which in turn terminates viral DNA growth. *Dolutegravir*—Inhibits HIV-1 integrase, which is required for viral replication. *Lamivudine*—After intracellular conversion to its active form (lamivudine-5-triphosphate), inhibits viral DNA synthesis by inhibiting the enzyme reverse transcriptase. **Therapeutic Effects:** Evidence of decreased viral replication and reduced viral load with slowed progression of HIV and its sequelae.

Pharmacokinetics

Abacavir

Absorption: Rapidly and extensively (83%) absorbed.

Distribution: Distributes into extravascular space and readily distributes into erythrocytes.

Metabolism and Excretion: Mostly metabolized by the liver; 1.2% excreted unchanged in urine.

Half-life: 1.5 hr.

Dolutegravir

Absorption: Absorption follows oral administration; bioavailability is unknown.

Distribution: Enters CSF.

Protein Binding: >98.9%.

Metabolism and Excretion: Metabolized primarily by the UGT1A1 enzyme system with some metabolism by CYP3A4. 53% excreted unchanged in feces. Metabolites are renally excreted, minimal renal elimination of unchanged drug. Poor metabolizers of dolutegravir have ↑ levels and ↓ clearance.

Half-life: 14 hr.

Lamivudine

Absorption: Well absorbed after oral administration (86% in adults, 66% in infants and children).

Distribution: Distributes into the extravascular space. Some penetration into CSF; remainder of distribution unknown.

Metabolism and Excretion: Mostly excreted unchanged in urine; <5% metabolized by the liver.

Half-life: 13–19 hr.

TIME/ACTION PROFILE (blood levels)

ROUTE	ONSET	PEAK	DURATION
PO	unknown	unknown	24 hr

Contraindications/Precautions

Contraindicated in: Hypersensitivity to any component (especially abacavir, rechallenge may be fatal); Resistance to any component; Presence of HLA-B*5701 allele; Concurrent use of dofetilide; Concurrent administration of lamivudine or abacavir alone or in other combination antiretroviral dose forms; Moderate to severe liver impairment; CCr <30 mL/min; OB: Avoid use through first trimester of pregnancy (may ↑ risk of neural tube defects); Lactation: Breast feeding not recommended for patients with HIV.

Use Cautiously in: Underlying hepatitis B or C (may worsen liver function); Mild hepatic impairment (if dose ↓ of abacavir is necessary, combination should be given as individual components); Women and obesity (↑ risk of lactic acidosis and severe hepatomegaly with steatosis); Underlying cardiovascular disease, including history of hypertension, hyperlipidemia, smoking history, or diabetes mellitus; OB: Can consider use during second or third trimester if potential maternal benefit justifies potential fetal risk; Pedi: Children <40 kg (safety and effectiveness not established).

Adverse Reactions/Side Effects

CV: MYOCARDIAL INFARCTION. **F and E:** LACTIC ACIDOSIS. **GI:** HEPATOMEGALY (WITH STEATOSIS), HEPATOTOXICITY (↑ WITH HEPATITIS B OR C), exacerbation of Hepatitis B. **Neuro:** fatigue, headache, insomnia. **Misc:** HYPERSENSITIVITY REACTIONS, immune reconstitution syndrome.

Interactions

Drug-Drug: Abacavir: Alcohol ↑ blood levels. May ↑ **methadone** metabolism in some patients; slight ↑ in **methadone** dosing may be needed. May ↑ levels and toxicity of **riociguat**; may need to ↓ riociguat dose. Combination therapy with **tenofovir** and **abacavir** may lead to virologic nonresponse; avoid use. **Dolutegravir:** May ↑ levels and toxicity from **dofetilide**; concurrent use contraindicated. Levels and effectiveness are ↓ by **etravirine** (should not be used concurrently without atazanavir/ritonavir, darunavir/ritonavir or lopinavir/ritonavir). Levels and effectiveness are ↓ by **efavirenz**, **fosamprenavir/ritonavir**, **tipranavir/ritonavir**, **carbamazepine**, and **rifampin**; ↑ dosage of dolutegravir recommended. Levels and effectiveness may be ↓ by **nevirapine**; avoid concurrent use. May ↑

© F.A. Davis Publishing

levels and toxicity from **metformin**. Levels and effectiveness may be ↓ by other **metabolic inducers** including **oxcarbazepine**, **phenobarbital**, and **phenytoin**; avoid concurrent use. Absorption and effectiveness may be ↓ by cation-containing **antacids** or **laxatives**, as well as **buffered medications**, or **sucralfate**; should be taken 2 hr before or 6 hr after these medications. Absorption and effectiveness may be ↓ by **calcium supplements** (oral) or **iron supplements** (oral); under fasting conditions, abacavir/dolutegravir/lamivudine should be taken 2 hr before or 6 hr after these medications; when taken with food, abacavir/dolutegravir/lamivudine and calcium or iron supplements may be taken at the same time. May ↑ **dalfampridine** levels and risk of seizures. **Lamivudine: Trimethoprim/sulfamethoxazole** ↑ levels (dose alteration may be necessary in renal impairment). ↑ risk of pancreatitis with concurrent use of other **drugs causing pancreatitis**. ↑ risk of neuropathy with concurrent use of other **drugs causing neuropathy**. **Sorbitol** may ↓ levels; avoid concurrent use.
Drug-Natural Products: Levels and effectiveness may be ↓ **St. John's wort**; avoid concurrent use.

Route/Dosage

PO (Adults and Children ≥40 kg): One tablet (abacavir 600 mg/dolutegravir 50 mg/lamivudine 300 mg) once daily; *Concurrent efavirenz, fosamprenavir/ritonavir, tipranavir/ritonavir, carbamazepine, or rifampin*—additional 50–mg dose of dolutegravir is required separated by 12 hr.

Availability

Tablets: abacavir 600 mg/dolutegravir 50 mg/lamivudine 300 mg.

NURSING IMPLICATIONS

Assessment

- Assess patient for change in severity of HIV symptoms and for symptoms of opportunistic infections during therapy.
- Assess for signs of hypersensitivity reactions (fever; rash; gastrointestinal—nausea, vomiting, diarrhea, abdominal pain; constitutional—malaise, fatigue, achiness; respiratory—dyspnea, cough, pharyngitis). May also cause elevated liver function tests, increased creatine kinase or serum creatinine, and lymphopenia. Patients who carry the HLA-B*5701 allele are at high risk for hypersensitivity reaction. Discontinue promptly if hypersensitivity reaction is suspected. Regardless of HLA-B*5701 status, permanently discontinue if hypersensitivity cannot be ruled out, even when other diagnoses are possible. Following a hypersensitivity reaction, never restart abacavir-containing products. More severe symptoms may occur within hr and may include life-threatening hypotension and death. Symptoms usually resolve upon discontinuation.
- May cause lactic acidosis and severe hepatomegaly with steatosis. Monitor patient for signs (↑ serum lactate levels, ↑ liver enzymes, liver enlargement on palpation). Therapy should be suspended if clinical or laboratory signs occur.
- Assess patient, especially pediatric patients, for signs of pancreatitis (nausea, vomiting, abdominal pain) periodically during therapy. May require discontinuation of therapy.
- Monitor patient for signs and symptoms of peripheral neuropathy (tingling, burning, numbness, or pain in hands or feet); may be difficult to differentiate from peripheral neuropathy of severe HIV disease. May require discontinuation of therapy.
- ***Lab Test Considerations:*** Verify negative pregnancy test in adolescent and adult females of reproductive potential prior to starting therapy.
- Monitor viral load and CD4 cell count regularly during therapy.
- Screen for HLA-B*5701 allele prior to initiation of therapy to decrease risk of hypersensitivity reaction. Screening is also recommended prior to reinitiation of abacavir in patients of unknown HLA-B*5701 status who have previously tolerated abacavir.
- Monitor liver function periodically. May cause ↑ levels of AST, ALT, and alkaline phosphatase, which usually resolve after interruption of therapy. Patients with concurrent Hepatitis B or C should be followed for at least several mo after stopping therapy. Lactic acidosis may occur with hepatic toxicity, causing hepatic steatosis; may be fatal, especially in women.
- May cause ↑ serum glucose, lipase, and triglyceride levels.

Implementation

- **PO:** Administer without regard to food.
- Take *Triumeq* 2 hr before or 6 hr after antacids, laxatives, other medications containing aluminum, magnesium, sucralfate, or buffering agents, calcium, or iron. Supplements containing calcium or iron can be taken with *Triumeq* if taken with food.

Patient/Family Teaching

- Emphasize the importance of taking *Triumeq* as directed. Must always be used in combination with other antiretroviral drugs. Do not take more than prescribed amount, and do not stop taking without consulting health care professional. Take missed doses as soon as remembered unless almost time for next dose; do not double doses. Advise patient to read the *Medication Guide* prior to starting therapy and with each Rx refill in case of changes.
- Instruct patient not to share medication with others.
- Inform patient that medication does not cure AIDS or prevent associated or opportunistic infections. Medication may reduce the risk of transmission of HIV to others through sexual contact or blood contamination. Caution patient to use a condom, and avoid sharing needles or donating blood to prevent spreading the AIDS virus to others. Advise patient that the long-term effects of medication are unknown at this time.

© F.A. Davis Publishing

- Advise patient of potential for hypersensitivity reactions that may result in death. Instruct patient to discontinue medication and notify health care professional immediately if symptoms of hypersensitivity or signs of Immune Reconstitution Syndrome (signs and symptoms of inflammation from previous infections) occur. A warning card summarizing symptoms of hypersensitivity is provided with each prescription; instruct patient to carry card at all times.
- Instruct patient to notify health care professional immediately if symptoms of lactic acidosis (tiredness or weakness, unusual muscle pain, trouble breathing, stomach pain with nausea and vomiting, cold especially in arms or legs, dizziness, fast or irregular heartbeat) or if signs of hepatotoxicity (yellow skin or whites of eyes, dark urine, light-colored stools, lack of appetite for several days or longer, nausea, abdominal pain) occur. These symptoms may occur more frequently in patients that are female, obese, or have been taking medications for a long time.
- Instruct patient to notify health care professional promptly if signs of peripheral neuropathy or pancreatitis occur.
- Advise patient to avoid sugarless gum or candy due to sorbitol content; may ↓ medication effectiveness.
- Inform patient that redistribution and accumulation of body fat may occur, causing central obesity, dorsocervical fat enlargement (buffalo hump), peripheral wasting, breast enlargement, and cushingoid appearance. The cause and long-term effects are not known.
- Advise patient to notify health care professional of all Rx or OTC medications, vitamins, or herbal products being taken and to consult with health care professional before taking other medications, especially methadone, St. John's wort, and other antiretrovirals.
- Rep: May cause fetal harm and increase risk of neural tube defects. Advise adolescent and adult females of reproductive potential to use effective contraception and to avoid breast feeding during therapy. Notify health care professional if pregnancy is planned or suspected. Switch to another antiviral regimen during 1st trimester; may increase risk of neural tube defects. May consider *Triumeq* during 2nd and 3rd trimesters of pregnancy if expected benefit justifies potential risk to pregnant woman and fetus. Pregnant patients should be encouraged to enroll in the Antiretroviral Pregnancy Registry by calling 1-800-258-4263.
- Emphasize the importance of regular follow-up exams and blood counts to determine progress and monitor for side effects.

Evaluation/Desired Outcomes

- Delayed progression of AIDS, and decreased opportunistic infections in patients with HIV.
- Decrease in viral load and increase in CD4 cell counts.

abemaciclib

(a-bem-a-**sye**-klib)

Verzenio

Classification

Therapeutic: antineoplastics

Pharmacologic: kinase inhibitors

Indications

Advanced or metastatic hormone receptor (HR)-positive, human epidermal growth factor 2 (HER2)-negative breast cancer in women with disease progression following endocrine therapy (in combination with fulvestrant). Advanced or metastatic HR-positive, HER2-negative breast cancer in women with disease progression following endocrine therapy and prior chemotherapy in the metastatic setting (as monotherapy). HR-positive, HER2-negative advanced or metastatic breast cancer in postmenopausal women (in combination with an aromatase inhibitor).

Action

Inhibits kinases (cyclin-dependent kinases 4 and 6) that are part of the signaling pathway for cell proliferation. **Therapeutic Effects:** Improved survival and decreased spread of breast cancer.

Pharmacokinetics

Absorption: 45% absorbed following oral administration.

Distribution: Extensively distributed to tissues.

Protein Binding: 96%.

Metabolism and Excretion: Primarily metabolized in the liver by CYP3A4 to several active metabolites; 81% excreted in feces, 3% in urine.

Half-life: 18.3 hr.

TIME/ACTION PROFILE (blood levels)

ROUTE	ONSET	PEAK	DURATION
PO	unknown	8 hr	24 hr

Contraindications/Precautions

Contraindicated in: OB: Pregnancy (may cause fetal harm); Lactation: Lactation.

Use Cautiously in: Severe renal impairment (CCr <30 mL/min); Severe hepatic impairment (↓ dose); Rep: Women of reproductive potential; Pedi: Safety and effectiveness not established in children.

Adverse Reactions/Side Effects

CV: VENOUS THROMBOEMBOLISM, peripheral edema. **Derm:** alopecia, pruritus, rash. **GI:** HEPATOTOXICITY, abdominal pain, ↓ appetite, constipation, diarrhea, dry mouth, ↑ liver enzymes, nausea, stomatitis, vomiting. **GU:** ↑ serum creatinine, ↓ fertility (males). **Hemat:** ANEMIA, LEUKOPENIA, NEUTROPENIA, THROMBOCYTOPENIA.

= Canadian drug name. = Genetic implication. ~~Strikethrough~~ = Discontinued.

*CAPITALS indicates life-threatening; underlines indicate most frequent.

© F.A. Davis Publishing

Metab: ↓ weight. **MS:** arthralgia. **Neuro:** dizziness, dysgeusia, fatigue, headache. **Resp:** INTERSTITIAL LUNG DISEASE/PNEUMONITIS, cough. **Misc:** INFECTION, fever.

Interactions

Drug-Drug: Strong CYP3A inhibitors, including **itraconazole** or **ketoconazole** may ↑ abemaciclib levels and risk of toxicity; avoid concurrent use with ketoconazole; ↓ abemaciclib dose when using other strong CYP3A4 inhibitors (resume original dose after 3–5 half-lives of offending drug have passed following discontinuation). **Strong CYP3A inducers**, including **rifampin** may ↓ abemaciclib levels and its effectiveness; avoid concurrent use.

Route/Dosage

PO (Adults): *With fulvestrant or an aromatase inhibitor*—150 mg twice daily; continue until disease progression or unacceptable toxicity. *As monotherapy*—200 mg twice daily; continue until disease progression or unacceptable toxicity. *Concurrent use of strong CYP3A inhibitor (other then ketoconazole)*—100 mg twice daily (with fulvestrant or as monotherapy); if dose already at 100 mg twice daily due to adverse reactions, ↓ dose to 50 mg twice daily; continue until disease progression or unacceptable toxicity.

Hepatic Impairment

PO (Adults): *Severe hepatic impairment (Child-Pugh C)*—With fulvestrant: 150 mg once daily; continue until disease progression or unacceptable toxicity. *As monotherapy*—200 mg once daily; continue until disease progression or unacceptable toxicity. *Concurrent use of strong CYP3A inhibitor (other then ketoconazole)*—100 mg once daily (with fulvestrant or as monotherapy); if dose already at 100 mg once daily due to adverse reactions, ↓ dose to 50 mg once daily; continue until disease progression or unacceptable toxicity.

Availability

Tablets: 50 mg, 100 mg, 150 mg, 200 mg.

NURSING IMPLICATIONS

Assessment

- Monitor for diarrhea, may result in dehydration and infection. *Grade 1:* no dose modification required. *Grade 2:* If resolves in 24 hrs to ≤Grade 1, suspend therapy until resolution. No dose reduction required. *Grade 2 that persists or recurs after resuming same dose despite maximum supportive measures:* Hold dose until diarrhea resolves to ≤Grade 1. Resume at next lower dose. *Grade 3 or 4 diarrhea or diarrhea that requires hospitalization,* withhold abemaciclib until resolves to ≤Grade 1, then resume at next lower dose.
- Monitor for signs and symptoms of venous thrombosis and pulmonary embolism and treat as needed.
- ***Lab Test Considerations:*** Verify negative pregnancy test before starting therapy.
- Monitor CBC before starting, every 2 wk for first 2 mo, monthly for next 2 mo, and as clinically indicated. *Grade 1 or 2 neutropenia:* No dose reduction required. *Grade 3:* Hold dose until resolves to ≤Grade 2. *Grade 3 recurrent or Grade 4:* Hold therapy until resolved to ≤Grade 2. Resume at next lower dose.
- Monitor ALT, AST, and serum bilirubin prior to starting therapy, every 2 wk for first 2 mo, monthly for next 2 mo, and as clinically indicated. *If Grade 1 (>upper limit of normal [ULN] to 3 times ULN), Grade 2 (>3.0 to 5.0 times ULN, without ↑ in total bilirubin >2 times ULN):* no dose reduction required. *If persistent or recurrent Grade 2, or Grade 3 (>5.0–20.0 × ULN), without ↑ in total bilirubin above 2 × ULN:* Hold therapy until toxicity resolves to baseline or Grade 1. Resume at next lower dose. *If elevation in AST and/or ALT >3 × ULN with total bilirubin >2 × ULN, in the absence of cholestasis or Grade 4 (>20.0 × ULN):* discontinue therapy.
- May cause ↑ serum creatinine without glomerular function being affected. Monitor BUN, cystatin C, or calculated glomerular filtration rate to determine impaired renal function.

Implementation

- **PO:** Administer twice daily, at the same times each day, without regard to food. Swallow tablets whole; do not crush, break, or chew.

Patient/Family Teaching

- Instruct patient to take abemaciclib at the same times each day as directed. If patient vomits or misses a dose, omit dose and take next dose as scheduled. Do not ingest tablets that are broken, cracked, or not intact. Advise patient to read *Patient Information* before starting therapy and with each Rx refill in case of changes.
- Advise patient that at first sign of diarrhea, start antidiarrheal therapy (loperamide), increase oral fluids, and notify health care professional.
- Advise patient to notify health care professional if signs and symptoms of infection (fever, chills), liver problems (feeling very tired, pain on upper right side of abdomen, loss of appetite, unusual bleeding or bruising), or venous thromboembolism (pain or swelling in arms or legs, shortness of breath, chest pain, rapid breathing, rapid heart rate) occurs.
- Instruct patient to notify health care professional of all Rx or OTC medications, vitamins, or herbal products being taken and to consult with health care professional before taking other medications.
- Rep: May be teratogenic. Advise females of reproductive potential to use effective contraception and avoid breast feeding during and for at least 3 wk after last dose of therapy. Inform male patient may impair fertility.

Evaluation/Desired Outcomes

- Decrease in the spread of breast cancer.

© F.A. Davis Publishing

A

abiraterone (a-bi-ra-te-rone)

Yonsa, Zytiga

Classification

Therapeutic: antineoplastics
Pharmacologic: enzyme inhibitors

Indications

Zytiga: Treatment of metastatic castration-resistant prostate cancer (in combination with prednisone). **Zytiga:** Treatment of metastatic high-risk castration-sensitive prostate cancer (in combination with prednisone). **Yonsa:** Treatment of metastatic castration-resistant prostate cancer (in combination with methylprednisolone).

Action

Inhibits the enzyme 17α-hydroxylase/C17,20−lyase (CYP17), which is required for androgen production. May also result in increased mineralocortocoid production. **Therapeutic Effects:** Decreased androgen production with decreased spread of androgen-sensitive prostate cancer.

Pharmacokinetics

Absorption: Hydrolyzed to its active compound following oral administration.
Distribution: Unknown.
Protein Binding: >99%.
Metabolism and Excretion: Metabolized by esterases to inactive compounds; eliminated primarily in feces as unchanged drug and metabolites; 5% excreted in urine.
Half-life: 12 hr.

TIME/ACTION PROFILE (blood level)

ROUTE	ONSET	PEAK	DURATION
PO	unknown	2 hr	12 hr

Contraindications/Precautions

Contraindicated in: Severe hepatic impairment; Concurrent use of radium Ra 223 dichloride (↑ risk of fractures and mortality); OB: Pregnancy (may cause fetal harm) (not indicated for women); Lactation: Lactation (not indicated for women).
Use Cautiously in: HF, recent MI, other cardiovascular disease, ventricular arrhythmias; Electrolyte abnormalities or hypertension (correct/treat prior to initiation); Pre-existing liver disease (dose modification required for Child-Pugh Class B); Stress, infection, trauma, acute disease process (may result in adrenocortical insufficiency requiring additional corticosteroids); Rep: Men with female partners of reproductive potential; Pedi: Safety and effectiveness not established in children.

Adverse Reactions/Side Effects

CV: TORSADES DE POINTES (in presence of hypokalemia), hypertension, arrhythmia, edema, QT interval prolongation (in presence of hypokalemia). **Derm:** hot flush. **Endo:** adrenocortical insufficiency (due to concurrent corticosteroid), hypoglycemia. **F and E:** hypokalemia. **GI:** HEPATOTOXICITY, diarrhea, dyspepsia. **GU:** ↓ fertility, nocturia, urinary frequency. **MS:** fracture, joint pain/discomfort. **Resp:** cough.

Interactions

Drug-Drug: May ↑ levels of and risk of toxicity from **CYP2D6 substrates**, including **thioridazine** and **dextromethorphan**; if concurrent use necessary, ↓ dose of CYP2D6 substrate. may be required. May ↑ levels of and risk of toxicity from **CYP2C8 substrates**, including **pioglitazone**; if concurrent use necessary, ↓ dose of CYP2C8 substrate may be required. **Strong CYP3A4 inducers**, including **carbamazepine**, **phenobarbital**, **phenytoin**, **rifabutin**, **rifapentine**, or **rifampin** may ↓ levels and effectiveness; avoid concurrent use. May ↑ risk of hypoglycemia when used with **pioglitazone** or **repaglinide**.

Route/Dosage

Zytiga

PO (Adults): 1000 mg once daily; *Concurrent use of strong CYP3A4 inducer*— 1000 mg twice daily.

Hepatic Impairment
PO (Adults): *Child-Pugh Class B*— 250 mg once daily.

Yonsa

PO (Adults): 500 mg once daily; *Concurrent use of strong CYP3A4 inducer*— 500 mg twice daily.

Hepatic Impairment
PO (Adults): *Child-Pugh Class B*— 125 mg once daily.

Availability (generic available)

Tablets (Zytiga): 250 mg, 500 mg. **Tablets (Yonsa):** 125 mg.

NURSING IMPLICATIONS

Assessment

- Monitor BP and assess for fluid retention at least monthly. Control hypertension during therapy.
- Monitor for signs and symptoms of adrenocortical insufficiency (hypotension, weight loss, weakness, nausea, vomiting, anorexia, lethargy, confusion, restlessness), especially in patients under stress or who are withdrawn from or have decreased prednisone dose. Symptoms may be masked by abiraterone.
- ***Lab Test Considerations:*** Monitor AST, ALT, and bilirubin prior to starting therapy, every 2 wk for 3

© F.A. Davis Publishing

mo, and monthly thereafter. Administer reduced dose to patients with baseline moderate hepatic impairment and monitor AST, ALT, and bilirubin prior to starting therapy, every wk for first mo, every 2 wk for 2 mo, and monthly thereafter. If clinical signs of hepatic toxicity occur, measure serum bilirubin, AST, and ALT promptly; monitor frequently if ↑ levels. If AST and/or ALT ↑ >5 times upper limit of normal or bilirubin ↑ >3 times upper limit of normal in patients with baseline moderate hepatic impairment, interrupt abiraterone. Following return of liver function to baseline or AST and ALT ↑>2.5 times upper limit of normal or bilirubin ↑ >1.5 times upper limit of normal may restart at a reduced dose of 750 mg once daily. Monitor serum transaminases and bilirubin every 2 wk for 3 mo and monthly thereafter. If hepatotoxicity recurs, may restart at 500 mg once daily following return to baseline or AST and ALT ↑ >2.5 times upper limit of normal or bilirubin ↑ >1.5 times upper limit of normal. If hepatotoxicity recurs at 500 mg dose, discontinue therapy. If concurrent ↑ ALT >3 times upper limit of normal and total bilirubin ↑>2 times upper limit of normal without biliary obstruction or other causes, permanently discontinue therapy.

- Monitor serum potassium and sodium at least monthly during therapy. May cause hypokalemia; control during therapy.
- May cause ↑ triglycerides and ↓ phosphorous.

Implementation

- Control hypertension and correct hypokalemia prior to starting therapy.
- Patients should also receive a gonadotropin-releasing hormone analog concurrently or should have had bilateral orchiectomy.
- **Zytiga:** *For castration-resistant prostate cancer:* Administer once daily with twice daily prednisone 5 mg on an empty stomach at least 1 hr before or 2 hrs after meals; food increases absorption and adverse reactions. Swallow tablets whole with water; do not crush, break, or chew. *For castration-sensitive prostate cancer:* Administer once daily with once daily prednisone 5 mg on an empty stomach at least 1 hr before or 2 hrs after meals; food increases absorption. Swallow tablets whole with water; do not crush, break, or chew.
- **Yonsa:** Administer orally once daily in combination with methylprednisolone 4 mg administered orally twice daily. Administer without regard to meals. ***DNC:*** Swallow tablets whole; do not crush, break, or chew.

Patient/Family Teaching

- Instruct patient to take medications as directed and not to stop abiraterone, prednisone or methylprednisolone, or gonadotropin-releasing hormone analog without consulting health care professional. If a dose is missed, take the following day. If more than 1 dose is missed, consult health care professional. Do not share medication with others, even if they have the same symptoms; may be dangerous. Advise patient to read *Patient Information* before starting therapy and with each Rx refill in case of changes.
- Advise patient to notify health care professional if signs and symptoms of high blood pressure, low potassium, and fluid retention (dizziness, fast heartbeats, feel faint or lightheaded, headache, confusion, muscle weakness, pain in legs, swelling in legs or feet), adrenal insufficiency, or hepatotoxicity (yellowing of skin and eyes, dark urine, pain in upper right quadrant, severe nausea or vomiting, difficulty concentrating, disorientation, confusion) occur or of side effects that are bothersome or persistent.
- Advise parents to notify health care professional of all Rx or OTC medications, vitamins, or herbal products being taken and to consult with health care professional before taking other medications.
- Rep: Male patients should use a condom and another form of contraception during sex with a women of reproductive potential during and for 3 wk after therapy. Pregnant women and women of reproductive potential should not touch tablets without wearing gloves. May impair reproductive function and fertility in males of reproductive potential.
- Explain need for continued follow-up exams and lab tests to assess possible side effects.

Evaluation/Desired Outcomes

- Decreased androgen production with decreased spread of androgen-sensitive prostate cancer.

acetaminophen (oral, rectal)

(a-seet-a-**min**-oh-fen)

Abenol, Acephen, Acet, Children Feverhalt, Fortolin, Infant's Feverall, Pediaphen, Pediatrix, Taminol, Tempra, Tylenol

acetaminophen (intravenous)

Ofirmev

Classification

Therapeutic: antipyretics, nonopioid analgesics

Indications

PO, Rect: Treatment of: Mild pain, Fever. **IV:** Treatment of: Mild to moderate pain, Moderate to severe pain with opioid analgesics, Fever.

Action

Inhibits synthesis of prostaglandins that may serve as mediators of pain and fever, primarily in the CNS. Has no significant anti-inflammatory properties or GI toxicity. **Therapeutic Effects:** Analgesia. Antipyresis.

© F.A. Davis Publishing

Pharmacokinetics

Absorption: Well absorbed following oral administration. Rectal absorption is variable. Intravenous administration results in complete bioavailability.

Distribution: Widely distributed. Crosses the placenta; enters breast milk in low concentrations.

Metabolism and Excretion: 85–95% metabolized by the liver (CYP2E1 enzyme system). Metabolites may be toxic in overdose situation. Metabolites excreted by the kidneys.

Half-life: Neonates: 7 hr; Infants and Children: 3–4 hr; Adults: 1–3 hr.

TIME/ACTION PROFILE (analgesia and antipyresis)

ROUTE	ONSET	PEAK	DURATION
PO	0.5–1 hr	1–3 hr	3–8 hr†
Rect	0.5–1 hr	1–3 hr	3–4 hr
IV‡	within 30 min	30 min	4–6 hr

†Depends on dose.
‡Antipyretic effects.

Contraindications/Precautions

Contraindicated in: Previous hypersensitivity; Products containing alcohol, aspartame, saccharin, sugar, or tartrazine (FDC yellow dye #5) should be avoided in patients who have hypersensitivity or intolerance to these compounds; Severe hepatic impairment/active liver disease.

Use Cautiously in: Hepatic disease/renal disease (lower chronic doses recommended); Alcoholism, chronic malnutrition, severe hypovolemia or severe renal impairment (CCr <30 mL/min, ↑ dosing interval and ↓ daily dose may be necessary); Chronic alcohol use/abuse; Malnutrition; OB: Use in pregnancy only if clearly needed (for IV); Lactation: Use cautiously (for IV).

Adverse Reactions/Side Effects

CV: hypertension (IV), hypotension (IV). **Derm:** ACUTE GENERALIZED EXANTHEMATOUS PUSTULOSIS, STEVENS-JOHNSON SYNDROME, TOXIC EPIDERMAL NECROLYSIS, rash, urticaria. **F and E:** hypokalemia (IV). **GI:** HEPATOTOXICITY (↑ DOSES), constipation (↑ in children) (IV), ↑ liver enzymes, nausea (IV), vomiting (IV). **GU:** renal failure (high doses/chronic use). **Hemat:** neutropenia, pancytopenia. **MS:** muscle spasms (IV), trismus (IV). **Neuro:** agitation (↑ in children) (IV), anxiety (IV), headache (IV), fatigue (IV), insomnia (IV). **Resp:** atelectasis (↑ in children) (IV), dyspnea (IV).

Interactions

Drug-Drug: Chronic high-dose acetaminophen (>2 g/day) may ↑ risk of bleeding with **warfarin** (INR should not exceed 4). Hepatotoxicity is additive with other **hepatotoxic substances**, including **alcohol**. Concurrent use of **isoniazid**, **rifampin**, **rifabutin**, **phenytoin**, **barbiturates**, and **carbamazepine** may ↑ the risk of acetaminophen-induced liver damage (limit self-medication); these agents will also ↓ therapeutic effects of acetaminophen. Concurrent use of **NSAIDs** may ↑ the risk of adverse renal effects (avoid chronic concurrent use). **Propranolol** ↓ metabolism and may ↑ effects. May ↓ effects of **lamotrigine** and **zidovudine**.

Route/Dosage

Children ≤12 yr should not receive >5 PO or rectal doses/24 hr without notifying physician or other health care professional. No dose adjustment needed when converting between IV and PO acetaminophen in adults and children ≥50 kg.

PO (Adults and Children >12 yr): 325–650 mg every 6 hr or 1 g 3–4 times daily or 1300 mg every 8 hr (not to exceed 3 g or 2 g/24 hr in patients with hepatic/renal impairment).

PO (Children 1–12 yr): 10–15 mg/kg/dose every 6 hr as needed (not to exceed 5 doses/24 hr).

PO (Infants): 10–15 mg/kg/dose every 6 hr as needed (not to exceed 5 doses/24 hr).

PO (Neonates): 10–15 mg/kg/dose every 6–8 hr as needed.

IV (Adults and Children ≥13 yr and ≥50 kg): 1000 mg every 6 hr or 650 mg every 4 hr (not to exceed 1000 mg/dose, 4 g/day [by all routes], and less than 4 hr dosing interval).

IV (Adults and Children ≥13 yr and <50 kg): 15 mg/kg every 6 hr or 12.5 mg/kg every 4 hr (not to exceed 15 mg/kg/dose [up to 750 mg/dose], 75 mg/kg/day [up to 3750 mg/day] [by all routes], and less than 4 hr dosing interval).

IV (Children 2–12 yr): 15 mg/kg every 6 hr or 12.5 mg/kg every 4 hr (not to exceed 15 mg/kg/dose [up to 750 mg/dose], 75 mg/kg/day [up to 3750 mg/day] [by all routes], and less than 4 hr dosing interval).

IV (Infants 29 days-2 yr): 15 mg/kg every 6 hr (not to exceed 60 mg/kg/day [by all routes]).

IV (Neonates Birth–28 days): 12.5 mg/kg every 6 hr (not to exceed 50 mg/kg [by all routes]).

Rect (Adults and Children >12 yr): 325–650 mg every 4–6 hr as needed or 1 g 3–4 times/day (not to exceed 4 g/24 hr).

Rect (Children 1–12 yr): 10–20 mg/kg/dose every 4–6 hr as needed.

Rect (Infants): 10–20 mg/kg/dose every 4–6 hr as needed.

Rect (Neonates): 10–15 mg/kg/dose every 6–8 hr as needed.

Availability (generic available)

Chewable tablets (fruit, bubblegum, or grape flavor): 80 mg[OTC], 160 mg[OTC]. **Tablets:** 160 mg[OTC], 325 mg[OTC]. **Caplets:** 325 mg[OTC]. **Solution (berry, fruit, and grape flavor):** 100 mg/mL[OTC]. **Liquid (mint):**

© F.A. Davis Publishing

160 mg/5 mL[OTC]. **Elixir (grape and cherry flavor):** 160 mg/5 mL[OTC]. **Drops:** 160 mg/ 5 mL [OTC]. **Suspension:** 100 mg/mL[OTC], 160 mg/5 mL[OTC]. **Syrup:** 160 mg/5 mL[OTC]. **Suppositories:** 80 mg[OTC], 120 mg[OTC], 325 mg[OTC]. **Solution for intravenous infusion:** 1000 mg/100 mL in 100-mL vials. ***In combination with:*** many other medications. See Appendix N.

NURSING IMPLICATIONS

Assessment

- Assess overall health status and alcohol usage before administering acetaminophen. Patients who are malnourished or chronically abuse alcohol are at higher risk of developing hepatotoxicity with chronic use of usual doses of this drug.
- Assess amount, frequency, and type of drugs taken in patients self-medicating, especially with OTC drugs. Prolonged use of acetaminophen increases risk of adverse hepatic and renal effects. For short-term use, combined doses of acetaminophen and salicylates should not exceed the recommended dose of either drug given alone. Do not exceed maximum daily dose of acetaminophen when considering all routes of administration and all combination products containing acetaminophen.
- Assess for rash periodically during therapy. May cause Stevens-Johnson syndrome. Discontinue therapy if rash (reddening of skin, blisters, and detachment of upper surface of skin peeling) or if accompanied with fever, general malaise, fatigue, muscle or joint aches, blisters, oral lesions, conjunctivitis, hepatitis, and/or eosinophilia.
- **Pain:** Assess type, location, and intensity prior to and 30–60 min following administration.
- **Fever:** Assess fever; note presence of associated signs (diaphoresis, tachycardia, and malaise).
- ***Lab Test Considerations:*** Evaluate hepatic, hematologic, and renal function periodically during prolonged, high-dose therapy.
- May alter results of blood glucose monitoring. May cause falsely ↓ values when measured with glucose oxidase/peroxidase method, but probably not with hexokinase/G6PD method. May also cause falsely ↑ values with certain instruments; see manufacturer's instruction manual.
- Increased serum bilirubin, LDH, AST, ALT, and prothrombin time may indicate hepatotoxicity.
- ***Toxicity and Overdose:*** If overdose occurs, **acetylcysteine** (Acetadote) is the antidote.

Implementation

- Do not confuse Tylenol with Tylenol PM. Do not confuse acetaminophen with acetazolamide.
- To prevent fatal medication errors ensure dose in milligrams (mg) and milliliters (mL) is not confused; dosing is based on weight for patients under 50 kg; program infusion pump for accuracy; and total daily dose of acetaminophen from all sources does not exceed maximum daily limits.
- When combined with opioids do not exceed the maximum recommended daily dose of acetaminophen.
- **PO:** Administer with a full glass of water.
- May be taken with food or on an empty stomach.

IV Administration

- **Intermittent Infusion:** *For 1000 mg dose*, insert vented IV set through septum of 100 mL vial; may be administered without further dilution. *For doses <1000 mg*, withdraw appropriate dose from vial place in a separate empty, sterile container for IV infusion. Place small volume pediatric doses up to 60 mL in a syringe and administer via syringe pump. Solution is clear and colorless; do not administer solutions that are discolored or contain particulate matter. Administer within 6 hrs of breaking vial seal. ***Rate:*** Infuse over 15 min. Monitor end of infusion in order to prevent air embolism, especially if acetaminophen is primary infusion.
- **Y-Site Compatibility:** buprenorphine, butorphanol, cefoxitin, ceftriaxone, clindamycin, D5W, dexamethasone, dexmedetomidine, D10W, D5/LR, D5/0.9% NaCl, diphenhydramine, droperidol, esmolol, fentanyl, gentamicin, granisetron, heparin, hydrocortisone, hydromorphone, ketorolac, LR, lidocaine, lorazepam, mannitol, meperidine, methylprednisolone, metoclopramide, midazolam, morphine, nalbuphine, 0.9% NaCl, ondansetron, oxytocin, piperacillin/tazobactam, potassium chloride, prochlorperazine, sufentanil, vancomycin.
- **Y-Site Incompatibility:** acyclovir, chlorpromazine, diazepam, metronidazole.
- **Additive Incompatibility:** Do not mix with other medications.

Patient/Family Teaching

- Advise patient to take medication exactly as directed and not to take more than the recommended amount. Chronic excessive use of >4 g/day (2 g in chronic alcoholics) may lead to hepatotoxicity, renal, or cardiac damage. Adults should not take acetaminophen longer than 10 days and children not longer than 5 days unless directed by health care professional. Short-term doses of acetaminophen with salicylates or NSAIDs should not exceed recommended daily dose of either drug alone.
- Advise patient to avoid alcohol (3 or more glasses per day increase the risk of liver damage) if taking more than an occasional 1–2 doses and to avoid taking concurrently with salicylates or NSAIDs for more than a few days, unless directed by health care professional.
- Advise patient to discontinue acetaminophen and notify health care professional if rash occurs.
- Inform patients with diabetes that acetaminophen may alter results of blood glucose monitoring. Advise patient to notify health care professional if changes are noted.

© F.A. Davis Publishing

- Caution patient to check labels on all OTC products. Advise patients to avoid taking more than one product containing acetaminophen at a time to prevent toxicity.
- Advise patient to consult health care professional if discomfort or fever is not relieved by routine doses of this drug or if fever is greater than 39.5°C (103°F) or lasts longer than 3 days.
- Pedi: Advise parents or caregivers to check concentrations of liquid preparations. All OTC single ingredient acetaminophen liquid products now come in a single concentration of 160 mg/5 mL. Errors have resulted in serious liver damage. Have parents or caregivers determine the correct formulation and dose for their child (based on the child's age/weight), and demonstrate how to measure it using an appropriate measuring device.

Evaluation/Desired Outcomes

- Relief of mild to moderate pain.
- Reduction of fever.

acetylcysteine

(a-se-teel-**sis**-teen)

Acetadote, ~~Mucomyst~~

Classification

Therapeutic: antidotes (for acetaminophen toxicity), mucolytic

Indications

PO, IV: Antidote for the management of potentially hepatotoxic overdose of acetaminophen. **Inhaln:** Mucolytic in the management of conditions associated with thick viscid mucous secretions. **Unlabeled Use: PO:** Prevention of radiocontrast-induced renal dysfunction.

Action

PO, IV: Decreases the buildup of a hepatotoxic metabolite in acetaminophen overdosage. **Inhaln:** Degrades mucus, allowing easier mobilization and expectoration. **Therapeutic Effects: PO:** Prevention or lessening of liver damage following acetaminophen overdose. **Inhaln:** Lowers the viscosity of mucus.

Pharmacokinetics

Absorption: Absorbed from the GI tract following oral administration. Action is local following inhalation; remainder may be absorbed from pulmonary epithelium. IV administration results in complete bioavailability.
Distribution: Crosses the placenta; 0.47 L/kg.
Protein Binding: 83% bound to plasma proteins.
Metabolism and Excretion: Partially metabolized by the liver, 22% excreted renally.
Half-life: *Adults*—5.6 hr (↑ in hepatic impairment) *newborns*—11 hr.

TIME/ACTION PROFILE

ROUTE	ONSET	PEAK	DURATION
PO (antidote)	unknown	30–60 min	4 hr
IV (antidote)	unknown	unknown	unknown
Inhaln (mucolytic)	1 min	5–10 min	short

Contraindications/Precautions

Contraindicated in: Hypersensitivity.
Use Cautiously in: Severe respiratory insufficiency, asthma, or history of bronchospasm; History of GI bleeding (oral only); OB: Use during pregnancy only if potential maternal benefit justifies potential fetal risk; Lactation: Safety not established in breast feeding.

Adverse Reactions/Side Effects

CV: vasodilation, tachycardia, hypotension. **Derm:** rash, clamminess, pruritus, urticaria. **EENT:** rhinorrhea. **F and E:** fluid overload. **GI:** nausea, vomiting, stomatitis. **Neuro:** drowsiness. **Resp:** bronchospasm, bronchial/tracheal irritation, chest tightness, ↑ secretions. **Misc:** HYPERSENSITIVITY REACTIONS (including anaphylaxis and angioedema) (primarily with IV), chills, fever.

Interactions

Drug-Drug: Activated charcoal may adsorb orally administered acetylcysteine and ↓ its effectiveness as an antidote.

Route/Dosage

Acetaminophen Overdose

PO (Adults and Children): 140 mg/kg initially, followed by 70 mg/kg every 4 hr for 17 additional doses.
IV (Adults and Children): *Loading dose*—150 mg/kg (maximum: 15 g) over 60 min initially followed by *First maintenance dose*—50 mg/kg (maximum: 5 g) over 4 hr, then *second maintenance dose*—100 mg/kg (maximum: 10 g) over 16 hr.

Mucolytic

Inhaln (Adults and Children 1–12 yr): *Nebulization via face mask*—3–5 mL of 20% solution or 6–10 mL of the 10% solution 3–4 times daily; *nebulization via tent or croupette*—volume of 10–20% solution required to maintain heavy mist; *direct instillation*—1–2 mL of 10–20% solution every 1–4 hr; *intratracheal instillation via tracheostomy*—1–2 mL of 10–20% solution every 1–4 hr (up to 2–5 mL of 20% solution via tracheal catheter into particular segments of the bronchopulmonary tree).
Inhaln (Infants): *Nebulization*—1–2 mL of 20% solution or 2–4 mL of 10% solution 3–4 times daily.

Prevention of Radiocontrast-Induced Renal Dysfunction

PO (Adults): 600 mg twice daily for 2 days, beginning the day before the procedure.

© F.A. Davis Publishing

Availability (generic available)

Solution for inhalation: 10% (100 mg/mL), 20% (200 mg/mL). **Solution for injection:** 20% (200 mg/mL).

NURSING IMPLICATIONS

Assessment

- **Antidote in Acetaminophen Overdose:** Assess type, amount, and time of acetaminophen ingestion. Assess plasma acetaminophen levels. Initial levels are drawn at least 4 hr after ingestion of acetaminophen. Plasma level determinations may be difficult to interpret following ingestion of extended-release preparations. Do not wait for results to administer dose.
- *IV:* Assess for anaphylaxis. Erythema and flushing are common, usually occurring 30–60 min after initiating infusion, and may resolve with continued administration. If rash, hypotension, wheezing, or dyspnea occur, initiate treatment for anaphylaxis (antihistamine and epinephrine). Interrupt acetylcysteine infusion until symptoms resolve and restart carefully. If anaphylaxis recurs, discontinue acetylcysteine and use alternative form of treatment.
- Assess patient for nausea, vomiting, and urticaria. Notify health care professional if these occur.
- Monitor for signs and symptoms of fluid overload (dyspnea, edema, increased BP) during therapy. Adjust volume of diluent as needed. May result in hyponatremia, seizures, and death.
- **Mucolytic:** Assess respiratory function (lung sounds, dyspnea) and color, amount, and consistency of secretions before and immediately following treatment to determine effectiveness of therapy.
- ***Lab Test Considerations:*** Monitor AST, ALT, and bilirubin levels along with international normalized ratio (INR) every 24 hr for 96 hr in patients with plasma acetaminophen levels indicating potential hepatotoxicity.
- Monitor cardiac and renal function (serum creatinine, BUN), serum glucose, and electrolytes. Maintain fluid and electrolyte balance; correct hypoglycemia.

Implementation

- After opening, solution for inhalation may turn light purple; does not alter potency. Refrigerate open vials and discard after 96 hr.
- Drug reacts with rubber and metals (iron, nickel, copper); avoid contact.
- **PO:** Prepare oral solution by diluting 20% acetylcysteine solution with diet cola or other diet soft drink to a final concentration of 5% (add 3 mL of diluent for each 1 mL of 20% acetylcysteine solution; do not decrease the proportion of diluent). Water may be used as diluent if administered via gastric tube or Miller-Abbott tube. Dilution should be freshly prepared and administered within 1 hr. Undiluted solutions are stable for 96 hrs if refrigerated.
- **Acetaminophen Overdose—** Empty stomach contents by inducing emesis or lavage prior to administration.

IV Administration

- **Intermittent Infusion:** Most effective if administered within 8 hr of acetaminophen ingestion. ***Dilution:*** Dilute in Sterile Water for Injection, D5W/0.45% NaCl, or D5W. Solution is colorless to slight pink or purple; do not administer solutions that are cloudy, discolored or contain particulate matter. Stable for 24 hr at room temperature. ***Concentration:*** **For loading dose:** *For patients 5–20 kg:* Dilute 150 mg in 3 mL/kg of diluent. *For patients 21–40 kg:* Dilute 150 mg/kg in 100 mL. *For patients 41–100 kg:* Dilute 150 mg/kg in 200 mL. **For Second Dose:** *For patients 5–20 kg:* Dilute 50 mg/kg in 7 mL/kg of diluent. *For patients 21–40 kg:* Dilute 50 mg/kg in 250 mL of diluent. *For patients 41–100 kg:* Dilute 50 mg/kg in 500 mL. **For Third Dose:** *For patients 5–20 kg:* Dilute 100 mg/kg in 14 mL/kg of diluent. *For patients 21–40 kg:* 100 mg/kg diluted in 500 mL of diluent. *For patients 41–100 kg:* Dilute 100 mg/kg in 1000 mL. Adjust fluid volume for patients requiring fluid restriction. Vials are single-use. Discard after using. Reconstituted solution is stable for 24 hr at room temperature. ***Rate:*** Administer **Loading Dose** over 1 hr.
- Administer **For Second Dose:** over 4 hr.
- Administer **For Third Dose:** over 16 hr.
- **Y-Site Compatibility:** heparin, naloxone, tigecycline, vancomycin.
- **Y-Site Incompatibility:** cefepime, ceftazidime.
- **Inhaln: Mucolytic—** Encourage adequate fluid intake (2000–3000 mL/day) to decrease viscosity of secretions.
- For nebulization, 20% solution may be diluted with 0.9% NaCl for injection or inhalation or sterile water for injection or inhalation. May use 10% solution undiluted. May be administered by nebulization, or 1–2 mL may be instilled directly into airway. During administration, when 25% of medication remains in nebulizer, dilute with equal amount of 0.9% NaCl or sterile water.
- An increased volume of liquefied bronchial secretions may occur following administration. Have suction equipment available for patients unable to effectively clear airways.
- If bronchospasm occurs during treatment, discontinue and consult health care professional regarding possible addition of bronchodilator to therapy. Patients with asthma or hyperactive airway disease should be given a bronchodilator prior to acetylcysteine to prevent bronchospasm.
- Rinse patient's mouth and wash face following treatment, as drug leaves a sticky residue.

Patient/Family Teaching

- Advise patient to notify health care professional if symptoms of hypersensitivity reaction or fluid overload occur.
- Rep: Advise females of reproductive potential to notify health care professional if pregnancy is planned

© F.A. Davis Publishing

or suspected and to avoid breast feeding for 30 hr after administration.
- **Acetaminophen Overdose:** Explain purpose of medication to patient.
- **Inhaln:** Instruct patient to clear airway by coughing deeply before taking aerosol treatment.
- Inform patient that unpleasant odor of this drug becomes less noticeable as treatment progresses and medicine dissipates.

Evaluation/Desired Outcomes
- Decreased acetaminophen levels.
- No further increase in hepatic damage during acetaminophen overdose therapy.
- Decreased dyspnea and clearing of lung sounds when used as a mucolytic.
- Prevention of radiocontrast-induced renal dysfunction.

aclidinium/formoterol
(a-kli-**din**-ee-um/for-**moh**-te-rol)
Duaklir Genuair, Duaklir Pressair

Classification
Therapeutic: bronchodilators
Pharmacologic: anticholinergics, adrenergics

Indications
Maintenance treatment of COPD.

Action
Aclidinium—Acts as an anticholinergic by inhibiting the M_3 receptor in bronchial smooth muscle. *Formoterol*—Beta$_2$-adrenergic agonist that stimulates adenyl cyclase, resulting in accumulation of cyclic adenosine monophosphate and subsequent bronchodilation.
Therapeutic Effects: Improved airflow and ↓ exacerbations in COPD.

Pharmacokinetics
Absorption: *Aclidinium*—6% systemically absorbed following inhalation; *Formoterol*—majority of inhaled drug is swallowed and absorbed.
Distribution: Unknown.
Metabolism and Excretion: *Aclidinium*—Rapidly hydrolyzed; metabolites are not pharmacologically active. Metabolites are eliminated in urine (54–65%) and feces (20–33%); <1% excreted unchanged in urine. *Formoterol*—Mostly metabolized by the liver; 10–18% excreted unchanged in urine.
Half-life: *Aclidinium*—12 hr. *Formoterol*—10 hr.

TIME/ACTION PROFILE (bronchodilation)

ROUTE	ONSET	PEAK	DURATION
Inhalation	1 hr	2–4 hr	12 hr

Contraindications/Precautions
Contraindicated in: Hypersensitivity; Severe hypersensitivity to milk proteins; Asthma; Acutely deteriorating COPD or acute respiratory symptoms.
Use Cautiously in: Narrow-angle glaucoma; Prostatic hyperplasia or bladder neck obstruction; Severe hypersensitivity to milk proteins; History of hypersensitivity to atropine (cross-sensitivity may occur); Cardiovascular disease (including angina, hypertension, and arrhythmias); Diabetes; Seizure disorders; Glaucoma; Hyperthyroidism; Pheochromocytoma; Excessive use (may lead to tolerance and paradoxical bronchospasm); OB: Use only if potential maternal benefit justifies potential fetal risk; may inhibit contractions during labor; Lactation: Use while breast feeding only if potential maternal benefit justifies potential risk to infant; Pedi: Safety and effectiveness not established.

Adverse Reactions/Side Effects
CV: angina, arrhythmias, hypertension, hypotension, palpitations, tachycardia. **EENT:** worsening of narrow-angle glaucoma. **F and E:** hypokalemia. **GI:** dry mouth, nausea. **GU:** urinary retention. **Metab:** hyperglycemia. **MS:** arthralgia, muscle cramps. **Neuro:** tremor, dizziness, headache, insomnia, nervousness. **Resp:** PARADOXICAL BRONCHOSPASM, cough. **Misc:** HYPERSENSITIVITY REACTIONS (including anaphylaxis and angioedema).

Interactions
Drug-Drug: Concurrent use with **MAO inhibitors**, **tricyclic antidepressants**, or other **QT interval prolonging agents** may results in serious arrhythmias; use concurrently only with extreme caution. ↑ risk of hypokalemia with **theophylline**, **corticosteroids**, **loop diuretics**, and **thiazide diuretics**. **Beta blockers** may ↓ therapeutic effects. ↑ adrenergic effects may occur with concurrent use of **adrenergics**. May ↑ risk of anticholinergic effects with other **anticholingerics**.

Route/Dosage
Inhaln (Adults): One inhalation (aclidinium 400 mcg/formoterol 12 mcg) twice daily.

Availability
Powder for inhalation (contains lactose): aclidinium 400 mcg/formoterol 12 mcg/actuation.

NURSING IMPLICATIONS

Assessment
- Assess lung sounds, pulse, and BP before administration and during peak of medication. Note amount, color, and character of sputum produced. Closely monitor patients on higher dose for adverse effects.
- Monitor pulmonary function tests before initiating and periodically during therapy to determine effectiveness.

© F.A. Davis Publishing

- Observe for paradoxical bronchospasm (wheezing, dyspnea, tightness in chest) and hypersensitivity reaction (rash; urticaria; swelling of the face, lips, or eyelids). If condition occurs, withhold medication and notify health care professional immediately.
- Monitor ECG periodically during therapy. May cause prolonged QTc interval.
- Monitor patient for signs of hypersensitivity reactions (difficulties in breathing or swallowing, swelling of tongue, lips and face), urticaria, or skin rash during therapy. Discontinue therapy and consider alternative if reaction occurs.
- ***Lab Test Considerations:*** May cause ↑ serum glucose and decreased serum potassium.

Implementation

- **Inhaln:** Administer as 1 inhalation twice daily, morning and evening. Inhaler is breath-activated.

Patient/Family Teaching

- Instruct patient to use medication as directed. Do not discontinue therapy without discussing with health care professional, even if feeling better. If a dose is missed skip dose and take next dose at regularly scheduled time. Do not double doses. Use a rapid-acting bronchodilator if symptoms occur before next dose is due. Caution patient not to use more than 1 time a day; may cause adverse effects, paradoxical bronchospasm, or loss of effectiveness of medication. Instruct patient to review *Patient Information* before starting therapy and with each Rx refill in case of changes.
- Caution patient not to use medication to treat acute symptoms. A rapid-acting inhaled beta-adrenergic bronchodilator should be used for relief of acute asthma attacks. Notify health care professional immediately if symptoms get worse or more inhalations than usual are needed from rescue inhaler.
- Instruct patient to contact health care professional immediately if shortness of breath is not relieved by medication or nausea, vomiting, shakiness, headache, fast or irregular heartbeat, sleeplessness, or signs and symptoms of narrow angle glaucoma (eye pain or discomfort, blurred vision, visual halos or colored images, red eyes) or urinary retention (difficulty passing urine, painful urination) occur.
- Advise patient to consult health care professional before taking any Rx, OTC, or herbal products or alcohol concurrently with this therapy. Caution patient also to avoid smoking and other respiratory irritants.
- Advise patient to notify health care professional if pregnancy is planned or suspected, or if breast feeding.

Evaluation/Desired Outcomes

- Bronchodilation with decreased airflow obstruction.

acyclovir (ay-**sye**-kloe-veer)

Sitavig, Zovirax

Classification

Therapeutic: antivirals

Pharmacologic: purine analogues

Indications

PO: Treatment of: Recurrent genital herpes infections, Localized cutaneous herpes zoster infections (shingles) and chickenpox (varicella). **Buccal:** Recurrent herpes labialis (cold sores) in nonimmunosuppressed patients. **IV:** Treatment of: Severe initial episodes of genital herpes in nonimmunosuppressed patients, Mucosal or cutaneous herpes simplex infections or herpes zoster infections (shingles) in immunosuppressed patients, Herpes simplex encephalitis, Neonatal herpes simplex infections. **Topical:** *Cream*—Recurrent herpes labialis (cold sores). *Ointment*—Treatment of limited non–life-threatening herpes simplex infections in immunocompromised patients (systemic treatment is preferred).

Action

Interferes with viral DNA synthesis. **Therapeutic Effects:** Inhibition of viral replication, decreased viral shedding, and reduced time for healing of lesions.

Pharmacokinetics

Absorption: Despite poor absorption (15–30%), therapeutic blood levels are achieved.
Distribution: Widely distributed. CSF concentrations are 50% of plasma. Crosses placenta; enters breast milk.
Protein Binding: <30%.
Metabolism and Excretion: >90% eliminated unchanged by kidneys; remainder metabolized by liver.
Half-life: Neonates: 4 hr; Children 1–12 yr: 2–3 hr; Adults: 2–3.5 hr (↑ in renal failure).

TIME/ACTION PROFILE (plasma concentrations)

ROUTE	ONSET	PEAK	DURATION
PO	unknown	1.5–2.5 hr	4 hr
IV	prompt	end of infusion	8 hr
Buccal	unknown	12 hr (7 hr†)	unknown

† Salivary concentrations

Contraindications/Precautions

Contraindicated in: Hypersensitivity to acyclovir or valacyclovir; Hypersensitivity to milk protein concentrate (buccal only).
Use Cautiously in: Pre-existing serious neurologic, hepatic, pulmonary, or fluid and electrolyte abnormalities; Renal impairment (dose alteration recommended if CCr <50 mL/min); Obese patients (dose should be based on ideal body weight); Patients with hypoxia; OB: Use during pregnancy only if potential maternal benefit justifies potential fetal risk; systemic exposure minimal following buccal or topical administration; Lactation:

© F.A. Davis Publishing

Use while breast feeding only if potential maternal benefit justifies potential risk to infant; systemic exposure minimal following buccal or topical administration; Pedi: Safety and effectiveness of buccal formulation not established in children; Geri: May need to ↓ dose in older adults due to age-related ↓ in renal function.

Adverse Reactions/Side Effects

Derm: STEVENS-JOHNSON SYNDROME, acne, hives, rash, unusual sweating. **Endo:** changes in menstrual cycle, polydipsia. **GI:** diarrhea, nausea, vomiting, ↑ liver enzymes, hyperbilirubinemia, abdominal pain, anorexia. **GU:** RENAL FAILURE, crystalluria, hematuria, renal pain. **Hemat:** THROMBOTIC THROMBOCYTOPENIC PURPURA/HEMOLYTIC UREMIC SYNDROME (high doses in immunosuppressed patients). **Local:** pain, phlebitis, local irritation. **MS:** joint pain. **Neuro:** SEIZURES, dizziness, headache, hallucinations, trembling.

Interactions

Drug-Drug: Probenecid and **theophylline** may ↑ levels and risk of toxicity. **Valproic acid** or **phenytoin** may ↓ levels and effectiveness. Concurrent use of other **nephrotoxic drugs** may ↑ risk nephrotoxicity. **Zidovudine** and intrathecal **methotrexate** may ↑ risk of CNS side effects.

Route/Dosage

Initial Genital Herpes

PO (Adults and Children): 200 mg every 4 hr while awake (5 times/day) for 7–10 days or 400 mg every 8 hr for 7–10 days; maximum dose in children: 80 mg/kg/day in 3–5 divided doses.
IV (Adults and Children ≥12 yr): 5 mg/kg every 8 hr for 5 days.

Chronic Suppressive Therapy for Recurrent Genital Herpes

PO (Adults and Children): 400 mg twice daily or 200 mg 3–5 times/day for up to 12 mo. Maximum dose in children: 80 mg/kg/day in 2–5 divided doses.

Intermittent Therapy for Recurrent Genital Herpes

PO (Adults and Children): 200 mg every 4 hr while awake (5 times/day) or 400 mg every 8 hr or 800 mg every 12 hr for 5 days, start at first sign of symptoms. Maximum dose in children: 80 mg/kg/day in 2–5 divided doses.

Acute Treatment of Herpes Zoster in Immunosuppressed Patients

PO (Adults): 800 mg every 4 hr while awake (5 times/day) for 7–10 days. *Prophylaxis*— 400 mg 5 times/day.
PO (Children): 250–600 mg/m²/dose 4–5 times/day.

Herpes Zoster in Immunocompetent Patients

PO (Adults and Children): 4000 mg/day in 5 divided doses for 5–7 days, maximum dose in children: 80 mg/kg/day in 5 divided doses.

Chickenpox

PO (Adults and Children): 20 mg/kg (not to exceed 800 mg/dose) 4 times daily for 5 days. Start within 24 hr of rash onset.

Mucosal and Cutaneous Herpes Simplex Infections in Immunosuppressed Patients

IV (Adults and Children >12 yr): 5 mg/kg every 8 hr for 7 days.
IV (Children 3 mo–12 yr): 10 mg/kg every 8 hr for 7 days.
Topical (Adults): 0.5 in. ribbon of 5% *ointment* for every 4-square-in. area every 3 hr (6 times/day) for 7 days.

Herpes Simplex Encephalitis

IV (Adults and Children ≥12 yr): 10 mg/kg every 8 hr for 10 days.
IV (Children 3 mo–12 yr): 20 mg/kg every 8 hr for 10 days.
IV (Children birth–3 mo): 20 mg/kg every 8 hr for 14–21 days.
IV (Neonates , premature): 10 mg/kg every 12 hr for 14–21 days.

Neonatal Herpes Simplex Infections

IV (Children post-menstrual age of ≥34 wk): 20 mg/kg every 8 hr for 21 days.
IV (Children post-menstrual age of <34 wk): 20 mg/kg every 12 hr for 21 days.

Varicella Zoster Infections in Immunosuppressed Patients

IV (Adults and Children ≥12 yr): 10 mg/kg every 8 hr for 7 days.
IV (Children <12 yr): 20 mg/kg every 8 hr for 7 days.

Renal Impairment

PO, IV (Adults and Children >3 mo): *CCr 25.1–50 mL/min/1.73 m²*— Normal dose every 12 hr; *CCr 10.1–25 mL/min/1.73 m²*— Normal dose every 24 hr; *CCr ≤10 mL/min/1.73 m²*— 50% of dose every 24 hr.

Herpes Labialis

Topical (Adults and Children >12 yr): Apply 5 times/day for 4 days; start at first symptoms.
Buccal (Adults): Apply one 50–mg buccal tablet to the upper gum region within 1 hr of onset of prodromal symptoms (but before appearance of any lesions).

© F.A. Davis Publishing

Availability (generic available)

Buccal tablets: 50 mg. **Capsules:** 200 mg. **Cost:** *Generic*—$97.70/100. **Cream:** 5%. **Cost:** $565.24/5 g. **Ointment:** 5%. **Cost:** *Generic*—$797.59/30 g. **Oral suspension (banana flavor):** 200 mg/5 mL. **Cost:** *Generic*—$137.70/473 mL. **Solution for injection (requires dilution):** 50 mg/mL. **Tablets:** 400 mg, 800 mg. **Cost:** *Generic*—400 mg $6.99/30, 800 mg $17.91/30. ***In combination with:*** hydrocortisone (Xerese). See Appendix N.

NURSING IMPLICATIONS

Assessment

- Assess lesions before and daily during therapy.
- Monitor frequency of recurrences.
- Monitor neurologic status in patients with herpes encephalitis.
- ***Lab Test Considerations:*** Monitor BUN, serum creatinine, and CCr before and during therapy. ↑ BUN and serum creatinine levels or ↓ CCr may indicate renal failure.

Implementation

- Do not confuse Zovirax with Doribax, Zyvox, or Zostrix.
- Start acyclovir treatment as soon as possible after herpes simplex symptoms appear and within 24 hr of a herpes zoster outbreak.
- **PO:** Acyclovir may be administered with food or on an empty stomach, with a full glass of water.
- Shake oral suspension well before administration.
- **Buccal:** Apply tablet with a dry finger to upper gum just above canine tooth immediately after taking out of blister. Hold in place with pressure on lip for 30 sec to ensure adhesion. May be more comfortable to apply rounded side of tablet to gum surface. Apply on same side as herpes labialis symptoms within 1 hr of onset of symptoms, before appearance of herpes labialis lesions. Once applied, stays in position and dissolves slowly during day; do not crush, suck, chew, or swallow. May eat and drink while tablet is in place; avoid interfering with adhesion of tablet (chewing gum, touching, or pressing tablet after placement, wearing upper denture, brushing teeth). If the teeth need to be cleaned while tablet is in place, rinse mouth gently. Drink plenty of liquids to prevent dry mouth.

IV Administration

- **IV:** Maintain adequate hydration (2000–3000 mL/day), especially during first 2 hr after IV infusion, to prevent crystalluria.
- Observe infusion site for phlebitis. Rotate infusion site to prevent phlebitis.
- Do not administer acyclovir injectable topically, IM, subcut, PO, or in the eye.
- **Intermittent Infusion:** Reconstitute 500-mg or 1-g vial with 10 mL or 20 mL, respectively, of sterile water for injection. Do not reconstitute with bacteriostatic water with benzyl alcohol or parabens. Shake well to dissolve completely. ***Dilution:*** Dilute in at least 100 mL of D5W, 0.9% NaCl, dextrose/saline combinations or LR. ***Concentration:*** 7 mg/mL. Patients requiring fluid restriction: 10 mg/mL. ***Rate:*** Administer via infusion pump over 1 hr to minimize renal tubular damage.
- Use reconstituted solution within 12 hr. Once diluted for infusion, the solution should be used within 24 hr. Refrigeration results in precipitation, which dissolves at room temperature.
- **Y-Site Compatibility:** alemtuzumab, alfentanil, allopurinol, amikacin, aminophylline, amphotericin B lipid complex, amphotericin B liposome, ampicillin, anidulafungin, argatroban, arsenic trioxide, atracurium, azithromycin, bivalirudin, bleomycin, bumetanide, buprenorphine, busulfan, butorphanol, calcium chloride, calcium gluconate, carboplatin, carmustine, cefazolin, cefotaxime, cefoxitin, ceftaroline, ceftazidime, ceftriaxone, cefuroxime, chloramphenicol, cisplatin, clindamycin, cyclophosphamide, cytarabine, dactinomycin, dantrolene, dexamethasone, dexmedetomidine, digoxin, dimenhydrinate, diphenhydramine, docetaxel, doxorubicin liposome, doxycycline, enalaprilat, ephedrine, ertapenem, erythromycin lactobionate, etoposide, etoposide phosphate, famotidine, fentanyl, filgrastim, fluconazole, fluorouracil, fosphenytoin, furosemide, glycopyrrolate, heparin, hetastarch, hydrocortisone, hydromorphone, ifosfamide, imipenem/cilastatin, insulin, isoproterenol, leucovorin calcium, linezolid, lorazepam, magnesium sulfate, mannitol, melphalan, methohexital, methotrexate, methylprednisolone, metoprolol, metronidazole, milrinone, mitoxantrone, multivitamins, nafcillin, naloxone, nitroglycerin, octreotide, oxacillin, oxytocin, paclitaxel, pamidronate, pancuronium, pantoprazole, pemetrexed, penicillin G potassium, pentobarbital, phenobarbital, potassium acetate, potassium chloride, propofol, propranolol, remifentanil, rituximab, rocuronium, sodium acetate, sodium bicarbonate, succinylcholine, sufentanil, theophylline, thiopental, thiotepa, tigecycline, tirofiban, tobramycin, trastuzumab, trimethoprim/sulfamethoxazole, vancomycin, vasopressin, vinblastine, vincristine, voriconazole, zidovudine, zoledronic acid.
- **Y-Site Incompatibility:** acetaminophen, amifostine, amphotericin B deoxycholate, ampicillin/sulbactam, aztreonam, cefepime, chlorpromazine, ciprofloxacin, dacarbazine, daptomycin, daunorubicin, dexrazoxane, diazepam, dobutamine, dopamine, doxorubicin hydrochloride, epinephrine, epirubicin, eptifibatide, esmolol, fenoldopam, fludarabine, foscarnet, gemcitabine, haloperidol, hydralazine, hydroxyzine, idarubicin, irinotecan, ketamine, ketorolac, labetalol, levofloxacin, lidocaine, mesna, midazolam, mitomycin, mycophenolate, nicardipine, nitroprusside, ondansetron, palonosetron, pentamidine, phenylephrine, phenytoin, piperacillin/tazobactam, potassium phosphates, procainamide, prochlorperazine, promethazine, quinupristin/dalfopristin, sargramostim, sodium phosphates, streptozocin, tacrolimus, vecuronium, verapamil, vinorelbine.

© F.A. Davis Publishing

- **Topical:** Apply to skin lesions only; do not use in the eye.

Patient/Family Teaching

- Instruct patient to take medication as directed for the full course of therapy. Take missed doses as soon as possible but not just before next dose is due; do not double doses. Acyclovir should not be used more frequently or longer than prescribed.
- Advise patients that the additional use of OTC creams, lotions, and ointments may delay healing and may cause spreading of lesions.
- Inform patient that acyclovir is not a cure; the virus lies dormant in the ganglia. Acyclovir will not prevent the spread of infection to others.
- Advise patient that condoms should be used during sexual contact and to avoid sexual contact while lesions are present.
- Instruct patient to consult health care professional if symptoms are not relieved after 7 days of topical therapy or if oral acyclovir does not decrease the frequency and severity of recurrences. Immunocompromised patients may require a longer time, usually 2 wk, for crusting over of lesions.
- Instruct women with genital herpes to have yearly Papanicolaou smears because they may be more likely to develop cervical cancer.
- Advise females of reproductive potential to notify health care professional if pregnancy is planned or suspected or if breast feeding.
- **Topical:** Instruct patient to apply ointment in sufficient quantity to cover all lesions every 3 hr, 6 times/day for 7 days. 0.5-in. ribbon of ointment covers approximately 4 square in. Use a finger cot or glove when applying to prevent inoculation of other areas or spread to other people. Keep affected areas clean and dry. Loose-fitting clothing should be worn to prevent irritation.
- Avoid drug contact in or around eyes. Report any unexplained eye symptoms to health care professional immediately; ocular herpetic infection can lead to blindness.
- **Buccal:** Instruct patient on correct application and use of buccal tablet. If buccal tablet does not adhere or falls off within first 6 hrs, reposition immediately with same tablet. If tablet cannot be repositioned, apply new tablet. If swallowed within first 6 hrs, advise patient to drink a glass of water and apply a new tablet. Do not reapply if tablet falls out after 6 hrs.

Evaluation/Desired Outcomes

- Crusting over and healing of skin lesions.
- Decrease in frequency and severity of recurrences.
- Acceleration of complete healing and cessation of pain in herpes zoster.
- Decrease in intensity of chickenpox.

adalimumab (a-da-li-**mu**-mab)

Abrilada, Amjevita, Cyltezo, Hadlima, Hulio, Humira, Hyrimoz

Classification

Therapeutic: antirheumatics
Pharmacologic: DMARDs, monoclonal antibodies

Indications

Abrilada, Amjevita, Cyltezo, Hadlima, Hulio, Humira, and Hyrimoz: Treatment of the following conditions: Moderately to severely active rheumatoid arthritis (may be used alone or with methotrexate or other nonbiologic DMARDs), Psoriatic arthritis (may be used alone or with other non-biologic DMARDs), Active ankylosing spondylitis, Moderately to severely active Crohn's disease in patients who have responded inadequately to conventional therapy, Moderately to severely active ulcerative colitis in patients who have responded inadequately to immunosuppressants such as corticosteroids, azathioprine, or 6–mercaptopurine, Moderate to severely active polyarticular juvenile idiopathic arthritis (as monotherapy or with methotrexate), Moderate to severe chronic plaque psoriasis in patients who are candidates for systemic therapy or phototherapy and when other systemic therapies are deemed inappropriate. **Humira only:** Treatment of the following conditions: Moderate to severe hidradenitis suppurativa, Non-infectious intermediate, posterior and panuveitis.

Action

Neutralizes and prevents the action of tumor necrosis factor (TNF), resulting in anti-inflammatory and antiproliferative activity. **Therapeutic Effects:** Decreased pain and swelling with decreased rate of joint destruction in patients with rheumatoid arthritis, psoriatic arthritis, juvenile idiopathic arthritis, and ankylosing spondylitis. Reduced signs and symptoms and maintenance of clinical remission of Crohn's disease. Induction and maintenance of clinical remission of ulcerative colitis. Reduced severity of plaques. Reduced number of abscesses and inflammatory nodules. Decreased progression of uveitis.

Pharmacokinetics

Absorption: 64% absorbed after subcut administration.
Distribution: Synovial fluid concentrations are 31–96% of serum.
Metabolism and Excretion: Unknown.
Half-life: 14 days (range 10–20 days).

TIME/ACTION PROFILE (improvement)

ROUTE	ONSET	PEAK	DURATION
Subcut	8–26 wk	131 hr*	2 wk†

*Blood level.
†Following discontinuation.

© F.A. Davis Publishing

Contraindications/Precautions

Contraindicated in: Hypersensitivity; Concurrent use of anakinra or abatacept; Active infection (including localized).

Use Cautiously in: History of chronic or recurrent infection or underlying illness/treatment predisposing to infection; History of exposure to tuberculosis; History of opportunistic infection; Patients residing, or who have resided, where tuberculosis, histoplasmosis, coccidioidomycoses, or blastomycosis is endemic; Pre-existing or recent-onset CNS demyelinating disorders; History of lymphoma; OB: Use during pregnancy only if potential maternal benefit justifies potential fetal risk; Lactation: Use while breast feeding only if potential maternal benefit justifies potential risk to infant; Pedi: Children <2 yr (safety not established); ↑ risk of lymphoma (including hepatosplenic T-cell lymphoma [HSTCL] in patients with Crohn's disease or ulcerative colitis), leukemia, and other malignancies in children; Geri: ↑ risk of infection/malignancy in older adults.

Adverse Reactions/Side Effects

CV: hypertension. **Derm:** rash, psoriasis. **EENT:** optic neuritis. **GI:** abdominal pain, nausea. **GU:** hematuria. **Hemat:** neutropenia, thrombocytopenia. **Local:** injection site reactions. **Metab:** hyperlipidemia. **MS:** back pain. **Neuro:** headache, Guillain-Barré syndrome, multiple sclerosis. **Misc:** HYPERSENSITIVITY REACTIONS (including anaphylaxis and angioedema), INFECTION (including reactivation tuberculosis and other opportunistic infections due to bacterial, invasive fungal, viral, mycobacterial, and parasitic pathogens), MALIGNANCY (including lymphoma, HSTCL, leukemia, and skin cancer), fever.

Interactions

Drug-Drug: Concurrent use with **anakinra**, **abatacept**, or other **TNF blocking agents** ↑ risk of serious infections; concurrent use contraindicated. Concurrent use with **azathioprine** and/or **methotrexate** may ↑ risk of HSTCL. **Live vaccinations** should not be given concurrently. Risks and benefits should be considered before using live vaccinations in an infant exposed to adalimumab therapy *in utero*.

Route/Dosage

Rheumatoid Arthritis, Ankylosing Spondylitis, and Psoriatic Arthritis

Subcut (Adults): 40 mg every other wk. Methotrexate, non-biologic DMARDs, corticosteroids, and/or analgesics may be continued during therapy. Patients not receiving concurrent methotrexate may receive additional benefit by ↑ dose to 40 mg once weekly *or* 80 mg every other wk.

Crohn's Disease

Subcut (Adults): 160 mg initially on Day 1 (given in one day or over two consecutive days), followed by 80 mg 2 wk later on Day 15. Two wk later (Day 29), begin maintenance dose of 40 mg every other wk. Aminosalicylates, corticosteroids, and/or immunomodulatory agents (e.g. azathioprine, 6–mercaptopurine, methotrexate) may be continued during therapy.

Subcut (Children ≥6 yr and ≥40 kg): *Humira only*—160 mg initially on Day 1 (given in one day or over two consecutive days), followed by 80 mg 2 wk later on Day 15. Two wk later (Day 29), begin maintenance dose of 40 mg every other wk. Aminosalicylates, corticosteroids, and/or immunomodulatory agents (e.g. azathioprine, 6–mercaptopurine, methotrexate) may be continued during therapy.

Subcut (Children ≥6 yr and 17–<40 kg): *Humira only*—80 mg initially on Day 1, followed by 40 mg 2 wk later on Day 15. Two wk later (Day 29), begin maintenance dose of 20 mg every other wk. Aminosalicylates, corticosteroids, and/or immunomodulatory agents (e.g. azathioprine, 6–mercaptopurine, methotrexate) may be continued during therapy.

Ulcerative Colitis

Subcut (Adults): 160 mg initially on Day 1 (given in one day or over two consecutive days), followed by 80 mg 2 wk later on Day 15. Two wk later (Day 29), begin maintenance dose of 40 mg every other wk. Aminosalicylates, corticosteroids, and/or immunomodulatory agents (e.g. azathioprine, 6–mercaptopurine, methotrexate) may be continued during therapy. Should be continued only if patients have evidence of clinical remission by wk 8 of therapy.

Subcut (Children ≥5 yr and ≥40 kg): *Humira only*—160 mg initially on Day 1 (given in one day or over two consecutive days), followed by 80 mg 1 wk later on Day 8, and then followed by 80 mg 1 wk later on Day 15. Two wk later (Day 29), begin maintenance dose of either 80 mg every other wk *or* 40 mg every wk. Aminosalicylates, corticosteroids, and/or immunomodulatory agents (e.g. azathioprine, 6–mercaptopurine, methotrexate) may be continued during therapy.

Subcut (Children ≥5 yr and 20–<40 kg): *Humira only*—80 mg initially on Day 1, followed by 40 mg 1 wk later on Day 8, and then followed by 40 mg 1 wk later on Day 15. Two wk later (Day 29), begin maintenance dose of either 40 mg every other wk *or* 20 mg every wk. Aminosalicylates, corticosteroids, and/or immunomodulatory agents (e.g. azathioprine, 6–mercaptopurine, methotrexate) may be continued during therapy.

Juvenile Idiopathic Arthritis

Subcut (Children 2–17 yr (Humira); 4–17 yr (Abrilada, Amjevita, Cyltezo, Hadlima, and Hyrimoz): *10–<15 kg (Abrilada and Humira only)*—10 mg every other wk; *15–<30 kg (Abrilada, Amjevita, Hulio, and Humira only)*—20 mg every other wk; *≥30 kg*—40 mg every other wk.

Plaque Psoriasis

Subcut (Adults): 80 mg initially, then in 1 wk, begin regimen of 40 mg every other wk.

© F.A. Davis Publishing

Uveitis

Subcut (Adults): 80 mg initially, then in 1 wk, begin regimen of 40 mg every other wk.
Subcut (Children ≥2 yr and ≥30 kg): 40 mg every other wk.
Subcut (Children ≥2 yr and 15–<30 kg): 20 mg every other wk.
Subcut (Children ≥2 yr and 10–<15 kg): 10 mg every other wk.

Hidradenitis Suppurativa

Subcut (Adults and Children ≥12 yr and ≥60 kg): 160 mg initially (given in one day or over two consecutive days), followed by 80 mg 2 wk later on Day 15. Two wk later (Day 29), begin maintenance dose of 40 mg every wk *or* 80 mg every other wk.
Subcut (Children ≥12 yr and 30–59 kg): 80 mg initially on Day 1, followed by 40 mg 1 wk later on Day 8. Two wk later (Day 22), begin maintenance dose of 40 mg every other wk.

Availability

Solution for injection (prefilled syringes): 10 mg/0.1 mL, 10 mg/0.2 mL, 20 mg/0.2 mL, 20 mg/0.4 mL, 40 mg/0.4 mL, 40 mg/0.8 mL, 80 mg/0.8 mL. **Solution for injection (vials):** 40 mg/0.8 mL. **Solution for injection (prefilled pens):** 40 mg/0.4 mL, 40 mg/0.8 mL, 80 mg/0.8 mL.

NURSING IMPLICATIONS

Assessment

- Assess for signs of infection (fever, dyspnea, flu-like symptoms, frequent or painful urination, redness or swelling at the site of a wound), including tuberculosis and Hepatitis B virus (HBV), prior to and periodically during therapy. Adalimumab is contraindicated in patients with active infection. Monitor new infections closely; most common are upper respiratory tract infections, bronchitis, and urinary tract infections. Infections may be fatal, especially in patients taking immunosuppressive therapy.
- Monitor for injection site reactions (redness and/or itching, rash, hemorrhage, bruising, pain, or swelling). Rash will usually disappear within a few days. Application of a towel soaked in cold water may relieve pain or swelling.
- Assess patient for latex allergy. Needle cover of syringe contains latex and should not be handled by persons sensitive to latex.
- Monitor patient for signs of anaphylaxis (urticaria, dyspnea, facial edema) following injection. Medications (antihistamines, corticosteroids, epinephrine) and equipment should be readily available in the event of a severe reaction. Discontinue adalimumab immediately if anaphylaxis or other severe allergic reaction occurs.
- Assess patient for latent tuberculosis with a tuberculin skin test prior to initiation of therapy. Treatment of latent tuberculosis should be started before therapy with adalimumab.
- Assess for signs and symptoms of systemic fungal infections (fever, malaise, weight loss, sweats, cough, dyspnea, pulmonary infiltrates, serious systemic illness with or without concomitant shock). Determine if patient lives in or has traveled to areas of endemic mycoses. Consider empiric antifungal treatment for patients at risk of histoplasmosis and other invasive fungal infections until pathogens are identified. Consult with an infectious diseases specialist. Consider stopping adalimumab until infection has been diagnosed and adequately treated.
- **Arthritis:** Assess pain and range of motion before and periodically during therapy.
- **Crohn's Disease or Ulcerative Colitis:** Monitor frequency and consistency of bowel movements periodically during therapy.
- **Plaque Psoriasis:** Assess skin lesions periodically during therapy.
- **Hidradenitis Suppurativa:** Monitor skin lesions (abscesses, inflammatory nodules, draining fistulas) during therapy.
- **Uveitis:** Monitor signs and symptoms of uveitis (red eye with or without pain, photosensitivity, blurry vision, seeing "floaters" all of a sudden) during therapy.
- ***Lab Test Considerations:*** May cause agranulocytosis, granulocytopenia, leukopenia, pancytopenia, and polycythemia.
- Monitor CBC with differential periodically during therapy. May cause leukopenia, neutropenia, thrombocytopenia, and pancytopenia. Discontinue adalimumab if symptoms of blood dyscrasias (persistent fever) occur.
- Monitor for HBV blood tests before starting during, and for several mo after therapy is completed.

Implementation

- Administer a tuberculin skin test prior to administration of adalimumab. Patients with active latent TB should be treated for TB prior to therapy.
- Immunizations should be current prior to initiating therapy. Patients on adalimumab may receive concurrent vaccinations, except for live vaccines.
- Administer initial injection under supervision of a health care professional.
- Vial is for institutional use only. With training, patient may use pen and prefilled syringes at home.
- Do not administer solutions that are discolored or contain particulate matter. Discard unused solution.
- **Subcut:** Solution may be left at room temperature for 15–30 min before injecting. Administer at a 45° angle in upper thighs or abdomen, avoiding the 2 inches around the navel. Put pressure on injection site for 10

© F.A. Davis Publishing

sec, do not rub. Rotate injection sites; avoid areas that are tender, bruised, hard, or red. If multiple injections required per dose, administer in separate sites. Solution is clear to slightly opalescent, colorless to pale brownish-yellow; do not administer solutions that are cloudy, discolored, or contain particulate matter. Refrigerate prefilled syringes and pens.

Patient/Family Teaching

- Instruct patient on the correct technique for administering adalimumab. Review *Medication Guide*, preparation of dose, administration sites and technique, and disposal of equipment into a puncture-resistant container.
- If a dose is missed, instruct patient to administer as soon as possible, then take next dose according to regular schedule.
- Caution patient to notify health care professional immediately if signs of infection, HBV (muscle aches, clay-colored bowel movements, feeling very tired, fever, dark urine, chills, skin or eyes look yellow, stomach discomfort, little or no appetite, skin rash, vomiting), severe rash, swollen face, or difficulty breathing occurs or if nervous system problems (numbness or tingling, problems vision, weakness in arms or legs, dizziness) occur while taking adalimumab.
- Inform patient that an increase risk of cancer occurs when taking adalimumab.
- Advise patient to notify health care professional of all Rx or OTC medications, vitamins, or herbal products being taken and to consult with health care professional before taking other medications.
- Instruct patient to notify health care professional of medication regimen prior to treatment or surgery.
- Advise patient to avoid live vaccines during therapy.
- Rep: Advise female patients to notify health care professional if pregnancy is planned or suspected or if breast feeding.
- **Pen:** Clean area for injection with alcohol swab. Hold pen with gray cap pointing up. Check solution through window; if discolored, cloudy, or contains flakes, discard solution. Turn pen over and point cap down to make sure solution reaches fill line; if not, do not use and contact pharmacist. Remove gray cap exposing the needle and the plum cap exposing the button; removing the plum cap activates the pen. Pinch skin and place pen, with window visible, against skin at a 90° angle and press button until a click is heard. Hold pen in place until all solution is injected (10 sec) and yellow marker is visible in window and has stopped moving. Continue to pinch skin throughout injection. Remove needle and press with a gauze pad or cotton ball for 10 sec. Do not rub injection site. Dispose of pen into a puncture-resistant container.

Evaluation/Desired Outcomes

- Decreased pain and swelling with decreased rate of joint destruction in patients with rheumatoid arthritis.
- Decreased signs and symptoms, slowed progression of joint destruction, and improved physical function in patients with psoriatic arthritis.
- Reduced signs and symptoms of ankylosing spondylitis.
- Decreased signs and symptoms, and maintenance of remission, in patients with Crohn's disease or ulcerative colitis.
- Reduced pain and swelling in patients moderate to severe polyarticular juvenile idiopathic arthritis in children 2 yr of age and older.
- Reduced severity of plaques in patients with severe chronic plaque psoriasis.
- Improvement in skin lesions in patients with hidradenitis suppurativa.
- Decreased progression of uveitis.

adenosine (a-**den**-oh-seen)

Adenocard, ~~Adenoscan~~

Classification

Therapeutic: antiarrhythmics

Indications

Conversion of paroxysmal supraventricular tachycardia (PSVT) to normal sinus rhythm when vagal maneuvers are unsuccessful. As a diagnostic agent (with noninvasive techniques) to assess myocardial perfusion defects occurring as a consequence of coronary artery disease.

Action

Restores normal sinus rhythm by interrupting re-entrant pathways in the AV node. Slows conduction time through the AV node. Also produces coronary artery vasodilation. **Therapeutic Effects:** Restoration of normal sinus rhythm.

Pharmacokinetics

Absorption: Following IV administration, absorption is complete.

Distribution: Taken up by erythrocytes and vascular endothelium.

Metabolism and Excretion: Rapidly converted to inosine and adenosine monophosphate.

Half-life: <10 sec.

TIME/ACTION PROFILE (antiarrhythmic effect)

ROUTE	ONSET	PEAK	DURATION
IV	immediate	unknown	1–2 min

Contraindications/Precautions

Contraindicated in: Hypersensitivity; 2nd- or 3rd-degree AV block or sick sinus syndrome, unless a functional artificial pacemaker is present; Myocardial ischemia/infarction (only when used as diagnostic agent); Lactation: Lactation.

Use Cautiously in: Patients with a history of asthma (may induce bronchospasm); Unstable angina; OB: Safety not established in pregnancy.

© F.A. Davis Publishing

Adverse Reactions/Side Effects

CV: MI, VENTRICULAR TACHYCARDIA, arrhythmias, chest pain, hypotension, palpitations. **Derm:** facial flushing, burning sensation, sweating. **EENT:** blurred vision, throat tightness. **GI:** metallic taste, nausea. **MS:** neck and back pain. **Neuro:** numbness, tingling, SEIZURES (only with Adenoscan), STROKE (only with Adenoscan), apprehension, dizziness, headache, head pressure, lightheadedness.. **Resp:** shortness of breath, chest pressure, hyperventilation. **Misc:** HYPERSENSITIVITY REACTIONS, heaviness in arms, pressure sensation in groin.

Interactions

Drug-Drug: Carbamazepine may ↑ risk of progressive heart block. **Dipyridamole** ↑ effects of adenosine; ↓ adenosine. Effects of adenosine ↓ by **theophylline** or **caffeine**; may need to ↑ adenosine dose. Concurrent use with **digoxin** may ↑ risk of ventricular fibrillation.

Route/Dosage

IV (Adults and Children >50 kg): *Antiarrhythmic*—6 mg by rapid IV bolus; if no results, repeat 1–2 min later as 12-mg rapid bolus. This dose may be repeated (single dose not to exceed 12 mg). *Diagnostic use*—140 mcg/kg/min for 6 min (0.84 mg/kg total). **IV (Children <50 kg):** *Antiarrhythmic*—0.05–0.1 mg/kg as a rapid bolus, may repeat in 1–2 min; if response is inadequate, may ↑ by 0.05–0.1 mg/kg until sinus rhythm is established or maximum dose of 0.3 mg/kg is used.

Availability (generic available)

Solution for injection: 3 mg/mL.

NURSING IMPLICATIONS

Assessment

- Monitor heart rate frequently (every 15–30 sec) and ECG continuously during therapy. A short, transient period of 1st-, 2nd-, or 3rd-degree heart block or asystole may occur following injection; usually resolves quickly due to short duration of adenosine. Once conversion to normal sinus rhythm is achieved, transient arrhythmias (premature ventricular contractions, atrial premature contractions, sinus tachycardia, sinus bradycardia, skipped beats, AV nodal block) may occur, but generally last a few sec.
- Monitor BP during therapy.
- Assess respiratory status (breath sounds, rate) following administration. Patients with history of asthma may experience bronchospasm.

Implementation

IV Administration

- **IV:** Crystals may occur if adenosine is refrigerated. Warm to room temperature to dissolve crystals. Solution must be clear before use. Do not administer solutions that are discolored or contain particulate matter. Discard unused portions.
- **IV Push:** ***Dilution:*** Administer undiluted. ***Concentration:*** 3 mg/mL. ***Rate:*** Administer over 1–2 sec via peripheral IV as proximal as possible to trunk. Slow administration may cause increased heart rate in response to vasodilation. Follow each dose with 20 mL rapid saline flush to ensure injection reaches systemic circulation.
- **Intermittent Infusion (for use in diagnostic testing):** ***Dilution:*** Administer 30-mL vial undiluted. ***Concentration:*** 3 mg/mL. ***Rate:*** Administer at a rate of 140 mcg/kg/min over 6 min for a total dose of 0.84 mg/kg. Thallium-201 should be injected as close to the venous access as possible at the midpoint (after 3 min) of the infusion.

Patient/Family Teaching

- Caution patient to change positions slowly to minimize orthostatic hypotension. Doses >12 mg decrease BP by decreasing peripheral vascular resistance.
- Instruct patient to report facial flushing, shortness of breath, or dizziness.
- Advise patient to avoid products containing methylxanthines (caffeinated coffee, tea, carbonated drinks or drugs such as aminophylline or theophylline) prior to myocardial perfusion imaging study.

Evaluation/Desired Outcomes

- Conversion of supraventricular tachycardia to normal sinus rhythm.
- Diagnosis of myocardial perfusion defects.

ado-trastuzumab

(ado tras-**too**-zoo-mab)

Kadcyla

Classification

Therapeutic: antineoplastics

Pharmacologic: drug-antibody conjugates

Indications

Treatment of HER2-positive metastatic breast cancer in patients previously treated with trastuzumab and a taxane who have either received prior therapy for metastatic disease or developed disease recurrence during or within 6 mo of completing adjuvant therapy. Adjuvant treatment of HER2–positive early breast cancer in patients who have residual invasive disease after neoadjuvant taxane and trastuzumab-based therapy.

Action

A HER2-targeted antibody and microtubule inhibitor conjugate. Trastuzumab, the antibody, attaches to receptors and is taken into the cell, where the microtu-

© F.A. Davis Publishing

bule inhibitor, DM1, causes cell cycle arrest and death.
Therapeutic Effects: Decreased spread of metastatic breast cancer, with improved progression-free survival.

Pharmacokinetics

Absorption: IV administration results in complete bioavailability.
Distribution: Unknown.
Metabolism and Excretion: DM1 is metabolized by CYP3A4/5.
Half-life: 4 days.

TIME/ACTION PROFILE (comparative improvement in progression-free survival)

ROUTE	ONSET	PEAK	DURATION
IV	4–6 mo	10–12 mo	2 yr

Contraindications/Precautions

Contraindicated in: Interstitial lung disease or pneumonitis; Concurrent use of strong CYP3A4 inhibitors; OB: Pregnancy (may cause fetal harm); Lactation: Lactation.
Use Cautiously in: Underlying cardiovascular or pulmonary disease, including dyspnea at rest; Rep: Women of reproductive potential and men with female partners of reproductive potential should use effective contraception; Pedi: Safety and effectiveness not established.

Adverse Reactions/Side Effects

CV: HF, hypertension, peripheral edema. **Derm:** pruritus, rash. **EENT:** blurred vision, conjunctivitis, dry eyes, ↑ lacrimation. **F and E:** hypokalemia. **GI:** HEPATOTOXICITY, constipation, ↑ liver enzymes, nausea, altered taste, diarrhea, dry mouth, dyspepsia, stomatitis, vomiting. **GU:** ↓ fertility. **Hemat:** HEMORRHAGE, THROMBOCYTOPENIA, anemia, neutropenia. **MS:** musculoskeletal pain, arthralgia, myalgia. **Neuro:** peripheral neuropathy, fatigue, headache, dizziness, insomnia, weakness. **Resp:** INTERSTITIAL LUNG DISEASE, cough. **Misc:** HYPERSENSITIVITY REACTIONS, chills, infusion-related reactions, fever.

Interactions

Drug-Drug: Strong CYP3A4 inhibitors, including **atazanavir**, **clarithromycin**, **indinavir**, **itraconazole**, **ketoconazole**, **nefazodone**, **nelfinavir**, **ritonavir**, **saquinavir**, and **voriconazole** may ↑ levels and risk of toxicity; avoid concurrent use. Concurrent use of **anticoagulants**, or **antiplatelet agents**, especially during the first cycle, may ↑ risk of bleeding.

Route/Dosage

Should not be used interchangeably with trastuzumab.

Metastatic Breast Cancer

IV (Adults): 3.6 mg/kg every 3 wk until disease progression or unacceptable toxicity.

Early Breast Cancer

IV (Adults): 3.6 mg/kg every 3 wk (21–day cycle) for a total of 14 cycles unless there is disease progression or unacceptable toxicity.

Availability

Lyophilized powder for injection (requires reconstitution and dilution): 100 mg/vial, 160 mg/vial.

NURSING IMPLICATIONS

Assessment

- Evaluate left ventricular function in all patients prior to and every 3 mo during therapy. **For patients with metastatic disease:** *If symptomatic HF:* discontinue ado-trastuzumab. *If left ventricular ejection fraction (LVEF) <40%:* Hold dose. Repeat LVEF assessment within 3 wk. If LVEF <40% is confirmed, discontinue therapy. *If LVEF 40% to ≤45% and decrease is ≥10% points from baseline:* Hold dose. Repeat LVEF within 3 wk. If LVEF has not recovered to within 10% points from baseline, discontinue therapy. *If LVEF 40% to ≤45% and decrease is <10% points from baseline:* Continue therapy with ado-trastuzumab. Repeat LVEF within 3 wk. *If LVEF >45%:* Continue therapy. Discontinue therapy if symptomatic heart failure occurs. **For patients with early breast cancer:** *If LVEF <45%:* Hold dose. Repeat LVEF within 3 wk. If LVEF < 45% confirmed, discontinue therapy. *If LVEF 45% to < 50% and decrease is ≥ 10% points from baseline:* Hold dose. Repeat LVEF within 3 wk. *If the LVEF < 50% and not recovered to < 10% points from baseline, discontinue therapy. If LVEF 45% to < 50% and decrease is < 10% points from baseline:* Continue therapy. Repeat LVEF within 3 wk. *If LVEF ≥ 50%:* Continue therapy. *If symptomatic heart failure, Grade 3-4 left ventricular systolic dysfunction or Grade 3-4 heart failure, or Grade 2 heart failure accompanied by LVEF < 45%:* Discontinue therapy.
- Monitor infusion site closely for infiltration and extravasation closely. Within 24 hrs erythema, tenderness, skin irritation, pain, or swelling at infusion site is seen if extravasation occurs.
- Assess for signs and symptoms of infusion reactions (fever, chills, flushing, dyspnea, hypotension, wheezing, bronchospasm, tachycardia). Slow or interrupt therapy if symptoms are severe. Observe closely during first infusion. Permanently discontinue for life-threatening reactions.
- Monitor neurologic status before and during treatment. Assess for paresthesia (numbness, tingling, pain, burning sensation), loss of deep tendon reflexes (Achilles reflex is usually first involved), weakness (wrist drop or footdrop, gait disturbances), cranial nerve palsies (jaw pain, hoarseness, ptosis, visual changes), arthralgia, myalgia, muscle spasm, autonomic dysfunction (ileus, diffi-

© F.A. Davis Publishing

culty voiding, orthostatic hypotension, impaired sweating), and CNS dysfunction (decreased level of consciousness, agitation, hallucinations). Temporarily discontinue therapy in patients with Grade 3 or 4 peripheral neuropathy (severe symptoms; limiting self-care activities of daily living (ADL)) until resolution to ≤ Grade 2 (moderate symptoms; limiting instrumental ADL) neuropathy.

- Monitor for signs and symptoms of pulmonary toxicity (dyspnea, cough, fatigue, pulmonary infiltrates). Permanently discontinue therapy if interstitial lung disease or pneumonitis develops.
- Monitor for hemorrhage (central nervous system, respiratory, gastrointestinal hemorrhage) during therapy, especially in patients receiving anticoagulants, antiplatelet therapy, or who have thrombocytopenia.
- ***Lab Test Considerations:*** 🧬 HER2 protein overexpression is used to determine whether treatment with ado-trastuzumab is indicated. HER2 protein overexpression should be determined by labs with proficiency in specific technology used. Information on approved tests is available at http://www.fda.gov/CompanionDiagnostics.
- Verify negative pregnancy status before starting therapy.
- Monitor serum transaminases and bilirubin prior to starting therapy and before each dose. **For patients with metastatic disease:** *If AST/ALT is Grade 2 (>2.5 to ≤5× upper limit of normal (ULN)):* Treat at same dose. *If AST/ALT is Grade 3 (>5 to ≤20× ULN):* Do not administer ado-trastuzumab until AST/ALT recovers to Grade ≤2, and then reduce 1 dose level. *If AST/ALT is Grade 4 (>20× ULN):* Permanently discontinue ado-trastuzumab. *If serum bilirubin is Grade 2 (>1.5 to ≤3× ULN):* Hold dose until bilirubin recovers to Grade ≤1, then treat at same dose level. *If bilirubin is Grade 3 (>3 to ≤10× ULN):* Hold dose until bilirubin recovers to Grade ≤1, then reduce 1 dose level. *If bilirubin is Grade 4 (>10× ULN):* Permanently discontinue ado-trastuzumab. Permanently discontinue ado-trastuzumab in patients with AST/ALT >3× ULN and concomitant total bilirubin >2× ULN. **For patients with early breast cancer:** *If ALT Grade 2-3 (>3.0 to ≤ 20 × ULN on day of scheduled treatment):* Hold dose until ALT recovers to Grade ≤1, then reduce one dose level. *If ALT Grade 4 (>20 × ULN at any time):* Permanently discontinue therapy. *If AST Grade 2 (>3.0 to ≤ 5 × ULN on day of scheduled treatment):* Hold dose until AST recovers to Grade ≤1, then treat with same dose. *If AST Grade 3 (>5 to ≤ 20 × ULN on day of scheduled treatment):* Hold dose until AST recovers to Grade ≤1, then reduce one dose level. *If AST Grade 4 (>20 × ULN at any time):* Permanently discontinue therapy. *If total bilirubin >1.0 to ≤ 2.0 × ULN on day of scheduled treatment:* Hold dose until total bilirubin ≤ 1.0× ULN, then reduce one dose level. *If total bilirubin >2 × ULN at any time:* Permanently discontinue therapy.
- Monitor platelet count prior to starting therapy and before each dose. Nadir of thrombocytopenia occurs by Day 8 and generally improves to Grade 0 or 1 by next scheduled dose. **For patients with metastatic disease:** *If thrombocytopenia is Grade 3 (platelets 25,000/mm³ to <50,000/mm³:* Hold dose until platelet count recovers to ≤Grade 1 (≥75,000/mm³), then treat at same dose level. *If thrombocytopenia is Grade 4 (platelets <25,000/mm₃):* Hold dose until platelet count recovers to ≤Grade 1, then reduce 1 dose level. **For patients with early breast cancer:** If Grade 2-3 on day of scheduled treatment (25,000 to < 75,000/mm³): Hold dose until platelet count recovers to Grade ≤1 (≥ 75,000/mm³), then treat at the same dose level. If 2 delays required due to thrombocytopenia, reduce dose by one level. *If Grade 4 at any time <25,000/mm³:* Hold dose until platelet count recovers to Grade ≤1 (≥ 75,000/mm³), then reduce one dose level.
- May cause ↓ hemoglobin, neutrophils, and serum potassium.

Implementation

- ***High Alert:*** Do not confuse ado-trastuzumab (Kadcyla) with trastuzumab (Herceptin). Double check names. Trade name of administered product should be clearly recorded in patient file to improve traceability.
- ***High Alert:*** Fatalities have occurred with chemotherapeutic agents. Before administering, clarify all ambiguous orders; double check single, daily, and course-of-therapy dose limits; have second practitioner independently double check original order, dose calculations and infusion pump settings.
- Solution should be prepared in a biologic cabinet. Wear gloves, gown, and mask while handling medication. Discard IV equipment in specially designated containers.

IV Administration

- **Intermittent Infusion:** Reconstitute by slowly injecting 5 or 8 mL of sterile water for injection into 100 or 160 mg vial of ado-trastuzumab respectively, for a solution of 20 mg/mL. Swirl gently until dissolved; do not shake. Solution is clear, colorless to pale brown, and slightly opalescent; do not administer solutions that are discolored or contain particulate matter. Use reconstituted vials immediately or store in refrigerator up to 4 hr; then discard. Do not freeze. Calculate amount of solution needed. ***Dilution:*** Withdraw from vial and add to infusion bag

© F.A. Davis Publishing

containing 250 mL of 0.9% NaCl; do not use dextrose solutions. Gently invert bag to mix without foaming. Use diluted solution immediately; may be stored in refrigerator up to 24 hrs prior to use, then discard; do not freeze or shake. Administer every 3 wk (21–day cycle); if cycle is delayed, administer as soon as possible. Do not wait until next planned cycle; maintain 3-wk interval between doses. ***Rate:*** Infuse through a 0.2 or 0.22 micron in-line non-protein adsorptive polyethersulfone (PES) filter. Do not administer as IV push or bolus. *First infusion:* Infuse over 90 min; observe for infusion related reaction. *Subsequent infusions:* Infuse over 30 min if prior infusions were well tolerated. Observe patient during infusion and for at least 90 min after infusion.

- Management of increased serum transaminases, hyperbilirubinemia, left ventricular dysfunction, thrombocytopenia, pulmonary toxicity, or peripheral neuropathy may require temporary interruption, dose reduction, or discontinuation.
- Dose reduction schedule is: *Starting dose*—3.6 mg/kg; *First dose reduction*—3 mg/kg; *Second dose reduction*—2.4 mg/kg; *Requirement for further dose reduction*—discontinue therapy.
- **Y-Site Incompatibility:** Do not mix or administer with other medications.

Patient/Family Teaching

- Explain purpose of medication to patient. If a dose is missed administer as soon as possible; do not wait until next scheduled dose. Adjust schedule to maintain 3 wk interval between doses.
- Inform patient of potential liver injury and HF. Advise patient to notify health care professional immediately if signs and symptoms of liver injury (nausea, vomiting, abdominal pain, jaundice, dark urine, pruritus, anorexia) or HF (new onset or worsening shortness of breath, cough, swelling of ankles/legs, palpitations, weight gain of >5 lbs in 24 hrs, dizziness, loss of consciousness) occur.
- Advise patient to notify health care professional if signs of peripheral neuropathy (burning, numbness, pain in hands and feet/legs) occur.
- Rep: Ado-trastuzumab can cause fetal harm. Advise male and female patients to use a highly effective method (IUD, hormonal contraceptive, tubal ligation, partner's vasectomy) of contraception during and for at least 4 mo after last dose. Instruct patient to notify health care professional promptly if pregnancy is suspected and to avoid breast feeding for at least 7 mo after last dose. Encourage women who have been exposed to ado-trastuzumab either directly or through seminal fluid, to immediately report exposure to Genentech Adverse Event Line at 1-888-835-2555. May impair fertility in male and female patients.

Evaluation/Desired Outcomes

- Decreased spread of metastatic breast cancer.

afatinib (a-fa-ti-nib)

Gilotrif, Giotrif

Classification

Therapeutic: antineoplastics
Pharmacologic: kinase inhibitors

Indications

First-line treatment of metastatic non-small cell lung cancer (NSCLC) where the tumor has non-resistant epidermal growth factor receptor (EGFR) mutations. Treatment of metastatic squamous NSCLC progressing after platinum chemotherapy.

Action

Inhibits tyrosine kinases which results in slowed proliferation of specific tumor cell lines. **Therapeutic Effects:** Decreased spread of NSCLC.

Pharmacokinetics

Absorption: Well absorbed (92%) following oral administration; absorption is decreased by high fat meal.
Distribution: Unknown.
Metabolism and Excretion: Metabolites occur partly as protein-bound products. Excretion is primarily fecal (85%) as parent drug; 4% excreted in urine.
Half-life: 37 hr.

TIME/ACTION PROFILE (improved progression-free survival)

ROUTE	ONSET	PEAK	DURATION
PO	3 mo	12 mo	20 mo

Contraindications/Precautions

Contraindicated in: Tumors with resistant EGFR mutations; OB: Pregnancy (may cause fetal harm); Lactation: Lactation.

Use Cautiously in: Concurrent use of corticosteroids, NSAIDs, or anti-angiogenic drugs, history of GI ulceration, history of diverticular disease, or history of bowel metastases (↑ risk of GI perforation); Severe renal impairment (↓ dose); Severe hepatic impairment (dose adjustment may be necessary); Asian ethnicity (may be ↑ susceptible to interstitial lung disease); Rep: Women of reproductive potential; Pedi: Safety and effectiveness not established in children; Geri: ↑ risk of GI perforation in older adults.

Adverse Reactions/Side Effects

Derm: STEVENS-JOHNSON SYNDROME, TOXIC EPIDERMAL NECROLYSIS, cutaneous reactions (including bullous/blistering/exfoliating reactions, acneiform eruptions and palmar-plantar erythrodysesthesia), dry skin, paronychia, pruritus, rash. **EENT:** conjunctivitis, epistaxis, keratitis, rhinorrhea. **GI:** GI PERFORATION, HEPATOTOXICITY, PANCREATITIS, diarrhea, ↓ appetite, ↓ weight, nausea, stomatitis, vomiting. **F and E:** hypokalemia. **Resp:** INTERSTITIAL LUNG DISEASE. **Misc:** fever.

© F.A. Davis Publishing

Interactions

Drug-Drug: Concurrent use of **P-gp inhibitors** including **amiodarone**, **cyclosporine**, **erythromycin**, **itraconazole**, **ketoconazole**, **quinidine ritonavir**, **saquinavir**, **tacrolimus**, or **verapamil** ↑ blood levels and the risk of toxicity; dosage adjustment may be necessary (ritonavir may be given concurrently or 6 hr after). Concurrent use of **P-gp inducers** including **carbamazepine**, **phenobarbital**, **phenytoin**, or **rifampin**↓ blood levels and may ↓ effectiveness; dosage adjustment may be necessary.

Route/Dosage

PO (Adults): 40 mg once daily; *concurrent use of P-gp inhibitors*— ↓ dose by 10 mg/day if necessary; *concurrent use of P-gp inducers*— ↑ dose by 10 mg/day if necessary. Continue until disease progression or occurrence of unacceptable toxicity.

Renal Impairment

PO (Adults): *eGFR 15–29 mL/min*— 30 mg once daily.

Availability

Tablets: 20 mg, 30 mg, 40 mg.

NURSING IMPLICATIONS

Assessment

- Monitor for diarrhea; occurs frequently. Provide patient with an antidiarrheal agent (loperamide) at the onset of diarrhea and until diarrhea ceases for 12 hrs. If diarrhea is severe and lasts more than 48 hr despite use of antidiarrheal agent (Grade 2 or higher), withhold afatinib until diarrhea resolves to Grade 1 or less, then resume with reduced dose of 10 mg/day.
- Assess for cutaneous reactions (bullous, blistering, exfoliative lesions; rash, erythema, acneiform rash) periodically during therapy. Discontinue afatinib if life-threatening lesions or prolonged Grade 2 cutaneous lesions lasting ≥7 days, intolerable Grade 2, or Grade 3 cutaneous reactions occur. Withhold afatinib until reaction resolves to Grade 1 or less and resume at 10 mg/day.
- Monitor for signs and symptoms of interstitial lung disease (lung infiltration, pneumonitis, acute respiratory distress syndrome, allergic alveolitis); 🧬 may occur more commonly in patients of Asian ethnicity. Withhold afatinib if symptoms occur; discontinue if interstitial lung disease is confirmed.
- Monitor for signs and symptoms of GI perforation (severe abdominal pain) during therapy. Permanently discontinue afatinib if perforation occurs.
- Monitor for signs and symptoms of keratitis (acute or worsening eye inflammation, lacrimation, light sensitivity, blurred vision, eye pain, red eye) during therapy. May require interruption or discontinuation of afatinib.
- ***Lab Test Considerations:*** Monitor liver function tests periodically during therapy. If severe decline in liver function occurs, discontinue afatinib. May cause ↑ AST and ALT.
- May cause hypokalemia.

Implementation

- **PO:** Administer once daily on an empty stomach, at least 1 hr before or 2 hrs after meals.

Patient/Family Teaching

- Instruct patient to take afatinib as directed. Take missed dose as soon as remembered unless within 12 hrs of next dose, then omit and take next dose at scheduled time; do not double doses. Advise patient to read *Patient Information* before starting therapy and with each Rx refill in case of changes.
- Caution patient to notify health care professional if signs and symptoms of keratitis (acute or worsening eye inflammation, lacrimation, light sensitivity, blurred vision, eye pain, and/or red eye) occur. Withhold if symptoms occur; if ulcerative keratitis is confirmed, discontinue afatinib. Advise patient that use of contact lenses is also a risk factor.
- Advise patient to wear sunscreen and protective clothing during therapy to minimize risk of skin disorders.
- Inform patient that diarrhea occurs in most patients and may cause dehydration and renal impairment. Notify health care professional if diarrhea is severe or persistent, if new or worsening lung symptoms (difficulty breathing, shortness of breath, cough, fever), symptoms of liver problems (yellow skin or whites of eyes, dark brown urine, pain on right side of abdomen, unusual bleeding or bruising, lethargy), severe abdominal pain, or if symptoms of left ventricular dysfunction (shortness of breath, exercise intolerance, cough, fatigue, swelling or ankles or feet, palpitations, sudden weight gain) occur.
- Advise patient to notify health care professional of all Rx or OTC medications, vitamins, or herbal products being taken and to consult with health care professional before taking other medications.
- Rep: May be teratogenic. Advise females of reproductive potential to use highly effective contraception and to avoid breast feeding during and for at least 2 wk after last dose. If pregnancy occurs, instruct patient to notify health care professional immediately. May impair fertility in males and females.

Evaluation/Desired Outcomes

- Decreased spread of non-small cell lung cancer.

© F.A. Davis Publishing

albuterol (al-**byoo**-ter-ole)
~~Accuneb~~, Airomir, Proair Digihaler, Proair HFA, Proair Respiclick, Proventil HFA, Salbutamol, Ventolin HFA, Ventolin Diskus, Ventolin Nebules, ~~VoSpire ER~~

Classification
Therapeutic: bronchodilators
Pharmacologic: adrenergics

Indications
Treatment or prevention of bronchospasm in asthma or chronic obstructive pulmonary disease (COPD). **Inhaln:** Prevention of exercise-induced bronchospasm. **PO:** Treatment of bronchospasm in asthma or COPD.

Action
Binds to beta$_2$-adrenergic receptors in airway smooth muscle, leading to activation of adenyl cyclase and increased levels of cyclic-3′, 5′-adenosine monophosphate (cAMP). Increases in cAMP activate kinases, which inhibit the phosphorylation of myosin and decrease intracellular calcium. Decreased intracellular calcium relaxes smooth muscle airways. Relaxation of airway smooth muscle with subsequent bronchodilation. Relatively selective for beta$_2$ (pulmonary) receptors. **Therapeutic Effects:** Bronchodilation.

Pharmacokinetics
Absorption: Well absorbed after oral administration but rapidly undergoes extensive metabolism.
Distribution: Small amounts appear in breast milk.
Metabolism and Excretion: Extensively metabolized by the liver and other tissues.
Half-life: Oral 2.7–5 hr; Inhalation: 3.8 hr.

TIME/ACTION PROFILE (bronchodilation)

ROUTE	ONSET	PEAK	DURATION
PO	15–30 min	2–3 hr	4–6 hr or more
Inhaln	5–15 min	60–90 min	3–6 hr

Contraindications/Precautions
Contraindicated in: Hypersensitivity to adrenergic amines.
Use Cautiously in: Cardiac disease; Hypertension; Hyperthyroidism; Diabetes; Glaucoma; Seizure disorders; Excess inhaler use may lead to tolerance and paradoxical bronchospasm; OB: Use during pregnancy only if potential maternal benefit justifies potential fetal risk; Lactation: Use while breast feeding only if potential maternal benefit justifies potential risk to infant; Pedi: Children <2 yr (safety and effectiveness not established); Geri: ↑ risk of adverse reactions in older adults; may require dose ↓.

Adverse Reactions/Side Effects
CV: chest pain, palpitations, angina, arrhythmias, hypertension. **Endo:** hyperglycemia. **F and E:** hypokalemia. **GI:** nausea, vomiting. **Neuro:** nervousness, restlessness, tremor, headache, hyperactivity (children), insomnia. **Resp:** PARADOXICAL BRONCHOSPASM (excessive use of inhalers).

Interactions
Drug-Drug: Concurrent use with other **adrenergic agents** will have ↑ adrenergic side effects. Use with **MAO inhibitors** may lead to hypertensive crisis. **Beta blockers** may negate therapeutic effect. May ↓ serum **digoxin** levels. Cardiovascular effects are potentiated in patients receiving **tricyclic antidepressants**. Risk of hypokalemia ↑ concurrent use of **potassium-losing diuretics**. Hypokalemia ↑ the risk of **digoxin** toxicity.
Drug-Natural Products: Use with caffeine-containing herbs (**cola nut**, **guarana**, **tea**, **coffee**) ↑ stimulant effect.

Route/Dosage
PO (Adults and Children ≥12 yr): 2–4 mg 3–4 times daily (not to exceed 32 mg/day).
PO (Geriatric Patients): Initial dose should not exceed 2 mg 3–4 times daily, may be ↑ carefully (up to 32 mg/day).
PO (Children 6–12 yr): 2 mg 3–4 times daily; may be carefully ↑ as needed (not to exceed 8 mg/day).
PO (Children 2–6 yr): 0.1 mg/kg 3 times daily (not to exceed 2 mg 3 times daily initially); may be carefully ↑ to 0.2 mg/kg 3 times daily (not to exceed 4 mg 3 times daily).
Inhaln (Adults and Children ≥4 yr): *Via metered-dose inhaler or dry powder inhaler*—2 inhalations every 4–6 hr (some patients may respond to 1 inhalation) or 2 inhalations 15 min before exercise; *NIH Guidelines for acute asthma exacerbation: Children*—4–8 puffs every 20 min for 3 doses then every 1–4 hr; *Adults*—4–8 puffs every 20 min for up to 4 hr then every 1–4 hr as needed.
Inhaln (Adults and Children >12 yr): *NIH Guidelines for acute asthma exacerbation via nebulization or IPPB*—2.5–5 mg every 20 min for 3 doses then 2.5–10 mg every 1–4 hr as needed; *Continuous nebulization*—10–15 mg/hr.
Inhaln (Children 2–12 yr): *NIH Guidelines for acute asthma exacerbation via nebulization or IPPB*—0.15 mg/kg/dose (minimum dose 2.5 mg) every 20 min for 3 doses then 0.15–0.3 mg/kg (not to exceed 10 mg) every 1–4 hr as needed *or* 1.25 mg 3–4 times daily for children 10–15 kg *or* 2.5 mg 3–4 times daily for children >15 kg; *Continuous nebulization*—0.5–3 mg/kg/hr.
Inhaln (Neonates): 1.25 mg/dose every 8 hr via nebulization or 1–2 puffs via MDI into the ventilator circuit every 6 hrs.

Availability (generic available)
Immediate-release tablets: 2 mg, 4 mg. **Cost:** *Generic*—4 mg $565.87/100. **Oral syrup (strawberry-flavored):** 2 mg/5 mL. **Inhalation solution:** 0.63 mg/3 mL (0.021%), 1.25 mg/3 mL (0.042%), 2.5

© F.A. Davis Publishing

mg/3 mL (0.083%), 1 mg/mL, 2 mg/mL, 5 mg/mL (0.5%). **Cost:** *Generic*—2.5 mg/3 mL $40.82/90 mL, 5 mg/mL $51.02/60 mL. **Metered-dose aerosol:** 90 mcg/inhalation in 6.7-g, 8-g, 8.5-g, and 18-g canisters (200 metered inhalations), 100 mcg/spray. **Cost:** *Proair HFA*—$52.53/8.5-g canister; *Proventil HFA*—$62.62/6.7-g canister; *Ventolin HFA*—$19.08/8-g canister. **Powder for inhalation (Proair Digihaler and Proair Respiclick):** 90 mcg/inhalation (200 metered inhalations). **Powder for inhalation (Ventolin Diskus):** 200 mcg. ***In combination with:*** ipratropium (Combivent). See Appendix N.

NURSING IMPLICATIONS

Assessment

- Assess lung sounds, pulse, and BP before administration and during peak of medication. Note amount, color, and character of sputum produced.
- Monitor pulmonary function tests before initiating therapy and periodically during therapy.
- Observe for paradoxical bronchospasm (wheezing). If condition occurs, withhold medication and notify health care professional immediately.
- ***Lab Test Considerations:*** May cause transient ↓ in serum potassium concentrations with nebulization or higher-than-recommended doses.

Implementation

- **PO:** Administer oral medication with meals to minimize gastric irritation.
- **Inhaln:** Shake inhaler well, and allow at least 1 min between inhalations of aerosol medication. Prime the inhaler before first use by releasing 4 test sprays into the air away from the face. *Proair Respiclick* does not require priming. Pedi: Use spacer for children <8 yr of age.
- For nebulization or IPPB, the 0.5-, 0.83-, 1-, and 2-mg/mL solutions do not require dilution before administration. The 5 mg/mL (0.5%) solution must be diluted with 1–2.5 mL of 0.9% NaCl for inhalation. Diluted solutions are stable for 24 hr at room temperature or 48 hr if refrigerated.
- For nebulizer, compressed air or oxygen flow should be 6–10 L/min; a single treatment of 3 mL lasts about 10 min.
- IPPB usually lasts 5–20 min.

Patient/Family Teaching

- Instruct patient to take albuterol as directed. If on a scheduled dosing regimen, take missed dose as soon as remembered, spacing remaining doses at regular intervals. Do not double doses or increase the dose or frequency of doses. Caution patient not to exceed recommended dose; may cause adverse effects, paradoxical bronchospasm (more likely with first dose from new canister), or loss of effectiveness of medication.
- Instruct patient to contact health care professional immediately if shortness of breath is not relieved by medication or is accompanied by diaphoresis, dizziness, palpitations, or chest pain.
- Instruct patient to prime unit with 4 sprays before using and to discard canister after 200 sprays. Actuators should not be changed among products.
- Inform patient that these products contain hydrofluoroalkane (HFA) and the propellant and are described as non-CFC or CFC-free (contain no chlorofluorocarbons).
- Instruct patient to notify health care professional of all Rx or OTC medications, vitamins, or herbal products being taken and to consult health care professional before taking any OTC medications or alcoholic beverages concurrently with this therapy. Caution patient also to avoid smoking and other respiratory irritants.
- Inform patient that albuterol may cause an unusual or bad taste.
- Rep: Advise females of reproductive potential to notify health care professional if pregnancy is planned or suspected or if breast feeding. Encourage patients who become pregnant during therapy to enroll in the pregnancy registry that monitors pregnancy outcomes in women exposed to asthma medications during pregnancy. For more information, contact the MothersToBaby Pregnancy Studies conducted by the Organization of Teratology Information Specialists at 1-877-311-8972 or visit http://mothertobaby.org/pregnancy-studies/.
- **Inhaln:** Instruct patient in the proper use of the metered-dose inhaler or nebulizer (see Appendix C).
- Advise patients to use albuterol first if using other inhalation medications and allow 5 min to elapse before administering other inhalant medications unless otherwise directed.
- Advise patient to rinse mouth with water after each inhalation dose to minimize dry mouth and clean the mouthpiece with water at least once a wk.
- Instruct patient to notify health care professional if there is no response to the usual dose or if contents of one canister are used in less than 2 wk. Asthma and treatment regimen should be re-evaluated and corticosteroids should be considered. Need for increased use to treat symptoms indicates decrease in asthma control and need to re-evaluate patient's therapy.

Evaluation/Desired Outcomes

- Prevention or relief of bronchospasm.

alclometasone, See CORTICOSTEROIDS (TOPICAL/LOCAL).

© F.A. Davis Publishing

alectinib (al-ekti-nib)

Alecensa, Alecensaro

Classification

Therapeutic: antineoplastics
Pharmacologic: kinase inhibitors

Indications

Patients with metastatic non-small cell lung cancer (NSCLC) that is positive for anaplastic lymphoma kinase (ALK).

Action

Inhibits tyrosine kinase receptors targeting anaplastic lymphoma kinase (ALK) and RET. **Therapeutic Effects:** Decreased spread of NSCLC.

Pharmacokinetics

Absorption: 37% absorbed following oral administration; high-fat, high-calorie meals ↑ absorption.
Distribution: Extensively distributed to tissues.
Protein Binding: 99%.
Metabolism and Excretion: Mostly metabolized by the CYP3A4 isoenzyme to its active metabolite, M4 (also metabolized by CYP3A4). 84% excreted in feces unchanged; minimal excretion in urine.
Half-life: 33 hr (alectinib); 31 hr (M4 active metabolite).

TIME/ACTION PROFILE (blood levels)

ROUTE	ONSET	PEAK	DURATION
PO	unknown	4 hr	unknown

Contraindications/Precautions

Contraindicated in: OB: Pregnancy (may cause fetal harm); Lactation: Lactation.
Use Cautiously in: Severe renal impairment (CCr <30 mL/min) or end-stage renal disease; Severe hepatic impairment (↓ dose); Rep: Women of reproductive potential; Pedi: Safety and effectiveness not established in children.

Adverse Reactions/Side Effects

CV: bradycardia, edema. **Derm:** photosensitivity, rash. **EENT:** blurred vision, diplopia. **Endo:** hyperglycemia. **F and E:** hypocalcemia, hypokalemia, hyponatremia, hypophosphatemia. **GI:** HEPATOTOXICITY, constipation, diarrhea, hyperbilirubinemia, nausea, vomiting. **GU:** ↑ serum creatinine. **Hemat:** HEMORRHAGE, anemia, lymphopenia, hemolytic anemia. **Metab:** ↑ weight. **MS:** back pain, ↑ creatine kinase, myalgia. **Neuro:** fatigue, headache. **Resp:** INTERSTITIAL LUNG DISEASE, PULMONARY EMBOLISM, cough, dyspnea.

Interactions

Drug-Drug: None reported.

Route/Dosage

PO (Adults): 600 mg twice daily.

Hepatic Impairment

PO (Adults): *Severe hepatic impairment (Child-Pugh Class C)* — 450 mg twice daily.

Availability

Capsules: 150 mg.

NURSING IMPLICATIONS

Assessment

- Monitor for signs and symptoms of interstitial lung disease/pneumonitis (worsening of respiratory symptoms, dyspnea, cough, fever). Withhold therapy if symptoms occur and permanently discontinue if no other potential causes are identified.
- Monitor heart rate and BP regularly during therapy. *If symptomatic bradycardia occurs*, withhold therapy until asymptomatic or heart rate ≥60 bpm. If concomitant medication identified as contributing and is discontinued, or its dose adjusted, resume alectinib at previous dose upon recovery to asymptomatic bradycardia or to heart rate ≥60 bpm. If no contributing medication identified, or if contributing medications are not discontinued or dose modified, resume alectinib at reduced dose upon recovery to asymptomatic bradycardia or to heart rate of ≥60 bpm. *If life-threatening bradycardia occurs*, permanently discontinue alectinib if no contributing medication is identified. If contributing medication is identified and discontinued, or its dose is adjusted, resume alectinib at reduced dose upon recovery to asymptomatic bradycardia or to heart rate of ≥60 bpm, with frequent monitoring as clinically indicated. Permanently discontinue alectinib in case of recurrence.
- Assess for myalgia periodically during therapy.
- ***Lab Test Considerations:*** For patient selection, determine presence of ALK positivity in tumor tissue or plasma specimens using FDA approved test. Information on FDA-approved tests for the detection of ALK rearrangements in NSCLC is available at http://www.fda.gov/CompanionDiagnostics.
- Dose reduction schedule: 1st dose reduction — 450 mg twice daily, 2nd dose reduction 300 mg twice daily. Discontinue if unable to tolerate 300 mg twice daily.
- Monitor liver function tests every 2 wk during first 3 mo of therapy, and then monthly and as clinically indicated during treatment. *If ALT or AST ↑ >5 times upper limit of normal (ULN) with total bilirubin ≤2 times ULN*, temporarily withhold until recovery to baseline or ≤3 times ULN, then resume at reduced dose. *If ALT or AST ↑ >3 times ULN with total bilirubin ↑ >2 times ULN in absence of cholestasis or hemolysis*, permanently discontinue alectinib. *If total bilirubin ↑ >3 times ULN*, temporarily withhold until recovery to baseline or to ≤1.5 times ULN, then resume at reduced dose.
- Assess creatine kinase (CK) every 2 wk during 1st mo of therapy and in patients reporting unexplained

© F.A. Davis Publishing

muscle pain, tenderness, or weakness. *If ↑ CK >5 times ULN*, temporarily withhold until recovery to baseline or ≤2.5 times ULN, then resume at same dose. *If ↑ CK >10 times ULN or 2nd occurrence of ↑ CK >5 times ULN*, temporarily withhold until recovery to baseline or ≤2.5 times ULN, then resume at reduced dose.

- Monitor serum creatinine periodically during therapy. *If Grade 3 renal impairment occurs,* hold doses until serum creatinine ≤ 1.5 times ULN, then resume at reduced dose. *If Grade 4 renal impairment occurs,* discontinue alectinib permanently.
- May cause hyperglycemia, hypocalcemia, hypokalemia, hypophosphatemia, and hyponatremia.
- May cause anemia and lymphopenia.

Implementation

- **PO:** Administer twice daily with food. ***DNC:*** Swallow capsules whole, do not open or dissolve capsule contents.

Patient/Family Teaching

- Instruct patient to take alectinib as directed. If a dose is missed or vomiting occurs after taking, omit dose and take next dose at scheduled time. Advise patient to read *Patient Information* before starting therapy and with each Rx refill in case of changes.
- Advise patient to use sunscreen and lip balm (SPF ≥50) and to wear protective clothing to prevent photosensitivity reaction.
- Advise patient to notify health care professional if signs and symptoms of liver problems (feeling tired, itchy skin, feeling less hungry than usual, nausea or vomiting, yellowing of skin or whites of eyes, pain on right side of stomach, dark urine, bleeding or bruising more easily than normal), respiratory problems (trouble breathing, shortness of breath, cough, fever), bradycardia (dizziness, lightheadedness, syncope), or myalgia (unexplained muscle pain, tenderness, or weakness) occur.
- Instruct patient to notify health care professional of all Rx or OTC medications, vitamins, or herbal products being taken and consult health care professional before taking any new medications.
- Rep: May cause fetal harm. Advise females of reproductive potential to use effective contraception and avoid breast feeding during and for at least 1 wk following therapy. Advise males with female partners of reproductive potential to use effective contraception during and for 3 mo after last dose.

Evaluation/Desired Outcomes

- Decreased spread of NSCLC.

alendronate (a-len-drone-ate)

Binosto, Fosamax

Classification

Therapeutic: bone resorption inhibitors

Pharmacologic: biphosphonates

Indications

Treatment and prevention of postmenopausal osteoporosis. Treatment of osteoporosis in men. Treatment of Paget's disease of the bone. Treatment of corticosteroid-induced osteoporosis in patients (men and women) who are receiving ≥7.5 mg of prednisone/day (or equivalent) with evidence of decreased bone mineral density.

Action

Inhibits resorption of bone by inhibiting osteoclast activity. **Therapeutic Effects:** Reversal of the progression of osteoporosis with decreased fractures. Decreased progression of Paget's disease.

Pharmacokinetics

Absorption: Poorly absorbed (0.6–0.8%) after oral administration.

Distribution: Transiently distributes to soft tissue, then distributes to bone.

Metabolism and Excretion: Excreted in urine.

Half-life: 10 yr (reflects release of drug from skeleton).

TIME/ACTION PROFILE (inhibition of bone resorption)

ROUTE	ONSET	PEAK	DURATION
PO	1 mo	3–6 mo	3 wk–7 mo†

†After discontinuation of alendronate.

Contraindications/Precautions

Contraindicated in: Abnormalities of the esophagus which delay esophageal emptying (i.e. strictures, achalasia); Inability to stand/sit upright for at least 30 min; Renal impairment (CCr <35 mL/min); OB: Pregnancy (may cause fetal harm).

Use Cautiously in: History of upper GI disorders; Pre-existing hypocalcemia or vitamin D deficiency; Invasive dental procedures, cancer, receiving chemotherapy, corticosteroids, or angiogenesis inhibitors, poor oral hygiene, periodontal disease, dental disease, anemia, coagulopathy, infection, or poorly-fitting dentures (may ↑ risk of jaw osteonecrosis); HF or hypertension (effervescent tablet only); Lactation: Safety not established in breast feeding; Pedi: Safety and effectiveness not established in children.

Adverse Reactions/Side Effects

CV: atrial fibrillation. **Derm:** erythema, photosensitivity, rash. **EENT:** blurred vision, conjunctivitis, eye pain/inflammation. **GI:** abdominal distention, abdominal pain, acid regurgitation, constipation, diarrhea, dyspepsia, dysphagia, esophageal cancer, esophageal ul-

© F.A. Davis Publishing

cer, esophagitis, flatulence, gastritis, nausea, taste perversion, vomiting. **MS:** musculoskeletal pain, femur fractures, osteonecrosis (primarily of jaw). **Neuro:** headache. **Resp:** asthma exacerbation.

Interactions

Drug-Drug: Calcium supplements, **antacids**, and **levothyroxine** may ↓ the absorption of alendronate. Doses >10 mg/day ↑ risk of adverse GI events when used with **NSAIDs**.

Drug-Food: Food significantly ↓ absorption. **Caffeine (coffee, tea, cola)**, **mineral water**, and **orange juice** also ↓ absorption.

Route/Dosage

PO (Adults): *Treatment of osteoporosis*— 10 mg once daily or 70 mg once weekly. *Prevention of osteoporosis*— 5 mg once daily or 35 mg once weekly. *Paget's disease*— 40 mg once daily for 6 mo. Retreatment may be considered for patients who relapse. *Treatment of corticosteroid-induced osteoporosis in men and premenopausal women*— 5 mg once daily. *Treatment of corticosteroid-induced osteoporosis in postmenopausal women not receiving estrogen*— 10 mg once daily.

Availability (generic available)

Effervescent tablets (strawberry flavor) (contains 603 mg of sodium/tablet): 70 mg. **Cost:** $168.00/4. **Oral solution (raspberry flavor):** 70 mg/75 mL. **Cost:** *Generic*— $23.44/75 mL. **Tablets:** 5 mg, 10 mg, 35 mg, 40 mg, 70 mg. **Cost:** *Generic*— 10 mg $20.94/100, 35 mg $6.99/4, 70 mg $8.22/4. ***In combination with:*** Cholecalciferol (Fosamax plus D) See Appendix N.

NURSING IMPLICATIONS

Assessment

- **Osteoporosis:** Assess patients for low bone mass before and periodically during therapy.
- **Paget's Disease:** Assess for symptoms of Paget's disease (bone pain, headache, decreased visual and auditory acuity, increased skull size).
- ***Lab Test Considerations:*** *Osteoporosis:* Assess serum calcium before and periodically during therapy. Correct hypocalcemia and vitamin D deficiency before initiating alendronate therapy. May cause mild, transient ↑ of calcium and phosphate.
- **Paget's Disease:** Monitor alkaline phosphatase before and periodically during therapy. Alendronate is indicated for patients with alkaline phosphatase twice the upper limit of normal.

Implementation

- **PO:** Administer first thing in the morning with 6–8 oz plain water 30 min before other medications, beverages, or food. Oral solution should be followed by at least 2 oz of water. Swallow tablets whole; do not crush, break, or chew.
- For *effervescent tablets* dissolve 1 tablet in half a glass (4 oz) of plain room temperature water (not mineral water or flavored water). Wait at least 5 min after the effervescence stops, stir the solution for approximately 10 sec and drink contents.

Patient/Family Teaching

- Instruct patient on the importance of taking exactly as directed, first thing in the morning, 30 min before other medications, beverages, or food. Waiting longer than 30 min will improve absorption. Take alendronate with 6–8 oz plain water (mineral water, orange juice, coffee, and other beverages decrease absorption). If a dose is missed, skip dose and resume the next morning; do not double doses or take later in the day. If a weekly dose is missed, take the morning after remembered and resume the following wk on the chosen day. Do not take 2 tablets on the same day. Do not discontinue without consulting health care professional. Advise patient to read *Medication Guide* before starting therapy and with each Rx refill in case of changes.
- Caution patient to remain upright for 30 min following dose to facilitate passage to stomach and minimize risk of esophageal irritation. Advise patient to discontinue alendronate and notify health care provider if pain or difficulty swallowing, retrosternal pain, or new/worsening heartburn occur.
- Caution patient not to swallow, chew, or allow undissolved effervescent tablet to dissolve in their mouth; may cause oropharyngeal irritation.
- Advise patient to eat a balanced diet and consult health care professional about the need for supplemental calcium and vitamin D.
- Encourage patient to participate in regular exercise and to modify behaviors that increase the risk of osteoporosis (stop smoking, reduce alcohol consumption).
- Advise parents to notify health care professional of all Rx or OTC medications, vitamins, or herbal products being taken and to consult with health care professional before taking other medications.
- Advise patient to inform health care professional of alendronate therapy prior to dental surgery.
- Caution patient to use sunscreen and protective clothing to prevent photosensitivity reactions.
- Advise patient to notify health care professional if blurred vision, eye pain, or inflammation occur.
- Advise female patient to notify health care professional if pregnancy is planned or suspected or if breast feeding.

Evaluation/Desired Outcomes

- Prevention of or decrease in the progression of osteoporosis in postmenopausal women. Reassess need for medication periodically. Consider discontinuation of alendronate after 3–5 yr in patients with low-risk of fractures. If discontinued, reassess fracture risk periodically.
- Treatment of osteoporosis in men.
- Decrease in the progression of Paget's disease.
- Treatment of corticosteroid-induced osteoporosis.

© F.A. Davis Publishing

A

alfuzosin (al-fyoo-zo-sin)

Uroxatral, Xatral

Classification

Therapeutic: urinary tract antispasmodics
Pharmacologic: peripherally acting antiadrenergics

Indications

Management of symptomatic benign prostatic hyperplasia (BPH).

Action

Selectively blocks alpha$_1$-adrenergic receptors in the lower urinary tract to relax smooth muscle in the bladder neck and prostate. **Therapeutic Effects:** Increased urine flow and decreased symptoms of BPH.

Pharmacokinetics

Absorption: 49% absorbed following oral administration; food enhances absorption.
Distribution: Unknown.
Metabolism and Excretion: Mostly metabolized by the liver (CYP3A4 enzyme system); 11% excreted unchanged in urine.
Half-life: 10 hr.

TIME/ACTION PROFILE

ROUTE	ONSET	PEAK	DURATION
PO-ER	within hr	8 hr	24 hr

Contraindications/Precautions

Contraindicated in: Hypersensitivity; Moderate to severe hepatic impairment; Potent inhibitors of the CYP3A4 enzyme system; Concurrent use of other alpha-adrenergic blocking agents; Severe renal impairment; Pedi: Children.
Use Cautiously in: Congenital or acquired QTc prolongation or concurrent use of other drugs known to prolong QTc; Mild hepatic impairment; Symptomatic hypotension; Concurrent use of antihypertensive agents, phosphodiesterase type 5 inhibitors, or nitrates (↑ risk of postural hypotension); Previous hypotensive episode with other medications; Geri: Consider age-related changes in body mass and cardiac, renal, and hepatic function when prescribing.

Adverse Reactions/Side Effects

EENT: intraoperative floppy iris syndrome. **Derm:** TOXIC EPIDERMAL NECROLYSIS. **Neuro:** dizziness, fatigue, headache. **Resp:** bronchitis, sinusitis, pharyngitis. **CV:** postural hypotension. **GI:** abdominal pain, constipation, dyspepsia, nausea. **GU:** erectile dysfunction, priapism. **Hemat:** thrombocytopenia.

Interactions

Drug-Drug: Ketoconazole, **itraconazole**, and **ritonavir** ↓ metabolism and significantly ↑ levels and effects (concurrent use contraindicated). Levels are ↑ by **cimetidine**, **atenolol**, and **diltiazem**. May ↑ levels and effects of **atenolol** and **diltiazem** (monitor BP and heart rate). ↑ risk of hypotension with **antihypertensives**, **nitrates**, **phosphodiesterase type 5 inhibitors** (including **sildenafil**, **tadalafil**, and **vardenafil**) and acute ingestion of **alcohol**.

Route/Dosage

PO (Adults): 10 mg once daily.

Availability (generic available)

Extended-release tablets: 10 mg.

NURSING IMPLICATIONS

Assessment

- Assess for symptoms of benign prostatic hyperplasia (urinary hesitancy, feeling of incomplete bladder emptying, interruption of urinary stream, impairment of size and force of urinary stream, terminal urinary dribbling, straining to start flow, dysuria, urgency) before and periodically during therapy.
- Assess for orthostatic reaction and syncope. Monitor BP (lying and standing) and pulse frequently during initial dose adjustment and periodically thereafter. May occur within a few hr after initial doses and occasionally thereafter.
- Rule out prostatic carcinoma before therapy; symptoms are similar.

Implementation

- **PO:** Administer with food at the same meal each day. Tablets must be swallowed whole; do not crush, break, or chew.

Patient/Family Teaching

- Instruct patient to take medication with the same meal each day. Take missed doses as soon as remembered. If not remembered until next day, omit; do not double doses.
- May cause dizziness or drowsiness. Advise patient to avoid driving or other activities requiring alertness until response to the medication is known.
- Caution patient to avoid sudden changes in position to decrease orthostatic hypotension.
- Advise patient to consult health care professional before taking any cough, cold, or allergy remedies.
- Instruct patient to notify health care professional of medication regimen before any surgery, especially cataract surgery.
- Advise patient to notify health care professional if priapism, angina, frequent dizziness, rash, or fainting occurs.
- Emphasize the importance of follow-up exams to evaluate effectiveness of medication.
- Geri: Assess risk for falls; implement fall prevention program and instruct patient and family in preventing falls at home.

© F.A. Davis Publishing

Evaluation/Desired Outcomes
- Decreased symptoms of benign prostatic hyperplasia.

alirocumab (a-li-**roe**-kyoo-mab)
Praluent

Classification
Therapeutic: lipid-lowering agents
Pharmacologic: proprotein convertase subtilisin kexin type 9 (PCSK9) inhibitors, monoclonal antibodies

Indications
Primary hyperlipidemia, including heterozygous familial hypercholesterolemia (HeFH) (as adjunct to diet, as monotherapy or in combination with other low-density lipoprotein cholesterol (LDL-C)-lowering therapies [e.g. statin, ezetimibe]). Reduction in risk of MI, stroke, and unstable angina requiring hospitalization in patients with established cardiovascular disease. Homozygous familial hypercholesterolemia (HoFH) (as adjunct to other LDL-C lowering therapies).

Action
A human monoclonal immunoglobulin (IgG1) produced in genetically engineered Chinese hamster ovary cells that binds to PCSK9 inhibiting its binding to the low density lipoprotein receptor (LDLR) resulting in ↑ number of LDLRs available to clear LDL from blood. **Therapeutic Effects:** Reduction in LDL-C in primary hyperlipidemia and HoFH. Reduction in risk of MI, stroke, and unstable angina requiring hospitalization.

Pharmacokinetics
Absorption: Well absorbed (85%) following subcut administration.
Distribution: Mostly distributed in the circulatory system; crosses the placenta.
Metabolism and Excretion: Eliminated by binding to PCSK9 and by proteolytic degradation.
Half-life: 17–20 days.

TIME/ACTION PROFILE (effect circulating unbound PCSK9)

ROUTE	ONSET	PEAK	DURATION
subcut	rapid	4–8 hr	2 wk

Contraindications/Precautions
Contraindicated in: Serious hypersensitivity.
Use Cautiously in: Severe renal/hepatic impairment; OB: Safety not established in pregnancy; Lactation: Safety not established in breast feeding; Pedi: Safety and effectiveness not established in children; Geri: Older adults may be more sensitive to drug effects.

Adverse Reactions/Side Effects
Local: injection site reactions. **Neuro:** confusion.
Misc: HYPERSENSITIVITY REACTIONS (including angioedema, vasculitis).

Interactions
Drug-Drug: None reported.

Route/Dosage
Primary Hyperlipidemia (including Heterozygous Familial Hypercholesterolemia) or Established Cardiovascular Disease
Subcut (Adults): 75 mg every 2 wk *or* 300 mg every 4 wk; if desired LDL-C has not been achieved, may ↑ dose to 150 mg every 2 wk. *Patients with HeFH undergoing apheresis*— 150 mg every 2 wk.

Homozygous Familial Hypercholesterolemia
Subcut (Adults): 150 mg every 2 wk.

Availability
Solution for injection (prefilled pens): 75 mg/mL, 150 mg/mL.

NURSING IMPLICATIONS
Assessment
- Obtain a diet history, especially with regard to fat consumption.
- Monitor for signs and symptoms of hypersensitivity reactions (pruritus, rash, urticaria, hypersensitivity vasculitis and hypersensitivity reactions requiring hospitalization) during therapy. If severe symptoms occur, discontinue alirocumab.
- ***Lab Test Considerations:*** Assess LDL-C levels within 4–8 wk of initiating or titrating alirocumab for patients taking every 2 wk or just before next dose for patients taking every 4 wk, to assess response and adjust dose, if needed.

Implementation
- **Subcut:** Allow solution to warm to room temperature for 30–40 min before injecting. May be kept at room temperature for up to 30 days. Solution is clear and colorless to pale yellow; do not administer solutions that are cloudy or contain particulate matter. Do not shake. Inject into thigh, abdomen, or upper arm into areas not tender, bruised, red, or indurated. Rotate sites with each injection. Do not inject into areas with skin disease or injury (sunburns, rashes, inflammation, skin infections). Do not reuse prefilled pen or syringe. Do not administer other injectable drugs at same site. Store in refrigerator; keep in original container, protect from light. Do not freeze.
- Administer 300 mg dose as two 150 mg injections in 2 different sites.

Patient/Family Teaching
- Instruct patient in correct technique for self-injection, care and disposal of equipment. Administer missed doses within 7 days, then resume original schedule. If not administered within 7 days, wait until next dose on original schedule. Advise patient to

© F.A. Davis Publishing

read *Patient Information* before starting therapy and with each Rx refill in case of changes.
- Advise patient that this medication should be used in conjunction with diet restrictions (fat, cholesterol, carbohydrates, alcohol), exercise, and cessation of smoking.
- Advise patient to notify health care professional immediately if signs and symptoms of hypersensitivity reactions occur.
- Instruct patient to notify health care professional of all Rx or OTC medications, vitamins, or herbal products being taken and to consult health care professional before taking any other Rx, OTC, or herbal products.
- Advise patient to notify health care professional of medication regimen prior to treatment or surgery.
- Rep: Advise patient to notify health care professional if pregnancy is planned or suspected or if breast feeding. There is a pregnancy safety study for alirocumab. If alirocumab is administered during pregnancy, report alirocumab exposure by contacting Regeneron at 1-844-734-6643.

Evaluation/Desired Outcomes
- ↓ LDL-C levels.
- Reduction in risk of MI, stroke, and unstable angina requiring hospitalization.

allopurinol (al-oh-**pure**-i-nole)
Aloprim, Lopurin, Zyloprim

Classification
Therapeutic: antigout agents, antihyperuricemics
Pharmacologic: xanthine oxidase inhibitors

Indications
PO: Prevention of attack of gouty arthritis and nephropathy. **PO, IV:** Treatment of secondary hyperuricemia, which may occur during treatment of tumors or leukemias.

Action
Inhibits the production of uric acid by inhibiting the action of xanthine oxidase. **Therapeutic Effects:** Lowering of serum uric acid levels.

Pharmacokinetics
Absorption: Well absorbed (80%) following oral administration.
Distribution: Widely distributed in tissue and breast milk.
Protein Binding: <1%.
Metabolism and Excretion: Metabolized to oxypurinol, an active compound with a long half-life. 12% excreted unchanged, 76% excreted as oxypurinol.
Half-life: 1–3 hr (oxypurinol 18–30 hr).

TIME/ACTION PROFILE (hypouricemic effect)

ROUTE	ONSET	PEAK	DURATION
PO, IV	1–2 days	1–2 wk	1–3 wk†

†Duration after discontinuation of allopurinol.

Contraindications/Precautions
Contraindicated in: Hypersensitivity; Presence of HLA-B*58:01 allele (↑ risk of hypersensitivity reactions).
Use Cautiously in: Acute attacks of gout; Renal impairment (dose ↓ required if CCr <20 mL/min); Dehydration (adequate hydration necessary); OB: Safety not established in pregnancy; Lactation: Use while breast feeding only if potential maternal benefit justifies potential risk to infant; Geri: Begin at lower end of dosage range in older adults.

Adverse Reactions/Side Effects
CV: hypotension, flushing, hypertension, bradycardia, and heart failure (reported with IV administration).
Derm: DRUG REACTION WITH EOSINOPHILIA AND SYSTEMIC SYMPTOMS (DRESS), STEVENS-JOHNSON SYNDROME, TOXIC EPIDERMAL NECROLYSIS, rash (discontinue drug at first sign of rash), urticaria. **GI:** diarrhea, hepatitis, nausea, vomiting. **GU:** renal failure, hematuria. **Hemat:** bone marrow depression. **Neuro:** drowsiness. **Misc:** HYPERSENSITIVITY REACTIONS.

Interactions
Drug-Drug: Use with **mercaptopurine** and **azathioprine** ↑ bone marrow depressant properties—doses of these drugs should be ↓. Use with **ampicillin** or **amoxicillin** ↑ risk of rash. Use with **oral hypoglycemic agents** and **warfarin** ↑ effects of these drugs. Use with **thiazide diuretics** or **ACE inhibitors** ↑ risk of hypersensitivity reactions. Large doses of allopurinol may ↑ risk of **theophylline** toxicity. May ↑ **cyclosporine** levels.

Route/Dosage

Gout
PO (Adults and Children >10 yr): *Initially*— 100 mg/day; ↑ at weekly intervals based on serum uric acid (not to exceed 800 mg/day). Doses >300 mg/day should be given in divided doses; *Maintenance dose*— 100–200 mg 2–3 times daily. Doses of ≤300 mg may be given as a single daily dose.

Secondary Hyperuricemia
PO (Adults and Children >10 yr): 600–800 mg/day in 2–3 divided doses starting 1–2 days before chemotherapy or radiation.
PO (Children 6–10 yr): 10 mg/kg/day in 2–3 divided doses (maximum 800 mg/day) or 300 mg daily in 2–3 divided doses.
PO (Children <6 yr): 10 mg/kg/day in 2–3 divided doses (maximum 800 mg/day) or 150 mg daily in 3 divided doses.

© F.A. Davis Publishing

IV (Adults and Children >10 yr): 200–400 mg/m²/day (up to 600 mg/day) as a single daily dose or in divided doses every 8–24 hr.
IV (Children <10 yr): 200 mg/m²/day initially as a single daily dose or in divided doses every 8–24 hr (maximum dose 600 mg/day).

Renal Impairment

(Adults and Children): *CCr 10–50 mL/min*—↓ dose to 50% of recommended; *CCr <10 mL/min*—↓ dosage to 30% of recommended.

Availability (generic available)

Powder for injection: 500 mg/vial. **Tablets:** 100 mg, 200 mg, 300 mg. **Cost:** *Generic*—100 mg $10.83/100, 300 mg $10.83/100.

NURSING IMPLICATIONS

Assessment

- Monitor intake and output ratios. Decreased kidney function can cause drug accumulation and toxic effects. Ensure that patient maintains adequate fluid intake (minimum 2500–3000 mL/day) to minimize risk of kidney stone formation.
- Consider testing for the HLA-B*58:01 allele in patients of African, Asian, and Native Hawaiian/Pacific Islander ancestry prior to using allopurinol; use not recommended if allele present.
- Assess patient for rash or more severe hypersensitivity reactions. Discontinue allopurinol immediately if rash occurs. Therapy should be discontinued permanently if reaction is severe. Therapy may be reinstated after a mild reaction has subsided, at a lower dose (50 mg/day with very gradual titration). If skin rash recurs, discontinue permanently.
- Monitor for signs and symptoms of DRESS (fever, rash, lymphadenopathy, and/or facial swelling, associated with involvement of other organ systems (hepatitis, nephritis, hematologic abnormalities, myocarditis, myositis) during therapy. May resemble an acute viral infection. Eosinophilia is often present. Discontinue therapy if signs occur.
- **Gout:** Monitor for joint pain and swelling. Addition of colchicine or NSAIDs may be necessary for acute attacks. Prophylactic doses of colchicine or an NSAID should be administered concurrently during first 3–6 mo of therapy because of an increased frequency of acute attacks of gouty arthritis during early therapy.
- ***Lab Test Considerations:*** Serum and urine uric acid levels usually begin to ↓ 2–3 days after initiation of oral therapy.
- Monitor blood glucose in patients receiving oral hypoglycemic agents. May cause hypoglycemia.
- Monitor hematologic, renal, and liver function tests before and periodically during therapy, especially during the first few mo. May cause ↑ serum alkaline phosphatase, bilirubin, AST, and ALT levels. ↓ CBC and platelets may indicate bone marrow depression. ↑ BUN, serum creatinine may indicate nephrotoxicity. These are usually reversed with discontinuation of therapy.

Implementation

- Do not confuse Zyloprim with zolpidem.
- **PO:** May be administered after milk or meals to minimize gastric irritation; give with plenty of fluid. May be crushed and given with fluid or mixed with food for patients who have difficulty swallowing.

IV Administration

- **Intermittent Infusion:** Reconstitute each 500 mg vial with 25 mL of sterile water for injection. Solution is clear and almost colorless with only slight opalescence; do not administer solutions that are cloudy, discolored, or contain particulate matter. ***Dilution:*** Dilute to desired concentration with 0.9% NaCl or D5W. Administer within 10 hr of reconstitution; do not refrigerate. Do not administer solutions that are discolored or contain particulate matter. ***Concentration:*** Not >6 m g/mL. ***Rate:*** Infusion should be initiated 24–48 hr before start of chemotherapy known to cause tumor cell lysis. Rate of infusion depends on volume of infusate (100–300 mg doses may be infused over 30 min). May be administered as a single infusion or equally divided infusions at 6-, 8-, or 12-hr intervals.
- **Y-Site Compatibility:** acyclovir, aminophylline, amphotericin B lipid complex, anidulafungin, argatroban, aztreonam, bivalirudin, bleomycin, bumetanide, buprenorphine, butorphanol, calcium gluconate, carboplatin, caspofungin, cefazolin, cefotetan, ceftazidime, ceftriaxone, cefuroxime, cisplatin, cyclophosphamide, dactinomycin, dexamethasone sodium phosphate, dexmedetomidine, docetaxel, doxorubicin liposome, enalaprilat, etoposide, famotidine, fenoldopam, filgrastim, fluconazole, fludarabine, fluorouracil, fosphenytoin, furosemide, ganciclovir, gemcitabine, granisetron, heparin, hetastarch, hydrocortisone, hydromorphone, ifosfamide, leucovorin calcium, linezolid, lorazepam, mannitol, mesna, methotrexate, milrinone, mitoxantrone, morphine, octreotide, oxytocin, paclitaxel, pamidronate, pantoprazole, pemetrexed, piperacillin/tazobactam, potassium chloride, sodium acetate, thiotepa, tigecycline, tirofiban, trimethoprim/sulfamethoxazole, vancomycin, vasopressin, vinblastine, vincristine, voriconazole, zidovudine, zoledronic acid.
- **Y-Site Incompatibility:** alemtuzumab, amikacin, amiodarone, carmustine, cefotaxime, chlorpromazine, clindamycin, cytarabine, dacarbazine, daptomycin, daunorubicin, dexrazoxane, diltiazem, diphenhydramine, doxorubicin, doxycycline, droperidol, epirubicin, ertapenem, etoposide phosphate, floxuridine, foscarnet, gentamicin, haloperidol, hydroxyzine, idarubicin, imipenem/cilastatin, irinotecan, meperidine, methylprednisolone sodium succinate, metoprolol, minocycline, mitomycin, moxifloxacin, mycophenolate, nalbuphine, ondansetron, palonosetron, pancuronium, potassium ace-

© F.A. Davis Publishing

tate, prochlorperazine, promethazine, sodium bicarbonate, streptozocin, tacrolimus, tobramycin, topotecan, vecuronium, vinorelbine.

Patient/Family Teaching

- Instruct patient to take allopurinol as directed. Take missed doses as soon as remembered. If dosing schedule is once daily, do not take if remembered the next day. If dosing schedule is more than once a day, take up to 300 mg for next dose.
- Instruct patient to continue taking allopurinol along with an NSAID or colchicine during an acute attack of gout. Allopurinol helps prevent, but does not relieve, acute gout attacks.
- Alkaline diet may be ordered. Urinary acidification with large doses of vitamin C or other acids may increase kidney stone formation (see Appendix J). Advise patient of need for increased fluid intake.
- May occasionally cause drowsiness. Caution patient to avoid driving or other activities requiring alertness until response to drug is known.
- Instruct patient to report skin rash, blood in urine, influenza symptoms (chills, fever, muscle aches and pains, nausea, or vomiting) or symptoms of DRESS to health care professional immediately; skin rash may indicate hypersensitivity.
- Advise patient that large amounts of alcohol increase uric acid concentrations and may decrease the effectiveness of allopurinol.
- Advise females of reproductive potential to notify health care professional if pregnancy is planned or suspected or if breast feeding.
- Emphasize the importance of follow-up exams to monitor effectiveness and side effects.

Evaluation/Desired Outcomes

- Decreased serum and urinary uric acid levels. May take 2–6 wk to observe clinical improvement in patients treated for gout.

almotriptan (al-moe-**trip**-tan)

~~Axert~~

Classification

Therapeutic: vascular headache suppressants
Pharmacologic: 5-HT_1 agonists

Indications

Acute treatment of migraine headache (for adolescents, migraines should be ≥4 hr in duration).

Action

Acts as an agonist at specific 5-HT_1 receptor sites in intracranial blood vessels and sensory trigeminal nerves.
Therapeutic Effects: Cranial vessel vasoconstriction with associated decrease in release of neuropeptides and resultant decrease in migraine headache.

Pharmacokinetics

Absorption: Well absorbed following oral administration (70%).
Distribution: Unknown.
Metabolism and Excretion: 40% excreted unchanged in urine; 27% metabolized by monoamine oxidase-A (MAO-A); 12% metabolized by CYP3A4 and CYP2D6; 13% excreted in feces as unchanged and metabolized drug.
Half-life: 3–4 hr.

TIME/ACTION PROFILE (Blood levels)

ROUTE	ONSET	PEAK	DURATION
PO	unknown	1–3 hr	unknown

Contraindications/Precautions

Contraindicated in: Hypersensitivity; Ischemic cardiovascular, cerebrovascular, or peripheral vascular syndromes (including ischemic bowel disease); History of significant cardiovascular disease; Uncontrolled hypertension; Should not be used within 24 hr of other 5-HT_1 agonists or ergot-type compounds (dihydroergotamine); Basilar or hemiplegic migraine; Concurrent MAO-A inhibitor therapy or within 2 wk of discontinuing MAO-A inhibitor therapy.
Use Cautiously in: Cardiovascular risk factors (hypertension, hypercholesterolemia, cigarette smoking, obesity, diabetes, strong family history, menopausal women or men >40 yr); use only if cardiovascular status has been evaluated and determined to be safe and first dose is administered under supervision; Impaired hepatic or renal function; Hypersensitivity to sulfonamides (cross-sensitivity may occur); OB, Lactation: Safety not established; Pedi: Children <12 yr (safety and effectiveness not established).

Adverse Reactions/Side Effects

CV: CORONARY ARTERY VASOSPASM, MI, VENTRICULAR ARRHYTHMIAS, myocardial ischemia. **GI:** dry mouth, nausea. **Neuro:** paresthesia, drowsiness, headache.

Interactions

Drug-Drug: Concurrent use with **MAO-A inhibitors** ↑ blood levels and the risk of adverse reactions (concurrent use or use within 2 wk or MAO inhibitor is contraindicated). Concurrent use with other **5-HT_1 agonists** or **ergot-type compounds (dihydroergotamine)** may result in additive vasoactive properties (avoid use within 24 hr of each other). ↑ serotonin levels and serotonin syndrome may occur when used concurrently with **SSRI and SNRI antidepressants**. Blood levels and effects may be ↑ by **ketoconazole**, **itraconazole**, **ritonavir**, and **erythromycin** (inhibitors of CYP3A4 enzymes).

© F.A. Davis Publishing

Route/Dosage

PO (Adults and Children ≥12 yr): 6.25–12.5 mg initially, may repeat in 2 hr; not to exceed 2 doses per 24-hr period.

Hepatic/Renal Impairment

PO (Adults): 6.25 mg initially, may repeat in 2 hr; not to exceed 2 doses per 24-hr period.

Availability (generic available)

Tablets: 6.25 mg, 12.5 mg.

NURSING IMPLICATIONS

Assessment

- Assess pain location, character, intensity, and duration and associated symptoms (photophobia, phonophobia, nausea, vomiting) during migraine attack.
- Assess for serotonin syndrome (mental changes [agitation, hallucinations, coma], autonomic instability [tachycardia, labile BP, hyperthermia], neuromuscular aberrations [hyperreflexia, incoordination], and/or GI symptoms [nausea, vomiting, diarrhea]), especially in patients taking other serotonergic drugs (SSRIs, SNRIs).

Implementation

- **PO:** Tablets should be swallowed whole with liquid.

Patient/Family Teaching

- Inform patient that almotriptan should only be used during a migraine attack. It is meant to be used for relief of migraine attacks but not to prevent or reduce the number of attacks.
- Instruct patient to administer almotriptan as soon as symptoms of a migraine attack appear, but it may be administered any time during an attack. If migraine symptoms return, a 2nd dose may be used. Allow at least 2 hr between doses, and do not use more than 2 doses in any 24-hr period.
- If first dose does not relieve headache, additional almotriptan doses are not likely to be effective; notify health care professional.
- Caution patient not to take almotriptan within 24 hr of another vascular headache suppressant.
- Advise patient that lying down in a darkened room following almotriptan administration may further help relieve headache.
- Advise patient that overuse (use more than 10 days/month) may lead to exacerbation of headache (migraine-like daily headaches, or as a marked increase in frequency of migraine attacks). May require gradual withdrawal of almotriptan and treatment of symptoms (transient worsening of headache).
- Advise patient to notify health care professional prior to next dose of almotriptan if pain or tightness in the chest occurs during use. If pain is severe or does not subside, notify health care professional immediately. If feelings of tingling, heat, flushing, heaviness, pressure, drowsiness, dizziness, tiredness, or sickness develop discuss with health care professional at next visit.
- May cause dizziness or drowsiness. Caution patient to avoid driving or other activities requiring alertness until response to medication is known.
- Advise patient to avoid alcohol, which aggravates headaches, during almotriptan use.
- Advise patient to notify health care professional of all Rx or OTC medications, vitamins, or herbal products being taken and to consult with health care professional before taking other medications.
- Advise patient to notify health care professional immediately if signs or symptoms of serotonin syndrome occur.
- Advise females of reproductive potential to notify health care professional if pregnancy is planned or suspected, or if breast feeding.

Evaluation/Desired Outcomes

- Relief of migraine attack.

alogliptin (al-oh-glip-tin)

Nesina

Classification

Therapeutic: antidiabetics
Pharmacologic: dipeptidyl peptidase-4 (DDP-4) inhibitors

Indications

Adjunct to diet and exercise to improve glycemic control in type 2 diabetes mellitus.

Action

Acts as a competitive inhibitor of dipeptidyl peptidase-4 (DPP-4) which slows the inactivation of incretin hormones, thereby increasing their concentrations and reducing fasting and postprandial glucose concentrations. **Therapeutic Effects:** Improved control of blood glucose.

Pharmacokinetics

Absorption: Completely absorbed following oral administration (100%).
Distribution: Well distributed into tissues.
Metabolism and Excretion: Not extensively metabolized, 76% excreted unchanged in urine.
Half-life: 21 hr.

TIME/ACTION PROFILE (inhibition of DPP-4)

ROUTE	ONSET	PEAK†	DURATION
PO	unknown	1–2 hr	24 hr

†Multiple dosing.

Contraindications/Precautions

Contraindicated in: Type 1 diabetes; Diabetic ketoacidosis; Previous severe hypersensitivity reactions.
Use Cautiously in: Hepatic impairment; Renal impairment (dose ↓ required if CCr <60 mL/min); HF or renal impairment (↑ risk for worsening HF); OB: Use only if potential maternal benefit justifies potential fetal risk; Lactation: Use while breast feeding only if potential

© F.A. Davis Publishing

maternal benefit justifies potential risk to infant; Pedi: Safety and effectiveness not established; Geri: May have ↑ sensitivity to effects.

Adverse Reactions/Side Effects

CV: HF. **Derm:** STEVENS-JOHNSON SYNDROME, bullous pemphigoid. **GI:** HEPATOTOXICITY, PANCREATITIS, ↑ liver enzymes. **MS:** RHABDOMYOLYSIS, arthralgia. **Neuro:** headache. **Misc:** HYPERSENSITIVITY REACTIONS (including anaphylaxis or angioedema).

Interactions

Drug-Drug: ↑ risk of hypoglycemia with **sulfonylureas** and **insulin**; dose adjustments may be necessary.

Route/Dosage

PO (Adults): 25 mg once daily.

Renal Impairment

PO (Adults): *CCr 30–59 mL/min*—12.5 mg once daily; *CCr 15–29 mL/min*—6.25 mg once daily; *CCr <15 mL/min or requiring hemodialysis*—6.25 mg once daily.

Availability

Tablets: 6.25 mg, 12.5 mg, 25 mg. ***In combination with:*** metformin (Kazano), pioglitazone (Oseni).

NURSING IMPLICATIONS

Assessment

- Observe for signs and symptoms of hypoglycemic reactions (abdominal pain, sweating, hunger, weakness, dizziness, headache, tremor, tachycardia, anxiety).
- Monitor for signs of pancreatitis (nausea, vomiting, anorexia, persistent severe abdominal pain, sometimes radiating to the back) during therapy. If pancreatitis occurs, discontinue alogliptin and monitor serum and urine amylase, amylase/CCr ratio, electrolytes, serum calcium, glucose, and lipase.
- Assess for signs and symptoms of HF (increasing shortness of breath, rapid increase in weight, swelling of feet) periodically during therapy.
- Assess for rash periodically during therapy. May cause Stevens-Johnson syndrome. Discontinue therapy if severe or if accompanied with fever, general malaise, fatigue, muscle or joint aches, blisters, oral lesions, conjunctivitis, hepatitis, and/or eosinophilia.
- ***Lab Test Considerations:*** Monitor hemoglobin A1C prior to and periodically during therapy.
- Monitor liver function tests prior to starting and periodically during therapy. Interrupt therapy and determine cause if significant ↑ in enzymes or abnormal tests persist or worsen. Do not restart therapy without explanation for abnormalities.
- Monitor renal function prior to and periodically during therapy.

Implementation

- Patients stabilized on a diabetic regimen who are exposed to stress, fever, trauma, infection, or surgery may require administration of insulin.
- **PO:** May be administered without regard to food.

Patient/Family Teaching

- Instruct patient to take alogliptin as directed. Take missed doses as soon as remembered, unless it is almost time for next dose; do not double doses. Advise patient to read *Medication Guide* before starting and with each Rx refill in case of changes.
- Explain to patient that alogliptin helps control hyperglycemia but does not cure diabetes. Therapy is usually long term.
- Instruct patient not to share this medication with others, even if they have the same symptoms; it may harm them.
- Encourage patient to follow prescribed diet, medication, and exercise regimen to prevent hyperglycemic or hypoglycemic episodes.
- Review signs of hypoglycemia and hyperglycemia with patient. If hypoglycemia occurs, advise patient to take a glass of orange juice or 2–3 tsp of sugar, honey, or corn syrup dissolved in water, and notify health care professional.
- Instruct patient in proper testing of blood glucose and urine ketones. These tests should be monitored closely during periods of stress or illness and health care professional notified if significant changes occur.
- Advise patient to stop taking alogliptin and notify health care professional promptly if symptoms of hypersensitivity reactions (rash; hives; swelling of face, lips, tongue, and throat; difficulty in breathing or swallowing), liver dysfunction (fatigue, nausea, vomiting, anorexia, right upper abdominal discomfort, dark urine, yellowing of skin or whites of eyes), HF, or pancreatitis occur.
- Advise patient to notify health care professional of all Rx or OTC medications, vitamins, or herbal products being taken and to consult with health care professional before taking other medications.
- Instruct patient to notify health care professional if severe joint pain occurs.
- Advise patient to notify health care professional if pregnancy is planned or suspected or if breast feeding.

Evaluation/Desired Outcomes

- Improved hemoglobin A1C, fasting plasma glucose and 2-hr post-prandial glucose levels.

alpelisib (al-pe-lisib)

Piqray

Classification

Therapeutic: antineoplastics

Pharmacologic: kinase inhibitors

© F.A. Davis Publishing

Indications

Treatment of postmenopausal women and men with hormone receptor (HR)-positive, human epidermal growth factor receptor 2 (HER2)-negative, PIK3CA-mutated, advanced or metastatic breast cancer (in combination with fulvestrant).

Action

Acts as an inhibitor of phosphatidylinositol 3−kinase (PI3K). Mutations in the gene encoding the catalytic α-subunit of PI3K (PI3KCA) lead to activation of PI3Kα and Akt-signaling, cellular transformation, and tumor generation. Alpelisib inhibits phosphorylation of PI3K downstream targets (including Akt) and demonstrated activity in cell lines harboring a PIK3CA mutation.

Therapeutic Effects: Decreased progression of breast cancer.

Pharmacokinetics

Absorption: Well absorbed following oral administration.

Distribution: Widely distributed to tissues.

Metabolism and Excretion: Primarily metabolized via hydrolysis; also metabolized to a lesser extent by CYP3A4. Excreted in feces (36% as unchanged drug; 32% as metabolites) and urine (2% as unchanged drug; 7% as metabolites).

Half-life: 8−9 hr.

TIME/ACTION PROFILE (plasma concentrations)

ROUTE	ONSET	PEAK	DURATION
PO	unknown	2−4 hr	24 hr

Contraindications/Precautions

Contraindicated in: History of serious hypersensitivity reactions including anaphylaxis, Steven-Johnson syndrome, or erythema multiforme; History of Stevens-Johnson syndrome, erythema multiforme, or toxic epidermal necrolysis; Concurrent use of strong inducers or substrates of CYP3A; OB: Pregnancy (may cause fetal harm); Lactation: Lactation.

Use Cautiously in: Diabetes or risk factors for hyperglycemia (obesity, elevated fasting plasma glucose, elevated HbA1c, concurrent use of systemic corticosteroids or age ≥75 yrs); Severe renal impairment (CCr ≤30 mL/min); Rep: Women of reproductive potential and men with female partners of reproductive potential; Pedi: Safety and effectiveness not established in children; Geri: Older adults may be more sensitive to drug effects.

Adverse Reactions/Side Effects

CV: peripheral edema. **Derm:** DRUG REACTION WITH EOSINOPHILIA AND SYSTEMIC SYMPTOMS (DRESS), ERYTHEMA MULTIFORME (EM), STEVENS-JOHNSON SYNDROME (SJS), TOXIC EPIDERMAL NECROLYSIS (TEN), alopecia, dry skin, pruritus, rash. **Endo:** KETOACIDOSIS, hyperglycemia, hypoglycemia, hyperglycemic hyperosmolar nonketotic syndrome. **F and E:** hypocalcemia, hypokalemia. **GI:** DIARRHEA, abdominal pain, ↓ appetite, ↑ lipase, ↑ liver enzymes, metallic taste, nausea, stomatitis, vomiting. **GU:** acute kidney injury, ↓ fertility. **Hemat:** anemia, lymphocytopenia, thrombocytopenia. **Metab:** ↓ weight, hypertriglyceridemia, hypoalbuminemia, hypomagnesemia. **Neuro:** fatigue, headache, insomnia. **Resp:** PNEUMONITIS, cough. **Misc:** HYPERSENSITIVITY REACTIONS (including anaphylaxis), INFECTION, fever.

Interactions

Drug-Drug: Strong CYP3A4 inducers may ↓ levels and effectiveness; avoid concurrent use. **BCRP inhibitors** may ↑ levels and risk of toxicity; avoid concurrent use. May ↓ levels of **CYP2C9 substrates**, including **warfarin**.

Route/Dosage

PO (Adults): 300 mg once daily until disease progression or unacceptable toxicity.

Availability

Tablets: 50 mg, 150 mg, 200 mg.

NURSING IMPLICATIONS

Assessment

- Monitor for signs and symptoms of hypersensitivity reactions (dyspnea, flushing, rash, fever, tachycardia) during therapy. If symptoms occur, permanently discontinue alpelisib.
- Assess for skin reactions including Stevens-Johnson Syndrome (SJS), erythema multiforme (EM), toxic epidermal necrolysis (TEN), and drug reaction with eosinophilia and systemic symptoms (DRESS) (prodrome of fever, flu-like symptoms, mucosal lesions, progressive skin rash) during therapy. *If rash is Grade 1 (< 10% body surface area (BSA) with active skin toxicity);* No dose adjustment needed. Initiate topical corticosteroid treatment. Consider adding oral antihistamine to manage symptoms. If rash is not improved within 28 days of treatment, add a low dose systemic corticosteroid. If the cause is SJS, EM, TEN, or DRESS, permanently discontinue alpelisib. *If Grade 2 (10-30% BSA with active skin toxicity);* No dose adjustment necessary. Initiate or intensify topical corticosteroid and oral antihistamines. Consider low dose systemic corticosteroid treatment. If rash improves to Grade ≤ 1 within 10 days, systemic corticosteroid may be discontinued. If the cause is SJS, EM, TEN, or DRESS, permanently discontinue alpelisib. *If Grade 3 (severe rash not responsive to medical management and >30% BSA with active skin toxicity):* Hold alpelisib. Initiate or intensify topical/systemic corticosteroid and oral antihistamines. If the cause is SJS, EM, TEN, or DRESS, permanently discontinue alpelisib. If the etiology is not SJS, EM, TEN, or DRESS, hold dose until improvement to Grade ≤ 1, then resume alpelisib at next lower dose. *If Grade 4 (severe bullous, blistering or exfoliating skin condi-*

© F.A. Davis Publishing

tions and any % BSA associated with extensive superinfection, with IV antibiotics indicated; life-threatening): Permanently discontinue alpelisib.

- Monitor for signs and symptoms of pneumonitis (hypoxia, cough, dyspnea, interstitial infiltrates) during therapy. If pneumonitis is confirmed, discontinue alpelisib permanently.
- Monitor for signs and symptoms of diarrhea during therapy. *If Grade 1 diarrhea occurs,* do not adjust alpelisib dose. Start antidiarrheal therapy and monitor symptoms. *If Grade 2 diarrhea occurs,* start or intensify antidiarrheal therapy and monitor symptoms. Hold alpelisib until recovery to Grade ≤1, then resume at same dose. *If Grade 3 diarrhea occurs,* start or intensify antidiarrheal therapy and monitor symptoms. Hold alpelisib until recovery to Grade ≤1, then resume at the next lower dose. *If Grade 4 diarrhea occurs,* permanently discontinue alpelisib.
- ***Lab Test Considerations:*** Verify negative pregnancy test before starting therapy.
- 🧬 Information on FDA approved tests for the detection of PIK3CA mutations in breast cancer is available at: http://www.fda.gov/CcompanionDiagnostics.
- May cause hyperglycemia. Before starting alpelisib therapy, test fasting blood glucose (FBG) and HbA1c; optimize blood glucose. After starting therapy, monitor blood glucose at least weekly for first 2 wk, then at least once every 4 wk, and as indicated. Monitor HbA1c every 3 mo and as indicated. If hyperglycemia develops, monitor FBG at least twice weekly until FBG decreases to normal. During treatment with anti-diabetic agents, continue monitoring FBG at least weekly for 8 wks, then once every 2 wks and as needed clinically. *If Grade 1 FBG >upper limit of normal (ULN)-160 mg/dL or > ULN -8.9 mmol/L,* No dose adjustment needed. Begin or intensify anti-diabetic treatment. *If Grade 2 FBG >160-250 mg/dL:* No dose adjustment needed. Begin or further intensify anti-diabetic therapy. If FBG does not decrease to ≤ 160 mg/dL within 21 days, reduce alpelisib dose by 1 dose level and follow FBG value recommendations. *If Grade 3 >250-500 mg/dL or >13.9-27.8 mmol/L,* Hold alpelisib. Begin or intensify oral anti-diabetic therapy and consider additional anti-diabetic agents for 1-2 days until hyperglycemia improves. Administer intravenous hydration and consider added intervention for electrolyte/ketoacidosis/hyperosmolar disturbances). If FBG decreases to ≤160 mg/dL within 3 to 5 days under appropriate anti-diabetic therapy, resume alpelisib at 1 lower dose level. If FBG does not decrease to ≤160 mg/dL within 3 to 5 days under appropriate anti-diabetic therapy, consult with a specialist in the treatment of hyperglycemia. If FBG does not decrease to ≤160 mg/dL within 21 days following appropriate anti-diabetic therapy, permanently discontinue alpelisib. *If Grade 4 >500 m g/dL or ≥ 27.8 mmol/L:* Hold alpelisib. Begin or intensify appropriate anti-diabetic therapy (administer intravenous hydration and consider appropriate intervention for electrolyte/ketoacidosis/hyperosmolar disturbances), recheck FBG within 24 hrs and as indicated. If FBG decreases to ≤500 mg/dL, follow FBG recommendations for Grade 3. If FBG is confirmed at >500 m g/dL, discontinue alpelisib permanently.

Implementation

- When starting at 300 mg once daily, two 150 mg tablets, dose adjustments for adverse reactions include *First-dose reduction:* 250 mg once daily, one 200 mg tablet and one 50 mg tablet. *Second-dose reduction:* 200 mg tablet once daily.
- **PO:** Administer with food once daily at same time of day. ***DNC:*** Swallow tablets whole, do not crush, break, or chew.
- When administered with fulvestrant, fulvestrant 500 mg is usually given on Days 1, 15, and 29, and once monthly thereafter.

Patient/Family Teaching

- Instruct patient to take alpelisib as directed. Take missed doses with food within 9 hrs of time usually taken. If >9 hrs, omit dose and take next dose next day at usual time. If patient vomits after dose, skip dose and take next dose next day. Advise patient to read *Patient Information* before starting and with each Rx refill in case of changes.
- Advise patients to notify health care professional of the signs and symptoms of hypersensitivity reactions, skin reactions, hyperglycemia (e.g., excessive thirst, urinating more often than usual or higher amount of urine than usual, or increased appetite with weight loss), and lung problems occur. Advise patients to immediately report new or worsening respiratory symptoms.
- If diarrhea occurs, advise patient to start antidiarrheal treatment, increase oral fluids, and notify health care professional.
- Advise patient to notify health care professional of all Rx or OTC medications, vitamins, or herbal products being taken and to consult health care professional before taking any new medications.
- Rep: May cause fetal harm. Advise females of reproductive potential and males with female partners of reproductive potential to use effective contraception during and for 1 wk after last dose. Advise patient to avoid breast feeding during and for 1 wk after last dose. May impair fertility in male and female patients.

Evaluation/Desired Outcomes

- Decreased progression of breast cancer.

© F.A. Davis Publishing

BEERS

ALPRAZolam (al-pray-zoe-lam)

Xanax, Xanax XR

Classification

Therapeutic: antianxiety agents
Pharmacologic: benzodiazepines

Schedule IV

Indications

Generalized anxiety disorder (GAD). Panic disorder. Anxiety associated with depression.

Action

Acts at many levels in the CNS to produce anxiolytic effect. May produce CNS depression. Effects may be mediated by GABA, an inhibitory neurotransmitter. **Therapeutic Effects:** Relief of anxiety.

Pharmacokinetics

Absorption: Well absorbed (90%) from the GI tract; absorption is slower with extended-release tablets.
Distribution: Widely distributed, crosses blood-brain barrier. Probably crosses the placenta and enters breast milk. Accumulation is minimal.
Metabolism and Excretion: Metabolized by the liver (CYP3A4 enzyme system) to an active compound that is subsequently rapidly metabolized.
Half-life: 12–15 hr.

TIME/ACTION PROFILE (sedation)

ROUTE	ONSET	PEAK	DURATION
PO	1–2 hr	1–2 hr	up to 24 hr

Contraindications/Precautions

Contraindicated in: Hypersensitivity; Cross-sensitivity with other benzodiazepines may exist; Pre-existing CNS depression; Severe uncontrolled pain; Angle-closure glaucoma; Obstructive sleep apnea or pulmonary disease; Concurrent use with itraconazole or ketoconazole; Lactation: Lactation.
Use Cautiously in: Renal impairment (↓ dose required); Hepatic impairment (↓ dose required); Concurrent use with nefazodone, fluvoxamine, cimetidine, fluoxetine, hormonal contraceptives, diltiazem, isoniazid, erythromycin, clarithromycin, or grapefruit juice (↓ dose may be necessary); History of suicide attempt or alcohol/drug dependence, debilitated patients (↓ dose required); OB: Use during pregnancy only if potential maternal benefit justifies potential fetal risk; Pedi: Safety and effectiveness not established in children; Geri: Appears on Beers list. Older adults have ↑ sensitivity to benzodiazepines; associated with ↑ risk of falls and excessive CNS effects (↓ dose required).

Adverse Reactions/Side Effects

Derm: rash. **EENT:** blurred vision. **GI:** constipation, diarrhea, nausea, vomiting, weight gain. **Neuro:** dizziness, drowsiness, lethargy, confusion, depression, hangover, headache, paradoxical excitation. **Misc:** physical dependence, psychological dependence, tolerance.

Interactions

Drug-Drug: Use with **opioids** or other **CNS depressants**, including other **benzodiazepines**, **nonbenzodiazepine sedative/hypnotics**, **anxiolytics**, **general anesthetics**, **muscle relaxants**, **antipsychotics**, and **alcohol** may cause profound sedation, respiratory depression, coma, and death; reserve concurrent use for when alternative treatment options are inadequate. **Hormonal contraceptives**, **disulfiram**, **fluoxetine**, **isoniazid**, **metoprolol**, **propranolol**, **valproic acid**, **CYP3A4 inhibitors** (**erythromycin**, **ketoconazole**, **itraconazole**, **fluvoxamine**, **cimetidine**, **nefazodone**) ↑ levels and effects; dose adjustments may be necessary; concurrent use with ketoconazole and itraconazole contraindicated. May ↓ efficacy of **levodopa**. **CYP3A4 inducers** (**rifampin**, **carbamazepine**, or **barbiturates**) ↓ levels and effects. Sedative effects may be ↓ by **theophylline**. **Cigarette smoking** ↓ levels and effects.
Drug-Natural Products: **Kava-kava**, **valerian**, or **chamomile** can ↑ CNS depression.
Drug-Food: Concurrent ingestion of **grapefruit juice** ↑ levels and effects.

Route/Dosage

Anxiety

PO (Adults): 0.25–0.5 mg 2–3 times daily (not to exceed 4 mg/day).
PO (Geriatric Patients): Begin with 0.25 mg 2–3 times daily.

Panic Attacks

PO (Adults): 0.5 mg 3 times daily; may be ↑ by 1 mg or less every 3–4 days as needed (not to exceed 10 mg/day). *Extended-release tablets*—0.5–1 mg once daily in the morning, may be ↑ every 3–4 days by not more than 1 mg/day; up to 10 mg/day (usual range 3–6 mg/day).

Availability (generic available)

Tablets: 0.25 mg, 0.5 mg, 1 mg, 2 mg. **Cost:** *Generic*—0.25 mg $10.59/100, 0.5 mg $5.25/100, 1 mg $10.41/100, 2 mg $15.13/100. **Extended-release tablets:** 0.5 mg, 1 mg, 2 mg, 3 mg. **Cost:** *Generic*—1 mg $54.05/180, 2 mg $86.76/180, 3 mg $319.38/60. **Orally disintegrating tablets (orange-flavor):** 0.25 mg, 0.5 mg, 1 mg, 2 mg. **Cost:** *Generic*—0.25 mg $151.73/100, 0.5 mg $189.04/100, 1 mg $252.22/100, 2 mg $428.86/100. **Oral solution (concentrate):** 1 mg/mL. **Cost:** *Generic*—$81.10/30 mL.

NURSING IMPLICATIONS

Assessment

- Assess degree and manifestations of anxiety and mental status (orientation, mood, behavior) prior to and periodically during therapy.

© F.A. Davis Publishing

- Assess patient for drowsiness, light-headedness, and dizziness. These symptoms usually disappear as therapy progresses. Dose should be reduced if these symptoms persist.
- Geri: Assess CNS effects and risk of falls. Institute falls prevention strategies.
- Assess risk for addiction, abuse, or misuse prior to administration and periodically during therapy.
- Prolonged high-dose therapy may lead to psychological or physical dependence. Risk is greater in patients taking >4 mg/day. Restrict the amount of drug available to patient. Assess regularly for continued need for treatment.
- ***Lab Test Considerations:*** Monitor CBC and liver and renal function periodically during long-term therapy. May cause ↓ hematocrit and neutropenia.
- ***Toxicity and Overdose:*** Flumazenil is the antidote for alprazolam toxicity or overdose. (Flumazenil may induce seizures in patients with a history of seizures disorder or who are taking tricyclic antidepressants).

Implementation

- Do not confuse Xanax (alprazolam) with Fanapt (iloperidone) or Tenex (guanfacine).
- Do not confuse alprazolam with clonazepam or lorazepam.
- If early morning anxiety or anxiety between doses occurs, same total daily dose should be divided into more frequent intervals.
- **PO:** May be administered with food if GI upset occurs. Administer greatest dose at bedtime to avoid daytime sedation.
- Tablets may be crushed and taken with food or fluids if patient has difficulty swallowing. Do not crush, break, or chew extended-release tablets.
- Taper by 0.5 mg every 3 days to prevent withdrawal; may require even more gradual taper if withdrawal symptoms (heightened sensory perception, impaired concentration, dysosmia, clouded sensorium, paresthesias, muscle cramps, muscle twitch, diarrhea, blurred vision, appetite decrease, weight loss) occur. Some patients may require longer tapering period (weeks to >12 mo).
- For *orally disintegrating tablets:* Remove tablet from bottle with dry hands just prior to taking medication. Place tablet on tongue. Tablet will dissolve with saliva; may also be taken with water. Remove cotton from bottle and reseal tightly to prevent moisture from entering bottle. If only ½ tablet taken, discard unused portion immediately; may not remain stable.

Patient/Family Teaching

- Instruct patient to take medication as directed; do not skip or double up on missed doses. If a dose is missed, take within 1 hr; otherwise, skip the dose and return to regular schedule. If medication is less effective after a few wk, check with health care professional; do not increase dose. Caution patient not to stop taking alprazolam without consulting health care professional. Abrupt withdrawal may cause sweating, vomiting, muscle cramps, tremors, and seizures; may be life-threatening.
- Advise patient to not take more than prescribed or share medication with anyone.
- Advise patient that alprazolam is a drug with known abuse potential. Protect it from theft, and never give to anyone other than the individual for whom it was prescribed. Store out of sight and reach of children, and in a location not accessible by others.
- May cause drowsiness or dizziness. Caution patient to avoid driving and other activities requiring alertness until response to the medication is known. Geri: Instruct patient and family how to reduce falls risk at home.
- Advise patient to avoid drinking grapefruit juice during therapy.
- Advise patient to avoid the use of alcohol or other CNS depressants, including opioids, concurrently with alprazolam. Instruct patient to consult health care professional before taking Rx, OTC, or herbal products concurrently with this medication.
- Inform patient that benzodiazepines are usually prescribed for short-term use and do not cure underlying problems.
- Rep: May cause fetal harm. Advise patient to notify health care professional if pregnancy is planned or suspected or if breast feeding. Monitor neonates exposed to benzodiazepines during pregnancy (especially during 3rd trimester) and labor for signs of sedation, respiratory depression, withdrawal, and feeding problems. Monitor neonates and infants exposed to alprazolam during breast feeding for sedation and withdrawal symptoms. Inform women who take alprazolam during pregnancy about the National Pregnancy Registry for Other Psychiatric Medications to monitor pregnancy outcomes in women exposed to alprazolam during pregnancy. Enroll patient by calling 1-866-961-2388 or visiting online at https://womensmentalhealth.org/clinical-and-research-programs/pregnancyregistry/othermedications/.

Evaluation/Desired Outcomes

- Decreased sense of anxiety without CNS side effects.
- Decreased frequency and severity of panic attacks.
- Decreased symptoms of premenstrual syndrome.

alteplase, See THROMBOLYTIC AGENTS.

© F.A. Davis Publishing

amcinonide, See CORTICOSTEROIDS (TOPICAL/LOCAL).

amifostine (a-mi-fos-teen)

Ethyol

Classification

Therapeutic: cytoprotective agents

Indications

Reduces renal toxicity from cisplatin. Reduces the incidence of moderate to severe xerostomia from postoperative radiation for head and neck cancer in which the radiation port includes a large portion of the parotid glands.

Action

Converted by alkaline phosphatase in tissue to a free thiol compound that binds and detoxifies damaging metabolites of cisplatin and reactive oxygen species generated by radiation. **Therapeutic Effects:** Decreased renal damage from cisplatin. Decreased severity of xerostomia following radiation for head and neck cancer.

Pharmacokinetics

Absorption: IV administration results in complete bioavailability.

Distribution: Unknown.

Metabolism and Excretion: Rapidly cleared from plasma; converted to cytoprotective compounds by alkaline phosphatase in tissues.

Half-life: 8 min.

TIME/ACTION PROFILE

ROUTE	ONSET	PEAK	DURATION
IV	unknown	unknown	unknown

Contraindications/Precautions

Contraindicated in: Hypersensitivity to aminothiol compounds; Hypotension or dehydration; Concurrent antineoplastic therapy for other tumors (especially malignancies of germ cell origin); OB: Pregnancy (may cause fetal harm); Lactation: Lactation.

Use Cautiously in: Cardiovascular disease (↑ risk of adverse reactions); Pedi: Safety and effectiveness not established; Geri: ↑ risk of adverse reactions.

Adverse Reactions/Side Effects

CV: hypotension. **EENT:** blurred vision, diplopia, sneezing. **Derm:** DRUG REACTION WITH EOSINOPHILIA AND SYSTEMIC SYMPTOMS (DRESS), ERYTHEMA MULTIFORME, EXFOLIATIVE DERMATITIS, STEVENS-JOHNSON SYNDROME, TOXIC EPIDERMAL NECROLYSIS, TOXODERMA, flushing. **F and E:** hypocalcemia. **GI:** hiccups, nausea, vomiting. **Neuro:** dizziness, somnolence. **Misc:** ANAPHYLAXIS, chills, injection site reactions.

Interactions

Drug-Drug: Concurrent use of **antihypertensives** ↑ risk of hypotension.

Route/Dosage

Reduction of Renal Damage with Cisplatin

IV (Adults): 910 mg/m² once daily, within 30 min before chemotherapy; if full dose is poorly tolerated, subsequent doses should be ↓ to 740 mg/m².

Reduction of Xerostomia from Radiation

IV (Adults): 200 mg/m² once daily starting 15–30 min before standard fraction radiation therapy.

Availability (generic available)

Powder for injection: 500 mg/vial.

NURSING IMPLICATIONS

Assessment

- Monitor BP before and every 5 min during infusion. Discontinue antihypertensives 24 hr prior to treatment. If significant hypotension requiring interruption of therapy occurs, place patient in Trendelenburg position and administer an infusion of 0.9% NaCl using a separate IV line. If BP returns to normal in 5 min and patient is asymptomatic, infusion may be resumed so that full dose may be given.
- Assess fluid status before administration. Correct dehydration before instituting therapy. Nausea and vomiting are frequent and may be severe. Administer prophylactic antiemetics including dexamethasone 20 mg IV and a serotonin-antagonist antiemetic (dolasetron, granisetron, ondansetron, palonosetron) before and during infusion. Monitor fluid status closely.
- Observe patient for signs and symptoms of anaphylaxis (rash, pruritus, laryngeal edema, wheezing). Discontinue the drug and notify physician or other health care professional immediately if these problems occur. Keep epinephrine, an antihistamine, and resuscitation equipment close by in case of an anaphylactic reaction.
- Monitor patient for skin reactions before, during, and after amifostine administration; reactions may be delayed by several wk after initiation of therapy. Permanently discontinue amifostine in patients who experience serious or severe cutaneous reactions or cutaneous reactions associated with fever or other symptoms of unknown cause. Withhold therapy and obtain dermatologic consultation and biopsy for cutaneous reactions or mucosal lesions of unknown cause appearing outside of injection site or radiation port, and for erythematous, edematous, or bullous lesions on the palms of the hand or soles of the feet.
- Monitor for signs and symptoms of DRESS (fever, rash, lymphadenopathy, and/or facial swelling, associated with involvement of other organ systems (hepatitis, nephritis, hematologic abnormalities, myocarditis, myositis) during therapy. May resemble an acute viral infection. Eosinophilia is often present. Discontinue therapy if signs occur.

© F.A. Davis Publishing

- **Xerostomia:** Assess patient for dry mouth and mouth sores periodically during therapy.
- ***Lab Test Considerations:*** Monitor serum calcium concentrations before and periodically during therapy. May cause hypocalcemia. Calcium supplements may be necessary.

Implementation

IV Administration

- **Intermittent Infusion:** ***Dilution:*** Reconstitute with 9.7 mL of sterile 0.9% NaCl. Dilute further with 0.9% NaCl. Do not administer solutions that are discolored or contain particulate matter. Solution is stable for 5 hr at room temperature or 24 hr if refrigerated. ***Concentration:*** Adults: dilute dose to a final volume of 50 mL; Children: 5–40 mg/mL. ***Rate:*** *For renal toxicity:* Administer over 15 min within 30 min before chemotherapy administration. Longer infusion times are not as well tolerated. *For xerostomia:* Administer over 3 min starting 15–30 min prior to radiation therapy.
- **Y-Site Compatibility:** alemtuzumab, amikacin, aminophylline, amphotericin B liposome, ampicillin, ampicillin/sulbactam, anidulafungin, argatroban, aztreonam, bivalirudin, bleomycin, bumetanide, buprenorphine, butorphanol, calcium gluconate, carboplatin, carmustine, caspofungin, cefazolin, cefotaxime, cefotetan, cefoxitin, ceftazidime, ceftriaxone, cefuroxime, ciprofloxacin, clindamycin, cyclophosphamide, cytarabine, dacarbazine, dactinomycin, daptomycin, daunorubicin, dexamethasone, dexmedetomidine, dexrazoxane, diltiazem, diphenhydramine, dobutamine, docetaxel, docetaxel, dopamine, doxorubicin, doxycycline, droperidol, enalaprilat, epirubicin, ertapenem, etoposide, etoposide phosphate, famotidine, fenoldopam, floxuridine, fluconazole, fludarabine, fluorouracil, foscarnet, fosphenytoin, furosemide, gemcitabine, gentamicin, granisetron, haloperidol, heparin, hetastarch, hydrocortisone, hydromorphone, idarubicin, ifosfamide, imipenem/cilastatin, irinotecan, leucovorin, levofloxacin, linezolid, lorazepam, magnesium sulfate, mannitol, meperidine, mesna, methotrexate, methylprednisolone, metoclopramide, metronidazole, milrinone, mitomycin, morphine, moxifloxacin, nalbuphine, octreotide, ondansetron, oxaliplatin, paclitaxel, palonosetron, pamidronate, pancuronium, pantoprazole, pemetrexed, piperacillin/tazobactam, potassium acetate, potassium chloride, promethazine, rituximab, sodium acetate, sodium bicarbonate, streptozocin, tacrolimus, thiotepa, tigecycline, tirofiban, tobramycin, trastuzumab, trimethoprim/sulfamethoxazole, vancomycin, vasopressin, vecuronium, vinblastine, vincristine, vinorelbine, voriconazole, zidovudine, zoledronic acid.
- **Y-Site Incompatibility:** acyclovir, amiodarone, amphotericin B deoxycholate, amphotericin B lipid complex, chlorpromazine, cisplatin, ganciclovir, hydroxyzine, minocycline, mycophenolate, prochlorperazine, quinupristin/dalfopristin, topotecan.

Patient/Family Teaching

- Explain the purpose of amifostine infusion to patient.
- Inform patient that amifostine may cause hypotension, nausea, vomiting, flushing, chills, dizziness, somnolence, hiccups, and sneezing.
- Advise patient to notify health care professional if skin reactions, or signs and symptoms of anaphylaxis or DRESS occur.

Evaluation/Desired Outcomes

- Prevention of renal toxicity associated with repeated administration of cisplatin in patients with ovarian cancer.
- Decreased severity of xerostomia from radiation treatment of head and neck cancer.

amikacin, See AMINOGLYCOSIDES.

aMILoride, See DIURETICS (POTASSIUM-SPARING).

aminocaproic acid

(a-mee-noe-ka-**pro**-ik **a**-sid)

Amicar

Classification

Therapeutic: hemostatic agents

Pharmacologic: fibrinolysis inhibitors

Indications

Management of acute, life-threatening hemorrhage due to systemic hyperfibrinolysis or urinary fibrinolysis.

Unlabeled Use: Prevention of recurrent subarachnoid hemorrhage. Prevention of bleeding following oral surgery in hemophiliacs. Management of severe hemorrhage caused by thrombolytic agents.

Action

Inhibits activation of plasminogen. **Therapeutic Effects:** Inhibition of fibrinolysis. Stabilization of clot formation.

Pharmacokinetics

Absorption: Rapidly absorbed following oral administration.

Distribution: Widely distributed.

Metabolism and Excretion: Mostly eliminated unchanged by the kidneys.

© F.A. Davis Publishing

Half-life: Unknown.

TIME/ACTION PROFILE (peak blood levels)

ROUTE	ONSET	PEAK	DURATION
PO	unknown	2 hr	N/A
IV	unknown	2 hr	N/A

Contraindications/Precautions

Contraindicated in: Active intravascular clotting.

Use Cautiously in: Upper urinary tract bleeding; Cardiac, renal, or liver disease (dosage reduction may be required); Disseminated intravascular coagulation (should be used concurrently with heparin); OB, Lactation: Safety not established; Pedi: Do not use products containing benzyl alcohol with neonates.

Adverse Reactions/Side Effects

CV: arrhythmias, hypotension (IV only). **EENT:** nasal stuffiness, tinnitus. **GI:** anorexia, bloating, cramping, diarrhea, nausea. **GU:** diuresis, renal failure. **MS:** myopathy. **Neuro:** dizziness, malaise.

Interactions

Drug-Drug: Concurrent use with **estrogens, conjugated** may result in a hypercoagulable state. Concurrent use with **clotting factors** may ↑ risk of thromboses.

Route/Dosage

Acute Bleeding Syndromes due to Elevated Fibrinolytic Activity

PO (Adults): 5 g 1st hr, followed by 1–1.25 g every hr for 8 hr or until hemorrhage is controlled; or 6 g over 24 hr after prostate surgery (not >30 g/day).
IV (Adults): 4–5 g over 1st hr, followed by 1 g/hr for 8 hr or until hemorrhage is controlled; or 6 g over 24 hr after prostate surgery (not >30 g/day).
PO, IV (Children): 100 mg/kg or 3 g/m^2 over 1st hr, followed by continuous infusion of 33.3 mg/kg/hr; or 1 g/m^2/hr (total dose not >18 g/m^2/24 hr).

Subarachnoid Hemorrhage

PO (Adults): *To follow IV*—3 g every 2 hr (36 g/day). If no surgery is performed, continue for 21 days after bleeding stops, then ↓ to 2 g every 2 hr (24 g/day) for 3 days, then 1 g every 2 hr (12 g/day) for 3 days.
IV (Adults): 36 g/day for 10 days followed by PO.

Prevention of Bleeding Following Oral Surgery in Hemophiliacs

PO (Adults): 75 mg/kg (up to 6 g) immediately after procedure, then every 6 hr for 7–10 days; syrup may also be used as an oral rinse of 1.25 g (5 mL) 4 times a day for 7–10 days.
IV, PO (Children): *Also for epistaxis*—50–100 mg/kg/dose administered IV every 6 hr for 2–3 days starting 4 hr before the procedure. After completion of IV therapy, aminocaproic acid should be given as 50–100 mg/kg/dose orally every 6 hr for 5–7 days.

Availability (generic available)

Tablets: 500 mg, 1000 mg. **Oral syrup (raspberry flavor):** 1.25 g/5 mL. **Solution for injection:** 250 mg/mL.

NURSING IMPLICATIONS

Assessment

- Monitor BP, pulse, and respiratory status as indicated by severity of bleeding.
- Monitor for overt bleeding every 15–30 min during acute bleed and periodically during therapy.
- Monitor neurologic status (pupils, level of consciousness, motor activity) in patients with subarachnoid hemorrhage.
- Monitor intake and output ratios frequently; notify health care professional if significant discrepancies occur.
- Assess for thromboembolic complications (especially in patients with history). Notify health care professional of positive Homans' sign, leg pain and edema, hemoptysis, dyspnea, or chest pain.
- ***Lab Test Considerations:*** Monitor platelet count and clotting factors prior to and periodically throughout therapy in patients with systemic fibrinolysis.
- ↑ CPK, AST, and serum aldolase may indicate myopathy.
- May ↑ serum potassium.

Implementation

- **PO:** Syrup may be used as an oral rinse, swished for 30 sec 4 times/day for 7–10 days for the control of bleeding during dental and oral surgery in hemophilic patients. Small amounts may be swallowed, except during 1st and 2nd trimesters of pregnancy. Syrup may be applied with an applicator in children or unconscious patients.

IV Administration

- **IV:** Stabilize IV catheter to minimize thrombophlebitis. Monitor site closely.
- **Intermittent Infusion:** ***Dilution:*** Do not administer undiluted. Dilute initial 4–5 g dose in 250 mL of sterile water for injection, 0.9% NaCl, D5W, or LR. Do not dilute with sterile water in patients with subarachnoid hemorrhage. ***Concentration:*** 20 mg/mL. ***Rate:*** Single doses: Administer over 1 hr. Rapid infusion rate may cause hypotension, bradycardia, or other arrhythmias.
- **Continuous Infusion:** Administer IV solution using infusion pump to ensure accurate dose. Administer via slow IV infusion.
- ***Rate:*** Initial dose may be followed by a continuous infusion of 1–1.25 g/hr in adults or 33.3 mg/kg/hr in children.
- **Y-Site Compatibility:** alemtuzumab, alfentanil, amikacin, aminophylline, amphotericin B deoxycholate, amphotericin B lipid complex, amphotericin B liposome, ampicillin, ampicillin/sulbactam, anidulafungin, argatroban, arsenic trioxide, atracurium,

azithromycin, aztreonam, bivalirudin, bleomycin, bumetanide, buprenorphine, butorphanol, calcium chloride, calcium gluconate, carboplatin, carmustine, cefazolin, cefepime, cefotaxime, cefotetan, cefoxitin, ceftazidime, ceftriaxone, cefuroxime, cisatracurium, clindamycin, cyclophosphamide, cyclosporine, cytarabine, dacarbazine, daptomycin, dexamethasone, dexmedetomidine, digoxin, diltiazem, diphenhydramine, dobutamine, docetaxel, dopamine, droperidol, enalaprilat, ephedrine, epinephrine, epirubicin, ertapenem, erythromycin, esmolol, etoposide, etoposide phosphate, famotidine, fenoldopam, fentanyl, fluconazole, fludarabine, foscarnet, fosphenytoin, furosemide, gemcitabine, gentamicin, granisetron, haloperidol, heparin, hetastarch, hydrocortisone, hydromorphone, idarubicin, ifosfamide, imipenem/cilastatin, irinotecan, isoproterenol, ketorolac, labetalol, leucovorin calcium, levofloxacin, levorphanol, lidocaine, linezolid, lorazepam, magnesium sulfate, mannitol, meperidine, meropenem, mesna, methohexital, methylprednisolone, metoclopramide, metoprolol, metronidazole, milrinone, mitoxantrone, morphine, nalbuphine, naloxone, nitroglycerin, nitroprusside, octreotide, ondansetron, oxaliplatin, oxytocin, palonosetron, pamidronate, pancuronium, pantoprazole, pamidronate, pancuronium, pantoprazole, pemetrexed, pentamidine, pentobarbital, phenobarbital, phenylephrine, piperacillin/tazobactam, potassium acetate, potassium chloride, potassium phosphates, procainamide, promethazine, propranolol, remifentanil, rocuronium, sargramostim, sodium bicarbonate, sodium phosphates, succinylcholine, sufentanil, tacrolimus, theophylline, thiotepa, tigecycline, tirofiban, tobramycin, trimethoprim/sulfamethoxazole, vancomycin, vasopressin, vecuronium, verapamil, vincristine, voriconazole, zidovudine, zoledronic acid.

- **Y-Site Incompatibility:** acyclovir, amiodarone, caspofungin, chlorpromazine, ciprofloxacin, diazepam, doxycycline, filgrastim, ganciclovir, midazolam, mycophenolate, nicardipine, phenytoin, prochlorperazine, quinupristin/dalfopristin, thiopental.
- **Additive Incompatibility:** Do not admix with other medications.

Patient/Family Teaching

- Instruct patient to notify the nurse immediately if bleeding recurs or if thromboembolic symptoms develop.
- **IV:** Caution patient to make position changes slowly to avoid orthostatic hypotension.

Evaluation/Desired Outcomes

- Cessation of bleeding.
- Prevention of rebleeding in subarachnoid hemorrhage without occurrence of undesired clotting.

AMINOGLYCOSIDES

amikacin (am-i-**kay**-sin)
~~Amikin~~, Arikayce

gentamicin† (jen-ta-**mye**-sin)
~~Garamycin~~

neomycin (neo-oh-**mye**-sin)

streptomycin (strep-toe-**mye**-sin)

tobramycin† (toe-bra-**mye**-sin)
Bethkis, Kitabis Pak, TOBI, TOBI Podhaler

Classification
Therapeutic: anti-infectives
Pharmacologic: aminoglycosides

†See Appendix B for ophthalmic use

Indications

Amikacin, gentamicin, and tobramycin: Treatment of serious gram-negative bacterial infections and infections caused by staphylococci when penicillins or other less toxic drugs are contraindicated. **Streptomycin:** In combination with other agents in the management of active tuberculosis. **Neomycin:** Used orally to prepare the GI tract for surgery, to decrease the number of ammonia-producing bacteria in the gut as part of the management of hepatic encephalopathy, and to treat diarrhea caused by *Escherichia coli*. **Amikacin by inhalation:** Treatment of *Mycobacterium avium* complex (MAC) lung disease in patients who have limited or no other treatment options and who do not achieve negative sputum cultures after ≥6 consecutive mo of a multidrug treatment regimen (in combination with other antibacterial drugs). **Tobramycin by inhalation:** Management of *Pseudomonas aeruginosa* in cystic fibrosis patients. **Gentamicin, streptomycin:** In combination with other agents in the management of serious enterococcal infections. **Gentamicin IV:** Prevention of infective endocarditis. **Gentamicin (topical):** Treatment of localized infections caused by susceptible organisms. **Unlabeled Use:** Amikacin: In combination with other agents in the management of *Mycobacterium avium* complex infections.

Action

Inhibits protein synthesis in bacteria at level of 30S ribosome. **Therapeutic Effects:** Bactericidal action. **Spectrum:** Most aminoglycosides notable for activity against: *P. aeruginosa*, *Klebsiella pneumoniae*, *E.coli*, *Proteus*, *Serratia*, *Acinetobacter*, *Staphylococcus aureus*. In treatment of enterococcal infections, synergy with a penicillin is required. Streptomycin and amikacin also active against *Mycobacterium*.

© F.A. Davis Publishing

Pharmacokinetics

Absorption: Well absorbed after IM administration. IV administration results in complete bioavailability. Some absorption follows administration by other routes. Minimal systemic absorption with neomycin (may accumulate in patients with renal failure).

Distribution: Widely distributed throughout extracellular fluid; cross the placenta; small amounts enter breast milk. Poor penetration into CSF (↑ when meninges are inflamed).

Metabolism and Excretion: Excretion is >90% renal.

Half-life: 2–4 hr (↑ in renal impairment).

TIME/ACTION PROFILE (blood levels*)

ROUTE	ONSET	PEAK	DURATION
PO (neomycin)	rapid	1–4 hr	N/A
IM	rapid	30–90 min	6–24 hr
IV	rapid	15–30 min†	6–24 hr

*All parenterally administered aminoglycosides.
†Postdistribution peak occurs 30 min after the end of a 30-min infusion and 15 min after the end of a 1-hr infusion.

Contraindications/Precautions

Contraindicated in: Hypersensitivity to aminoglycosides; Most parenteral products contain bisulfites and should be avoided in patients with known intolerance; Intestinal obstruction (neomycin only); OB: Avoid use of tobramycin (IV/IM), streptomycin, and inhaled amikacin during pregnancy (may cause fetal harm); Pedi: Products containing benzyl alcohol should be avoided in neonates.

Use Cautiously in: Renal impairment (dose adjustments necessary; blood level monitoring useful in preventing ototoxicity and nephrotoxicity); Hearing impairment; Neuromuscular diseases such as myasthenia gravis; Obese patients (dose should be based on ideal body weight); COPD or asthma (amikacin inhalation may worsen condition); Lactation: Safety not established; Pedi: Neonates have ↑ risk of neuromuscular blockade; difficulty in assessing auditory and vestibular function and immature renal function; safety and effectiveness of amikacin inhalation not established in children; Geri: Difficulty in assessing auditory and vestibular function and age-related renal impairment in older adults.

Adverse Reactions/Side Effects

Derm: rash (amikacin inhalation only). **EENT:** ototoxicity (vestibular and cochlear), voice alteration (amikacin inhalation only), epistaxis (amikacin inhalation only), oral candidiasis (amikacin inhalation only). **F and E:** hypomagnesemia. **GI:** diarrhea (amikacin inhalation only), nausea (amikacin inhalation only), diarrhea (neomycin only), dry mouth (amikacin inhalation only), metallic taste (amikacin inhalation only), nausea (neomycin only), vomiting (amikacin inhalation and neomycin only). **GU:** nephrotoxicity. **Metab:** ↓ weight (amikacin inhalation only). **MS:** muscle paralysis (high parenteral doses). **Neuro:** ↑ neuromuscular blockade, ataxia, headache (amikacin inhalation only), anxiety (amikacin inhalation only), vertigo. **Resp:** bronchospasm (amikacin inhalation only), cough (amikacin inhalation only), hemoptysis (amikacin inhalation only), apnea, bronchospasm (tobramycin inhalation only), hypersensitivity pneumonitis (amikacin inhalation only), wheezing (tobramycin inhalation only). **Misc:** hypersensitivity reactions.

Interactions

Drug-Drug: Inactivated by **penicillins** and **cephalosporins** when coadministered to patients with renal insufficiency. Possible respiratory paralysis after **inhalation anesthetics** or **neuromuscular blocking agents**. ↑ incidence of ototoxicity with **loop diuretics** or **mannitol (IV)**. ↑ incidence of nephrotoxicity with other **nephrotoxic drugs**. Neomycin may ↑ anticoagulant effects of **warfarin**. Neomycin may ↓ absorption of **digoxin** and **methotrexate**.

Route/Dosage

Amikacin

IM, IV (Adults and Children): 5 mg/kg every 8 hr or 7.5 mg/kg every 12 hr (not to exceed 1.5 g/day). *Mycobacterium avium complex*—7.5–15 mg/kg/day divided every 12–24 hr.
IM, IV (Neonates): *Loading dose*—10 mg/kg; *Maintenance dose*—7.5 mg/kg every 12 hr.
Inhaln (Adults): 590 mg once daily.

Renal Impairment

IM, IV (Adults): *Loading dose*—7.5 mg/kg, further dosing based on blood level monitoring and renal function assessment.

Gentamicin

Many regimens are used; most involve dosing adjusted on the basis of blood level monitoring and assessment of renal function.
IM, IV (Adults): 1–2 mg/kg every 8 hr (up to 6 mg/kg/day in 3 divided doses); *Once-daily dosing (unlabeled)*—4–7 mg/kg every 24 hr.
IM, IV (Children >5 yr): 2–2.5 mg/kg/dose every 8 hr; *Once daily*—5–7.5 mg/kg/dose every 24 hr; *Cystic fibrosis*—2.5–3.3 mg/kg/dose every 6–8 hr; *Hemodialysis*—1.25–1.75 mg/kg/dose postdialysis.
IM, IV (Children 1 mo–5 yr): 2.5 mg/kg/dose every 8 hr; *Once daily*—5–7.5 mg/kg/dose every 24 hr; *Cystic fibrosis*—2.5–3.3 mg/kg/dose every 6–8 hr; *Hemodialysis*—1.25–1.75 mg/kg/dose postdialysis.
IM, IV (Neonates full term and/or >1 wk): *Weight <1200 g*—2.5 mg/kg/dose every 18–24 hr; *Weight 1200–2000 g*—2.5 mg/kg/dose every 8–12 hr; *Weight >2000 g*—2.5 mg/kg/dose every 8 hr; *ECMO*—2.5 mg/kg/dose every 18 hr, subsequent doses based on serum concentrations; *Once daily*—3.5–5 mg/kg/dose every 24 hr.

© F.A. Davis Publishing

IM, IV (Neonates premature and/or ≤1 wk): *Weight <1000 g*—3.5 mg/kg/dose every 24 hr; *Weight 1000–1200 g*—2.5 mg/kg/dose every 18–24 hr; *Weight >1200 g*—2.5 mg/kg/dose every 12 hr; *Once daily*—3.5–4 mg/kg/dose every 24 hr.
IT (Adults): 4–8 mg/day.
IT (Infants >3 mo and Children): 1–2 mg/day.
IT (Neonates): 1 mg/day.
Topical (Adults and Children >1 mo): Apply cream or ointment 3–4 times daily.

Renal Impairment

IM, IV (Adults): Initial dose of 2 mg/kg. Subsequent doses/intervals based on blood level monitoring and renal function assessment.

Neomycin

PO (Adults): *Preoperative intestinal antisepsis*—1 g every hr for 4 doses, then 1 g every 4 hr for 5 doses *or* 1 g at 1 PM, 2 PM, and 11 PM on day before surgery; *Hepatic encephalopathy*—1–3 g every 6 hr for 5–6 days; may be followed by 4 g/day chronically.
PO (Children): *Preoperative intestinal antisepsis*—15 mg/kg every 4 hr for 2 days *or* 25 mg/kg at 1 PM, 2 PM, and 11 PM on day before surgery; *Hepatic encephalopathy*—12.5–25 mg/kg every 6 hr for 5–6 days (maximum dose = 12 g/day).

Streptomycin

IM (Adults): *Tuberculosis*—1 g/day initially, ↓ to 1 g 2–3 times weekly; *Other infections*—250 mg–1 g every 6 hr *or* 500 mg–2 g every 12 hr.
IM (Children): *Tuberculosis*—20 mg/kg/day (not to exceed 1 g/day); *Other infections*—5–10 mg/kg every 6 hr *or* 10–20 mg/kg every 12 hr.

Renal Impairment

IM (Adults): 1 g initially, further dosing determined by blood level monitoring and assessment of renal function.

Tobramycin

IM, IV (Adults): 1–2 mg/kg every 8 hr *or* 4–6.6 mg/kg/day every 24 hr.
IM, IV (Adults): 3–6 mg/kg/day in 3 divided doses, or 4–6.6 mg/kg once daily.
IM, IV (Children >5 yr): 6–7.5 mg/kg/day divided every 8 hr, up to 13 mg/kg/day divided every 6–8 hr in cystic fibrosis patients (dosing interval may vary from every 6 hr–every 24 hr, depending on clinical situation).
IM, IV (Children 1 mo–5 yr): 7.5 mg/kg/day divided every 8 hr, up to 13 mg/kg/day divided every 6–8 hr in cystic fibrosis.
IM, IV (Neonates): *Preterm <1000 g*—3.5 mg/kg/dose every 24 hr; *0–4 weeks, <1200 g*—2.5 mg/kg/dose every 18 hr; *Postnatal age <7 days*—2.5 mg/kg/dose every 12 hr; *Postnatal age ≥8 days, 1200–2000 g*—2.5 mg/kg/dose every 8–12 hr; *Postnatal age ≥8 days, >2000 g*—2.5 mg/kg/dose every 8 hr.
Inhaln (Adults and Children ≥6 yr): *Nebulizer solution*—300 mg twice daily for 28 days, then off for 28 days, then repeat cycle; *Powder for inhalation*—Inhale contents of four 28-mg capsules twice daily for 28 days, then off for 28 days, then repeat cycle.

Renal Impairment

IM, IV (Adults): 1 mg/kg initially, further dosing determined by blood level monitoring and assessment of renal function.

Availability

Amikacin (generic available)

Solution for injection: 250 mg/mL. **Suspension for oral inhalation:** 590 mg/8.4 mL.

Gentamicin (generic available)

Premixed infusion: 60 mg/50 mL, 80 mg/50 mL, 80 mg/100 mL, 100 mg/50 mL, 100 mg/100 mL, 120 mg/100 mL. **Solution for injection:** 10 mg/mL, 40 mg/mL. **Topical cream:** 0.1%. **Topical ointment:** 0.1%.

Neomycin (generic available)

Tablets: 500 mg. ***In combination with:*** other topical antibiotics or anti-inflammatory agents for skin, ear, and eye infections. See Appendix N.

Streptomycin (generic available)

Lyophilized powder for injection: 1 g/vial.

Tobramycin (generic available)

Lyophilized powder for injection: 1200 mg/vial. **Nebulizer solution (Bethkis):** 300 mg/4 mL. **Nebulizer solution (TOBI, Kitabis Pak):** 300 mg/5 mL. **Powder for inhalation (TOBI Podhaler):** 28 mg/capsule. **Solution for injection:** 10 mg/mL, 40 mg/mL.

NURSING IMPLICATIONS

Assessment

- Assess for infection (vital signs, wound appearance, sputum, urine, stool, WBC) at beginning of and throughout therapy.
- Obtain specimens for culture and sensitivity before initiating therapy. First dose may be given before receiving results.
- Evaluate eighth cranial nerve function by audiometry before and throughout therapy. Hearing loss is usually in high-frequency range. Prompt recognition and intervention are essential in preventing permanent damage. Monitor for vestibular dysfunction (vertigo, ataxia, nausea, vomiting). Eighth cranial nerve dysfunction is associated with persistently elevated peak aminoglycoside levels. Discontinue aminoglycosides if tinnitus or subjective hearing loss occurs.

© F.A. Davis Publishing

- Monitor intake and output and daily weight to assess hydration status and renal function.
- Assess for signs of superinfection (fever, upper respiratory infection, vaginal itching or discharge, increasing malaise, diarrhea).
- **Hepatic Encephalopathy:** Monitor neurologic status. Before administering oral medication, assess patient's ability to swallow.
- ***Lab Test Considerations:*** Monitor renal function by urinalysis, specific gravity, BUN, serum creatinine, and CCr before and during therapy.
- May cause ↑ BUN, AST, ALT, serum alkaline phosphatase, bilirubin, creatinine, and LDH concentrations.
- May cause ↓ serum calcium, magnesium, potassium, and sodium concentrations (streptomycin and tobramycin).
- ***Toxicity and Overdose:*** Monitor blood levels periodically during oral, IM, and IV therapy; not needed for inhalation therapy. Timing of blood levels is important in interpreting results. Draw blood for peak levels 1 hr after IM injection and 30 min after a 30-min IV infusion is completed. Draw trough levels just before next dose. Peak level for **amikacin** is 20–30 mcg/mL; trough level should be <10 mcg/mL. Peak level for **gentamicin** and **tobramycin** should not exceed 10 mcg/mL; trough level should not exceed 2 mcg/mL. Peak level for **streptomycin** should not exceed 25 mcg/mL.

Implementation

- Keep patient well hydrated (1500–2000 mL/day) during therapy.
- **Preoperative Bowel Prep:** Neomycin is usually used in conjunction with erythromycin, a low-residue diet, and a cathartic or enema.
- **PO:** Neomycin may be administered without regard to meals.
- **IM:** IM administration should be deep into a well-developed muscle. Alternate injection sites.
- **IV:** If aminoglycosides and penicillins or cephalosporins must be administered concurrently, administer in separate sites, at least 1 hr apart.

Amikacin

IV Administration

- **Intermittent Infusion:** ***Dilution:*** Dilute with D5W, D10W, 0.9% NaCl, dextrose/saline combinations, or LR. Solution may be pale yellow without decreased potency. Stable for 24 hr at room temperature. ***Concentration:*** 10 mg/mL. ***Rate:*** Infuse over 30–60 min for adults and children and over 1–2 hr in infants.
- **Y-Site Compatibility:** acyclovir, aldesleukin, alemtuzumab, alfentanil, amifostine, aminophylline, amiodarone, anidulafungin, arsenic trioxide, ascorbic acid, atracurium, atropine, aztreonam, benztropine, bivalirudin, bleomycin, bumetanide, buprenorphine, butorphanol, calcium chloride, calcium gluconate, cangrelor, carboplatin, carmustine, caspofungin, cefazolin, cefepime, cefotaxime, cefotetan, cefoxitin, ceftaroline, ceftazidime, ceftriaxone, cefuroxime, chloramphenicol, chlorpromazine, cisatracurium, cisplatin, clindamycin, cyanocobalamin, cyclophosphamide, cyclosporine, cytarabine, dactinomycin, daptomycin, daunorubicin, dexamethasone, dexmedetomidine, digoxin, diltiazem, diphenhydramine, dobutamine, docetaxel, dopamine, doxorubicin hydrochloride, doxycycline, enalaprilat, ephedrine, epinephrine, epirubicin, epoetin alfa, eptifibatide, ertapenem, erythromycin, esmolol, etoposide, etoposide phosphate, famotidine, fentanyl, filgrastim, fluconazole, fludarabine, fluorouracil, foscarnet, fosphenytoin, furosemide, gemcitabine, gentamicin, glycopyrrolate, granisetron, hydrocortisone, hydromorphone, idarubicin, ifosfamide, imipenem/cilastatin, irinotecan, isoproterenol, ketamine, ketorolac, labetalol, leucovorin calcium, levofloxacin, lidocaine, linezolid, lorazepam, magnesium sulfate, mannitol, melphalan, meperidine, mesna, methotrexate, methylprednisolone, metoclopramide, metoprolol, midazolam, milrinone, mitoxantrone, morphine, multivitamins, mycophenolate, nafcillin, nalbuphine, naloxone, nicardipine, nitroglycerin, nitroprusside, norepinephrine, octreotide, ondansetron, oxaliplatin, oxytocin, paclitaxel, palonosetron, pamidronate, pancuronium, pemetrexed, papaverine, penicillin G, phenobarbital, phentolamine, phenylephrine, phytonadione, piperacillin/tazobactam, posaconazole, potassium acetate, potassium chloride, procainamide, prochlorperazine, promethazine, propranolol, protamine, pyridoxine, quinupristin/dalfopristin, remifentanil, rituximab, rocuronium, sargramostim, sodium acetate, sodium bicarbonate, succinylcholine, sufentanil, tacrolimus, theophylline, thiamine, thiotepa, tigecycline, tirofiban, tobramycin, topotecan, vancomycin, vasopressin, vecuronium, verapamil, vinblastine, vincristine, vinorelbine , voriconazole, warfarin, zidovudine, zoledronic acid.
- **Y-Site Incompatibility:** allopurinol, amphotericin B colloidal, amphotericin B lipid complex, amphotericin B liposome, azathioprine, dacarbazine, dantrolene, diazepam, diazoxide, folic acid, ganciclovir, heparin, hetastarch, indomethacin, mitomycin, pentamidine, pentobarbital, phenytoin, propofol, trastuzumab, trimethoprim/sulfamethoxazole.
- **Inhaln:** If using a bronchodilator or with known hyperreactive airway disease, chronic obstructive pulmonary disease, asthma, or bronchospasm, pretreat with short-acting selective beta-2 agonists.
- Allow to come to room temperature before administering with *Lamira™ Nebulizer System* only. Shake vial well for 10–15 sec. until contents appear uniform and well mixed. Flip up plastic top of vial and pull down on metal ring to open. Remove metal ring and rubber stopper carefully. Pour contents of vial into medication reservoir of the nebulizer handset.

© F.A. Davis Publishing

Gentamicin

IV Administration

- **Intermittent Infusion:** ***Dilution:*** Dilute each dose with D5W, 0.9% NaCl, or LR. Do not use solutions that are discolored or that contain a precipitate. ***Concentration:*** 10 mg/mL. ***Rate:*** Infuse slowly over 30 min–2 hr.
- **Y-Site Compatibility:** aldesleukin, alemtuzumab, alfentanil, alprostadil, amifostine, amikacin, aminophylline, amiodarone, anidulafungin, argatroban, ascorbic acid, atropine, aztreonam, benztropine, bivalirudin, bleomycin, bumetanide, buprenorphine, butorphanol, calcium chloride, calcium gluconate, carboplatin, carmustine, caspofungin, chlorpromazine, ciprofloxacin, cisatracurium, cisplatin, clindamycin, cyanocobalamin, cyclophosphamide, cyclosporine, cytarabine, dactinomycin, daptomycin, dexmedetomidine, dexrazoxane, digoxin, diltiazem, dimenhydrinate, diphenhydramine, dobutamine, docetaxel, dopamine, doxapram, doxorubicin, doxorubicin liposome, doxycycline, enalaprilat, ephedrine, epinephrine, epirubicin, epoetin alfa, eptifibatide, ertapenem, erythromycin, esmolol, etoposide, etoposide phosphate, famotidine, fenoldopam, fentanyl, fluconazole, fludarabine, fluorouracil, foscarnet, fosphenytoin, gemcitabine, glycopyrrolate, granisetron, hydromorphone, ifosfamide, imipenem/cilastatin, irinotecan, isoproterenol, ketamine, ketorolac, labetalol, leucovorin calcium, levofloxacin, lidocaine, linezolid, lorazepam, magnesium sulfate, mannitol, melphalan, meperidine, meropenem, mesna, methylprednisolone, metoclopramide, metoprolol, metronidazole, midazolam, milrinone, mitoxantrone, morphine, multivitamins, mycophenolate, nalbuphine, naloxone, nicardipine, nitroglycerin, nitroprusside, norepinephrine, octreotide, ondansetron, oxaliplatin, oxytocin, paclitaxel, palonosetron, pamidronate, pancuronium, papaverine, phenobarbital, phentolamine, phenylephrine, phytonadione, posaconazole, potassium acetate, potassium chloride, procainamide, prochlorperazine, promethazine, propranolol, protamine, pyridoxine, remifentanil, rituximab, rocuronium, sargramostim, sodium acetate, sodium bicarbonate, succinylcholine, sufentanil, tacrolimus, telavancin, theophylline, thiamine, thiotepa, tigecycline, tirofiban, tobramycin, topotecan, trastuzumab, vancomycin, vasopressin, vecuronium, verapamil, vinblastine, vincristine, vinorelbine, vitamin B complex with C, voriconazole, zidovudine, zoledronic acid.
- **Y-Site Incompatibility:** allopurinol, amphotericin B colloidal, amphotericin B lipid complex, amphotericin B liposome, azathioprine, cangrelor, cefotetan, dacarbazine, dantrolene, diazepam, diazoxide, folic acid, ganciclovir, idarubicin, indomethacin, methotrexate, pemetrexed, pentamidine, pentobarbital, phenytoin, propofol, trimethoprim/sulfamethoxazole.

Tobramycin

IV Administration

- **Intermittent Infusion:** ***Dilution:*** Dilute each dose of tobramycin in 50–100 mL of D5W, D10W, D5/0.9% NaCl, 0.9% NaCl, Ringer's or lactated Ringer's solution. ***Concentration:*** not >10 m g/mL. Pediatric doses may be diluted in proportionately smaller amounts. Stable for 24 hr at room temperature, 96 hr if refrigerated. ***Rate:*** Infuse slowly over 30–60 min in both adult and pediatric patients.
- **Y-Site Compatibility:** acyclovir, aldesleukin, alemtuzumab, alfentanil, alprostadil, alteplase, amifostine, aminophylline, amiodarone, anidulafungin, argatroban, ascorbic acid, atropine, aztreonam, benztropine, bivalirudin, bleomycin, bumetanide, buprenorphine, butorphanol, calcium chloride, calcium gluconate, carboplatin, carmustine, caspofungin, chloramphenicol, chlorpromazine, ciprofloxacin, cisatracurium, cisplatin, clindamycin, cyanocobalamin, cyclophosphamide, cyclosporine, cytarabine, dactinomycin, daptomycin, daunorubicin, dexmedetomidine, dexrazoxane, digoxin, diltiazem, dimenhydrinate, diphenhydramine, dobutamine, docetaxel, dopamine, doxorubicin, doxorubicin liposomal, doxycycline, enalaprilat, ephedrine, epinephrine, epirubicin, epoetin alfa, ertapenem, esmolol, etoposide, etoposide phosphate, famotidine, fenoldopam, fentanyl, filgrastim, fluconazole, fludarabine, fluorouracil, foscarnet, furosemide, gemcitabine, gentamicin, glycopyrrolate, granisetron, hydromorphone, idarubicin, ifosfamide, imipenem/cilastatin, irinotecan, isoproterenol, ketamine, ketorolac, labetalol, leucovorin calcium, levofloxacin, lidocaine, linezolid, lorazepam, magnesium sulfate, mannitol, melphalan, meperidine, mesna, methotrexate, methylprednisolone, metoclopramide, metoprolol, metronidazole, midazolam, milrinone, mitomycin, mitoxantrone, morphine, multivitamins, mycophenolate, nalbuphine, naloxone, nicardipine, nitroglycerin, nitroprusside, norepinephrine, octreotide, ondansetron, oxaliplatin, oxytocin, paclitaxel, palonosetron, pamidronate, pancuronium, papaverine, phenobarbital, phentolamine, phenylephrine, phytonadione, potassium acetate, potassium chloride, procainamide, prochlorperazine, promethazine, propranolol, protamine, pyridoxine, quinupristin/dalfopristin, remifentanil, rituximab, rocuronium, sodium acetate, sodium bicarbonate, succinylcholine, sufentanil, tacrolimus, telavancin, theophylline, thiamine, thiotepa, tigecycline, tirofiban, topotecan, trastuzumab, vancomycin, vasopressin, vecuronium, verapamil, vinblastine,

© F.A. Davis Publishing

vincristine, vinorelbine, voriconazole, zidovudine, zoledronic acid.
- **Y-Site Incompatibility:** allopurinol, amphotericin B colloidal, amphotericin B lipid complex, amphotericin B liposome, azathioprine, cangrelor, cefazolin, cefotetan, ceftriaxone, dacarbazine, dantrolene, dexamethasone, diazepam, diazoxide, folic acid, ganciclovir, hetastarch, indomethacin, oxacillin, pemetrexed, pentamidine, pentobarbital, phenytoin, piperacillin/tazobactam, propofol, sargramostim, trimethoprim/sulfamethoxazole.
- **Topical:** Cleanse skin before application. Wear gloves during application.
- **Inhaln:** Do not mix *TOBI* with dornase alpha in nebulizer.
- *TOBI Podhaler* capsules are not for oral use. Store capsules in blister until immediately before use. Use new Podhaler device provided with each weekly packet. Check to see capsule is empty after inhaling. If powder remains in capsule, repeat inhalation until capsule is empty.

Patient/Family Teaching

- Instruct patient to report signs of hypersensitivity, tinnitus, vertigo, hearing loss, rash, dizziness, or difficulty urinating.
- Advise patient of the importance of drinking plenty of liquids.
- Teach patients with a history of rheumatic heart disease or valve replacement the importance of using antimicrobial prophylaxis before invasive medical or dental procedures.
- Advise females of reproductive potential to notify health care professional if pregnancy is planned or suspected or if breast feeding. May cause irreversible deafness in babies.
- **PO:** Instruct patient to take neomycin as directed for full course of therapy. Take missed doses as soon as possible if not almost time for next dose; do not take double doses.
- Caution patient that neomycin may cause nausea, vomiting, or diarrhea.
- **Topical:** Instruct patient to wash affected skin gently and pat dry. Apply a thin film of ointment. Apply occlusive dressing only if directed by health care professional. Patient should assess skin and inform health care professional if skin irritation develops or infection worsens.
- **Inhaln: Amikacin**: Advise patient to omit missed doses and administer next dose next day; do not double doses. Instruct patient to read *Medication Guide* before starting and with each Rx refill in case of changes.
- Advise patient to notify health care professional if signs and symptoms of allergic inflammation of lungs (fever, wheezing, coughing, shortness of breath, fast breathing), hemoptysis (coughing up blood), bronchospasm (shortness of breath, difficult or labored breathing, wheezing, coughing, chest tightness) or worsening of COPD occur. **Tobramycin**: Instruct patient to take inhalation twice daily as close to 12 hr apart as possible; not <6 hr apart. Solution is colorless to pale yellow and may darken with age without effecting quality. Administer over 15 min period using a hand-held PARI LC PLUS reusable nebulizer with a *PARI VIOS (for Bethkis) or DeVibiss Pulmo Aide (for TOBI)* compressor. Instruct patient on multiple therapies to take others first and use *tobramycin* last. Tobramycin-induced bronchospasm may be reduced if tobramycin is administered after bronchodilators. Instruct patient to sit or stand upright during inhalation and breathe normally through mouthpiece of nebulizer. Nose clips may help patient breath through mouth. Store at room temperature for up to 28 days. Advise patient to disinfect the nebulizer parts (except tubing) by boiling them in water for a full 10 min every other treatment day.
- Instruct patient in correct technique for use of *TOBI Podhaler*. Wipe mouthpiece with clean, dry cloth after use; do not wash with water.

Evaluation/Desired Outcomes

- Resolution of the signs and symptoms of infection. If no response is seen within 3–5 days, new cultures should be taken.
- Prevention of infection in intestinal surgery (neomycin).
- Improved neurologic status in hepatic encephalopathy (neomycin).
- Endocarditis prophylaxis (gentamicin).

BEERS HIGH ALERT

amiodarone (am-ee-**oh**-da-rone)

Nexterone, Pacerone

Classification

Therapeutic: antiarrhythmics (class III)

Indications

Life-threatening ventricular arrhythmias unresponsive to less toxic agents. **Unlabeled Use: PO:** Management of supraventricular tachyarrhythmias. **IV:** As part of the Advanced Cardiac Life Support (ACLS) and Pediatric Advanced Life Support (PALS) guidelines for the management of ventricular fibrillation (VF)/pulseless ventricular tachycardia (VT) after cardiopulmonary resuscitation and defibrillation have failed; also for other life-threatening tachyarrhythmias.

Action

Prolongs action potential and refractory period. Inhibits adrenergic stimulation. Slows the sinus rate, increases PR and QT intervals, and decreases peripheral vascular resistance (vasodilation). **Therapeutic Effects:** Suppression of arrhythmias.

© F.A. Davis Publishing

Pharmacokinetics

Absorption: Slowly and variably absorbed from the GI tract (35–65%). IV administration results in complete bioavailability.
Distribution: Distributed to and accumulates slowly in body tissues. Reaches high levels in fat, muscle, liver, lungs, and spleen. Crosses the placenta and enters breast milk.
Protein Binding: 96% bound to plasma proteins.
Metabolism and Excretion: Metabolized by the liver, excreted into bile. Minimal renal excretion. One metabolite has antiarrhythmic activity.
Half-life: 13–107 days.

TIME/ACTION PROFILE (suppression of ventricular arrhythmias)

ROUTE	ONSET	PEAK	DURATION
PO	2–3 days (up to 2–3 mo)	3–7 hr	wk–mos
IV	2 hr	3–7 hr	unknown

Contraindications/Precautions

Contraindicated in: Patients with cardiogenic shock; Severe sinus node dysfunction; 2nd- and 3rd-degree AV block; Bradycardia (has caused syncope unless a pacemaker is in place); Hypersensitivity to amiodarone or iodine; Lactation: Lactation.
Use Cautiously in: History of HF; Thyroid disorders; Corneal refractive laser surgery; Severe pulmonary or liver disease; OB: May cause fetal harm (cardiac, thyroid, neurodevelopmental, neurological, and growth adverse effects). Should only be used during pregnancy when arrhythmias are refractory to other treatments or when other treatments are contraindicated; Pedi: Safety and effectiveness not established in children; Geri: Initiate therapy in older adults at the low end of the dosing range due to ↓ hepatic, renal, or cardiac function; comorbid disease; or other drug therapy.

Adverse Reactions/Side Effects

EENT: corneal microdeposits, abnormal sense of smell, dry eyes, optic neuritis, optic neuropathy, photophobia. **Resp:** ACUTE RESPIRATORY DISTRESS SYNDROME (ARDS), PULMONARY FIBROSIS, PULMONARY TOXICITY. **CV:** HF, WORSENING OF ARRHYTHMIAS, QT INTERVAL PROLONGATION, bradycardia, hypotension. **GI:** anorexia, constipation, nausea, vomiting, abdominal pain, abnormal sense of taste, ↑ liver enzymes. **GU:** ↓ libido, epididymitis. **Derm:** TOXIC EPIDERMAL NECROLYSIS (rare), photosensitivity, blue discoloration. **Endo:** hypothyroidism, hyperthyroidism. **Neuro:** ataxia, involuntary movement, paresthesia, peripheral neuropathy, poor coordination, tremor, confusional states, disorientation, hallucinations, dizziness, fatigue, malaise, headache, insomnia.

Interactions

Drug-Drug: ↑ risk of QT prolongation with **fluoroquinolones**, **macrolides**, and **azole antifungals** (undertake concurrent use with caution). ↑ levels of **digoxin** (↓ dose of digoxin by 50%). ↑ levels of **class I antiarrhythmics** (**quinidine**, **mexiletine**, **lidocaine**, or **flecainide**— ↓ doses of other drugs by 30–50%). ↑ levels of **cyclosporine**, **dextromethorphan**, **methotrexate**, **phenytoin**, **carvedilol**, and **theophylline**. **Phenytoin** ↓ amiodarone levels. ↑ activity of **warfarin** (↓ dose of warfarin by 33–50%). ↑ risk of bradyarrhythmias, sinus arrest, or AV heart block with **beta blockers**, **verapamil**, **diltiazem**, **digoxin**, **ivabradine**, or **clonidine**. ↑ risk of bradycardia when used with **sofosbuvir**, **ledipasvir/sofosbuvir**, **sofosbuvir/velpatasvir**, or **sofosbuvir/velpatasvir/voxilaprevir**; concurrent use not recommended. **Cholestyramine** may ↓ amiodarone levels. **Cimetidine** and **ritonavir** ↑ amiodarone levels. Risk of myocardial depression is ↑ by **volatile anesthetics**. ↑ risk of myopathy with **lovastatin** and **simvastatin** (do not exceed 40 mg/day of lovastatin or 20 mg/day of simvastatin).
Drug-Natural Products: St. John's wort induces enzymes that metabolize amiodarone; may ↓ levels and effectiveness. Avoid concurrent use.
Drug-Food: Grapefruit juice inhibits enzymes in the GI tract that metabolize amiodarone resulting in ↑ levels and risk of toxicity; avoid concurrent use.

Route/Dosage

Ventricular Arrhythmias

PO (Adults): 800–1600 mg/day in 1–2 doses for 1–3 wk, then 600–800 mg/day in 1–2 doses for 1 mo, then 400 mg/day maintenance dose.
PO (Children): 10 mg/kg/day (800 mg/1.72 m^2/day) for 10 days or until response or adverse reaction occurs, then 5 mg/kg/day (400 mg/1.72 m^2/day) for several wk, then ↓ to 2.5 mg/kg/day (200 mg/1.72 m^2/day) or lowest effective maintenance dose.
IV (Adults): 150 mg over 10 min, followed by 360 mg over the next 6 hr and then 540 mg over the next 18 hr. Continue infusion at 0.5 mg/min until oral therapy is initiated. If arrhythmia recurs, a small loading infusion of 150 mg over 10 min should be given; in addition, the rate of the maintenance infusion may be ↑. *Conversion to initial oral therapy*— If duration of IV infusion was <1 wk, oral dose should be 800–1600 mg/day; if IV infusion was 1–3 wk, oral dose should be 600–800 mg/day; if IV infusion was >3 wk, oral dose should be 400 mg/day. *ACLS guidelines for pulseless VF/VT*— 300 mg IV push, may repeat once after 3–5 min with 150 mg IV push (maximum cumulative dose 2.2 g/24 hr; unlabeled).
IV: Intraosseous (Children and infants): *PALS guidelines for pulseless VF/VT*— 5 mg/kg as a bolus;

© F.A. Davis Publishing

Perfusion tachycardia—5 mg/kg loading dose over 20–60 min (maximum of 15 mg/kg/day; unlabeled).

Supraventricular Tachycardia

PO (Adults): 600–800 mg/day for 1 wk or until desired response occurs or side effects develop, then ↓ to 400 mg/day for 3 wk, then maintenance dose of 200–400 mg/day.
PO (Children): 10 mg/kg/day (800 mg/1.72 m^2/day) for 10 days or until response or side effects occur, then 5 mg/kg/day (400 mg/1.72 m^2/day) for several wk, then ↓ to 2.5 mg/kg/day (200 mg/1.72 m^2/day) or lowest effective maintenance dose.

Availability (generic available)

Premixed infusion (Nexterone): 150 mg/100 mL D5W (does not contain polysorbate 80 or benzyl alcohol), 360 mg/200 mL D5W (does not contain polysorbate 80 or benzyl alcohol). **Solution for injection:** 50 mg/mL. **Tablets:** 100 mg, 200 mg, 400 mg.

NURSING IMPLICATIONS

Assessment

- Monitor ECG continuously during IV therapy or initiation of oral therapy. Monitor heart rate and rhythm throughout therapy; PR prolongation, slight QRS widening, and T-wave amplitude reduction with T-wave widening and bifurcation may occur. QT prolongation may be associated with worsening of arrhythmias; monitor closely during IV therapy. Report bradycardia or increase in arrhythmias promptly; patients receiving IV therapy may require slowing rate, discontinuing infusion, or inserting a temporary pacemaker.
- Assess pacing and defibrillation threshold in patients with pacemakers and implanted defibrillators at beginning and periodically during therapy.
- Assess for signs of pulmonary toxicity (rales/crackles, decreased breath sounds, pleuritic friction rub, fatigue, dyspnea, cough, wheezing, pleuritic pain, fever, hemoptysis, hypoxia). Chest x-ray and pulmonary function tests are recommended before therapy. Monitor chest x-ray every 3–6 mo during therapy to detect diffuse interstitial changes or alveolar infiltrates. Bronchoscopy or gallium radionuclide scan may also be used for diagnosis. Usually reversible after withdrawal, but fatalities have occurred.
- **IV:** Assess for signs and symptoms of ARDS throughout therapy. Report dyspnea, tachypnea, or rales/crackles promptly. Bilateral, diffuse pulmonary infiltrates are seen on chest x-ray.
- Monitor BP frequently. Hypotension usually occurs during first several hrs of therapy and is related to rate of infusion. If hypotension occurs, slow rate.
- **PO:** Assess for neurotoxicity (ataxia, proximal muscle weakness, tingling or numbness in fingers or toes, uncontrolled movements, tremors); common during initial therapy, but may occur within 1 wk to several mo of initiation of therapy and may persist for more than 1 yr after withdrawal. Dose reduction is recommended. Assist patient during ambulation to prevent falls.
- Ophthalmic exams should be performed before and regularly during therapy and whenever visual changes (photophobia, halos around lights, decreased acuity) occur. May cause permanent loss of vision.
- Assess for signs of thyroid dysfunction, especially during initial therapy. Lethargy; weight gain; edema of the hands, feet, and periorbital region; and cool, pale skin suggest hypothyroidism and may require decrease in dose or discontinuation of therapy and thyroid supplementation. Tachycardia; weight loss; nervousness; sensitivity to heat; insomnia; and warm, flushed, moist skin suggest hyperthyroidism and may require discontinuation of therapy and treatment with antithyroid agents.
- ***Lab Test Considerations:*** Monitor liver and thyroid functions before and every 6 mo during therapy. Drug effects persist long after discontinuation. Thyroid function abnormalities are common, but clinical thyroid dysfunction is uncommon.
- Monitor AST, ALT, and alkaline phosphatase at regular intervals during therapy, especially in patients receiving high maintenance dose. If liver function studies are 3 times normal or double in patients with elevated baseline levels or if hepatomegaly occurs, dose should be reduced.
- May cause asymptomatic ↑ in ANA titer concentrations.
- Monitor serum potassium, calcium, and magnesium prior to starting and periodically during therapy. Hypokalemia, hypocalcemia, and/or hypomagnesemia may ↓ effectiveness or cause additional arrhythmias; correct levels before beginning therapy. Monitor closely when converting from IV to oral therapy, especially in geriatric patients.

Implementation

- ***High Alert:*** IV vasoactive medications are inherently dangerous; fatalities have occurred from medication errors involving amiodarone. Before administering, have second practitioner check original order, dose calculations, and infusion pump settings. Patients should be hospitalized and monitored closely during IV therapy and initiation of oral therapy. IV therapy should be administered only by clinicians experienced in treating life-threatening arrhythmias.
- Do not confuse amiodarone with amantadine.
- **PO:** May be administered with meals and in divided doses if GI intolerance occurs or if daily dose exceeds 1000 mg.

IV Administration

- **IV:** Administer via volumetric pump; drop size may be reduced, causing altered dosing with drop counter infusion sets.
- Administer through an in-line filter.

© F.A. Davis Publishing

- Infusions exceeding 2 hr must be administered in glass or polyolefin bottles to prevent adsorption. However, polyvinyl chloride (PVC) tubing must be used during administration because concentrations and infusion rate recommendations have been based on PVC tubing.
- **IV Push:** ***Dilution:*** Administer undiluted. May also be diluted in 20–30 mL of D5W or 0.9% NaCl. ***Concentration:*** 50 mg/mL. ***Rate:*** Administer IV push.
- **Intermittent Infusion:** ***Dilution:*** Dilute 150 mg of amiodarone in 100 mL of D5W. Infusion stable for 2 hr in PVC bag, or use pre-mixed bags. ***Concentration:*** 1.5 mg/mL. ***Rate:*** Infuse over 10 min. Do not administer IV push.
- **Continuous Infusion:** ***Dilution:*** Dilute 900 mg (18 mL) of amiodarone in 500 mL of D5W. Infusion stable for 24 hr in glass or polyolefin bottle. ***Concentration:*** 1.8 mg/mL. Concentration may range from 1–6 mg/mL (concentrations >2 mg/mL must be administered via central venous catheter). ***Rate:*** Infuse at a rate of 1 mg/min for the first 6 hr, then decrease infusion rate to 0.5 mg/min and continue until oral therapy initiated.
- **Y-Site Compatibility:** alemtuzumab, alfentanil, amikacin, amphotericin B lipid complex, anidulafungin, arsenic trioxide, atracurium, atropine, bleomycin, buprenorphine, busulfan, butorphanol, calcium chloride, cangrelor, carboplatin, carmustine, caspofungin, cefepime, ceftaroline, ceftolozane/tazobactam, chlorpromazine, ciprofloxacin, cisatracurium, cisplatin, clindamycin, cyclophosphamide, cyclosporine, dacarbazine, dactinomycin, daptomycin, daunorubicin hydrochloride, dexmedetomidine, dexrazoxane, diltiazem, diphenhydramine, docetaxel, dopamine, doxycycline, droperidol, enalaprilat, ephedrine, epinephrine, erythromycin lactobionate, esmolol, etoposide, etoposide phosphate, famotidine, fenoldopam, fluconazole, gemcitabine, gentamicin, glycopyrrolate, granisetron, hetastarch, hydralazine, hydromorphone, idarubicin, ifosfamide, irinotecan, isavuconazonium, isoproterenol, ketamine, labetalol, lidocaine, linezolid, lorazepam, mannitol, meperidine, mesna, metoclopramide, metoprolol, metronidazole, midazolam, milrinone, mitoxantrone, morphine, moxifloxacin, mycophenolate, nafcillin, nalbuphine, naloxone, nicardipine, nitroglycerin, octreotide, ondansetron, oxaliplatin, palonosetron, pancuronium, pemetrexed, penicillin G potassium, pentamidine, phentolamine, phenylephrine, procainamide, prochlorperazine, promethazine, propranolol, quinupristin/dalfopristin, remifentanil, rifampin, rocuronium, streptozocin, succinylcholine, sufentanil, tacrolimus, tedizolid, theophylline, tirofiban, tobramycin, topotecan, vancomycin, vasopressin, vecuronium, vinblastine, vincristine, vinorelbine, voriconazole, zidovudine, zoledronic acid.
- **Y-Site Incompatibility:** acyclovir, allopurinol, amifostine, aminocaproic acid, aminophylline, ampicillin, ampicillin/sulbactam, azithromycin, bivalirudin, cefotaxime, cefotetan, ceftazidime, chloramphenicol, cytarabine, dantrolene, dexamethasone, diazepam, digoxin, doxorubicin, eravacycline, ertapenem, fludarabine, fluorouracil, foscarnet, fosphenytoin, ganciclovir, gemtuzumab ozogamicin, heparin, hydrocortisone, imipenem-cilastatin, ketorolac, leucovorin calcium, levofloxacin, melphalan, meropenem, meropenem/vaborbactam, methotrexate, micafungin, mitomycin, paclitaxel, pentobarbital, phenobarbital, phenytoin, piperacillin/tazobactam, plazomicin, potassium acetate, potassium phosphate, sodium acetate, sodium bicarbonate, sodium phosphate, thiopental, thiotepa, tigecycline, trimethoprim/sulfamethoxazole, verapamil.

Patient/Family Teaching

- Instruct patient to take amiodarone as directed. If a dose is missed, do not take at all. Consult health care professional if more than two doses are missed. Advise patient to read the *Medication Guide* prior to first dose and with each Rx refill in case of changes.
- Advise patient to avoid drinking grapefruit juice during therapy.
- Inform patient that side effects may not appear until several days, weeks, or yr after initiation of therapy and may persist for several mo after withdrawal.
- Teach patients to monitor pulse daily and report abnormalities.
- Advise patients that photosensitivity reactions may occur through window glass, thin clothing, and sunscreens. Protective clothing and sunblock are recommended during and for 4 mo after therapy. If photosensitivity occurs, dose reduction may be useful.
- Inform patients that bluish discoloration of the face, neck, and arms is a possible side effect of this drug after prolonged use. This is usually reversible and will fade over several mo. Notify health care professional if this occurs.
- Instruct male patients to notify health care professional if signs and symptoms of epididymitis (pain and swelling in scrotum) occur. May require reduction in dose.
- Advise patient to notify health care professional of all Rx or OTC medications, vitamins, or herbal products being taken and to consult with health care professional before taking other medications, especially St. John's wort.
- Instruct patient to notify health care professional of medication regimen before treatment or surgery.
- Advise patient to notify health care professional if signs and symptoms of thyroid dysfunction occur.

© F.A. Davis Publishing

- Rep: May be teratogenic. Advise females of reproductive potential use effective contraception and to avoid breast feeding during and after last dose of therapy. May cause neonatal bradycardia, QT prolongation, periodic ventricular extrasystoles; neonatal hypothyroidism (with or without goiter) detected antenatally or in the newborn and reported even after a few days of exposure; neonatal hyperthyroxinemia; neurodevelopmental abnormalities independent of thyroid function, including speech delay and difficulties with written language and arithmetic, delayed motor development, and ataxia; jerk nystagmus with synchronous head titubation; fetal growth retardation; and premature birth. Advise patient to notify health care professional if pregnancy is planned or suspected.
- Emphasize the importance of follow-up exams, including chest x-ray and pulmonary function tests every 3–6 mo and ophthalmic exams after 6 mo of therapy, and then annually.

Evaluation/Desired Outcomes

- Cessation of life-threatening ventricular arrhythmias. Adverse effects may take up to 4 mo to resolve.

BEERS

amitriptyline

(a-mee-**trip**-ti-leen)

Elavil, Levate

Classification

Therapeutic: antidepressants

Pharmacologic: tricyclic antidepressants

Indications

Depression. **Unlabeled Use:** Anxiety, insomnia, treatment-resistant depression. Chronic pain syndromes (i.e., fibromyalgia, neuropathic pain/chronic pain, headache, low back pain).

Action

Potentiates the effect of serotonin and norepinephrine in the CNS. Has significant anticholinergic properties. **Therapeutic Effects:** Antidepressant action.

Pharmacokinetics

Absorption: Well absorbed from the GI tract. **Distribution:** Widely distributed. **Protein Binding:** 95% bound to plasma proteins. **Metabolism and Excretion:** Extensively metabolized by the liver (primarily by CYP2D6 isoenzyme); the CYP2D6 enzyme system exhibits genetic polymorphism (~7% of population may be poor metabolizers and may have significantly ↑ amitriptyline concentrations and an ↑ risk of adverse effects).Some metabolites have antidepressant activity. Undergoes enterohepatic recirculation and secretion into gastric juices. Probably crosses the placenta and enters breast milk. **Half-life:** 10–50 hr.

TIME/ACTION PROFILE (antidepressant effect)

ROUTE	ONSET	PEAK	DURATION
PO	2–3 wk (up to 30 days)	2–6 wk	days–wk

Contraindications/Precautions

Contraindicated in: Angle-closure glaucoma; Known history of QTc interval prolongation, recent MI, or heart failure; Lactation: Lactation.

Use Cautiously in: May ↑ risk of suicide attempt/ideation especially during dose early treatment or dose adjustment; risk may be greater in children or adolescents; Patients with pre-existing cardiovascular disease; Prostatic hyperplasia (↑ risk of urinary retention); History of seizures (threshold may be ↓); OB: Use during pregnancy only if potential maternal benefit justifies potential fetal risk; Pedi: Children <12 yr (safety and effectiveness not established); Geri: Appears on Beers list. ↑ risk of adverse reactions in older adults, including falls secondary to sedative and anticholinergic effects.

Adverse Reactions/Side Effects

EENT: blurred vision, dry eyes, dry mouth. **CV:** ARRHYTHMIAS, TORSADE DE POINTES, hypotension, ECG changes, QT interval prolongation. **GI:** constipation, hepatitis, paralytic ileus, ↑ appetite, weight gain. **GU:** urinary retention, ↓ libido. **Derm:** photosensitivity. **Endo:** changes in blood glucose, gynecomastia. **Hemat:** blood dyscrasias. **Neuro:** SUICIDAL THOUGHTS, lethargy, sedation.

Interactions

Drug-Drug: Amitriptyline is metabolized in the liver by the cytochrome P450 2D6 enzyme, and its action may be affected by drugs that compete for metabolism by this enzyme, including other **antidepressants**, **phenothiazines**, **carbamazepine**, **class 1C antiarrhythmics** including **propafenone**, and **flecainide**; when these drugs are used concurrently with amitriptyline, dosage ↓ of one or the other or both may be necessary. Concurrent use of other drugs that inhibit the activity of the enzyme, including **cimetidine**, **quinidine**, **amiodarone**, and **ritonavir**, may result in ↑ effects of amitriptyline. May cause hypotension, tachycardia, and potentially fatal reactions when used with **MAO inhibitors** (avoid concurrent use—discontinue 2 wk before starting amitriptyline). Concurrent use with **SSRI antidepressants** may result in ↑ toxicity and should be avoided (**fluoxetine** should be stopped 5 wk before starting amitriptyline). Concurrent use with **clonidine** may result in hypertensive crisis and should be avoided. Concurrent use with **levodopa** may result in delayed or ↓ absorption of levodopa or hypertension. Blood levels and effects may be ↓ by **rifampin**, **rifapentine**, and **rifabutin**. Concurrent use with **moxifloxacin** ↑ risk of adverse cardiovascular reactions. ↑ CNS depression with other **CNS depressants** including **alcohol**, **antihistamines**, **clonidine**, **opioids**, and **sedative/hyp-**

© F.A. Davis Publishing

notics. **Barbiturates** may alter blood levels and effects. **Adrenergic** and **anticholinergic** side effects may be ↑ with other agents having **anticholinergic** properties. **Phenothiazines** or **oral contraceptives** ↑ levels and may cause toxicity. **Nicotine** may ↑ metabolism and alter effects.

Drug-Natural Products: St. John's wort may ↓ serum concentrations and efficacy. Concomitant use of **kava-kava**, **valerian**, or **chamomile** can ↑ CNS depression. ↑ anticholinergic effects with **jimson weed** and **scopolia**.

Route/Dosage

PO (Adults): 75 mg/day in divided doses; may be ↑ up to 150 mg/day *or* 50–100 mg at bedtime, may ↑ by 25–50 mg up to 150 mg (in hospitalized patients, may initiate with 100 mg/day, and ↑ total daily dose up to 300 mg).

PO (Geriatric Patients): 10–25 mg at bedtime; may ↑ by 10–25 mg weekly if tolerated (usual dose range = 25–150 mg/day).

Availability (generic available)

Tablets: 10 mg, 25 mg, 50 mg, 75 mg, 100 mg, 150 mg. **Cost:** *Generic*— 25 mg $9.33/100, 75 mg $9.83/100.

NURSING IMPLICATIONS

Assessment

- Obtain weight and BMI initially and periodically during treatment.
- Assess fasting glucose and cholesterol levels in overweight/obese individuals.
- Monitor BP and pulse before and during initial therapy. Notify health care professional of decreases in BP (10–20 mm Hg) or sudden increase in pulse rate. Patients taking high doses or with a history of cardiovascular disease should have ECG monitored before and periodically during therapy.
- **Depression:** Monitor mental status (orientation, mood behavior) frequently. Assess for suicidal tendencies, especially during early therapy. Restrict amount of drug available to patient.
- Assess for suicidal tendencies, especially during early therapy. Restrict amount of drug available to patient. Risk may be increased in children, adolescents, and adults ≤24 yrs. After starting therapy, children, adolescents, and young adults should be seen by health care professional at least weekly for 4 wk, every 3 wk for next 4 wk, and on advice of health care professional thereafter.
- **Pain:** Assess intensity, quality, and location of pain periodically during therapy. May require several wk for effects to be seen. Use pain scale to monitor effectiveness of medication. Assess for sexual dysfunction (decreased libido; erectile dysfunction). Geri: Geriatric patients started on amitriptyline may be at an increased risk for falls; start with low dose and monitor closely. Assess for anticholinergic effects (weakness and sedation).
- ***Lab Test Considerations:*** Assess leukocyte and differential blood counts, liver function, and serum glucose before and periodically during therapy. May cause an ↑ serum bilirubin and alkaline phosphatase. May cause bone marrow depression. Serum glucose may be ↑ or ↓.

Implementation

- Dose increases should be made at bedtime due to sedation. Dose titration is a slow process; may take wks to mos. May give entire dose at bedtime. Sedative effect may be apparent before antidepressant effect is noted. May require tapering to avoid withdrawal effects.
- **PO:** Administer medication with or immediately after a meal to minimize gastric upset. Tablet may be crushed and given with food or fluids.

Patient/Family Teaching

- Instruct patient to take medication as directed. If a dose is missed, take as soon as possible unless almost time for next dose; if regimen is a single dose at bedtime, do not take in the morning because of side effects. Advise patient that drug effects may not be noticed for at least 2 wk. Abrupt discontinuation may cause nausea, vomiting, diarrhea, headache, trouble sleeping with vivid dreams, and irritability.
- May cause drowsiness and blurred vision. Caution patient to avoid driving and other activities requiring alertness until response to drug is known.
- Orthostatic hypotension, sedation, and confusion are common during early therapy, especially in geriatric patients. Protect patient from falls and advise patient to make position changes slowly. Institute fall precautions. Advise patient to make position changes slowly. Refer as appropriate for nutrition/weight management and medical management.
- Advise patient to avoid alcohol or other CNS depressant drugs during and for 3–7 days after therapy has been discontinued.
- Advise patient, family and caregivers to look for suicidality, especially during early therapy or dose changes. Notify health care professional immediately if thoughts about suicide or dying, attempts to commit suicide, new or worse depression or anxiety, agitation or restlessness, panic attacks, insomnia, new or worse irritability, aggressiveness, acting on dangerous impulses, mania, or other changes in mood or behavior occur.
- Instruct patient to notify health care professional if urinary retention, dry mouth, or constipation persists. Sugarless candy or gum may diminish dry mouth, and an increase in fluid intake or bulk may prevent constipation. If symptoms persist, dose re-

© F.A. Davis Publishing

duction or discontinuation may be necessary. Consult health care professional if dry mouth persists for >2 wk.
- Caution patient to use sunscreen and protective clothing to prevent photosensitivity reactions. Alert patient that medication may turn urine blue-green in color.
- Inform patient of need to monitor dietary intake. Increase in appetite may lead to undesired weight gain.
- Advise patient to notify health care professional of medication regimen before treatment or surgery. Medication should be discontinued as long as possible before surgery.
- Rep: Advise patient to notify health care professional if pregnancy is planned or suspected and to avoid breast feeding.
- Therapy for depression is usually prolonged and should be continued for at least 3 mo to prevent relapse. Emphasize the importance of follow-up exams to monitor effectiveness, side effects, and improved coping skills. Advise patient and family that treatment is not a cure and symptoms can recur after discontinuation of medication.

Evaluation/Desired Outcomes
- Increased sense of well-being.
- Renewed interest in surroundings.
- Increased appetite.
- Improved energy level.
- Improved sleep.
- Decrease in chronic pain symptoms.
- Full therapeutic effects may be seen 2–6 wk after initiating therapy.

amLODIPine (am-**loe**-di-peen)
Katerzia, Norvasc

Classification
Therapeutic: antihypertensives
Pharmacologic: calcium channel blockers

Indications
Hypertension (as monotherapy or in combination with other antihypertensive agents). Chronic stable angina (as monotherapy or in combination with other antianginal agents). Vasospastic (Prinzmetal's) angina (as monotherapy or in combination with other antianginal agents). Recently documented coronary artery disease by angiography and without HF or an ejection fraction <40%.

Action
Inhibits the transport of calcium into myocardial and vascular smooth muscle cells, resulting in inhibition of excitation-contraction coupling and subsequent contraction. **Therapeutic Effects:** Reduction in BP. Decreased frequency and severity of attacks of angina. Reduction in risk of hospitalization for angina or coronary revascularization in patients with recently documented coronary artery disease.

Pharmacokinetics
Absorption: Well absorbed after oral administration (64–90%).
Distribution: Probably crosses the placenta.
Protein Binding: 95–98%.
Metabolism and Excretion: Mostly metabolized by the liver.
Half-life: 30–50 hr (↑ in geriatric patients and patients with hepatic impairment).

TIME/ACTION PROFILE (cardiovascular effects)

ROUTE	ONSET	PEAK	DURATION
PO	unknown	6–9 hr	24 hr

Contraindications/Precautions
Contraindicated in: Hypersensitivity; Systolic BP <90 mm Hg.
Use Cautiously in: Severe hepatic impairment (dose ↓ recommended); Aortic stenosis; History of HF; OB: Use during pregnancy only if potential maternal benefit justifies potential fetal risk; other calcium channel blockers preferred in pregnancy; Lactation: Use while breast feeding only if potential maternal benefit justifies potential risk to infant; Pedi: Children <6 yr (safety and effectiveness not established); Geri: ↑ risk of hypotension in older adults (dose ↓ recommended).

Adverse Reactions/Side Effects
CV: peripheral edema, angina, bradycardia, hypotension, palpitations. **Derm:** flushing. **GI:** gingival hyperplasia, nausea. **Neuro:** dizziness, fatigue.

Interactions
Drug-Drug: Strong CYP3A4 inhibitors, including **ketoconazole**, **itraconazole**, **clarithromycin**, and **ritonavir** may ↑ levels. Additive hypotension may occur when used concurrently with **fentanyl**, other **antihypertensives**, **nitrates**, acute ingestion of **alcohol**, or **quinidine**. Antihypertensive effects may be ↓ by concurrent use of **nonsteroidal anti-inflammatory agents**. May ↑ risk of neurotoxicity with **lithium**. ↑ risk of myopathy with **simvastatin** (do not exceed 20 mg/day of simvastatin). May ↑ **cyclosporine** and **tacrolimus** levels.

Route/Dosage
PO (Adults): 5–10 mg once daily; *antihypertensive in fragile or small patients or patients already receiving other antihypertensives*—initiate at 2.5 mg/day, ↑ as required/tolerated (up to 10 mg/day) as an antihypertensive therapy with 2.5 mg/day in patients with hepatic insufficiency.
PO (Geriatric Patients): *Antihypertensive*—Initiate therapy at 2.5 mg/day, ↑ as required/tolerated (up to 10 mg/day); *antianginal*—initiate therapy at 5 mg/day, ↑ as required/tolerated (up to 10 mg/day).
PO (Children >6 yr): 2.5–5 mg once daily.

Hepatic Impairment
PO (Adults): *Antihypertensive*—Initiate therapy at 2.5 mg/day, ↑ as required/tolerated (up to 10 mg/day);

© F.A. Davis Publishing

antianginal—initiate therapy at 5 mg/day, ↑ as required/tolerated (up to 10 mg/day).

Availability (generic available)

Tablets: 2.5 mg, 5 mg, 10 mg. **Cost:** *Generic*—2.5 mg $11.35/100, 5 mg $12.86/100, 10 mg $8.42/100. **Oral suspension:** 1 mg/mL. ***In combination with:*** aliskiren/hydrochlorothiazide (Amturnide), atorvastatin (Caduet), benazepril (Lotrel), olmesartan (Azor), olmesartan/hydrochlorothiazide (Tribenzor), perindopril (Prestalia), telmisartan (Twynsta), valsartan (Exforge), and valsartan/hydrochlorothiazide (Exforge HCT). See Appendix N.

NURSING IMPLICATIONS

Assessment

- Monitor BP and pulse before therapy, during dose titration, and periodically during therapy. Monitor ECG periodically during prolonged therapy.
- Monitor intake and output ratios and daily weight. Assess for signs of HF (peripheral edema, rales/crackles, dyspnea, weight gain, jugular venous distention).
- Monitor frequency of prescription refills to determine adherence.
- **Angina:** Assess location, duration, intensity, and precipitating factors of patient's anginal pain.
- ***Lab Test Considerations:*** Total serum calcium concentrations are not affected by calcium channel blockers.

Implementation

- Do not confuse amlodipine with amiloride.
- **PO:** May be administered without regard to meals.
- Solution is a white to off-white liquid suspension. Shake before using.

Patient/Family Teaching

- Advise patient to take medication as directed, even if feeling well. Take missed doses as soon as possible within 12 hrs of missed dose. If >12 hrs since missed dose, skip dose and take next dose at scheduled time; do not double doses. May need to be discontinued gradually.
- Instruct patient on correct technique for monitoring pulse. Instruct patient to contact health care professional if heart rate is <50 bpm.
- Caution patient to change positions slowly to minimize orthostatic hypotension.
- May cause drowsiness or dizziness. Advise patient to avoid driving or other activities requiring alertness until response to the medication is known.
- Instruct patient on importance of maintaining good dental hygiene and seeing dentist frequently for teeth cleaning to prevent tenderness, bleeding, and gingival hyperplasia (gum enlargement).
- Instruct patient to notify health care professional of all Rx or OTC medications, vitamins, or herbal products being taken, to avoid alcohol, and to consult health care professional before taking any new medications, especially cold preparations.
- Advise patient to notify health care professional if irregular heartbeats, dyspnea, swelling of hands and feet, pronounced dizziness, nausea, constipation, or hypotension occurs or if headache is severe or persistent.
- Caution patient to wear protective clothing and use sunscreen to prevent photosensitivity reactions.
- Advise patient to inform health care professional of medication regimen before treatment or surgery.
- Advise females of reproductive potential to notify health care professional if pregnancy is planned or suspected or if breast feeding.
- **Angina:** Instruct patient on concurrent nitrate or beta-blocker therapy to continue taking both medications as directed and to use SL nitroglycerin as needed for anginal attacks.
- Advise patient to contact health care professional if chest pain does not improve or worsens after therapy, if it occurs with diaphoresis, if shortness of breath occurs, or if severe, persistent headache occurs.
- Caution patient to discuss exercise restrictions with health care professional before exertion.
- **Hypertension:** Encourage patient to comply with other interventions for hypertension (weight reduction, low-sodium diet, smoking cessation, moderation of alcohol consumption, regular exercise, and stress management). Medication controls but does not cure hypertension.
- Instruct patient and family in proper technique for monitoring BP. Advise patient to take BP weekly and to report significant changes to health care professional.

Evaluation/Desired Outcomes

- Decrease in BP.
- Decrease in frequency and severity of anginal attacks.
- Decrease in need for nitrate therapy.
- Increase in activity tolerance and sense of well-being. Reduction in risk of hospitalization for angina or coronary revascularization in patients with recently documented coronary artery disease.

amoxicillin (a-mox-i-**sill**-in)

~~Amoxil~~, ~~Trimox~~

Classification

Therapeutic: anti-infectives, antiulcer agents
Pharmacologic: aminopenicillins

Indications

Treatment of: Skin and skin structure infections, Otitis media, Sinusitis, Respiratory infections, Genitourinary infections. Endocarditis prophylaxis. Postexposure in-

© F.A. Davis Publishing

halational anthrax prophylaxis. Management of ulcer disease due to *Helicobacter pylori*. **Unlabeled Use:** Lyme disease in children <8 yr.

Action

Binds to bacterial cell wall, causing cell death. **Therapeutic Effects:** Bactericidal action; spectrum is broader than penicillins. **Spectrum:** Active against: Streptococci, Pneumococci, Enterococci, *Haemophilus influenzae*, *Escherichia coli*, *Proteus mirabilis*, *Neisseria meningitidis*, *N. gonorrhoeae*, *Shigella*, *Chlamydia trachomatis*, *Salmonella*, *Borrelia burgdorferi*, *H. pylori*.

Pharmacokinetics

Absorption: Well absorbed from duodenum (75–90%). More resistant to acid inactivation than other penicillins.
Distribution: Diffuses readily into most body tissues and fluids. CSF penetration increased when meninges are inflamed. Crosses placenta; enters breast milk in small amounts.
Metabolism and Excretion: 70% excreted unchanged in the urine; 30% metabolized by the liver.
Half-life: Neonates: 3.7 hr; Infants and Children: 1–2 hr; Adults: 0.7–1.4 hr.

TIME/ACTION PROFILE (blood levels)

ROUTE	ONSET	PEAK	DURATION
PO	30 min	1–2 hr	8–12 hr

Contraindications/Precautions

Contraindicated in: Hypersensitivity to penicillins (cross-sensitivity exists to cephalosporins and other beta-lactams).
Use Cautiously in: Severe renal impairment (↓ dose if CCr <30 mL/min); Infectious mononucleosis, acute lymphocytic leukemia, or cytomegalovirus infection (↑ risk of rash); OB, Lactation: Has been used safely.

Adverse Reactions/Side Effects

Derm: rash, urticaria. **GI:** CLOSTRIDIOIDES DIFFICILE-ASSOCIATED DIARRHEA (CDAD), diarrhea, nausea, vomiting, ↑ liver enzymes. **Hemat:** blood dyscrasias. **Neuro:** SEIZURES (high doses). **Misc:** HYPERSENSITIVITY REACTIONS (including anaphylaxis), SERUM SICKNESS, superinfection.

Interactions

Drug-Drug: Probenecid ↓ renal excretion and ↑ blood levels of amoxicillin—therapy may be combined for this purpose. May ↑ effect of **warfarin**. May ↓ effectiveness of **oral contraceptives**. **Allopurinol** may ↑ frequency of rash.

Route/Dosage

Most Infections

PO (Adults): 250–500 mg every 8 hr *or* 500–875 mg every 12 hr (not to exceed 2–3 g/day).
PO (Children >3 mo): 25–50 mg/kg/day in divided doses every 8 hr *or* 25–50 mg/kg/day in divided doses every 12 hr; *Acute otitis media due to highly resistant strains of S. pneumoniae*—80–90 mg/kg/day in divided doses every 12 hr; *Postexposure inhalational anthrax prophylaxis*—<40 kg: 45 mg/kg/day in divided doses every 8 hr; >40 kg: 500 mg every 8 hr.
PO (Infants ≤3 mo and neonates): 20–30 mg/kg/day in divided doses every 12 hr.

H. Pylori

PO (Adults): *Triple therapy*—1000 mg amoxicillin twice daily with lansoprazole 30 mg twice daily and clarithromycin 500 mg twice daily for 14 days *or* 1000 mg amoxicillin twice daily with omeprazole 20 mg twice daily and clarithromycin 500 mg twice daily for 14 days *or* amoxicillin 1000 mg twice daily with esomeprazole 40 mg daily and clarithromycin 500 mg twice daily for 10 days. *Dual therapy*—1000 mg amoxicillin three times daily with lansoprazole 30 mg three times daily for 14 days.

Endocarditis Prophylaxis

PO (Adults): 2 g 1 hr prior to procedure.
PO (Children): 50 mg/kg 1 hr prior to procedure (not to exceed adult dose).

Gonorrhea

PO (Adults and Children ≥40 kg): Single 3 g dose.
PO (Children >2 yr and <40 kg): 50 mg/kg with probenecid 25 mg/kg as a single dose.

Renal Impairment

PO (Adults): *CCr 10–30 mL/min*—250–500 mg every 12 hr; *CCr <10 mL/min*—250–500 mg every 24 hr.

Availability (generic available)

Capsules: 250 mg, 500 mg. **Cost:** *Generic*—250 mg $5.90/30, 500 mg $5.90/30. **Chewable tablets (cherry, banana, peppermint flavors):** 125 mg, 250 mg. **Cost:** *Generic*—250 mg $15.89/30. **Powder for oral suspension (strawberry [125 mg/5 mL] and bubblegum [200 mg/5 mL, 250 mg/5 mL, 400 mg/5 mL] flavors):** 125 mg/5 mL, 200 mg/5 mL, 250 mg/5 mL, 400 mg/5 mL. **Cost:** *Generic*—125 mg/5 mL $4.11/150 mL, 200 mg/5 mL $6.84/75 mL, 250 mg/5 mL $6.09/100 mL, 400 mg/5 mL $7.33/75 mL. **Tablets:** 500 mg, 875 mg. **Cost:** *Generic*—875 mg $9.53/30. ***In combination with:*** clarithromycin and lansoprazole in a compliance package (Prevpac); omeprazole and rifabutin (Talicia). See Appendix N.

NURSING IMPLICATIONS

Assessment

- Assess for infection (vital signs; appearance of wound, sputum, urine, and stool; WBC) at beginning of and throughout therapy.
- Obtain a history before initiating therapy to determine previous use of and reactions to penicillins or cephalosporins. Persons with a negative history of penicillin sensitivity may still have an allergic response.

© F.A. Davis Publishing

- Monitor for signs and symptoms of anaphylaxis (rash, pruritus, laryngeal edema, wheezing). Notify health care professional immediately if these occur.
- Obtain specimens for culture and sensitivity prior to therapy. First dose may be given before receiving results.
- Monitor bowel function. Diarrhea, abdominal cramping, fever, and bloody stools should be reported to health care professional promptly as a sign of Clostridioides difficile-associated diarrhea (CDAD). May begin up to several wk following cessation of therapy.
- ***Lab Test Considerations:*** May cause ↑ serum alkaline phosphatase, LDH, AST, and ALT concentrations.
- May cause false-positive direct Coombs' test result.

Implementation

- **PO:** Administer around the clock. May be given without regard to meals or with meals to decrease GI side effects. Capsule contents may be emptied and swallowed with liquids. ***DNC:*** Swallow extended-release tablets whole; do not crush, break, or chew. Crush or chew chewable tablets before swallowing with liquids.
- Shake oral suspension before administering. Suspension may be given straight or mixed in formula, milk, fruit juice, water, or ginger ale. Administer immediately after mixing. Discard refrigerated reconstituted suspension after 10 days.

Patient/Family Teaching

- Instruct patients to take medication around the clock and to finish the drug completely as directed, even if feeling better. Advise patients that sharing of this medication may be dangerous.
- Pedi: Teach parents or caregivers to calculate and measure doses accurately. Reinforce importance of using measuring device supplied by pharmacy or with product, not household items.
- Advise patient to report the signs of superinfection (furry overgrowth on the tongue, vaginal itching or discharge, loose or foul-smelling stools) and allergy.
- Instruct patient to notify health care professional immediately if diarrhea, abdominal cramping, fever, or bloody stools occur and not to treat with antidiarrheals without consulting health care professional.
- Instruct the patient to notify health care professional if symptoms do not improve.
- Teach patients with a history of rheumatic heart disease or valve replacement the importance of using antimicrobial prophylaxis before invasive medical or dental procedures.
- Rep: Caution female patients taking oral contraceptives to use an alternate or additional nonhormonal method of contraception during therapy with amoxicillin and until next menstrual period.

Evaluation/Desired Outcomes

- Resolution of the signs and symptoms of infection. Length of time for complete resolution depends on the organism and site of infection.
- Endocarditis prophylaxis.
- Eradication of *H. pylori* with resolution of ulcer symptoms.
- Prevention of inhalational anthrax (postexposure).

amoxicillin/clavulanate

(a-mox-i-**sill**-in/klav-yoo-**lan**-ate)

Augmentin, Augmentin ES, Clavulin

Classification

Therapeutic: anti-infectives

Pharmacologic: aminopenicillins/beta-lactamase inhibitors

Indications

Treatment of a variety of infections including: Skin and skin structure infections, Otitis media, Sinusitis, Respiratory tract infections, Genitourinary tract infections.

Action

Binds to bacterial cell wall, causing cell death; spectrum of amoxicillin is broader than penicillin. Clavulanate resists action of beta-lactamase, an enzyme produced by bacteria that is capable of inactivating some penicillins. **Therapeutic Effects:** Bactericidal action against susceptible bacteria. **Spectrum:** Active against: Streptococci, Pneumococci, Enterococci, *Haemophilus influenzae*, *Escherichia coli*, *Proteus mirabilis*, *Neisseria meningitidis*, *N. gonorrhoeae*, *Staphylococcus aureus*, *Klebsiella pneumoniae*, *Shigella*, *Salmonella*, *Moraxella catarrhalis*.

Pharmacokinetics

Absorption: Well absorbed from the duodenum (75–90%). More resistant to acid inactivation than other penicillins.

Distribution: Diffuses readily into most body tissues and fluids. Does not readily enter brain/CSF; CSF penetration is ↑ in the presence of inflamed meninges. Crosses the placenta and enters breast milk in small amounts.

Metabolism and Excretion: 70% excreted unchanged in the urine; 30% metabolized by the liver.

Half-life: 1–1.3 hr.

TIME/ACTION PROFILE (peak blood levels)

ROUTE	ONSET	PEAK	DURATION
PO	30 min	1–2 hr	8–12 hr

Contraindications/Precautions

Contraindicated in: Hypersensitivity to penicillins or clavulanate; Suspension and chewable tablets con-

© F.A. Davis Publishing

tain aspartame and should be avoided in phenylketonurics; History of amoxicillin/clavulanate-associated cholestatic jaundice.

Use Cautiously in: Severe renal insufficiency (dose ↓ necessary); Infectious mononucleosis (↑ risk of rash); Hepatic impairment (dose cautiously, monitor liver function).

Adverse Reactions/Side Effects

GI: CLOSTRIDIOIDES DIFFICILE-ASSOCIATED DIARRHEA (CDAD), diarrhea, hepatic dysfunction, nausea, vomiting. **GU:** vaginal candidiasis. **Derm:** rash, urticaria. **Hemat:** blood dyscrasias. **Neuro:** SEIZURES (high doses). **Misc:** allergic reactions including ANAPHYLAXIS and SERUM SICKNESS, superinfection.

Interactions

Drug-Drug: Probenecid ↓ renal excretion and ↑ blood levels of amoxicillin—therapy may be combined for this purpose. May ↑ the effect of **warfarin**. Concurrent **allopurinol** therapy ↑ risk of rash. May ↓ the effectiveness of **hormonal contraceptives**.

Drug-Food: Clavulanate absorption is ↓ by a **high fat** meal.

Route/Dosage

Most Infections (Dosing based on amoxicillin component)

PO (Adults and Children >40 kg): 250 mg every 8 hr or 500 mg every 12 hr.

Serious Infections and Respiratory Tract Infections

PO (Adults and Children >40 kg): 875 mg every 12 hr *or* 500 mg every 8 hr; *Acute bacterial sinusitis*—2000 mg every 12 hr for 10 days as extended release product; *Community-acquired pneumonia*—2000 mg every 12 hr for 7–10 days as extended release product.

Recurrent/persistent acute otitis media due to Multidrug-resistant *Streptococcus pneumonia, H. influenzae,* or *M. catarrhalis*

PO (Children <40 kg): 80–90 mg/kg/day in divided doses every 12 hr for 10 days (as ES formulation only).

Renal Impairment

PO (Adults): *CCr 10–30 mL/min*—250–500 mg every 12 hr (do not use 875 mg tablet); *CCr <10 mL/min*—250–500 mg every 24 hr.

Otitis Media, Sinusitis, Lower Respiratory Tract Infections, Serious Infections

PO (Children ≥3 mo): *200 mg/5 mL or 400 mg/5 mL suspension*—45 mg/kg/day divided every 12 hr; *125 mg/5 mL or 250 mg/5 mL suspension*—40 mg/kg/day divided every 8 hr.

Less Serious Infections

PO (Children ≥3 mo): *200 mg/5 mL or 400 mg/5 mL suspension*—25 mg/kg/day divided every 12 hr *or* 20 mg/kg/day divided every 8 hr (as 125 mg/5 mL or 250 mg/5 mL suspension).

PO (Children <3 mo): 15 mg/kg every 12 hr (125 mg/mL suspension recommended).

Availability (generic available)

Chewable tablets (cherry-banana flavor): 200 mg amoxicillin with 28.5 mg clavulanate, 400 mg amoxicillin with 57 mg clavulanate. **Cost:** *Generic*—200 mg $36.17/20, 400 mg $68.93/20. **Extended-release tablets (scored):** 1000 mg amoxicillin with 62.5 mg clavulanate. **Cost:** *Generic*—$108.62/28. **Immediate-release tablets:** 250 mg amoxicillin with 125 mg clavulanate, 500 mg amoxicillin with 125 mg clavulanate, 875 mg amoxicillin with 125 mg clavulanate. **Cost:** *Generic*—500 mg $18.98/20, 875 mg $23.46/30. **Powder for oral suspension (125 mg/5 mL is banana flavor; 200 mg/5mL is fruit flavor; 250 mg/5 mL is orange flavor; 400 mg/5 mL is fruit flavor; 600 mg/5 mL is orange or strawberry-creme flavor):** 125 mg amoxicillin with 31.25 mg clavulanate/5 mL, 200 mg amoxicillin with 28.5 mg clavulanate/5 mL, 250 mg amoxicillin with 62.5 mg clavulanate/5 mL, 400 mg amoxicillin with 57 mg clavulanate/5 mL, 600 mg amoxicillin with 42.9 mg clavulanate/5 mL (ES formulation). **Cost:** *Generic*—200 mg $36.17/100 mL, 250 mg $86.43/100 mL, 400 mg $68.93/100 mL, 600 mg $83.03/125 mL.

NURSING IMPLICATIONS

Assessment

- Assess for infection (vital signs; appearance of wound, sputum, urine, and stool; WBC) at beginning of and during therapy.
- Obtain a history before initiating therapy to determine previous use of and reactions to penicillins or cephalosporins. Persons with a negative history of penicillin sensitivity may still have an allergic response.
- Observe for signs and symptoms of anaphylaxis (rash, pruritus, laryngeal edema, wheezing). Notify health care professional immediately if these occur.
- Obtain specimens for culture and sensitivity prior to therapy. First dose may be given before receiving results.
- Monitor bowel function. Diarrhea, abdominal cramping, fever, and bloody stools should be reported to health care professional promptly as a sign of Clostridioides difficile-associated diarrhea (CDAD). May begin up to several wk following cessation of therapy.
- ***Lab Test Considerations:*** May cause ↑ serum alkaline phosphatase, LDH, AST, and ALT concentrations. Elderly men and patients receiving prolonged treatment are at ↑ risk for hepatic dysfunction.
- May cause false-positive direct Coombs' test result.

Implementation

- **PO:** Administer around the clock. Administer at the start of a meal to enhance absorption and to decrease GI side effects. Do not administer with high fat meals;

© F.A. Davis Publishing

clavulanate absorption is decreased. XR tablet is scored and can be broken for ease of administration. Capsule contents may be emptied and swallowed with liquids. Chewable tablets should be crushed or chewed before swallowing with liquids. Shake oral suspension before administering. Refrigerated reconstituted suspension should be discarded after 10 days.

- Two 250-mg tablets are not bioequivalent to one 500-mg tablet; 250-mg tablets and 250-mg chewable tablets are also not interchangeable. Two 500-mg tablets are not interchangeable with one 1000-mg extended release tablet; amounts of clavulanic acid and durations of action are different. Augmentin ES 600 (600 mg/5 mL) does not contain the same amount of clavulanic acid as any of the other Augmentin suspensions. Suspensions are not interchangeable.
- Pedi: Do not administer 250-mg chewable tablets to children <40 kg due to clavulanate content. Children <3 mo should receive the 125-mg/5 mL oral solution.

Patient/Family Teaching

- Instruct patients to take medication around the clock and to finish the drug completely as directed, even if feeling better. Advise patients that sharing of this medication may be dangerous.
- Pedi: Teach parents or caregivers to calculate and measure doses accurately. Reinforce importance of using measuring device supplied by pharmacy or with product, not household items.
- Advise patient to report the signs of superinfection (furry overgrowth on the tongue, vaginal itching or discharge, loose or foul-smelling stools) and allergy.
- Instruct patient to notify health care professional immediately if diarrhea, abdominal cramping, fever, or bloody stools occur and not to treat with antidiarrheals without consulting health care professionals.
- Instruct the patient to notify health care professional if symptoms do not improve or if nausea or diarrhea persists when drug is administered with food.
- Rep: Instruct females of reproductive potential taking oral contraceptives to use an alternate or additional method of contraception during therapy and until next menstrual period; may decrease effectiveness of hormonal contraceptives. Advise patient to notify health care professional if pregnancy is planned or suspected or if breast feeding.

Evaluation/Desired Outcomes

- Resolution of the signs and symptoms of infection. Length of time for complete resolution depends on the organism and site of infection.

amphetamine mixtures

(am-**fet**-a-meen)

~~Adderall~~, Adderall XR, Mydayis

Classification

Therapeutic: central nervous system stimulants

Schedule II

Indications

ADHD. Narcolepsy.

Action

Causes release of norepinephrine from nerve endings. Pharmacologic effects are: CNS and respiratory stimulation, Vasoconstriction, Mydriasis (pupillary dilation).

Therapeutic Effects: Increased motor activity, mental alertness, and decreased fatigue in narcoleptic patients. Increased attention span in ADHD.

Pharmacokinetics

Absorption: Well absorbed after oral administration.

Distribution: Widely distributed in body tissues, with high concentrations in the brain and CSF. Crosses placenta and enters breast milk.

Metabolism and Excretion: Some metabolism by the liver. Urinary excretion is pH-dependent. Alkaline urine promotes reabsorption and prolongs action.

Half-life: Children 6–12 yrs: 9–11 hr; Adults: 10–13 hr (depends on urine pH).

TIME/ACTION PROFILE (CNS stimulation)

ROUTE	ONSET	PEAK	DURATION
PO	tablet: 0.5–1 hr	tablet: 3 hr capsule: 7 hr	4–6 hr

Contraindications/Precautions

Contraindicated in: Hypersensitivity; Hyperexcitable states including hyperthyroidism; Psychotic personalities; Concurrent use or use within 14 days of MAO inhibitors or MAO-like drugs (linezolid or methylene blue); Suicidal or homicidal tendencies; Chemical dependence; Glaucoma; Structural cardiac abnormalities (may ↑ the risk of sudden death); End-stage renal disease; Lactation: Lactation.

Use Cautiously in: Cardiovascular disease (sudden death has occurred in children with structural cardiac abnormalities or other serious heart problems); History of substance use disorder (misuse may result in serious cardiovascular events/sudden death); Hypertension; Diabetes mellitus; Tourette's syndrome (may exacerbate tics); Severe renal impairment (↓ dose); OB: Use during pregnancy only if potential maternal benefit justifies potential fetal risk; may lead to premature delivery and low birth weight infants; Geri: Older adults may be more susceptible to side effects.

Adverse Reactions/Side Effects

CV: SUDDEN DEATH, palpitations, tachycardia, cardiomyopathy (increased with prolonged use, high doses), hy-

© F.A. Davis Publishing

pertension, hypotension, peripheral vasculopathy. **Derm:** alopecia, urticaria. **Endo:** growth inhibition (with long term use in children). **EENT:** blurred vision, mydriasis. **GI:** anorexia, constipation, cramps, diarrhea, dry mouth, metallic taste, nausea, vomiting. **GU:** erectile dysfunction, libido changes, priapism. **MS:** RHABDOMYOLYSIS. **Neuro:** paresthesia, hyperactivity, insomnia, restlessness, tremor, aggression, anger, behavioral disturbances, dizziness, hallucinations, headache, mania, irritability, skin picking, talkativeness, thought disorder, tics. **Misc:** HYPERSENSITIVITY REACTIONS (including anaphylaxis and angioedema), psychological dependence.

Interactions

Drug-Drug: Concurrent use with **MAO inhibitors** or **MAO-inhibitor-like drugs**, such as **linezolid** or **methylene blue** may result in serious, potentially fatal reactions; wait at least 14 days following discontinuation of MAO inhibitor before initiation of amphetamine mixtures. Drugs that affect serotonergic neurotransmitter systems, including **MAO inhibitors**, **tricyclic antidepressants**, **SSRIs**, **SNRIs**, **fentanyl**, **buspirone**, **tramadol**, **lithium**, and **triptans** ↑ risk of serotonin syndrome. ↑ adrenergic effects with other **adrenergics** or **thyroid preparations**. **Drugs that alkalinize urine (sodium bicarbonate, acetazolamide)** ↓ excretion, ↑ effects. **Drugs that acidify urine** (large doses of **ascorbic acid**) ↑ excretion, ↓ effects. ↑ risk of hypertension and bradycardia with **beta blockers**. ↑ risk of arrhythmias with **digoxin**. **Tricyclic antidepressants** may ↑ effect of amphetamine but may ↑ risk of arrhythmias, hypertension, or hyperpyrexia. **Proton pump inhibitors** may ↑ effects.

Drug-Natural Products: Use with **St. John's wort** may ↑ risk of serotonin syndrome.

Drug-Food: Foods that alkalinize the urine (fruit juices) can ↑ effect of amphetamine.

Route/Dosage

Dose is expressed in total amphetamine content (amphetamine + dextroamphetamine).

ADHD

PO (Adults): *Immediate-release tablets*—5 mg 1–2 times daily; may ↑ daily dose in 5–mg increments at weekly intervals; usual dose range = 5–40 mg/day in 1–3 divided doses. *Extended-release capsules (Adderall XR)*—20 mg once daily; *Extended-release capsules (Mydayis)*—12.5–25 mg once daily in the morning upon awakening; may ↑ daily dose in 12.5–mg increments at weekly intervals. (maximum dose = 50 mg/day).

PO (Children ≥13 yr): *Immediate-release tablets*—5 mg 1–2 times daily; may ↑ daily dose in 5–mg increments at weekly intervals; usual dose range = 5–40 mg/day in 1–3 divided doses. *Extended-release capsules (Adderall XR)*—10 mg once daily in the morning; may ↑ to 20 mg once daily in the morning after 1 wk; *Extended-release capsules (Mydayis)*—12.5 mg once daily in the morning upon awakening; may ↑ daily dose in 12.5–mg increments at weekly intervals (maximum dose = 25 mg/day).

PO (Children 6–12 yr): *Immediate-release tablets*—5 mg 1–2 times daily; may ↑ daily dose in 5–mg increments at weekly intervals; usual dose range = 5–40 mg/day in 1–3 divided doses. *Extended-release capsules (Adderall XR)*—5–10 mg once daily in the morning; may ↑ daily dose in 5–10–mg increments at weekly intervals (maximum dose = 30 mg/day).

PO (Children 3–5 yr): *Immediate-release tablets*—2.5 mg once daily in the morning; may ↑ daily dose in 2.5–mg increments at weekly intervals; usual dose range = 2.5–40 mg/day in 1–3 divided doses.

Renal Impairment

PO (Adults): *GFR 15–29 mL/min/1.73 m²*—Extended-release capsules (Adderall XR)—15 mg once daily in the morning; Extended–release capsules (Mydayis)—12.5 mg once daily in the morning upon awakening; may ↑ daily dose in 12.5–mg increments at weekly intervals (maximum dose = 25 mg/day).

Renal Impairment

(Children ≥13 yr): *GFR 15–29 mL/min/1.73 m²*—Extended–release capsules (Mydayis)—12.5 mg once daily in the morning upon awakening (maximum dose = 12.5 mg/day).

Renal Impairment

(Children ≥6 yr): *GFR 15–29 mL/min/1.73 m²*—Extended–release capsules (Adderall XR)—5 mg once daily in the morning (maximum dose = 20 mg/day in children 6–12 yrs).

Narcolepsy

PO (Adults and Children ≥13 yr): *Immediate-release tablets*—10 mg once daily in the morning; may ↑ daily dose in 10–mg increments at weekly intervals; usual dosage range = 5–60 mg/day in 1–3 divided doses.

PO (Children 6–12 yr): *Immediate-release tablets*—5 mg once daily; may ↑ daily dose in 5–mg increments at weekly intervals; usual dose range = 5–60 mg/day in 1–3 divided doses.

Availability (generic available)

Amount is expressed in total amphetamine content (amphetamine + dextroamphetamine).

Extended-release capsules (Adderall XR): 5 mg, 10 mg, 15 mg, 20 mg, 25 mg, 30 mg. **Cost:** *Generic*—All strengths $613.15/100. **Extended-release capsules (Mydayis):** 12.5 mg, 25 mg, 37.5 mg, 50 mg. **Tablets:** 5 mg, 7.5 mg, 10 mg, 12.5 mg, 15 mg, 20 mg, 30 mg. **Cost:** *Generic*—All strengths $171.40/100.

NURSING IMPLICATIONS

Assessment

- Monitor BP, pulse, and respiration before and periodically during therapy. Obtain a history (including assessment of family history of sudden death or ventricular arrhythmia), physical exam to assess for

© F.A. Davis Publishing

cardiac disease, and further evaluation (ECG and echocardiogram), if indicated. If exertional chest pain, unexplained syncope, or other cardiac symptoms occur, evaluate promptly.

- May produce a false sense of euphoria and well-being. Provide frequent rest periods and observe patient for rebound depression after the effects of the medication have worn off.
- Monitor closely for behavior change during therapy.
- Assess for risk of abuse before starting therapy. Monitor for signs and symptoms of abuse (increased heart rate, respiratory rate, blood pressure, sweating, dilated pupils, hyperactivity, restlessness, insomnia, decreased appetite, loss of coordination, tremors, flushed skin, vomiting, abdominal pain, anxiety, psychosis, hostility, aggression, suicidal or homicidal ideation) during therapy. Has high dependence and abuse potential. Tolerance to medication occurs rapidly; do not increase dose.
- Assess infants born to mothers taking amphetamines for symptoms of withdrawal (feeding difficulties, irritability, agitation, excessive drowsiness).
- **ADHD:** Monitor weight biweekly and height periodically and inform health care professional of significant loss.
- Assess child's attention span, impulse control, and interactions with others. Therapy may be interrupted at intervals to determine whether symptoms are sufficient to continue therapy.
- **Narcolepsy:** Observe and document frequency of narcoleptic episodes.
- ***Lab Test Considerations:*** May interfere with urinary steroid determinations.
- May cause ↑ plasma corticosteroid concentrations; greatest in evening.

Implementation

- **PO:** Administer in the morning to prevent insomnia. May be taken without regard to food. Individualize dose to therapeutic needs and response of patient. Use the lowest effective dose.
- Administer short acting doses 4–6 hrs apart.
- Extended-release capsules may be swallowed whole or opened and sprinkled on applesauce; swallow contents without chewing. Applesauce should be swallowed immediately; do not store. Do not divide contents of capsule; entire contents of capsule should be taken.
- **ADHD:** Pedi: When symptoms are controlled, dose reduction or interruption of therapy may be possible during summer mo or may be given on each of the 5 school days, with medication-free weekends and holidays.

Patient/Family Teaching

- Instruct patient to take medication once in the early morning as directed. With extended release capsule, avoid afternoon doses to prevent insomnia. Omit missed doses and resume schedule next day. Do not double doses. Discuss safe use, risks, and proper storage and disposal of amphetamines with patients and caregivers with each Rx. Advise patient and parents to read the *Medication Guide* prior to starting therapy and with each Rx refill in case of changes. Instruct patient not to alter dose without consulting health care professional. Abrupt cessation of high doses may cause extreme fatigue and mental depression.
- Advise patient that amphetamine mixtures are drugs with known abuse potential. Protect them from theft, and never give to anyone other than the individual for whom they were prescribed. Store out of sight and reach of children, and in a location not accessible by others. Amphetamine mixtures are a federally controlled substance (CII) because it can be abused or lead to dependence. Keep this medication in a safe place to prevent misuse and abuse. Selling or giving away amphetamines may harm others, and is against the law.
- Caution patients to inform health care professional if they have ever abused or been dependent on alcohol or drugs, or if they are now abusing or dependent on alcohol or drugs.
- Inform patient that the effects of drug-induced dry mouth can be minimized by rinsing frequently with water or chewing sugarless gum or candies.
- Advise patient to limit intake of foods that alkalinize the urine (fruit juices).
- May impair judgment. Advise patient to use caution when driving or during other activities requiring alertness until response to medication is known.
- Advise patient to notify health care professional of all Rx or OTC medications, vitamins, or herbal products being taken and to consult with health care professional before taking other medications, especially St. John's wort.
- Inform patient that periodic holidays from the drug may be used to assess progress and decrease dependence. Pedi: Children should be given a drug-free holiday each yr to reassess symptoms and treatment. Doses will change as children age due to pharmacokinetic changes such as slower hepatic metabolism.
- Advise patient and/or parents to notify health care professional of behavioral changes (new or worse behavior and thought problems, bipolar illness, or aggressive behavior or hostility; new psychotic symptoms such as hearing voices, believing things that are not true, are suspicious, or new manic symptoms).
- Advise patient to notify health care professional if symptoms of heart problems (chest pain, shortness of breath, fainting), nervousness, restlessness, insomnia, dizziness, anorexia, or dry mouth becomes severe. Pedi: If reduced appetite and weight loss occur, advise parents to provide high calorie meals

© F.A. Davis Publishing

when drug levels are low (at breakfast and or bedtime).
- Inform patients of risk of peripheral vasculopathy. Instruct patients to notify health care professional of any new numbness; pain; skin color change from pale, to blue, to red; or coolness or sensitivity to temperature in fingers or toes, and call if unexplained wounds appear on fingers or toes.
- Rep: Advise patient to notify health care professional if pregnancy is planned or suspected, and to avoid breast feeding. May cause birth complications. Enroll women exposed to amphetamine mixtures during pregnancy by calling the National Pregnancy Registry for Psychostimulants at 1-866-961-2388 or online at https://womensmentalhealth.org/clinical-and-research-programs/pregnancyregistry/other-medications/. Monitor infants born to mothers taking amphetamines for symptoms of withdrawal (feeding difficulties, irritability, agitation, excessive drowsiness).
- Emphasize the importance of routine follow-up exams to monitor progress.
- **Home Care Issues:** Advise parents to notify school nurse of medication regimen.

Evaluation/Desired Outcomes
- Improved attention span in patients with ADHD.
- Increased motor activity, mental alertness, and decreased fatigue in patients with narcolepsy.

ampicillin/sulbactam
(am-pi-**sil**-in/sul-**bak**-tam)
Unasyn

Classification
Therapeutic: anti-infectives
Pharmacologic: aminopenicillins/beta-lactamase inhibitors

Indications
Treatment of the following infections: Skin and skin structure infections, soft-tissue infections, Otitis media, Intra-abdominal infections, Sinusitis, Respiratory infections, Genitourinary infections, Meningitis, Septicemia.

Action
Binds to bacterial cell wall, resulting in cell death; spectrum is broader than that of penicillin. Addition of sulbactam increases resistance to beta-lactamases, enzymes produced by bacteria that may inactivate ampicillin. **Therapeutic Effects:** Bactericidal action. **Spectrum:** Active against: Streptococci, Pneumococci, Enterococci, *Haemophilus influenzae*, *Escherichia coli*, *Proteus mirabilis*, *Neisseria meningitidis*, *N. gonorrhoeae*, *Shigella*, *Salmonella*, *Bacteroides fragilis*, *Moraxella catarrhalis*. Use should be reserved for infections caused by beta-lactamase–producing strains.

Pharmacokinetics
Absorption: Well absorbed from IM sites.
Distribution: Ampicillin diffuses readily into bile, blister and tissue fluids. Poor CSF penetration unless meninges are inflamed. Crosses the placenta; enters breast milk in small amounts.
Metabolism and Excretion: Ampicillin is variably metabolized by the liver (12–50%). Renal excretion is also variable. Sulbactam is eliminated unchanged in urine.
Protein Binding: *Ampicillin*—28%; *sulbactam*—38%.
Half-life: *Ampicillin*—1–1.8 hr; *sulbactam*—1–1.3 hr.

TIME/ACTION PROFILE (blood levels)

ROUTE	ONSET	PEAK	DURATION
IM	rapid	1 hr	6–8 hr
IV	immediate	end of infusion	6–8 hr

Contraindications/Precautions
Contraindicated in: Hypersensitivity to penicillins or sulbactam; History of cholestatic jaundice or hepatic impairment with ampicillin/sulbactam.
Use Cautiously in: Severe renal impairment (↓ dosage if CCr <30 mL/min); Epstein-Barr virus infection, acute lymphocytic leukemia, or cytomegalovirus infection (↑ risk of rash); OB: Safety not established in pregnancy; Lactation: Use while breast feeding only if potential maternal benefit justifies potential risk to infant.

Adverse Reactions/Side Effects
Derm: ERYTHEMA MULTIFORME, STEVENS-JOHNSON SYNDROME, TOXIC EPIDERMAL NECROLYSIS, acute generalized exanthematous pustulosis, rash, urticaria. **GI:** HEPATOTOXICITY, CLOSTRIDIOIDES DIFFICILE-ASSOCIATED DIARRHEA (CDAD), diarrhea, cholestasis, nausea, vomiting. **Hemat:** blood dyscrasias. **Local:** pain at injection site, phlebitis. **Neuro:** SEIZURES (high doses). **Misc:** HYPERSENSITIVITY REACTIONS (including anaphylaxis and myocardial ischemia [with or without myocardial infarction]), superinfection.

Interactions
Drug-Drug: Probenecid ↓ renal excretion and ↑ levels of ampicillin—therapy may be combined for this purpose. May potentiate the effect of **warfarin**. Concurrent **allopurinol** therapy (↑ risk of rash). May ↓ levels and effectiveness of **hormonal contraceptives**.

Route/Dosage
Dosage based on ampicillin component.
IM, IV (Adults and Children ≥40 kg): 1–2 g ampicillin every 6–8 hr (not to exceed 12 g ampicillin/day).
IM, IV (Children ≥1 yr): 100–200 mg ampicillin/kg/day divided every 6 hr; *Meningitis*—200–400 mg ampicillin/kg/day divided every 6 hr; maximum dose: 8 g ampicillin/day.
IM, IV (Infants >1 mo): 100–150 mg ampicillin/kg/day divided every 6 hr.

© F.A. Davis Publishing

Renal Impairment

IM, IV (Adults , Children, and Infants): *CCr 15–29 mL/min*—Administer every 12 hr; *CCr 5–14*—Administer every 24 hr.

Availability (generic available)

Powder for injection: 1.5 g/vial (1 g ampicillin with 500 mg sulbactam), 3 g/vial (2 g ampicillin with 1 g sulbactam), 15 g/vial (10 g ampicillin with 5 g sulbactam).

NURSING IMPLICATIONS

Assessment

- Assess patient for infection (vital signs, wound appearance, sputum, urine, stool, and WBCs) at beginning and throughout therapy.
- Obtain a history before initiating therapy to determine previous use of, and reactions to, penicillins or cephalosporins. Persons with a negative history of penicillin sensitivity may still have an allergic response.
- Obtain specimens for culture and sensitivity before therapy. First dose may be given before receiving results.
- Monitor for signs and symptoms of anaphylaxis (rash, pruritus, laryngeal edema, wheezing). Discontinue drug and notify health care professional immediately if these occur. Keep epinephrine, an antihistamine, and resuscitation equipment close by in the event of an anaphylactic reaction.
- Monitor bowel function. Diarrhea, abdominal cramping, fever, and bloody stools should be reported to health care professional promptly as a sign of CDAD. May begin up to several mo following cessation of therapy.
- Monitor for rash, may lead to severe skin reactions.
- ***Lab Test Considerations:*** Monitor hepatic function periodically during therapy. May cause ↑ AST, ALT, LDH, bilirubin, alkaline phosphatase, BUN, and serum creatinine.
- May cause ↓ hemoglobin, hematocrit, RBC, WBC, neutrophils, and lymphocytes.
- May cause transient ↓ estradiol, total conjugated estriol, estriol-glucuronide, or conjugated estrone in pregnant women.
- May cause a false-positive Coombs' test result.

Implementation

- **IM:** Reconstitute for IM use by adding 3.2 mL of sterile water or 0.5% or 2% lidocaine HCl to the 1.5-g vial or 6.4 mL to the 3-g vial. Administer within 1 hr of preparation, deep IM into well-developed muscle.

IV Administration

- **IV Push:** ***Reconstitution:*** Reconstitute 1.5-g vial with 3.2 mL of sterile water for injection and the 3-g vial with 6.4 mL. ***Concentration:*** 375 mg ampicillin/sulbactam per mL. ***Rate:*** Administer over at least 10–15 min within 1 hr of reconstitution. More rapid administration may cause seizures.
- **Intermittent Infusion:** ***Reconstitution:*** Reconstitute vials as per directions above. ***Dilution:*** Further dilute in 50–100 mL of 0.9% NaCl, D5W, D5/0.45% NaCl, or LR. Stability of solution varies from 2–8 hr at room temperature or 3–72 hr if refrigerated, depending on concentration and diluent. ***Concentration:*** Final concentration of infusion should be 3–45 mg of ampicillin/sulbactam per mL. ***Rate:*** Infuse over 15–30 min.
- **Y-Site Compatibility:** alemtuzumab, amifostine, aminocaproic acid, anidulafungin, argatroban, azithromycin, bivalirudin, bleomycin, cangrelor, carboplatin, carmustine, cefepime, cisplatin, cyclophosphamide, cytarabine, dactinomycin, daptomycin, dexmedetomidine, dexrazoxane, docetaxel, doxorubicin liposomal, eptifibatide, etoposide, etoposide phosphate, fenoldopam, filgrastim, fludarabine, fluorouracil, foscarnet, fosphenytoin, gemcitabine, granisetron, hydromorphone, ifosfamide, irinotecan, leucovorin calcium, levofloxacin, linezolid, mesna, methotrexate, metronidazole, milrinone, mitomycin, octreotide, oxaliplatin, paclitaxel, palonosetron, pamidronate, pancuronium, pantoprazole, pemetrexed, potassium acetate, remifentanil, rituximab, rocuronium, sodium acetate, telavancin, thiotepa, tigecycline, tirofiban, trastuzumab, vecuronium, vinblastine, vincristine, voriconazole, zoledronic acid.
- **Y-Site Incompatibility:** acyclovir, amiodarone, amphotericin B deoxycholate, amphotericin B lipid complex, amphotericin B liposome, azathioprine, caspofungin, chlorpromazine, ciprofloxacin, dacarbazine, dantrolene, daunorubicin, diazepam, diazoxide, dobutamine, doxorubicin, doxycycline, epirubicin, ganciclovir, haloperidol, hydralazine, hydrocortisone, hydroxyzine, idarubicin, lansoprazole, lorazepam, methylprednisolone, midazolam, mitoxantrone, mycophenolate, nicardipine, ondansetron, papaverine, pentamidine, phenytoin, prochlorperazine, promethazine, protamine, quinupristin/dalfopristin, sargramostim, topotecan, tranexamic acid, trimethoprim/sulfamethoxazole, verapamil, vinorelbine, If aminoglycosides and penicillins must be given concurrently, administer in separate sites at least 1 hr apart.

Patient/Family Teaching

- Advise patient to report rash, signs of superinfection (furry overgrowth on the tongue, vaginal itching or discharge, loose or foul-smelling stools) and allergy.
- Caution patient to notify health care professional if fever and diarrhea occur, especially if stool contains blood, pus, or mucus. Advise patient not to treat diarrhea without consulting health care professional. May occur up to several wk after discontinuation of medication.

© F.A. Davis Publishing

- Rep: Caution patients taking oral contraceptives to use an alternative or additional nonhormonal method of contraception while taking ampicillin/sulbactam and until next menstrual period. Advise patient to notify health care professional if pregnancy is planned or suspected or if breast feeding.
- Instruct the patient to notify health care professional if symptoms do not improve.

Evaluation/Desired Outcomes

- Resolution of signs and symptoms of infection. Length of time for complete resolution depends on the organism and site of infection.

anastrozole (a-nass-troe-zole)

Arimidex

Classification

Therapeutic: antineoplastics
Pharmacologic: aromatase inhibitors

Indications

Adjuvant treatment of postmenopausal hormone receptor-positive early breast cancer. Initial therapy in women with postmenopausal hormone receptor-positive or hormone receptor unknown, locally advanced, or metastatic breast cancer. Advanced postmenopausal breast cancer in women with disease progression despite tamoxifen therapy.

Action

Inhibits the enzyme aromatase, which is partially responsible for conversion of precursors to estrogen.
Therapeutic Effects: Lowers levels of circulating estrogen, which may halt progression of estrogen-sensitive breast cancer.

Pharmacokinetics

Absorption: 83–85% absorbed following oral administration.
Distribution: Unknown.
Metabolism and Excretion: 85% metabolized by the liver; 11% excreted renally.
Half-life: 50 hr.

TIME/ACTION PROFILE (lowering of serum estradiol)

ROUTE	ONSET	PEAK	DURATION
PO	within 24 hr	14 days	6 days†

†Following cessation of therapy.

Contraindications/Precautions

Contraindicated in: OB: Pregnancy (may cause fetal harm); Lactation: Lactation.
Use Cautiously in: Ischemic heart disease; Rep: Women of reproductive potential; Pedi: Safety not established.

Adverse Reactions/Side Effects

CV: MYOCARDIAL INFARCTION, angina, peripheral edema. **Derm:** rash, sweating. **EENT:** pharyngitis. **F and E:** hypercalcemia. **GI:** nausea, abdominal pain, anorexia, constipation, diarrhea, dry mouth, vomiting. **GU:** ↓ fertility (females), pelvic pain, vaginal bleeding, vaginal dryness. **Metab:** hypercholesterolemia, weight gain. **MS:** back pain, arthritis, bone pain, carpal tunnel syndrome, fracture, myalgia. **Neuro:** paresthesia, headache, weakness, dizziness.. **Resp:** cough, dyspnea. **Misc:** allergic reactions including ANGIOEDEMA, URTICARIA, ANAPHYLAXIS, hot flashes, pain.

Interactions

Drug-Drug: None significant.

Route/Dosage

PO (Adults): 1 mg once daily.

Availability (generic available)

Tablets: 1 mg.

NURSING IMPLICATIONS

Assessment

- Assess patient for pain and other side effects periodically during therapy.
- ***Lab Test Considerations:*** Obtain a negative pregnancy test before starting therapy.
- May cause ↑ GGT, AST, ALT, alkaline phosphatase, total cholesterol, and LDL cholesterol levels.

Implementation

- **PO:** Take medication consistently with regard to food.

Patient/Family Teaching

- Instruct patient to take medication as directed. Take missed doses as soon as remembered unless it is almost time for next dose. Do not double doses. Advise patient to read the *Patient Information* leaflet before starting and with each Rx refill; changes may occur.
- Inform patient of potential for adverse reactions, and advise patient to notify health care professional immediately if allergic reactions (swelling of the face, lips, tongue, and/or throat, difficulty in swallowing and/or breathing), liver problems (general feeling of not being well, yellowing of skin or whites of eyes, pain on the right side of abdomen), skin reactions (lesions, ulcers, or blisters), or chest pain occurs.
- Advise patient that vaginal bleeding may occur during first few wk after changing over from other hormonal therapy. Continued bleeding should be evaluated.
- Teach patient to report increase in pain so treatment can be initiated.
- Rep: May be teratogenic. Advise female patients of reproductive potential to use effective contraception during and for at least 3 wk after last dose of therapy, to avoid breast feeding for at least 2 wk after last dose, and to notify health care professional immediately if pregnancy is planned or suspected. May impair female fertility.

Evaluation/Desired Outcomes

- Slowing of disease progression in women with advanced breast cancer.

© F.A. Davis Publishing

ANGIOTENSIN-CONVERTING ENZYME (ACE) INHIBITORS

benazepril (ben-**aye**-ze-pril)
Lotensin

captopril (**kap**-toe-pril)
~~Capoten~~

enalapril/enalaprilat
(e-**nal**-a-pril/e-**nal**-a-pril-at)
Epaned, Vasotec, Vasotec IV

fosinopril (foe-**sin**-oh-pril)
~~Monopril~~

lisinopril (lyse-**in**-oh-pril)
Prinivil, Qbrelis, Zestril

moexipril (moe-**eks**-i-pril)
~~Univasc~~

perindopril (pe-**rin**-do-pril)
~~Accon~~, Coversyl

quinapril (**kwin**-a-pril)
Accupril

ramipril (ra-**mi**-pril)
Altace

trandolapril (tran-**doe**-la-pril)
Mavik

Classification
Therapeutic: antihypertensives
Pharmacologic: ACE inhibitors

Indications

Alone or with other agents in the management of hypertension. **Captopril, enalapril, fosinopril, lisinopril, quinapril, ramipril, trandolapril:** Management of HF. **Captopril, lisinopril, ramipril, trandolapril:** Reduction of risk of death or development of HF following MI. **Enalapril:** Slowed progression of left ventricular dysfunction into overt heart failure. **Ramipril:** Reduction of the risk of MI, stroke, and death from cardiovascular disease in patients at risk (>55 yr old with a history of CAD, stroke, peripheral vascular disease, or diabetes with another cardiovascular risk factor). **Captopril:** ↓ progression of diabetic nephropathy. **Perindopril:** Reduction of risk of death from cardiovascular causes or nonfatal MI in patients with stable CAD.

Action

ACE inhibitors block the conversion of angiotensin I to the vasoconstrictor angiotensin II. ACE inhibitors also prevent the degradation of bradykinin and other vasodilatory prostaglandins. ACE inhibitors also ↑ plasma renin levels and ↓ aldosterone levels. Net result is systemic vasodilation. **Therapeutic Effects:** Lowering of BP in hypertensive patients. Improved symptoms in patients with HF (selected agents only). ↓ development of overt heart failure (enalapril only). Improved survival and ↓ development of overt HF after MI (selected agents only). ↓ risk of death from cardiovascular causes or MI in patients with stable CAD (perindopril only). ↓ risk of MI, stroke or death from cardiovascular causes in high-risk patients (ramipril only). ↓ progression of diabetic nephropathy (captopril only).

Pharmacokinetics

Absorption: *Benazepril*—37% absorbed after oral administration. *Captopril*—60–75% absorbed after oral administration (↓ by food). *Enalapril*—55–75% absorbed after oral administration. *Enalaprilat*—IV administration results in complete bioavailability. *Fosinopril*—36% absorbed after oral administration. *Lisinopril*—25% absorbed after oral administration (much variability). *Moexipril*—13% bioavailability as moexiprilat after oral administration (↓ by food). *Perindopril*—25% bioavailability as perindoprilat after oral administration. *Quinapril*—60% absorbed after oral administration (high-fat meal may ↓ absorption). *Ramipril*—50–60% absorbed after oral administration. *Trandolapril*—70% bioavailability as trandolapril at after oral administration.

Distribution: All ACE inhibitors cross the placenta. *Benazepril, captopril, enalapril, fosinopril, quinapril*, and *trandolapril*—Enter breast milk. *Lisinopril*—Minimal penetration of CNS. *Ramipril*—Probably does not enter breast milk. *Trandolapril*—Enters breast milk.

Protein Binding: *Benazepril*—95%, *Fosinopril*—99.4%, *Moexipril*—90%, *Quinapril*—97%.

Metabolism and Excretion: *Benazepril*—Converted by the liver to benazeprilat, the active metabolite. 20% excreted by kidneys; 11–12% nonrenal (biliary elimination). *Captopril*—50% metabolized by the liver to inactive compounds, 50% excreted unchanged by the kidneys. *Enalapril, enalaprilat*—Enalapril is converted by the liver to enalaprilat, the active metabolite; primarily eliminated by the kidneys. *Fosinopril*—Converted by the liver and GI mucosa to fosinoprilat, the active metabolite—50% excreted in urine, 50% in feces. *Lisinopril*—100% eliminated by the kidneys. *Moexipril*—Converted by liver and GI mucosa to moexiprilat, the active metabolite; 13% excreted in urine, 53% in feces. *Perindopril*—Converted by the liver to perindoprilat, the active metabolite; primarily excreted in urine. *Quinapril*—Converted by the liver, GI mucosa, and tissue to quinaprilat, the active metabolite: 96% eliminated by the kidneys. *Ramipril*—Converted by the liver to ramiprilat, the active metabolite; 60% excreted in urine, 40% in feces. *Trandolapril*—

© F.A. Davis Publishing

Converted by the liver to trandolaprilat, the active metabolite; 33% excreted in urine, 66% in feces.

Half-life: *Benazeprilat*—10–11 hr. *Captopril*—2 hr (↑ in renal impairment). *Enalapril*—2 hr (↑ in renal impairment). *Enalaprilat*—35–38 hr (↑ in renal impairment). *Fosinoprilat*—12 hr. *Lisinopril*—12 hr (↑ in renal impairment). *Moexiprilat*—2–9 hr (↑ in renal impairment). *Perindoprilat*—3–10 hr (↑ in renal impairment). *Quinaprilat*—3 hr (↑ in renal impairment). *Ramiprilat*—13–17 hr (↑ in renal impairment). *Trandolaprilat*—22.5 hr (↑ in renal impairment).

TIME/ACTION PROFILE (effect on BP—single dose†)

ROUTE	ONSET	PEAK	DURATION
Benazepril	within 1 hr	2–4 hr	24 hr
Captopril	15–60 min	60–90 min	6–12 hr
Enalapril PO	1 hr	4–8 hr	12–24 hr
Enalapril IV	15 min	1–4 hr	4–6 hr
Fosinopril	within 1 hr	2–6 hr	24 hr
Lisinopril	1 hr	6 hr	24 hr
Moexipril	within 1 hr	3–6 hr	up to 24 hr
Perindoprilat	within 1–2 hr	3–7 hr	up to 24 hr
Quinapril	within 1 hr	2–4 hr	up to 24 hr
Ramipril	within 1–2 hr	3–6 hr	24 hr
Trandolapril	within 1–2 hr	4–10 hr	up to 24 hr

†Full effects may not be noted for several wks.

Contraindications/Precautions

Contraindicated in: Hypersensitivity; History of angioedema with previous use of ACE inhibitors (also in absence of previous use of ACE inhibitors for benazepril); Concurrent use with aliskiren in patients with diabetes or moderate-to-severe renal impairment (CCr <60 mL/min); Concurrent use with sacubitril/valsartan; must be a 36–hr wash-out period after switching to/from sacubitril/valsartan; OB: Pregnancy (may cause fetal harm); Lactation: Lactation.

Use Cautiously in: Renal impairment, hepatic impairment, hypovolemia, hyponatremia, concurrent diuretic therapy; ⛓ Black patients with hypertension (monotherapy less effective, may require additional therapy; ↑ risk of angioedema); Rep: Women of reproductive potential; Surgery/anesthesia (hypotension may be exaggerated); Pedi: Safety and effectiveness not established in children <18 yr (moexipril, perindopril, quinapril ramipril, trandolapril) or <6 yr (benazepril, fosinopril, lisinopril); Geri: Initial dose ↓ recommended for most agents due to age-related ↓ in renal function.

Exercise Extreme Caution in: Family history of angioedema.

Adverse Reactions/Side Effects

CV: hypotension, chest pain, edema, tachycardia. **Derm:** flushing, pruritus, rashes. **Endo:** hyperuricemia. **F and E:** hyperkalemia. **GI:** taste disturbances, abdominal pain, anorexia, constipation, diarrhea, nausea, vomiting. **GU:** erectile dysfunction, proteinuria, renal dysfunction, renal failure. **Hemat:** AGRANULOCYTOSIS, neutropenia (captopril only). **MS:** back pain, muscle cramps, myalgia. **Neuro:** dizziness, drowsiness, fatigue, headache, insomnia, vertigo, weakness. **Resp:** cough, dyspnea. **Misc:** ANGIOEDEMA, fever.

Interactions

Drug-Drug: Concurrent use with **sacubitril** ↑ risk of angioedema; concurrent use contraindicated; do not administer within 36 hr of switching to/from **sacubitril/valsartan**. Excessive hypotension may occur with concurrent use of **diuretics** and other **antihypertensives**. ↑ risk of hyperkalemia with concurrent use of **potassium supplements**, **potassium-sparing diuretics**, or **potassium-containing salt substitutes**. ↑ risk of hyperkalemia, renal dysfunction, hypotension, and syncope with concurrent use of **angiotensin II receptor blockers** or **aliskiren**; avoid concurrent use with aliskiren in patients with diabetes or CCr <60 mL/min; avoid concurrent use with angiotensin II receptor blockers. **NSAIDs** and selective **COX-2 inhibitors** may blunt the antihypertensive effect and ↑ the risk of renal dysfunction. Absorption of fosinopril may be ↓ by **antacids** (separate administration by 1–2 hr). ↑ levels and may ↑ risk of **lithium** toxicity. Quinapril may ↓ absorption of **tetracycline**, **doxycycline**, and **fluoroquinolones** (because of magnesium in tablets). ↑ risk of angioedema with **temsirolimus**, **sirolimus**, or **everolimus**.

Drug-Food: Food significantly ↓ absorption of captopril and moexipril (administer drugs 1 hr before meals).

Route/Dosage

Benazepril

⛓ **PO (Adults):** 10 mg once daily, ↑ gradually to maintenance dose of 20–40 mg/day in 1–2 divided doses (begin with 5 mg/day in patients receiving diuretics). **PO (Children ≥6 yr):** 0.2 mg/kg once daily; may be titrated up to 0.6 mg/kg/day (or 40 mg/day).

Renal Impairment

PO (Adults): *CCr <30 mL/min*—Initiate therapy with 5 mg once daily.

Renal Impairment

PO (Children ≥6 yr): *CCr <30 mL/min*—Contraindicated.

Captopril

PO (Adults): *Hypertension*—12.5–25 mg 2–3 times daily, may be ↑ at 1–2 wk intervals up to 150 mg 3 times daily (begin with 6.25–12.5 mg 2–3 times daily in patients receiving diuretics) (maximum dose = 450 mg/day); *HF*—25 mg 3 times daily (6.25–12.5 mg 3 times daily in patients who have been vigorously diuresed); titrated up to target dose of 50 mg 3 times daily; *Post-MI*—6.25-mg test dose, followed by 12.5 mg 3 times daily, may be ↑ up to 50 mg 3 times daily; *Diabetic nephropathy*—25 mg 3 times daily.

© F.A. Davis Publishing

PO (Children): *HF*—0.3 mg/kg–0.5 mg/kg/dose 3 times daily, titrate up to a maximum of 6 mg/kg/day in 2–4 divided doses; *Older Children*—6.25–12.5 mg/dose every 12–24 hr, titrate up to a maximum of 6 mg/kg/day in 2–4 divided doses.
PO (Infants): *HF*—0.15–0.3 mg/kg/dose, titrate up to a maximum of 6 mg/kg/day in 1–4 divided doses.
PO (Neonates): *HF*—0.05–0.1 mg/kg/dose every 8–24 hr, may ↑ as needed up to 0.5 mg/kg every 6–24 hr; *Premature neonates*—0.01 mg/kg/dose every 8–12 hr.

Renal Impairment

PO (Adults): *CCr 10–50 mL/min*—Administer 75% of dose; *CCr <10 mL/min*—Administer 50% of dose.

Enalapril/Enalaprilat

PO (Adults): *Hypertension*—2.5–5 mg once daily, ↑ as required up to 40 mg/day in 1–2 divided doses (initiate therapy at 2.5 mg once daily in patients receiving diuretics); *HF*—2.5 mg 1–2 times daily, titrated up to target dose of 10 mg twice daily; begin with 2.5 mg once daily in patients with hyponatremia (serum sodium <130 mEq/L); *Asymptomatic left ventricular dysfunction*—2.5 mg twice daily, titrated up to a target dose of 10 mg twice daily.
PO (Children >1 mo): *Hypertension*—0.08 mg/kg once daily; may be slowly titrated up to a maximum of 0.58 mg/kg/day.
IV (Adults): *Hypertension*—0.625–1.25 mg (0.625 mg if receiving diuretics) every 6 hr; can be titrated up to 5 mg every 6 hr.
IV (Children >1 mo): *Hypertension*—5–10 mcg/kg/dose given every 8–24 hr.

Renal Impairment

PO, IV (Adults): *Hypertension CCr 10–50 mL/min*—Administer 75% of dose; *CCr <10 mL/min*—Administer 50% of dose.

Renal Impairment

PO, IV (Children >1 mo): *CCr <30 mL/min*—Contraindicated.

Fosinopril

PO (Adults): *Hypertension*—10 mg once daily, may be ↑ as required up to 80 mg/day. *HF*—10 mg once daily (5 mg once daily in patients who have been vigorously diuresed), may be ↑ over several wk up to 40 mg/day.
PO (Children ≥6 yr and >50 kg): *Hypertension*—5–10 mg once daily.

Lisinopril

PO (Adults): *Hypertension*—10 mg once daily, can be ↑ up to 20–40 mg/day (initiate therapy at 5 mg/day in patients receiving diuretics); *HF*—5 mg once daily; may be titrated every 2 wk up to 40 mg/day; begin with 2.5 mg once daily in patients with hyponatremia (serum sodium <130 mEq/L); *Post-MI*—5 mg once daily for 2 days, then 10 mg daily.
PO (Children ≥6 yr): *Hypertension*—0.07 mg/kg once daily (up to 5 mg/day), may be titrated every 1–2 wk up to 0.6 mg/kg/day (or 40 mg/day).

Renal Impairment

PO (Adults): *CCr 10–30 mL/min*—Begin with 5 mg once daily; may be slowly titrated up to 40 mg/day; *CCr <10 mL/min*—Begin with 2.5 mg once daily; may be slowly titrated up to 40 mg/day.

Renal Impairment

(Children ≥6 yr): *CCr <30 mL/min*—Contraindicated.

Moexipril

PO (Adults): 7.5 mg once daily, may be ↑ up to 30 mg/day in 1–2 divided doses (begin with 3.75 mg/day in patients receiving diuretics).

Renal Impairment

PO (Adults): *CCr ≤40 mL/min*—Initiate therapy at 3.75 mg once daily, may be titrated upward carefully to 15 mg/day.

Perindopril

PO (Adults): *Hypertension*—4 mg once daily, may be slowly titrated up to 16 mg/day in 1–2 divided doses (should not exceed 8 mg/day in elderly patients) (begin with 2–4 mg/day in 1–2 divided doses in patients receiving diuretics); *Stable CAD*—4 mg once daily for 2 wk, may be ↑, if tolerated, to 8 mg once daily; for elderly patients, begin with 2 mg once daily for 1 wk (may be ↑, if tolerated, to 4 mg once daily for 1 wk, then, ↑ as tolerated to 8 mg once daily).

Renal Impairment

PO (Adults): *CCr 30–60 mL/min*—2 mg/day initially, may be slowly titrated up to 8 mg/day in 1–2 divided doses.

Quinapril

PO (Adults): *Hypertension*—10–20 mg once daily initially, may be titrated every 2 wk up to 80 mg/day in 1–2 divided doses (initiate therapy at 5 mg/day in patients receiving diuretics); *HF*—5 mg twice daily initially, may be titrated at weekly intervals up to 20 mg twice daily.

Renal Impairment

PO (Adults): *CCr >60 mL/min*—Initiate therapy at 10 mg/day; *CCr 30–60 mL/min*—Initiate therapy at 5 mg/day; *CCr 10–30 mL/min*—Initiate therapy at 2.5 mg/day.

Ramipril

PO (Adults): *Hypertension*—2.5 mg once daily, may be ↑ slowly up to 20 mg/day in 1–2 divided doses (ini-

© F.A. Davis Publishing

tiate therapy at 1.25 mg/day in patients receiving diuretics). *HF post-MI*—1.25–2.5 mg twice daily initially, may be ↑ slowly up to 5 mg twice daily. *Reduction in risk of MI, stroke, and death from cardiovascular causes*—2.5 mg once daily for 1 wk, then 5 mg once daily for 3 wk, then ↑ as tolerated to 10 mg once daily (can also be given in 2 divided doses).

Renal Impairment

PO (Adults): *CCr <40 mL/min*—Initiate therapy at 1.25 mg once daily, may be slowly titrated up to 5 mg/day in 1–2 divided doses.

Trandolapril

PO (Adults): *Hypertension*—1 mg once daily (2 mg once daily in black patients); *HF post-MI*—Initiate therapy at 1 mg once daily, titrate up to 4 mg once daily if possible.

Renal Impairment

PO (Adults): *CCr <30 mL/min*—Initiate therapy at 0.5 mg once daily, may be slowly titrated upward (maximum dose = 4 mg/day).

Hepatic Impairment

PO (Adults): Initiate therapy at 0.5 mg once daily, may be slowly titrated upward (maximum dose = 4 mg/day).

Availability

Benazepril (generic available)

Tablets: 5 mg, 10 mg, 20 mg, 40 mg. **Cost:** *Generic*—All strengths $10.83/100. ***In combination with:*** amlodipine (Lotrel) and hydrochlorothiazide (Lotensin HCT). See Appendix N.

Captopril (generic available)

Tablets: 12.5 mg, 25 mg, 50 mg, 100 mg. **Cost:** *Generic*—12.5 mg $77.18/100, 25 mg $83.44/100, 50 mg $143.08/100, 100 mg $190.54/100. ***In combination with:*** hydrochlorothiazide (Capozide). See Appendix N.

Enalapril (generic available)

Tablets: 2.5 mg, 5 mg, 10 mg, 20 mg. **Cost:** *Generic*—2.5 mg $88.33/100, 5 mg $106.37/100, 10 mg $117.81/100, 20 mg $167.64/100. **Oral solution (mixed berry flavor):** 1 mg/mL. ***In combination with:*** hydrochlorothiazide (Vaseretic). See Appendix N.

Enalaprilat (generic available)

Solution for injection: 1.25 mg/mL.

Fosinopril (generic available)

Tablets: 10 mg, 20 mg, 40 mg. **Cost:** *Generic*—All strengths $107.08/90. ***In combination with:*** hydrochlorothiazide. See Appendix N.

Lisinopril (generic available)

Tablets: 2.5 mg, 5 mg, 10 mg, 20 mg, 30 mg, 40 mg. **Cost:** *Generic*—2.5 mg $9.63/100, 5 mg $10.83/100, 10 mg $6.99/100, 20 mg $9.14/100, 30 mg $10.83/100, 40 mg $7.41/100. **Oral solution:** 1 mg/mL. ***In combination with:*** hydrochlorothiazide (Prinzide, Zestoretic). See Appendix N.

Moexipril (generic available)

Tablets: 7.5 mg, 15 mg. **Cost:** *Generic*—7.5 mg $138.92/100, 15 mg $145.54/100. ***In combination with:*** hydrochlorothiazide (Uniretic).

Perindopril (generic available)

Tablets: 2 mg, 4 mg, 8 mg. **Cost:** *Generic*—2 mg $189.77/100, 4 mg $221.27/100, 8 mg $268.76/100. ***In combination with:*** amlodipine (Prestalia). See Appendix N.

Quinapril (generic available)

Tablets: 5 mg, 10 mg, 20 mg, 40 mg. **Cost:** *Generic*—5 mg $27.20/100, 10 mg $39.19/100, 20 mg $21.04/100, 40 mg $27.50/100. ***In combination with:*** hydrochlorothiazide (Accuretic, Quinaretic). See Appendix N.

Ramipril (generic available)

Capsules: 1.25 mg, 2.5 mg, 5 mg, 10 mg, 15 mg. **Cost:** *Generic*—1.25 mg $153.01/100, 2.5 mg $180.61/100, 5 mg $189.49/100, 10 mg $221.72/100.

Trandolapril (generic available)

Tablets: 0.5 mg, 1 mg, 2 mg, 4 mg. **Cost:** *Generic*—All strengths $123.93/100. ***In combination with:*** verapamil. See Appendix N.

NURSING IMPLICATIONS

Assessment

- **Hypertension:** Monitor BP and pulse frequently during initial dose adjustment and periodically during therapy. Notify health care professional of significant changes.
- Monitor frequency of prescription refills to determine adherence.
- Assess patient for signs of angioedema (swelling of face, extremities, eyes, lips, tongue, difficulty in swallowing or breathing); may occur at any time during therapy. Discontinue medication and provide supportive care.
- **HF:** Monitor weight and assess patient routinely for resolution of fluid overload (peripheral edema, rales/crackles, dyspnea, weight gain, jugular venous distention).
- ***Lab Test Considerations:*** Monitor BUN, creatinine, and electrolyte levels periodically. Serum potassium, BUN and creatinine may be ↑, whereas sodium levels may be ↓. If ↑ BUN or serum creatinine concentrations occur, dose reduction or withdrawal may be required.
- Monitor CBC periodically during therapy. Certain drugs may rarely cause slight ↓ in hemoglobin and hematocrit, leukopenia, and eosinophilia.
- May cause ↑ AST, ALT, alkaline phosphatase, serum bilirubin, uric acid, and glucose.
- Assess urine protein prior to and periodically during therapy for up to 1 yr in patients with renal impair-

© F.A. Davis Publishing

ment or those receiving >150 mg/day of captopril. If excessive or ↑ proteinuria occurs, re-evaluate ACE inhibitor therapy.
- *Captopril:* May cause positive ANA titer.
- *Captopril:* May cause false-positive test results for urine acetone.
- *Captopril:* Monitor CBC with differential prior to initiation of therapy, every 2 wk for first 3 mo, and periodically for up to 1 yr in patients at risk for neutropenia (patients with renal impairment or collagen-vascular disease) or at first sign of infection. Discontinue therapy if neutrophil count is $<1000/mm^3$.

Implementation

- Do not confuse Accupril with Aciphex. Do not confuse benazepril with Benadryl. Do not confuse captopril with carvedilol. Do not confuse Zestril with Zegerid, Zetia, or Zyprexa.
- Correct volume depletion, if possible, before initiation of therapy.
- **PO:** Precipitous drop in BP during first 1–3 hr after first dose may require volume expansion with normal saline but is not usually considered an indication for stopping therapy. Discontinuing diuretic therapy or cautiously increasing salt intake 2–3 days before initiation may ↓ risk of hypotension. Monitor closely for at least 1 hr after BP has stabilized. Resume diuretics if BP is not controlled.

Benazepril

- **PO:** For patients with difficulty swallowing tablets, pharmacist may compound oral suspension; stable for 30 days if refrigerated. Shake suspension before each use.

Captopril

- **PO:** Administer 1 hr before or 2 hr after meals. May be crushed if patient has difficulty swallowing. Tablets may have a sulfurous odor.
- An oral solution may be prepared by crushing a 25-mg tablet and dissolving it in 25–100 mL of water. Shake for at least 5 min and administer within 30 min.

Enalapril

- **PO:** For patients with difficulty swallowing tablets, oral solution is available ready to use. Shake solution before each use. Solution is stable at controlled room temperature for 60 days.

Enalaprilat

IV Administration

- **IV Push:** ***Dilution:*** May be administered undiluted. ***Concentration:*** 1.25 mg/mL. ***Rate:*** Administer over at least 5 min.
- **Intermittent Infusion:** ***Dilution:*** Dilute in up to 50 mL of D5W, 0.9% NaCl, D5/0.9% NaCl, or D5/LR. Diluted solution is stable for 24 hr. ***Rate:*** Administer as a slow infusion over at least 5 min.
- **Y-Site Compatibility:** acyclovir, alemtuzumab, alfentanil, allopurinol, amifostine, amikacin, aminocaproic acid, aminophylline, amiodarone, amphotericin B lipid complex, amphotericin B liposome, anidulafungin, argatroban, arsenic trioxide, ascorbic acid, atropine, azathioprine, azithromycin, aztreonam, benztropine, bivalirudin, bleomycin, bumetanide, buprenorphine, butorphanol, calcium chloride, calcium gluconate, cangrelor, carboplatin, carmustine, cefazolin, cefotaxime, cefotetan, cefoxitin, ceftaroline, ceftazidime, ceftriaxone, cefuroxime, chloramphenicol, chlorpromazine, cisatracurium, cisplatin, cladribine, clindamycin, cyanocobalamin, cyclophosphamide, cyclosporine, cytarabine, dacarbazine, dactinomycin, daptomycin, daunorubicin, dexamethasone, dexmedetomidine, dexrazoxane, digoxin, diltiazem, diphenhydramine, dobutamine, docetaxel, dopamine, doxorubicin, doxorubicin liposomal, doxycycline, ephedrine, epinephrine, epirubicin, epoetin alfa, eptifibatide, ertapenem, erythromycin, esmolol, etoposide, etoposide phosphate, famotidine, fenoldopam, fentanyl, filgrastim, fluconazole, fludarabine, fluorouracil, folic acid, foscarnet, fosphenytoin, furosemide, ganciclovir, gemcitabine, gentamicin, glycopyrrolate, granisetron, heparin, hetastarch, hydrocortisone, hydromorphone, idarubicin, ifosfamide, imipenem/cilastatin, indomethacin, insulin, regular, irinotecan, isoproterenol, ketorolac, labetalol, lactated Ringer's, leucovorin calcium, levofloxacin, lidocaine, linezolid, lorazepam, magnesium sulfate, mannitol, melphalan, meperidine, meropenem, mesna, methotrexate, methylprednisolone, metoclopramide, metoprolol, metronidazole, midazolam, milrinone, mitomycin, mitoxantrone, morphine, moxifloxacin, multivitamins, mycophenolate, nafcillin, nalbuphine, naloxone, nicardipine, nitroglycerin, nitroprusside, norepinephrine, octreotide, ondansetron, oxacillin, oxaliplatin, oxytocin, paclitaxel, palonosetron, pamidronate, pancuronium, papaverine, pemetrexed, penicillin G, pentamidine, pentobarbital, phenobarbital, phentolamine, phenylephrine, phytonadione, piperacillin, piperacillin/tazobactam, potassium acetate, potassium chloride, potassium phosphates, procainamide, prochlorperazine, promethazine, propofol, propranolol, protamine, pyridoxine, quinupristin/dalfopristin, remifentanil, rituximab, rocuronium, sodium acetate, sodium bicarbonate, succinylcholine, sufentanil, tacrolimus, tetracycline, theophylline, thiamine, thiotepa, tigecycline, tirofiban, tobramycin, topotecan, trastuzumab, vancomycin, vasopressin, vecuronium, verapamil, vinblastine, vincristine, vinorelbine, voriconazole, zoledronic acid.

© F.A. Davis Publishing

- **Y-Site Incompatibility:** amphotericin B deoxycholate, caspofungin, cefepime, dantrolene, diazepam, diazoxide, gemtuzumab ozogamicin, phenytoin.

Lisinopril

- **PO:** Oral solution is clear to slightly opalescent. Administer without dilution.

Moexipril

- **PO:** Administer moexipril on an empty stomach, 1 hr before a meal.

Ramipril

- **PO:** Capsules may be opened and sprinkled on applesauce, or dissolved in 4 oz water or apple juice for patients with difficulty swallowing. Effectiveness is same as capsule. Prepared mixtures can be stored for up to 24 hr at room temperature or up to 48 hr if refrigerated.

Trandolapril

- **PO:** May be taken with or without food.

Patient/Family Teaching

- Instruct patient to take medication as directed at the same time each day, even if feeling well. Take missed doses as soon as possible but not if almost time for next dose. Do not double doses. Warn patient not to discontinue ACE inhibitor therapy unless directed by health care professional.
- Caution patient to avoid salt substitutes or foods containing high levels of potassium or sodium unless directed by health care professional (see Appendix J).
- Caution patient to change positions slowly to minimize hypotension. Use of alcohol, standing for long periods, exercising, and hot weather may ↑ orthostatic hypotension.Instruct patient to notify health care professional of all Rx or OTC medications, vitamins, or herbal products being taken and consult health care professional before taking any new medications, especially cough, cold, or allergy remedies.
- May cause dizziness. Caution patient to avoid driving and other activities requiring alertness until response to medication is known.
- Advise patient to inform health care professional of medication regimen prior to treatment or surgery.
- Advise patient that medication may cause impairment of taste that generally resolves within 8–12 wk, even with continued therapy.
- Instruct patient to notify health care professional immediately if rash; mouth sores; sore throat; fever; swelling of hands or feet; irregular heart beat; chest pain; dry cough; hoarseness; swelling of face, eyes, lips, or tongue; difficulty swallowing or breathing occur; or if taste impairment or skin rash persists. Persistent dry cough may occur and may not subside until medication is discontinued. Consult health care professional if cough becomes bothersome. Also notify health care professional if nausea, vomiting, or diarrhea occurs and continues.
- Advise diabetic patients to monitor blood glucose closely, especially during first mo of therapy; may cause hypoglycemia.
- Rep: May cause fetal harm. Advise females of reproductive potential to use effective contraception during therapy and notify health care professional if pregnancy is planned or suspected. If pregnancy is detected, discontinue medication as soon as possible. Closely observe infants with histories of in utero exposure to angiotensin—converting enzyme inhibitors for hypotension, oliguria, and hyperkalemia. If oliguria or hypotension occur, support blood pressure and renal perfusion. Exchange transfusions or dialysis may be required as a means of reversing hypotension and substituting for disordered renal function. Advise patient to avoid breast feeding during therapy.
- Emphasize the importance of follow-up examinations to monitor progress.
- **Hypertension:** Encourage patient to comply with additional interventions for hypertension (weight reduction, low sodium diet, discontinuation of smoking, moderation of alcohol consumption, regular exercise, and stress management). Medication controls but does not cure hypertension.
- Instruct patient and family on correct technique for monitoring BP. Advise them to check BP at least weekly and to report significant changes to health care professional.

Evaluation/Desired Outcomes

- Decrease in BP without appearance of excessive side effects.
- Decrease in signs and symptoms of HF (some drugs may also improve survival).
- Decrease in development of overt HF (enalapril).
- Reduction of risk of death or development of HF following MI.
- Reduction of risk of death from cardiovascular causes and MI in patients with stable CAD (perindopril).
- Reduction of risk of MI, stroke, or death from cardiovascular causes in patients at high-risk for these events (ramipril).
- Decrease in progression of diabetic nephropathy (captopril).

valsartan (val-**sar**-tan)
Diovan

Classification
Therapeutic: antihypertensives
Pharmacologic: angiotensin II receptor antagonists

Indications

Alone or with other agents in the management of hypertension. Treatment of diabetic nephropathy in patients with type 2 diabetes and hypertension (irbesartan and losartan only). Management of HF (New York Heart Association class II-IV) in patients who cannot tolerate ACE inhibitors (candesartan and valsartan only) or in combination with an ACE inhibitor and beta-blocker (candesartan only). Prevention of stroke in patients with hypertension and left ventricular hypertrophy (losartan only). Reduction of risk of death from cardiovascular causes in patients with left ventricular systolic dysfunction after MI (valsartan only). Reduction of risk of myocardial infarction, stroke, or cardiovascular death in patients ≥55 yr who are at high risk for cardiovascular events and are unable to take ACE inhibitors (telmisartan only).

Action

Blocks vasoconstrictor and aldosterone-producing effects of angiotensin II at receptor sites, including vascular smooth muscle and the adrenal glands. **Therapeutic Effects:** Lowering of BP. Slowed progression of diabetic nephropathy (irbesartan and losartan only). Reduced cardiovascular death and hospitalizations due to HF in patients with HF (candesartan and valsartan only). Decreased risk of cardiovascular death in patients with left ventricular systolic dysfunction who are post-MI (valsartan only). Decreased risk of stroke in patients with hypertension and left ventricular hypertrophy (effect may be less in black patients) (losartan only).

Pharmacokinetics

Absorption: *Azilsartan* — Azilsartan medoxomil is converted to azilsartan, the active component. 60% absorbed; *Candesartan* — Candesartan cilexetil is converted to candesartan, the active component; 15% bioavailability of candesartan; *Irbesartan* — 60–80% absorbed after oral administration; *Losartan* — well absorbed, with extensive first-pass hepatic metabolism, resulting in 33% bioavailability; *Olmesartan* — Olmesartan medoxomil is converted to olmesartan, the active component; 26% bioavailability of olmesartan; *Telmisartan* — 42–58% absorbed following oral administration (bioavailability ↑ in patients with hepatic impairment); *Valsartan* — 10–35% absorbed following oral administration; systemic exposure 60% higher with the suspension compared to tablets.

Distribution: All angiotensin receptor blockers (ARBs) cross the placenta; *Candesartan* — enters breast milk.

Protein Binding: All ARBs are >90% protein-bound.

Metabolism and Excretion: *Azilsartan* — 50% metabolized by the liver, primarily by the CYP2C9 enzyme system. 55% eliminated in feces, 42% in urine (15% as unchanged drug); *Candesartan* — Minor metabolism by the liver; 33% excreted in urine, 67% in feces (via bile); *Irbesartan* — Some hepatic metabolism; 20% excreted in urine, 80% in feces; *Losartan* — Undergoes extensive first-pass hepatic metabolism; 14% is converted to an active metabolite. 4% excreted unchanged in urine; 6% excreted in urine as active metabolite; some biliary elimination; *Olmesartan* — 30–50% excreted unchanged in urine, remainder eliminated in feces via bile; *Telmisartan* — Excreted mostly unchanged in feces via biliary excretion; *Valsartan* — Minor metabolism by the liver; 13% excreted in urine, 83% in feces.

Half-life: *Azilsartan* — 11 hr; *Candesartan* — 9 hr; *Irbesartan* — 11–15 hr; *Losartan* — 2 hr (6–9 hr for metabolite); *Olmesartan* — 13 hr; *Telmisartan* — 24 hr; *Valsartan* — 6 hr.

TIME/ACTION PROFILE (antihypertensive effect with chronic dosing)

DRUG	ONSET	PEAK	DURATION
Azilsartan	within 2 hr	18 hr	24 hr
Candesartan	2–4 hr	4 wk	24 hr
Irbesartan	within 2 hr	2 wk	24 hr
Losartan	6 hr	3–6 wk	24 hr
Olmesartan	within 1 wk	2 wk	24 hr
Telmisartan	within 3 hr	4 wk	24 hr
Valsartan	within 2 hr	4 wk	24 hr

Contraindications/Precautions

Contraindicated in: Hypersensitivity; Concurrent use with aliskiren in patients with diabetes or moderate-to-severe renal impairment (CCr <60 mL/min); Severe hepatic impairment (candesartan); OB: Pregnancy (may cause fetal harm); Lactation: Lactation.

Use Cautiously in: HF (may result in azotemia, oliguria, acute renal failure and/or death); Volume- or salt-depleted patients or patients receiving high doses of diuretics (correct deficits before initiating therapy or initiate at lower doses); Black patients (may not be effective); Impaired renal function due to primary renal disease or HF (may worsen renal function); Obstructive biliary disorders (telmisartan) or hepatic impairment (losartan, or telmisartan); Severe renal impairment (CCr <30 mL/min) (valsartan); Rep: Women of repro-

© F.A. Davis Publishing

ductive potential; Pedi: Safety and effectiveness not established in children <18 yr (azilsartan, candesartan, irbesartan, telmisartan), <6 yr (losartan, olmesartan), and <1 yr (valsartan).

Adverse Reactions/Side Effects

CV: hypotension, chest pain, edema, tachycardia. **Derm:** rashes. **EENT:** nasal congestion, pharyngitis, rhinitis, sinusitis. **GI:** abdominal pain, diarrhea, drug-induced hepatitis, dyspepsia, nausea, vomiting. **GU:** impaired renal function. **F and E:** hyperkalemia. **MS:** arthralgia, back pain, myalgia. **Neuro:** dizziness, anxiety, depression, fatigue, headache, insomnia, weakness. **Misc:** ANGIOEDEMA.

Interactions

Drug-Drug: NSAIDs and selective **COX-2 inhibitors** may blunt the antihypertensive effect and ↑ the risk of renal dysfunction. ↑ antihypertensive effects with other **antihypertensives** and **diuretics**. Telmisartan may ↑ serum **digoxin** levels. Concurrent use of **potassium-sparing diuretics**, **potassium-containing salt substitutes**, or **potassium supplements** may ↑ risk of hyperkalemia. ↑ risk of hyperkalemia, renal dysfunction, hypotension, and syncope with concurrent use of **ACE inhibitors** or **aliskiren**; avoid concurrent use with aliskiren in patients with diabetes or CCr <60 mL/min; avoid concurrent use with ACE inhibitors. Candesartan, valsartan, and irbesartan may ↑ **lithium** levels. Irbesartan and losartan may ↑ effects of **amiodarone**, **fluoxetine**, **glimepiride**, **glipizide**, **phenytoin**, **rosiglitazone**, and **warfarin**. **Rifampin** may ↓ effects of losartan. ↑ risk of renal dysfunction when telmisartan used with **ramipril** (concurrent use not recommended). **Colesevelam** may ↓ olmesartan levels; administer olmesartan ≥4 hr before colesevelam.

Route/Dosage

Azilsartan

PO (Adults): 80 mg once daily, initial dose may be ↓ to 40 mg once daily if high doses of diuretics are used concurrently.

Candesartan

PO (Adults): *Hypertension*—16 mg once daily; may ↑ up to 32 mg/day in 1–2 divided doses (begin therapy at a lower dose in patients who are receiving diuretics or are volume depleted). *HF*—4 mg once daily initially, dose may be doubled at 2 wk intervals up to target dose of 32 mg once daily.
PO (Children 6–16 yr and >50 kg): 8–16 mg/day (in 1–2 divided doses); may ↑ up to 32 mg/day (in 1–2 divided doses).
PO (Children 6–16 yr and <50 kg): 4–8 mg/day (in 1–2 divided doses); may ↑ up to 16 mg/day (in 1–2 divided doses).
PO (Children 1–5 yr): 0.20 mg/kg/day (in 1–2 divided doses); may ↑ up to 0.4 mg/kg/day (in 1–2 divided doses).

Hepatic Impairment

PO (Adults): *Moderate hepatic impairment*—Initiate at 8 mg once daily.

Irbesartan

PO (Adults): *Hypertension*—150 mg once daily; may ↑ to 300 mg once daily. Initiate therapy at 75 mg once daily in patients who are receiving diuretics or are volume depleted. *Type 2 diabetic nephropathy*—300 mg once daily.

Losartan

PO (Adults): *Hypertension*—50 mg once daily initially (range 25–100 mg/day as a single daily dose or 2 divided doses) (initiate therapy at 25 mg once daily in patients who are receiving diuretics or are volume depleted). *Prevention of stroke in patients with hypertension and left ventricular hypertrophy*—50 mg once daily initially; hydrochlorothiazide 12.5 mg once daily should be added and/or dose of losartan ↑ to 100 mg once daily followed by an ↑ in hydrochlorothiazide to 25 mg once daily based on BP response. *Type 2 diabetic nephropathy*—50 mg once daily, may ↑ to 100 mg once daily depending on BP response.

Hepatic Impairment

PO (Adults): 25 mg once daily initially; may ↑ as tolerated.
PO (Children >6 yr): *Hypertension*—0.7 mg/kg once daily (up to 50 mg/day), may titrate up to 1.4 mg/kg/day (or 100 mg/day).

Renal Impairment

PO (Children >6 yr): *CCr <30 mL/min*—Contraindicated.

Olmesartan

PO (Adults): 20 mg once daily; may ↑ up to 40 mg once daily (patients who are receiving diuretics or are volume-depleted should be started on lower doses).
PO (Children 6–16 yr): *≥35 kg*—20 mg once daily; may ↑ after 2 wk up to 40 mg once daily; *20–34.9 kg*—10 mg once daily; may ↑ after 2 wk up to 20 mg once daily.

Telmisartan

PO (Adults): *Hypertension*—40 mg once daily (volume-depleted patients should start with 20 mg once daily); may be titrated up to 80 mg/day; *Cardiovascular risk reduction*—80 mg once daily.

Valsartan

Oral tablets and suspension are NOT interchangeable on a mg-per-mg basis. These dosage forms should not be combined to arrive at a particular dose.
PO (Adults): *Hypertension*—80 mg or 160 mg once daily initially in patients who are not volume-depleted; may ↑ to 320 mg once daily; *HF*—40 mg twice daily, may be titrated up to target dose of 160 mg twice daily as tolerated; *Post-MI*—20 mg twice daily (may be initiated ≥ 12 hr after MI); dose may be titrated up to target dose of 160 mg twice daily, as tolerated.

© F.A. Davis Publishing

PO (Children 1–16 yr): *Hypertension*—1 mg/kg once daily (maximum dose = 40 mg/day) (may consider using starting dose of 2 mg/kg once daily if greater BP reduction needed); may ↑ up to 4 mg/kg once daily (maximum dose = 160 mg/day).

Availability

Azilsartan

Tablets: 40 mg, 80 mg. **Cost:** All strengths $113.23/30. ***In combination with:*** chlorthalidone (Edarbyclor); see Appendix N.

Candesartan (generic available)

Tablets: 4 mg, 8 mg, 16 mg, 32 mg. **Cost:** *Generic*—4 mg $99.16/30, 8 mg $99.16/30, 16 mg $285.56/30, 32 mg $386.60/30. ***In combination with:*** hydrochlorothiazide (Atacand HCT); see Appendix N.

Irbesartan (generic available)

Tablets: 75 mg, 150 mg, 300 mg. **Cost:** *Generic*—75 mg $10.44/90, 150 mg $279.97/90, 300 mg $31.13/90. ***In combination with:*** hydrochlorothiazide (Avalide); see Appendix N.

Losartan (generic available)

Tablets: 25 mg, 50 mg, 100 mg. **Cost:** *Generic*—25 mg $151.43/90, 50 mg $67.88/30, 100 mg $277.36/90. ***In combination with:*** hydrochlorothiazide (Hyzaar); see Appendix N.

Olmesartan (generic available)

Tablets: 5 mg, 20 mg, 40 mg. **Cost:** 5 mg $288.15/90, 20 mg $358.41/90, 40 mg $543.45/100. ***In combination with:*** hydrochlorothiazide (Benicar HCT); amlodipine (Azor); see Appendix N.

Telmisartan (generic available)

Tablets: 20 mg, 40 mg, 80 mg. **Cost:** 20 mg $445.33/90, 40 mg $441.19/90, 80 mg $441.19/90. ***In combination with:*** hydrochlorothiazide (Micardis HCT); amlodipine (Twynsta); see Appendix N.

Valsartan (generic available)

Tablets: 40 mg, 80 mg, 160 mg, 320 mg. **Cost:** 40 mg $330.05/90, 80 mg $428.25/90, 160 mg $469.86/90, 320 mg $581.92/90. ***In combination with:*** amlodipine (Exforge); hydrochlorothiazide (Diovan HCT); amlodipine and hydrochlorothiazide (Exforge HCT); see Appendix N.

NURSING IMPLICATIONS

Assessment

- Assess BP (lying, sitting, standing) and pulse periodically during therapy. Notify health care professional of significant changes.
- Monitor frequency of prescription refills to determine adherence.
- Assess patient for signs of angioedema (dyspnea, facial swelling). May rarely cause angioedema.
- **HF:** Monitor daily weight and assess patient routinely for resolution of fluid overload (peripheral edema, rales/crackles, dyspnea, weight gain, jugular venous distention).
- ***Lab Test Considerations:*** Monitor renal function and electrolyte levels periodically. Serum potassium, BUN, and serum creatinine may be ↑.
- May cause ↑ AST, ALT, and serum bilirubin (candesartan and olmesartan only).
- May cause ↑ uric acid, slight ↓ in hemoglobin and hematocrit, neutropenia, and thrombocytopenia.

Implementation

- Do not confuse Benicar with Mevacor. Do not confuse Diovan with Zyban.
- Correct volume depletion, if possible, prior to initiation of therapy.
- **PO:** May be administered without regard to meals.

Losartan

- **PO:** For patients with difficulty swallowing tablets, pharmacist can compound oral suspension; stable for 4 wk if refrigerated. Shake suspension before each use.

Valsartan

- For pediatric patients unable to swallow tablets, suspension can be prepared by pharmacist. Tablets and suspension are not interchangeable. Do not combine tablets and suspension. Suspension should be used for pediatric patients aged 1 to 5 yrs, for patients >5 yrs of age who cannot swallow tablets and for pediatric patients for whom the calculated dose (mg/kg) does not correspond to the available tablet strengths of valsartan.

Patient/Family Teaching

- Instruct patient to take as medication directed, even if feeling well. Take missed doses as soon as remembered if not almost time for next dose; do not double doses. Instruct patient to take medication at the same time each day. Warn patient not to discontinue therapy unless directed by health care professional.
- Caution patient to avoid salt substitutes containing potassium or food containing high levels of potassium or sodium unless directed by health care professional. See Appendix J.
- Caution patient to avoid sudden changes in position to decrease orthostatic hypotension. Use of alcohol, standing for long periods, exercising, and hot weather may increase orthostatic hypotension.
- May cause dizziness. Caution patient to avoid driving or other activities requiring alertness until response to medication is known.
- Instruct patient to notify health care professional of all Rx or OTC medications, vitamins, or herbal products being taken and consult health care profes-

© F.A. Davis Publishing

sional before taking any new medications, especially NSAIDs and cough, cold, or allergy remedies.
- Instruct patient to notify health care professional of medication regimen prior to treatment or surgery.
- Instruct patient to notify health care professional immediately if swelling of face, eyes, lips, or tongue occurs, or if difficulty swallowing or breathing occurs.
- Rep: May cause fetal harm. Advise females of reproductive potential to use contraception and notify health care professional if pregnancy is suspected or planned, or if breast feeding. If pregnancy is detected, discontinue medication as soon as possible. In patients taking during pregnancy, perform serial ultrasound examinations to assess the intra-amniotic environment. Fetal testing may be appropriate, based on the week of gestation. Patients and physicians should be aware, however, that oligohydramnios may not appear until after the fetus has sustained irreversible injury. If oligohydramnios is observed, consider alternative drug treatment. Closely observe neonates with histories of in utero exposure to valsartan for hypotension, oliguria, and hyperkalemia. In neonates with a history of in utero exposure to valsartan, if oliguria or hypotension occurs, support blood pressure and renal perfusion. Exchange transfusions or dialysis may be required as a means of reversing hypotension and replacing renal function.
- Emphasize the importance of follow-up exams to evaluate effectiveness of medication.
- **Hypertension:** Encourage patient to comply with additional interventions for hypertension (weight reduction, low-sodium diet, discontinuation of smoking, moderation of alcohol consumption, regular exercise, stress management). Medication controls but dose not cure hypertension.
- Instruct patient and family on proper technique for monitoring BP. Advise them to check BP at least weekly and to report significant changes.

Evaluation/Desired Outcomes
- Decrease in BP without appearance of excessive side effects.
- Slowed progression of diabetic nephropathy (irbesartan, losartan).
- Decreased cardiovascular death and HF-related hospitalizations in patients with HF (candesartan).
- Decreased hospitalizations in patients with HF (valsartan).
- Decreased risk of cardiovascular death in patients with left ventricular systolic dysfunction after MI (valsartan).
- Reduced risk of stroke in patients with hypertension and left ventricular hypertrophy (losartan).
- Reduction of risk of myocardial infarction, stroke, or cardiovascular death (telmisartan).

anidulafungin
(a-**ni**-du-la-fun-gin)
Eraxis

Classification
Therapeutic: antifungals
Pharmacologic: echinocandins

Indications
Candidemia and other serious candidal infections including intra-abdominal abscess, peritonitis. Esophageal candidiasis.

Action
Inhibits the synthesis of fungal cell wall. **Therapeutic Effects:** Death of susceptible fungi. **Spectrum:** Active against *Candida albicans*, *C. glabrata*, *C. parapsilosis*, and *C. tropicalis*.

Pharmacokinetics
Absorption: IV administration results in complete bioavailability.
Distribution: Crosses the placenta.
Metabolism and Excretion: Undergoes chemical degradation without hepatic metabolism; <1% excreted in urine.
Half-life: 40–50 hr.

TIME/ACTION PROFILE (blood levels)

ROUTE	ONSET	PEAK	DURATION
IV	rapid	end of infusion	24 hr

Contraindications/Precautions
Contraindicated in: Hypersensitivity; Known or suspected Hereditary Fructose Intolerance.
Use Cautiously in: Underlying liver disease (may worsen); OB: Safety not established in pregnancy; other antifungal agents preferred in pregnancy for infections caused by *Candida*; Lactation: Use while breast feeding only if potential maternal benefit justifies potential risk to infant; Pedi: Safety and effectiveness not established in children <1 mo (candidemia and intra-abdominal abscess and peritonitis caused by *Candida* or <18 yr (esophageal candidiasis); may lead to polysorbate toxicity in low-birth weight infants).

Adverse Reactions/Side Effects
CV: hypotension. **Derm:** flushing, rash, urticaria. **F and E:** hypokalemia. **GI:** diarrhea, ↑ liver enzymes. **Resp:** bronchospasm, dyspnea. **Misc:** ANAPHYLAXIS, infusion reactions.

Interactions
Drug-Drug: None noted.

© F.A. Davis Publishing

Route/Dosage

Candidemia and Intra-abdominal Abscess or Peritonitis Caused by *Candida*

IV (Adults): 200 mg loading dose on Day 1, then 100 mg once daily. Continue therapy for ≥14 days after last positive culture.
IV (Children ≥1 mo): 3 mg/kg (max = 200 mg) loading dose on Day 1, then 1.5 mg/kg (max = 100 mg) once daily. Continue therapy for ≥14 days after last positive culture.

Esophageal Candidiasis

IV (Adults): 100 mg loading dose on Day 1, then 50 mg once daily. Continue therapy for a minimum of 14 days and for ≥7 days following resolution of symptoms.

Availability

Lyophilized powder for injection (contains fructose and polysorbate 80): 50 mg/vial, 100 mg/vial.

NURSING IMPLICATIONS

Assessment

- Assess infected area and monitor cultures before and periodically during therapy.
- Obtain specimens for culture before starting therapy. Therapy may be started before results are obtained.
- Monitor for signs and symptoms of anaphylaxis (rash, urticaria, flushing, pruritus, bronchospasm, dyspnea, hypotension); usually related to histamine release. To decrease risk, do not exceed a rate of infusion of 1.1 mg/min.
- ***Lab Test Considerations:*** May cause ↑ ALT, AST, alkaline phosphatase, and hepatic enzymes.
- May cause hypokalemia.
- May cause neutropenia and leukopenia.

Implementation

IV Administration

- **Adults: Intermittent Infusion:** ***Reconstitution:*** Reconstitute each 50 mg vial with 15 mL or the 100 mg vial with 30 mL of Sterile Water for Injection. ***Concentration:*** 3.33 mg/mL. Stable at room temperature for up to 24 hr. *Adults:* ***Dilution:*** Further dilute within 24 hr by transferring contents of reconstituted vial into IV bag of D5W or 0.9% NaCl. For the 50 mg dose, dilute with 50 mL for an infusion volume of 65 mL. For the 100 mg dose, dilute with 100 mL for an infusion volume of 130 mL. For the 200 mg dose, dilute with 200 mL for a total infusion volume of 260 mL. ***Concentration:*** Final concentration is 0.77 mg/mL. Do not administer solutions that are discolored or contain particulate matter. Solution is stable for up to 48 hr at room temperature. ***Rate:*** Infuse over at least 45 min for the 50 mg dose, 90 min for the 100 mg dose, or 180 min for the 200 mg dose.
- **Pediatric Patients: Intermittent Infusion:** ***Reconstitution:*** Reconstitute each vial with Sterile Water for Injection. ***Concentration:*** 3.33 mg/mL. ***Dilution:*** Dilute with 0.9% NaCl or D5W. ***Concentration:*** Final concentration is 0.77 mg/mL. Prepare in infusion syringe or IV infusion bag. ***Rate:*** Administer at a rate not to exceed 1.1 mg/min (1.4 mL/min or 84 mL/hr).
- **Y-Site Compatibility:** acyclovir, alemtuzumab, alfentanil, allopurinol, amifostine, amikacin, aminophylline, amiodarone, amphotericin B lipid complex, amphotericin B liposome, ampicillin, ampicillin/sulbactam, argatroban, arsenic trioxide, atracurium, azithromycin, aztreonam, bivalirudin, bleomycin, bumetanide, buprenorphine, busulfan, butorphanol, calcium chloride, calcium gluconate, carboplatin, carmustine, caspofungin, cefazolin, cefepime, cefotaxime, cefotetan, cefoxitin, ceftazidime, ceftriaxone, cefuroxime, chloramphenicol, ciprofloxacin, cisatracurium, cisplatin, clindamycin, cyclophosphamide, cyclosporine, cytarabine, dacarbazine, dactinomycin, daunorubicin hydrochloride, dexamethasone, dexmedetomidine, digoxin, diltiazem, diphenhydramine, dobutamine, docetaxel, dopamine, doxorubicin hydrochloride, doxorubicin liposome, doxycycline, droperidol, enalaprilat, ephedrine, epinephrine, epirubicin, eptifibatide, erythromycin, esmolol, etoposide, etoposide phosphate, famotidine, fenoldopam, fentanyl, fluconazole, fludarabine, fluorouracil, foscarnet, fosphenytoin, furosemide, ganciclovir, gemcitabine, gentamicin, glycopyrrolate, granisetron, haloperidol, heparin, hydralazine, hydrocortisone, hydromorphone, idarubicin, ifosfamide, imipenem/cilastatin, insulin, irinotecan, isoproterenol, ketorolac, labetalol, leucovorin calcium, levofloxacin, linezolid, lorazepam, mannitol, melphalan, meperidine, meropenem, mesna, methotrexate, methylprednisolone, metoclopramide, metoprolol, metronidazole, midazolam, milrinone, mitomycin, mitoxantrone, morphine, mycophenolate, nafcillin, naloxone, nicardipine, nitroglycerin, nitroprusside, norepinephrine, octreotide, ondansetron, oxaliplatin, oxytocin, paclitaxel, palonosetron, pamidronate, pancuronium, pantoprazole, pentamidine, pentobarbital, phenobarbital, phentolamine, phenylephrine, piperacillin/tazobactam, potassium acetate, potassium chloride, procainamide, prochlorperazine, promethazine, propranolol, quinupristin/dalfopristin, remifentanil, rocuronium, sodium acetate, streptozocin, succinylcholine, sufentanil, tacrolimus, theophylline, thiopental, thiotepa, tirofiban, tobramycin, topotecan, trimethoprim/sulfamethoxazole, vancomycin, vasopressin, vecuronium, verapamil, vinblastine, vincristine, vinorelbine, voriconazole, zidovudine, zoledronic acid.

© F.A. Davis Publishing

- **Y-Site Incompatibility:** amphotericin B deoxycholate, dantrolene, diazepam, ertapenem, magnesium sulfate, nalbuphine, pemetrexed, phenytoin, potassium phosphates, sodium bicarbonate, sodium phosphates.

Patient/Family Teaching

- Explain purpose of medication to patient.
- Instruct patient to notify health care professional if signs and symptoms of anaphylaxis occur or if diarrhea becomes pronounced.
- Inform patient that anidulafungin contains fructose. May be life-threatening when administered to patients with hereditary fructose intolerance.
- Advise patient to notify health care professional if pregnancy is planned or suspected or if breast feeding.

Evaluation/Desired Outcomes

- Resolution of clinical and laboratory indications of fungal infections. Duration of therapy should be based on the patients clinical response. Therapy should be continued for at least 14 days after the last positive culture. For esophageal candidiasis, treatment should continue for at least 7 days following resolution of symptoms.

anifrolumab (an-i-frol-ue-mab)

Saphnelo

Classification

Therapeutic: none assigned

Pharmacologic: monoclonal antibodies, interferon receptor antagonists

Indications

Moderate to severe systemic lupus erythematosus (SLE) in patients who are receiving standard therapy.

Action

Monoclonal antibody that binds to subunit 1 of the type I interferon receptor which inhibits type I interferon signaling and reduces inflammatory and immunological processes that occur in SLE. **Therapeutic Effects:** Reduction in SLE disease activity.

Pharmacokinetics

Absorption: IV administration results in complete bioavailability.

Distribution: Not widely distributed to extravascular tissues.

Metabolism and Excretion: Unknown.

Half-life: Unknown.

TIME/ACTION PROFILE (plasma concentrations)

ROUTE	ONSET	PEAK	DURATION
IV	unknown	unknown	unknown

Contraindications/Precautions

Contraindicated in: History of anaphylaxis to anifrolumab; Active infection; Concurrent use with other biologic therapies.

Use Cautiously in: Chronic infection, history of recurrent infections, or risk factors for infection; Risk factors for malignancy; OB: Safety not established in pregnancy; Lactation: Safety not established in breast feeding; Pedi: Safety and effectiveness not established in children.

Adverse Reactions/Side Effects

Resp: cough. **Misc:** HYPERSENSITIVITY REACTIONS (including anaphylaxis and angioedema), INFECTION, MALIGNANCY, infusion-related reactions.

Interactions

Drug-Drug: ↑ risk of adverse reactions and ↓ immune response to **live vaccines** or **live-attenuated vaccines**; avoid concurrent use.

Route/Dosage

IV (Adults): 300 mg every 4 wk.

Availability

Solution for injection: 150 mg/mL.

NURSING IMPLICATIONS

Assessment

- Assess patient for lupus symptoms before starting and periodically during therapy.
- Monitor for signs and symptoms of infections (fever, sore throat, shortness of breath, rash, urinary burning or frequency) during therapy. May require interruption of therapy.
- Monitor for signs and symptoms of hypersensitivity reactions (swelling of face, tongue, or mouth, breathing difficulties, and/or fainting, dizziness, feeling lightheaded) during therapy.

Implementation

- Update immunizations, according to current immunization guidelines, before starting therapy.
- **Intermittent Infusion:** ***Dilution:*** Solution is clear to opalescent, colorless to slightly yellow; do not administer solutions that are cloudy, discolored, or contain particulate matter. Withdraw and discard 2 mL of solution from a 100 mL 0.9% NaCl infusion bag. Withdraw 2 mL of solution from vial of anifrolumab and add it to infusion bag. Mix the solution by gentle inversion. Do not shake. Administer immediately after mixing. Diluted solution is stable for 4 hr at room temperature and up to 24 hr if refrigerated. Allow solution to reach room temperature before administering. ***Rate:*** Administer over 30 min through an infusion line containing a sterile, low-protein binding 0.2 or 0.22 micron in-line filter. Flush infusion set with 25 mL of 0.9% NaCl to ensure all solution has been administered.

© F.A. Davis Publishing

Patient/Family Teaching

- Explain purpose of anifrolumab to patient. Advise patient to read *Patient Information* before starting anifrolumab and periodically during therapy in case of changes.
- Advise patient to notify health care professional if signs and symptoms of infection (fever or flu-like symptoms; muscle aches; cough; shortness of breath; burning on urination or urinating more often than usual; diarrhea or stomach pain; shingles [a red skin rash that can cause pain and burning]) or hypersensitivity reactions occur.
- Instruct patient to avoid live or live-attenuated vaccines during therapy.
- Instruct patient to notify health care professional of all Rx or OTC medications, vitamins, or herbal products being taken and consult health care professional before taking any new medications.
- Rep: Advise females of reproductive potential to notify health care professional if pregnancy is planned or suspected or if breast feeding. Inform patient of pregnancy exposure registry monitors pregnancy outcomes in women exposed to anifrolumab during pregnancy. For more information about the registry or to report a pregnancy while on *Saphnelo*, contact AstraZeneca at 1-877-693-9268.

Evaluation/Desired Outcomes

- Decrease in disease activity of lupus.

ANTIFUNGALS (TOPICAL)

butenafine (byoo-**ten**-a-feen)
Lotrimin Ultra, Mentax

ciclopirox (sye-kloe-**peer**-ox)
Loprox, Penlac, Stieprox

clotrimazole (kloe-**trye**-ma-zole)
Canesten, Clotrimaderm, Lotrimin AF, Mycelex, Neo-Zol

econazole (ee-**kon**-a-zole)
Ecoza

ketoconazole (kee-toe-**koe**-na-zole)
Extina, Ketoderm, Nizoral, Nizoral A-D, Xolegel

luliconazole (loo-li-**kon**-a-zole)
Luzu

miconazole (mye-**kon**-a-zole)
Fungoid, Lotrimin AF, Micatin, Micozole, Zeasorb-AF

naftifine (**naff**-ti-feen)
Naftin

nystatin (nye-**stat**-in)
~~Mycostatin~~, Nyaderm, Nystop

oxiconazole (ox-i-**kon**-a-zole)
Oxistat

sulconazole (sul-**kon**-a-zole)
Exelderm

terbinafine (ter-**bin**-a-feen)
Lamisil, Lamisil AT

tolnaftate (tol-**naff**-tate)
Canesten, EZ Clear, Flexitol, Fungicure, Fungifoam, Lamisil AF, Podactin, Proclearz, Tinactin

Classification
Therapeutic: antifungals (topical)

Indications

Treatment of a variety of cutaneous fungal infections, including cutaneous candidiasis, tinea pedis (athlete's foot), tinea cruris (jock itch), tinea corporis (ringworm), tinea versicolor, seborrheic dermatitis, dandruff, and onychomycosis of fingernails and toes.

Action

Butenafine, nystatin, clotrimazole, econazole, ketoconazole, luliconazole, miconazole, naftifine, oxiconazole, sulconazole, and terbinafine affect the synthesis of the fungal cell wall, allowing leakage of cellular contents. Tolnaftate distorts the hyphae and stunts mycelial growth in fungi. Ciclopirox inhibits the transport of essential elements in the fungal cell, disrupting the synthesis of DNA, RNA, and protein. **Therapeutic Effects:** Decrease in symptoms of fungal infection.

Pharmacokinetics

Absorption: Absorption through intact skin is minimal.
Distribution: Distribution after topical administration is primarily local.
Metabolism and Excretion: Metabolism and excretion not known following local application.
Half-life: *Butenafine*—35 hr; *Ciclopirox*—5.5 hr (gel); *Terbinafine*—21 hr.

TIME/ACTION PROFILE (resolution of symptoms/lesions†)

ROUTE	ONSET	PEAK	DURATION
Butenafine	unknown	up to 4 wk	unknown
Luliconazole	unknown	3–4 wk	unknown
Tolnaftate	24–72 hr	unknown	unknown

† Only the drugs with known information included in this table.

Contraindications/Precautions

Contraindicated in: Hypersensitivity to active ingredients, additives, preservatives, or bases; Some

© F.A. Davis Publishing

products contain alcohol or bisulfites and should be avoided in patients with known intolerance.
Use Cautiously in: Nail and scalp infections (may require additional systemic therapy); OB, Lactation: Safety not established.

Adverse Reactions/Side Effects

Local: burning, itching, local hypersensitivity reactions, redness, stinging.

Interactions

Drug-Drug: Econazole may ↑ levels of and risk of bleeding from **warfarin**.

Route/Dosage

Butenafine

Topical (Adults and Children >12 yr): Apply once daily for 2 wk for tinea corporis, tinea cruris, or tinea versicolor. Apply once daily for 4 wk or once daily for 7 days for tinea pedis.

Ciclopirox

Topical (Adults and Children >10 yr): *Cream/lotion*—Apply twice daily for 2–4 wk; *Topical solution (nail lacquer)*—Apply to nails at bedtime or 8 hr prior to bathing for up to 48 wk. Each daily application should be made over the previous coat and then removed with alcohol every 7 days; *Gel*—Apply twice daily for 4 wk; *Shampoo*—5–10 mL applied to scalp, lather and leave on for 3 min, rinse; repeat twice weekly for 4 wk (at least 3 days between applications).

Clotrimazole

Topical (Adults and Children >3 yr): Apply twice daily for 1–4 wk.

Econazole

Topical (Adults and Children): Apply once daily for tinea pedis (for 4 wk), tinea cruris (for 2 wk), tinea corporis (for 2 wk), or tinea versicolor (for 2 wk). Apply twice daily for cutaneous candidiasis (for 2 wk).

Ketoconazole

Topical (Adults): Apply cream once daily for cutaneous candidiasis (for 2 wk), tinea corporis (for 2 wk), tinea cruris (for 2 wk), tinea pedis (for 6 wk), or tinea versicolor (for 2 wk). Apply cream twice daily for seborrheic dermatitis (for 4 wk). For dandruff, use shampoo twice weekly (wait 3–4 days between treatments) for 4 wk, then intermittently.

Luliconazole

Topical (Adults and Children ≥12 yr): *Interdigital tinea pedis*—Apply to affected and surrounding areas once daily for 2 wk; *Tinea cruris*—Apply to affected and surrounding areas once daily for 1 wk.
Topical (Adults and Children ≥2 yr): *Tinea corporis*—Apply to affected and surrounding areas once daily for 1 wk.
Topical (Adults): *Interdigital tinea pedis*—Apply to affected and surrounding areas once daily for 2 wk; *Tinea cruris and tinea corporis*—Apply to affected and surrounding areas once daily for 1 wk.

Miconazole

Topical (Adults and Children >2 yr): Apply twice daily. Treat tinea cruris for 2 wk and tinea pedis or tinea corporis for 4 wk.

Naftifine

Topical (Adults): *Interdigital tinea pedis*—Apply cream or gel once daily for 2 wk; *Tinea cruris or tinea corporis*—apply cream once daily for 2 wk.
Topical (Children ≥12 yr): *Interdigital tinea pedis*—Apply cream or gel once daily for 2 wk.
Topical (Children ≥2 yr): *Tinea corporis*—Apply cream once daily for 2 wk.

Nystatin

Topical (Adults and Children): Apply 2–3 times daily until healing is complete.

Oxiconazole

Topical (Adults and Children): Apply cream or lotion 1–2 times daily for tinea pedis (for 4 wk), tinea corporis (for 2 wk), or tinea cruris (for 2 wk). Apply cream once daily for tinea versicolor (for 2 wk).

Sulconazole

Topical (Adults): Apply 1–2 times daily (twice daily for tinea pedis). Treat tinea corporis, tinea cruris, or tinea versicolor for 3 wk, and tinea pedis for 4 wk.

Terbinafine

Topical (Adults): Apply twice daily for tinea pedis (for 1 wk) or daily for tinea cruris or tinea corporis for 1 wk.

Tolnaftate

Topical (Adults): Apply twice daily for tinea cruris (for 2 wk), tinea pedis (for 4 wk), or tinea corporis (for 4 wk).

Cream: 1%[OTC]. **Powder:** 1%[OTC]. **Solution:** 1%[OTC]. **Spray liquid:** 1%[OTC]. **Spray powder:** 1%[OTC].

NURSING IMPLICATIONS

Assessment
- Inspect involved areas of skin and mucous membranes before and frequently during therapy. Increased skin irritation may indicate need to discontinue medication.

Implementation
- Consult health care professional for proper cleansing technique before applying medication.
- Choice of vehicle is based on use. Ointments, creams, and liquids are used as primary therapy. Lotion is usually preferred in intertriginous areas; if cream is used, apply sparingly to avoid maceration. Powders are usually used as adjunctive therapy but may be used as primary therapy for mild conditions (especially for moist lesions).
- **Topical:** Apply small amount to cover affected area completely. Avoid use of occlusive wrappings or dressings unless directed by health care professional.
- **Nail lacquer:** Avoid contact with skin other than skin immediately surrounding treated nail. Avoid contact with eyes or mucous membranes. Removal of unattached, infected nail, as frequently as monthly, by health care professional is needed with use of this medication. Up to 48 wk of daily application and professional removal may be required to achieve clear or almost clear nail. 6 mo of treatment may be required before results are noticed.
- **Ciclopirox or Ketoconazole shampoo:** Moisten hair and scalp thoroughly with water. Apply sufficient shampoo to produce enough lather to wash scalp and hair and gently massage it over the entire scalp area for approximately 1 min. Rinse hair thoroughly with warm water. Repeat process, leaving shampoo on hair for an additional 3 min. After the 2nd shampoo, rinse and dry hair with towel or warm air flow. Shampoo twice a wk for 4 wk with at least 3 days between each shampooing and then intermittently as needed to maintain control.
- **Ketoconazole foam:** Hold container upright and dispense foam into cap of can or other smooth surface; dispensing directly on to hand is not recommended as the foam begins to melt immediately on contact with warm skin. Pick up small amounts with fingertips and gently massage into affected areas until absorbed. Move hair to allow direct application to skin.

Patient/Family Teaching
- Instruct patient to apply medication as directed for full course of therapy, even if feeling better. Emphasize the importance of avoiding the eyes.
- Caution patient that some products may stain fabric, skin, or hair. Check label information. Fabrics stained from cream or lotion can usually be cleaned by hand washing with soap and warm water; stains from ointments can usually be removed with standard cleaning fluids.
- Patients with athlete's foot should be taught to wear well-fitting, ventilated shoes, to wash affected areas thoroughly, and to change shoes and socks at least once a day.
- Advise patient to report increased skin irritation or lack of response to therapy to health care professional.
- **Nail lacquer:** File away loose nail and trim nails every 7 days after solution is removed with alcohol. Do not use nail polish on treated nails. Inform health care professional if patient has diabetes mellitus before using.

Evaluation/Desired Outcomes
- Decrease in skin irritation and resolution of infection. Early relief of symptoms may be seen in 2–3 days. For *Candida,* tinea cruris, and tinea corporis, 2 wk are needed, and for tinea pedis, therapeutic response may take 3–4 wk. Recurrent fungal infections may be a sign of systemic illness.

ANTIFUNGALS (VAGINAL)

butoconazole (byoo-toe-**kon**-a-zole)
Gynezole-1, Mycelex-3

© F.A. Davis Publishing

clotrimazole (kloe-**trye**-ma-zole)
Canesten, Clotrimaderm, Gyne-Lotrimin-3, Mycelex-7

miconazole (mye-**kon**-a-zole)
Monistat-1, Monistat-3, Monistat-7, Vagistat-3

terconazole (ter-**kon**-a-zole)
Terazol-3, Terazol-7

tioconazole (tye-oh-**kon**-a-zole)
1–Day, Monistat-1Day, Vagistat-1

Classification
Therapeutic: antifungals (vaginal)

Indications
Treatment of vulvovaginal candidiasis.

Action
Affects the permeability of the fungal cell wall, allowing leakage of cellular contents. Not active against bacteria.
Therapeutic Effects: Inhibited growth and death of susceptible *Candida*, with decrease in accompanying symptoms of vulvovaginitis (vaginal burning, itching, discharge).

Pharmacokinetics
Absorption: Absorption through intact skin is minimal.
Distribution: Unknown. Action is primarily local.
Metabolism and Excretion: Negligible with local application.
Half-life: Not applicable.

TIME/ACTION PROFILE

ROUTE	ONSET	PEAK	DURATION
All agents	rapid	unknown	24 hr

Contraindications/Precautions
Contraindicated in: Hypersensitivity to active ingredients, additives, or preservatives; OB: Safety not established; Lactation: Safety not established.
Use Cautiously in: None noted.

Adverse Reactions/Side Effects
Derm: *terconazole*— TOXIC EPIDERMAL NECROLYSIS. **GU:** itching, pelvic pain, vulvovaginal burning. **Misc:** *terconazole*— ANAPHYLAXIS.

Interactions
Drug-Drug: Concurrent use of vaginal miconazole with **warfarin** ↑ risk of bleeding/bruising (appropriate monitoring recommended).

Route/Dosage

Butoconazole
Vag (Adults and Children ≥12 yr): 1 applicatorful (5 g) at bedtime for 3 days (Mycelex-3) *or* one applicatorful single dose (Gynezole-1).

Clotrimazole
Vag (Adults and Children >12 yr): *Vaginal tablets*— 100 mg at bedtime for 7 nights (preferred regimen for pregnancy) *or* 200 mg at bedtime for 3 nights. *Vaginal cream*— 1 applicatorful (5 g) of 1% cream at bedtime for 7 days *or* 1 applicatorful (5 g) of 2% cream at bedtime for 3 days.

Miconazole
Vag (Adults and Children ≥12 yr): *Vaginal suppositories*— one 100-mg suppository at bedtime for 7 days *or* one 200-mg suppository at bedtime for 3 days *or* one 1200-mg suppository as a single dose. *Vaginal cream*— 1 applicatorful of 2% cream at bedtime for 7 days *or* 1 applicatorful of 4% cream at bedtime for 3 days. *Combination packages*— contain a cream or suppositories as well as an external vaginal cream (may be used twice daily for up to 7 days, as needed, for symptomatic management of itching).

Terconazole
Vag (Adults): *Vaginal cream*— 1 applicatorful (5 g) of 0.4% cream at bedtime for 7 days *or* 1 applicatorful (5 g) of 0.8% cream at bedtime for 3 days. *Vaginal suppositories*— 1 suppository (80 mg) at bedtime for 3 days.

Tioconazole
Vag (Adults and Children ≥12 yr): 1 applicatorful (4.6 g) at bedtime as a single dose.

Availability

Butoconazole
Vaginal cream: 2%[Rx, OTC].

Clotrimazole (generic available)
Vaginal tablets: 100 mg[OTC], 200 mg[OTC]. **Vaginal cream:** 1%[OTC], 2%[OTC].

Miconazole (generic available)
Vaginal cream: 2%[OTC], 4%[OTC]. **Vaginal suppositories:** 100 mg[OTC], 200 mg[Rx, OTC]. ***In combination with:*** combination package of three 200-mg suppositories and 2% external cream[OTC]; one 1200-mg suppository and 2% external cream[OTC]; 4% vaginal cream and 2% external cream[OTC]; seven 100-mg suppositories and 2% external cream[OTC]; 2% vaginal cream and 2% external cream[OTC].

Terconazole (generic available)
Vaginal cream: 0.4%, 0.8%. **Vaginal suppositories:** 80 mg.

Tioconazole
Vaginal ointment: 6.5%[OTC].

NURSING IMPLICATIONS

Assessment
- Inspect involved areas of skin and mucous membranes before and frequently during therapy. Increased skin irritation may indicate need to discontinue medication.

© F.A. Davis Publishing

Implementation

- Consult health care professional for proper cleansing technique before applying medication.
- **Vag:** Applicators are supplied for vaginal administration.

Patient/Family Teaching

- Instruct patient to apply medication as directed for full course of therapy, even if feeling better. Therapy should be continued during menstrual period.
- Instruct patient on proper use of vaginal applicator. Medication should be inserted high into the vagina at bedtime. Instruct patient to remain recumbent for at least 30 min after insertion. Advise use of sanitary napkins to prevent staining of clothing or bedding.
- Advise patient to avoid using tampons while using this product.
- Advise patient to consult health care professional regarding intercourse during therapy. Vaginal medication may cause minor skin irritation in sexual partner. Advise patient to refrain from sexual contact during therapy or have male partner wear a condom. Some products may weaken latex contraceptive devices. Another method of contraception should be used during treatment.
- Advise patient to report to health care professional increased skin irritation or lack of response to therapy. A second course may be necessary if symptoms persist.
- Instruct patient to stop using medication and notify health care professional if rash or signs and symptoms of anaphylaxis (wheezing, rash, hives, shortness of breath) occur.
- Advise patient to dispose of applicator after each use (except for terconazole).

Evaluation/Desired Outcomes

- Decrease in skin irritation and vaginal discomfort. Therapeutic response is usually seen after 1 wk. Diagnosis should be reconfirmed with smears or cultures before a second course of therapy to rule out other pathogens associated with vulvovaginitis. Recurrent vaginal infections may be a sign of systemic illness.

apixaban (a-pix-a-ban)

Eliquis

Classification

Therapeutic: anticoagulants

Pharmacologic: factor Xa inhibitors

Indications

Decreases risk of stroke/systemic embolism associated with nonvalvular atrial fibrillation. Prevention of deep vein thrombosis that may lead to pulmonary embolism following knee or hip replacement surgery. Treatment of and reduction in risk of recurrence of deep vein thrombosis (DVT) or pulmonary embolism (PE).

Action

Acts as a selective, reversible site inhibitor of factor Xa, inhibiting both free and bound factor. Does not affect platelet aggregation directly, but does inhibit thrombin-induced platelet aggregation. Decreases thrombin generation and thrombus development. **Therapeutic Effects:** Treatment and prevention of thromboembolic events.

Pharmacokinetics

Absorption: 50% absorbed following oral administration.

Distribution: Unknown.

Metabolism and Excretion: 25% metabolized (mostly by CYP3A4) and excreted in urine and feces. Biliary and direct intestinal excretion account for fecal elimination.

Half-life: 6 hr (12 hr after repeated dosing due to prolonged absorption).

TIME/ACTION PROFILE (effect on hemostasis)

ROUTE	ONSET	PEAK	DURATION
PO	unknown	3–4 hr†	24 hr

†Blood levels.

Contraindications/Precautions

Contraindicated in: Previous severe hypersensitivity reactions; Active pathological bleeding; Severe hepatic impairment; Not recommended for use in patients with prosthetic heart valves; Concurrent use of strong dual inducers of CYP3A4 and P-gp; PE with hemodynamic instability or requiring thrombolysis or pulmonary embolectomy; Triple-positive antiphospholipid syndrome (↑ risk of thrombosis); Lactation: Lactation.

Use Cautiously in: Neuroaxial spinal anesthesia or spinal puncture, especially if concurrent with an indwelling epidural catheter, drugs affecting hemostasis, history of traumatic/repeated spinal puncture or spinal deformity (↑ risk of spinal hematoma); Discontinuation ↑ risk of thromboses; Surgery; Renal impairment (dose ↓ may be required); Moderate hepatic impairment (↑ risk of bleeding); Concurrent use of strong dual inhibitors of CYP3A4 and P-gp (dose ↓ required); Rep: Women of reproductive potential; OB: Use during pregnancy only if potential maternal benefit justifies potential fetal risk; Pedi: Safety and effectiveness not established in children.

Adverse Reactions/Side Effects

Hemat: BLEEDING. **Misc:** hypersensitivity reactions including ANAPHYLAXIS.

© F.A. Davis Publishing

Interactions

Drug-Drug: ↑ risk of bleeding with other **anticoagulants**, **aspirin**, **clopidogrel**, **ticagrelor**, **prasugrel**, **fibrinolytics**, **NSAIDs**, **SNRIs**, or **SSRIs**. Concurrent use of strong inhibitors of both the CYP3A4 and P-gp enzyme systems (including **itraconazole**, **ketoconazole**, and **ritonavir**) ↑ levels and bleeding risk; may need to ↓ apixaban dose or avoid concurrent use. Inducers of the CYP3A4 enzyme system and the P-gp system including **carbamazepine**, **phenytoin**, **rifampin** will ↓ levels and may ↑ risk of thromboses; avoid concomitant use.

Drug-Natural Products: Concurrent use **St. John's wort**, a strong dual inducer of the CYP3A4 and P-gp enzyme systems can ↓ levels and ↑ risk of thromboses and should be avoided.

Route/Dosage

Reduction in Risk of Stroke/Systemic Embolism in Nonvalvular Atrial Fibrillation

PO (Adults): 5 mg twice daily; *Any 2 of the following: age ≥80 yr, weight ≤60 kg, serum creatinine ≥1.5 mg/dL*—2.5 mg twice daily; *Concurrent use of strong inhibitors of both CYP3A4 and P-gp*—2.5 mg twice daily; if patient already taking 2.5 mg twice daily, avoid concomitant use.

Renal Impairment

PO (Adults): *Hemodialysis*—5 mg twice daily; *HD and either age ≥80 yr or weight ≤60 kg*—2.5 mg twice daily.

Prevention of Deep Vein Thrombosis Following Knee or Hip Replacement Surgery

PO (Adults): 2.5 mg twice daily, initiated 12–24 hr postoperatively (when hemostasis is achieved) continued for 35 days after hip replacement or 12 days after knee replacement; *Concurrent use of strong inhibitors of both CYP3A4 and P-gp*—Avoid concomitant use.

Treatment of DVT or PE

PO (Adults): 10 mg twice daily for 7 days, then 5 mg twice daily; *Concurrent use of strong inhibitors of both CYP3A4 and P-gp*—2.5 mg twice daily.

Reduction in Risk of Recurrence of DVT or PE

PO (Adults): 2.5 mg twice daily after ≥6 mo of treatment of DVT or PE; *Concurrent use of strong inhibitors of both CYP3A4 and P-gp*—Avoid concomitant use.

Availability (generic available)

Tablets: 2.5 mg, 5 mg.

NURSING IMPLICATIONS

Assessment

- Assess patient for symptoms of stroke, DVT, PE, bleeding, or peripheral vascular disease periodically during therapy.
- ***Toxicity and Overdose:*** Antidote is andexanet alfa. Effects persist for at least 24 hrs after last dose. Oral activated charcoal decreases apixaban absorption, lowering plasma concentrations. Other agents and hemodialysis do not have a significant effect.

Implementation

- When *converting from warfarin*, discontinue warfarin and start apixaban when INR is <2.0.
- When *converting from apixaban to warfarin*, apixaban affects INR, so INR measurements may not be useful for determining appropriate dose of warfarin. If continuous anticoagulation is necessary, discontinue apixaban and begin both a parenteral anticoagulant and warfarin at time of next dose of apixaban, discontinue parenteral anticoagulant when INR reaches acceptable range.
- When *switching between apixaban and anticoagulants other than warfarin*, discontinue one being taken and begin the other at the next scheduled dose.
- *For surgery*, discontinue apixaban at least 48 hrs before invasive or surgical procedures with a moderate or high risk of unacceptable or clinically significant bleeding or at least 24 hrs prior to procedures with a low risk of bleeding or where the bleeding would be non-critical in location and easily controlled.
- **PO:** Administer twice daily without regard to food.
- For patients who cannot swallow tablet, 5 mg and 2.5 mg tablets can be crushed, suspended in water, D5W, or apple juice, or mixed with applesauce and administered immediately orally. May also be suspended in 60 mL of water or D5W and promptly administered through a nasogastric tube.

Patient/Family Teaching

- Instruct patient to take apixaban as directed. Take missed doses as soon as remembered on the same day and resume twice daily administration; do not double doses. Do not discontinue without consulting health care professional; may increase risk of having a stroke, DVT, or PE. If temporarily discontinued, restart as soon as possible. Store apixaban at room temperature. Advise patient to read *Medication Guide* before beginning therapy and with each Rx refill in case of changes.
- Inform patient that they may bruise and bleed more easily or longer than usual. Advise patient to notify health care professional immediately if signs of bleeding (unusual bruising, pink or brown urine, red or black, tarry stools, coughing up blood, vomiting blood, pain or swelling in a joint, headache, dizziness, weakness, recurring nose bleeds, unusual bleeding from gums, heavier than normal menstrual bleeding, dyspepsia, abdominal pain, epigastric pain) occurs or if injury occurs, especially head injury.
- Caution patient to notify health care professional if skin rash or signs of severe allergic reaction (chest

© F.A. Davis Publishing

pain or tightness, swelling of face or tongue, trouble breathing or wheezing, feeling dizzy or faint) occur.
- Advise patient to notify health care professional of medication regimen prior to treatment or surgery.
- Instruct patient to notify health care professional of all Rx or OTC medications, vitamins, or herbal products being taken and consult health care professional before taking any new medications, especially St. John's wort. Risk of bleeding is increased with aspirin, NSAIDs, warfarin, heparin, SSRIs or SNRIs.
- Inform patient having had neuraxial anesthesia or spinal puncture to watch for signs and symptoms of spinal or epidural hematomas (numbness or weakness of legs, bowel or bladder dysfunction). Notify health care professional immediately if symptoms occur.
- Rep: Advise female patient to notify health care professional if pregnancy is planned or suspected and to avoid breast feeding during therapy. May increase risk of uterine bleeding; advise patient to notify health care professional if significant uterine bleeding occurs.

Evaluation/Desired Outcomes

- Reduction in the risk and treatment of stroke and systemic embolism.

aprepitant (oral) (a-**prep**-i-tant)
Emend

aprepitant (injection)
(a-**prep**-i-tant)
Cinvanti

fosaprepitant (injection)
(fos-a-**prep**-i-tant)
Emend

Classification
Therapeutic: antiemetics
Pharmacologic: neurokinin antagonists

Indications

PO, IV: Prevention of: Acute and delayed nausea and vomiting associated with initial and repeat courses of highly emetogenic chemotherapy (in combination with other antiemetic agents) (IV aprepitant, PO/IV fosaprepitant), Delayed nausea and vomiting associated with initial and repeat courses of moderately emetogenic chemotherapy (in combination with other antiemetic agents) (IV aprepitant, IV fosaprepitant), Nausea and vomiting associated with initial and repeat courses of moderately emetogenic chemotherapy (in combination with other antiemetic agents) (IV aprepitant, PO fosaprepitant).

Action

Acts as a selective antagonist at substance P/neurokinin 1 (NK_1) receptors in the brain. **Therapeutic Effects:** Decreased nausea and vomiting associated with chemotherapy. Augments the antiemetic effects of dexamethasone and 5-HT_3 antagonists.

Pharmacokinetics

Absorption: 60–65% absorbed following oral administration. Following IV administration, fosaprepitant is rapidly converted to aprepitant, the active component. IV administration results in complete bioavailability.
Distribution: Crosses the blood brain barrier; remainder of distribution unknown.
Protein Binding: 95–99%.
Metabolism and Excretion: Mostly metabolized by the liver (CYP3A4 enzyme system); not renally excreted.
Half-life: *Aprepitant*—9–13 hr.

TIME/ACTION PROFILE (antiemetic effect)

ROUTE	ONSET	PEAK	DURATION
PO	1 hr	4 hr*	24 hr
IV	rapid	end of infusion*	24 hr

*Blood level.

Contraindications/Precautions

Contraindicated in: Hypersensitivity; Concurrent use with pimozide.
Use Cautiously in: Concurrent use with any CYP3A4 substrates; Concurrent use with strong or moderate CYP3A4 inhibitors; Concurrent use with strong CYP3A4 inducers; OB: Safety not established in pregnancy; Lactation: Safety not established in breast feeding; Pedi: Children <6 mo (safety and effectiveness not established).

Adverse Reactions/Side Effects

CV: dizziness, fatigue, weakness. **Derm:** STEVENS-JOHNSON SYNDROME. **GI:** diarrhea. **Neuro:** headache. **Misc:** HYPERSENSITIVITY REACTIONS (including anaphylaxis), hiccups, infusion reactions (fosaprepitant IV only).

Interactions

Drug-Drug: May significantly ↑ levels of **pimozide**, which can ↑ risk of torsade de pointes; concurrent use contraindicated. May ↑ levels of **CYP3A4 substrates**, including **docetaxel**, **paclitaxel**, **etoposide**, **irinotecan**, **ifosfamide**, **imatinib**, **vinorelbine**, **vinblastine**, **vincristine**, **midazolam**, **triazolam**, and **alprazolam**; concurrent use should be undertaken with caution. **Moderate or strong CYP3A4 inhibitors**, including **ketoconazole**, **itraconazole**, **nefazodone**, **clarithromycin**, **ritonavir**, **nelfinavir**, and

© F.A. Davis Publishing

diltiazem) may ↑ levels and risk of adverse reactions. **Strong CYP3A4 inducers**, including **rifampin**, **carbamazepine**, and **phenytoin** may ↓ levels and effects. ↑ levels and effects of **dexamethasone** (regimen reflects a 50% dose ↓); a similar effect occurs with **methylprednisolone** (↓ IV dose by 25%, ↓ PO dose by 50% when used concurrently). May ↓ the effects of **warfarin** (carefully monitor INR for 2 wk), **oral contraceptives** (use alternate method), and **phenytoin**.

Route/Dosage

Prevention of Nausea and Vomiting Associated with Highly Emetogenic Chemotherapy

PO (Adults): *Capsules or suspension* — 125 mg given 1 hr prior to chemotherapy (Day 1) (with dexamethasone 12 mg PO given 30 min prior to chemotherapy and a 5-HT_3 antagonist given prior to chemotherapy), then 80 mg once daily for 2 days (Days 2 and 3) (with dexamethasone 8 mg once daily for 3 days [Days 2–4]).

IV (Adults): *Fosaprepitant* — 150 mg given 30 min prior to chemotherapy on Day 1 (with dexamethasone 12 mg PO given 30 min prior to chemotherapy and a 5-HT_3 antagonist prior to chemotherapy). Continue dexamethasone on Days 2–4 (8 mg PO on Day 2, 8 mg twice daily on Days 3 and 4); *Aprepitant* — 130 mg given 30 min prior to chemotherapy on Day 1 (with dexamethasone 12 mg PO given 30 min prior to chemotherapy and a 5-HT_3 antagonist prior to chemotherapy). Continue dexamethasone on Days 2–4 (8 mg PO on Day 2, 8 mg twice daily on Days 3 and 4).

PO (Children ≥12 yr): *Capsules* — 125 mg given 1 hr prior to chemotherapy (Day 1) (with PO dexamethasone at 50% of recommended dose given 30 min prior to chemotherapy and a 5-HT_3 antagonist given prior to chemotherapy), then 80 mg once daily for 2 days (Days 2 and 3) (with PO dexamethasone at 50% of recommended dose once daily for 3 days [Days 2–4]).

PO (Children 6 mo–<12 yr and >6 kg): *Suspension* — 3 mg/kg (max dose = 125 mg) given 1 hr prior to chemotherapy (Day 1) (with PO dexamethasone at 50% of recommended dose given 30 min prior to chemotherapy and a 5-HT_3 antagonist given prior to chemotherapy), then 2 mg/kg (max dose = 80 mg) once daily for 2 days (Days 2 and 3) (with PO dexamethasone at 50% of recommended dose once daily for 3 days [Days 2–4]).

IV (Children 12–17 yr and ≥6 kg): *Single–day chemotherapy regimen* — 150 mg given 30 min prior to chemotherapy on Day 1 (with PO dexamethasone at 50% of recommended dose given 30 min prior to chemotherapy and a 5-HT_3 antagonist given prior to chemotherapy). Continue dexamethasone on Day 2; *Multi–day chemotherapy regimen* — 115 mg given 30 min prior to chemotherapy on Day 1 (with PO dexamethasone at 50% of recommended dose given 30 min prior to chemotherapy and a 5-HT_3 antagonist given prior to chemotherapy), then 80 mg PO once daily (capsules) for 2 days (Days 2 and 3) (with PO dexamethasone at 50% of recommended dose once daily for 2 days [Days 2 and 3].

IV (Children 2–<12 yr and ≥6 kg): *Single–day chemotherapy regimen* — 4 mg/kg (max dose = 150 mg) given 30 min prior to chemotherapy on Day 1 (with PO dexamethasone at 50% of recommended dose given 30 min prior to chemotherapy and a 5-HT_3 antagonist given prior to chemotherapy). Continue dexamethasone on Day 2; *Multi–day chemotherapy regimen* — 3 mg/kg (max dose = 115 mg) given 30 min prior to chemotherapy on Day 1 (with PO dexamethasone at 50% of recommended dose given 30 min prior to chemotherapy and a 5-HT_3 antagonist given prior to chemotherapy), then 2 mg/kg (max dose = 80 mg) (oral suspension) PO once daily for 2 days (Days 2 and 3) (with PO dexamethasone at 50% of recommended dose once daily for 2 days [Days 2 and 3].

IV (Children 6 mo-<2 yr and ≥6 kg): *Single–day chemotherapy regimen* — 5 mg/kg (max dose = 150 mg) given 30 min prior to chemotherapy on Day 1 (with PO dexamethasone at 50% of recommended dose given 30 min prior to chemotherapy and a 5-HT_3 antagonist given prior to chemotherapy). Continue dexamethasone on Day 2; *Multi–day chemotherapy regimen* — 3 mg/kg (max dose = 115 mg) given 30 min prior to chemotherapy on Day 1 (with PO dexamethasone at 50% of recommended dose given 30 min prior to chemotherapy and a 5-HT_3 antagonist given prior to chemotherapy), then 2 mg/kg (max dose = 80 mg) (oral suspension) PO once daily for 2 days (Days 2 and 3) (with PO dexamethasone at 50% of recommended dose once daily for 2 days [Days 2 and 3].

Prevention of Nausea and Vomiting Associated with Moderately Emetogenic Chemotherapy

PO (Adults): *Capsules or suspension* — 125 mg given 1 hr prior to chemotherapy (Day 1) (with dexamethasone 12 mg PO given 30 min prior to chemotherapy and a 5-HT_3 antagonist), then 80 mg once daily for 2 days (Days 2 and 3).

IV (Adults): *Fosaprepitant (for delayed nausea/vomiting)* — 150 mg given 30 min prior to chemotherapy on Day 1 (with dexamethasone 12 mg PO given 30 min prior to chemotherapy and a 5-HT_3 antagonist prior to chemotherapy); *Aprepitant (single–dose regimen for delayed nausea/vomiting)* — 130 mg given 30 min prior to chemotherapy on Day 1 (with dexamethasone 12 mg PO given 30 min prior to chemotherapy and a 5-HT_3 antagonist prior to chemotherapy). *Aprepitant (3–day regimen)* — 100 mg given 30 min prior to chemotherapy on Day 1 (with dexamethasone 12 mg PO given 30 min prior to chemotherapy and a 5-HT_3 antagonist prior to chemotherapy). Continue aprepitant 80 mg PO on Days 2 and 3.

PO (Children ≥12 yr): *Capsules* — 125 mg given 1 hr prior to chemotherapy (Day 1) (with PO dexameth-

© F.A. Davis Publishing

asone at 50% of recommended dose given 30 min prior to chemotherapy and a 5-HT_3 antagonist), then 80 mg once daily for 2 days (Days 2 and 3).

PO (Children 6 mo–<12 yr and >6 kg): *Suspension*—3 mg/kg (max dose = 125 mg) given 1 hr prior to chemotherapy (Day 1) (with PO dexamethasone at 50% of recommended dose given 30 min prior to chemotherapy and a 5-HT_3 antagonist given prior to chemotherapy), then 2 mg/kg (max dose = 80 mg) once daily for 2 days (Days 2 and 3) (with PO dexamethasone at 50% of recommended dose once daily for 3 days [Days 2–4]).

IV (Children 12–17 yr and ≥6 kg): *Single–day chemotherapy regimen*—150 mg given 30 min prior to chemotherapy on Day 1 (with PO dexamethasone at 50% of recommended dose given 30 min prior to chemotherapy and a 5-HT_3 antagonist given prior to chemotherapy). Continue dexamethasone on Day 2; *Multi–day chemotherapy regimen*—115 mg given 30 min prior to chemotherapy on Day 1 (with PO dexamethasone at 50% of recommended dose given 30 min prior to chemotherapy and a 5-HT_3 antagonist given prior to chemotherapy), then 80 mg PO once daily (capsules) for 2 days (Days 2 and 3) (with PO dexamethasone at 50% of recommended dose once daily for 2 days [Days 2 and 3].

IV (Children 2–<12 yr and ≥6 kg): *Single–day chemotherapy regimen*—4 mg/kg (max dose = 150 mg) given 30 min prior to chemotherapy on Day 1 (with PO dexamethasone at 50% of recommended dose given 30 min prior to chemotherapy and a 5-HT_3 antagonist given prior to chemotherapy). Continue dexamethasone on Day 2; *Multi–day chemotherapy regimen*—3 mg/kg (max dose = 115 mg) given 30 min prior to chemotherapy on Day 1 (with PO dexamethasone at 50% of recommended dose given 30 min prior to chemotherapy and a 5-HT_3 antagonist given prior to chemotherapy), then 2 mg/kg (max dose = 80 mg) (oral suspension) PO once daily for 2 days (Days 2 and 3) (with PO dexamethasone at 50% of recommended dose once daily for 2 days [Days 2 and 3].

IV (Children 6 mo-<2 yr and ≥6 kg): *Single–day chemotherapy regimen*—5 mg/kg (max dose = 150 mg) given 30 min prior to chemotherapy on Day 1 (with PO dexamethasone at 50% of recommended dose given 30 min prior to chemotherapy and a 5-HT_3 antagonist given prior to chemotherapy). Continue dexamethasone on Day 2; *Multi–day chemotherapy regimen*—3 mg/kg (max dose = 115 mg) given 30 min prior to chemotherapy on Day 1 (with PO dexamethasone at 50% of recommended dose given 30 min prior to chemotherapy and a 5-HT_3 antagonist given prior to chemotherapy), then 2 mg/kg (max dose = 80 mg) (oral suspension) PO once daily for 2 days (Days 2 and 3) (with PO dexamethasone at 50% of recommended dose once daily for 2 days [Days 2 and 3].

Availability (generic available)

Capsules (aprepitant): 40 mg, 80 mg, 125 mg. **Emulsion for injection (aprepitant):** 7.2 mg/mL. **Lyophilized powder for injection (fosaprepitant):** 150 mg/vial. **Powder for oral suspension (aprepitant):** 125 mg/pouch.

NURSING IMPLICATIONS

Assessment

- Assess nausea, vomiting, appetite, bowel sounds, and abdominal pain prior to and following administration.
- Monitor hydration, nutritional status, and intake and output. Patients with severe nausea and vomiting may require IV fluids in addition to antiemetics.
- Assess for rash periodically during therapy. May cause Stevens-Johnson syndrome. Discontinue therapy if severe rash or if accompanied with fever, general malaise, fatigue, muscle or joint aches, blisters, skin peeling, sores, oral lesions, conjunctivitis, hepatitis, and/or eosinophilia.
- Monitor for signs and symptoms of infusion site reaction (erythema, edema, pain, thrombophlebitis). Treat symptomatically. Avoid infusion into small veins or through a butterfly catheter.
- Monitor for signs and symptoms of hypersensitivity reactions (flushing, erythema, dyspnea, hypotension, syncope) periodically during therapy. If symptoms occur, discontinue therapy and treat symptoms; do not reinitiate therapy if symptoms occur with first use.
- ***Lab Test Considerations:*** Monitor clotting status closely during the 2 wk period, especially at 7–10 days, following aprepitant therapy in patients on chronic warfarin therapy.
- May cause mild, transient ↑ in alkaline phosphatase, AST, ALT, and BUN.
- May cause proteinuria, erythrocyturia, leukocyturia, hyperglycemia, hyponatremia, and ↑ leukocytes.
- May cause ↓ hemoglobin and WBC.

Implementation

- For chemotherapy, aprepitant/fosaprepitant is given as part of a regimen that includes a corticosteroid and a 5-HT_3 antagonist (see Route/Dosage).
- **PO:** Administer daily for 3 days. *Day 1*—administer 1 hr prior to chemotherapy. *Days 2 and 3*—administer once in the morning. May be administered without regard to food. Swallow capsules whole; do not open, crush, or chew.
- Oral suspension may be used for pediatric patients or those with difficulty swallowing. Follow manufacture's instructions for preparing suspension. Refrigerate suspension; may be stored at room temperature for up to 3 hrs before use. To administer, take cap off, place dispenser in patient's mouth along inner cheek. Dispense slowly. Discard after 72 hrs.

© F.A. Davis Publishing

IV Administration

Aprepitant

- **IV Push:** ***Dilution:*** 0.9% NaCl or D5W. *For Highly-Emetogenic Chemotherapy:* Using 130 mL of diluent, withdraw 18 mg aprepitant from vial and add to bag for 148 mL. *For Moderately-Emetogenic Chemotherapy:* Using 100 mL of diluent, withdraw 14 mL aprepitant from vial and add to bag for 114 mL. Mix by gently inverting bag 4–5 times. Solution is an opaque, off-white emulsion. Do not administer solutions that are discolored or contain particulate matter. May be stored at room temperature for 6 hrs if mixed with 0.9% NaCl or 12 hrs if mixed with D5W or in refrigerator for up to 72 hrs. ***Rate:*** Inject over 2 min. Flush line with 0.9% NaCl before and after injection.
- **Solution Incompatibility:** Incompatible with solutions containing divalent cations (calcium, magnesium) including LR and Hartmann's solution.

Fosaprepitant

- **Intermittent Infusion:** Inject 5 mL of 0.9% NaCl for Injection into vial. Swirl gently; avoid shaking or jetting saline into vial. ***Dilution:*** Prepare an infusion bag of 145 mL 0.9% NaCl. Withdraw entire volume from vial, and transfer to infusion bag for a total volume of 150 mL. ***Concentration:*** 1 mg/mL. Gently invert bag 2–3 times. Solution is stable for 24 hr at room temperature. Inspect solution for particulate matter. Do not administer solutions that are discolored or contain particulate matter. Solution is stable for 24 hr at room temperature. ***Rate:*** Infuse over 20–30 min, 30 min prior to chemotherapy.
- **Y-Site Compatibility:** dexamethasone, granisetron, methylprednisolone, ondansetron, palonosetron.
- **Solution Incompatibility:** Incompatible with solutions containing divalent cations (calcium, magnesium) including LR.

Patient/Family Teaching

- Instruct patient to take aprepitant as directed. Direct patient to read the *Patient Package Insert* before starting therapy and each time Rx renewed in case of changes.
- Instruct patient to notify health care professional if nausea and vomiting occur prior to administration.
- Advise patient to notify health care professional immediately if symptoms of hypersensitivity reaction (hives, rash, itching, redness of the face/skin, difficulty in breathing or swallowing) occur.
- Instruct patient to notify health care professional of all Rx or OTC medications, vitamins, or herbal products being taken and consult health care professional before taking any new medications.
- Advise patient and family to use general measures to decrease nausea (begin with sips of liquids and small, non-greasy meals; provide oral hygiene; remove noxious stimuli from environment).
- Rep: Caution patient that aprepitant and fosaprepitant may decrease efficacy of oral contraceptives. Advise patient to use effective alternate nonhormonal methods of contraception during and for 1 mo following treatment. Advise patient to notify health care professional if pregnancy is planned or suspected or if breast feeding.

Evaluation/Desired Outcomes

- Decreased nausea and vomiting associated with chemotherapy.
- Augmentation of antiemetic effects of dexamethasone and 5-HT_3 antagonists.

HIGH ALERT

argatroban (ar-gat-tro-ban)

Classification
Therapeutic: anticoagulants
Pharmacologic: thrombin inhibitors

Indications

Prophylaxis or treatment of thrombosis in patients with heparin-induced thrombocytopenia. As an anticoagulant in patients with or at risk for heparin-induced thrombocytopenia who are undergoing percutaneous coronary intervention (PCI).

Action

Inhibits thrombin by binding to its receptor sites. Inhibition of thrombin prevents activation of factors V, VIII, and XII; the conversion of fibrinogen to fibrin; platelet adhesion and aggregation. **Therapeutic Effects:** Decreased thrombus formation and extension with decreased sequelae of thrombosis (emboli, postphlebitic syndromes).

Pharmacokinetics

Absorption: IV administration results in complete bioavailability.
Distribution: Unknown.
Metabolism and Excretion: Mostly metabolized by the liver; excreted primarily in feces via biliary excretion. 16% excreted unchanged in urine, 14% excreted unchanged in feces.
Half-life: 39–51 min (↑ in hepatic impairment).

TIME/ACTION PROFILE (anticoagulant effect)

ROUTE	ONSET	PEAK	DURATION
IV	immediate	1–3 hr	2–4 hr

Contraindications/Precautions

Contraindicated in: Major bleeding; Hypersensitivity.
Use Cautiously in: Hepatic impairment (↓ initial infusion rate recommended); OB: Use only if potential maternal benefit justifies potential fetal risk; Lactation: Use while breast feeding only if potential maternal ben-

© F.A. Davis Publishing

efit justifies potential risk to infant; Pedi: Safety and effectiveness not established.

Adverse Reactions/Side Effects

CV: hypotension. **GI:** diarrhea, nausea, vomiting. **Hemat:** BLEEDING. **Misc:** HYPERSENSITIVITY REACTIONS (including anaphylaxis), fever.

Interactions

Drug-Drug: Risk of bleeding may be ↑ by concurrent use of **antiplatelet agents**, **thrombolytic agents**, or **other anticoagulants**.

Drug-Natural Products: ↑ bleeding risk with **anise**, **arnica**, **chamomile**, **clove**, **feverfew**, **garlic**, **ginger**, **ginkgo**, **Panax ginseng**, and others.

Route/Dosage

IV (Adults): 2 mcg/kg/min as a continuous infusion; adjust infusion rate on the basis of activated partial thromboplastin time (aPTT). *Patients undergoing PCI*— 350 mcg/kg bolus followed by infusion at 25 mcg/kg/min, activated clotting time (ACT) should be assessed 5–10 min later. If ACT is 300–450 sec, procedure may be started. If ACT <300 sec, give additional bolus of 150 mcg/kg and ↑ infusion rate to 30 mcg/kg/min. If ACT is >450 sec infusion rate should be ↓ to 15 mcg/kg/min and ACT rechecked after 5–10 min. If thrombotic complications occur or ACT drops to <300 sec, an additional bolus of 150 mcg/kg may be given and the infusion rate ↑ to 40 mcg/kg/min followed by ACT monitoring. If anticoagulation is required after surgery, lower infusion rates should be used.

Hepatic Impairment

IV (Adults): 0.5 mcg/kg/min as a continuous infusion; adjust infusion rate on the basis of aPTT.

Availability (generic available)

Premixed infusion: 50 mg/50 mL, 125 mg/125 mL, 250 mg/250 mL. **Solution for injection:** 100 mg/mL.

NURSING IMPLICATIONS

Assessment

- Monitor vital signs periodically during therapy. Unexplained decreases in BP may indicate hemorrhage. Assess patient for bleeding. Minimize arterial and venous punctures, IM injections, and use of urinary catheters, nasotracheal intubation, and nasogastric tubes. Avoid noncompressible sites for IV access. Monitor for blood in urine, lower back pain, pain or burning on urination. If bleeding cannot be controlled with pressure, decrease dose or discontinue argatroban immediately.
- Monitor for signs of anaphylaxis (rash, coughing, dyspnea) throughout therapy.
- ***Lab Test Considerations:*** Monitor aPTT prior to initiation of continuous infusion, 2 hrs after initiation of therapy, and periodically during therapy to confirm aPTT is within desired therapeutic range.
- For patients undergoing PCI, monitor ACT as described in Route and Dose section.
- Assess hemoglobin, hematocrit, and platelet count prior to, and periodically during, argatroban therapy. May cause ↓ hemoglobin and hematocrit. Unexplained ↓ hematocrit may indicate hemorrhage.
- Use of argatroban concurrently with multiple doses of warfarin will result in more prolonged prothrombin time and international normalized ratio (INR) (although there is not an ↑ in vitamin K-dependent factor X_a activity) than when warfarin is used alone. Monitor INR daily during concomitant therapy. Repeat INR 4–6 hr after argatroban is discontinued. If repeat value is below desired therapeutic value for warfarin alone, restart argatroban therapy and continue until desired therapeutic range for warfarin alone is reached. To obtain the INR for warfarin alone when dose of argatroban is >2 mcg/kg/min, temporarily reduce argatroban dose to 2 mcg/kg/min; INR for combined therapy may then be obtained 4–6 hr after argatroban dose was reduced.
- ***Toxicity and Overdose:*** There is no specific antidote for argatroban. If overdose occurs, discontinue argatroban. Anticoagulation parameters usually return to baseline within 2–4 hr after discontinuation.

Implementation

- Do not confuse argatroban with Aggrastat (tirofiban).
- All parenteral anticoagulants should be discontinued before argatroban therapy is initiated. Oral anticoagulation may be initiated with maintenance dose of warfarin; do not administer loading dose. Discontinue argatroban therapy when INR for combined therapy is >4.

IV Administration

- **IV:** Do not administer solutions that are cloudy or contain particulate matter. Discard unused portion.
- **IV Push:** ***Dilution:*** Bolus dose of 350 mcg/kg should be given prior to continuous infusion in patients undergoing PCI. For Diluent information, see Continuous Infusion section below. ***Rate:*** Administer bolus over 3–5 min.
- **Continuous Infusion:** ***Dilution:*** Dilute each 100 mg/mL in 0.9% NaCl, D5W, or LR. ***Concentration:*** 1 mg/mL. Mix by repeated inversion for 1 min. Diluted solution is slightly viscous, clear, and colorless to pale yellow; may show a slight haziness that disappears upon mixing; solution must be clear before use. Solution is stable at controlled room temperature and ambient light for 24 hrs, or for 96 hrs at controlled room temperature or refrigerated and protected from light; do not expose to direct sunlight. Pre-mixed solutions are clear and colorless. Store at room temperature, do not refrigerate or freeze. ***Rate:*** Based on patient's weight (See Route/

© F.A. Davis Publishing

Dosage section). Dose adjustment may be made 2 hr after starting infusion or changing dose until steady-state aPTT is 1.5–3 times the initial baseline value (not to exceed 100 sec).

- **Y-Site Compatibility:** acyclovir, alemtuzumab, alfentanil, allopurinol, amifostine, amikacin, aminocaproic acid, aminophylline, amiodarone, amphotericin B deoxycholate, amphotericin B lipid complex, amphotericin B liposome, ampicillin, ampicillin/sulbactam, anidulafungin, arsenic trioxide, atracurium, atropine, azithromycin, aztreonam, bivalirudin, bleomycin, bumetanide, buprenorphine, busulfan, butorphanol, calcium acetate, calcium chloride, calcium gluconate, carboplatin, carmustine, caspofungin, cefazolin, cefotaxime, cefotetan, cefoxitin, ceftazidime, ceftriaxone, cefuroxime, chloramphenicol, chlorpromazine, ciprofloxacin, cisatracurium, cisplatin, clindamycin, cyclophosphamide, cyclosporine, cytarabine, dacarbazine, dactinomycin, dantrolene, daptomycin, daunorubicin, dexamethasone, dexmedetomidine, dexrazoxane, digoxin, diltiazem, diphenhydramine, dobutamine, docetaxel, dopamine, doxorubicin, doxorubicin liposomal, doxycycline, droperidol, enalaprilat, ephedrine, epinephrine, epirubicin, eptifibatide, ertapenem, erythromycin, esmolol, etoposide, etoposide phosphate, famotidine, fenoldopam, fentanyl, fluconazole, fludarabine, fluorouracil, foscarnet, fosphenytoin, furosemide, ganciclovir, gemcitabine, gentamicin, glycopyrrolate, granisetron, haloperidol, heparin, hydralazine, hydrocortisone, hydromorphone, ibutilide, idarubicin, ifosfamide, imipenem/cilastatin, insulin, irinotecan, isoproterenol, ketorolac, labetalol, leucovorin, levofloxacin, lidocaine, linezolid, lorazepam, magnesium sulfate, mannitol, melphalan, meperidine, meropenem, mesna, methotrexate, methylprednisolone, metoclopramide, metoprolol, midazolam, milrinone, mitomycin, mitoxantrone, morphine, moxifloxacin, mycophenolate, nafcillin, nalbuphine, naloxone, nicardipine, nitroglycerin, nitroprusside, norepinephrine, octreotide, ondansetron, oxaliplatin, oxytocin, paclitaxel, palonosetron, pamidronate, pancuronium, pantoprazole, pentamidine, pentobarbital, phenobarbital, phentolamine, phenylephrine, phenytoin, piperacillin/tazobactam, potassium acetate, potassium chloride, potassium phosphates, procainamide, prochlorperazine, promethazine, propranolol, quinupristin/dalfopristin, remifentanil, rocuronium, sodium acetate, sodium bicarbonate, sodium phosphates, streptozocin, succinylcholine, sufentanil, tacrolimus, theophylline, thiopental, thiotepa, tigecycline, tirofiban, tobramycin, topotecan, trimethoprim/sulfamethoxazole, vancomycin, vasopressin, vecuronium, verapamil, vinblastine, vincristine, vinorelbine, voriconazole, zidovudine, zoledronic acid.
- **Y-Site Incompatibility:** cefepime, dantrolene, diazepam, phenytoin.

Patient/Family Teaching

- Inform patient of the purpose of argatroban.
- Advise patient to avoid other products known to affect bleeding.
- Instruct patient to notify health care professional immediately if any bleeding or signs and symptoms of allergic reaction is noted.

Evaluation/Desired Outcomes

- Decreased thrombus formation and extension.
- Decreased sequelae of thrombosis (emboli, postphlebitic syndromes).

BEERS

ARIPiprazole (a-ri-**pip**-ra-zole)

Abilify, Abilify Maintena, Abilify Mycite, Aristada, Aristada Initio

Classification

Therapeutic: antipsychotics, mood stabilizers
Pharmacologic: serotonin-dopamine activity modulators (SDAM)

Indications

Schizophrenia (Abilify, Abilify Maintena, Abilify Mycite, and Aristada). Acute treatment of manic and mixed episodes associated with bipolar I disorder (as monotherapy or with lithium or valproate) (Abilify and Abilify Mycite). Maintenance treatment of bipolar I disorder (as monotherapy) (Abilify Maintena). Maintenance treatment of bipolar I disorder (as monotherapy or with lithium or valproate) (Abilify Mycite). Adjunctive treatment of depression (Abilify and Abilify Mycite). Agitation associated with schizophrenia or bipolar disorder (Abilify only). Irritability associated with autistic disorder (Abilify only). Tourette's disorder (Abilify only).

Action

Psychotropic activity may be due to agonist activity at dopamine D_2 and serotonin 5-HT_{1A} receptors and antagonist activity at the 5-HT_{2A} receptor. Also has alpha$_1$ adrenergic blocking activity. **Therapeutic Effects:** Decreased manifestations of schizophrenia. Decreased mania in bipolar patients. Decreased symptoms of depression. Decreased agitation associated with schizophrenia or bipolar disorder. Decreased emotional and behavioral symptoms of irritability. Decreased incidence of tics.

Pharmacokinetics

Absorption: Well absorbed (87%) following oral administration; 100% following IM injection.
Distribution: Extensive extravascular distribution.
Protein Binding: >99%.
Metabolism and Excretion: Mostly metabolized by the liver (CYP3A4 and CYP2D6 isoenzymes); the CYP2D6 enzyme system exhibits genetic polymorphism; ~7% of population may be poor metabolizers (PMs)

© F.A. Davis Publishing

and may have significantly ↑ aripiprazole concentrations and an ↑ risk of adverse effects (↓ dose by 50% in PMs); one metabolite (dehydro-aripiprazole) has antipsychotic activity. 18% excreted unchanged in feces; <1% excreted unchanged in urine.

Half-life: *Aripiprazole*—75 hr; *dehydro-aripiprazole—94 hr*; ER injectable suspension: 30–46 days (Abilify Maintena); 29–35 days (Aristada).

TIME/ACTION PROFILE (antipsychotic effect)

ROUTE	ONSET	PEAK	DURATION
PO	unknown	2 wk	unknown
ER-IM	unknown	unknown	unknown

Contraindications/Precautions

Contraindicated in: Hypersensitivity; CYP2D6 PMs or concurrent use of strong CYP3A4 inhibitors, strong CYP2D6 inhibitors, or strong CYP3A4 inducers (Aristada Initio only).

Use Cautiously in: Known cardiovascular or cerebrovascular disease; Conditions which cause hypotension (dehydration, treatment with antihypertensives or diuretics); Diabetes (may ↑ risk of hyperglycemia); Seizure disorders; Patients at risk for aspiration pneumonia or falls; Concurrent ketoconazole or other potential CYP3A4 inhibitors (↓ aripiprazole dose by 50%); Concurrent quinidine, fluoxetine, paroxetine, or other potential CYP2D6 inhibitors; Concurrent carbamazepine or other potential CYP3A4 inducers; OB: Neonates at ↑ risk for extrapyramidal symptoms and withdrawal after delivery when exposed during the 3rd trimester; use only if maternal benefit outweighs risk to fetus; Lactation: Use while breast feeding only if potential maternal benefit justifies potential risk to infant; Pedi: May ↑ risk of suicide attempt/ideation especially during dose early treatment or dose adjustment; risk may be greater in children, adolescents, and young adults taking antidepressants (safety in children/adolescents not established); Geri: ↑ risk of mortality in elderly patients treated for psychosis related to dementia/neurocognitive disorders.

Adverse Reactions/Side Effects

CV: bradycardia, chest pain, edema, hypertension, orthostatic hypotension, tachycardia. **Derm:** DRUG REACTION WITH EOSINOPHILIA AND SYSTEMIC SYMPTOMS (DRESS), dry skin, ecchymosis, skin ulcer, sweating. **EENT:** blurred vision, conjunctivitis, ear pain. **GI:** constipation, anorexia, ↑ salivation, nausea, vomiting, weight gain, weight loss. **GU:** urinary incontinence. **Hemat:** AGRANULOCYTOSIS, anemia, leukopenia, neutropenia. **Metab:** dyslipidemia, hyperglycemia. **MS:** muscle cramps, neck pain. **Neuro:** tremor, abnormal gait, SUICIDAL THOUGHTS, drowsiness, extrapyramidal reactions, akathisia, confusion, depression, fatigue, hostility, impaired cognitive function, impulse control disorders (eating/binge eating, gambling, sexual, shopping), insomnia, lightheadedness, manic reactions, nervousness, restlessness, sedation, seizures, tardive dyskinesia. **Resp:** dyspnea. **Misc:** HYPERSENSITIVITY REACTIONS, NEUROLEPTIC MALIGNANT SYNDROME, ↓ heat regulation, injection site reactions.

Interactions

Drug-Drug: Ketoconazole, **clarithromycin**, or other **strong CYP3A4 inhibitors** ↓ metabolism and ↑ effects (↓ aripiprazole dose by 50%). **Quinidine**, **fluoxetine**, **paroxetine**, or **other strong CYP2D6 inhibitors** ↓ metabolism and ↑ effects (↓ aripiprazole dose by at least 50%). Concurrent **carbamazepine** or **other potential CYP3A4 inducers** ↑ metabolism and ↓ effects (double aripiprazole dose).

Route/Dosage

If used concurrently with combination of strong, moderate, or weak CYP3A4 and CYP2D6 inhibitors, ↓ oral aripiprazole dose by 75%. Aripiprazole dose should be ↓ by 75% in CYP2D6 PMs who are concomitantly receiving a strong CYP3A4 inhibitor. Do NOT substitute Aristada Initio for Aristada.

Schizophrenia

PO (Adults): 10 or 15 mg once daily; doses up to 30 mg/day have been used; increments in dosing should not be made before 2 wk at a given dose.

PO (Children 13–17 yr): 2 mg once daily; ↑ to 5 mg once daily after 2 days, and then to target dose of 10 mg once daily after another 2 days; may further ↑ dose in 5-mg increments if needed (max: 30 mg/day).

IM (Adults): *Abilify Maintena*—400 mg every mo; after 1st injection, continue treatment with oral aripiprazole (10–20 mg/day) for 14 days; if no adverse reactions to 400 mg/mo dose, may ↓ dose to 300 mg every mo. *CYP2D6 PMs*—↓ dose to 300 mg monthly; *CYP2D6 PMs concomitantly receiving strong CYP3A4 inhibitor*—↓ dose to 200 mg monthly; *Concomitant therapy with strong CYP2D6 or CYP3A4 inhibitor*—↓ dose to 300 mg monthly (if originally receiving 400 mg monthly) or 200 mg monthly (if originally receiving 300 mg monthly); *Concomitant therapy with strong CYP2D6 and CYP3A4 inhibitor*—↓ dose to 200 mg monthly (if originally receiving 400 mg monthly) or 160 mg monthly (if originally receiving 300 mg monthly); *Concomitant therapy with CYP3A4 inducer*—Avoid use.

IM (Adults): *Aristada with Aristada Initio*—administer 675–mg injection of Aristada Initio with first injection of Aristada (dose is based on total daily dose of oral aripiprazole; if patient receiving 10 mg/day of oral aripiprazole, administer 441 mg every mo; if patient receiving 15 mg/day of oral aripiprazole, administer 662 mg every mo, 882 mg every 6 wk, or 1064 mg every 2 mo; if patient receiving ≥20 mg/day of oral aripipra-

© F.A. Davis Publishing

zole, administer 882 mg every mo) (initial Aristada dose can be given on same day as or within 10 days of Aristada Initio) AND one dose of oral aripiprazole 30 mg; *Aristada without Aristada Initio*—Dose is based on total daily dose of oral aripiprazole; if patient receiving 10 mg/day of oral aripiprazole, administer 441 mg every mo; if patient receiving 15 mg/day of oral aripiprazole, administer 662 mg every mo, 882 mg every 6 wk, or 1064 mg every 2 mo; if patient receiving ≥20 mg/day of oral aripiprazole, administer 882 mg every mo; after 1st injection; continue treatment with oral aripiprazole for 21 days; *Concomitant therapy with strong CYP2D6 or CYP3A4 inhibitor for >2 wk*—↓ dose of Aristada to 441 mg monthly (if originally receiving 662 mg monthly) or 662 mg monthly (if originally receiving 882 mg monthly); no dose adjustment necessary if originally receiving 441 mg monthly; avoid use of Aristada Initio; *CYP2D6 PMs concomitantly receiving strong CYP3A4 inhibitor for >2 wk*—↓ dose of Aristada to 441 mg monthly (if originally receiving 662 mg or 882 mg monthly); no dose adjustment necessary if originally receiving 441 mg monthly; avoid use of Aristada Initio; *Concomitant therapy with strong CYP2D6 and CYP3A4 inhibitor*—avoid use of Aristada in patients requiring 662 mg or 882 mg monthly dose; no dose adjustment of Aristada necessary if originally receiving 441 mg monthly; avoid use of Aristada Initio; *Concomitant therapy with CYP3A4 inducer*—↑ dose of Aristada to 662 mg monthly (if originally receiving 441 mg monthly); no dose adjustment if Aristada necessary if originally receiving 662 mg or 882 mg monthly; avoid use of Aristada Initio.

Acute Manic or Mixed Episodes Associated with Bipolar I Disorder

PO (Adults): 15 mg once daily as monotherapy or 10–15 mg once daily with lithium or valproate; target dose is 15 mg once daily; may ↑ to 30 mg once daily, if needed.
PO (Children 10–17 yr): 2 mg once daily; ↑ to 5 mg once daily after 2 days, and then to target dose of 10 mg once daily after another 2 days; may further ↑ dose in 5-mg increments if needed (max: 30 mg/day).

Maintenance Treatment of Bipolar I Disorder

PO (Adults): *Abilify Mycite*—15 mg once daily as monotherapy or 10–15 mg once daily with lithium or valproate; target dose is 15 mg once daily; may ↑ to 30 mg once daily, if needed.
IM (Adults): 400 mg every mo; after 1st injection, continue treatment with oral aripiprazole (10–20 mg/day) for 14 days; if no adverse reactions to 400 mg/mo dose, may ↓ dose to 300 mg every mo. *CYP2D6 PMs*—↓ dose to 300 mg monthly; *CYP2D6 PMs concomitantly receiving strong CYP3A4 inhibitor*—↓ dose to 200 mg monthly; *Concomitant therapy with strong CYP2D6 or CYP3A4 inhibitor*—↓ dose to 300 mg monthly (if originally receiving 400 mg monthly) or 200 mg monthly (if originally receiving 300 mg monthly); *Concomitant therapy with strong CYP2D6 and CYP3A4 inhibitor*—↓ dose to 200 mg monthly (if originally receiving 400 mg monthly) or 160 mg monthly (if originally receiving 300 mg monthly); *Concomitant therapy with CYP3A4 inducer*—Avoid use.

Depression

PO (Adults): 2–5 mg once daily, may titrate upward at 1-wk intervals to 5–10 mg once daily (max: 15 mg/day).

Irritability Associated with Autistic Disorder

PO (Children 6–17 yr): 2 mg once daily; ↑ to 5 mg once daily after at least 1 wk; may further ↑ dose in 5-mg increments if needed at ≥1-wk intervals (max: 15 mg/day).

Tourette's Disorder

PO (Children 6–18 yr and ≥50 kg): 2 mg once daily; ↑ to target dose of 5 mg once daily after 2 days; may further ↑ dose if needed at ≥1-wk intervals (max: 10 mg/day).
PO (Children 6–18 yr and <50 kg): 2 mg once daily; ↑ to 5 mg once daily after 2 days, and then to target dose of 10 mg once daily after 5 days; may further ↑ dose in 5-mg increments if needed at ≥1-wk intervals (max: 20 mg/day).

Availability (generic available)

Extended-release suspension for injection (Abilify Maintena) (prefilled syringes or vials): 300 mg, 400 mg. **Extended-release suspension for injection (Aristada) (prefilled syringes):** 441 mg/1.6 mL, 662 mg/2.4 mL, 882 mg/3.2 mL, 1064 mg/3.9 mL. **Extended-release suspension for injection (Aristada Initio) (prefilled syringes):** 675 mg/2.4 mL. **Immediate-release tablets:** 2 mg, 5 mg, 10 mg, 15 mg, 20 mg, 30 mg. **Cost:** 2 mg $2,208.52/90, 5 mg $2,208.52/90, 10 mg $2,208.52/90, 15 mg $2,208.52/90, 20 mg $3,107.38/90, 30 mg $3,107.38/90. **Immediate-release tablets with sensor (Abilify Mycite):** 2 mg, 5 mg, 10 mg, 15 mg, 20 mg, 30 mg. **Oral solution (orange cream):** 1 mg/mL. **Orally disintegrating tablets (vanilla flavor):** 10 mg, 15 mg. **Cost:** All strengths $955.82/30.

NURSING IMPLICATIONS

Assessment

- Assess mental status (orientation, mood, behavior) before and periodically during therapy. Assess for suicidal tendencies, especially during early therapy for depression. Restrict amount of drug available to patient. Risk may be increased in children, adolescents, and adults ≤24 yrs.
- Assess weight and BMI initially and throughout therapy. Compare weight of children and adolescents with that expected during normal growth.

© F.A. Davis Publishing

- Monitor BP (sitting, standing, lying), pulse, and respiratory rate before and periodically during therapy.
- Observe patient carefully when administering medication to ensure that medication is actually taken and not hoarded or cheeked.
- Monitor patient for onset of akathisia (restlessness or desire to keep moving) and extrapyramidal side effects (*parkinsonian*—difficulty speaking or swallowing, loss of balance control, pill rolling of hands, masklike face, shuffling gait, rigidity, tremors; and *dystonic*—muscle spasms, twisting motions, twitching, inability to move eyes, weakness of arms or legs) periodically throughout therapy. Report these symptoms.
- Monitor for tardive dyskinesia (uncontrolled rhythmic movement of mouth, face, and extremities; lip smacking or puckering; puffing of cheeks; uncontrolled chewing; rapid or worm-like movements of tongue). Notify health care professional immediately if these symptoms occur, as these side effects may be irreversible.
- Monitor for development of neuroleptic malignant syndrome (fever, muscle rigidity, altered mental status, respiratory distress, tachycardia, seizures, diaphoresis, hypertension or hypotension, pallor, tiredness, loss of bladder control). Notify health care professional immediately if these symptoms occur.
- Assess for falls risk. Drowsiness, orthostatic hypotension, and motor and sensory instability increase risk. Institute prevention if indicated.
- ***Lab Test Considerations:*** May cause ↑ creatine kinase.
- Monitor CBC frequently during initial mo of therapy in patients with pre-existing or history of low WBC. May cause leukopenia, neutropenia, or agranulocytosis. Discontinue therapy if this occurs.
- Monitor blood glucose and cholesterol levels prior to starting and periodically during therapy.

Implementation

- Do not confuse aripiprazole with rabeprazole.
- *Aristada Initio* is only used as a one-time dose to initiate *Aristada* therapy or if doses of *Aristada* are missed. Administer missed doses as soon as possible, may supplement next *Aristada* injection with *Aristada Initio.* **If last Aristada injection 441 mg** *and time since last injection ≤6 wk,* do not supplement; *if >6 wk and ≤ 7 wk since last dose,* supplement with single dose of *Aristada Initio*; *if >7 wk since last dose,* re-initiate with a single dose of *Aristada Initio* and a single dose of oral aripiprazole 30 mg. **If last Aristada injection 662 mg or 882 mg** *and time since last injection ≤8 wk,* do not supplement; *if >8 wk and ≤12 wk since last dose,* supplement with single dose of *Aristada Initio*; *if ≥12 wk since last dose,* re-initiate with a single dose of *Aristada Initio* and a single dose of oral aripiprazole 30 mg. **If last Aristada injection 1064 mg** *and time since last injection ≤10 wk,* do not supplement; *if >8 wk and ≤12 wk since last dose,* supplement with single dose of *Aristada Initio*; *if ≥12 wk since last dose,* re-initiate with a single dose of *Aristada Initio* and a single dose of oral aripiprazole 30 mg.
- **PO:** Administer once daily without regard to meals.
- *Orally disintegrating tablets:* Do not open blister until ready to administer. For single tablet removal, open package and peel back foil on blister to expose tablet. Do not push tablet through foil; may damage tablet. Immediately upon opening blister, using dry hands, remove tablet and place entire orally disintegrating tablet on tongue. Tablet disintegration occurs rapidly in saliva. Take tablet without liquid; but if needed, it can be taken with liquid. Do not attempt to split tablet.
- **Abilify Mycite:** Comprised of aripiprazole tablets embedded with an ingestible event marker (IEM) sensor to track drug ingestion. Kit includes tablets, a wearable sensor (Mycite patch) that detects signal from IEM after ingestion and transmits to a smartphone, a smartphone app (Mycite app) to display information for patient, and a web-based portal for health care professionals and caregivers. Ensure patient is capable and willing before use. Download app, follow instructions, ensure app is compatible with smartphone and paired with patch. When instructed by app, apply patch to left side of body just above lower edge of rib cage for *1-component patch* or to right or left side for *2–component patch*. Avoid applying patch in areas where skin is scraped, cracked, inflamed, or irritated, or in a location that overlaps area of most recently removed patch; if skin irritation occurs remove patch. Change patch at least weekly; do not remove for showering, swimming, or exercising. Ingestion is usually detected within 30 min, but may take up to 2 hr. If ingestion is not detected, do not repeat dose. Administer tablet without regard to food. Swallow tablet whole; do not divide, crush, or chew.
- **Extended-Release IM:** *Abilify Maintena* is available in vials or dual chamber prefilled syringes. *For vials,* reconstitute 300 mg dose with 1.5 mL and 400 mg dose with 1.9 mL of sterile water for injection; discard extra sterile water. Withdraw air to equalize pressure in vial. Shake vial vigorously for 30 sec until suspension is uniform; suspension is opaque and milky white. If injection is not given immediately, shake vial vigorously to resuspend prior to injection. Do not store suspension in syringe. Determine volume needed for dose: from 400 mg vial: 400 mg = 2 mL, 300 mg = 1.5 mL, 200 mg = 1.0, and 160 mg = 0.8 mL. From 300 mg vial: 300 mg = 1.5 mL,

© F.A. Davis Publishing

200 mg = 1 mL, and 160 mg = 0.8 mL. *For prefilled syringes,* push plunger rod slightly to engage threads. Rotate plunger rod until rod stops rotating to release diluent; middle stopper will be at indicator line. Vertically shake syringe vigorously for 20 sec until drug is uniformly milky-white. *For deltoid site,* use 23 gauge needle, 1 inch in length for non-obese patients and 22 gauge 1.5 inch for obese patients. *For gluteal site,* use 22 gauge needle, 1.5 inches in length for non-obese patients and 22 gauge, 2 inch for obese patients. Inject deep into deltoid or gluteal site; do not massage. Continue oral dosing of aripiprazole for 2 wk after first dose of *Abilify Maintena*.

- If 2nd or 3rd doses of *Abilify Maintena* are missed and >4 wk and <5 wk since last injection, administer injection as soon as possible. If >5 wk since last injection, restart concomitant oral aripiprazole for 14 days with next administered injection. If fourth or subsequent doses are missed and >4 wk and <6 wk since last injection, administer injection as soon as possible. If >6 wk since last injection, restart concomitant oral aripiprazole for 14 days with next administered injection.
- *Aristada* comes in a kit with several needle sizes. Tap syringe at least 10 times to dislodge settled material and shake syringe vigorously for at least 30 sec to ensure suspension is uniform. Shake again if syringe not used within 15 min. Select needle and injection site. Deltoid may be used for 441 mg dose only. May use gluteal site for all doses. Remove air from syringe. Inject entire contents rapidly and continuously over <10 sec.

Patient/Family Teaching

- Advise patient to take medication as directed and not to skip doses or double up on missed doses. Take missed doses as soon as remembered unless almost time for the next dose. Emphasize importance of maintaining regular scheduled injections when taking *Abilify Maintena or Aristada.*
- Inform patient of possibility of extrapyramidal symptoms and tardive dyskinesia. Instruct patient to report these symptoms immediately.
- Advise patient to make position changes slowly to minimize orthostatic hypotension.
- Medication may cause drowsiness and lightheadedness. Caution patient to avoid driving or other activities requiring alertness until response to medication is known.
- Advise patient and family to notify health care professional if thoughts about suicide or dying, attempts to commit suicide; new or worse depression; new or worse anxiety; feeling very agitated or restless; panic attacks; trouble sleeping; new or worse irritability; acting aggressive; being angry or violent; acting on dangerous impulses; an extreme increase in activity and talking; other unusual changes in behavior or mood or if signs and symptoms of high blood sugar (feel very thirsty, urinating more than usual, feel very hungry, feel weak or tired, nausea, confusion, breath smells fruity) occur.
- Inform patient that aripiprazole may cause weight gain. Advise patient to monitor weight periodically. Notify health care professional of significant weight gain.
- Instruct patient to notify health care professional of all Rx or OTC medications, vitamins, or herbal products being taken and to consult health care professional before taking any new medications. Caution patient to avoid taking alcohol or other CNS depressants concurrently with this medication.
- Advise patient that extremes in temperature should be avoided, because this drug impairs body temperature regulation.
- Advise patient to notify health care professional if new or increased eating/binge eating, gambling, sexual, shopping, or other impulse control disorders occur.
- Advise patient to notify health care professional of medication regimen prior to treatment or surgery.
- Rep: Advise female patients to notify health care professional if pregnancy is planned or suspected and or if breast feeding. Encourage pregnant patients to enroll in pregnancy exposure registry that monitors outcomes of women exposed to aripiprazole during pregnancy by contacting National Pregnancy Registry for Atypical Antipsychotics at 1-866-961-2388 or visit http://womensmentalhealth.org/clinical-and-research-programs/pregnancyregistry/.
- Emphasize the importance of routine follow-up exams and continued participation in psychotherapy as indicated.
- **Abilify Mycite:** Advise patient referred for MRI test to remove patch and replace with a new patch as soon as possible.

Evaluation/Desired Outcomes

- Decrease in excitable, paranoid, or withdrawn behavior.
- Decrease incidence of mood swings in patients with bipolar disorders.
- Increased sense of well-being in patients with depression.
- Decreased agitation associated with schizophrenia or bipolar disorder.
- Decreased emotional and behavioral symptoms of irritability.
- Decrease in tics.

BEERS

asenapine (a-**sen**-a-peen)
Saphris, Secuado

Classification
Therapeutic: antipsychotics, mood stabilizers
Pharmacologic: dibenzo-oxepino pyrroles

© F.A. Davis Publishing

Indications

SL, Transdermal: Schizophrenia. **SL:** Acute treatment of manic/mixed episodes associated with bipolar I disorder (as monotherapy or with lithium or valproate). **SL:** Maintenance treatment of manic/mixed episodes associated with bipolar I disorder (as monotherapy).

Action

May act through combined antagonism of dopaminergic (D_2) and 5-HT_{2A} receptors. **Therapeutic Effects:** Decreased symptoms of acute schizophrenia and mania/mixed episodes of bipolar I disorder.

Pharmacokinetics

Absorption: 35% absorbed following SL administration; 60% released from transdermal system.
Distribution: Extensively distributed to extravascular tissues.
Protein Binding: 95%.
Metabolism and Excretion: Primarily metabolized by CYP1A2 and UGTA14 enzyme systems; 50% excreted in urine, 40% in feces, primarily as metabolites.
Half-life: 24 hr.

TIME/ACTION PROFILE (plasma concentrations)

ROUTE	ONSET	PEAK	DURATION
SL	unknown	0.5–1.5 hr	12 hr
TD	unknown	12–24 hr	24 hr

Contraindications/Precautions

Contraindicated in: Hypersensitivity; Dementia-related psychoses; Severe hepatic impairment.
Use Cautiously in: History of cardiac arrhythmias, congenital QT prolongation, electrolyte abnormalities (especially hypomagnesemia or hypokalemia; correct prior to use) or concurrent use of medications known to prolong the QTc interval (may ↑ risk of life-threatening arrhythmias); History of seizures or conditions/medications known to ↓ seizure threshold; History of leukopenia/neutropenia; Strenuous exercise, exposure to extreme heat, concurrent medications with anticholinergic activity, or risk of dehydration; History of suicide attempt; Dehydration, hypovolemia, concurrent use of antihypertensive medications, history of myocardial infarction/ischemic heart disease/HF/conduction abnormalities/cerebrovascular disease (↑ risk of hypotension); Patients at risk for falls; OB: Neonates at ↑ risk for extrapyramidal symptoms and withdrawal after delivery when exposed during the 3rd trimester; use during pregnancy only if potential maternal benefit justifies potential fetal risk; Lactation: Safety not established in breast feeding; Pedi: Children <10 yr (safety and effectiveness not established); Geri: ↑ risk of adverse reactions in older adults; consider age-related ↓ in hepatic function, cardiovascular status, and concurrent medications; ↑ risk of mortality and stroke/TIA in older adults treated for dementia-related psychosis.

Adverse Reactions/Side Effects

CV: QT INTERVAL PROLONGATION, bradycardia, orthostatic hypotension, tachycardia. **GI:** oral hypoesthesia, dry mouth, dyspepsia, dysphagia, oral blisters, oral inflammation, oral peeling/sloughing, oral ulcers. **Endo:** dyslipidemia, hyperglycemia, hyperprolactinemia. **Hemat:** AGRANULOCYTOSIS, leukopenia, neutropenia. **Local:** application site reactions (↑ in African Americans). **Metab:** weight gain, ↑ appetite. **Neuro:** NEUROLEPTIC MALIGNANT SYNDROME, SEIZURES, SUICIDAL THOUGHTS, akathisia, dizziness, drowsiness, extrapyramidal symptoms, anxiety, fatigue, syncope, tardive dyskinesia. **Misc:** HYPERSENSITIVITY REACTIONS (including anaphylaxis and angioedema).

Interactions

Drug-Drug: Concurrent use of **QTc interval prolonging drugs** including **Class 1A antiarrhythmics** such as **quinidine** and **procainamide** or **Class 3 antiarrhythmics** including **amiodarone** and **sotalol** or other **antipsychotics** including **ziprasidone**, **chlorpromazine** or **thioridazine** or certain **antibiotics** such as **moxifloxacin**; may ↑ risk of torsade de pointes and/or sudden death; avoid concurrent use. **Fluvoxamine**, a strong inhibitor of CYP1A2, ↑ levels and risk of toxicity; use cautiously. Similar effects may occur with **paroxetine**, a CYP2D6 substrate and inhibitor. Drugs having similar properties (**substrates/inhibitors of CYP2D6**) should also be used cautiously with asenapine. ↑ risk of CNS depression with other **CNS depressants** including **antihistamines**, some **antidepressants**, **sedative/hypnotics**, and **alcohol**.

Route/Dosage

Schizophrenia

SL (Adults): 5 mg twice daily; may ↑ to 10 mg twice daily after 1 wk.
Transdermal (Adults): Apply 3.8 mg/24 hours patch once daily; may ↑ to 5.7 mg/24 hours or 7.6 mg/24 hours patch once daily after 1 week.

Acute Manic/Mixed Episodes Associated with Bipolar I Disorder

SL (Adults): *Monotherapy*— 10 mg twice daily; may ↓ to 5 mg twice daily if tolerated poorly; continue on the dose that caused stabilization as maintenance therapy; *Adjunctive therapy with lithium or valproate*— 5 mg twice daily; may ↑ to 10 mg twice daily.
SL (Children 10–17 yr): *Monotherapy*— 2.5 mg twice daily; may ↑ to 5 mg twice daily after 3 days; may ↑ to 10 mg twice daily after another 3 days.

© F.A. Davis Publishing

Availability (generic available)

Sublingual tablets (Saphris) (black cherry flavor): 2.5 mg, 5 mg, 10 mg. **Transdermal patch (Secuado):** 3.8 mg/24 hours, 5.7 mg/24 hours, 7.6 mg/24 hours.

NURSING IMPLICATIONS

Assessment

- Assess mental status (orientation, mood, behavior) before and periodically during therapy. Assess for suicidal tendencies. Restrict amount of drug available to patient. Risk may be increased in children, adolescents, and adults ≤24 yrs.
- Assess weight and BMI initially and throughout therapy.
- Monitor BP (sitting, standing, lying) and pulse before and periodically during therapy.
- Observe patient carefully when administering medication to ensure that medication is actually taken and not hoarded.
- Monitor patient for onset of akathisia (restlessness or desire to keep moving) and extrapyramidal side effects (*parkinsonian*—difficulty speaking or swallowing, loss of balance control, pill rolling of hands, masklike face, shuffling gait, rigidity, tremors; and *dystonic*—muscle spasms, twisting motions, twitching, inability to move eyes, weakness of arms or legs) periodically throughout therapy. Report these symptoms.
- Monitor for tardive dyskinesia (uncontrolled rhythmic movement of mouth, face, and extremities; lip smacking or puckering; puffing of cheeks; uncontrolled chewing; rapid or worm-like movements of tongue). Notify health care professional immediately if these symptoms occur, as these side effects may be irreversible.
- Monitor for development of neuroleptic malignant syndrome (fever, muscle rigidity, altered mental status, respiratory distress, tachycardia, seizures, diaphoresis, hypertension or hypotension, pallor, tiredness, loss of bladder control). Discontinue asenapine and notify health care professional immediately if these symptoms occur.
- Monitor for symptoms related to hyperprolactinemia (menstrual abnormalities, galactorrhea, sexual dysfunction).
- Assess for falls risk. Drowsiness, orthostatic hypotension, and motor and sensory instability increase risk. Institute prevention if indicated.
- Assess patient for signs and symptoms of hypersensitivity reactions, including anaphylaxis, angioedema, hypotension, tachycardia, swollen tongue, dyspnea, itching, wheezing, and rash.
- ***Lab Test Considerations:*** Obtain fasting blood glucose, lipid profile, and cholesterol levels initially and periodically during therapy.
- Monitor CBC frequently during initial mo of therapy in patients with pre-existing or history of low WBC. May cause leukopenia, neutropenia, or agranulocytosis. Monitor patients with neutropenia for fever or other symptoms of infection and treat promptly. Discontinue therapy if ANC $<1000/mm^3$ occurs.
- May cause transient ↑ in serum ALT.

Implementation

- **SL:** Open packet immediately before use by firmly pressing thumb button and pulling out tablet pack. Do not push tablet through or cut or tear tablet pack. Peel back colored tab and gently remove tablet. Place tablet under tongue and allow to dissolve completely; dissolves in saliva within sec. Do not split, crush, chew, or swallow tablets. Avoid eating or drinking for 10 min after administration. Slide tablet pack back into case until it clicks.
- **Transdermal patch:** Apply to clean, dry, and intact skin of upper arm, upper back, abdomen, or hip. Rotate site with each application. Do not cut open pouch until ready to apply and do not use if pouch seal is broken or appears to be damaged. Do not cut patch; apply whole patch. If patch lifts at edges, reattach by pressing firmly and smoothing down edges. If patch comes off completely, apply a new patch. Remove old patch; apply only 1 patch at a time. Discard by folding patch so that adhesive side sticks to itself and safely discard. If irritation or a burning sensation occurs while wearing patch, remove the system and apply a new patch to a new application site. May wear during shower, but use during swimming or taking a bath has not been evaluated. Do not apply external heat sources (heating pad) over patch; prolonged application of heat over patch increases plasma concentrations of asenapine.

Patient/Family Teaching

- Instruct patient to take medication as directed and not to skip doses or double up on missed doses. Take missed doses as soon as remembered unless almost time for the next dose. Advise patient to read *Instructions for Use* before starting asenapine.
- Inform patient of possibility of extrapyramidal symptoms and tardive dyskinesia. Instruct patient to report these symptoms immediately.
- Advise patient to make position changes slowly to minimize orthostatic hypotension. Protect from falls.
- Medication may cause drowsiness and dizziness. Caution patient to avoid driving or other activities requiring alertness until response to medication is known.
- Advise patient and family to notify health care professional if thoughts about suicide or dying, attempts to commit suicide; new or worse depression; new or worse anxiety; feeling very agitated or restless; panic attacks; trouble sleeping; new or worse irritability; acting aggressive; being angry or violent; acting on dangerous impulses; an extreme increase in activity and talking; other unusual changes in behavior or mood or if signs and symptoms of hypersensitivity reactions (difficulty breathing, itching, swelling of the face, tongue or throat, feeling lightheaded) occur.

© F.A. Davis Publishing

- Instruct patient to notify health care professional of all Rx or OTC medications, vitamins, or herbal products being taken, to avoid alcohol, and to consult health care professional before taking any new medications and to avoid taking alcohol or other CNS depressants concurrently with this medication.
- Advise patient that extremes in temperature should be avoided, because this drug impairs body temperature regulation.
- Advise patient to notify health care professional of medication regimen prior to treatment or surgery.
- Rep: Advise female patients to notify health care professional if pregnancy is planned or suspected and to avoid breast feeding during therapy. If used during 3rd trimester may cause extrapyramidal and or withdrawal symptoms in infant. Encourage pregnant patients to enroll in registry by contacting National Pregnancy Registry for Atypical Antipsychotics at 1-866-961-2388 or visit http://womensmentalhealth.org/clinical-and-research-programs/pregnancyregistry/.
- Emphasize the importance of routine follow-up exams and continued participation in psychotherapy as indicated.
- **SL:** Inform patient that oral ulcers, blisters, peeling/sloughing, and inflammation may occur at application site. Advise patient to notify health care professional if these occur, may require discontinuation. Inform patient that numbness or tingling of mouth or throat may occur shortly after administration of asenapine; usually resolves within 1 hr.
- **Transdermal patch:** Instruct patient in correct application of patch. May cause erythema, pruritus, papules, discomfort, pain, edema, or irritation at site of application during wear time or immediately after removal; occurs more frequently in African Americans. Risk increases if worn longer that 24 hr or if site is used repeatedly.

Evaluation/Desired Outcomes

- Decrease in excitable, paranoic, or withdrawn behavior.
- Decrease incidence of mood swings in patients with bipolar disorders.
- Decreased agitation associated with schizophrenia or bipolar disorder.

BEERS

aspirin (as-pir-in)

Acuprin, Asaphen, Aspergum, Aspir-Low, Aspirtab, Bayer Aspirin, Bayer Timed-Release Arthritic Pain Formula, Easprin, Ecotrin, 8-Hour Bayer Timed-Release, Empirin, Entrophen, Halfprin, Healthprin, Lowprin, Norwich Aspirin, Novasen, Rivasa, Sloprin, St. Joseph Adult Chewable Aspirin, Therapy Bayer, Vazalore, ZORprin

Classification

Therapeutic: antiplatelet agents, antipyretics, nonopioid analgesics

Pharmacologic: salicylates, nonsteroidal anti-inflammatory drugs (NSAIDs)

Indications

Inflammatory disorders including: Rheumatoid arthritis, Osteoarthritis. Mild to moderate pain. Fever. Prophylaxis of transient ischemic attacks and MI. **Unlabeled Use:** Adjunctive treatment of Kawasaki disease.

Action

Produce analgesia and reduce inflammation and fever by inhibiting the production of prostaglandins. Decreases platelet aggregation. **Therapeutic Effects:** Analgesia. Reduction of inflammation. Reduction of fever. Decreased incidence of transient ischemic attacks and MI.

Pharmacokinetics

Absorption: Well absorbed from the upper small intestine; absorption from enteric-coated preparations may be unreliable; rectal absorption is slow and variable.

Distribution: Rapidly and widely distributed; crosses the placenta and enters breast milk.

Metabolism and Excretion: Extensively metabolized by the liver; inactive metabolites excreted by the kidneys. Amount excreted unchanged by the kidneys depends on urine pH; as pH increases, amount excreted unchanged increases from 2–3% up to 80%.

Half-life: 2–3 hr for low doses; up to 15–30 hr with larger doses because of saturation of liver metabolism.

TIME/ACTION PROFILE (analgesia/fever reduction)

ROUTE	ONSET	PEAK	DURATION
PO	5–30 min	1–3 hr	3–6 hr

Contraindications/Precautions

Contraindicated in: Hypersensitivity to aspirin or other salicylates; Cross-sensitivity with other NSAIDs may exist (less with nonaspirin salicylates); Bleeding disorders or thrombocytopenia; OB: Avoid use after 30 wk gestation; Pedi: May ↑ risk of Reye's syndrome in children or adolescents with viral infections.

Use Cautiously in: History of GI bleeding or ulcer disease; Chronic alcohol use/abuse; Severe hepatic or renal disease; OB: Use at or after 20 wk gestation may cause fetal or neonatal renal impairment; if NSAID treatment is necessary between 20 wk and 30 wk gestation, limit use to the lowest effective dose and shortest

© F.A. Davis Publishing

duration possible; Lactation: Safety not established in breast feeding; Geri: ↑ risk of adverse reactions in older adults, especially GI bleeding.

Adverse Reactions/Side Effects

Derm: DRUG REACTION WITH EOSINOPHILIA AND SYSTEMIC SYMPTOMS (DRESS), rash, urticaria. **EENT:** tinnitus. **GI:** GI BLEEDING, dyspepsia, epigastric distress, nausea, abdominal pain, anorexia, hepatotoxicity, vomiting. **Hemat:** anemia, hemolysis. **Misc:** HYPERSENSITIVITY REACTIONS (including anaphylaxis and laryngeal edema).

Interactions

Drug-Drug: May ↑ the risk of bleeding with **warfarin**, **heparin**, **heparin-like agents**, **thrombolytic agents**, **dipyridamole**, **clopidogrel**, **tirofiban**, or **eptifibatide**, although these agents are frequently used safely in combination and in sequence. **Ibuprofen:** may negate the cardioprotective antiplatelet effects of low-dose aspirin. May ↑ risk of bleeding with **cefotetan** and **valproic acid**. May ↑ activity of **penicillins**, **phenytoin**, **methotrexate**, **valproic acid**, **oral hypoglycemic agents**, and **sulfonamides**. **Urinary acidification** ↑ reabsorption and may ↑ serum salicylate levels. **Alkalinization of the urine** or the ingestion of large amounts of **antacids** ↑ excretion and ↓ serum salicylate levels. May blunt the therapeutic response to **diuretics** and **ACE inhibitors**. ↑ risk of GI irritation with **NSAIDs**.

Drug-Natural Products: ↑ anticoagulant effect and bleeding risk with **arnica**, **chamomile**, **clove**, **feverfew**, **garlic**, **ginger**, **ginkgo**, **Panax ginseng**, and others.

Drug-Food: **Foods capable of acidifying the urine** (see Appendix J) may ↑ serum salicylate levels.

Route/Dosage

Pain/Fever

PO, Rect (Adults): 325–1000 mg every 4–6 hr (not to exceed 4 g/day). *Extended-release tablets*—650 mg every 8 hr or 800 mg every 12 hr.
PO, Rect (Children 2–11 yr): 10–15 mg/kg/dose every 4–6 hr; maximum dose: 4 g/day.

Inflammation

PO (Adults): 2.4 g/day initially; ↑ to maintenance dose of 3.6–5.4 g/day in divided doses (up to 7.8 g/day for acute rheumatic fever).
PO (Children): 60–100 mg/kg/day in divided doses (up to 130 mg/kg/day for acute rheumatic fever).

Prevention of Transient Ischemic Attacks

PO (Adults): 50–325 mg once daily.

Prevention of Myocardial Infarction/Antiplatelet Effects

PO (Adults): 80–325 mg once daily. *Suspected acute MI*—160 mg as soon as MI is suspected.
PO (Children): 3–10 mg/kg/day given once daily (round dose to a convenient amount).

Kawasaki Disease

PO (Children): 80–100 mg/kg/day in 4 divided doses until fever resolves; may be followed by maintenance dose of 3–5 mg/kg/day as a single dose for up to 8 wk.

Availability (generic available)

Immediate-release tablets: 81 mg^{OTC}, 162.5 mg^{OTC}, 325 mg^{OTC}, 500 mg^{OTC}, 650 mg^{OTC}, 975 mg^{OTC}. **Immediate-release capsules:** 325 mg^{OTC}. **Extended-release tablets:** 325 mg^{OTC}, 650 mg^{OTC}, 800 mg. **Enteric-coated (delayed-release) tablets:** 80 mg^{OTC}, 165 mg^{OTC}, 300 mg^{OTC}, 325 mg^{OTC}, 500 mg^{OTC}, 600 mg^{OTC}, 650 mg^{OTC}, 975 mg^{OTC}. **Delayed-release capsules:** 325 mg^{OTC}, 500 mg^{OTC}. **Chewable tablets:** 80 mg^{OTC}, 81 mg^{OTC}. **Dispersible tablets:** 325 mg^{OTC}, 500 mg^{OTC}. **Suppositories:** 60 mg^{OTC}, 120 mg^{OTC}, 125 mg^{OTC}, 130 mg^{OTC}, 150 mg^{OTC}, 160 mg^{OTC}, 195 mg^{OTC}, 200 mg^{OTC}, 300 mg^{OTC}, 320 mg^{OTC}, 325 mg^{OTC}, 600 mg^{OTC}, 640 mg^{OTC}, 650 mg^{OTC}, 1.2 g^{OTC}. ***In combination with:*** antihistamines, decongestants, cough suppressants^{OTC}, and opioids. See Appendix N.

NURSING IMPLICATIONS

Assessment

- Patients who have asthma, allergies, and nasal polyps or who are allergic to tartrazine are at an increased risk for developing hypersensitivity reactions.
- Monitor for signs and symptoms of DRESS (fever, rash, lymphadenopathy, facial swelling) periodically during therapy. Discontinue therapy if symptoms occur.
- **Pain:** Assess pain and limitation of movement; note type, location, and intensity before and 60 min after administration.
- **Fever:** Assess fever and note associated signs (diaphoresis, tachycardia, malaise, chills).
- ***Lab Test Considerations:*** Monitor hepatic function before antirheumatic therapy and if symptoms of hepatotoxicity occur; more likely in patients, especially children, with rheumatic fever, systemic lupus erythematosus, juvenile arthritis, or pre-existing hepatic disease. May cause ↑ serum AST, ALT, and alkaline phosphatase, especially when plasma concentrations exceed 25 mg/100 mL. May return to normal despite continued use or dose reduction. If severe abnormalities or active liver disease occurs, discontinue and use with caution in future.
- Monitor serum salicylate levels periodically with prolonged high-dose therapy to determine dose, safety, and efficacy, especially in children with Kawasaki disease.
- May alter results of serum uric acid, urine vanillylmandelic acid (VMA), protirelin-induced thyroid-stimulating hormone (TSH), urine hydroxyindole-

© F.A. Davis Publishing

acetic acid (5-HIAA) determinations, and radionuclide thyroid imaging.
- Prolongs bleeding time for 4–7 days and, in large doses, may cause prolonged prothrombin time. Monitor hematocrit periodically in prolonged high-dose therapy to assess for GI blood loss.
- ***Toxicity and Overdose:*** Monitor for the onset of tinnitus, headache, hyperventilation, agitation, mental confusion, lethargy, diarrhea, and sweating. If these symptoms appear, withhold medication and notify health care professional immediately.

Implementation
- Use lowest effective dose for shortest period of time.
- **PO:** Administer after meals or with food or an antacid to minimize gastric irritation. Food slows but does not alter the total amount absorbed.
- ***DNC:*** Do not crush or chew enteric-coated tablets. Do not take antacids within 1–2 hr of enteric-coated tablets. Chewable tablets may be chewed, dissolved in liquid, or swallowed whole. Some extended-release tablets may be broken or crumbled but must not be ground up before swallowing. See manufacturer's prescribing information for individual products.

Patient/Family Teaching
- Instruct patient to take salicylates with a full glass of water and to remain in an upright position for 15–30 min after administration.
- Advise patient to report tinnitus; unusual bleeding of gums; bruising; black, tarry stools; or fever lasting longer than 3 days.
- Caution patient to avoid concurrent use of alcohol with this medication to minimize possible gastric irritation; 3 or more glasses of alcohol per day may increase risk of GI bleeding. Caution patient to avoid taking concurrently with acetaminophen or NSAIDs for more than a few days, unless directed by health care professional to prevent analgesic nephropathy.
- Instruct patients on a sodium-restricted diet to avoid effervescent tablets or buffered-aspirin preparations.
- Tablets with an acetic (vinegar-like) odor should be discarded.
- Advise patients on long-term therapy to inform health care professional of medication regimen before surgery. Aspirin may need to be withheld for 1 wk before surgery.
- Rep: May cause fetal harm. Advise females of reproductive potential to notify health care professional if pregnancy is planned or suspected or if breast feeding. Advise women to avoid aspirin in the 3rd trimester of pregnancy (after 29 wk), may cause premature closure of the fetal ductus arteriosus. Use of aspirin after 20 wk may cause fetal renal dysfunction leading to oligohydramnios. May cause reversible infertility in women attempting to conceive; may consider discontinuing aspirin.
- Pedi: Centers for Disease Control and Prevention warns against giving aspirin to children or adolescents with varicella (chickenpox) or influenza-like or viral illnesses because of a possible association with Reye's syndrome.
- **Transient Ischemic Attacks or MI:** Advise patients receiving aspirin prophylactically to take only prescribed dose. Increasing dose has not been found to provide additional benefits.

Evaluation/Desired Outcomes
- Relief of mild to moderate discomfort.
- Increased ease of joint movement. May take 2–3 wk for maximum effectiveness.
- Reduction of fever.
- Prevention of transient ischemic attacks.
- Prevention of MI.

atazanavir/cobicistat
(a-ta-**zan**-a-veer/koe-**bik**-i-stat)
Evotaz

Classification
Therapeutic: antiretrovirals
Pharmacologic: protease inhibitors, pharmacoenhancers

Indications
HIV infection in treatment-experienced and treatment-naïve patients (in combination with other antiretrovirals).

Action
Atazanavir—Inhibits the action of HIV protease, preventing maturation of virions. *Cobicistat*—↑ blood levels of atazanavir. **Therapeutic Effects:** ↑ CD4 cell counts and ↓ viral load with subsequent slowed progression of HIV and its sequelae.

Pharmacokinetics
Atazanavir
Absorption: Rapidly absorbed (↑ by food).
Distribution: Enters cerebrospinal fluid and semen.
Metabolism and Excretion: 80% metabolized (CYP3A); 13% excreted unchanged in urine.
Half-life: 7 hr.
Cobicistat
Absorption: Absorption follows oral administration.
Distribution: Unknown.
Protein Binding: 97–98%.
Metabolism and Excretion: Metabolized by CYP3A and to a small extent by CYP2D6; 86.2 eliminated in feces, 8.2% in urine.
Half-life: 3–4 hr.

© F.A. Davis Publishing

TIME/ACTION PROFILE (blood levels)

ROUTE	ONSET	PEAK	DURATION
atazanavir PO	rapid	2.5 hr	24 hr
cobicistat PO	unknown	3 hr	24 hr

Contraindications/Precautions

Contraindicated in: Previous hypersensitivity, including Stevens-Johnson syndrome, erythema multiforme or other serious skin reactions; Concurrent use of alfuzosin, carbamazepine, colchicine, dihydroergotamine, dronedarone, drospirenone/ethinyl estradiol, elbasvir/grazoprevir, ergotamine, glecaprevir/pibrentasvir, indinavir, irinotecan, lomitapide, lovastatin, lurasidone, methylergonovine, nevirapine, phenobarbital, phenytoin, pimozide, ranolazine, rifampin, sildenafil (for pulmonary hypertension), simvastatin, St. John's wort and triazolam; Renal impairment (CCr <70 mL/min) (when used concomitantly with tenofovir disoproxil fumarate); End-stage renal disease managed by dialysis (treatment-experienced patients); Hepatic impairment; OB: Not recommended for use during pregnancy (↓ concentrations of atazanavir and cobicistat); Lactation: Avoid breast feeding in women with HIV.

Use Cautiously in: History of pre-existing cardiac conduction disease (marked first-degree AV block, second-or third-degree AV block; ECG monitoring recommended); Renal impairment (consider alterative medications); Hepatitis B or C co-infection (↑ risk of further hepatic impairment); Diabetes mellitus (↑ risk of new onset/ exacerbation); Hemophilia (risk of spontaneous bleeding and need for additional factor VIII); Pedi: Children <35 kg (safety and effectiveness not established); use of atazanavir in infants <3 mo may ↑ risk of kernicterus).

Adverse Reactions/Side Effects

CV: cardiac conduction abnormalities. **Derm:** DRUG RASH WITH EOSINOPHILIA AND SYSTEMIC SYMPTOMS (DRESS), ERYTHEMA MULTIFORME, STEVENS-JOHNSON SYNDROME, rash. **EENT:** ocular icterus. **Endo:** Graves' disease, hyperglycemia. **GI:** autoimmune hepatitis, cholelithiasis, hepatotoxicity, hyperbilirubinemia, jaundice, nausea. **GU:** nephrolithiasis, new onset/worsening renal impairment. **Metab:** accumulation/redistribution of body fat. **MS:** polymyositis. **Neuro:** Guillain-Barré syndrome. **Misc:** immune reconstitution syndrome.

Interactions

Drug-Drug: Carbamazepine, **phenobarbital**, **phenytoin**, **rifampin** and **nevirapine** ↓ blood levels and effectiveness; concurrent use contraindicated. ↑ levels and risk of serious toxicity with **alfuzosin**, **dihydroergotamine**, **dronedarone**, **ergotamine**, **irinotecan**, **lomitapide**, **lovastatin**, **lurasidone**, **methylergonovine**, **pimozide**, **ranolazine**, **sildenafil** (for pulmonary hypertension), **simvastatin**, and **triazolam**; concurrent use contraindicated. ↑ levels and risk of serious toxicity with **colchicine**; concurrent use contraindicated in patients with renal or hepatic impairment. ↑ risk of indirect hyperbilirubinemia with **indinavir**; concurrent use contraindicated. ↑ risk of hepatotoxicity with **elbasvir/grazoprevir** and **glecaprevir/pibrentasvir**; concurrent use contraindicated. Concurrent use with **drospirenone/ethinyl estradiol** may ↑ drospirenone levels and risk of hyperkalemia; concurrent use contraindicated. ↑ risk of renal impairment with **tenofovir disoproxil fumarate**; avoid concurrent use with nephrotoxic agents. Concurrent use with other **antiretrovirals that require inhibition of CYP3A for adequate exposure** especially **protease inhibitors** (may ↓ antiretroviral effectiveness). ↑ levels and risk of toxicity from some **antiarrhythmics** (including **amiodarone**, **digoxin**, **disopyramide**, **flecainide**, **mexiletine** and **propafenone**, **antineoplastics** (including **dasatinib**, **nilotinib**, **vinblastine** and **vincristine**), **anticonvulsants metabolized by CYP3A** (including **clonazepam**); monitor drug effects carefully, titrate if necessary and consider alternatives. ↑ risk of sedation with **sedative/hypnotics**, including **buspirone**, **diazepam**, **midazolam**, **zolpidem** and **others metabolized by CYP3A** (careful monitoring with dose reduction recommended). Absorption of atazanavir may be ↓ by **proton-pump inhibitors** (administer 12 hr after PPI, dose should not >20 mg omeprazole or equivalent/day, not recommended in treatment-experienced patients), **antacids** (separate dose by 2 hr), **buffered medications**, **H_2-receptor antagonists** (administer famotidine at same time or at least 10 hr after famotidine [dose should not exceed famotidine 40 mg twice daily or equivalent in treatment-naïve patients or 20 mg twice daily or equivalent in treatment-experienced patients]). Concurrent use with **didanosine (buffered)** ↓ atazanavir levels (administer 1 hr before or 2 hr after atazanavir/cobicistat. ↓ levels of concurrent didanosine EC (administer at different times). Concurrent use with **efavirenz** or **etravirine** may ↓ levels and effectiveness (concurrent use is not recommended). ↑ levels of **maraviroc** (↓ dose of maraviroc to 150 mg twice daily). ↑ levels and risk of adverse reactions from **clarithromycin** and**erythromycin**; concurrent use may also ↑ levels of atazanavir and cobicistat; consider alternative anti-infectives. ↑ levels and risk of bleeding with **apixaban**, **dabigatran**, **edoxaban**, and **rivaroxaban** (concurrent use of rivaroxaban not recommended, dose adjustments or alternatives necessary for apixaban, dabigatran, or edoxaban). Levels and effectiveness may be ↓ by **oxcarbazepine**; monitor levels and clinical response carefully, consider alternative anticonvulsants. May ↑ or alter effects of **antidepressants** including **SSRIs**, **tricyclic antidepressants** and **trazodone** (monitor for drug effect and titrate to lowest effective dose). ↑ levels of **ketoconazole** and **itraconazole** (**voriconazole** not recommended unless benefits outweigh risks); ketoconazole and itraconazole may also ↑ levels of atazanavir and cobicistat. ↑ levels and risk of toxicity with **rifabutin** (↓ dose by 75% and monitor for adverse reactions). ↑ levels and

© F.A. Davis Publishing

risk of adverse reactions with **beta-blockers metabolized by CYP2D6** including **carvedilol**, **metoprolol** and **timolol** (clinical monitoring for adverse cardiovascular effects recommended). ↑ levels and risk of adverse reactions with **calcium channel blockers metabolized by CYP3A** including **amlodipine**, **diltiazem**, **felodipine**, **nifedipine** and **verapamil** (clinical monitoring for adverse cardiovascular effects recommended). Concurrent use with **corticosteroids that induce CYP3A** including **dexamethasone** ↓ effectiveness and ↑ corticosteroid effects (consider alternative corticosteroid). Levels and effectiveness may be ↓ by **bosentan** while effects of bosentan are ↑ (specific dose alteration of bosentan is required). ↑ levels and risk of toxicity from **atorvastatin**, **fluvastatin**, **pravastatin** and **rosuvastatin**; concurrent use with atorvastatin not recommended; rosuvastatin dose should not exceed 10 mg/day; for other statins, use lowest effective dose and monitor for adverse effects. ↑ levels and effects of **immunosuppressants** including **cyclosporine**, **everolimus**, **sirolimus**. **tacrolimus** (blood level monitoring recommended). ↑ risk of adverse cardiovascular effects with inhaled **salmeterol** (concurrent use not recommended. ↑ risk of corticosteroid effects with **inhaled/nasal corticosteroids** metabolized by CYP3A including and **budesonide** and **fluticasone** (consider alternative corticosteroids). May ↑ CNS and respiratory depression with **opioid analgesics** or **tramadol** (dose reduction and careful titration recommended). May ↑ levels and risk of adverse reactions with **neuroleptics metabolized by CYP3A or CYP2D6** including **perphenazine**, **risperidone** and **thioridazine** (dose reduction may be necessary). ↑ levels and risk of adverse cardiovascular effects with **PDE-5 inhibitors** including **avanafil**, **sildenafil**, **tadalafil** and **vardenafil** (avanafil use not recommended, dose reductions required for sildenafil (for erectile dysfunction), tadalafil and vardenafil). May ↑ **quetiapine** levels; ↓ quetiapine dose to 1/6 of current dose. Concurrent use with **sofosbuvir/velpatasvir/voxilaprevir** may ↑ voxilaprevir levels; concurrent use not recommended.

Drug-Natural Products: St. John's wort ↓ blood levels and effectiveness; concurrent use contraindicated.

Route/Dosage

PO (Adults and Children ≥35 kg): One tablet (atazanavir 300 mg/cobicistat 150 mg) once daily.

Availability

Tablets: atazanavir 300 mg/cobicistat 150 mg.

NURSING IMPLICATIONS

Assessment

- Assess for change in severity of HIV symptoms and for symptoms of opportunistic infections throughout therapy.
- Monitor ECG periodically in patients with first, second, or third-degree AV blocks.
- Assess for rash which can occur within initial 8 wk of therapy. Usually resolves within 2 wk without altering therapy. Discontinue therapy if rash becomes severe.
- Monitor for signs and symptoms of DRESS (fever, rash, lymphadenopathy, and/or facial swelling, associated with involvement of other organ systems (hepatitis, nephritis, hematologic abnormalities, myocarditis, myositis) during therapy. May resemble an acute viral infection. Eosinophilia is often present. Discontinue therapy if signs occur.
- ***Lab Test Considerations:*** Monitor viral load and CD4 cell count regularly during therapy.
- Monitor CCr prior to starting therapy and when atazanavir/cobicistat is co-administered with tenofovir disoproxil fumarate. Cobicistat causes modest ↑ serum creatinine and declines in estimated creatinine clearance without affecting renal glomerular function. If serum creatinine ↑ >0.4 mg/dL from baseline, monitor renal frequently.
- Monitor urine glucose and urine protein when administering with tenofovir disoproxil fumarate at baseline and periodically during therapy. May cause ↑ serum amylase, lipase and hyperglycemia.
- Assess liver function tests prior to starting therapy and periodically during therapy in patients with hepatitis B or C virus infections. May ↑ liver enzymes.
- May ↑ creatine kinase.
- May cause ↑ in unconjugated bilirubin; reversible on discontinuation.

Implementation

- **PO:** Administer once daily with food.
- Take with other antiretroviral agents as prescribed.

Patient/Family Teaching

- Emphasize the importance of taking atazanavir/cobicistat with food as directed. Advise patient to read the *Patient Information* before taking and with each Rx refill; in case of changes. Atazanavir/cobicistat must always be used in combination with other antiretroviral drugs. Do not take more than prescribed amount and do not stop taking without consulting health care professional. Take missed doses as soon as remembered if less than 12 hrs of dose, then return to regular dose schedule. If within 12 hr of next dose, omit dose and take next dose at regular time. Do not double doses.
- Instruct patient that atazanavir/cobicistat should not be shared with others.
- Inform patient that atazanavir/cobicistat does not cure HIV or prevent associated or opportunistic infections. Atazanavir/cobicistat may reduce the risk of transmission of HIV to others through sexual contact or blood contamination. Caution patient to use a

© F.A. Davis Publishing

condom and to avoid sharing needles or donating blood to prevent spreading the HIV virus to others.
- Instruct patient to notify health care professional of all Rx or OTC medications, vitamins, or herbal products being taken and consult health care professional before taking any new medications, especially St. John's wort; interactions may be fatal.
- May cause dizziness. Caution patient to notify health care professional if this occurs and to avoid driving and other activities requiring alertness until response to medication is known.
- Instruct patient to notify health care professional immediately if signs and symptoms of hepatitis (flu-like symptoms, tiredness, nausea, lack of appetite, yellow skin or eyes, dark urine, pale stools, pain or sensitivity to touch on right side below ribs), skin reactions with symptoms (fever, general malaise, muscle or joint aches, blisters, oral lesions, conjunctivitis, facial edema), gallbladder disorder (right or middle upper stomach pain, fever, nausea, vomiting, or yellowing of skin and whites of eyes), kidney stones (side pain, blood in urine, pain upon urination), change in heart rhythm, high blood sugar, or signs of immune reconstitution syndrome (signs and symptoms of an infection) occur.
- Inform patient that redistribution and accumulation of body fat may occur, causing central obesity, dorsocervical fat enlargement (buffalo hump), peripheral wasting, breast enlargement, and cushingoid appearance. The cause and long-term effects are not known.
- Rep: Advise females of reproductive potential to avoid pregnancy and breast feeding during therapy. Instruct females using hormonal contraceptives to use an effective alternative nonhormonal method of contraception. Advise patient to notify health care professional immediately if pregnancy is planned or suspected or if breast feeding. If pregnant patient is exposed to atazanavir/cobicistat, register patient in *Antiretroviral Pregnancy Registry* by calling 1-800-258-4263. Monitor neonates exposed to atazanavir in utero for development of severe hyperbilirubinemia during first few days of life.
- Emphasize the importance of regular follow-up exams and blood counts to determine progress and monitor for side effects.

Evaluation/Desired Outcomes

- Delayed progression of HIV and decreased opportunistic infections in patients with HIV.
- Decrease in viral load and increase in CD4 cell counts.

atenolol (a-**ten**-oh-lole)

Tenormin

Classification

Therapeutic: antianginals, antihypertensives
Pharmacologic: beta blockers

Indications

Management of hypertension. Management of angina pectoris. Prevention of MI.

Action

Blocks stimulation of $beta_1$ (myocardial)-adrenergic receptors. Does not usually affect $beta_2$ (pulmonary, vascular, uterine)-receptor sites. **Therapeutic Effects:** Decreased BP and heart rate. Decreased frequency of attacks of angina pectoris. Prevention of MI.

Pharmacokinetics

Absorption: 50–60% absorbed after oral administration.
Distribution: Minimal penetration of CNS. Crosses the placenta and enters breast milk.
Metabolism and Excretion: 40–50% excreted unchanged by the kidneys; remainder excreted in feces as unabsorbed drug.
Half-life: 6–9 hr.

TIME/ACTION PROFILE (cardiovascular effects)

ROUTE	ONSET	PEAK	DURATION
PO	1 hr	2–4 hr	24 hr

Contraindications/Precautions

Contraindicated in: Uncompensated HF; Pulmonary edema; Cardiogenic shock; Bradycardia or heart block.
Use Cautiously in: Renal impairment (dosage ↓ recommended if CCr ≤35 mL/min); Hepatic impairment; Geri: ↑ sensitivity to beta blockers; initial dose ↓ recommended; Pulmonary disease (including asthma; beta selectivity may be lost at higher doses); Diabetes mellitus (may mask signs of hypoglycemia); Thyrotoxicosis (may mask symptoms); Patients with a history of severe allergic reactions (intensity of reactions may be ↑); OB: Crosses the placenta and may cause fetal/neonatal bradycardia, hypotension, hypoglycemia, or respiratory depression; Lactation, Pedi: Safety not established.

Adverse Reactions/Side Effects

EENT: blurred vision, stuffy nose. **Neuro:** fatigue, weakness, anxiety, depression, dizziness, drowsiness, insomnia, memory loss, mental status changes, nervousness, nightmares. **Resp:** bronchospasm, wheezing. **CV:** BRADYCARDIA, HF, PULMONARY EDEMA, hypotension, peripheral vasoconstriction. **GI:** constipation, diarrhea, ↑ liver enzymes, nausea, vomiting. **GU:** erectile dysfunction, ↓ libido, urinary frequency. **Derm:** rashes. **Endo:** hyperglycemia, hypoglycemia. **MS:** arthralgia, back pain, joint pain. **Misc:** drug-induced lupus syndrome.

Interactions

Drug-Drug: General anesthesia, **IV phenytoin**, and **verapamil** may cause additive myocardial depression. Additive bradycardia may occur with **digoxin**. Ad-

© F.A. Davis Publishing

ditive hypotension may occur with other **antihypertensives**, acute ingestion of **alcohol**, or **nitrates**. Concurrent use with **amphetamine**, **cocaine**, **ephedrine**, **epinephrine**, **norepinephrine**, **phenylephrine**, or **pseudoephedrine** may result in unopposed alpha-adrenergic stimulation (excessive hypertension, bradycardia). Concurrent **thyroid** administration may ↓ effectiveness. May alter the effectiveness of **insulins** or **oral hypoglycemic agents** (dosage adjustments may be necessary). May ↓ the effectiveness of **theophylline**. May ↓ the beneficial $beta_1$-cardiovascular effects of **dopamine** or **dobutamine**. Use cautiously within 14 days of **MAO inhibitor** therapy (may result in hypertension).

Route/Dosage

PO (Adults): *Antianginal*—50 mg once daily; may be ↑ after 1 wk to 100 mg/day (up to 200 mg/day). *Antihypertensive*—25–50 mg once daily; may be ↑ after 2 wk to 50–100 mg once daily. *MI*—50 mg, then 50 mg 12 hr later, then 100 mg/day as a single dose or in 2 divided doses for 6–9 days or until hospital discharge.

Renal Impairment

PO (Adults): *CCr 15–35 mL/min*—dosage should not exceed 50 mg/day; *CCr <15 mL/min*—dosage should not exceed 50 mg every other day.

Availability (generic available)

Tablets: 25 mg, 50 mg, 100 mg. **Cost:** *Generic*—All strengths $10.83/100. ***In combination with:*** chlorthalidone (Tenoretic). See Appendix N.

NURSING IMPLICATIONS

Assessment

- Monitor BP, ECG, and pulse frequently during dose adjustment period and periodically throughout therapy.
- Monitor intake and output ratios and daily weights. Assess routinely for HF (dyspnea, rales/crackles, weight gain, peripheral edema, jugular venous distention).
- Monitor frequency of prescription refills to determine adherence.
- **Angina:** Assess frequency and characteristics of angina periodically during therapy.
- ***Lab Test Considerations:*** May cause ↑ BUN, serum lipoprotein, potassium, triglyceride, and uric acid levels.
- May cause ↑ ANA titers.
- May cause ↑ in blood glucose levels.
- ***Toxicity and Overdose:*** Monitor patients receiving beta blockers for signs of overdose (bradycardia, severe dizziness or fainting, severe drowsiness, dyspnea, bluish fingernails or palms, seizures). Notify health care professional immediately if these signs occur.

Implementation

- **PO:** Take apical pulse before administering drug. If <50 bpm or if arrhythmia occurs, withhold medication and notify health care professional.

Patient/Family Teaching

- Instruct patient to take atenolol as directed at the same time each day, even if feeling well; do not skip or double up on missed doses. Take missed doses as soon as possible up to 8 hr before next dose. Abrupt withdrawal may cause life-threatening arrhythmias, hypertension, or myocardial ischemia.
- Advise patient to make sure enough medication is available for weekends, holidays, and vacations. A written prescription may be kept in wallet in case of emergency.
- Teach patient and family how to check pulse and BP. Instruct them to check pulse daily and BP biweekly and to report significant changes.
- May cause drowsiness or dizziness. Caution patients to avoid driving or other activities that require alertness until response to the drug is known.
- Advise patients to change positions slowly to minimize orthostatic hypotension.
- Caution patient that atenolol may increase sensitivity to cold.
- Instruct patient to notify health care professional of all Rx or OTC medications, vitamins, or herbal products being taken, to avoid alcohol, and to consult health care professional before taking any new medications, especially cold preparations.
- Patients with diabetes should closely monitor blood glucose, especially if weakness, malaise, irritability, or fatigue occurs. Medication does not block sweating as a sign of hypoglycemia.
- Advise patient to notify health care professional if slow pulse, difficulty breathing, wheezing, cold hands and feet, dizziness, light-headedness, confusion, depression, rash, fever, sore throat, unusual bleeding, or bruising occurs.
- Instruct patient to inform health care professional of medication regimen before treatment or surgery.
- Advise female patient to notify health care professional if pregnancy is planned or suspected, or if breast feeding.
- Advise patient to carry identification describing disease process and medication regimen at all times.
- **Hypertension:** Reinforce the need to continue additional therapies for hypertension (weight loss, sodium restriction, stress reduction, regular exercise, moderation of alcohol consumption, and smoking cessation). Medication controls but does not cure hypertension.

© F.A. Davis Publishing

Evaluation/Desired Outcomes

- Decrease in BP.
- Reduction in frequency of angina.
- Increase in activity tolerance.
- Prevention of MI.

atezolizumab

(a-te-zoe-**liz**-ue-mab)

Tecentriq

Classification

Therapeutic: antineoplastics

Pharmacologic: monoclonal antibodies, programmed death ligand 1 (PD-L1) inhibitors

Indications

Locally advanced or metastatic urothelial carcinoma in patients who are not eligible for cisplatin-containing chemotherapy and whose tumors express programmed death ligand 1 (PD-L1), or are not eligible for any platinum-containing chemotherapy regardless of the level of PD-L1 tumor expression. First-line treatment of metastatic non-small cell lung cancer (NSCLC) in patients whose tumors have high PD-L1 expression (PD-L1 stained ≥ 50% of tumor cells or PD-L1 stained tumor-infiltrating immune cells covering ≥ 10% of the tumor area) and have no EGFR or ALK genomic tumor aberrations. Metastatic non-small cell lung cancer (NSCLC) in patients who have disease progression during or following platinum-containing chemotherapy (as monotherapy). Patients with epidermal growth factor receptor (EGFR) or anaplastic lymphoma kinase (ALK) genomic tumor aberrations should have disease progression on FDA-approved therapy for these aberrations prior to receiving atezolizumab. Metastatic nonsquamous, non-small cell lung cancer (NSq NSCLC) as first-line therapy in patients whose tumors have no EGFR or ALK genomic tumor aberrations (in combination with bevacizumab, paclitaxel, and carboplatin). Metastatic NSq NSCLC as first-line therapy in patients whose tumors have no EGFR or ALK genomic tumor aberrations (in combination with paclitaxel protein bound and carboplatin). Unresectable, locally advanced or metastatic triple-negative breast cancer in patients whose tumors express PD-L1 (in combination with paclitaxel protein-bound). Extensive-stage small cell lung cancer (SCLC) as first-line therapy (in combination with carboplatin and etoposide). Unresectable or metastatic hepatocellular carcinoma (HCC) in patients who have not previously received systemic therapy (in combination with bevacizumab). BRAF V600 mutation-positive unresectable or metastatic melanoma (in combination with cobimetinib and vemurafenib).

Action

Binds to (PD-L1 to prevent its interaction with the programmed cell death-1 (PD-1) and B7.1 (or CD80) receptors, which activates the anti-tumor immune response. **Therapeutic Effects:** Decreased spread of urothelial carcinoma. Decreased spread of NSCLC, SCLC, triple-negative breast cancer, HCC, and melanoma with increased survival.

Pharmacokinetics

Absorption: IV administration results in complete bioavailability.

Distribution: Minimally distributed to tissues.

Metabolism and Excretion: Unknown.

Half-life: 27 days.

TIME/ACTION PROFILE (blood levels)

ROUTE	ONSET	PEAK	DURATION
IV	unknown	unknown	unknown

Contraindications/Precautions

Contraindicated in: OB: Pregnancy (may cause fetal harm); Lactation: Lactation.

Use Cautiously in: Allogeneic hematopoietic stem cell transplant recipients (↑ risk of transplantation complications); Rep: Women of reproductive potential; Pedi: Safety and effectiveness not established in children.

Adverse Reactions/Side Effects

CV: peripheral edema, myocarditis. **Derm:** DRUG REACTION WITH EOSINOPHILIA AND SYSTEMIC SYMPTOMS (DRESS), STEVENS-JOHNSON SYNDROME, TOXIC EPIDERMAL NECROLYSIS, pruritus, rash. **Endo:** ADRENAL INSUFFICIENCY, hypothyroidism, hyperglycemia, hyperthyroidism, hypophysitis, type 1 diabetes mellitus. **F and E:** hyponatremia, dehydration. **GI:** COLITIS/DIARRHEA, HEPATOTOXICITY, PANCREATITIS, constipation, ↓ appetite, nausea, vomiting, abdominal pain, ↑ liver enzymes. **GU:** hematuria, acute kidney injury, ↓ fertility (females), ↑ serum creatinine, nephritis, urinary obstruction. **Hemat:** lymphopenia, anemia. **Metab:** hypoalbuminemia. **MS:** arthralgia, ↑ alkaline phosphatase. **Neuro:** ENCEPHALITIS, GUILLAIN-BARRE SYNDROME, MENINGITIS, MYASTHENIA GRAVIS. **Resp:** INTERSTITIAL LUNG DISEASE, cough, dyspnea. **Misc:** INFECTIONS (including herpes encephalitis and tuberculosis), INFUSION-RELATED REACTIONS, fatigue, fever.

Interactions

Drug-Drug: None known.

Route/Dosage

Urothelial Carcinoma

IV (Adults): 840 mg every 2 wk until disease progression or unacceptable toxicity *or* 1200 mg every 3 wk until disease progression or unacceptable toxicity *or* 1680 mg every 4 wk until disease progression or unacceptable toxicity.

Non-Small Cell Lung Cancer

IV (Adults): *As monotherapy*—840 mg every 2 wk until disease progression or unacceptable toxicity *or* 1200 mg every 3 wk until disease progression or un-

© F.A. Davis Publishing

acceptable toxicity *or* 1680 mg every 4 wk until disease progression or unacceptable toxicity. *Combination therapy*—840 mg every 2 wk until disease progression or unacceptable toxicity *or* 1200 mg every 3 wk until disease progression or unacceptable toxicity *or* 1680 mg every 4 wk until disease progression or unacceptable toxicity. Administer prior to bevacizumab and chemotherapy when given on same day.

Small Cell Lung Cancer

IV (Adults): 840 mg every 2 wk until disease progression or unacceptable toxicity *or* 1200 mg every 3 wk until disease progression or unacceptable toxicity *or* 1680 mg every 4 wk until disease progression or unacceptable toxicity. Administer prior to carboplatin and etoposide when given on same day.

Triple-Negative Breast Cancer

Do NOT substitute paclitaxel protein-bound with paclitaxel (↑ risk of mortality).

IV (Adults): 840 mg every 2 wk until disease progression or unacceptable toxicity *or* 1200 mg every 3 wk until disease progression or unacceptable toxicity *or* 1680 mg every 4 wk until disease progression or unacceptable toxicity. Administer prior to paclitaxel protein-bound when given on same day.

Hepatocellular Carcinoma

IV (Adults): 840 mg every 2 wk until disease progression or unacceptable toxicity *or* 1200 mg every 3 wk until disease progression or unacceptable toxicity *or* 1680 mg every 4 wk until disease progression or unacceptable toxicity. Administer prior to bevacizumab when given on same day.

Melanoma

IV (Adults): 840 mg every 2 wk until disease progression or unacceptable toxicity *or* 1200 mg every 3 wk until disease progression or unacceptable toxicity *or* 1680 mg every 4 wk until disease progression or unacceptable toxicity. A 28–day treatment cycle of cobimetinib and vemurafenib should be administered prior to starting atezolizumab therapy.

Availability

Solution for injection: 60 mg/mL.

NURSING IMPLICATIONS

Assessment

- Monitor for signs and symptoms of pneumonitis (new or worsening cough, dyspnea, chest pain) during therapy. Monitor with x-rays as needed. *For ≥Grade 2 pneumonitis,* hold atezolizumab and administer corticosteroids at a dose of 1–2 mg/kg/day prednisolone equivalents followed by a taper. Resume after taper corticosteroid if Grade 0–1. If no complete or partial resolution within 12 wk of starting corticosteroids or inability to reduce prednisone to ≤10 mg per day within 12 wk of starting steroids, permanently discontinue atezolizumab. *For Grade 3 or 4 pneumonitis,* permanently discontinue atezolizumab.
- Monitor for signs and symptoms of hepatitis (jaundice, severe nausea or vomiting, pain on right side of abdomen, lethargy, dark urine, unusual bleeding or bruising, anorexia) periodically during therapy.
- Monitor for signs and symptoms of diarrhea or colitis (blood in stools, dark tarry stools, abdominal pain or tenderness) periodically during therapy. *For Grade 2 or 3,* hold atezolizumab until Grade 1 or resolved and corticosteroid dose ≤prednisone 10 mg per day (or equivalent). *For Grade 4,* permanently discontinue atezolizumab.
- Monitor for signs and symptoms of adrenal insufficiency (extreme tiredness, dizziness or fainting, frequent urination, nausea or vomiting, changes in mood or behavior, ↓ sex drive, irritability, forgetfulness), hypophysitis (unusual headaches, persistent headaches, vision problems), hyperthyroidism, and Type 1 diabetes periodically during therapy. *If Grades 2, 3, or 4 occur,* hold dose until Grade 1 or resolved and clinically stable on hormone replacement therapy.
- Monitor for signs and symptoms of immune-mediated skin reactions (rash, pruritus, blistering, painful sores in mouth, nose, throat, genital area) periodically during therapy. Topical emollients and/or topical corticosteroids may treat mild to moderate non-exfoliative rashes. May cause exfoliative dermatitis (SJS, TEN, DRESS). *If SJS, TEN, or DRESS is suspected,* hold atezolizumab. *If SJS, TEN, or DRESS are confirmed,* permanently discontinue atezolizumab.
- Monitor for signs and symptoms of meningitis or encephalitis (fever, confusion, changes in mood or behavior, extreme sensitivity to light, neck stiffness) during therapy. If symptoms occur, permanently discontinue atezolizumab. Administer 1–2 mg/kg/day methylprednisolone or equivalent. Convert to oral prednisone 60 mg/day or equivalent once improved. When symptoms improve to ≤Grade 1, taper steroids over ≥1 mo.
- Monitor for signs and symptoms of motor or sensory neuropathy (severe muscle weakness, numbness or tingling in hands or feet) periodically during therapy. For Grade 2 neurological toxicities, hold atezolizumab and administer corticosteroids at a dose of 1–2 mg/kg/day prednisolone equivalents followed by a taper. Resume after taper corticosteroid if Grade 0–1. If no complete or partial resolution within 12 wk of starting corticosteroids or inability to reduce prednisone to ≤10 mg per day within 12 wk of starting steroids, permanently discontinue atezolizumab. *If Grades 3 or 4 or symptoms of myasthenic syndrome/myasthenia gravis or Guillain-*

© F.A. Davis Publishing

Barre syndrome occur, permanently discontinue atezolizumab. Institute treatment as needed.

- Monitor for signs and symptoms of pancreatitis (abdominal pain) during therapy. *If Grade 2 or 3 pancreatitis,* hold atezolizumab. Treat with methylprednisolone IV 1–2 mg/kg/day or equivalent. Once symptoms improve, follow with 1–2 mg/kg/day of oral prednisone or equivalent. Resume atezolizumab if symptoms of pancreatitis resolved and corticosteroid reduced to ≤10 mg/day oral prednisone or equivalent. *For Grade 4 or recurrent pancreatitis,* permanently discontinue atezolizumab.
- Monitor for signs and symptoms of infection (fever, cough, frequent urination, flu-like symptoms, painful urination) periodically during therapy. Treat suspected or confirmed infections with antibiotics. *For ≥Grade 3 or 4 infections,* withhold atezolizumab until Grade 1 or resolved.
- Monitor for signs and symptoms of infusion-related reactions (chills or shaking, itching or rash, flushing, dyspnea, wheezing, dizziness, fever, feeling faint, back or neck pain, facial swelling) during therapy. *For Grade 1 or 2,* interrupt or slow infusion. *For Grade 3 or 4 infusion reactions,* permanently discontinue atezolizumab.
- Monitor for signs and symptoms of myocarditis (chest pain, irregular heartbeat, shortness of breath, swelling of ankles) during therapy. *If Grade 2, 3, or 4 myocarditis occurs,* discontinue atezolizumab permanently.
- ***Lab Test Considerations:*** Verify a negative pregnancy test before starting therapy.
- Confirm PD-L1 expression in locally advanced or metastatic urothelial carcinoma or triple-negative breast cancer via tests and BRAF V600E and V600K in unresectable or metastatic melanoma at http://www.fda.gov/CompanionDiagnostics. An FDA-approved test for the detection of other BRAF V600 mutations for this use is not currently available.
- For patients with hepatitis with no tumor involvement of the liver, monitor AST, ALT, and serum bilirubin prior to and periodically during therapy. *If AST or ALT >3 and ≤ 8 times upper limit of normal (ULN) or total bilirubin >1.5 and ≤ 3 times ULN* hold dose until Grade 1 or resolved and corticosteroid dose ≤prednisone 10 mg per day (or equivalent). *If AST or ALT >8 times ULN or total bilirubin >3 times ULN,* permanently discontinue atezolizumab. For patients with hepatitis with tumor involvement of the liver, *If baseline AST or ALT >1 and ≤3 times ULN and increases to >5 and ≤10 times ULN or baseline AST or ALT >3 and ≤5 times ULN and increases to >8 and ≤10 times ULN,* hold atezolizumab and administer corticosteroids at a dose of 1–2 mg/kg/day prednisolone equivalents followed by a taper. Resume after taper corticosteroid if Grade 0–1. If no complete or partial resolution within 12 wk of starting corticosteroids or inability to reduce prednisone to ≤10 mg per day within 12 wk of starting steroids, permanently discontinue atezolizumab. *If AST or ALT increases to >10 times ULN or total bilirubin increases to >3 times ULN,* permanently discontinue atezolizumab.
- Monitor thyroid function prior to and periodically during therapy. *If asymptomatic,* continue therapy. *For symptomatic hypothyroidism (extreme tiredness, weight gain, constipation, feeling cold, hair loss, deepening voice),* withhold atezolizumab and begin thyroid replacement therapy as needed without corticosteroids. *For symptomatic hyperthyroidism (hunger, irritability, mood swings, weight loss),* hold atezolizumab until Grade 1 or resolved and clinically stable on hormone replacement therapy. Resume therapy when symptoms of hyper- or hypothyroidism are controlled and thyroid function is improving.
- Monitor blood glucose periodically during therapy. For type 1 diabetes, begin treatment with insulin. For ≥Grade 2, 3, or 4 hyperglycemia (fasting glucose >250–500 mg/dL), hold atezolizumab until Grade 1 or resolved and control is achieved on insulin replacement therapy.
- Monitor serum amylase or lipase in patients with symptoms of pancreatitis. If serum amylase or lipase levels ≥Grade 3 (>2× upper limit of normal), withhold atezolizumab. Treat with methylprednisolone IV 1–2 mg/kg/day or equivalent. Once symptoms improve, follow with 1–2 mg/kg/day of oral prednisone or equivalent. Resume atezolizumab if symptoms of pancreatitis resolved and corticosteroid ↓ to ≤10 mg/day oral prednisone or equivalent.
- Monitor renal function prior to and periodically during therapy. If serum creatinine increases to Grades 2 or 3, hold atezolizumab and administer corticosteroids at a dose of 1–2 mg/kg/day prednisolone equivalents followed by a taper. Resume after taper corticosteroid if Grade 0–1. If no complete or partial resolution within 12 wk of starting corticosteroids or inability to reduce prednisone to ≤10 mg per day within 12 wk of starting steroids, permanently discontinue atezolizumab. If serum creatinine increases to Grade 4, permanently discontinue atezolizumab.
- May cause lymphopenia, hyponatremia, anemia, ↑ alkaline phosphatase, ↑ serum creatinine, and hypoalbuminemia.

Implementation

IV Administration

- **Intermittent Infusion:** ***Dilution:*** Dilute with 0.9% NaCl in a polyvinyl chloride, polyethylene, or polyolefin infusion bag. ***Concentration:*** 3.2 mg/mL to 16.8 mg/mL. Gently invert to dilute; do not shake. Solution is clear and colorless to slightly yellow. Do not administer solutions that are discolored or contain particulate matter. Administer immediately once prepared or store for ≤6 hrs at room

© F.A. Davis Publishing

temperature (including infusion time) or ≤24 hrs if refrigerated. Do not freeze.
- Administer atezolizumab before chemotherapy or other antineoplastic drugs when given on same day. ***Rate:*** Administer over 60 min with or without a sterile, non-pyrogenic, low-protein binding in-line filter (0.2–0.22 micron); do not administer via IV push or bolus. If first infusion is tolerated, subsequent infusions may be infused over 30 min.
- **Y-Site Incompatibility:** Do not administer other drugs through same IV line.

Patient/Family Teaching

- Explain purpose of atezolizumab to patient. Advise patient to read the *Medication Guide* before starting and periodically during therapy in case of changes.
- Advise patient to notify health care professional immediately if symptoms of pneumonitis, hepatitis, colitis, endocrine problems, meningitis, nervous system problems, ocular inflammatory toxicity (blurry or double vision, eye pain or redness), pancreatitis, infection, infusion-related reactions, or rash occur.
- Advise patient to notify health care professional of all Rx or OTC medications, vitamins, or herbal products being taken and to consult with health care professional before taking other medications.
- Rep: May cause fetal harm. Advise females of reproductive potential to use effective contraception and to avoid breast feeding during and for at least 5 mo after last dose. Inform females that atezolizumab may impair fertility during therapy.

Evaluation/Desired Outcomes

- Decreased spread of urothelial carcinoma, NSCLC, SCLC, triple-negative breast cancer, HCC, and melanoma with increased survival.

atomoxetine (a-to-**mox**-e-teen)

Strattera

Classification

Therapeutic: agents for attention deficit disorder

Pharmacologic: selective norepinephrine reuptake inhibitors

Indications

Attention-deficit/hyperactivity disorder (ADHD).

Action

Selectively inhibits the presynaptic transporter of norepinephrine. **Therapeutic Effects:** Increased attention span.

Pharmacokinetics

Absorption: Well absorbed following oral administration.

Distribution: Unknown.

Protein Binding: 98%.

Metabolism and Excretion: Mostly metabolized by the liver (CYP2D6 enzyme pathway); the CYP2D6 enzyme system exhibits genetic polymorphism (~7% of population may be poor metabolizers and may have significantly ↑ atomoxetine concentrations and an ↑ risk of adverse effects).

Half-life: 5 hr.

TIME/ACTION PROFILE

ROUTE	ONSET	PEAK	DURATION
PO	unknown	1–2 hr	12–24 hr

Contraindications/Precautions

Contraindicated in: Hypersensitivity; Concurrent or within 2 wk therapy with MAO inhibitors; Angle-closure glaucoma; Pheochromocytoma; Hypertension, tachycardia, cardiovascular, or cerebrovascular disease.

Use Cautiously in: Pre-existing psychiatric illness; Concurrent albuterol or vasopressors (↑ risk of adverse cardiovascular reactions); CYP2D6 poor metabolizers (↓ dose); OB: Use during pregnancy only if potential maternal benefit justifies potential fetal risk; Lactation: Safety not established in breast feeding; Pedi: May ↑ risk of suicide attempt/ideation especially during dose early treatment or dose adjustment; risk may be greater in children or adolescents; Pedi: Children <6 yr (safety and effectiveness not established).

Adverse Reactions/Side Effects

CV: hypertension, orthostatic hypotension, QT interval prolongation, syncope, tachycardia. **Derm:** ↑ sweating, rash, urticaria. **GI:** HEPATOTOXICITY, dyspepsia, nausea, vomiting; *Adults*, dry mouth, constipation. **GU:** *Adults*— dysmenorrhea, ejaculatory problems, erectile dysfunction, libido changes, priapism, urinary hesitation, urinary retention. **Metab:** ↓ appetite, weight/growth loss. **MS:** RHABDOMYOLYSIS. **Neuro:** *Adults*— paresthesia, SUICIDAL THOUGHTS, dizziness, fatigue, mood swings, behavioral disturbances, hallucinations, hostility, mania, thought disorder; *Adults*, insomnia. **Misc:** HYPERSENSITIVITY REACTIONS (including anaphylaxis and angioedema).

Interactions

Drug-Drug: Concurrent use with **MAO inhibitors** may result in serious, potentially fatal reactions (do not use within 2 wk of each other). ↑ risk of cardiovascular effects with **albuterol** or **vasopressors** (use cautiously). **CYP2D6 inhibitors**, including **quinidine**, **fluoxetine**, or **paroxetine**, may ↑ levels and risk of toxicity; dose ↓ recommended.

Route/Dosage

PO (Children and Adolescents ≥6 yr and <70 kg): 0.5 mg/kg/day initially; may ↑ every 3 days to a

© F.A. Davis Publishing

daily target dose of 1.2 mg/kg, given as a single dose in the morning or evenly divided doses in the morning and late afternoon/early evening (not to exceed 1.4 mg/kg/day or 100 mg/day whichever is less). *Concurrent use of CYP2D6 inhibitor (quinidine, fluoxetine, paroxetine) or CYP2D6 poor metabolizer*—0.5 mg/kg/day initially, may ↑ if needed to 1.2 mg/kg/day after 4 wk. **PO (Adults , Adolescents, and Children ≥6 yr and >70 kg):** 40 mg/day initially; may ↑ every 3 days to a daily target dose of 80 mg/day given as a single dose in the morning or evenly divided doses in the morning and late afternoon/early evening; may further ↑ after 2–4 wk up to 100 mg/day. *Concurrent use of CYP2D6 inhibitor (quinidine, fluoxetine, paroxetine)*—40 mg/day initially, may ↑ if needed to 80 mg/day after 4 wk.

Hepatic Impairment

PO (Adults and Children): *Moderate hepatic impairment (Child-Pugh Class B)*—↓ initial and target dose by 50%; *Severe hepatic impairment (Child-Pugh Class C)*—↓ initial and target dose to 25% of normal.

Availability (generic available)

Capsules: 10 mg, 18 mg, 25 mg, 40 mg, 60 mg, 80 mg, 100 mg.

NURSING IMPLICATIONS

Assessment

- Assess attention span, impulse control, and interactions with others.
- Monitor BP and pulse periodically during therapy. Obtain a history (including assessment of family history of sudden death or ventricular arrhythmia), physical exam to assess for cardiac disease, and further evaluation (ECG and echocardiogram), if indicated. If exertional chest pain, unexplained syncope, or other cardiac symptoms occur, evaluate promptly.
- Monitor growth, body height, and weight in children.
- Assess for signs of liver injury (pruritus, dark urine, jaundice, right upper quadrant tenderness, unexplained "flu-like" symptoms) during therapy. Monitor liver function tests at first sign of liver injury. Discontinue and do not restart atomoxetine in patients with jaundice or laboratory evidence of liver injury.
- Monitor closely for notable changes in behavior that could indicate the emergence or worsening of suicidal thoughts or behavior or depression.

Implementation

- Do not confuse atomoxetine with atorvastatin.
- **PO:** Administer without regard to food. Swallow capsules whole; do not open, crush, or chew. Doses may be discontinued without tapering.

Patient/Family Teaching

- Instruct patient to take medication as directed. Take missed doses as soon as possible, but should not take more than the total daily amount in any 24-hr period. Advise patient and parents to read the *Medication Guide* prior to starting therapy and with each Rx refill in case of changes.
- Inform patient that sharing this medication may be dangerous.
- Advise patient and family to notify health care professional if thoughts about suicide or dying, attempts to commit suicide; new or worse depression; new or worse anxiety; feeling very agitated or restless; panic attacks; trouble sleeping; new or worse irritability; acting aggressive or hostile; being angry or violent; acting on dangerous impulses; an extreme increase in activity and talking; other unusual changes in behavior or mood occur or if signs and symptoms of severe liver injury (pruritus, dark urine, jaundice, right upper quadrant tenderness, or unexplained "flu-like" symptoms) occur.
- Instruct patient to notify health care professional of all Rx or OTC medications, vitamins, or herbal products being taken and consult health care professional before taking any new medications.
- May cause dizziness. Caution patient to avoid driving or other activities requiring alertness until response to medication is known.
- Rep: Advise female patients to notify health care professional if pregnancy is planned or suspected or if they are breast feeding. Register patients who took atomoxetine during pregnancy in Pregnancy Exposure Registry to monitor pregnancy outcomes by calling the National Pregnancy Registry for ADHD Medications at 1-866-961-2388 or visiting https://womensmentalhealth.org/adhd-medications/.

Evaluation/Desired Outcomes

- Improved attention span and social interactions in ADHD.

atorvastatin, See HMG-CoA REDUCTASE INHIBITORS (statins).

atovaquone (a-toe-va-kwone)

Mepron

Classification

Therapeutic: anti-infectives

Indications

Treatment of mild to moderate *Pneumocystis jirovecii* pneumonia (PJP) in patients who are unable to tolerate trimethoprim/sulfamethoxazole. Prophylaxis of *PJP*.

Action

Inhibits the action of enzymes necessary to nucleic acid and ATP synthesis. **Therapeutic Effects:** Active against *P. jirovecii*.

Pharmacokinetics

Absorption: Absorption is poor but is increased by food, particularly fat.

© F.A. Davis Publishing

Distribution: Enters CSF in very low concentrations (<1% of plasma levels).
Protein Binding: >99.9%.
Metabolism and Excretion: Undergoes enterohepatic recycling; elimination occurs in feces.
Half-life: 2.2–2.9 days.

TIME/ACTION PROFILE (blood levels)

ROUTE	ONSET	PEAK	DURATION
PO	unknown	1–8 hr; 24–96 hr†	12 hr

†Two peaks are due to enterohepatic recycling.

Contraindications/Precautions

Contraindicated in: Hypersensitivity; Lactation: Avoid breast feeding in patients infected with HIV.
Use Cautiously in: ↓ hepatic, renal, or cardiac function (dose modification may be necessary); GI disorders (absorption may be limited); OB: Use only if potential maternal benefit justifies potential fetal risk; Pedi: Safety not established.

Adverse Reactions/Side Effects

Derm: rash. **GI:** diarrhea, nausea, vomiting. **Neuro:** headache, insomnia. **Resp:** cough. **Misc:** fever.

Interactions

Drug-Drug: Rifampin or **rifabutin** may ↓ levels and efficacy; concurrent use not recommended. **Tetracycline** may ↓ levels and efficacy; use caution when using concurrently. **Metoclopramide** may ↓ levels and efficacy; use only if no other alternative available. May ↓ **indinavir** levels and efficacy; use caution when using concurrently.
Drug-Food: Food ↑ absorption.

Route/Dosage

Treatment

PO (Adults): 750 mg twice daily for 21 days.
PO (Children): 40 mg/kg/day (unlabeled).

Prevention

PO (Adults and Adolescents 13–16 yr): 1500 mg once daily.

Availability (generic available)

Suspension: 750 mg/5 mL. ***In combination with:*** proguanil (Malarone). See Appendix N.

NURSING IMPLICATIONS

Assessment

- Assess patient for signs of infection (vital signs, lung sounds, sputum, WBCs) at beginning of and throughout therapy.
- Obtain specimens prior to initiating therapy. First dose may be given before receiving results.
- ***Lab Test Considerations:*** Monitor hematologic and hepatic functions. May cause mild, transient anemia and neutropenia. May also cause ↑ serum amylase, AST, ALT, and alkaline phosphatase.
- Monitor electrolytes. May cause hyponatremia.

Implementation

- **PO:** Administer with food twice daily for 21 days for treatment and once daily for prevention.
- Shake suspension gently prior to administration.

Patient/Family Teaching

- Instruct patient to take atovaquone as directed around the clock for full course of therapy, even if feeling better. Emphasize the importance of taking atovaquone with food, especially foods high in fat; taking without food may decrease plasma concentrations and effectiveness.
- Advise patient to notify health care professional if rash occurs.
- Advise female patient to notify health care professional if pregnancy is planned or suspected and to avoid breast feeding.

Evaluation/Desired Outcomes

- Resolution of the signs and symptoms of infection.

BEERS

atropine† (at-ro-peen)

Atro-Pen

Classification
Therapeutic: antiarrhythmics
Pharmacologic: anticholinergics, antimuscarinics

†See Appendix B for ophthalmic use

Indications

IM: Given preoperatively to decrease oral and respiratory secretions. **IV:** Treatment of sinus bradycardia and heart block. **IV:** Reversal of adverse muscarinic effects of anticholinesterase agents (neostigmine, physostigmine, or pyridostigmine). **IM, IV:** Treatment of anticholinesterase (organophosphate pesticide) poisoning. **Inhaln:** Treatment of exercise-induced bronchospasm.

Action

Inhibits the action of acetylcholine at postganglionic sites located in: Smooth muscle, Secretory glands, CNS (antimuscarinic activity). Low doses decrease: Sweating, Salivation, Respiratory secretions. Intermediate doses result in: Mydriasis (pupillary dilation), Cycloplegia (loss of visual accommodation), Increased heart rate. GI and GU tract motility are decreased at larger doses. **Therapeutic Effects:** Increased heart rate. Decreased GI and respiratory secretions. Reversal of muscarinic effects. May have a spasmolytic action on the biliary and genitourinary tracts.

© F.A. Davis Publishing

Pharmacokinetics

Absorption: Well absorbed following subcut or IM administration.
Distribution: Readily crosses the blood-brain barrier. Crosses the placenta and enters breast milk.
Metabolism and Excretion: Mostly metabolized by the liver; 30–50% excreted unchanged by the kidneys.
Half-life: Children <2 yr: 4–10 hr; Children >2 yr: 1.5–3.5 hr; Adults: 4–5 hr.

TIME/ACTION PROFILE (inhibition of salivation)

ROUTE	ONSET	PEAK	DURATION
IM, subcut	rapid	15–50 min	4–6 hr
IV	immediate	2–4 min	4–6 hr

Contraindications/Precautions

Contraindicated in: Hypersensitivity; Angle-closure glaucoma; Acute hemorrhage; Tachycardia secondary to cardiac insufficiency or thyrotoxicosis; Obstructive disease of the GI tract.
Use Cautiously in: Intra-abdominal infections; Prostatic hyperplasia; Chronic renal, hepatic, pulmonary, or cardiac disease; OB: Safety not established in pregnancy; Lactation: Use while breast feeding only if potential maternal benefit justifies potential risk to infant; Pedi: Infants with Down syndrome have ↑ sensitivity to cardiac effects and mydriasis. Children may have ↑ susceptibility to adverse reactions. Exercise care when prescribing to children with spastic paralysis or brain damage; Geri: Older adults have ↑ sensitivity to adverse reactions.

Adverse Reactions/Side Effects

CV: tachycardia, palpitations, arrhythmias. **Derm:** ↓ sweating, flushing. **EENT:** blurred vision, cycloplegia, photophobia, dry eyes, mydriasis. **GI:** dry mouth, constipation, impaired GI motility. **GU:** urinary hesitancy, retention, impotency. **Neuro:** drowsiness, confusion, hyperpyrexia. **Resp:** tachypnea, pulmonary edema.

Interactions

Drug-Drug: ↑ anticholinergic effects with other **anticholinergics**, including **antihistamines**, **tricyclic antidepressants**, **quinidine**, and **disopyramide**. Anticholinergics may alter the absorption of other **orally administered drugs** by slowing motility of the GI tract. **Antacids** ↓ absorption of **anticholinergics**. May ↑ GI mucosal lesions in patients taking oral **potassium chloride** tablets. May alter response to **beta-blockers**.

Route/Dosage

Preanesthesia (To Decrease Salivation/Secretions)

IM, IV, Subcut (Adults): 0.4–0.6 mg 30–60 min preop.
IM, IV, Subcut (Children >5 kg): 0.01–0.02 mg/kg/dose 30–60 min preop to a maximum of 0.4 mg/dose; minimum: 0.1 mg/dose.
IM, IV, Subcut (Children <5 kg): 0.02 mg/kg/dose 30–60 min preop then every 4–6 hr as needed.

Bradycardia

IV (Adults): 0.5–1 mg; may repeat as needed every 5 min, not to exceed a total of 2 mg (every 3–5 min in Advanced Cardiac Life Support guidelines) or 0.04 mg/kg (total vagolytic dose).
IV (Children): 0.02 mg/kg (maximum single dose is 0.5 mg in children and 1 mg in adolescents); may repeat every 5 min up to a total dose of 1 mg in children (2 mg in adolescents).
Endotracheal (Children): use the IV dose and dilute before administration.

Reversal of Adverse Muscarinic Effects of Anticholinesterases

IV (Adults): 0.6–12 mg for each 0.5–2.5 mg of neostigmine or 10–20 mg of pyridostigmine concurrently with anticholinesterase.

Organophosphate Poisoning

IM (Adults): 2 mg initially, then 2 mg every 10 min as needed up to 3 times total.
IV (Adults): 1–2 mg/dose every 10–20 min until atropinic effects observed then every 1–4 hr for 24 hr; up to 50 mg in first 24 hr and 2 g over several days may be given in severe intoxication.
IM (Children >10 yr >90 lbs): 2 mg.
IM (Children 4–10 yr 40–90 lbs): 1 mg.
IM (Children 6 mo–4 yr 15–40 lbs): 0.5 mg.
IV (Children): 0.02–0.05 mg/kg every 10–20 min until atropinic effects observed then every 1–4 hr for 24 hr.

Bronchospasm

Inhaln (Adults): 0.025–0.05 mg/kg/dose every 4–6 hr as needed; maximum 2.5 mg/dose.
Inhaln (Children): 0.03–0.05 mg/kg/dose 3–4 times/day; maximum 2.5 mg/dose.

Availability (generic available)

Solution for injection: 0.05 mg/mL, 0.1 mg/mL, 0.4 mg/mL, 1 mg/mL, 0.5 mg/0.7 mL (auto-injector), 1 mg/0.7 mL Auto-injector, 2 mg/0.7 mL (auto-injector).

NURSING IMPLICATIONS

Assessment

- Assess vital signs and ECG tracings frequently during IV drug therapy. Report any significant changes in heart rate or BP, or increased ventricular ectopy or angina to health care professional promptly.
- Monitor intake and output ratios in elderly or surgical patients because atropine may cause urinary retention.
- Assess patients routinely for abdominal distention and auscultate for bowel sounds. If constipation be-

© F.A. Davis Publishing

comes a problem, increasing fluids and adding bulk to the diet may help alleviate constipation.
- ***Toxicity and Overdose:*** If overdose occurs, physostigmine is the antidote.

Implementation

- **IM:** Intense flushing of the face and trunk may occur 15–20 min following IM administration. In children, this response is called "atropine flush" and is not harmful.

IV Administration

- **IV Push:** ***Dilution:*** Administer undiluted. ***Rate:*** Administer over 1 min; more rapid administration may be used during cardiac resuscitation (follow with 20 mL saline flush). Slow administration (over >1 min) may cause a paradoxical bradycardia (usually resolved in approximately 2 min).
- **Y-Site Compatibility:** alfentanil, amikacin, aminophylline, amiodarone, argatroban, ascorbic acid, azathioprine, aztreonam, benztropine, bivalirudin, bumetanide, buprenorphine, butorphanol, calcium chloride, calcium gluconate, cefazolin, cefotaxime, cefotetan, cefoxitin, ceftazidime, ceftriaxone, cefuroxime, chloramphenicol, chlorpromazine, clindamycin, cyanocobalamin, cyclosporine, dexamethasone, dexmedetomidine, digoxin, diphenhydramine, dobutamine, dopamine, doxycycline, enalaprilat, ephedrine, epinephrine, epoetin alfa, eptifibatide, erythromycin, esmolol, etomidate, famotidine, fenoldopam, fentanyl, fluconazole, folic acid, furosemide, ganciclovir, gentamicin, glycopyrrolate, heparin, hydrocortisone sodium succinate, hydromorphone, imipenem/cilastatin, indomethacin, insulin, isoproterenol, ketamine, ketorolac, labetalol, lidocaine, magnesium sulfate, mannitol, meperidine, meropenem, methadone, methylprednisolone, metoclopramide, metoprolol, midazolam, morphine, multivitamins, nafcillin, nalbuphine, naloxone, nitroglycerin, nitroprusside, norepinephrine, ondansetron, oxacillin, oxytocin, palonosetron, papaverine, penicillin G, pentamidine, pentobarbital, phenobarbital, phentolamine, phenylephrine, phytonadione, potassium chloride, procainamide, prochlorperazine, promethazine, propranolol, protamine, pyridoxine, sodium bicarbonate, succinylcholine, sufentanil, theophylline, thiamine, tirofiban, tobramycin, vancomycin, vasopressin, verapamil, vitamin B complex with C.
- **Y-Site Incompatibility:** amphotericin B deoxycholate, dantrolene, diazepam, diazoxide, pantoprazole, phenytoin, trimethoprim/sulfamethoxazole, thiopental.
- **Endotracheal:** Dilute with 5–10 mL of 0.9% NaCl.
- ***Rate:*** Inject directly into the endotracheal tube followed by several positive pressure ventilations.
- ***Atropen*:** Patients at risk for organophosphorus or carbamate poisoning should have 3 *Atropen* autoinjectors; 1 for mild symptoms (blurred vision, teary eyes, runny nose, drooling, chest tightness, dyspnea, tremors, nausea, vomiting, wheezing, stomach cramps, tachycardia or bradycardia) plus 2 more for severe symptoms (confused behavior, severe dyspnea, copious airway secretions, severe muscle twitching, incontinence of bowels or bladder, convulsions, unconsciousness). Dose of *Atropen* depends on patient's weight. Administer as soon as symptoms of organophosphorus or carbamate poisoning appear. Monitor patient for at least 48–72 hr after injection. Inject at a 90° in mid-lateral thigh; hold autoinjector in place for at least 10 sec to allow injection to finish. May be injected through clothes. Remove autoinjector and massage injection site.

Patient/Family Teaching

- May cause drowsiness. Caution patients to avoid driving or other activities requiring alertness until response to medication is known.
- Instruct patient that oral rinses, sugarless gum or candy, and frequent oral hygiene may help relieve dry mouth.
- Caution patients that atropine impairs heat regulation. Strenuous activity in a hot environment may cause heat stroke. Advise patient to notify health care professional of all Rx or OTC medications, vitamins, or herbal products being taken and to consult with health care professional before taking other medications.
- Advise patient to notify health care professional if pregnancy is planned or suspected or if breast feeding.
- Pedi: Instruct parents or caregivers that medication may cause fever and to notify health care professional before administering to a febrile child.
- Geri: Inform male patients with benign prostatic hyperplasia that atropine may cause urinary hesitancy and retention. Changes in urinary stream should be reported to health care professional.

Evaluation/Desired Outcomes

- Increase in heart rate.
- Dryness of mouth.
- Reversal of muscarinic effects.

avanafil (av-an-a-fil)

Stendra

Classification

Therapeutic: erectile dysfunction agents
Pharmacologic: phosphodiesterase type 5 inhibitors

= Canadian drug name. = Genetic implication. ~~Strikethrough~~ = Discontinued.
*CAPITALS indicates life-threatening; underlines indicate most frequent.

© F.A. Davis Publishing

Indications
Treatment of erectile dysfunction.

Action
Enhances effects of nitric oxide released during sexual stimulation. Nitric oxide activates guanylate cyclase, which produces ↑ levels of cyclic guanosine monophosphate (cGMP). cGMP produces smooth muscle relaxation of the corpus cavernosum, which promotes ↑ blood flow and subsequent erection. Inhibits the enzyme phosphodiesterase type 5 (PDE5), PDE5 inactivates cGMP. **Therapeutic Effects:** Enhanced blood flow to the corpus cavernosum and erection sufficient to allow sexual intercourse. Requires sexual stimulation.

Pharmacokinetics
Absorption: Rapidly absorbed following oral administration.
Distribution: Minimal amounts enter semen.
Protein Binding: 99%.
Metabolism and Excretion: Mostly metabolized by the liver (primarily by the CYP3A4 enzyme system), metabolites excreted in feces (62%) and urine (21%). One metabolite had inhibitory activity on PDE5.
Half-life: 5 hr.

TIME/ACTION PROFILE (effect on BP)

ROUTE	ONSET	PEAK	DURATION
PO	within 1 hr	1–2 hr	unknown

Contraindications/Precautions
Contraindicated in: Hypersensitivity; Concurrent use of nitrates or riociguat; Severe renal or hepatic impairment; Concurrent use of strong CYP3A4 inhibitors; Serious underlying cardiovascular disease (including history of MI, stroke, or serious arrhythmia within 6 mo), cardiac failure, or coronary artery disease with unstable angina, angina with sexual intercourse; History of HF, coronary artery disease, uncontrolled hypertension (BP >170/110 mm Hg) or hypotension (BP <90/50 mm Hg), dehydration, autonomic dysfunction, or severe left ventricular outflow obstruction; Hereditary degenerative retinal disorders; Women.
Use Cautiously in: Serious underlying cardiovascular disease or conditions in which sexual activity is not advised; History of sudden severe vision loss or non-arteritic ischemic optic neuropathy (NAION); may ↑ risk of recurrence; Low cup to disk ratio, age >50 yr, diabetes, hypertension, coronary artery disease, hyperlipidemia, or smoking (↑ risk of NAION); Alpha adrenergic blockers (patients should be on stable dose of alpha blockers before treatment, initiate with 50 mg dose); Anatomic penile deformity (angulation, cavernosal fibrosis, Peyronie disease); Conditions associated with priapism (sickle cell anemia, multiple myeloma, leukemia); Concurrent use of moderate CYP3A4 inhibitors (initiate with 50 mg dose); History of hearing loss; Bleeding disorders or peptic ulceration; Geri: Elderly may be more sensitive to drug effects; Pedi: Safety not established.

Adverse Reactions/Side Effects
EENT: nasal congestion, nasopharyngitis, sudden hearing/vision loss. **GU:** priapism. **Derm:** flushing. **MS:** back pain. **Neuro:** headache, dizziness..

Interactions
Drug-Drug: Concurrent use of **nitrates** may cause serious, life-threatening hypotension and is contraindicated. Concurrent use of **riociguat** may result in severe hypotension; concurrent use contraindicated. Blood levels and effects may be ↑ by **CYP3A4 inhibitors**, concurrent use of **strong CYP3A4 inhibitors** including **atazanavir**, **clarithromycin**, **indinavir**, **itraconazole**, **ketoconazole**, **nefazodone**, **nelfinavir**, and **saquinavir** is contraindicated. A similar but lesser effect is expected with **moderate CYP3A4 inhibitors** including **erythromycin**, **aprepitant**, **diltiazem**, **fluconazole**, **fosamprenavir**, **ritonavir**, and **verapamil**; initial dose should not exceed 50 mg/24 hr. ↑ risk of hypotension with **alpha-adrenergic blockers**, **antihypertensives**, and **alcohol** (more than 3 units); dosage adjustments may be necessary.

Route/Dosage
PO (Adults): 100 mg 15 min prior to sexual activity, not to exceed once daily (range 50–200 mg, use lowest effective dose); *Concurrent alpha-blockers or moderate CYP3A4 inhibitors*— 50 mg, not to exceed once daily.

Availability
Tablets: 50 mg, 100 mg, 200 mg.

NURSING IMPLICATIONS

Assessment
- Determine erectile dysfunction before administration. Avanafil has no effect in the absence of sexual stimulation.

Implementation
- **PO:** Administer dose as needed for erectile dysfunction at least 15 min prior to sexual activity.
- May be administered without regard to food.

Patient/Family Teaching
- Instruct patient to take avanafil as needed for ED at least 15 min before sexual activity and not more than once per day. Inform patient that sexual stimulation is required for an erection to occur after taking avanafil.
- Advise patient that avanafil is not indicated for use in women.
- Caution patient not to take avanafil concurrently with alpha adrenergic blockers (unless on a stable dose) or nitrates. If chest pain occurs after taking avanafil, instruct patient to seek immediate medical attention.
- Advise patient to avoid excess alcohol intake (≥3 units) in combination with avanafil; may increase

© F.A. Davis Publishing

risk of orthostatic hypotension, increased heart rate, decreased standing BP, dizziness, headache.
- Instruct patient to notify health care professional promptly if erection lasts longer than 4 hr, if they are not satisfied with their sexual performance, develop unwanted side effects or if they experience sudden or decreased vision loss in one or both eyes or loss or decrease in hearing, ringing in the ears, or dizziness.
- Advise patient to notify health care professional of all Rx or OTC medications, vitamins, or herbal products being taken and to consult with health care professional before taking other medications that may interact with avanafil.
- Inform patient that avanafil offers no protection against sexually transmitted diseases. Counsel patient that protection against sexually transmitted diseases and HIV infection should be considered.

Evaluation/Desired Outcomes
- Male erection sufficient to allow intercourse.

azaTHIOprine
(ay-za-**thye**-oh-preen)
Azasan, Imuran

Classification
Therapeutic: immunosuppressants
Pharmacologic: purine antagonists

Indications
Prevention of renal transplant rejection (with corticosteroids, local radiation, or other cytotoxic agents). Treatment of severe, active, erosive rheumatoid arthritis unresponsive to more conventional therapy. **Unlabeled Use:** Management of Crohn's disease or ulcerative colitis.

Action
Antagonizes purine metabolism with subsequent inhibition of DNA and RNA synthesis. **Therapeutic Effects:** Suppression of cell-mediated immunity and altered antibody formation.

Pharmacokinetics
Absorption: Readily absorbed after oral administration.
Distribution: Crosses the placenta. Enters breast milk in low concentrations.
Metabolism and Excretion: Metabolized to 6–mercaptopurine, which is further metabolized (one route is by thiopurine methyltransferase [TPMT] to form an inactive metabolite; nucleotide diphosphatase [NUDT15] is also involved in inactivation process). Minimal renal excretion of unchanged drug.
Half-life: 3 hr.

TIME/ACTION PROFILE

ROUTE	ONSET	PEAK	DURATION
PO (anti-inflammatory)	6–8 wk	12 wk	unknown

Contraindications/Precautions
Contraindicated in: Hypersensitivity; Concurrent use of mycophenolate; OB: Has been shown to cause fetal harm; Lactation: Appears in breast milk.
Use Cautiously in: Infection; Malignancies; ↓ bone marrow reserve; Previous or concurrent radiation therapy; Other chronic debilitating illnesses; Severe renal impairment/oliguria (↑ sensitivity); TPMT or NUDT15 enzyme deficiency (alternative therapy or substantial dose ↓ are required to avoid hematologic adverse events); Rep: Women of reproductive potential; Pedi: ↑ risk of hepatosplenic T-cell lymphoma [HSTCL] in patients with inflammatory bowel disease.

Adverse Reactions/Side Effects
Derm: alopecia, rash. **EENT:** retinopathy. **GI:** anorexia, hepatotoxicity, nausea, vomiting, diarrhea, mucositis, pancreatitis. **Hemat:** anemia, leukopenia, pancytopenia, thrombocytopenia. **MS:** arthralgia. **Neuro:** PROGRESSIVE MULTIFOCAL LEUKOENCEPHALOPATHY. **Resp:** pulmonary edema. **Misc:** MALIGNANCY (including post-transplant lymphoma, HSTCL, and skin cancer), SERUM SICKNESS, chills, fever, Raynaud's phenomenon, retinopathy.

Interactions
Drug-Drug: **Febuxostat** inhibits the metabolism of azathioprine, increasing toxicity; concurrent use not recommended. Additive myelosuppression with **antineoplastics**, **cyclosporine**, and **myelosuppressive agents**. **Allopurinol** inhibits the metabolism of azathioprine, increasing toxicity. Dose of azathioprine should be ↓ to 25–33% of the usual dose when used with allopurinol. May ↓ antibody response to **live-virus vaccines** and ↑ the risk of adverse reactions.
Drug-Natural Products: Concomitant use with **echinacea** and **melatonin** may interfere with immunosuppression.

Route/Dosage

Renal Allograft Rejection Prevention
PO (Adults and Children): 3–5 mg/kg/day initially; maintenance dose 1–3 mg/kg/day.

Rheumatoid Arthritis
PO (Adults and Children): 1 mg/kg/day for 6–8 wk, ↑ by 0.5 mg/kg/day every 4 wk until response or up to 2.5 mg/kg/day, then ↓ by 0.5 mg/kg/day every 4–8 wk to minimal effective dose.

© F.A. Davis Publishing

Inflammatory Bowel Disease (Crohn's Disease or Ulcerative Colitis) (unlabeled use)

PO (Adults and Children): 50 mg once daily; may ↑ by 25 mg/day every 1–2 wk as tolerated to target dose of 2–3 mg/kg/day.

Availability (generic available)

Tablets: 50 mg, 75 mg, 100 mg.

NURSING IMPLICATIONS

Assessment

- Assess for infection (vital signs, sputum, urine, stool, WBC) during therapy.
- Monitor intake and output and daily weight. Decreased urine output may lead to toxicity with this medication.
- **Rheumatoid Arthritis:** Assess range of motion; degree of swelling, pain, and strength in affected joints; and ability to perform activities of daily living before and periodically during therapy.
- ***Lab Test Considerations:*** Monitor renal, hepatic, and hematologic functions before beginning therapy, weekly during the 1st mo, bimonthly for the next 2–3 mo, and monthly thereafter.
- Leukocyte count of <3000 or platelet count of <100,000/mm^3 may necessitate a reduction in dose or temporary discontinuation.
- ↓ in hemoglobin may indicate bone marrow suppression.
- Hepatotoxicity may be manifested by ↑ alkaline phosphatase, bilirubin, AST, ALT, and amylase concentrations. Usually occurs within 6 mo of transplant, rarely with rheumatoid arthritis, and is reversible on discontinuation of azathioprine.
- May ↓ serum and urine uric acid and plasma albumin.

Implementation

- Do not confuse azathioprine with azacitidine.
- Protect transplant patients from staff members and visitors who may carry infection. Maintain protective isolation as indicated.
- **PO:** May be administered with or after meals or in divided doses to minimize nausea.

Patient/Family Teaching

- Instruct patient to take azathioprine as directed. If a dose is missed on a once-daily regimen, omit dose; if on several-times-a-day dosing, take as soon as possible or double next dose. Consult health care professional if more than 1 dose is missed or if vomiting occurs shortly after dose is taken. Do not discontinue without consulting health care professional.
- Advise patient to report unusual tiredness or weakness; cough or hoarseness; fever or chills; lower back or side pain; painful or difficult urination; severe diarrhea; black, tarry stools; blood in urine; or transplant rejection to health care professional immediately.
- Reinforce the need for lifelong therapy to prevent transplant rejection.
- Inform patient of increased risk of malignancy.
- Instruct patient to notify health care professional of all Rx or OTC medications, vitamins, or herbal products being taken and consult health care professional before taking any new medications or receiving any vaccinations while taking this medication.
- Advise patient to avoid contact with persons with contagious diseases and persons who have recently taken oral poliovirus vaccine or other live viruses.
- Rep: This drug may have teratogenic properties. Advise patient to use contraception during and for at least 4 mo after therapy is completed and to avoid breast feeding during therapy.
- Emphasize the importance of follow-up exams and lab tests.
- **Rheumatoid Arthritis:** Concurrent therapy with salicylates, NSAIDs, or corticosteroids may be necessary. Patient should continue physical therapy and adequate rest. Explain that joint damage will not be reversed; goal is to slow or stop disease process.

Evaluation/Desired Outcomes

- Prevention of transplant rejection.
- Decreased stiffness, pain, and swelling in affected joints in 6–8 wk in rheumatoid arthritis. Therapy is discontinued if no improvement in 12 wk.

azelastine† (a-zel-as-teen)

Astepro Allergy

Classification

Therapeutic: allergy, cold, and cough remedies, antihistamines

† See Appendix B for ophthalmic use

Indications

Seasonal allergic rhinitis. Perennial allergic rhinitis. Temporary relief of nasal congestion, runny nose, sneezing, and itchy nose due to hay fever or other upper respiratory allergies (Astepro Allergy).

Action

Locally antagonizes the effects of histamine at H_1-receptor sites; does not bind to or inactivate histamine.

Therapeutic Effects: Decreased sneezing, nasal rhinitis, pruritus and postnasal drip.

Pharmacokinetics

Absorption: 40% absorbed after intranasal administration.

Distribution: 14.5 L/kg.

Metabolism and Excretion: Most of absorbed azelastine is metabolized by the liver (converted to an active metabolite.

Half-life: 22–25 hr.

© F.A. Davis Publishing

TIME/ACTION PROFILE (relief of symptoms)

ROUTE	ONSET	PEAK	DURATION
Intranasal	rapid	2–3 hr†	12 hr

†Plasma concentration.

Contraindications/Precautions

Contraindicated in: Hypersensitivity.

Use Cautiously in: OB: Safety not established in pregnancy; Lactation: Safety not established in breast feeding; Pedi: Safety not established in children <6 yr (Astepro Allergy) or <6 mo (Astepro).

Adverse Reactions/Side Effects

EENT: epistaxis, nasal burning, pharyngitis, sinusitis, sneezing. **GI:** bitter taste, dry mouth, nausea. **Metab:** weight gain. **MS:** myalgia. **Neuro:** drowsiness, dizziness, dysesthesia, fatigue, headache.

Interactions

Drug-Drug: Additive CNS depression with **CNS depressants**, including **alcohol**, **sedative/hypnotics**, and **opioid analgesics**. Concurrent use of **cimetidine** ↑ blood levels.

Drug-Natural Products: Concomitant use of **kava**, **valerian**, **skullcap**, **chamomile**, or **hops** can ↑ CNS depression.

Route/Dosage

Seasonal Allergic Rhinitis

Intranasal (Adults and Children ≥12 yr): *Generic*— 1–2 sprays/nostril twice daily.
Intranasal (Children 2–11 yr): *Generic*— 1 spray/nostril twice daily.

Perennial Allergic Rhinitis

Intranasal (Adults and Children ≥12 yr): *Generic*— 2 sprays/nostril twice daily.
Intranasal (Children 6 mo–11 yr): *Generic*— 1 spray/nostril twice daily.

Temporary Relief of Symptoms Due to Hay Fever or Other Upper Respiratory Allergies

Intranasal (Adults and Children ≥12 yr): *Astepro Allergy*— 2 sprays/nostril once daily *or* 1–2 sprays/nostril twice daily.
Intranasal (Children 6–11 yr): *Astepro Allergy*— 1 spray/nostril twice daily.

Availability (generic available)

Nasal spray: 137 mcg/spray (200 sprays/bottle). **Nasal spray (Astepro Allergy):** 205.5 mcg/spray (60–200 sprays/bottle) OTC. ***In combination with:*** fluticasone (Dymista); see Appendix N).

NURSING IMPLICATIONS

Assessment

- Assess allergy symptoms (rhinitis, sneezing, conjunctivitis, hives) before and periodically during therapy.
- Assess lung sounds and character of bronchial secretions. Maintain fluid intake of 1500–2000 mL/day to decrease viscosity of secretions.
- ***Lab Test Considerations:*** May cause false-negative allergy skin testing. Discontinue antihistamines at least 72 hr before testing.

Implementation

- **Intranasal:** Before initial use, remove the safety clip on the bottle and prime the delivery system with 6 sprays or until a fine mist appears. When ≥3 days have elapsed since last use, re-prime the unit with 2 sprays or until a fine mist appears.

Patient/Family Teaching

- Instruct patient in the proper technique for administration of azelastine. Keep head tilted downward toward toes during instillation of intranasal spray to decrease bitter taste.
- May cause drowsiness. Caution patient to avoid driving or other activities requiring alertness until effects of the medication are known.
- Advise patient to avoid taking alcohol or other CNS depressants concurrently with this drug.
- Advise patient that good oral hygiene, frequent rinsing of the mouth, and sugarless gum or candy may help relieve dry mouth. Patient should notify dentist if dry mouth persists >2 wk.
- Instruct patient to notify health care professional of all Rx or OTC medications, vitamins, or herbal products being taken and consult health care professional before taking any new medications.
- Advise female patients to notify health care professional if pregnancy is planned or suspected or if breast feeding.
- Instruct patient to contact health care professional if symptoms persist.

Evaluation/Desired Outcomes

- Decreased sneezing, nasal rhinitis, pruritus and post-nasal drip.

azilsartan, See ANGIOTENSIN II RECEPTOR ANTAGONISTS.

azithromycin

(aye-**zith**-roe-mye-sin)
Zithromax, ~~Zmax~~

Classification
Therapeutic: agents for atypical mycobacterium, anti-infectives
Pharmacologic: macrolides

© F.A. Davis Publishing

Indications

Treatment of the following infections due to susceptible organisms: Upper respiratory tract infections, including streptococcal pharyngitis, acute bacterial exacerbations of chronic bronchitis and tonsillitis, Lower respiratory tract infections, including bronchitis and pneumonia, Acute otitis media, Skin and skin structure infections, Nongonococcal urethritis, cervicitis, gonorrhea, and chancroid. Prevention of disseminated *Mycobacterium avium* complex (MAC) infection in patients with advanced HIV infection. **Unlabeled Use:** Prevention of bacterial endocarditis. Treatment of cystic fibrosis lung disease. Treatment and post-exposure prophylaxis of pertussis in infants.

Action

Inhibits protein synthesis at the level of the 50S bacterial ribosome. **Therapeutic Effects:** Bacteriostatic action against susceptible bacteria. **Spectrum:** Active against the following gram-positive aerobic bacteria: *Staphylococcus aureus*, *Streptococcus pneumoniae*, *S. pyogenes* (group A strep). Active against these gram-negative aerobic bacteria: *Haemophilus influenzae*, *Moraxella catarrhalis*, *Neisseria gonorrhoeae*. Also active against: *Bordetella pertussis*, *Mycoplasma*, *Legionella*, *Chlamydia pneumoniae*, *Ureaplasma urealyticum*, *Borrelia burgdorferi*, *M. avium*. Not active against methicillin-resistant *S. aureus*.

Pharmacokinetics

Absorption: Rapidly absorbed (40%) after oral administration. IV administration results in complete bioavailability.

Distribution: Widely distributed to body tissues and fluids. Intracellular and tissue levels exceed those in serum; low CSF levels.

Protein Binding: 7–51%.

Metabolism and Excretion: Mostly excreted unchanged in bile; 4.5% excreted unchanged in urine.

Half-life: 11–14 hr after single dose; 2–4 days after several doses.

TIME/ACTION PROFILE (serum)

ROUTE	ONSET	PEAK	DURATION
PO	rapid	2.5–3.2 hr	24 hr
IV	rapid	end of infusion	24 hr

Contraindications/Precautions

Contraindicated in: Hypersensitivity to azithromycin, erythromycin, or other macrolide anti-infectives; History of cholestatic jaundice or hepatic dysfunction with prior use of azithromycin; QT interval prolongation, hypokalemia, hypomagnesemia, or bradycardia; Concurrent use of quinidine, procainamide, dofetilide, amiodarone, or sotalol.

Use Cautiously in: Severe hepatic impairment (dose adjustment may be required); Severe renal impairment (CCr <10 mL/min); Myasthenia gravis (may worsen symptoms); Geri: May have ↑ risk of QT interval prolongation; OB: Use only if potential maternal benefit justifies potential fetal risk; Lactation: Use during breast feeding only if potential maternal benefit justifies potential risk to infant; Pedi: Neonates (↑ risk of infantile hypertrophic pyloric stenosis at up to 42 days of life).

Adverse Reactions/Side Effects

CV: TORSADES DE POINTES, chest pain, hypotension, palpitations, QT interval prolongation. **Derm:** ACUTE GENERALIZED EXANTHEMATOUS PUSTULOSIS, DRUG REACTION WITH EOSINOPHILIA AND SYSTEMIC SYMPTOMS (DRESS), STEVENS-JOHNSON SYNDROME, TOXIC EPIDERMAL NECROLYSIS, photosensitivity, rash. **EENT:** ototoxicity. **F and E:** hyperkalemia. **GI:** HEPATOTOXICITY, CLOSTRIDIOIDES DIFFICILE-ASSOCIATED DIARRHEA (CDAD), abdominal pain, diarrhea, nausea, cholestatic jaundice, ↑ liver enzymes, dyspepsia, flatulence, melena, oral candidiasis, pyloric stenosis. **GU:** nephritis, vaginitis. **Hemat:** anemia, leukopenia, thrombocytopenia. **Neuro:** dizziness, seizures, drowsiness, fatigue, headache. **Misc:** HYPERSENSITIVITY REACTIONS (including anaphylaxis and angioedema).

Interactions

Drug-Drug: Quinidine, **procainamide**, **dofetilide**, **sotalol**, and **amiodarone** may ↑ risk of QT interval prolongation; concurrent use should be avoided. **Aluminum-** and **magnesium-containing antacids** ↓ peak levels. **Nelfinavir** ↑ levels (monitor carefully); azithromycin also ↓ nelfinavir levels. **Efavirenz** ↑ levels. May ↑ the effects and risk of toxicity of **warfarin** and **zidovudine**. Other macrolide anti-infectives have been known to ↑ levels and effects of **digoxin**, **theophylline**, **ergotamine**, **dihydroergotamine**, **triazolam**, **carbamazepine**, **cyclosporine**, **tacrolimus**, and **phenytoin**; careful monitoring of concurrent use is recommended.

Route/Dosage

Most Respiratory and Skin Infections

PO (Adults): 500 mg on 1st day, then 250 mg/day for 4 more days (total dose of 1.5 g); *Acute bacterial sinusitis*— 500 mg once daily for 3 days.

PO (Children ≥ 6 mo): *Pneumonia/Pertussis*— 10 mg/kg (not to exceed 500 mg/dose) on 1st day, then 5 mg/kg once daily (not to exceed 250 mg/dose) for 4 more days. *Pharyngitis/tonsilitis*— 12 mg/kg once daily for 5 days (not to exceed 500 mg/dose); *Acute bacterial sinusitis*— 10 mg/kg once daily for 3 days.

PO (Neonates): *Pertussis, treatment and post-exposure prophylaxis*— 10 mg/kg once daily for 5 days.

Otitis Media

PO (Children ≥6 mo): 30 mg/kg single dose (not to exceed 1500 mg/dose) *or* 10 mg/kg once daily (not to exceed 500 mg/dose) for 3 days *or* 10 mg/kg (not to exceed 500 mg/dose) on 1st day, then 5 mg/kg once daily (not to exceed 250 mg/dose) for 4 more days.

© F.A. Davis Publishing

Acute Bacterial Exacerbations of Chronic Bronchitis

PO (Adults): 500 mg on 1st day, then 250 mg once daily for 4 more days (total dose of 1.5 g) *or* 500 mg once daily for 3 days.

Community-Acquired Pneumonia

IV, PO (Adults): *More severe*— 500 mg IV every 24 hr for at least 2 doses, then 500 mg PO every 24 hr for a total of 7–10 days; *Less severe*— 500 mg PO, then 250 mg/day PO for 4 more days.
PO (Children >6 mo): 10 mg/kg on 1st day, then 5 mg/kg once daily for 4 more days.

Pelvic Inflammatory Disease

IV, PO (Adults): 500 mg IV every 24 hr for 1–2 days, then 250 mg PO every 24 hr for a total of 7 days.

Endocarditis Prophylaxis

PO (Adults): 500 mg 1 hr before procedure.
PO (Children): 15 mg/kg 1 hr before procedure.

Nongonococcal Urethritis, Cervicitis, Chancroid, Chlamydia

PO (Adults): Single 1-g dose.
PO (Children): *Chancroid:* Single 20-mg/kg dose (not to exceed 1000 mg/dose). *Urethritis or cervicitis:* Single 10-mg/kg dose (not >1000 mg/dose).

Gonorrhea

PO (Adults): Single 2-g dose.

Prevention of Disseminated MAC Infection

PO (Adults): 1.2 g once weekly (alone or with rifabutin).
PO (Children): 5 mg/kg once daily (not >250 mg/dose) or 20 mg/kg (not >1200 mg/dose) once weekly (alone or with rifabutin).

Cystic Fibrosis

PO (Children ≥6 yrs, ≥40 kg): 500 mg every Monday, Wednesday, and Friday.
PO (Children ≥6 yrs, 25 kg to <40 kg): 250 mg every Monday, Wednesday, and Friday.

Availability (generic available)

Powder for injection (requires reconstitution and dilution): 500 mg/vial. **Powder for oral suspension (cherry and banana flavor) (requires reconstitution):** 1 g/pkt. **Cost:** *Generic*— $72.45/3 pkts. **Powder for oral suspension (cherry, creme de vanilla, and banana flavor) (requires reconstitution):** 100 mg/5 mL, 200 mg/5 mL. **Cost:** *Generic*— 100 mg/5 mL $34.88/15 mL, 200 mg/5 mL $34.88/22.5 mL. **Tablets:** 250 mg, 500 mg, 600 mg. **Cost:** *Generic*— 250 mg $8.82/6, 500 mg $10.03/3, 600 mg $104.62/30.

NURSING IMPLICATIONS

Assessment

- Assess patient for infection (vital signs; appearance of wound, sputum, urine, and stool; WBC) at beginning of and throughout therapy.
- Obtain specimens for culture and sensitivity before initiating therapy. First dose may be given before receiving results.
- Observe for signs and symptoms of anaphylaxis (rash, pruritus, laryngeal edema, wheezing). Notify health care professional immediately if these occur.
- Assess patient for skin rash frequently during therapy. Discontinue azithromycin at first sign of rash; may be life-threatening. Stevens-Johnson syndrome or toxic epidermal necrolysis may develop. Treat symptomatically; may recur once treatment is stopped.
- ***Lab Test Considerations:*** May cause ↑ serum bilirubin, AST, ALT, LDH, and alkaline phosphatase concentrations.
- May cause ↑ creatine phosphokinase, potassium, prothrombin time, BUN, serum creatinine, and blood glucose concentrations.
- May occasionally cause ↓ WBC and platelet count.

Implementation

- **PO:** Administer 1 hr before or 2 hr after meals.
- For administration of single 1-g packet, thoroughly mix entire contents of packet with 2 oz (60 mL) of water. Drink entire contents immediately; add an additional 2 oz of water, mix and drink to assure complete consumption of dose. Do not use the single packet to administer doses other than 1000 mg of azithromycin. Pedi: 1-g packet is not for pediatric use.

IV Administration

- **Intermittent Infusion:** ***Dilution:*** Reconstitute each 500-mg vial with 4.8 mL of sterile water for injection to achieve a concentration of 100 mg/mL. Reconstituted solution is stable for 24 hr at room temperature. Further dilute the 500-mg dose in 250 mL or 500 mL of 0.9% NaCl, 0.45% NaCl, D5W, LR, D5/0.45% NaCl, or D5/LR. Infusion is stable for 24 hr at room temperature or for 7 days if refrigerated. ***Concentration:*** Final concentration of infusion is 1–2 mg/mL. ***Rate:*** Administer the 1-mg/mL solution over 3 hr or the 2-mg/mL solution over 1 hr. Do not administer as a bolus.
- **Y-Site Compatibility:** acyclovir, alemtuzumab, alfentanil, aminocaproic acid, aminophylline, amphotericin B lipid complex, amphotericin B liposome, ampicillin, ampicillin/sulbactam, anidulafungin, argatroban, arsenic trioxide, atracurium, bivalirudin, bleomycin, bumetanide, buprenorphine, butorphanol, calcium chloride, calcium gluconate, cangrelor, carboplatin, carmustine, cefazolin, cefepime,

© F.A. Davis Publishing

cefotetan, cefoxitin, ceftaroline, ceftazidime, cisatracurium, cisplatin, cyclophosphamide, cyclosporine, cytarabine, dacarbazine, daptomycin, daunorubicin, dexamethasone, dexmedetomidine, dexrazoxane, digoxin, diltiazem, diphenhydramine, dobutamine, docetaxel, dopamine, doxorubicin liposome, doxycycline, droperidol, enalaprilat, ephedrine, epinephrine, eptifibatide, ertapenem, esmolol, etoposide, etoposide phosphate, fenoldopam, fluconazole, fluorouracil, foscarnet, fosphenytoin, ganciclovir, gemcitabine, granisetron, haloperidol, heparin, hetastarch, hydrocortisone, hydromorphone, idarubicin, ifosfamide, irinotecan, isoproterenol, labetalol, leucovorin, lidocaine, linezolid, lorazepam, magnesium sulfate, mannitol, meperidine, meropenem, mesna, methohexital, methotrexate, methylprednisolone, metoclopramide, milrinone, nalbuphine, naloxone, nitroglycerin, nitroprusside, octreotide, ondansetron, oxaliplatin, oxytocin, paclitaxel, palonosetron, pamidronate, pancuronium, pantoprazole, pemetrexed, pentobarbital, phenobarbital, phenylephrine, potassium acetate, potassium phosphates, procainamide, prochlorperazine, promethazine, propranolol, remifentanil, rocuronium, sodium acetate, sodium bicarbonate, sodium phosphates, succinylcholine, sufentanil, tacrolimus, telavancin, thiotepa, tigecycline, tirofiban, trimethoprim/sulfamethoxazole, vancomycin, vasopressin, vecuronium, verapamil, vincristine, voriconazole, zidovudine, zoledronic acid.

- **Y-Site Incompatibility:** amiodarone, amphotericin B deoxycholate, chlorpromazine, diazepam, doxorubicin, epirubicin, midazolam, mitoxantrone, mycophenolate, nicardipine, pentamidine, phenytoin, quinupristin/dalfopristin, thiopental.

Patient/Family Teaching

- Instruct patients to take medication as directed and to finish the drug completely, even if they are feeling better. Take missed doses as soon as possible unless almost time for next dose; do not double doses. Advise patients that sharing of this medication may be dangerous.
- Instruct patient not to take azithromycin with food or antacids.
- May cause drowsiness and dizziness. Caution patient to avoid driving or other activities requiring alertness until response to medication is known.
- Advise patient to use sunscreen and protective clothing to prevent photosensitivity reactions.
- Advise patient to report symptoms of chest pain, palpitations, yellowing of skin or eyes, or signs of superinfection (black, furry overgrowth on the tongue; vaginal itching or discharge; loose or foul-smelling stools) or rash.
- Instruct patient to notify health care professional if fever and diarrhea develop, especially if stool contains blood, pus, or mucus. Advise patient not to treat diarrhea without advice of health care professional.
- Advise patients being treated for nongonococcal urethritis or cervicitis that sexual partners should also be treated.
- Instruct parents, caregivers, or patient to notify health care professional if symptoms do not improve.
- Rep: Advise female patient of reproductive potential to notify health care professional if pregnancy is planned or suspected or if breast feeding. Advise women to monitor breast-fed infant for diarrhea, vomiting, or rash.

Evaluation/Desired Outcomes

- Resolution of the signs and symptoms of infection. Length of time for complete resolution depends on the organism and site of infection.

aztreonam (az-tree-oh-nam)

Azactam, Cayston

Classification

Therapeutic: anti-infectives
Pharmacologic: monobactams

Indications

Treatment of serious gram-negative infections including: Septicemia, Skin and skin structure infections, Intra-abdominal infections, Gynecologic infections, Respiratory tract infections, Urinary tract infections. Useful for treatment of multi-resistant strains of some bacteria including aerobic gram-negative pathogens. **Inhaln:** To improve respiratory symptoms in cystic fibrosis (CF) patients with *Pseudomonas aeruginosa*.

Action

Binds to the bacterial cell wall membrane, causing cell death. **Therapeutic Effects:** Bactericidal action against susceptible bacteria. **Spectrum:** Displays significant activity against gram-negative aerobic organisms only: *Escherichia coli*, *Serratia*, *Klebsiella oxytoca or pneumoniae*, *Citrobacter*, *Proteus mirabilis*, *Pseudomonas aeruginosa*, *Enterobacter*, *Haemophilus influenzae*. Not active against: *Staphylococcus aureus*, *Enterococcus*, *Bacteroides fragilis*, *Streptococci*.

Pharmacokinetics

Absorption: Well absorbed following IM administration. Low absorption follows administration by inhalation.
Distribution: Widely distributed. Crosses the placenta and enters breast milk in low concentrations. High concentrations achieved in sputum with inhalation.
Protein Binding: 56%.
Metabolism and Excretion: 60–70% excreted unchanged by the kidneys. 10% of inhaled dose excreted unchanged in urine. Small amounts metabolized by the liver.

© F.A. Davis Publishing

Half-life: Adults: 1.5–2 hr; Children: 1.7 hr; Neonates: 2.4–9 hr (↑ in renal impairment).

TIME/ACTION PROFILE (blood levels)

ROUTE	ONSET	PEAK	DURATION
IM	rapid	60 min	6–8 hr
IV	rapid	end of infusion	6–8 hr
Inhaln	rapid	unknown	Several hr

Contraindications/Precautions

Contraindicated in: Hypersensitivity.

Use Cautiously in: Renal impairment (dosage ↓ required if CCr 30 mL/min or less); Cross-sensitivity with penicillins or cephalosporins may occur rarely. Has been used safely in patients with a history of penicillin or cephalosporin allergy; Patients with FEV_1 <25% or >75% predicted, or patients colonized with *Burkholderia cepacia* (safety and effectiveness not established); OB, Lactation: Safety of IV formulation not established; systemic absorption of inhalation expected to be minimal; Pedi: Children <7 yr (inhalation) (safety and effectiveness not established); Geri: Consider age-related ↓ in renal function.

Adverse Reactions/Side Effects

EENT: nasal congestion (inhalation), nasopharyngeal pain (inhalation). **CV:** chest discomfort (inhalation). **GI:** CLOSTRIDIOIDES DIFFICILE-ASSOCIATED DIARRHEA (CDAD), abdominal pain (inhalation), altered taste, diarrhea, nausea, vomiting. **Neuro:** SEIZURES. **Resp:** cough (inhalation), wheezing (inhalation), bronchospasm (inhalation). **Derm:** rash. **Local:** pain at IM site, phlebitis at IV site. **Misc:** HYPERSENSITIVITY REACTIONS (including anaphylaxis) , fever (inhalation), superinfection.

Interactions

Drug-Drug: Serum levels may be ↑ by **furosemide** or **probenecid**.

Route/Dosage

IM, IV (Adults): *Moderately severe infections*— 1–2 g every 8–12 hr; *severe or life-threatening infections (including those due to Pseudomonas aeruginosa)*— 2 g every 6–8 hr; *urinary tract infections*— 0.5–1 g every 8–12 hr.

IV (Children 1 mo–16 yr): *Mild to moderate infections*— 30 mg/kg every 8 hr; *moderate to severe infections*— 30 mg/kg every 6–8 hr; *cystic fibrosis*— 50 mg/kg every 6–8 hr.

IV (Neonates >2 kg): 30 mg/kg every 6–8 hr.

IV (Neonates ≤2 kg): 30 mg/kg every 8–12 hr.

Inhaln (Adults and Children >7 yr): 75 mg three times daily for 28 days.

Renal Impairment

IV (Adults): *CCr 10–30 mL/min*— 1–2 g initially, then 50% of usual dosage at usual interval; *CCr <10 mL/min*— 500 mg–2 g initially, then 25% of usual dosage at usual interval (½ of initial dose should also be given after each hemodialysis session).

Availability (generic available)

Injection: 500 mg/vial, 1 g/vial, 2 g/vial. **Lyophilized powder for use with diluent provided in Altera Nebulizer System only (Cayston):** 75 mg/vial with 1 mL ampule of diluent (0.17% sodium chloride).

NURSING IMPLICATIONS

Assessment

- Assess for infection (vital signs; wound appearance, sputum, urine, and stool; WBC) at beginning of and throughout therapy.
- Obtain a history before initiating therapy to determine previous use of and reactions to penicillins and cephalosporins. Patients allergic to these drugs may exhibit hypersensitivity reactions to aztreonam. However, aztreonam can often be used in these patients.
- Obtain specimens for culture and sensitivity before initiating therapy. First dose may be given before receiving results.
- Assess respiratory status prior to and following inhalation therapy.
- Observe for signs and symptoms of anaphylaxis (rash, pruritus, laryngeal edema, wheezing). Notify the health care professional immediately if these occur.
- Monitor bowel function. Report diarrhea, abdominal cramping, fever, and bloody stools to health care professional promptly as a sign of *Clostridioides difficile*-associated diarrhea (CDAD). May begin up to several wk following cessation of therapy.
- ***Lab Test Considerations:*** May cause ↑ in AST, ALT, alkaline phosphatase, LDH, and serum creatinine. May cause ↑ prothrombin and partial thromboplastin times, and positive Coombs' test.

Implementation

- After adding diluent to vial, shake immediately and vigorously. Not for multidose use; discard unused solution. IV route is recommended if single dose >1 g or for severe or life-threatening infection.
- **IM:** Use 15-mL vial and dilute each gram of aztreonam with at least 3 mL of 0.9% NaCl, or sterile or bacteriostatic water for injection. Stable at room temperature for 48 hr or 7 days if refrigerated.
- Administer into large, well-developed muscle.

IV Administration

- **IV Push:** Reconstitute 15 mL vial with 6–10 mL of sterile water for injection. ***Rate:*** Administer slowly over 3–5 min by direct injection or into tubing of a compatible solution.
- **Intermittent Infusion:** Reconstitute 15 mL vial with 3 mL of sterile water for injection. ***Dilution:*** Dilute further with 0.9% NaCl, Ringer's or LR, D5W,

© F.A. Davis Publishing

D10W, D5/0.9% NaCl, D5/0.45% NaCl, D5/0.2% NaCl, D5/LR, or sodium lactate. ***Concentration:*** Do not exceed 50 mg/mL. Solution is stable for 48 hr at room temperature and 7 days if refrigerated. Solutions range from colorless to light, straw yellow or may develop a pink tint upon standing; this does not affect potency. ***Rate:*** Infuse over 20–60 min.

- **Y-Site Compatibility:** alemtuzumab, alfentanil, allopurinol, amifostine, amikacin, aminophylline, amphotericin B lipid complex, anidulafungin, argatroban, ascorbic acid, atracurium, atropine, benztropine, bivalirudin, bleomycin, bumetanide, buprenorphine, butorphanol, calcium chloride, calcium gluconate, carboplatin, carmustine, caspofungin, cefazolin, cefepime, cefotaxime, cefotetan, cefoxitin, ceftazidime, ceftriaxone, cefuroxime, chloramphenicol, ciprofloxacin, cisatracurium, cisplatin, clindamycin, cyanocobalamin, cyclophosphamide, cyclosporine, cytarabine, dacarbazine, dactinomycin, daptomycin, dexamethasone sodium phosphate, dexmedetomidine, digoxin, diltiazem, dobutamine, docetaxel, dopamine, doxorubicin hydrochloride, doxorubicin liposome, doxycycline, droperidol, enalaprilat, ephedrine, epinephrine, epirubicin, epoetin alfa, eptifibatide, ertapenem, esmolol, etoposide, etoposide phosphate, famotidine, fenoldopam, fentanyl, filgrastim, floxuridine, fluconazole, fludarabine, fluorouracil, folic acid, foscarnet, furosemide, gemcitabine, gentamicin, glycopyrrolate, granisetron, heparin, hetastarch, hydrocortisone, hydromorphone, idarubicin, ifosfamide, insulin, irinotecan, isoproterenol, ketorolac, labetalol, leucovorin calcium, levofloxacin, lidocaine, linezolid, magnesium sulfate, mannitol, melphalan, meperidine, mesna, methotrexate, methylprednisolone sodium succinate, metoclopramide, metoprolol, midazolam, milrinone, morphine, multivitamins, nafcillin, nalbuphine, naloxone, nicardipine, nitroglycerin, nitroprusside, norepinephrine, octreotide, ondansetron, oxacillin, oxaliplatin, oxytocin, paclitaxel, palonosetron, pamidronate, pancuronium, pemetrexed, penicillin G, phenobarbital, phentolamine, phenylephrine, phytonadione, piperacillin/tazobactam, potassium acetate, potassium chloride, procainamide, propofol, propranolol, protamine, pyridoxine, remifentanil, rituximab, rocuronium, sargramostim, sodium acetate, sodium bicarbonate, succinylcholine, sufentanil, tacrolimus, theophylline, thiamine, thiotepa, tigecycline, tirofiban, tobramycin, vasopressin, vecuronium, verapamil, vinblastine, vincristine, vinorelbine, voriconazole, zidovudine, zoledronic acid.
- **Y-Site Incompatibility:** acyclovir, amphotericin B deoxycholate, amphotericin B liposome, azathioprine, azithromycin, chlorpromazine, dantrolene, daunorubicin hydrochloride, diazepam, diazoxide, erythromycin, ganciclovir, indomethacin, lorazepam, metronidazole, mitomycin, mitoxantrone, mycophenolate, pantoprazole, papaverine, pentamidine, pentobarbital, phenytoin, prochlorperazine, streptozocin, trastuzumab.
- **Inhaln:** Open glass aztreonam vial by removing metal ring and pulling tab, and removing gray rubber stopper. Twist tip of diluent ampule and squeeze contents into glass aztreonam vial. Replace rubber stopper and swirl gently until contents are completely dissolved. Administer immediately after reconstitution using *Altera Nebulizer System*. Pour reconstituted solution into handset of nebulizer. Turn unit on. Place mouthpiece into mouth and breathe normally only through mouth. Administration takes 2–3 min. Do not use other nebulizers or mix with other medications. Do not administer IV or IM. Refrigerate aztreonam and diluent; may be stored at room temperature for up to 28 days. Protect from light.
- Administer short-acting bronchodilator between 15 min and 4 hr or long-acting bronchodilator between 30 min and 12 hr prior to treatment. If taking multiple inhaled therapies, administer in the following order: bronchodilator, mucolytic, and lastly, aztreonam.

Patient/Family Teaching

- Advise patient to report the signs of superinfection (furry overgrowth on the tongue, vaginal itching or discharge, loose or foul-smelling stools) and allergy.
- Instruct patient to notify health care professional if fever and diarrhea develop, especially if stool contains blood, pus, or mucus. Advise patient not to treat diarrhea without consulting health care professional.
- Advise patient to notify health care professional if new or worsening symptoms occur or if signs or symptoms of anaphylaxis occur.
- Rep: Advise females of reproductive potential to notify health care professional if pregnancy is planned or suspected or if breast feeding. Patients receiving IV aztreonam should consider temporarily discontinuing breast feeding or using formula during therapy.
- **Inhaln:** Instruct patient to use aztreonam as directed for the full 28-day course, even if feeling better. If a dose is missed, take all 3 daily doses, as long as doses are at least 4 hr apart. Skipping doses or not completing full course of therapy may decrease effectiveness and increase likelihood of bacterial resistance not treatable in the future. Inform patient of the importance of using a bronchodilator prior to treatment and in use and cleaning of nebulizer. Advise patient to read *Patient Information* before starting therapy.

Evaluation/Desired Outcomes

- Resolution of signs and symptoms of infection. Length of time for complete resolution depends on the organism and site of infection.
- Improvement in respiratory symptoms in patients with cystic fibrosis.

© F.A. Davis Publishing

baclofen (bak-loe-fen)

Gablofen, Lioresal, Ozobax

Classification

Therapeutic: antispasticity agents, skeletal muscle relaxants (centrally acting)

Indications

PO: Treatment of reversible spasticity due to multiple sclerosis or spinal cord lesions. **IT:** Treatment of severe spasticity of cerebral or spinal origin (should be reserved for patients who do not respond or are intolerant to oral baclofen) (should wait at least one yr in patients with traumatic brain injury before considering therapy). **Unlabeled Use:** Management of pain in trigeminal neuralgia.

Action

Inhibits reflexes at the spinal level. **Therapeutic Effects:** Decreased muscle spasticity; bowel and bladder function may also be improved.

Pharmacokinetics

Absorption: Well absorbed after oral administration.
Distribution: Widely distributed; crosses the placenta.
Protein Binding: 30%.
Metabolism and Excretion: 70–80% eliminated unchanged by the kidneys.
Half-life: 2.5–4 hr.

TIME/ACTION PROFILE (effects on spasticity)

ROUTE	ONSET	PEAK	DURATION
PO	hr–wk	unknown	unknown
IT	0.5–1 hr	4 hr	4–8 hr

Contraindications/Precautions

Contraindicated in: Hypersensitivity.
Use Cautiously in: Patients in whom spasticity maintains posture and balance; Patients with epilepsy (may ↓ seizure threshold); Renal impairment (↓ dose may be required); OB: Safety not established in pregnancy; Lactation: Use while breast feeding only if potential maternal benefit justifies potential risk to infant; Pedi: Children <4 yr (intrathecal) (safety not established); Geri: ↑ risk of CNS side effects in older adults.

Adverse Reactions/Side Effects

CV: edema, hypotension. **Derm:** pruritus, rash. **EENT:** nasal congestion, tinnitus. **GI:** nausea, constipation. **GU:** frequency. **Metab:** hyperglycemia, ↑ weight. **Neuro:** ataxia, SEIZURES (IT), dizziness, drowsiness, fatigue, weakness, confusion, depression, headache, insomnia. **Misc:** hypersensitivity reactions, sweating.

Interactions

Drug-Drug: ↑ CNS depression with other **CNS depressants** including **alcohol**, **antihistamines**, **opioid analgesics**, and **sedative/hypnotics**. Use with **MAO inhibitors** may lead to ↑ CNS depression or hypotension.
Drug-Natural Products: Concomitant use of **kava-kava**, **valerian**, or **chamomile** can ↑ CNS depression.

Route/Dosage

PO (Adults): 5 mg 3 times daily. May increase every 3 days by 5 mg/dose up to 80 mg/day (some patients may have a better response to 4 divided doses).
PO (Children ≥8 yr): 30–40 mg daily divided every 8 hr; titrate to a maximum of 120 mg/day.
PO (Children 2–7 yr): 20–30 mg daily divided every 8 hr; titrate to a maximum of 60 mg/day.
PO (Children <2 yr): 10–20 mg daily divided every 8 hr; titrate to a maximum of 40 mg/day.
IT (Adults): 100–800 mcg/day infusion; dose is determined by response during screening phase.
IT (Children ≥4 yr): 25–1200 mcg/day infusion (average 275 mcg/day); dose is determined by response during screening phase.

Availability (generic available)

Oral solution (grape flavor): 1 mg/mL. **Solution for intrathecal injection:** 50 mcg/mL, 500 mcg/mL, 1000 mcg/mL, 2000 mcg/mL. **Tablets:** 5 mg, 10 mg, 20 mg. **Cost:** *Generic*— 10 mg $10.83/100, 20 mg $11.04/100.

NURSING IMPLICATIONS

Assessment

- Assess muscle spasticity before and periodically during therapy.
- Observe patient for drowsiness, dizziness, or ataxia. May be alleviated by a change in dose.
- **IT:** Monitor patient closely during test dose and titration. Resuscitative equipment should be immediately available for life-threatening or intolerable side effects.
- ***Lab Test Considerations:*** May cause ↑ in serum glucose, alkaline phosphatase, AST, and ALT levels.

Implementation

- **PO:** Administer with milk or food to minimize gastric irritation.
- **IT:** For *screening phase,* dilute for a concentration of 50 mcg/mL with sterile preservative-free NaCl for injection. Test dose should be administered over at least 1 min. Observe patient for a significant decrease in muscle tone or frequency or severity of spasm. If response is inadequate, 2 additional test doses, each 24 hr apart, 75 mcg/1.5 mL and 100 mcg/2 mL respectively, may be administered. Pa-

© F.A. Davis Publishing

tients with an inadequate response should not receive chronic IT therapy. Avoid use of prefilled syringes for filling reservoir of pump; prefilled syringes are not sterile.
- Dose titration for implantable IT pumps is based on patient response. If no substantive response after dose increase, check pump function and catheter patency.

Patient/Family Teaching

- Instruct patient to take baclofen as directed. Take a missed dose within 1 hr; do not double doses. Caution patient to avoid abrupt withdrawal of this medication; may precipitate an acute withdrawal reaction (hallucinations, increased spasticity, seizures, mental changes, restlessness). Discontinue baclofen gradually over 2 wk or more.
- May cause dizziness and drowsiness. Advise patient to avoid driving or other activities requiring alertness until response to drug is known.
- Instruct patient to change positions slowly to minimize orthostatic hypotension.
- Advise patient to avoid concurrent use of alcohol or other CNS depressants while taking this medication.
- Instruct patient to notify health care professional if frequent urge to urinate or painful urination, constipation, nausea, headache, insomnia, tinnitus, depression, or confusion persists.
- Advise patient to report signs and symptoms of hypersensitivity (rash, itching) promptly.
- Rep: Advise female patient of reproductive potential to notify health care professional if pregnancy is planned or suspected or if breast feeding. Inform patient that use during pregnancy or breast feeding may cause withdrawal symptoms (increased muscle tone, tremor, jitteriness, seizures) in infants starting hrs to days after delivery.
- **IT:** Caution patient and caregiver not to discontinue IT therapy abruptly. May result in fever, mental status changes, exaggerated rebound spasticity, and muscle rigidity. Advise patient not to miss scheduled refill appointments and to notify health care professional promptly if signs of withdrawal occur.

Evaluation/Desired Outcomes

- Decrease in muscle spasticity and associated musculoskeletal pain with an increased ability to perform activities of daily living.
- Decreased pain in patients with trigeminal neuralgia. May take wk to obtain optimal effect.

baloxavir (ba-lox-a-veer)

Xofluza

Classification

Therapeutic: antivirals
Pharmacologic: endonuclease inhibitors

Indications

Treatment of acute uncomplicated influenza in patients who have been symptomatic for ≤48 hr and who are otherwise healthy or at high risk of developing influenza-related complications. Post-exposure prophylaxis of influenza following contact with an individual who has influenza.

Action

Inhibits the endonuclease activity of the polymerase acidic protein in the viral RNA polymerase complex that is required for viral gene transcription, thereby resulting in inhibition of influenza virus replication. **Therapeutic Effects:** Reduced duration of flu-related symptoms.

Pharmacokinetics

Absorption: Administered as a prodrug (baloxavir marboxil) which is rapidly absorbed from the GI tract and converted by the liver to the active form, baloxavir.
Distribution: Extensively distributed to tissues.
Protein Binding: 93–94%.
Metabolism and Excretion: Rapidly metabolized by the liver by UGT1A3 to baloxavir, the active metabolite. Primarily excreted in feces (80%); 15% excreted in urine (3% as active metabolite).
Half-life: 79 hr.

TIME/ACTION PROFILE (plasma concentrations)

ROUTE	ONSET	PEAK	DURATION
PO	unknown	4 hr	unknown

Contraindications/Precautions

Contraindicated in: Hypersensitivity.
Use Cautiously in: OB: Safety not established during pregnancy; Lactation: Safety not established in breast feeding; Pedi: Children <12 yr (safety and effectiveness not established).

Adverse Reactions/Side Effects

EENT: nasopharyngitis. **GI:** diarrhea, nausea.
Neuro: headache. **Misc:** HYPERSENSITIVITY REACTIONS (including anaphylaxis and angioedema).

Interactions

Drug-Drug: Medications containing divalent or trivalent cations, including **calcium**, **iron**, **magnesium**, **selenium**, or **zinc** may ↓ absorption of baloxavir; avoid concurrent use. May ↓ the therapeutic effect of the **live attenuated influenza vaccine**.
Drug-Food: **Calcium** in foods or **dairy products** may ↓ absorption of baloxavir; avoid concurrent administration.

Route/Dosage

PO (Adults and Children ≥12 yr and ≥80 kg): 80 mg as a single dose.
PO (Adults and Children ≥12 yr and <80 kg): 40 mg as a single dose.

© F.A. Davis Publishing

Availability

Oral suspension (strawberry flavor): 40 mg/20 mL. **Tablets:** 40 mg, 80 mg.

NURSING IMPLICATIONS

Assessment

- Monitor influenza symptoms (sudden onset of fever, cough, headache, fatigue, muscular weakness, sore throat). Additional supportive treatment may be indicated to treat symptoms.
- Monitor for signs and symptoms of hypersensitivity reactions (anaphylaxis, angioedema, urticaria, erythema multiforme) following therapy.

Implementation

- Administer as soon as possible after influenza symptom onset or exposure to influenza.
- **PO:** Administer 2 tablets without regard to food within 48 hr of onset of symptoms. Avoid taking dairy products, calcium-fortified beverages, polyvalent cation-containing laxatives, antacids or oral supplements (calcium, iron, magnesium, selenium, or zinc) at same time.
- Suspension may be used for patients with difficulty swallowing or require enteral administration. Gently tap bottom of bottle to loosen granules (white to light yellow) and constitute with 20 mL of drinking water or sterile water. Swirl to mix granules evenly; do not shake. Solution is stable for 10 hr since constitution at room temperature; write expiration time and date on label. Measure dose with oral syringe or measuring cup to ensure correct dose; may require more than 1 bottle. Patient must sit upright when taking baloxavir; do not give while patient is lying down. Do not mix suspension with soft food or another liquid.
- For administration via feeding tube, draw up suspension with an enteral syringe. Flush with 1 mL of water before and after administration.

Patient/Family Teaching

- Instruct patient to take baloxavir as directed. Advise patient to read *Patient Information* before taking baloxavir.
- Advise patient to notify health care professional immediately if signs and symptoms of hypersensitivity reactions (rash, hives, difficulty breathing, swelling of lips, face, and throat) occur.
- Advise patient to consult health care professional before receiving a live attenuated influenza vaccine after taking baloxavir.
- Advise patient that baloxavir is not a substitute for a flu shot. Patients should receive annual flu shot according to immunization guidelines.
- Advise patient to notify health care professional of all Rx or OTC medications, vitamins, or herbal products being taken and to consult health care professional before taking any new medications.
- Rep: Advise females of reproductive potential to notify health care professional if pregnancy is planned or suspected, or if breast feeding. Pregnant women are at higher risk of severe complications from influenza, which may lead to adverse pregnancy and/or fetal outcomes, including maternal death, stillbirth, birth defects, preterm delivery, low birth weight, and small for gestational age.

Evaluation/Desired Outcomes

- Reduced duration or prevention of flu-related symptoms.

baricitinib (bar-i-**sye**-ti-nib)

Olumiant

Classification

Therapeutic: antirheumatics
Pharmacologic: kinase inhibitors

Indications

Moderately to severely active rheumatoid arthritis (RA) in patients who have had an inadequate response/intolerance to ≥1 tumor necrosis factor inhibitor therapies (as monotherapy or in combination with methotrexate or other nonbiologic disease-modifying antirheumatic drugs [DMARDs]) (not to be used with other Janus kinase [JAK] inhibitors, biologic DMARDs or potent immunosuppressants including azathioprine and cyclosporine).

Action

Acts as a JAK inhibitor which prevents the activation of signal transducers and activators of transcription resulting in a reduction in immunoglobulins and C-reactive protein. **Therapeutic Effects:** Improvement in clinical and symptomatic parameters of RA.

Pharmacokinetics

Absorption: Well absorbed following oral administration (80%).
Distribution: Widely distributed into tissues.
Metabolism and Excretion: Metabolized by the liver by CYP3A4; primarily excreted in the urine (69% as unchanged drug); 15% excreted in feces as unchanged drug.
Half-life: 12 hr.

TIME/ACTION PROFILE (clinical improvement)

ROUTE	ONSET	PEAK	DURATION
PO	1 wk	3 mo	unknown

Contraindications/Precautions

Contraindicated in: Active infection; Severe renal impairment (eGFR <30 mL/min/1.73 m²); Severe he-

© F.A. Davis Publishing

patic impairment; Increased risk for thrombosis; Absolute lymphocyte count <500 cells/mm^3, absolute neutrophil count (ANC) <1000 cells/mm^3, or hemoglobin levels <8 g/dL; Lactation: Lactation.

Use Cautiously in: Active malignancy (other than non-melanoma skin cancer); Diverticulitis (↑ risk of GI perforation); Moderate renal impairment (eGFR 30–60 mL/min/m^2) (↓ dose); OB: Use during pregnancy only if potential maternal benefit justifies potential fetal risk; Pedi: Safety and effectiveness not established in children; Geri: Infection risk may be ↑ in older adults.

Adverse Reactions/Side Effects

CV: ARTERIAL THROMBOSIS, DEEP VEIN THROMBOSIS. **GI:** GI PERFORATION, ↑ liver enzymes, nausea. **GU:** ↑ serum creatinine. **Hemat:** anemia, lymphopenia, neutropenia, thrombocytosis. **Metab:** ↑ lipids. **MS:** ↑ creatine kinase. **Resp:** PULMONARY EMBOLISM. **Misc:** HYPERSENSITIVITY REACTIONS (including angioedema), INFECTION (including tuberculosis, bacterial, invasive fungal infections, viral, and other infections due to opportunistic pathogens), MALIGNANCY.

Interactions

Drug-Drug: Organic anion transporter 3 (OAT3) inhibitors, including **probenecid** may ↑ levels and risk of toxicity; avoid concurrent use.

Route/Dosage

PO (Adults): 2 mg once daily. *Concurrent use of OAT3 inhibitors*— 1 mg once daily.

Renal Impairment

PO (Adults): *eGFR 30–60 mL/min/m^2*— 1 mg once daily.

Availability

Film-coated tablets: 1 mg, 2 mg.

NURSING IMPLICATIONS

Assessment

- Assess pain and range of motion before and periodically during therapy.
- Assess for signs of infection (fever, dyspnea, flu-like symptoms, frequent or painful urination, redness or swelling at the site of a wound), including tuberculosis and hepatitis B virus (HBV), prior to and periodically during therapy. Baricitinib is contraindicated in patients with active infection. New infections should be monitored closely; most common are upper respiratory tract infections, bronchitis, and urinary tract infections. Infections may be fatal, especially in patients taking immunosuppressive therapy.
- Assess patient for latent tuberculosis with a tuberculin skin test prior to initiation of therapy. Treatment of latent tuberculosis should be started before therapy with baricitinib.
- Monitor for signs and symptoms of hypersensitivity reactions (hives, rash, pruritus swelling of lips, face or tongue, dyspnea) during therapy. Discontinue baricitinib promptly if symptoms occur.
- ***Lab Test Considerations:*** May cause neutropenia. Monitor ANC at baseline and periodically during therapy. *If ANC ≥1000 cells/mm^3,* maintain dose. *If ANC <1000 cells/mm^3,* hold baricitinib until ANC ≥1000 cells/mm^3.
- May cause lymphopenia. Monitor absolute lymphocyte count (ALC) at baseline and periodically during therapy. *If ALC ≥500 cells/mm^3,* maintain dose. *If ALC <500 cells/mm^3,* hold baricitinib until ALC ≥500 cells/mm^3. Do not start therapy if ALC <500 cells/mm^3.
- May cause anemia. Monitor hemoglobin at baseline and periodically during therapy. *If hemoglobin ≥8 g/dL,* maintain dose. *If hemoglobin <8 g/dL,* hold baricitinib until hemoglobin ≥8 g/dL. Do not start therapy if hemoglobin <8 g/dL.
- Monitor liver enzymes at baseline and periodically during therapy. If elevations in AST or ALT and liver injury is suspected, hold baricitinib until cause determined.
- May cause elevations in serum lipids. Monitor total cholesterol, low-density lipoprotein (LDL) cholesterol, and high-density lipoprotein (HDL) cholesterol 12 wk after starting therapy.

Implementation

- Administer a tuberculin skin test prior to administration of baricitinib. Patients with active latent TB should be treated for TB prior to therapy.
- Immunizations should be current prior to initiating therapy. Patients on baricitinib may receive concurrent vaccinations, except for live vaccines.
- **PO:** Administer once daily without regard to food.

Patient/Family Teaching

- Instruct patient to take baricitinib as directed. Advise patient to read *Medication Guide* before starting therapy and with each Rx refill in case of changes.
- Advise patient to notify health care professional if signs and symptoms of infections (fever; sweating; chills; muscle aches; cough; shortness of breath; blood in your phlegm; weight loss; warm, red, or painful skin or sores on body; diarrhea or stomach pain; burning during urination or urinating more often than normal, feeling tired) blood clots in legs (swelling, pain or tenderness in leg, sudden unexplained chest pain, shortness of breath), stomach problems (fever, stomach-area pain that does not go away, change in bowel habits), or hypersensitivity reactions occur.
- Advise patient to notify health care professional of all Rx or OTC medications, vitamins, or herbal products being taken and to consult with health care professional before taking other medications.
- Inform patients that baricitinib may increase risk of certain cancers. Instruct patients to notify health care professional if they have ever had any type of cancer.
- Advise patient to avoid live vaccines during therapy.

© F.A. Davis Publishing

- Rep: Advise patient to notify health care professional if pregnancy is planned or suspected, and to avoid breast feeding during therapy.

Evaluation/Desired Outcomes

- Decreased pain and swelling with decreased rate of joint destruction in patients with rheumatoid arthritis.

basiliximab (ba-sil-ix-i-mab)

Simulect

Classification

Therapeutic: immunosuppressants
Pharmacologic: monoclonal antibodies

Indications

Prevention of acute organ rejection in patients undergoing renal transplantation; used with corticosteroids and cyclosporine.

Action

Binds to and blocks specific interleukin-2 (IL-2) receptor sites on activated T lymphocytes. **Therapeutic Effects:** Prevention of acute organ rejection following renal transplantation.

Pharmacokinetics

Absorption: IV administration results in complete bioavailability.
Distribution: Unknown.
Metabolism and Excretion: Unknown.
Half-life: 7.2 days.

TIME/ACTION PROFILE (effect on immune function)

ROUTE	ONSET	PEAK	DURATION
IV	2 hr	unknown	36 days

Contraindications/Precautions

Contraindicated in: Hypersensitivity; OB: May affect fetal developing immune system; Lactation: May enter breast milk.
Use Cautiously in: Women with childbearing potential; Geri: Due to greater incidence of infection.

Adverse Reactions/Side Effects

Noted for patients receiving corticosteroids and cyclosporine in addition to basiliximab.
EENT: abnormal vision, cataracts. **Resp:** coughing. **CV:** HEART FAILURE, edema, hypertension, angina, arrhythmias, hypotension. **GI:** abdominal pain, constipation, diarrhea, dyspepsia, moniliasis, nausea, vomiting, GI bleeding, gingival hyperplasia, stomatitis. **Derm:** acne, wound complications, hypertrichosis, pruritus. **Endo:** hyperglycemia, hypoglycemia. **F and E:** acidosis, hypercholesterolemia, hyperkalemia, hyperuricemia, hypocalcemia, hypokalemia, hypophosphatemia. **Hemat:** bleeding, coagulation abnormalities. **MS:** back pain, leg pain. **Neuro:** tremor, neuropathy, paresthesia, dizziness, headache, insomnia, weakness.. **Misc:** hypersensitivity reactions including ANAPHYLAXIS, infection, weight gain, chills.

Interactions

Drug-Drug: Immunosuppression may be ↑ with other **immunosuppressants**.
Drug-Natural Products: Concommitant use with **echinacea** and **melatonin** may interfere with immunosuppression.

Route/Dosage

IV (Adults and Children ≥35 kg): 20 mg given 2 hr before transplantation; repeated 4 days after transplantation. Second dose should be withheld if complications or graft loss occurs.
IV (Children <35 kg): 10 mg given 2 hr before transplantation; repeated 4 days after transplantation. Second dose should be withheld if complication or graft loss occurs.

Availability

Powder for reconstitution: 20 mg/vial, 10 mg/vial.

NURSING IMPLICATIONS

Assessment

- Monitor for signs of anaphylactic or hypersensitivity reactions (hypotension, tachycardia, cardiac failure, dyspnea, wheezing, bronchospasm, pulmonary edema, respiratory failure, urticaria, rash, pruritus, sneezing) at each dose. Onset of symptoms is usually within 24 hr. Resuscitation equipment and medications for treatment of severe hypersensitivity should be readily available. If a severe hypersensitivity reaction occurs, basiliximab therapy should be permanently discontinued. Patients who have previously received basiliximab should only receive subsequent therapy with extreme caution.
- Monitor for infection (fever, chills, rash, sore throat, purulent discharge, dysuria). Notify physician immediately if these symptoms occur; may necessitate discontinuation of therapy.
- ***Lab Test Considerations:*** May cause ↑ or ↓ hemoglobin, hematocrit, serum glucose, potassium, and calcium concentrations.
- May cause ↑ serum cholesterol levels.
- May cause ↑ BUN, serum creatinine, and uric acid concentrations.
- May cause ↓ serum magnesium, phosphate, and platelet levels.

Implementation

IV Administration

- Basiliximab is usually administered concurrently with cyclosporine and corticosteroids.

© F.A. Davis Publishing

- Reconstitute with 2.5 mL or 5 mL of sterile water for injection for the 10 mg or 20 mg vial, respectively. Shake gently to dissolve powder.
- **IV Push:** ***Dilution:*** May be administered undiluted. Bolus administration may be associated with nausea, vomiting, and local reactions (pain). ***Concentration:*** 4 mg/mL. ***Rate:*** Administer over 20–30 min via peripheral or central line.
- **Intermittent Infusion:** ***Dilution:*** Dilute further with 25–50 mL of 0.9% NaCl or D5W. Gently invert bag to mix; do not shake, to avoid foaming. Solution is clear to opalescent and colorless; do not administer solutions that are discolored or contain particulate matter. Discard unused portion. Administer within 4 hr or may be refrigerated for up to 24 hr. Discard after 24 hr. ***Concentration:*** 0.08–0.16 mg/mL. ***Rate:*** Administer over 20–30 min via peripheral or central line.
- **Additive Incompatibility:** Do not admix; do not administer in IV line containing other medications.

Patient/Family Teaching

- Explain purpose of medication to patient. Explain that patient will need to resume lifelong therapy with other immunosuppressive drugs after completion of basiliximab course.
- May cause dizziness. Caution patient to avoid driving or other activities requiring alertness until response is known.
- Instruct patient to continue to avoid crowds and persons with known infections, because basiliximab also suppresses the immune system.

Evaluation/Desired Outcomes

- Prevention of acute organ rejection in patients receiving renal transplantation.

becaplermin (be-**kap**-lerm-in)

Regranex

Classification

Therapeutic: wound/ulcer/decubiti healing agent

Pharmacologic: platelet-derived growth factors

Indications

Treatment of lower extremity diabetic neuropathic ulcers extending to subcut tissue or beyond and having adequate blood supply.

Action

Promotes chemotaxis of cells involved in wound repair and enhances formation of granulation tissue. **Therapeutic Effects:** Improved healing.

Pharmacokinetics

Absorption: Minimal absorption (<3%).
Distribution: Action is primarily local.
Metabolism and Excretion: Unknown.
Half-life: Unknown.

TIME/ACTION PROFILE (improvement in ulcer healing)

ROUTE	ONSET	PEAK	DURATION
Topical	within 10 wk	unknown	unknown

Contraindications/Precautions

Contraindicated in: Known hypersensitivity to becaplermin or parabens; Known neoplasm at site of application; Wounds that close by primary intention.
Use Cautiously in: Known malignancy; OB, Lactation, Pedi: Safety not established.

Adverse Reactions/Side Effects

Derm: erythematous rash at application site. **Misc:** MALIGNANCY.

Interactions

Drug-Drug: None known.

Route/Dosage

Topical (Adults): Length of gel *in inches* from 15- or 7.5-g tube = length × width of ulcer area × 0.6; from the 2-g tube = length × width of ulcer area × 1.3. Length of gel *in centimeters* from 15- or 7.5-g tube = length × width of ulcer area ÷ 4; from the 2-g tube = length × width of ulcer area ÷ 2; for 12 hr each day.

Availability

Gel: 0.01%.

NURSING IMPLICATIONS

Assessment

- Assess size, color, drainage, and skin surrounding wound at weekly or biweekly intervals. Amount of gel to be applied is recalculated based on wound size.

Implementation

- **Topical:** Calculated amount is applied as a thin layer (1/16-in. thick) and covered with a moist saline dressing for 12 hr; dressing is removed, ulcer rinsed and redressed with moist dressing without becaplermin for rest of day. Process is repeated daily.
- Store gel in refrigerator; do not freeze. Do not use beyond expiration date on crimped end of tube.

Patient/Family Teaching

- Instruct patient on proper technique for application. Wash hands before applying gel and use cotton swab or tongue depressor to aid in application. Tip of tube should not come in contact with ulcer or any other surface; recap tightly after each use. Squeeze calculated amount of gel onto a clean, firm, nonabsorbable surface (wax paper). Spread gel with swab or tongue depressor over the ulcer surface in an even layer to the thickness of a dime. Cover with a saline-moistened gauze dressing.
- Do not apply more than calculated amount; has not been shown to be beneficial. If a dose is missed, ap-

© F.A. Davis Publishing

ply as soon as remembered. If not remembered until next day, skip dose and return to regular dosing schedule. Do not double doses.
- After 12 hr, rinse ulcer gently with saline or water to remove residual gel and cover with saline-moistened gauze.
- Emphasize the importance of strict wound care and non–weight-bearing program.

Evaluation/Desired Outcomes
- Improved healing of ulcers. If the ulcer does not decrease in size by 30% within 10 wk or if complete healing has not occurred within 20 wk, continuation of therapy should be reassessed.

beclomethasone, See CORTICOSTEROIDS (INHALATION) and CORTICOSTEROIDS (NASAL).

belatacept (be-lat-a-sept)
Nulojix

Classification
Therapeutic: immunosuppressants
Pharmacologic: fusion proteins

Indications
Prevention of organ rejection following kidney transplant in adult patients; in combination with basiliximab induction, mycophenolate, and corticosteroids.

Action
Binds to CD80 and CD86 sites, thereby blocking T-cell costimulation; result is inhibition of T-lymphocyte proliferation and cytokine production. **Therapeutic Effects:** Prolonged graft survival with decreased production of anti-donor antibodies following kidney transplantation.

Pharmacokinetics
Absorption: IV administration results in complete bioavailability.
Distribution: Unknown.
Metabolism and Excretion: Unknown.
Half-life: 9.8 days.

TIME/ACTION PROFILE

ROUTE	ONSET	PEAK	DURATION
IV	unknown	end of infusion	up to 4 wk

Contraindications/Precautions
Contraindicated in: Epstein-Barr virus (EBV) seronegativity or unknown EBV serostatus; Liver transplantation; Lactation: Lactation.

Use Cautiously in: Cytomegalovirus (CMV) infection/T-cell depleting therapy (↑ risk of post-transplant lymphoproliferative disorder [PTLD]), CMV prophylaxis recommended for 3 mo following transplant; Change in body weight >10% (dose adjustment recommended); Unknown tuberculosis status (latent infection should be treated prior to use); Evidence of polyoma virus-associated nephropathy (PVAN), ↓ immunosuppression may be necessary; Patients being converted from a calcineurin inhibitor based maintenance regimen (↑ risk of rejection) (conversion is only recommended if patient is intolerant to calcineurin inhibitor); OB: Use during pregnancy only if potential maternal benefit justifies potential fetal risk; Pedi: Safety and effectiveness not established in children.

Adverse Reactions/Side Effects
CV: hypertension, peripheral edema. **Endo:** diabetes mellitus. **F and E:** hyperkalemia, hypokalemia. **GI:** constipation, diarrhea, nausea, vomiting. **GU:** proteinuria. **Hemat:** anemia, leukopenia. **Neuro:** PROGRESSIVE MULTIFOCAL LEUKOENCEPHALOPATHY (PML), headache. **Resp:** cough. **Misc:** INFECTION, MALIGNANCY, POST-TRANSPLANT LYMPHOPROLIFERATIVE DISORDER (PTLD), fever, graft dysfunction, infusion reactions.

Interactions
Drug-Drug: May ↓ antibody response to and ↑ risk of adverse reactions from **live virus vaccines**; avoid use during treatment. May ↑ levels and toxicity of **mycophenolate mofetil**; ↓ dose of mycophenolate mofetil. Concurrent use with **antithymocyte globulin** may ↑ risk of venous thrombosis of renal allograft; separate administration by 12 hr.

Route/Dosage
Prescribed dose must be evenly divisible by 12.5 to ensure accurate preparation.
IV (Adults): *Initial phase*— 10 mg/kg on day of transplant/prior to implantation, day 5 (96 hr after day 1 dose), and at end of wk 2, 4, 8, and 12 following transplantation; *Maintenance phase*— 10 mg/kg at end of wk 16 and then every 4 wk (±3 days).

Availability
Lyophilized powder for injection: 250 mg/vial.

NURSING IMPLICATIONS

Assessment
- Assess for symptoms of organ rejection throughout therapy.
- Assess for signs of progressive multifocal leukoencephalopathy (hemiparesis, apathy, confusion, cognitive deficiencies, and ataxia) periodically during therapy.
- Monitor for signs and symptoms of infection (fever, dyspnea) periodically during therapy.

© F.A. Davis Publishing

- Assess for signs and symptoms of post-transplant lymphoproliferative disorder (changes in mood or usual behavior, confusion, problems thinking, loss of memory, changes in walking or talking, decreased strength or weakness on one side of the body, changes in vision) during and for at least 36 mo post-transplant.
- Monitor for infusion reactions (hypotension, hypertension) during therapy.
- ***Lab Test Considerations:*** Determine Epstein-Barr virus (EBV) status before starting therapy. Only administer to patients who are EBV seropositive.
- May cause hyperkalemia, hypokalemia, hypophosphatemia, hyperglycemia, hypocalcemia, hypercholesterolemia, hypomagnesemia, and hyperuricemia.

Implementation

- Pre-medication is not required.
- Cortisone doses should be consistent with clinical trials experience. Cortisone doses were tapered to between 10–20 mg/day by first 6 wk after transplant, then remained at 10 mg (5–10 mg) per day for first 6 mo after transplant.
- Treat patient for latent tuberculosis prior to therapy.
- Prophylaxis for *Pneumocystis jiroveci* is recommended after transplant.

IV Administration

- **Intermittent Infusion:** Calculate number of vials required for total infusion dose. ***Reconstitution:*** Reconstitute contents of each vial with 10.5 mL of 0.9% of Sterile Water for Injection, NaCl or D5W using the silicone-free disposable syringe provided and an 18–21 gauge needle for a concentration of 25 mg/mL. Direct stream of diluent to wall of vial. Rotate and invert vial gently; do not shake to avoid foaming. Solution is clear to slightly opalescent and colorless to pale yellow; do not use if opaque particles, discoloration, or other particles are present. Calculate total volume needed for infusion dose. ***Dilution:*** Dilute further with 0.9% NaCl or D5W if reconstituted with sterile water for injection, 0.9% NaCl if reconstituted with 0.9% NaCl, or with D5W if reconstituted with D5W. ***Concentration:*** 2 mg/mL. Withdraw amount of diluent from infusion container equal to volume of infusion dose. Using same *silicone-free disposable syringe* used for reconstitution, withdraw required amount of belatacept solution from vial, inject into infusion container, and rotate gently to mix. Typical infusion volume is 100 mL, but may range from 50–250 mL. Transfer from vial to infusion container immediately; infusion must be completed within 24 hr of reconstitution. May be refrigerated and protected from light for 24 hr. Do not administer solutions that are discolored or contain particulate matter. Discard unused solution in vials. ***Rate:*** Infuse over 30 min using a non-pyrogenic, low-protein-binding filter with 0.2–1.2 micron pore size.
- **Y-Site Incompatibility:** Do not mix or infuse in same line with other agents.

Patient/Family Teaching

- Explain purpose of belatacept to patient.
- Reinforce the need for lifelong therapy to prevent transplant rejection. Review symptoms of rejection for the transplanted organ, and stress need to notify health care professional immediately if signs of rejection or infection occur.
- Advise patient to avoid contact with persons with contagious diseases.
- Inform patient of the increased risk of skin cancer and other malignancies. Advise patient to use sunscreen with a high protection factor and wear protective clothing to decrease risk of skin cancer.
- Advise patient to notify health care professional of all Rx or OTC medications, vitamins, or herbal products being taken and to consult with health care professional before taking other medications.
- Advise patient to notify health care professional immediately if signs or symptoms of infection, post-transplant lymphoproliferative disorder or progressive multifocal leukoencephalopathy occur.
- Advise patients to avoid live vaccines during therapy.
- Rep: Advise female patients to notify health care professional if pregnancy is planned or suspected or if breast feeding. Encourage patients who become pregnant or whose partners have received belatacept to register with the Transplant Pregnancy Registry International (TPR) by calling 1-877-955-6877.
- Emphasize the importance of routine follow-up laboratory tests.

Evaluation/Desired Outcomes

- Prevention of rejection of transplanted kidneys.

belimumab (be-li-moo-mab)

Benlysta

Classification

Therapeutic: immunosuppressants
Pharmacologic: monoclonal antibodies

Indications

Active autoantibody-positive systemic lupus erythematosus (SLE) in patients currently receiving standard therapy. Active lupus nephritis in patients currently receiving standard therapy.

Action

A monoclonal antibody produced by recombinant DNA technique that specifically binds to B-lymphocyte stimulator protein (BLyS), thereby inactivating it. **Therapeutic Effects:** ↓ survival of B cells, including autoreactive ones and ↓ differentiation into immunoglobulin-producing plasma cells. Result is ↓ disease activity with lessened damage/improvement in mucocutaneous, musculoskeletal, and immunologic

© F.A. Davis Publishing

manifestations of SLE. Improvement in or stabilization of renal function in lupus nephritis.

Pharmacokinetics

Absorption: 74% absorbed after subcut administration; IV administration results in complete bioavailability.
Distribution: Unknown.
Metabolism and Excretion: Unknown.
Half-life: 19.4 days.

TIME/ACTION PROFILE (reduction in activated B cells)

ROUTE	ONSET	PEAK	DURATION
IV or subcut	8 wk	unknown	52 wk†

†With continuous treatment.

Contraindications/Precautions

Contraindicated in: Hypersensitivity; Concurrent use of other biologicals or cyclophosphamide; Concurrent use of live vaccines; Receiving therapy for chronic infection.
Use Cautiously in: Infections (consider temporary withdrawal for acute infections, treat aggressively); Previous history of depression or suicidal ideation (may worsen); OB: Use during pregnancy only if potential maternal benefit justifies potential fetal risk; Lactation: Safety not established in breast feeding; Rep: Women of reproductive potential; Pedi: Children <5 yr (safety and effectiveness not established); Geri: Older adults may be more sensitive to drug effects, consider age-related changes in renal, hepatic and cardiac function, concurrent drug therapy, and chronic disease states.

Adverse Reactions/Side Effects

Derm: rash. **GI:** nausea, diarrhea. **GU:** cystitis. **Hemat:** leukopenia. **MS:** extremity pain, myalgia. **Neuro:** PROGRESSIVE MULTIFOCAL LEUKOENCEPHALOPATHY (PML), SUICIDAL IDEATION/BEHAVIOR, depression, insomnia, migraine, anxiety, fatigue. **Misc:** ANAPHYLAXIS, INFECTION, infusion reactions, fever, facial edema.

Interactions

Drug-Drug: ↑ risk of adverse reactions and ↓ immune response to **live vaccines**; should not be given concurrently.

Route/Dosage

Systemic Lupus Erythematosus

IV (Adults and Children ≥5 yr): 10 mg/kg every 2 wk for 3 doses, then 10 mg/kg every 4 wk.
Subcut (Adults): 200 mg once weekly; if transitioning from IV therapy, give first subcut dose 1–4 wk after last IV dose.

Lupus Nephritis

IV (Adults and Children ≥5 yr): 10 mg/kg every 2 wk for 3 doses, then 10 mg/kg every 4 wk.
Subcut (Adults): 400 mg (given as two, 200–mg injections) once weekly for 4 wk, then 200 mg once weekly. May transition from IV therapy after completing first two IV doses, give first subcut dose 1–2 wk after last IV dose.

Availability

Lyophilized powder for injection: 120 mg/vial, 400 mg/vial. **Solution for injection (prefilled syringes and autoinjectors):** 200 mg/mL.

NURSING IMPLICATIONS

Assessment

- Monitor patient for signs of anaphylaxis (hypotension, angioedema, urticaria, rash, pruritus, wheezing, dyspnea, facial edema) during and following injection. Medications (antihistamines, corticosteroids, epinephrine) and equipment should be readily available in the event of a severe reaction. Discontinue belimumab immediately if anaphylaxis or other severe allergic reaction occurs.
- Monitor for infusion reactions (headache, nausea, skin reactions, bradycardia, myalgia, headache, rash, urticaria, hypotension). There is insufficient evidence to determine whether premedication diminishes frequency or severity. Infusion rate may be slowed or interrupted if an infusion reaction occurs.
- Assess for signs of infection (fever, dyspnea, flu-like symptoms, frequent or painful urination, redness or swelling at the site of a wound), including tuberculosis, prior to injection. Belimumab is contraindicated in patients with active infection. New infections should be monitored closely; most common are upper respiratory tract infections, bronchitis, and urinary tract infections. Signs and symptoms of inflammation may be lessened due to suppression from belimumab. Infections may be fatal, especially in patients taking immunosuppressive therapy. If patient develops a serious infection, consider discontinuing belimumab until infection is controlled.
- Assess mental status and mood changes. Inform health care professional if patient demonstrates significant ↑ in depressed mood, anxiety, nervousness, or insomnia.
- Assess for signs of progressive multifocal leukoencephalopathy (hemiparesis, apathy, confusion, cognitive deficiencies, and ataxia) periodically during therapy.

Implementation

- Consider premedication for prophylaxis against infusion reactions and hypersensitivity reactions.
- **Subcut:** Allow autoinjector or prefilled syringe to sit at room temperature for 30 min prior to injection; do not use other methods of warming. Solution is clear to opalescent and colorless to pale yellow. Do not inject solutions that are discolored or contain

© F.A. Davis Publishing

particulate matter. Administer first injection under supervision of health care professional into abdomen or thigh. Rotate injection sites each wk. Avoid areas of tenderness, bruising, redness, or hardness. Refrigerate autoinjectors and prefilled syringes prior to use; do not freeze or shake. Avoid exposure to heat. May be stored at room temperature if protected from sunlight for up to 12 hrs.

IV Administration

- **Intermittent Infusion:** Remove belimumab from refrigerator and allow to stand 10–15 min to reach room temperature. ***Reconstitution:*** Using a 21–25 gauge needle, reconstitute 120 mg vial with 1.5 mL and 400 mg vial with 4.8 mL of sterile water for injection by directing stream toward side of vial to minimize foaming. Swirl gently for 60 sec. Allow vial to sit at room temperature during reconstitution, swirling gently for 60 sec every 5 min until powder is dissolved. Do not shake. Reconstitution usually takes 10–15 min, but may take up to 30 min. Protect from sunlight. Solution is opalescent and colorless to pale yellow and without particles. Small bubbles are expected and acceptable. ***Concentration:*** 80 mg/mL. ***Dilution:*** 0.9% NaCl, 0.45% NaCl or LR. Remove volume of patient's dose from a 250 mL infusion bag and discard. Replace with required amount of reconstituted solution. Gently invert bag to mix. Do not administer solutions that are discolored or contain particulate matter. Discard unused solution in vial. If not used immediately, refrigerate and protect from light. Solution is stable for 8 hrs. ***Rate:*** Infuse over 1 hr; may slow or interrupt rate if patient develops an infusion reaction.
- **Y-Site Incompatibility:** Do not administer with dextrose solutions or other solutions or medications.

Patient/Family Teaching

- Instruct patient in correct technique for subcut injection, care, and disposal of equipment. Inject on the same day each wk. Inject missed doses as soon as remembered, then resume on usual day or start a new weekly schedule from the day missed dose was administered. Do not inject 2 doses on same day. Advise patient to read *Medication Guide* prior to each treatment session in case of changes.
- Caution patient to notify health care professional immediately if signs of infection (fever, sweating, chills, muscle aches, cough, shortness of breath, blood in phlegm, weight loss, warm, red or painful skin or sores, diarrhea or stomach pain, burning on urination, urinary frequency, feeling tired), progressive multifocal leukoencephalopathy, severe rash, swollen face, or difficulty breathing occurs while taking.
- Advise patient, family, and caregivers to look for depression and suicidality, especially during early therapy or dose changes. Notify health care professional immediately if thoughts about suicide or dying, attempts to commit suicide; new or worse depression or anxiety; agitation or restlessness; panic attacks; insomnia; new or worse irritability; aggressiveness; acting on dangerous impulses, mania, or other changes in mood or behavior, or if symptoms of serotonin syndrome occur.
- Caution patient to avoid receiving live vaccines for 30 days before and during belimumab therapy.
- Instruct patient to notify health care professional of all Rx or OTC medications, vitamins, or herbal products being taken and consult health care professional before taking any new medications.
- Rep: Advise females of reproductive potential to use effective contraception during and for at least 4 mo after final treatment and to notify health care professional if breast feeding. Encourage pregnant patients to enroll in pregnancy registry by calling 1-877-681-6296.

Evaluation/Desired Outcomes

- Improvement in mucocutaneous, musculoskeletal, and immunologic disease activity in patients with SLE.
- Improvement in or stabilization of renal function in lupus nephritis.

benazepril, See ANGIOTENSIN-CONVERTING ENZYME (ACE) INHIBITORS.

benralizumab

(ben-ra-**liz**-ue-mab)

Fasenra

Classification

Therapeutic: anti-asthmatics

Pharmacologic: monoclonal antibodies, interleukin antagonists

Indications

Add-on maintenance treatment of severe asthma that is of an eosinophilic phenotype.

Action

Interleukin-5 (IL-5) antagonist that inhibits binding of IL-5 to the surface of the eosinophil, which reduces the production and survival of eosinophils. **Therapeutic Effects:** Decreased incidence of asthma exacerbations. Reduction in use of maintenance oral corticosteroid therapy.

Pharmacokinetics

Absorption: 58% absorbed following subcut administration.

Distribution: Minimally distributed to tissues.

Metabolism and Excretion: Degraded by proteolytic enzymes located throughout the body.

Half-life: 15 days.

© F.A. Davis Publishing

TIME/ACTION PROFILE (blood levels)

ROUTE	ONSET	PEAK	DURATION
Subcut	unknown	unknown	unknown

Contraindications/Precautions

Contraindicated in: Hypersensitivity; Acute bronchospasm or status asthmaticus.

Use Cautiously in: Pre-existing helminth infections; OB: Use during pregnancy only if potential maternal benefit outweighs potential fetal risk; Lactation: Safety not established in breast feeding; Pedi: Children <12 yr (safety and effectiveness not established).

Adverse Reactions/Side Effects

EENT: pharyngitis. **Neuro:** headache. **Misc:** HYPERSENSITIVITY REACTIONS (including anaphylaxis, angioedema, urticaria, and rash), fever, injection site reactions.

Interactions

Drug-Drug: None reported.

Route/Dosage

Subcut (Adults and Children ≥12 yr): 30 mg every 4 wk for first three doses, then 30 mg every 8 wk thereafter.

Availability

Solution for injection (prefilled syringes or autoinjectors): 30 mg/mL.

NURSING IMPLICATIONS

Assessment

- Assess lung sounds, pulse, and BP periodically during therapy. Note amount, color, and character of sputum produced.
- Monitor for signs and symptoms of hypersensitivity reactions (rash, pruritus, hives, swelling of face and neck, dyspnea, fainting, dizziness, feeling lightheaded) periodically during therapy; usually occur within hrs, but may occur days after injection. Discontinue medication if reaction occurs.

Implementation

- Treat pre-existing helminth infections before starting therapy.
- Prefilled syringe is for administration by a health care professional. Autoinjector can be administered by patient or caregiver with training.
- **Subcut:** Administer every 4 wk for the 1st three doses and every 8 wk thereafter in upper arm, thigh or abdomen. Store in refrigerator; protect from light. Do not freeze or shake. Leave carton at room temperature for 30 min before administration. Solution is clear to opalescent, colorless to slightly yellow; may contain a few translucent or white to off-white particles. Do not administer if liquid is cloudy, discolored, or contains large particles or foreign particulate matter. Do not expel the air bubble prior to administration. Pinch skin to inject medication.

Patient/Family Teaching

- Instruct patient to have medication administered by health care professional as scheduled. Instruct patient in correct technique for injection, care, and disposal of equipment. Advise patient to read *Patient Information* before starting therapy and with each Rx refill in case of changes.
- Advise patient that benralizumab should not be used to treat an acute asthma attack. Patient should continue asthma medications, including corticosteroids, unless otherwise instructed by health care professional.
- Advise patient to stop using medication and notify health care professional immediately if signs and symptoms of hypersensitivity reactions occur.
- Instruct patient to notify health care professional of all Rx or OTC medications, vitamins, or herbal products being taken and to consult health care professional before taking any OTC medications or alcoholic beverages concurrently with this therapy. Caution patient also to avoid smoking and other respiratory irritants.
- Instruct patient whose systemic corticosteroids have been recently reduced or withdrawn to carry a warning card indicating the need for supplemental systemic corticosteroids in the event of stress or severe asthma attack unresponsive to bronchodilators.
- Advise patient to have helminth infections treated before starting benralizumab therapy.
- Rep: Advise females of reproductive potential to notify health care professional if pregnancy is planned or suspected or if breast feeding. Encourage health care professional or pregnant patients to enroll in pregnancy registry to monitor outcomes of women exposed to benralizumab during pregnancy by calling 1-877-311-8972 or visiting mothertobaby.org/Fasenra.

Evaluation/Desired Outcomes

- Decreased incidence of asthma exacerbations. Reduction in use of maintenance oral corticosteroid therapy.

BEERS

benztropine (benz-troe-peen)

Cogentin

Classification

Therapeutic: antiparkinson agents

Pharmacologic: anticholinergics

© F.A. Davis Publishing

Indications
Adjunctive treatment of all forms of Parkinson's disease, including drug-induced extrapyramidal effects and acute dystonic reactions.

Action
Blocks cholinergic activity in the CNS, which is partially responsible for the symptoms of Parkinson's disease. Restores the natural balance of neurotransmitters in the CNS. **Therapeutic Effects:** Reduction of rigidity and tremors.

Pharmacokinetics
Absorption: Well absorbed following PO and IM administration.
Distribution: Unknown.
Metabolism and Excretion: Unknown.
Half-life: Unknown.

TIME/ACTION PROFILE (antidyskinetic activity)

ROUTE	ONSET	PEAK	DURATION
PO	1–2 hr	several days	24 hr
IM, IV	within min	unknown	24 hr

Contraindications/Precautions
Contraindicated in: Hypersensitivity; Children <3 yr; Angle-closure glaucoma; Tardive dyskinesia.
Use Cautiously in: Prostatic hyperplasia; Seizure disorders; Cardiac arrhythmias; OB, Lactation: Safety not established; Geri: ↑ risk of adverse reactions.

Adverse Reactions/Side Effects
EENT: blurred vision, dry eyes, mydriasis. **CV:** arrhythmias, hypotension, palpitations, tachycardia. **GI:** constipation, dry mouth, ileus, nausea. **GU:** hesitancy, urinary retention. **Neuro:** confusion, depression, dizziness, hallucinations, headache, sedation, weakness. **Misc:** decreased sweating.

Interactions
Drug-Drug: Additive anticholinergic effects with **drugs sharing anticholinergic properties**, such as **antihistamines**, **phenothiazines**, **quinidine**, **disopyramide**, and **tricyclic antidepressants**. Counteracts the cholinergic effects of **bethanechol**. **Antacids** and **antidiarrheals** may ↓ absorption.
Drug-Natural Products: ↑ anticholinergic effect with **angel's trumpet**, **jimson weed**, and **scopolia**.

Route/Dosage

Parkinsonism
PO (Adults): 1–2 mg/day in 1–2 divided doses (range 0.5–6 mg/day).

Acute Dystonic Reactions
IM, IV (Adults): 1–2 mg, then 1–2 mg PO twice daily.

Drug-Induced Extrapyramidal Reactions
PO, IM, IV (Adults): 1–4 mg given once or twice daily (1–2 mg 2–3 times daily may also be used PO).

Availability (generic available)
Tablets: 0.5 mg, 1 mg, 2 mg. **Cost:** *Generic*—0.5 mg $26.07/100, 1 mg $25.74/100, 2 mg $51.86/100. **Injection:** 1 mg/mL.

NURSING IMPLICATIONS

Assessment
- Assess parkinsonian and extrapyramidal symptoms (restlessness or desire to keep moving, rigidity, tremors, pill rolling, masklike face, shuffling gait, muscle spasms, twisting motions, difficulty speaking or swallowing, loss of balance control) before and throughout therapy.
- Assess bowel function daily. Monitor for constipation, abdominal pain, distention, or absence of bowel sounds.
- Monitor intake and output ratios and assess patient for urinary retention (dysuria, distended abdomen, infrequent voiding of small amounts, overflow incontinence).
- Patients with mental illness are at risk of developing exaggerated symptoms of their disorder during early therapy with benztropine. Withhold drug and notify physician or other health care professional if significant behavioral changes occur.
- **IM/IV:** Monitor pulse and BP closely and maintain bedrest for 1 hr after administration. Advise patients to change positions slowly to minimize orthostatic hypotension.

Implementation
- **PO:** Administer with food or immediately after meals to minimize gastric irritation. May be crushed and administered with food if patient has difficulty swallowing.
- **IM:** Parenteral route is used only for dystonic reactions.

IV Administration
- **IV Push:** IV route is rarely used because onset is same as with IM route. ***Rate:*** Administer at a rate of 1 mg over 1 min.
- **Y-Site Compatibility:** alfentanil, amikacin, aminophylline, ascorbic acid, atracurium, atropine, azathioprine, aztreonam, bumetanide, buprenorphine, butorphanol, calcium chloride, calcium gluconate, cefazolin, cefotaxime, cefotetan, cefoxitin, ceftazidime, ceftriaxone, cefuroxime, chlorpromazine, clindamycin, cyanocobalamin, cyclosporine, dexamethasone, digoxin, diphenhydramine, dobutamine, dopamine, doxycycline, enalaprilat, ephedrine, epinephrine, epoetin alfa, erythromycin, esmolol, famotidine, fentanyl, fluconazole, folic acid, gentamicin, glycopyrrolate, heparin, hydrocortisone, imipenem/cilastatin, insulin, isoproterenol, ketorolac, labetalol, lidocaine, magnesium sulfate, mannitol, meperidine, metaraminol, methyldopate, methylprednisolone, metoclopramide, metoprolol, midazolam, morphine, multivitamins, nafcillin, nalbuphine, nal-

© F.A. Davis Publishing

oxone, nitroglycerin, nitroprusside, norepinephrine, ondansetron, oxacillin, oxytocin, papaverine, penicillin G, pentamidine, phenobarbital, phentolamine, phenylephrine, phytonadione, potassium chloride, procainamide, prochlorperazine, promethazine, propranolol, protamine, pyridoxime, sodium bicarbonate, succinylcholine, sufentanil, tacrolimus, theophylline, thiamine, tobramycin, tolazoline, vancomycin, vasopressin, verapamil.

- **Y-Site Incompatibility:** amphotericin B deoxycholate, chloramphenicol, dantrolene, diazepam, diazoxide, furosemide, ganciclovir, indomethacin, pentobarbital, phenytoin, sulfamethoxazole/trimethoprim.

Patient/Family Teaching

- Encourage patient to take benztropine as directed. Take missed doses as soon as possible, up to 2 hr before the next dose. Taper gradually when discontinuing or a withdrawal reaction may occur (anxiety, tachycardia, insomnia, return of parkinsonian or extrapyramidal symptoms).
- May cause drowsiness or dizziness. Advise patient to avoid driving or other activities that require alertness until response to the drug is known.
- Instruct patient that frequent rinsing of mouth, good oral hygiene, and sugarless gum or candy may decrease dry mouth. Patient should notify health care professional if dryness persists (saliva substitutes may be used). Also, notify the dentist if dryness interferes with use of dentures.
- Caution patient to change positions slowly to minimize orthostatic hypotension.
- Instruct patient to notify health care professional if difficulty with urination, constipation, abdominal discomfort, rapid or pounding heartbeat, confusion, eye pain, or rash occurs.
- Advise patient to confer with health care professional before taking OTC medications, especially cold remedies, or drinking alcoholic beverages.
- Caution patient that this medication decreases perspiration. Overheating may occur during hot weather. Patient should notify health care professional if unable to remain indoors in an air-conditioned environment during hot weather.
- Advise patient to avoid taking antacids or antidiarrheals within 1–2 hr of this medication.
- Emphasize the importance of routine follow-up exams.

Evaluation/Desired Outcomes

- Decrease in tremors and rigidity and an improvement in gait and balance. Therapeutic effects are usually seen 2–3 days after the initiation of therapy.

betamethasone, See CORTICOSTEROIDS (SYSTEMIC) and CORTICOSTEROIDS (TOPICAL/LOCAL).

bevacizumab

(be-va-**siz**-uh-mab)

Avastin, Mvasi, Zirabev

Classification

Therapeutic: antineoplastics

Pharmacologic: monoclonal antibodies

Indications

Avastin, Mvasi, and Zirabev: Treatment of the following conditions: Metastatic colorectal cancer (in combination with IV 5–fluorouracil-based chemotherapy as first-line or second-line therapy), Metastatic colorectal cancer in patients who have progressed on a first-line regimen containing bevacizumab (in combination with fluoropyrimidine-irinotecan- or fluoropyrimidine-oxaliplatin-based chemotherapy), First-line treatment of patients with unresectable, locally advanced, recurrent or metastatic non-squamous, non-small cell lung cancer (in combination with carboplatin and paclitaxel), Recurrent glioblastoma (as monotherapy), Metastatic renal cell carcinoma (in combination with interferon alfa), Persistent, recurrent, or metastatic cervical cancer (in combination with paclitaxel and cisplatin or paclitaxel and topotecan), **Avastin and Zirabev only:** Treatment of the following conditions: Platinum-resistant recurrent epithelial ovarian, fallopian tube, or primary peritoneal cancer in patients who have received ≤2 previous chemotherapy regimens (in combination with paclitaxel, pegylated liposomal doxorubicin, or topotecan), Platinum-sensitive recurrent epithelial ovarian, fallopian tube, or primary peritoneal cancer (in combination with carboplatin and paclitaxel or carboplatin and gemcitabine followed by bevacizumab as a single agent), Stage III or IV epithelial ovarian, fallopian tube, or primary peritoneal cancer following initial surgical resection (in combination with carboplatin and paclitaxel followed by bevacizumab as a single agent). **Avastin only:** Unresectable or metastatic hepatocellular carcinoma (HCC) in patients who have not previously received systemic therapy (in combination with atezolizumab).

Action

A monoclonal antibody that binds to vascular endothelial growth factor (VEGF), preventing its attachment to binding sites on vascular endothelium, thereby inhibiting growth of new blood vessels (angiogenesis). **Therapeutic Effects:** Decreased metastatic disease progression and microvascular growth.

© F.A. Davis Publishing

Pharmacokinetics

Absorption: IV administration results in complete bioavailability.
Distribution: Unknown.
Metabolism and Excretion: Unknown.
Half-life: 20 days (range 11–50 days).

TIME/ACTION PROFILE

ROUTE	ONSET	PEAK	DURATION
IV	rapid	end of infusion	14 days

Contraindications/Precautions

Contraindicated in: Hypersensitivity; Recent hemoptysis or other serious recent bleeding episode; First 28 days after major surgery; OB: Pregnancy (can cause fetal harm); Lactation: Discontinue nursing during treatment and, due to long half-life, for several wk following treatment.
Use Cautiously in: Cardiovascular disease; Diabetes (↑ risk of arterial thromboembolic events); Previous use of anthracyclines (↑ risk of HF); Esophageal varices (in patients with HCC); Rep: Women of reproductive potential; Pedi: Safety not established (cases of non-mandibular osteonecrosis reported); Geri: ↑ risk of serious adverse reactions including arterial thromboembolic events.

Adverse Reactions/Side Effects

CV: HF, THROMBOEMBOLIC EVENTS, hypertension, hypotension. **Derm:** NECROTIZING FASCIITIS. **GI:** GI PERFORATION. **GU:** ↑ serum creatinine, nephrotic syndrome, ovarian failure, proteinuria. **Hemat:** BLEEDING.
Neuro: POSTERIOR REVERSIBLE ENCEPHALOPATHY SYNDROME (PRES). **Resp:** HEMOPTYSIS, non-gastrointestinal fistulas, nasal septum perforation. **Misc:** WOUND DEHISCENCE, impaired wound healing, infusion reactions.

Interactions

Drug-Drug: ↑ blood levels of SN 38 (the active metabolite of **irinotecan**); significance is not known. ↑ risk of microangiopathic hemolytic anemia when used with **sunitinib**; concurrent use should be avoided.

Route/Dosage

Colorectal Cancer

IV (Adults): 5 mg/kg every 14 days when given with bolus-IFL chemotherapy regimen *or* 10 mg/kg every 14 days when given with FOLFOX4 chemotherapy regimen *or* 5 mg/kg every 14 days or 7.5 mg/kg every 21 days when given with a fluoropyrimidine-irinotecan or fluoropyrimidine-oxaliplatin based chemotherapy regimen.

Lung Cancer or Cervical Cancer

IV (Adults): 15 mg/kg every 3 wk.

Glioblastoma or Renal Cell Carcinoma

IV (Adults): 10 mg/kg every 2 wk.

Platinum-Resistant Epithelial Ovarian, Fallopian Tube, or Primary Peritoneal Cancer

IV (Adults): 10 mg/kg every 2 wk when given with paclitaxel, pegylated liposomal doxorubicin, or topotecan (weekly) *or* 15 mg/kg every 3 wk when given with topotecan (every 3 wk).

Platinum-Sensitive Epithelial Ovarian, Fallopian Tube, or Primary Peritoneal Cancer

IV (Adults): 15 mg/kg every 3 wk when given with carboplatin and paclitaxel for 6–8 cycles, followed by 15 mg/kg every 3 wk as a single agent *or* 15 mg/kg every 3 wk when given with carboplatin and gemcitabine for 6–10 cycles, followed by 15 mg/kg every 3 wk as a single agent.

Stage III or IV Epithelial Ovarian, Fallopian Tube, or Primary Peritoneal Cancer Following Surgical Resection

IV (Adults): 15 mg/kg every 3 wk when given with carboplatin and paclitaxel for up to 6 cycles, followed by 15 mg/kg every 3 wk as a single agent for a total up to 22 cycles or until disease progression, whichever occurs earlier .

Hepatocellular Carcinoma

IV (Adults): 15 mg/kg every 3 wk (administer after atezolizumab on same day) until disease progression or unacceptable toxicity.

Availability

Solution for injection: 25 mg/mL.

NURSING IMPLICATIONS

Assessment

- Assess for signs of GI perforation (abdominal pain associated with constipation, fever, nausea, and vomiting), fistula formation, and wound dehiscence during therapy; discontinue therapy if this occurs.
- Assess for signs of hemorrhage (epistaxis, hemoptysis, bleeding) and thromboembolic events (stroke, MI, deep vein thrombosis, pulmonary embolus) during therapy. If Grade 3 or 4 hemorrhage, severe arterial thromboembolism, or Grade 4 venous thromboembolism occurs, discontinue therapy. Hold bevacizumab for patients with recent history of hemoptysis of ≥1/2 teaspoon (2.5 mL) of red blood.
- Monitor BP every 2–3 wk during therapy. Temporarily suspend therapy during severe hypertension not controlled with medical management; permanently discontinue if hypertensive crisis or encephalopathy occurs.
- Assess for infusion reactions (stridor, wheezing, hypertension, oxygen desaturation, chest pain, headache, rigors, diaphoresis) during therapy. May require epinephrine, corticosteroids, IV antihistamines, bronchodilators and/or oxygen. If

© F.A. Davis Publishing

clinically significant reaction occurs, hold therapy until resolved and resume at decreased rate. Stop therapy if severe reaction occurs.
- Assess for signs of HF (dyspnea, peripheral edema, rales/crackles, jugular venous distension) during therapy. Discontinue therapy if symptoms occur.
- Monitor for signs of PRES (headache, seizure, lethargy, confusion, blindness). Hypertension may or may not be present. May occur within 16 hr to 1 yr of initiation of therapy. Treat hypertension if present and discontinue bevacizumab therapy. Symptoms usually resolve within days.
- Monitor wound healing. *If wound healing complications occur,* hold bevacizumab until adequate wound healing. *If necrotizing fasciitis occurs,* discontinue therapy.
- ***Lab Test Considerations:*** Monitor serial urinalysis for proteinuria during therapy. Patients with a 2+ or greater urine dipstick require further testing with a 24-hr urine collection. Hold therapy for ≥2 grams of proteinuria/24 hr and resume when proteinuria is <2 g/24 hr. Discontinue therapy in patients with nephrotic syndrome.
- May cause leukopenia, thrombocytopenia, hypokalemia, and hyperbilirubinemia.
- May cause ↑ serum creatinine.

Implementation
- Avoid administration for at least 28 days before elective surgery and at least 28 days following major surgery; surgical incision should be fully healed due to potential for impaired wound healing.

IV Administration
- **Intermittent Infusion:** ***Dilution:*** Dilute prescribed dose in 100 mL of 0.9% NaCl. Do not shake. Discard unused portions. Solution is colorless to pale yellow; do not administer solution that is discolored or contains particulate matter. Stable if refrigerated for up to 8 hr. ***Rate:*** Administer initial dose over 90 min. If well tolerated, second infusion may be administered over 60 min. If well tolerated, all subsequent infusions may be administered over 30 min. **Do not administer as an IV push or bolus**.
- **Additive Incompatibility:** Do not mix or administer with dextrose solutions.

Patient/Family Teaching
- Inform patient of purpose of medication.
- Advise patient of the need for monitoring BP periodically during therapy; notify health care professional if BP is elevated.
- Advise patient to report any signs of bleeding, unusual bleeding, high fever, rigors, sudden onset of worsening neurological function, or persistent or severe abdominal pain, severe constipation, or vomiting immediately to health care professional.
- Inform patient of increased risk of wound healing complications and arterial thromboembolic events.
- Rep: Bevacizumab is teratogenic. Advise females of reproductive potential to use effective contraception and avoid breast feeding during and for 6 mo after last dose. Inform female patient of reproductive potential of risk of ovarian failure that may lead to sterility following therapy.

Evaluation/Desired Outcomes
- Decreased metastatic disease progression and microvascular growth.

bezlotoxumab
(bez-loe-**tox**-ue-mab)
Zinplava

Classification
Therapeutic: antidiarrheals
Pharmacologic: monoclonal antibodies

Indications
Reduction in recurrence of *Clostridioides difficile* infection (CDI) in patients who are receiving antibacterial drug treatment of CDI and are at a high risk for CDI recurrence.

Action
Binds to *Clostridioides difficile* toxin B and neutralizes its effects. **Therapeutic Effects:** Reduced CDI recurrence.

Pharmacokinetics
Absorption: IV administration results in complete bioavailability.
Distribution: Minimally distributed to tissues.
Metabolism and Excretion: Eliminated primarily through catabolism.
Half-life: 19 days.

TIME/ACTION PROFILE (blood levels)

ROUTE	ONSET	PEAK	DURATION
IV	unknown	unknown	unknown

Contraindications/Precautions
Contraindicated in: None.
Use Cautiously in: Heart failure; OB, Lactation: Safety not established; Pedi: Safety and effectiveness not established.

Adverse Reactions/Side Effects
CV: HF. **GI:** nausea. **Neuro:** headache. **Misc:** infusion reactions, fever.

Interactions
Drug-Drug: None known.

Route/Dosage
IV (Adults): 10 mg/kg as a single dose.

© F.A. Davis Publishing

Availability
Solution for injection (requires dilution): 25 mg/mL.

NURSING IMPLICATIONS
Assessment
- Assess for signs and symptoms of CDI prior to and following therapy.

Implementation
- Not for treatment of CDI; must be used with antibacterial agents.

IV Administration
- **Intermittent Infusion:** ***Dilution:*** Withdraw volume from bezlotoxumab vial based on patient weight and transfer to IV bag of 0.9% NaCl or D5W. Invert gently to mix; do not shake. Solution is clear to moderately opalescent, colorless to pale yellow; do not administer solutions that are discolored or contain particulate matter. ***Concentration:*** 1 mg/mL to 10 mg/mL. Store in refrigerator for up to 24 hrs or at room temperature protected from light for up to 16 hrs prior to preparation; do not freeze. ***Rate:*** Infuse over 60 min using a sterile, non-pyrogenic, low-protein binding 0.205 micron in-line or add-on filter. Do not administer as IV push or bolus. May be infused via central line or peripheral catheter.
- **Y-Site Incompatibility:** Do not administer other drugs simultaneously through same infusion line.

Patient/Family Teaching
- Inform patient that bezlotoxumab does not replace antibacterial treatment for their CDI infection. Antibacterial medications must be continued as directed.
- Rep: Advise female patient to notify health care professional if pregnancy is planned or suspected or if breast feeding.

Evaluation/Desired Outcomes
- Decrease in recurrence of CDI.

bicalutamide
(bye-ka-**loot**-a-mide)
Casodex

Classification
Therapeutic: antineoplastics
Pharmacologic: antiandrogens

Indications
Treatment of metastatic prostate carcinoma in conjunction with luteinizing hormone–releasing hormone (LHRH) analogs (goserelin, leuprolide).

Action
Antagonizes the effects of androgen at the cellular level.
Therapeutic Effects: Decreased spread of prostate carcinoma.

Pharmacokinetics
Absorption: Well absorbed after oral administration.
Distribution: Unknown.
Protein Binding: 96%.
Metabolism and Excretion: Mostly metabolized by the liver.
Half-life: 5.8 days.

TIME/ACTION PROFILE (blood levels)

ROUTE	ONSET	PEAK	DURATION
PO	unknown	31.3 hr	unknown

Contraindications/Precautions
Contraindicated in: Hypersensitivity; Women.
Use Cautiously in: Moderate to severe liver impairment; Rep: Men with female partners of reproductive potential; Pedi: Safety not established.

Adverse Reactions/Side Effects
CV: chest pain, hypertension, peripheral edema. **Derm:** alopecia, photosensitivity, rash, sweating. **Endo:** breast pain, gynecomastia. **GI:** HEPATOTOXICITY, constipation, diarrhea, nausea, abdominal pain, ↑ liver enzymes, vomiting. **GU:** erectile dysfunction, ↓ fertility, hematuria, incontinence, nocturia, urinary tract infections. **Hemat:** anemia. **Metab:** hyperglycemia, weight loss. **MS:** back pain, pelvic pain, bone pain. **Neuro:** paresthesia, weakness, dizziness, headache, insomnia. **Resp:** dyspnea. **Misc:** generalized pain, hot flashes, flu-like syndrome, infection.

Interactions
Drug-Drug: May ↑ the effect of **warfarin**.

Route/Dosage
PO (Adults): 50 mg once daily (must be given concurrently with LHRH analog).

Availability (generic available)
Tablets: 50 mg.

NURSING IMPLICATIONS
Assessment
- Assess patient for adverse GI effects. Diarrhea is the most common cause of discontinuation of therapy.
- ***Lab Test Considerations:*** Monitor serum prostate-specific antigen (PSA) periodically to determine response to therapy. If levels rise, assess patient for disease progression. May require periodic LHRH analogue administration without bicalutamide.
- Monitor serum transaminases before, regularly during first 4 mo of therapy, and periodically during therapy. May cause ↑ serum alkaline phosphatase, AST, ALT, and bilirubin concentrations. If patient is jaundiced or if transaminases ↑>2 times normal, discontinue bicalutamide; levels usually return to normal after discontinuation.
- May cause ↑ BUN and serum creatinine, and ↓ hemoglobin and WBCs.

© F.A. Davis Publishing

- May cause ↓ glucose tolerance in males taking LHRH agonists concurrently; monitor blood glucose in patients receiving bicalutamide in combination with LHRH agonists.
- Monitor PT/INR closely in patients taking warfarin. May lead to severe bleeding.

Implementation

- Start treatment with bicalutamide at the same time as LHRH analogue.
- **PO:** May be administered in the morning or evening, without regard to food.

Patient/Family Teaching

- Instruct patient to take bicalutamide along with the LHRH analog as directed at the same time each day. If a dose is missed, omit and take the next dose at regular time; do not double doses. Do not discontinue without consulting health care professional. Advise patient to read *Patient Information* prior to starting and with each Rx refill in case of changes.
- May cause dizziness. Caution patient to avoid driving or other activities requiring alertness until response to medication is known.
- Advise patient to stop taking bicalutamide and notify health care professional immediately of symptoms of liver dysfunction (nausea, vomiting, abdominal pain, fatigue, anorexia, "flu-like" symptoms, dark urine, jaundice, or right upper quadrant tenderness) or interstitial lung disease (trouble breathing with or without a cough or fever).
- Advise patient to notify health care professional of all Rx or OTC medications, vitamins, or herbal products being taken and to consult health care professional before taking any new medications.
- Instruct patient to report severe or persistent diarrhea.
- Discuss with patient the possibility of hair loss, breast enlargement and breast pain. Explore methods of coping.
- Advise patient to use sunscreen, avoid sunlight or sunlamps and tanning beds, and wear protective clothing to prevent photosensitivity reactions.
- Rep: Advise female and male patients to use effective contraception during and for 130 days after last dose of therapy. Female patients should avoid breast feeding during therapy. Advise male patients bicalutamide may impair fertility.
- Emphasize the importance of regular follow-up exams and blood tests to determine progress; monitor for side effects.

Evaluation/Desired Outcomes

- Decreased spread of prostate carcinoma.

bictegravir/emtricitabine/tenofovir alafenamide

(bik-**teg**-ra-vir/em-trye-**sye**-ta-been/ten-**of**-oh-veer al-a-**fen**-a-mide)

Biktarvy

Classification

Therapeutic: antiretrovirals

Pharmacologic: nucleoside reverse transcriptase inhibitors, integrase strand transfer inhibitors (INSTI)

Indications

Management of HIV infection in patients who have no antiretroviral treatment history or in those on a stable antiretroviral regimen who are virologically suppression (with HIV-1 RNA <50 copies/mL) and no history of treatment failure or no known substitutions associated with resistance to the individual components of the medication (to replace their current antiretroviral regimen).

Action

Bictegravir—Inhibits HIV-1 integrase, which is required for viral replication; *Emtricitabine*—Phosphorylated intracellularly where it inhibits HIV reverse transcriptase, resulting in viral DNA chain termination; *Tenofovir*—Phosphorylated intracellularly where it inhibits HIV reverse transcriptase resulting in disruption of DNA synthesis. **Therapeutic Effects:** Slowed progression of HIV infection and decreased occurrence of sequelae.

Pharmacokinetics

Absorption: *Bictegravir*—Extent of absorption following oral administration unknown; *Emtricitabine*—Well absorbed (93%) following oral administration; *Tenofovir*—Tenofovir alafenamide is a prodrug, which is hydrolyzed into tenofovir, the active component; absorption enhanced by high-fat meals.

Distribution: *Bictegravir, emtricitabine, and tenofovir*—Unknown.

Protein Binding: *Bictegravir*—>99%.

Metabolism and Excretion: *Bictegravir*—Primarily metabolized by the CYP3A4 isoenzyme and UGT1A1 in the liver; 60% excreted in feces, 35% excreted in urine; *Emtricitabine*—Undergoes some metabolism, 70% excreted in urine, 14% excreted in feces; *Tenofovir*—Tenofovir is phosphorylated to tenofovir diphosphate (active metabolite); 32% excreted in feces, <1% excreted in urine.

Half-life: *Bictegravir*—17.3 hr; *Emtricitabine*—10.4 hr; *Tenofovir alafenamide*—0.51 hr; *Tenofovir diphosphate*—150–180 hr.

© F.A. Davis Publishing

TIME/ACTION PROFILE (plasma concentrations)

ROUTE	ONSET	PEAK	DURATION
bictegravir PO	unknown	2–4 hr	24 hr
emtricitabine PO	unknown	1.5–2 hr	24 hr
tenofovir PO	unknown	0.5–2 hr	24 hr

Contraindications/Precautions

Contraindicated in: Concurrent use of dofetilide or rifampin; Severe renal impairment (CCr 15–30 mL/min) or end-stage renal disease (CCr <15 mL/min) not receiving hemodialysis; Patients with no antiretroviral treatment history and end-stage renal disease (CCr <15 mL/min) who are receiving chronic hemodialysis; Severe hepatic impairment; Lactation: Breast feeding not recommended in patients with HIV.

Use Cautiously in: Hepatitis B co-infection; History of suicidal ideation or depression (↑ risk of suicidal thoughts); Renal impairment or receiving nephrotoxic medications (↑ risk of renal impairment); OB: Use during pregnancy only if potential benefit justifies potential fetal risk; Pedi: Children weighing <25 kg (safety and effectiveness not established).

Adverse Reactions/Side Effects

GI: LACTIC ACIDOSIS/HEPATOMEGALY WITH STEATOSIS, diarrhea, ↑ amylase, ↑ liver enzymes, nausea. **GU:** ACUTE RENAL FAILURE/FANCONI SYNDROME. **Hemat:** neutropenia. **Metab:** hyperlipidemia. **MS:** ↑ creatine kinase. **Neuro:** abnormal dreams, dizziness, fatigue, headache, insomnia. **Misc:** ACUTE EXACERBATION OF HEPATITIS B, immune reconstitution syndrome.

Interactions

Drug-Drug: Bictegravir may ↑ **dofetilide** levels and the risk of torsades de pointes; concurrent use contraindicated. **Rifampin** may ↓ bictegravir levels and its effectiveness; concurrent use contraindicated. Medications that compete for active tubular secretion, including **acyclovir**, **cidofovir**, **ganciclovir**, **valacyclovir**, **valganciclovir**, or **aminoglycosides** may ↑ emtricitabine and tenofovir levels and toxicity. Nephrotoxic agents, including **NSAIDs** ↑ risk of nephrotoxicity with tenofovir; avoid concurrent use. **Carbamazepine**, **oxcarbazepine**, **phenobarbital**, **phenytoin**, **rifabutin**, and **rifapentine** may ↓ bictegravir and tenofovir levels and their effectiveness; avoid concurrent use. Administration with **antacids**, containing **magnesium** or **aluminum** ↓ absorption of bictegravir; take ≥2 hr before or ≥6 hr after magnesium- or aluminum-containing antacids. Administration with supplements or antacids containing **calcium** or **iron**↓ absorption of bictegravir; take at the same time as calcium or iron supplements with food (and not on an empty stomach). May ↑ **metformin** levels.

Drug-Natural Products: St. John's wort may ↓ bictegravir and tenofovir levels and their effectiveness; avoid concurrent use.

Route/Dosage

PO (Adults and Children ≥25 kg): *CCr ≥30 mL/min* — 1 tablet once daily.

Renal Impairment

PO (Adults): *Virologically suppressed with CCr <15 mL/min and receiving chronic hemodialysis* — 1 tablet once daily (on days of hemodialysis, give dose after hemodialysis session).

Availability

Tablets: bictegravir 50 mg/emtricitabine 200 mg/tenofovir alafenamide 25 mg.

NURSING IMPLICATIONS

Assessment

- Assess patient for change in severity of HIV symptoms and for symptoms of opportunistic infections during therapy.
- May cause lactic acidosis and severe hepatomegaly with steatosis. Monitor patient for signs (increased serum lactate levels, elevated liver enzymes, liver enlargement on palpation). Therapy should be suspended if clinical or laboratory signs occur.
- ***Lab Test Considerations:*** Monitor viral load and CD4 cell count regularly during therapy.
- Test patients for chronic hepatitis B virus (HBV) before initiating therapy. Medication is not indicated for treatment of HBV. Exacerbations of HBV have occurred upon discontinuation of therapy.
- Assess serum creatinine, estimated CCr, urine glucose and urine protein prior to and periodically during therapy. Also monitor serum phosphorous in patients with chronic kidney disease. Discontinue therapy in patients who develop clinically significant ↓ renal function or evidence of Fanconi syndrome.
- Monitor liver function tests in patients co-infected with HIV and HBV who discontinue *Biktarvy*. May cause an exacerbation of hepatitis B. May cause ↑ AST, ALT, bilirubin, creatine kinase, serum amylase, serum lipase, and triglycerides.
- May cause ↓ neutrophil count.
- May cause ↑ LDL cholesterol.

Implementation

- **PO:** Administer once daily without regard for food.
- Administer medication at least 2 hr before or 6 hr after antacids containing aluminum or magnesium. Medication may be taken with food at same time as supplements or antacids containing iron or calcium.
- *For virologically-suppressed adults with estimated creatinine clearance <15 mL per min who are receiving chronic hemodialysis:* On days of hemodialysis, administer daily dose after completion of hemodialysis treatment.

Patient/Family Teaching

- Emphasize the importance of taking medication as directed. Do not take more than prescribed amount and do not stop taking without consulting health care professional. Take missed doses as soon as re-

© F.A. Davis Publishing

membered, but not if almost time for next dose; do not double doses. Advise patient to read *Patient Information* before starting therapy and with each Rx refill in case of changes.
- Instruct patient that medication should not be shared with others.
- Inform patient that medication does not cure AIDS or prevent associated or opportunistic infections. Therapy may reduce the risk of transmission of HIV to others through sexual contact or blood contamination. Caution patient to use a condom and to avoid sharing needles or donating blood to prevent spreading the AIDS virus to others.
- Instruct patient to notify health care professional immediately if symptoms of lactic acidosis (tiredness or weakness, unusual muscle pain, trouble breathing, stomach pain with nausea and vomiting, cold especially in arms or legs, dizziness, fast or irregular heartbeat) or if signs of hepatotoxicity (yellow skin or whites of eyes, dark urine, light colored stools, lack of appetite for several days or longer, nausea, abdominal pain) occur.
- Instruct patient to notify health care professional of all Rx or OTC medications, vitamins, or herbal products being taken and consult health care professional before taking any new medications, especially St. John's wort.
- Advise patient to notify health care professional if signs and symptoms of immune reconstitution syndrome (signs and symptoms of an infection) occur.
- Rep: May cause fetal harm. Advise patient taking oral contraceptives to use a nonhormonal method of birth control during therapy. If pregnancy is suspected notify health care professional promptly. Inform pregnant women about the Antiretroviral Pregnancy Registry. Enroll patient by calling 1-800-258-4263. Advise female patient to avoid breast feeding.
- Emphasize the importance of regular follow-up exams and blood counts to determine progress and monitor for side effects.

Evaluation/Desired Outcomes
- Delayed progression of AIDS and decreased opportunistic infections in patients with HIV.
- Decrease in viral load and increase in CD4 cell counts.

binimetinib (bin-i-**me**-ti-nib)
Mektovi

Classification
Therapeutic: antineoplastics
Pharmacologic: kinase inhibitors

Indications
Treatment of metastatic/unresectable melanoma with the BRAF V600E or V600K mutation (in combination with encorafenib).

Action
Inhibits the activity of mitogen-activated extracellular kinase (MEK) 1 and 2 which are enzymes that normally promote cellular proliferation. **Therapeutic Effects:** Decreased progression of melanoma and improved survival.

Pharmacokinetics
Absorption: At least 50% absorbed following oral administration.
Distribution: Extensively distributed to tissues.
Protein Binding: 97%.
Metabolism and Excretion: Mostly metabolized by the liver via glucuronidation. 62% excreted in feces (32% as unchanged drug); 31% excreted in urine (6.5% as unchanged drug).
Half-life: 3.5 hr.

TIME/ACTION PROFILE (blood levels)

ROUTE	ONSET	PEAK	DURATION
PO	unknown	1.6 hr	unknown

Contraindications/Precautions
Contraindicated in: OB: Pregnancy (may cause fetal harm); Lactation: Lactation.
Use Cautiously in: Left ventricular ejection fraction <50%; History of retinal vein occlusion; Uncontrolled glaucoma or history of hypercoagulability (↑ risk of retinal vein occlusion); Moderate or severe hepatic impairment (↓ dose); Rep: Women of reproductive potential; Pedi: Safety and effectiveness not established.

Adverse Reactions/Side Effects
CV: CARDIOMYOPATHY, DEEP VENOUS THROMBOSIS, hypertension, peripheral edema. **Derm:** rash. **EENT:** retinopathy, visual impairment, macular edema, retinal detachment, retinal vein occlusion, uveitis. **F and E:** hyponatremia. **GI:** HEPATOTOXICITY, abdominal pain, constipation, diarrhea, ↑ liver enzymes, nausea, vomiting, colitis. **GU:** ↑ serum creatinine. **Hemat:** HEMORRHAGE, anemia, leukopenia, lymphopenia, neutropenia. **MS:** RHABDOMYOLYSIS, ↑ creatine kinase. **Neuro:** dizziness, fatigue. **Resp:** INTERSTITIAL LUNG DISEASE, PULMONARY EMBOLISM. **Misc:** fever.

Interactions
Drug-Drug: None reported.

Route/Dosage
PO (Adults): 45 mg twice daily; continue until disease progression or unacceptable toxicity.

© F.A. Davis Publishing

Hepatic Impairment

PO (Adults): *Moderate or severe hepatic impairment*— 30 mg twice daily; continue until disease progression or unacceptable toxicity.

Availability

Tablets: 15 mg.

NURSING IMPLICATIONS

Assessment

- Monitor cardiac function (LVEF) by ECG or multigated acquisition (MUGA) scan before starting therapy with binimetinib, one mo after initiation of therapy, and then at 2- to 3-mo intervals during therapy. *If asymptomatic, absolute decrease in LVEF >10% from baseline that is also below lower limit of normal (LLN) occurs,* hold binimetinib for up to 4 wk and evaluate LVEF every 2 wk. Resume binimetinib at reduced dose if present: LVEF ≥ LLN and absolute decrease from baseline is ≤10% and patient is asymptomatic. If LVEF does not recover within 4 wk, permanently discontinue binimetinib. *If symptomatic HF occurs with absolute decrease in LVEF >20% from baseline that is also below LLN,* discontinue binimetinib permanently.
- Monitor for signs and symptoms of venous thromboembolism (shortness of breath, chest pain, arm or leg swelling, cool or pale arm or leg) during therapy. *If uncomplicated deep vein thrombosis (DVT) or pulmonary embolus (PE) occurs,* hold binimetinib. If improves to Grade 0-1, resume at reduced dose. If not improved, permanently discontinue. *If life-threatening PE occurs,* permanently discontinue binimetinib.
- Assess for visual symptoms at each visit. Perform regular ophthalmologic exams. Monitor for signs and symptoms of ocular toxicities (blurred vision, loss of vision, other vision changes, see color dots, halo around objects), swelling, redness, photophobia, eye pain). *If symptomatic retinopathy/retinal pigment epithelial detachments occur*, hold binimetinib for up to 10 days. If improves and becomes asymptomatic, resume at same dose. If not improved, resume at a lower dose or permanently discontinue. *If any grade retinal vein occlusion (RVO) occurs,* permanently discontinue binimetinib. *If Grade 1-3 uveitis occurs,* if Grade 1 or 2 does not respond to specific ocular therapy, or for Grade 3 uveitis, withhold binimetinib for up to 6 wk. If improved, resume at same or reduced dose. If not improved, permanently discontinue binimetinib. *If Grade 4 uveitis occurs,* permanently discontinue therapy.
- Monitor for signs and symptoms of interstitial lung disease or pneumonitis (cough, dyspnea, hypoxia, pleural effusion, infiltrates) during therapy. *If Grade 2 occurs,* hold binimetinib for up to 4 wk. If improved to Grade 0-1, resume at reduced dose. If not resolved within 4 wk, permanently discontinue binimetinib. *If Grade 3 or 4 occurs,* discontinue binimetinib permanently.
- Assess for bleeding (headaches, dizziness, feeling weak, coughing up blood or blood clots, vomiting blood or vomit looks like "coffee grounds", red or black stools that look like tar) during therapy. *If recurrent Grade 2 or first occurrence of Grade 3 occurs,* hold binimetinib for up to 4 wk. If improves to Grade 0-1 or to pretreatment/baseline levels, resume at reduced dose. If no improvement, permanently discontinue binimetinib. *If first occurrence of Grade 4 hemorrhagic event occurs,* permanently discontinue binimetinib, or hold for up to 4 wk. If improves to Grade 0-1 or to pretreatment/baseline levels, resume at reduced dose. If no improvement, permanently discontinue. *If recurrent Grade 3 hemorrhagic event occurs,* consider discontinuing binimetinib permanently. *If recurrent Grade 4 hemorrhagic event occurs,* permanently discontinue therapy.
- ***Lab Test Considerations:*** Verify negative pregnancy test prior to starting therapy.
- Confirm presence of BRAF V600E or V600K mutation in tumor specimens before starting therapy. Information on FDA-approved tests for the detection of BRAF V600 mutations in melanoma is available at: http://www.fda.gov/CompanionDiagnostics.
- Monitor liver function tests before starting therapy, monthly during therapy, and as indicated. *If Grade 2 AST or ALT increased,* continue dose. If no improvement within 2 wk, hold binimetinib until improved to Grade 0-1 or to pretreatment/baseline levels and resume at same dose. *If Grade 3 or 4 AST or increased ALT occurs,* consider permanently discontinuing binimetinib.
- May cause rhabdomyolysis. Monitor CK and serum creatinine levels prior to starting therapy, periodically during therapy, and as indicated. *If Grade 4 asymptomatic CK elevation or any Grade CK elevation with symptoms or with renal impairment occurs,* hold dose for up to 4 wk. If improved to Grade 0-1 resume at reduced dose. If not resolved within 4 wk, permanently discontinue binimetinib.

Implementation

- Dose adjustments for adverse reactions include: *First dose reduction,* 30 mg twice daily. *If patient unable to tolerate 30 mg twice daily,* discontinue binimetinib.
- **PO:** Administer twice daily, about 12 hr apart, without regard to food. Usually taken with encorafenib.

Patient/Family Teaching

- Instruct patient to take medication as directed. Take missed doses as soon as remembered, but not closer than 6 hr to next dose. If patient vomits after dose, omit and take next dose when scheduled.
- Advise patient to notify health care professional promptly if signs and symptoms of HF, venous thromboembolism (sudden onset of difficulty

© F.A. Davis Publishing

breathing, leg pain, swelling), changes in vision, interstitial lung disease (new or worsening cough or dyspnea), hepatotoxicity (jaundice, dark urine, nausea, vomiting, loss of appetite, fatigue, bruising, bleeding), rhabdomyolysis (unusual or new onset weakness, myalgia, darkened urine), or hemorrhage occur.

- Rep: May be teratogenic. Advise females of reproductive potential to use effective contraception during and for at least 30 days after last dose and to avoid breast feeding for 3 days after last dose. Advise patient to notify health care professional if pregnancy is planned or suspected.

Evaluation/Desired Outcomes

- Decreased progression of melanoma and improved survival.

bisacodyl (bis-a-koe-dill)

Bisac-Evac, Bisacolax, Biscolax, Carter's Little Pills, Codulax, Correctol, Dacodyl, Doxidan, Dulcolax, Ex-Lax Ultra, Femilax, Fleet Laxative, Soflax-Ex

Classification

Therapeutic: laxatives
Pharmacologic: stimulant laxatives

Indications

Treatment of constipation. Evacuation of the bowel before radiologic studies or surgery. Part of a bowel regimen in spinal cord injury patients.

Action

Stimulates peristalsis. Alters fluid and electrolyte transport, producing fluid accumulation in the colon. **Therapeutic Effects:** Evacuation of the colon.

Pharmacokinetics

Absorption: Variable absorption follows oral administration; rectal absorption is minimal; action is local in the colon.
Distribution: Small amounts of metabolites excreted in breast milk.
Metabolism and Excretion: Small amounts absorbed are metabolized by the liver.
Half-life: Unknown.

TIME/ACTION PROFILE (evacuation of bowel)

ROUTE	ONSET	PEAK	DURATION
PO	6–12 hr	unknown	unknown
Rectal	15–60 min	unknown	unknown

Contraindications/Precautions

Contraindicated in: Hypersensitivity; Abdominal pain; Obstruction; Nausea or vomiting (especially with fever or other signs of an acute abdomen).
Use Cautiously in: Severe cardiovascular disease; Anal or rectal fissures; Excess or prolonged use (may result in dependence); OB, Lactation: May be used during pregnancy and lactation.

Adverse Reactions/Side Effects

GI: abdominal cramps, nausea, diarrhea, rectal burning. **F and E:** hypokalemia (with chronic use). **MS:** muscle weakness (with chronic use). **Misc:** protein-losing enteropathy, tetany (with chronic use).

Interactions

Drug-Drug: Antacids, histamine H_2-receptor antagonists, and **gastric acid–pump inhibitors** may remove enteric coating of tablets resulting in gastric irritation/dyspepsia. May ↓ the absorption of other **orally administered drugs** because of ↑ motility and ↓ transit time.
Drug-Food: Milk may remove enteric coating of tablets, resulting in gastric irritation/dyspepsia.

Route/Dosage

PO (Adults and Children ≥12 yr): 5–15 mg/day (up to 30 mg/day) as a single dose.
PO (Children 3–11 yr): 5–10 mg/day (0.3 mg/kg) as a single dose.
Rect (Adults and Children ≥12 yr): 10 mg/day single dose.
Rect (Children 2–11 yr): 5–10 mg/day single dose.
Rect (Children <2 yr): 5 mg/day single dose.

Availability (generic available)

Enteric-coated tablets: 5 mg[OTC]. **Enteric coated and delayed release:** 5 mg[OTC]. **Suppositories:** 10 mg[OTC]. **Rectal solution:** 10 mg/30 mL[OTC]. ***In combination with:*** In Bowel Preparation kits with Magnesium citrate (Evac-Q-Kwik[OTC], EZ-EM Prep Kit[OTC], LiquiPrep Bowel Evacuant[OTC], Tridate Bowel Cleansing Kit[OTC]), Phosphate/biphosphate (Fleet Prep Kit. No. 1[OTC], Fleet Prep Kit No. 2[OTC], Fleet Prep Kit No. 3[OTC]), sennosides (X-Prep Bowel Evacuant Kit #1[OTC]), sennosides, magnesium citrate, magnesium sulfate (X-Prep Bowel Evacuant Kit #2[OTC]). See Appendix N.

NURSING IMPLICATIONS

Assessment

- Assess patient for abdominal distention, presence of bowel sounds, and usual pattern of bowel function.
- Assess color, consistency, and amount of stool produced.

Implementation

- Do not confuse Dulcolax (bisacodyl) with Dulcolax (docusate sodium).

© F.A. Davis Publishing

- May be administered at bedtime for morning results.
- **PO:** Taking on an empty stomach will produce more rapid results.
- Do not crush or chew enteric-coated tablets. Take with a full glass of water or juice.
- Do not administer oral doses within 1 hr of milk or antacids; this may lead to premature dissolution of tablet and gastric or duodenal irritation.
- **Rect:** Suppository or enema can be given at the time a bowel movement is desired. Lubricate suppositories with water or water-soluble lubricant before insertion. Encourage patient to retain the suppository or enema 15–30 min before expelling.

Patient/Family Teaching

- Advise patients, other than those with spinal cord injuries, that laxatives should be used only for short-term therapy. Prolonged therapy may cause electrolyte imbalance and dependence.
- Advise patient to increase fluid intake to at least 1500–2000 mL/day during therapy to prevent dehydration.
- Encourage patients to use other forms of bowel regulation (increasing bulk in the diet, increasing fluid intake, or increasing mobility). Normal bowel habits may vary from 3 times/day to 3 times/wk.
- Instruct patients with cardiac disease to avoid straining during bowel movements (Valsalva maneuver).
- Advise patient that bisacodyl should not be used when constipation is accompanied by abdominal pain, fever, nausea, or vomiting.

Evaluation/Desired Outcomes

- Soft, formed bowel movement when used for constipation.
- Evacuation of colon before surgery or radiologic studies, or for patients with spinal cord injuries.

bisoprolol (bis-**oh**-proe-lol)

~~Zebeta~~

Classification

Therapeutic: antihypertensives
Pharmacologic: beta blockers

Indications

Management of hypertension.

Action

Blocks stimulation of $beta_1$ (myocardial)-adrenergic receptors. Does not usually affect $beta_2$ (pulmonary, vascular, uterine)-receptor sites. **Therapeutic Effects:** Decreased BP and heart rate.

Pharmacokinetics

Absorption: Well absorbed after oral administration, but 20% undergoes first-pass hepatic metabolism.
Distribution: Unknown.
Metabolism and Excretion: 50% excreted unchanged by the kidneys; remainder renally excreted as metabolites; 2% excreted in feces.
Half-life: 9–12 hr.

TIME/ACTION PROFILE (antihypertensive effect)

ROUTE	ONSET	PEAK	DURATION
PO	unknown	1–4 hr	24 hr

Contraindications/Precautions

Contraindicated in: Uncompensated HF; Pulmonary edema; Cardiogenic shock; Bradycardia or heart block.
Use Cautiously in: Renal impairment (dosage ↓ recommended); Hepatic impairment (dosage ↓ recommended); Pulmonary disease (including asthma; $beta_1$ selectivity may be lost at higher doses); avoid use if possible; Diabetes mellitus (may mask signs of hypoglycemia); Thyrotoxicosis (may mask symptoms); Patients with a history of severe allergic reactions (intensity of reactions may be ↑); OB, Lactation, Pedi: Safety not established; crosses the placenta and may cause fetal/neonatal bradycardia, hypotension, hypoglycemia, or respiratory depression; Geri: ↑ sensitivity to beta blockers; initial dosage ↓ recommended.

Adverse Reactions/Side Effects

EENT: blurred vision, stuffy nose. **Neuro:** fatigue, weakness, anxiety, depression, dizziness, drowsiness, insomnia, memory loss, mental status changes, nervousness, nightmares. **Resp:** bronchospasm, wheezing. **CV:** BRADYCARDIA, HF, PULMONARY EDEMA, hypotension, peripheral vasoconstriction. **GI:** constipation, diarrhea, ↑ liver function tests, nausea, vomiting. **GU:** erectile dysfunction, ↓ libido, urinary frequency. **Derm:** rash. **Endo:** hyperglycemia, hypoglycemia. **MS:** arthralgia, back pain, joint pain. **Misc:** drug-induced lupus syndrome.

Interactions

Drug-Drug: General anesthetics, **IV phenytoin**, and **verapamil** may cause additive myocardial depression. Additive bradycardia may occur with **digoxin**, **diltiazem**, **verapamil**, or **clonidine**. Additive hypotension may occur with other **antihypertensives**, acute ingestion of **alcohol**, or **nitrates**. Concurrent use with **amphetamine**, **cocaine**, **ephedrine**, **epinephrine**, **norepinephrine**, **phenylephrine**, or **pseudoephedrine** may result in unopposed alpha-adrenergic stimulation (excessive hypertension, bradycardia). Concurrent thyroid preparation administration may ↓ effectiveness. May alter the effectiveness of **insulins** or **oral hypoglycemic agents** (dose adjustments may be necessary). May ↓ the effectiveness of **theophylline**. May ↓ the $beta_1$-cardiovascular effects of **dopamine** or **dobutamine**. Use cautiously within 14 days of **MAO inhibitor** therapy (may result in hypertension).

Route/Dosage

PO (Adults): 5 mg once daily, may be ↑ to 10 mg once daily (range 2.5–20 mg/day).

© F.A. Davis Publishing

Renal Impairment
PO (Adults): *CCr <40 mL/min*— Initiate therapy with 2.5 mg/day, titrate cautiously.

Hepatic Impairment
PO (Adults): *Hepatitis/Cirrhosis*— Initiate therapy with 2.5 mg/day, titrate cautiously.

Availability (generic available)
Tablets: 5 mg, 10 mg. ***In combination with:*** hydrochlorothiazide (Ziac). See Appendix N.

NURSING IMPLICATIONS

Assessment
- Monitor BP, ECG, and pulse frequently during dosage adjustment period and periodically throughout therapy.
- Monitor intake and output ratios and daily weights. Assess routinely for signs and symptoms of HF (dyspnea, rales/crackles, weight gain, peripheral edema, jugular venous distention).
- Monitor frequency of prescription refills to determine adherence.
- ***Lab Test Considerations:*** May cause increased BUN, serum lipoprotein, potassium, triglyceride, and uric acid levels.
- May cause increased ANA titers.
- May cause increase in blood glucose levels.

Implementation
- **PO:** Take apical pulse before administering. If <50 bpm or if arrhythmia occurs, withhold medication and notify physician or other health care professional.
- May be administered without regard to meals.

Patient/Family Teaching
- Instruct patient to take medication exactly as directed, at the same time each day, even if feeling well; do not skip or double up on missed doses. If a dose is missed, it should be taken as soon as possible up to 4 hr before next dose. Abrupt withdrawal may precipitate life-threatening arrhythmias, hypertension, or myocardial ischemia.
- Teach patient and family how to check pulse and BP. Instruct them to check pulse daily and BP biweekly and to report significant changes to health care professional.
- May cause drowsiness. Caution patients to avoid driving or other activities that require alertness until response to the drug is known.
- Advise patients to change positions slowly to minimize orthostatic hypotension.
- Caution patient that this medication may increase sensitivity to cold.
- Instruct patient to notify health care professional of all Rx or OTC medications, vitamins, or herbal products being taken and to consult health care professional before taking any Rx, OTC, or herbal products, especially cold preparations, concurrently with this medication. Patients on antihypertensive therapy should also avoid excessive amounts of coffee, tea, and cola.
- Diabetics should closely monitor blood glucose, especially if weakness, malaise, irritability, or fatigue occurs. Medication does not block dizziness or sweating as signs of hypoglycemia.
- Advise patient to notify health care professional if slow pulse, difficulty breathing, wheezing, cold hands and feet, dizziness, light-headedness, confusion, depression, rash, fever, sore throat, unusual bleeding, or bruising occurs.
- Instruct patient to inform health care professional of medication regimen before treatment or surgery.
- Advise patient to carry identification describing disease process and medication regimen at all times.
- **Hypertension:** Reinforce the need to continue additional therapies for hypertension (weight loss, sodium restriction, stress reduction, regular exercise, moderation of alcohol consumption, and smoking cessation). Medication controls but does not cure hypertension.

Evaluation/Desired Outcomes
- Decrease in BP.

HIGH ALERT

bivalirudin (bi-val-i-**roo**-din)
Angiomax

Classification
Therapeutic: anticoagulants
Pharmacologic: thrombin inhibitors

Indications
Patients undergoing percutaneous coronary intervention (PCI), including those with heparin-induced thrombocytopenia (HIT) or heparin-induced thrombocytopenia and thrombosis syndrome (HITTS).

Action
Specifically and reversibly inhibits thrombin by binding to its receptor sites. Inhibition of thrombin prevents activation of factors V, VIII, and XII; the conversion of fibrinogen to fibrin; platelet adhesion and aggregation.
Therapeutic Effects: Decreased acute ischemic complications in patients with unstable angina (death, MI, or the urgent need for revascularization procedures).

Pharmacokinetics
Absorption: IV administration results in complete bioavailability.
Distribution: Unknown.
Metabolism and Excretion: Cleared from plasma by a combination of renal mechanisms and proteolytic breakdown.

© F.A. Davis Publishing

Half-life: 25 min (↑ in renal impairment).

TIME/ACTION PROFILE (anticoagulant effect)

ROUTE	ONSET	PEAK	DURATION
IV	immediate	unknown	1–2 hr

Contraindications/Precautions

Contraindicated in: Active major bleeding; Hypersensitivity.

Use Cautiously in: Any disease state associated with an ↑ risk of bleeding; Heparin-induced thrombocytopenia or heparin-induced thrombocytopenia-thrombosis syndrome; Patients with unstable angina not undergoing PCI; Patients with other acute coronary syndromes; Concurrent use with other platelet aggregation inhibitors (safety not established); Renal impairment (↓ infusion rate if CCr <30 mL/min); OB: Safety not established; Lactation: Use while breast feeding only if benefit to patient outweighs potential risk to infant; Pedi: Safety and effectiveness not established.

Adverse Reactions/Side Effects

CV: ACUTE STENT THROMBOSIS (especially in patients with ST-segment elevation mi undergoing PCI), hypotension, bradycardia, hypertension. **GI:** nausea, abdominal pain, dyspepsia, vomiting. **Hemat:** BLEEDING. **Local:** injection site pain. **MS:** back pain. **Neuro:** headache, anxiety, insomnia, nervousness. **Misc:** pain, fever, pelvic pain.

Interactions

Drug-Drug: Risk of bleeding may be ↑ by concurrent use of **heparin**, **low molecular weight heparins**, **clopidogrel**, **thrombolytics**, or any other **drugs that inhibit coagulation**.

Drug-Natural Products: ↑ risk of bleeding with **arnica**, **chamomile**, **clove**, **dong quai**, **feverfew**, **garlic**, **ginger**, **gingko**, **Panax ginseng**, and others.

Route/Dosage

IV (Adults): 0.75 mg/kg as a bolus injection, followed by an infusion at a rate of 1.75 mg/kg/hr for the duration of the PCI procedure. An activated clotting time (ACT) should be performed 5 min after bolus dose and an additional bolus dose of 0.3 mg/kg may be administered if needed. Continuation of the infusion (at a rate of 1.75 mg/kg/hr) for up to 4 hr post-procedure is optional (should be considered in patients with ST-segment elevation MI). Therapy should be initiated prior to the procedure and given in conjunction with aspirin.

Renal Impairment

IV (Adults): No ↓ in the bolus dose is needed in any patient with renal impairment. *CCr <30 mL/min*— ↓ infusion rate to 1 mg/kg/hr; *Hemodialysis*— ↓ infusion rate to 0.25 mg/kg/hr.

Availability (generic available)

Lyophilized powder for injection: 250 mg/vial.

Premixed infusion: 250 mg/50 mL (in 0.9% NaCl or as ready-to-use vial), 500 mg/100 mL 0.9% NaCl.

NURSING IMPLICATIONS

Assessment

- Assess for bleeding. Most common is oozing from the arterial access site for cardiac catheterization. Minimize use of arterial and venous punctures, IM injections, and use of urinary catheters, nasotracheal intubation, and nasogastric tubes. Avoid noncompressible sites for IV access. If bleeding cannot be controlled with pressure, discontinue bivalirudin immediately.
- Monitor vital signs. May cause bradycardia, hypertension, or hypotension. An unexplained decrease in BP may indicate hemorrhage.
- Monitor patients with STEMI undergoing primary PCI with bivalirudin for acute stent thrombosis for at least 24 hrs in a facility capable of managing ischemic complications.
- ***Lab Test Considerations:*** Assess hemoglobin, hematocrit, and platelet count prior to bivalirudin therapy and periodically during therapy. May cause ↓ hemoglobin and hematocrit. An unexplained ↓ in hematocrit may indicate hemorrhage.
- Bivalirudin interferes with INR measurements; INR may not be useful in determining appropriate dose of warfarin.
- Monitor ACT periodically in patients with renal dysfunction.

Implementation

- Administer IV just prior to PCI, in conjunction with aspirin 300 mg to 325 mg/day. Do not administer IM.

IV Administration

- **IV Push:** (for bolus dose) ***Reconstitution:*** Reconstitute each 250-mg vial with 5 mL of sterile water for injection. Reconstituted vials are stable for 24 hr if refrigerated. ***Dilution:*** Further dilute in 50 mL of D5W or 0.9% NaCl. Withdraw bolus dose out of bag. Infusion is stable for 24 hr at room temperature. ***Concentration:*** Final concentration of infusion is 5 mg/mL. ***Rate:*** Administer as a bolus injection.
- **Intermittent Infusion:** ***Reconstitution:*** Reconstitute each 250-mg vial as per the above directions. ***Dilution:*** Further dilute in 50 mL of D5W or 0.9% NaCl. If infusion is to be continued after 4 hr (at a rate of 0.2 mg/kg/hr), reconstituted vial should be diluted in 500 mL of D5W or 0.9% NaCl. Infusion is stable for 24 hr at room temperature. ***Concentration:*** 5 mg/mL (for infusion rate of 1.75 mg/kg/hr); 0.5 mg/mL (for infusion rate of 0.2 mg/kg/hr). ***Rate:*** Based on patient's weight (see Route/Dosage section).
- **Y-Site Compatibility:** acyclovir, alfentanil, allopurinol, amifostine, amikacin, aminocaproic acid, aminophylline, amphotericin B liposome, ampicillin, ampicillin-sulbactam, anidulafungin, argatroban, arsenic trioxide, atropine, azithromycin, aztreonam, bleomycin, bumetanide, buprenorphine, busulfan,

© F.A. Davis Publishing

butorphanol, calcium chloride, calcium gluconate, cangrelor, carboplatin, carmustine, cefazolin, cefepime, cefotaxime, cefotetan, cefoxitin, ceftazidime, ceftriaxone, cefuroxime, chloramphenicol, ciprofloxacin, cisatracurium, cisplatin, clindamycin, cyclophosphamide, cyclosporine, cytarabine, dacarbazine, dactinomycin, daptomycin, daunorubicin, dexamethasone, dexmedetomidine, dexrazoxane, digoxin, diltiazem, diphenhydramine, docetaxel, dopamine, doxorubicin, doxorubicin liposomal, doxycycline, droperidol, enalaprilat, ephedrine, epinephrine, epirubicin, epoprostenol, eptifibatide, ertapenem, erythromycin, esmolol, etoposide, etoposide phosphate, fenoldopam, fentanyl, fluconazole, fludarabine, fluorouracil, foscarnet, fosphenytoin, furosemide, ganciclovir, gemcitabine, gentamicin, glycopyrrolate, granisetron, heparin, hydralazine, hydrocortisone, hydromorphone, idarubicin, ifosfamide, imipenem/cilastatin, insulin, irinotecan, isoproterenol, ketorolac, leucovorin calcium, levofloxacin, lidocaine, linezolid, magnesium sulfate, mannitol, melphalan, meperidine, meropenem, mesna, methotrexate, methylprednisolone, metoclopramide, metoprolol, metronidazole, midazolam, milrinone, mitomycin, mitoxantrone, morphine, moxifloxacin, mycophenolate, nafcillin, nalbuphine, naloxone, nicardipine, nitroglycerin, nitroprusside, norepinephrine, octreotide, ondansetron, oxaliplatin, oxytocin, paclitaxel, palonosetron, pamidronate, pancuronium, pemetrexed, pentobarbital, phenobarbital, phenylephrine, piperacillin-tazobactam, potassium acetate, potassium chloride, potassium phosphates, procainamide, propranolol, remifentanil, rocuronium, sodium acetate, sodium bicarbonate, sodium phosphates, streptozocin, succinylcholine, sufentanil, tacrolimus, theophylline, thiopental, thiotepa, tigecycline, tirofiban, tobramycin, topotecan, trimethoprim/sulfamethoxazole, vasopressin, vecuronium, verapamil, vinblastine, vincristine, vinorelbine, voriconazole, warfarin, zidovudine, zoledronic acid.

- **Y-Site Incompatibility:** alteplase, amiodarone, amphotericin B deoxycholate, amphotericin B lipid complex, caspofungin, chlorpromazine, dantrolene, diazepam, dobutamine, pentamidine, phenytoin, prochlorperazine, quinupristin/dalfopristin, reteplase, vancomycin.

Patient/Family Teaching

- Inform patient of the purpose of bivalirudin.
- Instruct patient to notify health care professional immediately if any bleeding or bruising is noted.
- Instruct patient to notify health care professional of all Rx or OTC medications, vitamins, or herbal products being taken and consult health care professional before taking any new medications.
- Advise female patients of reproductive potential to notify health care professional if pregnancy is planned or suspected or of breast feeding.

Evaluation/Desired Outcomes

- Decreased acute ischemic complications in patients with unstable angina (death, MI, or the urgent need for revascularization procedures).

HIGH ALERT

bleomycin (blee-oh-**mye**-sin)

Blenoxane

Classification

Therapeutic: antineoplastics
Pharmacologic: antitumor antibiotics

Indications

Treatment of: Lymphomas, Squamous cell carcinoma, Testicular embryonal cell carcinoma, Choriocarcinoma, Teratocarcinoma. Intrapleural administration to prevent the reaccumulation of malignant effusions.

Action

Inhibits DNA and RNA synthesis. **Therapeutic Effects:** Death of rapidly replicating cells, particularly malignant ones.

Pharmacokinetics

Absorption: Well absorbed from IM and subcut sites. Absorption follows intrapleural and intraperitoneal administration.
Distribution: Widely distributed, concentrates in skin, lungs, peritoneum, kidneys, and lymphatics.
Metabolism and Excretion: 60–70% excreted unchanged by the kidneys.
Half-life: 2 hr (↑ in renal impairment).

TIME/ACTION PROFILE (tumor response)

ROUTE	ONSET	PEAK	DURATION
IV, IM, Subcut	2–3 wk	unknown	unknown

Contraindications/Precautions

Contraindicated in: Hypersensitivity; OB, Lactation: Potential for fetal, infant harm.
Use Cautiously in: Renal impairment (dose ↓ required if CCr <35 mL/min); Pulmonary impairment; Nonmalignant chronic debilitating illness; Patients with childbearing potential; Geri: ↑ risk of pulmonary toxicity and reduction in renal function.

Adverse Reactions/Side Effects

Neuro: aggressive behavior, disorientation, weakness. **Resp:** PULMONARY FIBROSIS, pneumonitis. **CV:** hypotension, peripheral vasoconstriction. **GI:** anorexia, nausea, stomatitis, vomiting. **Derm:** hyperpigmentation, mucocutaneous toxicity, alopecia, erythema,

© F.A. Davis Publishing

rashes, urticaria, vesiculation. **Hemat:** anemia, leukopenia, thrombocytopenia. **Local:** pain at tumor site, phlebitis at IV site. **Metab:** weight loss. **Misc:** ANAPHYLACTOID REACTIONS, chills, fever.

Interactions

Drug-Drug: Hematologic toxicity ↑ with concurrent use of **radiation therapy** and other **antineoplastics**. Concurrent use with **cisplatin** ↓ elimination of bleomycin and may ↑ toxicity. ↑ risk of pulmonary toxicity with other **antineoplastics** or thoracic **radiation therapy**. **General anesthesia** ↑ the risk of pulmonary toxicity. ↑ risk of Raynaud's phenomenon when used with **vinblastine**.

Route/Dosage

Lymphoma patients should receive initial test doses of 2 units or less for the first 2 doses.

IV, IM, Subcut (Adults and Children): 0.25–0.5 unit/kg (10–20 units/m^2) weekly or twice weekly initially. If favorable response, lower maintenance doses given (1 unit/day or 5 units/wk IM or IV). May also be given as continuous IV infusion at 0.25 unit/kg or 15 units/m^2/day for 4–5 days.

Intrapleural (Adults): 15–20 units instilled for 4 hr, then removed.

Availability (generic available)

Injection: 15 units/vial, 30 units/vial.

NURSING IMPLICATIONS

Assessment

- Monitor vital signs before and frequently during therapy.
- Assess for fever and chills. May occur 3–6 hr after administration and last 4–12 hr.
- Monitor for anaphylactic (fever, chills, hypotension, wheezing) and idiosyncratic (confusion, hypotension, fever, chills, wheezing) reactions. Keep resuscitation equipment and medications on hand. Lymphoma patients are at particular risk for idiosyncratic reactions that may occur immediately or several hrs after therapy, usually after the 1st or 2nd dose.
- Assess respiratory status for dyspnea and rales/crackles. Monitor chest x-ray before and periodically during therapy. Pulmonary toxicity occurs primarily in geriatric patients (age 70 or older) who have received 400 or more units or at lower doses in patients who received other antineoplastics or thoracic radiation. May occur 4–10 wk after therapy. Discontinue and do not resume bleomycin if pulmonary toxicity occurs.
- Assess nausea, vomiting, and appetite. Weigh weekly. Modify diet as tolerated. Antiemetics may be given before administration.
- ***Lab Test Considerations:*** Monitor CBC before and periodically during therapy. May cause thrombocytopenia and leukopenia (nadir occurs in 12 days and usually returns to pretreatment levels by day 17).
- Monitor baseline and periodic renal and hepatic function.

Implementation

- ***High Alert:*** Fatalities have occurred with chemotherapeutic agents. Before administering, clarify all ambiguous orders; double-check single, daily, and course-of-therapy dose limits; have second practitioner independently double-check original order and dose calculations.
- Prepare solution in a biologic cabinet. Wear gloves, gown, and mask while handling medication. Discard equipment in specially designated containers.
- Lymphoma patients should receive a 1- or 2-unit test dose 2–4 hr before initiation of therapy. Monitor closely for anaphylactic reaction. May not detect reactors.
- Premedication with acetaminophen, corticosteroids, and diphenhydramine may reduce drug fever and risk of anaphylaxis.
- Reconstituted solution is stable for 24 hr at room temperature and for 14 days if refrigerated.
- **IM Subcut:** Reconstitute vial with 1–5 mL of sterile water for injection, 0.9% NaCl, or bacteriostatic water for injection. Do not reconstitute with diluents containing benzyl alcohol when used for neonates.

IV Administration

- **Intermittent Infusion:** Prepare IV doses by diluting 15-unit vial with at least 5 mL of 0.9% NaCl. ***Dilution:*** Further dilute dose in 50 to 1000 mL of D5W or 0.9% NaCl. ***Rate:*** Administer slowly over 10 min.
- **Y-Site Compatibility:** allopurinol, amifostine, aminocaproic acid, aminophylline, amiodarone, anidulafungin, atracurium, aztreonam, bivalirudin, bumetanide, busulfan, calcium chloride, calcium gluconate, carboplatin, carmustine, caspofungin, cefepime, chlorpromazine, cimetidine, cisatracurium, cisplatin, codeine, cyclophosphamide, cyclosporine, cytarabine, dacarbazine, dactinomycin, daptomycin, daunorubicin, dexamethasone, dexmedetomidine, dexrazoxane, digoxin, diltiazem, diphenhydramine, dobutamine, docetaxel, dopamine, doxacurium, doxorubicin, doxorubicin liposome, droperidol, enalaprilat, epinephrine, epirubicin, ertapenem, esmolol, etoposide, etoposide phosphate, famotidine, fenoldopam, filgrastim, fludarabine, fluorouracil, fosphenytoin, furosemide, gemcitabine, glycopyrrolate, granisetron, haloperidol, heparin, hetastarch, hydralazine, hydrocortisone, idarubicin, ifosfamide, insulin, isoproterenol, ketorolac, labetalol, leucovorin calcium, levofloxacin, lidocaine, magnesium sulfate, mannitol, melphalan, meperidine, mesna, metaraminol, methotrexate, methyldopate, methylprednisolone, metoclopramide, metoprolol, milrinone, mitomycin, mitoxantrone, naloxone, nicardipine, nitroglycerin, norepinephrine, octreotide, ondansetron, oxaliplatin, paclitaxel, palonosetron, pancuronium, pantoprazole, pemetrexed, phentol-

© F.A. Davis Publishing

amine, phenylephrine, piperacillin/tazobactam, potassium chloride, potassium phosphates, procainamide, quinupristin/dalfopristin, rituximab, sargramostim, sodium acetate, thiotepa, tirofiban, trastuzumab, vinblastine, vincristine, vinorelbine, voriconazole.

- **Y-Site Incompatibility:** amphotericin B liposome, dantrolene, phenytoin, tigecycline.
- **Intrapleural:** Dissolve 60 units in 50–100 mL of 0.9% NaCl.
- May be administered through thoracotomy tube. Position patient as directed.

Patient/Family Teaching

- Instruct patient to notify health care professional if fever, chills, wheezing, faintness, diaphoresis, shortness of breath, prolonged nausea and vomiting, or mouth sores occur.
- Encourage patient not to smoke because this may worsen pulmonary toxicity.
- Explain to the patient that skin toxicity may manifest itself as skin sensitivity, hyperpigmentation (especially at skin folds and points of skin irritation), and skin rashes and thickening.
- Instruct patient to inspect oral mucosa for erythema and ulceration. If ulceration occurs, advise patient to use sponge brush and rinse mouth with water after eating and drinking. Opioid analgesics may be required if pain interferes with eating.
- Discuss with patient the possibility of hair loss. Explore coping strategies.
- Advise patient of the need for contraception during therapy.
- Instruct patient not to receive any vaccinations without advice of health care professional.
- Emphasize need for periodic lab tests to monitor for side effects.

Evaluation/Desired Outcomes

- Decrease in tumor size without evidence of hypersensitivity or pulmonary toxicity.

bortezomib (bor-**tez**-o-mib)

Velcade

Classification

Therapeutic: antineoplastics

Pharmacologic: proteasome inhibitors

Indications

Multiple myeloma (as initial therapy or after progression) (in combination with melphalan and prednisone). Mantle cell lymphoma.

Action

Inhibits proteasome, a regulator of intracellular protein catabolism, resulting in disruption of various intracellular processes. Cytotoxic to a variety of cancerous cells.

Therapeutic Effects: Decreased progression and improved survival in multiple myeloma and mantle cell lymphoma.

Pharmacokinetics

Absorption: IV administration results in complete bioavailability.

Distribution: Unknown.

Metabolism and Excretion: Mostly metabolized by the liver (P450 enzymes); excretion is unknown.

Half-life: 9–15 hr.

TIME/ACTION PROFILE

ROUTE	ONSET	PEAK	DURATION
IV	unknown	38 days*	unknown

*Median time to response based on clinical parameters.

Contraindications/Precautions

Contraindicated in: Hypersensitivity to bortezomib, boron, or mannitol; Intrathecal administration (may cause death); OB: Pregnancy (may cause fetal harm); Lactation: Lactation.

Use Cautiously in: Moderate to severe hepatic impairment (may ↑ levels, risk of toxicity); History of or risk factors for HF; Rep: Women of reproductive potential and men with female partners of reproductive potential; Pedi: Safety not established.

Adverse Reactions/Side Effects

CV: hypotension, HF. **Derm:** STEVENS-JOHNSON SYNDROME, TOXIC EPIDERMAL NECROLYSIS. **EENT:** blurred vision, diplopia. **GI:** LIVER FAILURE, anorexia, constipation, diarrhea, nausea, vomiting. **Hemat:** THROMBOTIC THROMBOCYTOPENIC PURPURA/HEMOLYTIC UREMIC SYNDROME, BLEEDING, anemia, neutropenia, thrombocytopenia. **Neuro:** peripheral neuropathy, PROGRESSIVE MULTIFOCAL LEUKOENCEPHALOPATHY (PML), POSTERIOR REVERSIBLE ENCEPHALOPATHY SYNDROME (PRES), fatigue, malaise, weakness, dizziness, syncope. **Resp:** pneumonia. **Misc:** fever, tumor lysis syndrome.

Interactions

Drug-Drug: Concurrent neurotoxic medications including **amiodarone**, some **antivirals**, **nitrofurantoin**, **isoniazid**, or **HMG-CoA reductase inhibitors** may ↑ risk of peripheral neuropathy.

Route/Dosage

Previously Untreated Multiple Myeloma

IV, Subcut (Adults): 1.3 mg/m² twice weekly for Cycles 1–4 (days 1, 4, 8, 11, 22, 25, 29, and 32; no treatment during cycle 3), then once weekly for Cycles 5–9 (days 1, 8, 22, and 29; no treatment during Cycle 7); further cycles/doses depend on response and toxicity.

© F.A. Davis Publishing

Previously Untreated Mantle Cell Lymphoma

IV, Subcut (Adults): 1.3 mg/m² twice weekly on days 1, 4, 8, and 11, followed by a 10–day rest (days 12–21); repeat for 5 additional cycles; further cycles/doses depend on response and toxicity.

Relapsed Multiple Myeloma and Mantle Cell Lymphoma

IV, Subcut (Adults): 1.3 mg/m² twice weekly for 2 wk (days 1, 4, 8, and 11), followed by a 10-day rest; further cycles/doses depend on response and toxicity. Patients with multiple myeloma who have previously responded to bortezomib therapy and who have relapsed ≥6 mo after prior bortezomib therapy can be started on their last tolerated dose; dose should be given twice weekly (days 1, 4, 8, and 11) every 3 wk for a maximum of 8 cycles.

Hepatic Impairment

IV (Adults): *Moderate or severe hepatic impairment*—0.7 mg/m² per injection for the first cycle, then may ↑ to 1 mg/m² per injection or ↓ further to 0.5 mg/m² per injection, based on tolerability.

Availability (generic available)

Lyophilized powder for injection: 3.5 mg/vial.

NURSING IMPLICATIONS

Assessment

- Monitor vital signs frequently during therapy. May cause fever and orthostatic hypotension requiring adjustment of antihypertensives, hydration, or administration of mineralocorticoids.
- Monitor for GI adverse effects. May require antidiarrheals, antiemetics, and fluid and electrolyte replacement to prevent dehydration. Weigh weekly; modify diet as tolerated.
- Monitor for signs and symptoms of peripheral neuropathy (burning sensation, hyperesthesia, hypoesthesia, paresthesia, discomfort, neuropathic pain, weakness) during therapy. *If peripheral neuropathy is Grade 1 (paresthesia or loss of reflexes without pain or loss of function)* continue prescribed dose. *If paresthesia is Grade 1 with pain or Grade 2 (interfering with function but not with daily activities)* reduce dose to 1.0 mg/m². *If peripheral neuropathy is Grade 2 with pain or Grade 3 (interfering with activities of daily living)* withhold dose until toxicity resolves, then reinitiate with a reduced dose of 0.7 mg/m² and decrease frequency to once/wk. *If peripheral neuropathy is Grade 4 (permanent sensory loss that interferes with daily function)* discontinue bortezomib.
- Monitor for signs and symptoms of tumor lysis syndrome (tachypnea, tachycardia, hypotension, pulmonary edema). Patients with high tumor burden prior to treatment are at increased risk.
- Monitor for signs of PRES (headache, seizure, lethargy, confusion, blindness). Hypertension may or may not be present. May occur within 16 hr to 1 yr of initiation of therapy. Treat hypertension if present and discontinue bortezomib therapy. Symptoms usually resolve within days.
- Assess for any new signs or symptoms that may be suggestive of PML, an opportunistic infection of the brain caused by the JC virus, that leads to death or severe disability; withhold dose and notify health care professional promptly. PML symptoms may begin gradually but usually worsen rapidly. Symptoms vary depending on which part of brain is infected (mental function declines rapidly and progressively, causing dementia; speaking becomes increasingly difficult; partial blindness; difficulty walking; rarely, headaches and seizures occur). Diagnosis is usually made via gadolinium-enhanced MRI and CSF analysis. Risk of PML increases with the number of infusions. Withhold bortezomib at first sign of PML.
- Monitor for signs and symptoms of thrombotic angiopathy (thrombocytopenia, microangiopathic hemolytic anemia, thrombotic thrombocytopenic purpura/hemolytic uremic syndrome, acute kidney injury). Discontinue therapy immediately if clinical or lab symptoms occur.
- ***Lab Test Considerations:*** Verify negative pregnancy test before starting therapy.
- Monitor CBC frequently during therapy. Assess platelet count before each dose. Dose modifications for hematologic toxicity are made based on indication and concurrent drug therapy; see manufacturer's recommendations. The nadir of thrombocytopenia is day 11 and recovery is usually by next cycle. Occurs more commonly in cycles 1 and 2, but may occur throughout therapy. May require discontinuation of therapy.
- Monitor blood glucose levels closely in patients taking oral hypoglycemic agents; may require adjustment of antidiabetic agent dose.

Implementation

- Should be administered under the supervision of a physician experienced in the use of antineoplastic therapy.
- Solution should be prepared in a biologic cabinet. Wear gloves, gown, and mask while handling medication. Discard IV equipment in specially designated containers.

IV Administration

- **Subcut:** ***Reconstitution:*** Reconstitute each vial with 1.4 mL of 0.9% NaCl. ***Concentration:*** 2.5 mg/mL. Solution should be clear and colorless; do not administer solutions that are discolored or contain particulate matter. May inject into thigh or abdomen; rotate injection sites. Inject into sites at least 1 inch from other sites and avoid tender, bruised, erythematous, or indurated sites. If local injection site reac-

© F.A. Davis Publishing

tions occur, may inject a less concentrated (1 mg/mL) solution.

- **IV Push:** ***Reconstitution:*** Reconstitute each vial with 3.5 mL of 0.9% NaCl. Solution should be clear and colorless; do not administer solutions that are discolored or contain particulate matter. ***Concentration:*** 1 mg/mL. Administer reconstituted solution within 8 hr at room temperature; 3 of the 8 hr may be stored in a syringe. ***Rate:*** Administer as a 3–5 sec bolus injection twice weekly for 2 wk followed by a 10-day rest period. At least 72 hr should elapse between consecutive doses.

Patient/Family Teaching

- Caution the patient that dehydration may occur with vomiting or diarrhea. Advise patient to maintain fluid intake and to notify health care professional if dizziness or fainting occurs.
- Instruct patient to contact health care professional if they experience new or worsening signs of peripheral neuropathy (tingling, numbness, pain, burning feeling in the feet or hands, weakness in the arms or legs), PML (progressive weakness on one side of the body or clumsiness of limbs; disturbance of vision; changes in thinking, memory, and orientation leading to confusion and personality changes), or if symptoms of dehydration (dizziness, fainting) due to vomiting or diarrhea; rash; shortness of breath; cough; swelling of feet, ankles, or legs; bleeding, infection, convulsions; persistent headache; reduced eyesight; increase in BP or blurred vision occur.
- May cause dizziness and blurred vision. Caution patient to avoid driving or other activities requiring alertness until response to medication is known.
- Advise patient to notify health care professional of all Rx or OTC medications, vitamins, or herbal products being taken and consult health care professional before taking Rx, OTC, or herbal products, especially St. John's wort.
- Advise diabetic patients taking oral hypoglycemic agents to monitor blood glucose frequently and notify health care professional of changes in blood sugar.
- Rep: Advise females of reproductive potential to use effective contraception during and for 7 mo after last dose and to avoid breast feeding during therapy and for 2 mo after therapy. Advise males with female partner of reproductive potential to use effective contraception for 4 mo after last dose of bortezomib. Patient should notify health care professional immediately if pregnancy is suspected. May impair fertility for male and female patients.

Evaluation/Desired Outcomes

- Decrease in serum and urine myeloma protein.
- Decrease in size and spread of malignancy.

bremelanotide

(**bre**-me-**lan**-oh-tide)

Vyleesi

Classification

Therapeutic: sexual dysfunction agents

Pharmacologic: melanocortin receptor agonists

Indications

Treatment of premenopausal women with acquired, generalized hypoactive sexual desire disorder (HSDD) that is characterized by low sexual desire that causes marked distress or interpersonal difficulty and is NOT due to a concomitant medical or psychiatric condition, relationship problems, or the effects of a medication or drug substance.

Action

Stimulates various melanocortin receptors, with the most notable being MC4R (present in the CNS) and MC41 (present on melanocytes). The precise mechanism by which this receptor activation improves HSDD is unknown. **Therapeutic Effects:** Improved sexual desire.

Pharmacokinetics

Absorption: Completely absorbed following subcutaneous administration.

Distribution: Not distributed to the tissues.

Metabolism and Excretion: Primarily undergoes hydrolysis; 65% excreted in urine, 23% in feces.

Half-life: 2.7 hr.

TIME/ACTION PROFILE (plasma concentrations)

ROUTE	ONSET	PEAK	DURATION
Subcut	unknown	1 hr	unknown

Contraindications/Precautions

Contraindicated in: Uncontrolled hypertension; Cardiovascular disease; OB: Pregnancy (may cause fetal harm).

Use Cautiously in: Patients at high risk for cardiovascular disease; Patients with dark skin (↑ risk for focal hyperpigmentation); Severe hepatic impairment; Severe renal impairment (CCr <30 mL/min); Lactation: Use while breast feeding only if potential maternal benefit justifies potential risk to infant; Rep: Women of reproductive potential; Pedi: Safety and effectiveness not established; Geri: Safety and effectiveness not established.

Adverse Reactions/Side Effects

CV: ↓ heart rate, ↑ blood pressure. **Derm:** flushing, focal hyperpigmentation. **EENT:** nasal congestion, rhi-

© F.A. Davis Publishing

norrhea. **GI:** nausea, abdominal pain, diarrhea, vomiting. **Local:** injection site reactions. **MS:** arthralgia, ↑ creatine kinase, myalgia. **Neuro:** paresthesia, restless leg syndrome, headache, dizziness, fatigue. **Resp:** cough. **Misc:** pain.

Interactions

Drug-Drug: May ↓ absorption of concomitantly administered medications; avoid using bremelanotide when using antibiotics or analgesics. May ↓ **naltrexone** levels; avoid using bremelanotide in patients using naltrexone for substance use disorders.

Route/Dosage

PO (Adults): 1.75 mg given on an as needed basis ≥45 min before anticipated sexual activity (not to exceed one dose/24 hr or 8 doses/mo). Discontinue after 8 wk if no improvement in symptoms.

Availability

Solution for injection: 1.75 mg/0.3 mL.

NURSING IMPLICATIONS

Assessment

- Assess sexual desire prior to and periodically during therapy.
- Assess cardiovascular risk and control of BP periodically during therapy. Systolic BP ↑ 6 mmHg, diastolic BP ↑ 3 mmHg and HR ↓ up to 5 bpm transiently after dose; usually return to normal within 12 hr of dose.
- Assess for focal hyperpigmentation of face, gingiva, and breasts periodically during therapy. More common in patients with dark skin or with >8 doses/month. Consider discontinuation of therapy if hyperpigmentation occurs; may not resolve with discontinuation.
- Assess for nausea during therapy; may require antiemetics. Usually improves with 2nd dose; may require discontinuation.

Implementation

- **Subcut:** Using auto-injector, inject into abdomen or thigh 45 min before anticipated sexual activity. Do not administer more than 1 dose/24 hr or more than 8 doses/month.

Patient/Family Teaching

- Instruct patient to take medication as directed with no more than 1 dose/24 hr or no more than 8 doses/month. Advise patient to read *Patient Information* before starting and with each Rx refill in case of changes.
- Inform patient that increases in BP and decreases in HR may occur after each dose; usually resolve within 12 hr.
- Inform patient that darkening of the skin of the face, gums, and breasts may occur, especially in patients with darker skin. Risks increase with daily use. Advise patient that changes may not resolve after stopping the medication. Contact health care professional for concerns about skin changes.
- Inform patient that nausea may occur, especially after first dose, lasting 2 or more hr. May require antiemetics. Advise patient to notify health care professional if nausea is problematic.
- Instruct patient to notify health care professional of all Rx or OTC medications, vitamins, or herbal products being taken and consult health care professional before taking any new medications.
- Rep: Advise women of reproductive potential use effective contraception during therapy and to notify health care professional if pregnancy is planned or expected or if breast feeding. Discontinue bremelanotide if pregnancy is suspected. Encourage pregnant women exposed to bremelanotide to call the VYLEESI Pregnancy Exposure Registry at (877) 411-2510.

Evaluation/Desired Outcomes

- Improved sexual desire in premenopausal women. If no improvement in 8 wks, discontinue medication.

⋈ brentuximab (bren-tux-i-mab)

Adcetris

Classification

Therapeutic: antineoplastics
Pharmacologic: drug-antibody conjugates

Indications

Classical Hodgkin lymphoma (cHL) in patients who have failed autologous hematopoietic stem cell transplant (auto-HSCT) or who have failed ≥2 prior multiagent chemotherapies and are not candidates for auto-HSCT. cHL in patients who are at high risk of relapse or progression as post-auto-HSCT consolidation. Previously untreated stage III or IV cHL (in combination with doxorubicin, vinblastine, and dacarbazine). Systemic anaplastic large cell lymphoma after failure of ≥1 multi-agent chemotherapy regimen. ⋈ Primary cutaneous anaplastic large cell lymphoma or CD30-expressing mycosis fungoides in patients who have received prior systemic therapy. ⋈ Previously untreated systemic anaplastic large cell lymphoma or other CD30− expressing peripheral T-cell lymphoma (in combination with cyclophosphamide, doxorubicin, and prednisone).

Action

⋈ An antibody-drug conjugate made up three parts: an antibody specific for human CD30 (cAC10, a cell membrane protein of the tumor necrosis factor receptor), a microtubule disrupting agent monomethyl auristatin (MMAE), and a protease-cleavable linker that attaches MMAE covalently to cAC10. The combination disrupts the intracellular microtubule network causing cell-cycle arrest and apoptotic cellular death. **Therapeutic Effects:** Decreased spread of lymphoma.

Pharmacokinetics

Absorption: IV administration results in complete bioavailability.

© F.A. Davis Publishing

Distribution: Unknown.
Metabolism and Excretion: Small amounts of MMAE that are released are metabolized by the liver and eliminated mostly by the kidneys.
Half-life: *ADC*—4–6 days.

TIME/ACTION PROFILE (blood levels)

ROUTE	ONSET	PEAK	DURATION
IV (ADC)	unknown	end of infusion	3 wk
IV (MMAE)	unknown	1–3 days	3 wk

Contraindications/Precautions

Contraindicated in: Concurrent use of bleomycin (↑ risk of pulmonary toxicity); Severe renal impairment (CCr <30 mL/min); Moderate or severe hepatic impairment; OB: Pregnancy (may cause fetal harm); Lactation: Lactation.
Use Cautiously in: Preexisting GI involvement (↑ risk of GI perforation); High BMI or diabetes (↑ risk of hyperglycemia); Rep: Women of reproductive potential and males with female partners of reproductive potential; Pedi: Safety and effectiveness in children not established.

Adverse Reactions/Side Effects

CV: peripheral edema. **Derm:** STEVENS-JOHNSON SYNDROME, TOXIC EPIDERMAL NECROLYSIS, alopecia, night sweats, pruritus, rash, dry skin. **Endo:** hyperglycemia. **F and E:** KETOACIDOSIS. **GI:** BOWEL OBSTRUCTION, ENTEROCOLITIS, GI HEMORRHAGE, GI PERFORATION, GI ULCER, ILEUS, HEPATOTOXICITY, NEUTROPENIC COLITIS, PANCREATITIS, abdominal pain, constipation, ↓ appetite, diarrhea, nausea, vomiting, ulcer. **GU:** ↓ fertility. **Hemat:** NEUTROPENIA, THROMBOCYTOPENIA, anemia. **Metab:** weight loss. **MS:** arthralgia, back pain, extremity pain, myalgia, muscle spasm. **Neuro:** peripheral neuropathy, PROGRESSIVE MULTIFOCAL LEUKOENCEPHALOPATHY (PML), anxiety, dizziness, fatigue, headache, insomnia. **Resp:** ACUTE RESPIRATORY DISTRESS SYNDROME, INTERSTITIAL LUNG DISEASE, cough, dyspnea, oropharyngeal pain. **Misc:** INFUSION REACTIONS (including anaphylaxis), TUMOR LYSIS SYNDROME, fever, lymphadenopathy, chills.

Interactions

Drug-Drug: MMAE is both a substrate and inhibitor of the CYP3A4/5 enzyme system. **Bleomycin** may ↑ risk of pulmonary toxicity; concurrent use contraindicated. **Strong CYP3A4 inhibitors**, including **ketoconazole** may ↑ levels and risk of adverse reactions. **Strong CYP3A4 inducers**, including **rifampin**, may ↓ levels and effectiveness.

Route/Dosage

Relapsed cHL or Relapsed Systemic Anaplastic Large Cell Lymphoma

IV (Adults): 1.8 mg/kg (max dose = 180 mg) every 3 wk until disease progression or unacceptable toxicity.

Renal Impairment

IV (Adults): *CCr <30 mL/min*—Avoid use.

Hepatic Impairment

IV (Adults): *Mild (Child-Pugh A)*—1.2 mg/kg (max dose = 120 mg) every 3 wk until disease progression or unacceptable toxicity; *Moderate (Child-Pugh B) or severe (Child-Pugh C)*—Avoid use.

cHL Consolidation

IV (Adults): 1.8 mg/kg (max dose = 180 mg) every 3 wk until a maximum of 16 cycles completed, disease progression, or unacceptable toxicity. Initiate therapy within 4–6 wk post-auto-HSCT or upon recovery of auto-HSCT.

Renal Impairment

IV (Adults): *CCr <30 mL/min*—Avoid use.

Hepatic Impairment

IV (Adults): *Mild (Child-Pugh A)*—1.2 mg/kg (max dose = 120 mg) every 3 wk until a maximum of 16 cycles completed, disease progression or unacceptable toxicity; *Moderate (Child-Pugh B) or severe (Child-Pugh C)*—Avoid use.

Previously Untreated Stage III or IV cHL

IV (Adults): 1.2 mg/kg (max dose = 120 mg) every 2 wk until a maximum of 12 doses completed, disease progression or unacceptable toxicity.

Renal Impairment

IV (Adults): *CCr <30 mL/min*—Avoid use.

Hepatic Impairment

IV (Adults): *Mild (Child-Pugh A)*—0.9 mg/kg (max dose = 90 mg) every 2 wk until a maximum of 12 doses completed, disease progression or unacceptable toxicity; *Moderate (Child-Pugh B) or severe (Child-Pugh C)*—Avoid use.

Relapsed Primary Cutaneous Anaplastic Large Cell Lymphoma or CD-30 Expressing Mycosis Fungoides

IV (Adults): 1.8 mg/kg (max dose = 180 mg) every 3 wk until a maximum of 16 cycles completed, disease progression, or unacceptable toxicity.

Renal Impairment

IV (Adults): *CCr <30 mL/min*—Avoid use.

Hepatic Impairment

IV (Adults): *Mild (Child-Pugh A)*—1.2 mg/kg (max dose = 120 mg) every 3 wk until a maximum of 16 cy-

© F.A. Davis Publishing

cles completed, disease progression, or unacceptable toxicity; *Moderate (Child-Pugh B) or severe (Child-Pugh C)* — Avoid use.

Previously Untreated Systemic Anaplastic Large Cell Lymphoma or Other CD-30 Expressing Peripheral T-Cell Lymphomas

IV (Adults): 1.8 mg/kg (max dose = 180 mg) every 3 wk with each cycle of chemotherapy for 6–8 doses.

Renal Impairment

IV (Adults): *CCr <30 mL/min* — Avoid use.

Hepatic Impairment

IV (Adults): *Mild (Child-Pugh A)* — 1.2 mg/kg (max dose = 120 mg) every 3 wk with each cycle of chemotherapy for 6–8 doses; *Moderate (Child-Pugh B) or severe (Child-Pugh C)* — Avoid use.

Availability

Lyophilized powder for injection: 50 mg/vial.

NURSING IMPLICATIONS

Assessment

- Monitor for signs and symptoms of peripheral neuropathy (hypoesthesia, hyperesthesia, paresthesia, discomfort, burning, neuropathic pain, weakness). *For new or worsening neuropathy Grade 2 or 3,* delay next dose until neuropathy improves to Grade 1 or baseline, then restart at 1.2 mg/kg. *If Grade 4 peripheral neuropathy occurs,* discontinue therapy.
- Monitor temperature periodically during therapy, especially if neutropenic.
- Assess for signs and symptoms of infusion-related reaction, including anaphylaxis (rash, pruritus, dyspnea, swelling of face and neck). If anaphylaxis occurs, discontinue infusion immediately; do not restart. Treat other infusion-related reactions by stopping and treating symptoms. Premedicate patient prior to subsequent infusions with acetaminophen, an antihistamine, and a corticosteroid.
- Monitor for tumor lysis syndrome due to rapid reduction in tumor volume (acute renal failure, hyperkalemia, hypocalcemia, hyperuricemia, or hypophosphatemia). Risks are higher in patients with greater tumor burden and rapidly proliferating tumors; may be fatal. Correct electrolyte abnormalities, monitor renal function and fluid balance, and administer supportive care, including dialysis, as indicated.
- Assess for skin rash frequently during therapy. Discontinue at first sign of rash; may be life-threatening. Stevens-Johnson syndrome may develop. Treat symptomatically; may recur once treatment is stopped.
- Assess for any new signs or symptoms that may be suggestive of PML, an opportunistic infection of the brain caused by the JC virus, that leads to death or severe disability; withhold dose and notify health care professional promptly. PML symptoms may begin gradually but usually worsen rapidly. Symptoms vary depending on which part of brain is infected (mental function declines rapidly and progressively, causing dementia; speaking becomes increasingly difficult; partial blindness; difficulty walking; rarely, headaches and seizures occur). Diagnosis is usually made via gadolinium-enhanced MRI and CSF analysis. Risk of PML increases with the number of infusions. Withhold brentuximab at first sign of PML.
- Monitor for signs and symptoms of pulmonary toxicity (cough, dyspnea) during therapy. If new or worsening pulmonary symptoms occur, hold brentuximab during assessment and until symptoms improve.
- Monitor for severe abdominal pain during therapy; may cause pancreatitis.
- ***Lab Test Considerations:*** Verify negative pregnancy status prior to starting therapy.
- Monitor CBC prior to each dose and more frequently in patients with Grade 3 or 4 neutropenia. Prolonged (≥1 wk) severe neutropenia may occur. Hold dose of brentuximab for Grade 3 or 4 neutropenia until resolution to baseline or Grade 2 or lower. Consider growth factor support for subsequent cycles for patients who developed Grade 3 or 4 neutropenia. Discontinue brentuximab or reduce dose to 1.2 mg/kg in patients with recurrent Grade 4 neutropenia despite use of growth factors.
- Monitor liver enzymes and bilirubin periodically during therapy. Signs of new, worsening, or recurrent hepatotoxicity may require decrease in dose, or interruption or discontinuation of therapy.
- Monitor blood glucose frequently during therapy. May occur more frequently in patients with high body mass index or diabetes. If hyperglycemia develops, administer antihyperglycemic agents as clinically indicated.

Implementation

IV Administration

- Premedicate patients with previously untreated Stage III, IV cHL and PTCL who are treated with brentuximab in combination with chemotherapy with G-CSF beginning with Cycle 1.
- **Intermittent Infusion:** Calculate dose and number of brentuximab vials needed. Calculate for 100 kg for patients weighing >100 kg. ***Reconstitution:*** Reconstitute each 50 mg vial with 10.5 mL of Sterile Water for Injection. Direct stream to side of vial. Swirl gently; do not shake. ***Concentration:*** 5 mg/mL. Solution should be clear to slightly opalescent, and colorless. Do not administer solutions that are discolored or contain a precipitate. Withdraw volume of brentuximab dose from infusion bag of at least 100 mL. ***Dilution:*** 0.9% NaCl, D5W, or LR. ***Concentration:*** 0.4 — 1.8 mg/mL. Invert bag gently to mix. Dilute immediately into infusion bag or store solution in refrigerator; use within 24 hrs of

© F.A. Davis Publishing

reconstitution. Do not freeze. ***Rate:*** Infuse over 30 min. Do not administer as IV push or bolus.

- **Y-Site Incompatibility:** Do not administer with other mediations or solutions.

Patient/Family Teaching

- Instruct patient to notify health care professional of any numbness or tingling of hands or feet or any muscle weakness.
- Advise patient to notify health care professional immediately if signs and symptoms of infection (fever of ≥100.5 F, chills, cough, pain on urination), hepatotoxicity (fatigue, anorexia, right upper abdominal discomfort, dark urine, jaundice), PML (changes in mood or usual behavior, confusion, thinking problems, loss of memory, changes in vision, speech, or walking, decreased strength or weakness on one side of body), pulmonary toxicity, GI complications or pancreatitis (abdominal pain, nausea, vomiting, diarrhea, rash), or infusion reactions (fever, chills, rash, breathing problems within 24 hr of infusion) occur.
- Educate patient about signs and symptoms of hyperglycemia (blurred vision; drowsiness; dry mouth; flushed, dry skin; fruit-like breath odor; increased urination; ketones in urine; loss of appetite; stomachache; nausea or vomiting; tiredness; rapid, deep breathing; unusual thirst; unconsciousness). Advise patient to notify health care professional if symptoms occur.
- Advise patient to notify health care professional of all Rx or OTC medications, vitamins, or herbal products being taken and to consult with health care professional before taking other medications.
- Rep: May be teratogenic. Advise females of reproductive potential and males with a partner of reproductive potential to use effective contraception during therapy and for at least 6 mo after last dose and to avoid breast feeding during therapy. If pregnancy is suspected, notify health care professional promptly. Inform male patients therapy may impair fertility.

Evaluation/Desired Outcomes

- Decreased spread of lymphoma.

REMS

brexanolone (brex-**an**-oh-lone)

Zulresso

Classification

Therapeutic: antidepressants

Pharmacologic: corticosteroids, gamma aminobutyric acid (GABA) enhancers

Schedule IV

Indications

Postpartum depression.

Action

Although not fully understood, thought to be related to positive allosteric modulation of GABA-A receptors.

Therapeutic Effects: Reduction in depressive symptoms.

Pharmacokinetics

Absorption: IV administration results in complete absorption.

Distribution: Extensively distributed to tissues.

Metabolism and Excretion: Extensively metabolized via keto-reduction, glucuronidation, and sulfation to inactive metabolites. Primarily excreted in feces (47%) and urine (42%) as metabolites.

Half-life: 9 hr.

TIME/ACTION PROFILE (reduction in depressive symptoms)

ROUTE	ONSET	PEAK	DURATION
IV	1–2 hr	60–72 hr	At least 30 days

Contraindications/Precautions

Contraindicated in: End-stage renal disease (CCr <15 mL/min) (↑ accumulation of solubilizing agent).

Use Cautiously in: OB: Safety not established; Lactation: Enters breast milk; use while breast feeding only if potential maternal benefit justifies potential risk to infant; Pedi: May ↑ risk of suicide thoughts/behaviors.

Adverse Reactions/Side Effects

CV: tachycardia. **Derm:** flushing. **GI:** dry mouth, diarrhea, dyspepsia, oropharyngeal pain. **Neuro:** SUICIDAL THOUGHTS/BEHAVIORS, dizziness, presyncope, sedation, vertigo, altered consciousness, loss of consciousness.

Interactions

Drug-Drug: Use with **benzodiazepines** or other **CNS depressants**, including **opioids**, **non-benzodiazepine sedative/hypnotics**, **anxiolytics**, **muscle relaxants**, and **alcohol** may cause profound sedation, loss of consciousness, and/or respiratory depression; avoid concurrent use, if possible.

Route/Dosage

IV (Adults): 30 mcg/kg/hr for 4 hr, then ↑ to 60 mcg/kg/hr for 20 hr, then ↑ to 90 mcg/kg/hr for 28 hr, then ↓ to 60 mcg/kg/hr for 4 hr, then ↓ to 30 mcg/kg/hr for 4 hr, then discontinue. Total duration of infusion = 60 hr.

Availability

Solution for injection (requires dilution): 5 mg/mL.

© F.A. Davis Publishing

NURSING IMPLICATIONS

Assessment

- Monitor for hypoxia using continuous pulse oximetry equipped with alarm. Assess for excessive sedation every 2 hrs during planned, non-sleep periods. Stop infusion immediately if signs or symptoms of excessive sedation occur. Time to full recovery from loss or altered state of consciousness ranges from 15–60 min after infusion is stopped. Infusion may be resumed at same or lower dose after symptoms resolve. If hypoxia occurs, immediately stop infusion and do not resume.
- Assess for suicidal tendencies, especially during early therapy. Risk may be increased in adults ≤24 yr. Consider changing therapeutic regimen, including discontinuing brexanolone, in patients whose depression becomes worse or who experience emergent suicidal thoughts and behaviors.

Implementation

- Start brexanolone therapy early enough during the day to allow for recognition of excessive sedation.
- Brexanolone is only available through a restricted Risk Evaluation and Mitigation Strategy (REMS) called the Zulresso REMS due to potential harm from excessive sedation or sudden loss of consciousness. Healthcare facilities must enroll to ensure medication is only given to patients enrolled in program. Pharmacies must be certified with the program. Patients must be enrolled before receiving brexanolone.
- **Continuous Infusion:** Prepare 5 infusion bags for 60 hr period, more if patient weighs ≥90 kg. For each bag, prepare and store in polyolefin, non-DEHP, nonlatex bag, only. Dilute in infusion bag immediately after initial puncture of vial. Withdraw 20 mL of brexanolone from vial and place in infusion bag. ***Dilution:*** Dilute with 40 mL of sterile water for injection, and further dilute with 40 mL of 0.9% NaCl 100 mL volume. ***Concentration:*** 1 mg/mL. Immediately place infusion bag in refrigerator until use. Solution is clear and colorless; do not administer solutions that are discolored or contain particulate matter. Solution is stable for up to 96 hrs if refrigerated. Diluted solution is stable for 12 hr at room temperature. Each 60 hr infusion requires at least 5 bags. Discard bag after 12 hrs of infusion. ***Rate:*** Using a programmable peristaltic infusion pump to ensure accurate delivery. See Route and Dosage for rate. Use a dedicated line; do not mix with other medications in bag or line. Prime infusion line with admixture before inserting into pump and connecting to venous catheter. Use a PVC, non-DEHP, nonlatex infusion set. Do not use in-line filter infusion sets.

Patient/Family Teaching

- Explain purpose of medication to patient and family and requirements of Zulresso REMS program. Advise patient to read *Medication Guide* before starting brexanolone.
- Advise patient to notify health care professional if excessive sedation occurs during infusion. Patients must not be the primary caregiver of dependents and must be accompanied during interactions with their child(ren).
- Caution patient to avoid driving and activities requiring alertness until response from medication is known.
- Instruct patient to notify health care professional of all Rx or OTC medications, vitamins, or herbal products being taken and consult health care professional before taking any new medications. Advise patient to avoid taking other CNS depressants or alcohol.
- Rep: Advise females of reproductive potential to notify health care professional if they could possibly be pregnant prior to therapy. Advise pregnant women and females of reproductive potential of the potential risk to a fetus. Encourage patient to enroll in the registry that monitors pregnancy outcomes in women exposed to antidepressants during pregnancy. To register patients, healthcare professionals call the National Pregnancy Registry for Antidepressants at 1-844-405-6185 or online at https://womensmentalhealth.org/clinical-and-researchprograms/pregnancyregistry/antidepressants/.

Evaluation/Desired Outcomes

- Decreased symptoms of postpartum depression.

BEERS

brexpiprazole

(brex-**pip**-ra-zole)

Rexulti

Classification

Therapeutic: none assigned, antipsychotics, antidepressants

Pharmacologic: serotonin-dopamine activity modulators (SDAM)

Indications

Treatment of schizophrenia. Adjunctive treatment of major depressive disorder.

Action

Psychotropic activity may be due to partial agonist activity at dopamine D_2 and serotonin 5-HT_{1A} receptors and antagonist activity at the 5-HT_{2A} receptor. **Therapeutic Effects:** Decreased manifestations of schizophrenia including excitable, paranoic, or withdrawn behavior. Improvement in symptoms of depression with increased sense of wellbeing.

Pharmacokinetics

Absorption: Well absorbed (95%) following oral administration.

Distribution: Displays extravascular distribution.

© F.A. Davis Publishing

Protein Binding: >99%.

Metabolism and Excretion: Metabolized by CYP3A4 and CYP2D6; ⛓ the CYP2D6 enzyme system exhibits genetic polymorphism (~7% of population may be poor metabolizers and may have significantly ↑ brexpiprazole concentrations and an ↑ risk of adverse effects). 25% excreted in urine (<1% unchanged), 46% in feces (14% unchanged).

Half-life: 91 hr.

TIME/ACTION PROFILE (improvement in symptoms)

ROUTE	ONSET	PEAK	DURATION
PO (schizophrenia)	within 1–2 wk	4–6 wk	unknown
PO (depression)	within 1 wk	5 wk	unknown

Contraindications/Precautions

Contraindicated in: Hypersensitivity.

Use Cautiously in: History of seizures, concurrent use of medications that may ↓ seizure threshold; Pre-existing cardiovascular disease, dehydration, hypotension, concurrent antihypertensives, diuretics, electrolyte imbalance (↑ risk of orthostatic hypotension, correct deficits before treatment); Pre-existing low WBC (may ↑ risk of leukopenia/neutropenia; History of diabetes, metabolic syndrome or dyslipidemia (may exacerbate); Patients <24 yr (may ↑ suicidal ideation/behaviors, monitor carefully); Patients at risk for falls; ⛓ Poor CYP2D6 metabolizers (PM), dose ↓ required; OB: Use during third trimester may result in extrapyramidal/withdrawal symptoms in infant; use during pregnancy only if potential maternal benefit justifies potential fetal risk; Lactation: Safety not established during breast feeding; Pedi: Antidepressants may ↑ risk of suicidal ideation/behaviors in children; safety and effectiveness not established in children; Geri: ↑ risk of mortality in older adults with dementia-related psychosis; consider age, concurrent medical conditions and medications, and renal/hepatic/cardiac function when initiating therapy.

Adverse Reactions/Side Effects

EENT: blurred vision. **CV:** cerebrovascular adverse reactions (↑ in elderly patients with dementia-related psychoses), orthostatic hypotension/syncope. **GI:** abdominal pain, constipation, diarrhea, dry mouth, dysphagia, excess salivation, flatulence. **Hemat:** agranulocytosis, leukopenia, neutropenia. **Metab:** ↑ appetite, ↑ weight, hyperglycemia/diabetes, dyslipidemia. **Neuro:** akathisia, dystonia, extrapyramidal symptoms, tardive dyskinesia, tremor, SEIZURES, abnormal dreams, dizziness, drowsiness, headache, restlessness, urges (eating, gambling, sexual, shopping). **Misc:** NEUROLEPTIC MALIGNANT SYNDROME, allergic reactions including ANAPHYLAXIS, body temperature dysregulation.

Interactions

Drug-Drug: Concurrent use with strong CYP3A4 inhibitors including **clarithromycin**, **itraconazole** or **ketoconazole** ↑ blood levels, effects and risk of adverse reactions; ↓ dose of brexpiprazole required. Concurrent use with strong CYP2D6 inhibitors including **fluoxetine**, **paroxetine**, or **quinidine**↑ blood levels, effects and risk of adverse reactions; ↓ dose of brexpiprazole required. Combined use of **strong or moderate CYP3A4 inhibitors with strong or moderate CYP2D6 inhibitors** in addition to brexpiprazole including the following combinations **itraconazole + quinidine**, **fluconazole + paroxetine**, **itraconazole + duloxetine** or **fluconazole + duloxetine** ↑ blood levels, effects and risk of toxicity; ↓ dose of brexpiprazole required. Concurrent use of **strong inducers of CYP3A4** including **rifampin**↓ blood levels and effectiveness; ↑ dose of brexpiprazole required. Concurrent use of **antihypertensives** or **diuretics** (↑ risk of hypotension). Concurrent use of **medications that may ↓ seizure threshold** (↑ risk of seizures).

Drug-Natural Products: Concurrent use of **St. John's wort** ↓ blood levels and effectiveness; ↑ dose of brexpiprazole required.

Route/Dosage

PO (Adults): *Schizophrenia*—1 mg once daily for the 1st 4 days (Days 1–4), then ↑ to 2 mg once daily for the next 3 days (Days 5–8), then ↑ to 4 mg once daily on Day 8 (not to exceed 4 mg once daily); *Major depressive disorder*—0.5 or 1 mg once daily initially, may be ↑ to 2 mg once daily (not to exceed 3 mg once daily); *Known CYP2D6 poor metabolizers*—use 50% of the usual dose. *Concurrent use of strong CYP2D6 inhibitors (schizophrenia only) or CYP3A4 inhibitors*—use 50% of the usual dose; *Concurrent use of strong/moderate CYP2D6 inhibitors AND strong/moderate CYP3A4 inhibitors*—use 25% of the usual dose; *Known CYP2D6 poor metabolizer taking concurrent strong/moderate CYP3A4 inhibitors*—use 25% of the usual dose; *Concurrent use of strong CYP3A4 inducers*—double usual dose over 1–2 wk; titrate by clinical response.

Hepatic Impairment

PO (Adults): *Moderate to severe hepatic impairment [Child-Pugh score ≥7]*—maximum daily dose should not exceed 3 mg for schizophrenia or 2 mg for major depressive disorder.

Renal Impairment

PO (Adults): *Moderate/severe/end-stage renal impairment [CCr <60 mL/min]*—maximum daily dose should not exceed 3 mg for schizophrenia or 2 mg for major depressive disorder.

Availability

Tablets: 0.25 mg, 0.5 mg, 1 mg, 2 mg, 3 mg, 4 mg.

© F.A. Davis Publishing

NURSING IMPLICATIONS

Assessment

- Assess mental status (orientation, mood, behavior) before and periodically during therapy. Assess for suicidal tendencies, especially during early therapy for depression. Restrict amount of drug available to patient. Risk may be increased in children, adolescents, and adults ≤24 yrs.
- Assess weight and BMI initially and throughout therapy.
- Obtain fasting blood glucose and cholesterol levels initially and periodically during therapy.
- Monitor BP (sitting, standing, lying), pulse, and respiratory rate before and periodically during therapy.
- Observe patient carefully when administering medication to ensure that medication is actually taken and not hoarded or cheeked.
- Monitor patient for onset of akathisia (restlessness or desire to keep moving) and extrapyramidal side effects (*parkinsonian*—difficulty speaking or swallowing, loss of balance control, pill rolling of hands, masklike face, shuffling gait, rigidity, tremors; and *dystonic*—muscle spasms, twisting motions, twitching, inability to move eyes, weakness of arms or legs) periodically throughout therapy. Report these symptoms.
- Monitor for tardive dyskinesia (uncontrolled rhythmic movement of mouth, face, and extremities; lip smacking or puckering; puffing of cheeks; uncontrolled chewing; rapid or worm-like movements of tongue). Notify health care professional immediately if these symptoms occur; symptoms may partially or completely resolve, but may be irreversible.
- Monitor for development of neuroleptic malignant syndrome (fever, muscle rigidity, altered mental status, respiratory distress, tachycardia, seizures, diaphoresis, hypertension or hypotension, pallor, tiredness, loss of bladder control, elevated CK, myoglobinuria/rhabdomyolysis, acute renal failure). Notify health care professional immediately if these symptoms occur.
- Assess for falls risk. Drowsiness, orthostatic hypotension, and motor and sensory instability increase risk. Institute prevention if indicated.
- ***Lab Test Considerations:*** Monitor CBC frequently during initial mo of therapy in patients with pre-existing or history of low WBC. May cause leukopenia, neutropenia, or agranulocytosis. Discontinue therapy if severe neutropenia (ANC <1000 mm^3 occurs).
- Monitor blood glucose and cholesterol levels initially and periodically during therapy.

Implementation

- **PO:** Administer once daily without regard to meals.

Patient/Family Teaching

- Advise patient to take medication as directed and not to skip doses or double up on missed doses. Take missed doses as soon as remembered unless almost time for the next dose. Do not stop taking brexpiprazole without consulting health care professional. Advise patient to read *Medication Guide* before starting and with each Rx refill in case of changes.
- Inform patient of possibility of extrapyramidal symptoms and tardive dyskinesia. Instruct patient to report these symptoms immediately.
- Advise patient to make position changes slowly to minimize orthostatic hypotension. Protect from falls.
- Medication may cause drowsiness and lightheadedness. Caution patient to avoid driving or other activities requiring alertness until response to medication is known.
- Advise patient and family to notify health care professional if thoughts about suicide or dying, attempts to commit suicide; new or worse depression; new or worse anxiety; feeling very agitated or restless; panic attacks; trouble sleeping; new or worse irritability; acting aggressive; being angry or violent; acting on dangerous impulses; an extreme increase in activity and talking; other unusual changes in behavior or mood occur.
- Inform patient that brexipiprazole may cause weight gain. Advise patient to monitor weight periodically. Notify health care professional of significant weight gain.
- Instruct patient to notify health care professional of all Rx or OTC medications, vitamins, or herbal products being taken and to consult health care professional before taking any new medications. Caution patient to avoid taking alcohol or other CNS depressants concurrently with this medication.
- Advise patient that extremes in temperature should be avoided, because this drug impairs body temperature regulation.
- Advise patient to notify health care professional if new or increased eating/binge eating, gambling, sexual, shopping, or other impulse control disorders occur.
- Advise patient to notify health care professional of medication regimen prior to treatment or surgery.
- Rep: Advise females of reproductive potential to notify health care professional if pregnancy is planned or suspected and to avoid breast feeding during therapy. Encourage pregnant patients to enroll in registry by contacting National Pregnancy Registry for Atypical Antipsychotics at 1-866-961-2388 or visit http://womensmentalhealth.org/clinical-and-research-programs/pregnancyregistry/.
- Emphasize the importance of routine follow-up exams and continued participation in psychotherapy as indicated.

Evaluation/Desired Outcomes

- Decrease in excitable, paranoic, or withdrawn behavior.
- Increased sense of wellbeing in patients with depression.

© F.A. Davis Publishing

brigatinib (bri-ga-ti-nib)

Alunbrig

Classification

Therapeutic: antineoplastics
Pharmacologic: kinase inhibitors

Indications

Metastatic non-small cell lung cancer (NSCLC) that is positive for anaplastic lymphoma kinase (ALK).

Action

Inhibits receptor tyrosine kinases including anaplastic lymphoma kinase (ALK), insulin-like growth factor—1 receptor (IGF-1R), ROS1, and FMS-like tyrosine kinase-3 (FLT-3). **Therapeutic Effects:** Improved progression free survival in NSCLC.

Pharmacokinetics

Absorption: Well absorbed following oral administration. Bioavailability reduced by high fat meals.
Distribution: Extensively distributed to tissues.
Metabolism and Excretion: Mostly metabolized by the liver (CYP2C8 and CYP3A4 isoenzymes); also induces CYP3A. 27% excreted in feces unchanged, 22% eliminated unchanged in urine.
Half-life: 25 hr.

TIME/ACTION PROFILE (blood levels)

ROUTE	ONSET	PEAK	DURATION
PO	unknown	1–4 hr	unknown

Contraindications/Precautions

Contraindicated in: Concurrent use of moderate or strong inhibitors/inducers of the CYP3A enzyme system; OB: Pregnancy (may cause fetal harm); Lactation: Lactation.
Use Cautiously in: Diabetes; Severe renal or hepatic impairment; Rep: Women of reproductive potential and men with female sexual partners of reproductive potential; Pedi: Safety and effectiveness not established in children.

Adverse Reactions/Side Effects

CV: hypertension, bradycardia. **Derm:** rash, photosensitivity. **EENT:** blurred vision, ↓ visual acuity, diplopia, cataracts, macular edema, photophobia. **Endo:** hyperglycemia. **F and E:** hypophosphatemia. **GI:** abdominal pain, constipation, ↓ appetite, diarrhea, ↑ amylase, ↑ lipase, ↑ liver enzymes, nausea, vomiting. **Hemat:** anemia, ↑ activated partial thromboplastin time, lymphopenia. **MS:** arthralgia, back pain, ↑ creatine kinase, muscle spasms, myalgia. **Neuro:** peripheral neuropathy, headache, insomnia. **Resp:** INTERSTITIAL LUNG DISEASE/PNEUMONITIS, cough, dyspnea, hypoxia, pneumonia. **Misc:** fatigue, fever.

Interactions

Drug-Drug: Strong or moderate CYP3A inhibitors, including, **clarithromycin**, **cobicistat**, **conivaptan**, **indinavir**, **itraconazole**, **ketoconazole**, **lopinavir**, **nefazodone**, **nelfinavir**, **posaconazole**, **ritonavir**, **saquinavir**, and **voriconazole** may ↑ levels; concurrent use should be avoided; if concurrent therapy must be used, ↓ brigatinib dose. **Strong CYP3A inducers**, including **carbamazepine**, **phenytoin**, and **rifampin** may ↓ levels and effectiveness; concurrent use should be avoided; if concurrent therapy with moderate CYP3A inducer must be used, ↓ brigatinib dose. **Beta-blockers**, **verapamil**, **diltiazem**, **digoxin**, and **clonidine** may ↑ risk of bradycardia; avoid concurrent use, if possible.
Drug-Natural Products: Concurrent use of **St. John's wort** may ↓ levels and effectiveness and should be avoided.
Drug-Food: Grapefruit or **grapefruit juice** may ↑ levels and should be avoided.

Route/Dosage

PO (Adults): 90 mg once daily for 7 days, then 180 mg once daily. Continue until disease progression or unacceptable toxicity. *Concurrent use of strong CYP3A inhibitor*—If previously taking 180 mg once daily, ↓ dose to 90 mg once daily; if previously taking 90 mg once daily, ↓ dose to 60 mg once daily; *Concurrent use of moderate CYP3A inhibitor*—If previously taking 180 mg once daily, ↓ dose to 120 mg once daily; if previously taking 120 mg once daily, ↓ dose to 90 mg once daily; if previously taking 90 mg once daily, ↓ dose to 60 mg once daily; *Concurrent use of moderate CYP3A inducer*—↑ daily dose in 30–mg increments after 7 days of treatment with the dose used prior to initiation of moderate CYP3A inducer; dose may be ↑ up to a maximum of twice the dose that was tolerated prior to initiating the moderate CYP3A inducer.

Renal Impairment

PO (Adults): *Severe renal impairment (CCr 15–29 mL/min)*—If previously taking 180 mg once daily, ↓ dose to 90 mg once daily; if previously taking 90 mg once daily, ↓ dose to 60 mg once daily.

Hepatic Impairment

PO (Adults): *Severe hepatic impairment (Child–Pugh C)*—If previously taking 180 mg once daily, ↓ dose to 120 mg once daily; if previously taking 120 mg once daily, ↓ dose to 90 mg once daily; if previously taking 90 mg once daily, ↓ dose to 60 mg once daily.

Availability

Film-coated tablets: 30 mg, 90 mg, 180 mg.

= Canadian drug name. = Genetic implication. ~~Strikethrough~~ = Discontinued.
*CAPITALS indicates life-threatening; underlines indicate most frequent.

© F.A. Davis Publishing

NURSING IMPLICATIONS

Assessment

- Assess respiratory function (lung sounds, dyspnea, oxygen saturation) periodically during therapy.
- Monitor for signs and symptoms of interstitial lung disease (ILD) or pneumonitis (difficulty breathing, shortness or breath, cough with or without mucus, fever) periodically during therapy. **Grade 1:** *If new pulmonary symptoms occur during first 7 days of therapy,* hold brigatinib until recovery to baseline, then resume at same dose; do not escalate to 180 mg if ILD/pneumonitis is suspected. *If new pulmonary symptoms occur after first 7 days of therapy,* hold brigatinib until recovery to baseline, then resume at same dose. *If ILD/pneumonitis recurs,* permanently discontinue brigatinib. **Grade 2:** *If new pulmonary symptoms occur during first 7 days of therapy,* hold brigatinib until recovery to baseline, then resume at same dose; do not escalate to 180 mg if ILD/pneumonitis is suspected. *If new pulmonary symptoms occur after first 7 days of therapy,* hold brigatinib until recovery to baseline. If ILD/pneumonitis is suspected, resume at next lower dose; if not, resume at same dose. *If ILD/pneumonitis recurs,* permanently discontinue brigatinib. **Grade 3 or 4:** Permanently discontinue brigatinib for ILD/pneumonitis.
- Monitor BP prior to therapy, after 2 wk, and monthly during therapy. Control BP prior to therapy. Monitor blood pressure after 2 wk and at least monthly during therapy. *If Grade 3 hypertension (SBP ≥160 mmHg or DBP ≥100 mmHg) occurs,* hold brigatinib until hypertension ≤Grade 1 (SBP <140 mmHg and DBP <90 mmHg), then resume brigatinib at next lower dose. *If recurrence of Grade 3:* withhold therapy until recovery to ≤Grade 1, and resume at next lower dose or permanently discontinue treatment. *If Grade 4 hypertension (life-threatening consequences, urgent intervention indicated) occurs,* hold brigatinib until ≤Grade 1, and resume at next lower dose or permanently discontinue. *Grade 4 recurrence:* permanently discontinue brigatinib.
- Monitor for bradycardia (HR <60 bpm) periodically during therapy, especially if concurrent medications decrease HR. *If symptomatic bradycardia (dizziness, lightheadedness, fainting) occurs,* hold brigatinib until asymptomatic bradycardia or resting heart rate of ≥60 bpm. *If concomitant medication known to cause bradycardia is identified and discontinued or dose reduced,* resume at same dose once asymptomatic or resting heart rate of ≥60 bpm. *If no concomitant medication known to cause bradycardia, or if contributing concomitant medications are not discontinued or dose reduced,* resume brigatinib at next lower dose upon recovery to asymptomatic bradycardia or to resting heart rate of ≥60 bpm. *If bradycardia with life-threatening consequences or urgent intervention needed,* permanently discontinue brigatinib if no contributing concomitant medication is identified. *If contributing concomitant medication is identified and discontinued or dose reduced,* resume therapy at next lower dose when recovered to asymptomatic bradycardia or to a resting heart rate of ≥60 bpm, with frequent monitoring. *Grade 4 recurrence:* permanently discontinue therapy.
- Treat hypertension before starting therapy. Monitor BP after 2 wks and at least monthly during therapy. *If Grade 3 hypertension (SBP ≥160 mmHg or DBP ≥100 mmHg) occurs,* hold brigatinib until hypertension ≤Grade 1 (SBP <140 mmHg and DBP <90 mmHg), then resume therapy at same dose. If hypertension recurs, hold brigatinib until ≤Grade 1; resume at next lower dose or permanently discontinue therapy. *If Grade 4 hypertension (life-threatening) occurs,* hold brigatinib until ≤Grade 1; resume at next lower dose or permanently discontinue therapy. If Grade 4 hypertension recurs, permanently discontinue brigatinib.
- Monitor for visual changes (blurred vision, diplopia, reduced visual acuity) periodically during therapy. *If Grade 2 or 3 visual disturbance occurs,* hold doses until recovery to Grade 1 or baseline, then resume at next lower dose. *If Grade 4 visual disturbance occurs,* discontinue brigatinib permanently.
- ***Lab Test Considerations:*** Verify negative pregnancy before starting therapy.
- Information on FDA-approved tests for the detection of ALK rearrangements in NSCLC is available at http://www.fda.gov/CompanionDiagnostics.
- Monitor CK levels periodically during therapy. *If Grade 3 CK ↑ (>5.0 × upper limit of normal [ULN]) occurs,* hold therapy until ≤Grade 1 (≤2.5 × ULN) or to baseline, then resume at same dose. *If Grade 4 CK ↑ (>10.0 × ULN) or recurrence of Grade 3 ↑ occurs,* hold brigatinib until ≤Grade 1 (≤2.5 × ULN) or to baseline, then resume therapy at next lower dose.
- Monitor serum lipase and amylase periodically during therapy. *If Grade 3 lipase or amylase ↑ (>2.0 × ULN) occurs,* hold brigatinib until ≤Grade 1 (≤1.5 × ULN) or baseline, then resume brigatinib at same dose. *If Grade 4 lipase or amylase ↑ (>5.0 × ULN) or recurrence of Grade 3 ↑ occurs,* hold brigatinib until ≤Grade 1 (≤ 1.5 × ULN) or baseline, then resume therapy at next lower dose.
- Monitor fasting serum glucose prior to starting and periodically during therapy. May cause new or worsening hyperglycemia. Use antihyperglycemic medications as needed. If Grade 3 (>250 mg/dL or 13.9 mmol/L or Grade 4 hyperglycemia occurs, hold brigatinib until adequate hyperglycemic control is achieved and resume at next lower dose or discontinue brigatinib.

Implementation

- Dose reductions for adverse reactions. **Patients taking 90 mg once daily:** *First reduction:* 60 mg once

© F.A. Davis Publishing

daily. *Second reduction:* permanently discontinue brigatinib. **Patients taking 180 mg once daily:** *First reduction:* 120 mg once daily. *Second reduction:* 90 mg once daily. *Third reduction:* 60 mg once daily.

- **PO:** Administer daily without regard to food. ***DNC:*** Swallow tablets whole; do not crush, break, or chew.If therapy is interrupted for 14 days or longer, other than adverse reactions, resume therapy at 90 mg once daily for 7 days before increasing to previously tolerated dose.

Patient/Family Teaching

- Instruct patient to take brigatinib as directed. If patient vomits or misses a dose, omit dose and take next dose as scheduled. Do not double doses. Advise patient to read *Patient Information* before starting therapy and with each Rx refill in case of changes.
- Advise patient to avoid eating grapefruit or drinking grapefruit juice during therapy.
- Advise patient to notify health care professional if signs and symptoms of lung problems (cough, chest pain, fever), hypertension (headaches, dizziness, blurred vision, chest pain, shortness of breath), bradycardia (dizziness, lightheadedness, feeling faint), visual changes (double vision, seeing flashes of light, blurry vision, light hurting eyes, new or increased floaters), symptoms of pancreatitis (upper abdominal pain, weight loss, nausea), new or worsening symptoms of myalgia (unexplained muscle pain, tenderness, or weakness), or hyperglycemia (feeling very thirsty, needing to urinate more than usual, feeling very hungry, nausea, feeling weak or tired, feeling confused) occur, may require dose reduction or discontinuation.
- Advise patients to limit sun exposure while taking brigatinib, and for at least 5 days after stopping therapy. Wear a hat and protective clothing, and use a broad-spectrum Ultraviolet A (UVA)/ Ultraviolet B (UVB) sunscreen and lip balm (SPF ≥30) to help protect against sunburn. Sunburn may require interrupting or discontinuing therapy based on severity.
- Instruct patient to notify health care professional of all Rx or OTC medications, vitamins, or herbal products being taken and consult health care professional before taking any new medications, especially St. John's wort.
- Rep: May cause fetal harm. Advise females of reproductive potential to use effective non-hormonal contraception during and for at least 4 mo after final dose. Advise males with female partners of reproductive potential to use effective contraception during and for at least 3 mo after last dose of brigatinib. Advise patient to avoid breast feeding during and for 1 wk after last dose. Inform male patient that brigatinib may impair fertility.

Evaluation/Desired Outcomes

- Decreased spread in lung cancer.

brivaracetam

(briv-a-**ra**-se-tam)

Briviact, Brivlera

Classification

Therapeutic: anticonvulsants

Schedule V

Indications

Partial-onset seizures.

Action

Displays a high and selective affinity for synaptic vesicle protein 2A (SV2A) in the brain, which may contribute to its anticonvulsant effect. **Therapeutic Effects:** Decreased incidence of seizures.

Pharmacokinetics

Absorption: Rapidly and completely absorbed following oral administration. IV administration results in complete bioavailability.

Distribution: Widely distributed to tissues.

Metabolism and Excretion: Hepatic and extrahepatic amidase-mediated hydrolysis of the amide moiety to form carboxylic acid metabolite (primary route) and hydroxylation primarily by CYP2C19 to form the hydroxy metabolite (secondary route) (all metabolites inactive). the CYP2C19 enzyme system exhibits genetic polymorphism (2% of Whites, 4% of Blacks, and 14% of Asians may be poor metabolizers and may have significantly ↑ brivaracetam concentrations and an ↑ risk of adverse effects). >95% excreted by the kidneys (<10% excreted unchanged).

Half-life: 9 hr.

TIME/ACTION PROFILE (blood levels)

ROUTE	ONSET	PEAK	DURATION
PO	unknown	1–4hr†	unknown
IV	unknown	unknown	unknown

†1 hr in fasting state; 4 hr with high-fat meal.

Contraindications/Precautions

Contraindicated in: Hypersensitivity; End-stage renal disease.

Use Cautiously in: All patients (may ↑ risk of suicidal thoughts/behaviors); Patients who are known or suspected to be poor CYP2C19 metabolizers (may require dose ↓); Hepatic impairment (dose ↓ recommended); OB: Safety not established in pregnancy; Lactation: Safety not established in breast feeding; Pedi: Children <1 mo (safety and effectiveness not established); Geri: Dose adjustment may be needed because of ↓ renal and hepatic function in older adults.

Adverse Reactions/Side Effects

EENT: nystagmus. **GI:** constipation, nausea, vomiting. **Hemat:** leukopenia. **Neuro:** SUICIDAL THOUGHTS/

© F.A. Davis Publishing

BEHAVIOR, aggression, agitation, anger, apathy, belligerence, anxiety, depression, dizziness, drowsiness, hallucinations, irritability, mood swings, paranoia, psychosis, restlessness, tearfulness, vertigo, ataxia, balance disorder, coordination difficulties, dysgeusia, euphoria, fatigue. **Local:** infusion site pain. **Misc:** HYPERSENSITIVITY REACTIONS (including bronchospasm and angioedema).

Interactions

Drug-Drug: CYP2C19 inducers including **rifampin** may ↓ levels and effectiveness; ↑ brivaracetam dose by up to 100%. Concurrent use with **carbamazepine** may ↑ levels of carbamazepine-epoxide (active metabolite); consider ↓ dose of carbamazepine if tolerability issues occur. May ↑ levels of **phenytoin**.

Route/Dosage

IV route should only be used when oral therapy is not feasible.

PO, IV (Adults and Children ≥16 yrs): 50 mg twice daily; may titrate down to 25 mg twice daily or up to 100 mg twice daily based on tolerability and effectiveness.

PO, IV (Children ≥1 mo and ≥50 kg): 25–50 mg twice daily; may titrate up to 100 mg twice daily based on tolerability and effectiveness.

PO, IV (Children ≥1 mo and 20–<50 kg): 0.5-1 mg/kg twice daily; may titrate up to 2 mg/kg twice daily based on tolerability and effectiveness.

PO, IV (Children ≥1 mo and 11–<20 kg): 0.5-1.25 mg/kg twice daily; may titrate up to 2.5 mg/kg twice daily based on tolerability and effectiveness.

PO, IV (Children ≥1 mo and <11 kg): 0.75-1.5 mg/kg twice daily; may titrate up to 3 mg/kg twice daily based on tolerability and effectiveness.

Hepatic Impairment

PO, IV (Adults and Children ≥16 yr): 25 mg twice daily; may titrate up to 75 mg twice daily based on tolerability and effectiveness.

Hepatic Impairment

PO, IV (Children ≥1 mo and ≥50 kg): 25 mg twice daily; may titrate up to 75 mg twice daily based on tolerability and effectiveness.

Hepatic Impairment

PO, IV (Children ≥1 mo and 20–<50 kg): 0.5 mg/kg twice daily; may titrate up to 1.5 mg/kg twice daily based on tolerability and effectiveness.

Hepatic Impairment

PO, IV (Children ≥1 mo and 11–<20 kg): 0.5 mg/kg twice daily; may titrate up to 2 mg/kg twice daily based on tolerability and effectiveness.

Hepatic Impairment

PO, IV (Children ≥1 mo and <11 kg): 0.75 mg/kg twice daily; may titrate up to 2.25 mg/kg twice daily based on tolerability and effectiveness.

Availability

Tablets: 10 mg, 25 mg, 50 mg, 75 mg, 100 mg. **Oral solution (raspberry-flavored):** 10 mg/mL. **Solution for injection:** 10 mg/mL.

NURSING IMPLICATIONS

Assessment

- Assess mental status (orientation, mood, behavior) before and periodically during therapy. Monitor closely for notable changes in behavior that could indicate the emergence or worsening of suicidal thoughts or behavior or depression.
- Monitor for signs and symptoms of bronchospasm (wheezing, dyspnea) and angioedema (rash, pruritus, perioral swelling) during therapy. If signs of hypersensitivity occur discontinue brivaracetam.
- ***Lab Test Considerations:*** May cause ↓ WBC and neutrophil counts.

Implementation

- Initiate therapy with oral or IV administration. IV administration may be used when oral dose is not feasible; administer at same dose and frequency as oral doses.
- **PO:** Administer twice daily without regard to food. ***DNC:*** Swallow tablets whole with liquid; do not crush or chew.
- Use a calibrated measuring device for accuracy with oral solution. Dilution is not necessary, May be administered via nasogastric or gastrostomy tube. Oral solution is stable for 5 mo after opening.

IV Administration

- **Intermittent Infusion:** ***Dilution:*** May be administered undiluted or diluted with 0.9% NaCl, LR, or D5W. Solution is clear and colorless; do not administer solutions that are discolored or contain particulate matter. Solution is stable for up to 4 hr at room temperature; may be stored in polyvinyl chloride bags. ***Rate:*** Administer over 2–15 min.

Patient/Family Teaching

- Instruct patient to take brivaracetam as directed. Decrease dose gradually; do not stop abruptly to minimize risk of increased seizure frequency and status epilepticus. Advise patient to read *Medication Guide* prior to therapy and with each Rx refill in case of changes.
- May cause drowsiness, fatigue, dizziness, and balance problems. Caution patient to avoid driving or other activities requiring alertness until response to medication is known. Do not resume driving until physician gives clearance based on control of seizure disorder.
- Advise patient and family to notify health care professional if behavioral changes, thoughts about suicide or dying, attempts to commit suicide; new or worse depression; new or worse anxiety; feeling very agitated or restless; panic attacks; trouble sleeping; new or worse irritability; acting aggressive; being angry

© F.A. Davis Publishing

or violent; acting on dangerous impulses; an extreme increase in activity and talking, other unusual changes in behavior or mood occur.

- Advise patient to notify health care professional of all Rx or OTC medications, vitamins, or herbal products being taken and to consult with health care professional before taking other medications.
- Rep: Advise females of reproductive potential to notify health care professional if pregnancy is planned or suspected or if breast feeding. Encourage patients who become pregnant to enroll in the North American Antiepileptic Drug (NAAED) Pregnancy Registry by calling 1-888-233-2334 or on the web at www.aedpregnancyregistry.org. Enrollment must be done by patients themselves.

Evaluation/Desired Outcomes

- Decreased incidence of partial-onset seizures.

REMS

brodalumab (broe-dal-ue-mab)

Siliq

Classification

Therapeutic: antipsoriatics

Pharmacologic: interleukin antagonists

Indications

Moderate-to-severe plaque psoriasis in patients who are candidates for systemic therapy or phototherapy and have failed to respond or have lost response to other systemic therapies.

Action

A monoclonal antibody that acts as an antagonist of interleukin (IL)−17RA by selectively binding to it and preventing its interaction with numerous interleukin cytokines. Antagonism prevents production of inflammatory cytokines and chemokines. **Therapeutic Effects:** Decreased plaque formation and spread.

Pharmacokinetics

Absorption: 55% absorbed following subcut administration.

Distribution: Minimally distributed to tissues.

Metabolism and Excretion: Primarily eliminated by being catabolized into small peptides and amino acids.

Half-life: Unknown.

TIME/ACTION PROFILE (blood levels)

ROUTE	ONSET	PEAK	DURATION
Subcut	unknown	3 days	unknown

Contraindications/Precautions

Contraindicated in: Crohn's disease (may worsen disease); Active tuberculosis.

Use Cautiously in: History of suicidality or depression; Chronic infection or history of recurrent infection; OB, Lactation: Safety not established; Pedi: Safety and effectiveness not established.

Adverse Reactions/Side Effects

EENT: oropharyngeal pain. **GI:** Crohn's disease, diarrhea, nausea. **Hemat:** neutropenia. **MS:** arthralgia, myalgia. **Neuro:** SUICIDAL THOUGHTS/BEHAVIORS, headache. **Misc:** INFECTIONS (including reactivation tuberculosis), fatigue, injection site reactions.

Interactions

Drug-Drug: May ↓ antibody response to **live-virus vaccine** and ↑ risk of adverse reactions (do not administer concurrently). May affect activity of CYP450 enzymes and may alter the effectiveness/toxicity of drugs that are substrates of CYP450 (including **warfarin** and **cyclosporine**); close monitoring is recommended and necessary dose modifications undertaken.

Route/Dosage

Subcut (Adults): 210 mg at Wk 0, 1, and 2 then 210 mg every 2 wk; consider discontinuing therapy if adequate response not achieved after 12–16 wk of therapy.

Availability

Solution for subcutaneous injection (prefilled syringes): 210 mg/1.5 mL.

NURSING IMPLICATIONS

Assessment

- Assess skin lesions prior to and periodically during therapy.
- Assess for tuberculosis (TB) infection prior to starting therapy. Begin treatment for latent TB prior to brodalumab administration; do not administer to patients with active TB infection.
- Assess for new or worsening symptoms of depression, anxiety, other mood disorders, or suicidality. Refer to mental health professional as appropriate. Re-evaluate risks and benefits of brodalumab if depression occurs.
- Monitor for signs and symptoms of infection (fever, sweats, chills, muscle aches, cough, dyspnea, sore throat or difficulty swallowing, warm, red or painful skin or sores, diarrhea or stomach pain, burning or frequency of urination) during therapy. If serious infection develops or is not responding to therapy, monitor patient closely and discontinue brodalumab until infection resolves.

Implementation

- Available only through restricted program called Siliq REMS due to suicide risks. Providers must be certified, patients must sign a Patient-Provider Agreement form, and pharmacies must be certified

© F.A. Davis Publishing

and only dispense to patients authorized to receive brodalumab. Further information and a list of qualified pharmacies can be found at www.SILIQREMS.com or by calling 855-511-6135.

- **Subcut:** Allow prefilled syringe to reach room temperature for approximately 30 min before injecting. Do not warm any other way. Solution is clear to slightly opalescent, colorless to slightly yellow. A few translucent to white, amorphous proteinaceous particles may be present; do not administer if solution is cloudy or discolored. Inject full dose (1.5 mL) into thigh, abdomen, or upper arm. Pinch skin and inject at a 45 or 90 angle. Do not rub injection site. Do not inject in skin areas that are tender, bruised, red, hard, thick, scaly, or affected by psoriasis. Store in refrigerator or at room temperature for up to 14 days; do not return to refrigerator after room temperature. Protect from light. Do not freeze.

Patient/Family Teaching

- Advise patient to administer injection as directed, according to schedule. Health care professional should supervise first self-injection. Instruct patient to inject full dose, and to use proper technique for syringe and needle disposal. Inform patient that they must enroll in SILIQ REMS program and to carry SILIQ Patient Wallet Card at all times and share with other health care professionals. Card describes symptoms which, if experienced, should prompt patient to seek immediate medical evaluation. Provide patient with telephone number and website for pharmacies participating in SILIQ REMS program.
- Caution patient to avoid live vaccines during therapy.
- May cause depression or suicide. Instruct patients and caregivers to monitor for emergence of suicidal thoughts and behaviors. Notify health care professional immediately if suicidal thoughts, new or worsening depression, anxiety, changes in behavior or mood, thoughts of suicide, dying, or hurting self, or acting on dangerous impulses occur. Instruct patient to carry wallet card and to call the national Suicide Prevention Lifeline at 1-800-273-8255 if they experience suicidal thoughts.
- Instruct patient to notify health care professional if signs and symptoms of infection occur.
- Instruct patient to notify health care professional of all Rx or OTC medications, vitamins, or herbal products being taken and consult health care professional before taking any new medications.
- Rep: Advise female patient to notify health care professional if pregnancy is planned or suspected or if breast feeding.

Evaluation/Desired Outcomes

- Decrease in plaque formation and spread of plaque psoriasis. Consider discontinuing if adequate response not achieved after 12–16 wk. Treatment beyond 16 wk in patients without an adequate response is not likely to result in greater success.

budesonide, See CORTICOSTEROIDS (INHALATION), CORTICOSTEROIDS (NASAL), and CORTICOSTEROIDS (SYSTEMIC).

budesonide/formoterol/glycopyrrolate

(byoo-**des**-oh-nide/for-**moe**-te-rol/glye-koe-**pye**-roe-late)

Breztri Aerosphere

Classification

Therapeutic: anti-inflammatories (steroidal), bronchodilators

Pharmacologic: corticosteroids, long-acting beta2-adrenergic agonists (LABAs), anticholinergics

Indications

Maintenance treatment of COPD.

Action

Budesonide—Potent, locally acting anti-inflammatory; *formoterol*—a $beta_2$-adrenergic agonist that stimulates adenyl cyclase, resulting in accumulation of cyclic adenosine monophosphate at $beta_2$—adrenergic receptors resulting in bronchodilation; *glycopyrrolate*—acts as an anticholinergic by inhibiting M3 muscarinic receptors in bronchial smooth muscle resulting in bronchodilation. **Therapeutic Effects:** Bronchodilation with decreased airflow obstruction.

Pharmacokinetics

Budesonide

Absorption: Unknown.

Distribution: Extensively distributed to extravascular tissues.

Metabolism and Excretion: Primarily metabolized by the liver by the CYP3A4 isoenzyme into inactive metabolites; primarily excreted in urine and feces as metabolites.

Half-life: 5 hr.

Formoterol

Absorption: Unknown.

Distribution: Extensively distributed to extravascular tissues.

Metabolism and Excretion: Primarily metabolized by the liver by glucuronidation and O-demethylation to inactive metabolites; 62% of drug excreted in urine, 24% excreted in feces.

Half-life: 10 hr.

Glycopyrrolate

Absorption: Unknown.

Distribution: Extensively distributed to extravascular tissues.

© F.A. Davis Publishing

Metabolism and Excretion: Metabolism (primarily by CYP2D6 isoenzyme) plays minor role in elimination; 85% excreted in urine.
Half-life: 15 hr.

TIME/ACTION PROFILE (improvement in FEV_1)

ROUTE	ONSET	PEAK	DURATION
Inhalation	within 5 min	4 wk	unknown

Contraindications/Precautions

Contraindicated in: Hypersensitivity; Asthma; Acutely deteriorating COPD or acute respiratory symptoms.
Use Cautiously in: Systemic corticosteroid therapy (should not be abruptly discontinued when inhaled therapy is started; additional corticosteroids needed during stress or trauma); Prolonged immobilization, family history of osteoporosis, postmenopausal status, cigarette smoking, advanced age, or poor nutrition (↑ risk of osteoporosis); Narrow-angle glaucoma; Seizure disorders; Thyrotoxicosis; Urinary retention, prostatic hyperplasia, bladder-neck obstruction; Diabetes; Severe hepatic impairment; Severe renal impairment (CCr <30 mL/min) or end-stage renal disease requiring dialysis (use only if expected benefit exceeds potential risk); OB: Safety not established in pregnancy; Lactation: Use while breast feeding only if potential maternal benefit justifies potential risk to infant; Pedi: Safety and effectiveness not established in children.
Exercise Extreme Caution in: Concurrent use of MAO inhibitors, tricyclic antidepressants or drugs that prolong the QTc interval.

Adverse Reactions/Side Effects

CV: arrhythmias, hypertension, tachycardia. **EENT:** cataracts, glaucoma, oropharyngeal candidiasis, sinusitis. **Endo:** adrenal suppression (high dose, long-term therapy only), hyperglycemia. **F and E:** hypokalemia. **GI:** diarrhea. **MS:** ↓ bone density, muscle spasms. **Resp:** bronchospasm, cough, pneumonia. **Misc:** HYPERSENSITIVITY REACTIONS (including angioedema, urticaria, or rash).

Interactions

Drug-Drug: Strong **CYP3A4 inhibitors**, including **atazanavir**, **clarithromycin**, **indinavir**, **itraconazole**, **ketoconazole**, **nefazodone**, **nelfinavir**, **ritonavir**, and **saquinavir** may ↑ levels and toxicity of budesonide. **Anticonvulsants**, **oral corticosteroids**, and **proton pump inhibitors** may ↑ risk of osteoporosis. Concurrent use with other **adrenergics** may ↑ adrenergic adverse reactions of formoterol (↑ heart rate, ↑ BP, jitteriness). **Xanthine derivatives**, **corticosteroids**, **diuretics** may ↑ risk of hypokalemia or ECG changes with formoterol. ↑ risk of serious adverse cardiovascular effects with **MAO inhibitors**, **tricyclic antidepressants**, **QT-interval prolonging drugs**; use with extreme caution. Effectiveness of formoterol may be ↓ by **beta-blockers**; use cautiously and only when necessary. ↑ risk of anticholinergic adverse reactions with glycopyrrolate when used concurrently with other **anticholinergics**; avoid concurrent use.

Route/Dosage

Inhaln (Adults): 2 inhalations twice daily.

Availability

Inhalation aerosol: budesonide 160 mcg/glycopyrrolate 9 mcg/formoterol 4.8 mcg per inhalation in 10.7–g canister (120 inhalations).

NURSING IMPLICATIONS

Assessment

- Assess lung sounds, pulse, and BP before administration and during peak of medication. Note amount, color, and character of sputum produced.
- Observe for paradoxical bronchospasm (wheezing, dyspnea, tightness in chest) and hypersensitivity reaction (rash; urticaria; swelling of the face, lips, or eyelids). If condition occurs, withhold medication and notify health care professional immediately.
- Monitor patient for signs of hypersensitivity reactions (difficulties in breathing or swallowing; swelling of tongue, lips and face; urticaria; skin rash) during therapy. Discontinue therapy and consider alternative if reaction occurs.
- ***Lab Test Considerations:*** May cause ↑ serum glucose and decreased serum potassium.

Implementation

- **Inhaln:** Administer as 2 inhalations twice daily, morning and evening. Shake well prior to use. Prime by releasing 4 sprays into air away from face before 1st use and by releasing 2 sprays if unused for more than 7 days. After inhalation, rinse mouth with water without swallowing. See Appendix for use of metered-dose inhalers.

Patient/Family Teaching

- Instruct patient to use medication as directed. Do not discontinue therapy without discussing with health care professional, even if feeling better. If a dose is missed, skip dose and take next dose at regularly scheduled time. Do not double doses. Use a rapid-acting bronchodilator if symptoms occur before next dose is due. Caution patient not to use more than 2 times a day; may cause adverse effects, paradoxical bronchospasm, or loss of effectiveness of medication. Instruct patient to review *Medication Guide* before starting therapy and with each Rx refill in case of changes.
- Advise patient that inhaler should be discarded when display window indicates zero or 3 mo (120-inhala-

© F.A. Davis Publishing

tion canister) or 3 wk (28-inhalation canister) after removal of canister from pouch, whichever comes first. Never immerse the canister into water to determine the amount remaining in the canister ("float test").

- Caution patient not to use medication to treat acute symptoms. A rapid-acting inhaled beta-adrenergic bronchodilator should be used for relief of acute asthma attacks. Notify health care professional immediately if symptoms get worse or more inhalations than usual are needed from rescue inhaler.
- Advise patient to rinse the mouth with water without swallowing after inhalation to help reduce the risk of getting a fungus infection (thrush) in the mouth and throat.
- Instruct patient to contact health care professional immediately if shortness of breath is not relieved by medication or nausea, vomiting, shakiness, headache, fast or irregular heartbeat, sleeplessness, or signs and symptoms of narrow angle glaucoma (eye pain or discomfort, blurred vision, visual halos or colored images, red eyes), urinary retention (difficulty passing urine, painful urination) or pneumonia (increase in mucus (sputum) production, change in mucus color, fever, chills, increased cough, increased breathing problems) occur.
- Advise patient to consult health care professional before taking any Rx, OTC, or herbal products or alcohol concurrently with this therapy. Caution patient also to avoid smoking and other respiratory irritants.
- Advise patient to notify health care professional if pregnancy is planned or suspected, or if breast feeding.

Evaluation/Desired Outcomes

- Bronchodilation with decreased airflow obstruction.

bumetanide (byoo-met-a-nide)

~~Bumex~~, Burinex

Classification

Therapeutic: diuretics
Pharmacologic: loop diuretics

Indications

Edema due to heart failure, hepatic disease, or renal impairment. **Unlabeled Use:** Reversal of oliguria in preterm neonates.

Action

Inhibits the reabsorption of sodium and chloride from the loop of Henle and distal renal tubule. Increases renal excretion of water, sodium chloride, magnesium, potassium, and calcium. Effectiveness persists in impaired renal function. **Therapeutic Effects:** Diuresis and subsequent mobilization of excess fluid (edema, pleural effusions).

Pharmacokinetics

Absorption: Well absorbed after oral or IM administration.
Distribution: Widely distributed.
Protein Binding: 72–96%.
Metabolism and Excretion: Partially metabolized by liver; 50% eliminated unchanged by kidneys and 20% excreted in feces.
Half-life: 60–90 min (6 hr in neonates).

TIME/ACTION PROFILE (diuretic effect)

ROUTE	ONSET	PEAK	DURATION
PO	30–60 min	1–2 hr	4–6 hr
IM	30–60 min	1–2 hr	4–6 hr
IV	2–3 min	15–45 min	2–3 hr

Contraindications/Precautions

Contraindicated in: Hypersensitivity; Cross-sensitivity with thiazides and sulfonamides may occur; Hepatic coma or anuria.
Use Cautiously in: Severe liver disease (may precipitate hepatic coma; concurrent use with potassium-sparing diuretics may be necessary); Electrolyte depletion; Diabetes mellitus; Increasing azotemia; Lactation, Pedi: Safety not established; bumetanide is a potent displacer of bilirubin and should be used cautiously in critically ill or jaundiced neonates because of risk of kernicterus. Injection contains benzyl alcohol, which may cause gasping syndrome in neonates; Geri: May have ↑ risk of side effects, especially hypotension and electrolyte imbalance, at usual doses.

Adverse Reactions/Side Effects

EENT: hearing loss, tinnitus. **CV:** hypotension. **GI:** diarrhea, dry mouth, nausea, vomiting. **GU:** ↑ BUN, excessive urination. **Derm:** STEVENS-JOHNSON SYNDROME, TOXIC EPIDERMAL NECROLYSIS, photosensitivity, pruritis, rash. **Endo:** hyperglycemia, hyperuricemia. **F and E:** dehydration, hypocalcemia, hypochloremia, hypokalemia, hypomagnesemia, hyponatremia, hypovolemia, metabolic alkalosis. **MS:** arthralgia, muscle cramps, myalgia. **Neuro:** dizziness, encephalopathy, headache.

Interactions

Drug-Drug: ↑ risk of hypotension with **antihypertensives**, **nitrates**, or acute ingestion of **alcohol**. ↑ risk of hypokalemia with other **diuretics**, **amphotericin B**, **stimulant laxatives**, and **corticosteroids**. Hypokalemia may ↑ risk of **digoxin** toxicity. ↓ **lithium** excretion, may cause **lithium** toxicity. ↑ risk of ototoxicity with **aminoglycosides**. **NSAIDS** ↓ effects of bumetanide.

Route/Dosage

PO (Adults): 0.5–2 mg/day given in 1–2 doses; titrate to desired response (maximum daily dose = 10 mg/day).
PO (Infants and Children): 0.015–0.1 mg/kg/dose every 6–24 hrs (maximum: 10 mg/day).

© F.A. Davis Publishing

PO (Neonates): 0.01–0.05 mg/kg/dose every 12–24 in term neonates or every 24–48 hrs in preterm neonates.
IM, IV (Adults): 0.5–1 mg/dose, may repeat every 2–3 hr as needed (up to 10 mg/day).
IM, IV (Infants and Children): 0.015–0.1 mg/kg/dose every 6–24 hrs (maximum: 10 mg/day).
IM, IV (Neonates): 0.01–0.05 mg/kg/dose every 12–24 in term neonates or every 24–48 hrs in preterm neonates.

Availability (generic available)

Tablets: 0.5 mg, 1 mg, 2 mg, 5 mg. **Cost:** *Generic*—0.5 mg $30.20/100, 1 mg $44.52/100, 2 mg $75.18/100. **Injection:** 0.25 mg/mL.

NURSING IMPLICATIONS

Assessment

- Assess fluid status during therapy. Monitor daily weight, intake and output ratios, amount and location of edema, lung sounds, skin turgor, and mucous membranes. Notify health care professional if thirst, dry mouth, lethargy, weakness, hypotension, or oliguria occurs.
- Monitor BP and pulse before and during administration. Monitor frequency of prescription refills to determine compliance.
- Assess patients receiving digoxin for anorexia, nausea, vomiting, muscle cramps, paresthesia, and confusion; ↑ risk of digoxin toxicity due to potassium-depleting effect of diuretic. Potassium supplements or potassium-sparing diuretics may be used concurrently to prevent hypokalemia.
- Assess patient for tinnitus and hearing loss. Audiometry is recommended for patients receiving prolonged high-dose IV therapy. Hearing loss is most common after rapid or high-dose IV administration in patients with decreased renal function or those taking other ototoxic drugs.
- Assess for allergy to sulfonamides.
- Assess patient for skin rash frequently during therapy. Discontinue bumetanide at first sign of rash; may be life-threatening. Stevens-Johnson syndrome or toxic epidermal necrolysis may develop. Treat symptomatically; may recur once treatment is stopped.
- Geri: Diuretic use is associated with increased risk for falls in older adults. Assess falls risk and implement fall prevention strategies.
- ***Lab Test Considerations:*** Monitor electrolytes, renal and hepatic function, serum glucose, and uric acid levels before and periodically during therapy. May cause ↓ serum sodium, potassium, calcium, and magnesium concentrations. May also cause ↑ BUN, serum glucose, creatinine, and uric acid levels.

Implementation

- If administering twice daily, give last dose no later than 5 PM to minimize disruption of sleep cycle.
- IV is preferred over IM for parenteral administration.
- **PO:** May be taken with food to minimize gastric irritation.

IV Administration

- **IV Push:** ***Dilution:*** Administer undiluted. ***Concentration:*** 0.25 mg/mL. ***Rate:*** Administer slowly over 1–2 min.
- **Continuous Infusion:** ***Dilution:*** May dilute in D5W or 0.9% NaCl. May also administer as undiluted drug. Protect from light. ***Concentration:*** Not to exceed 0.25 mg/mL. ***Rate:*** Infuse over 5 min. May be administered over 12 hr for patients with renal impairment.
- **Y-Site Compatibility:** acyclovir, alfentanil, allopurinol, amifostine, amikacin, aminocaproic acid, aminophylline, amiodarone, amphotericin B lipid complex, amphotericin B liposome, anidulafungin, argatroban, ascorbic acid, atropine, azithromycin, aztreonam, benztropine, bivalirudin, bleomycin, buprenorphine, butorphanol, calcium chloride, calcium gluconate, carboplatin, carmustine, caspofungin, cefazolin, cefepime, cefotaxime, cefoxitin, ceftaroline, ceftazidime, ceftriaxone, cefuroxime, chloramphenicol, cisatracurium, cisplatin, cladribine, clindamycin, cyanocobalamin, cyclophosphamide, cyclosporine, cytarabine, dactinomycin, daptomycin, dexamethasone, dexmedetomidine, dexrazoxane, digoxin, diltiazem, diphenhydramine, dobutamine, docetaxel, dopamine, doxorubicin, doxorubicin liposomal, doxycycline, enalaprilat, ephedrine, epinephrine, epirubicin, epoetin alfa, eptifibatide, ertapenem, erythromycin, esmolol, etoposide, etoposide phosphate, famotidine, fentanyl, filgrastim, fluconazole, fludarabine, fluorouracil, folic acid, furosemide, gemcitabine, gentamicin, glycopyrrolate, granisetron, heparin, hetastarch, hydrocortisone sodium succinate, hydromorphone, idarubicin, ifosfamide, imipenem/cilastatin, indomethacin, insulin, irinotecan, isoproterenol, ketorolac, labetalol, leucovorin calcium, levofloxacin, lidocaine, linezolid, lorazepam, magnesium sulfate, mannitol, melphalan, meperidine, methotrexate, methyldopate, methylprednisolone sodium succinate, metoclopramide, metoprolol, metronidazole, micafungin, milrinone, mitoxantrone, morphine, moxifloxacin, multivitamins, mycophenolate, nafcillin, nalbuphine, naloxone, nitroglycerin, nitroprusside, norepinephrine, octreotide, ondansetron, oxacillin, oxaliplatin, oxytocin, paclitaxel, palonosetron, pamidronate, pancuronium, pantoprazole, pemetrexed, penicillin G, pentobarbital,

© F.A. Davis Publishing

phenobarbital, phentolamine, phenylephrine, phytonadione, piperacillin/tazobactam, potassium acetate, potassium chloride, procainamide, promethazine, propofol, propranolol, protamine, pyridoxime, remifentanil, rifampin, rituximab, rocuronium, sodium acetate, sodium bicarbonate, succinylcholine, sufentanil, tacrolimus, theophylline, thiamine, thiotepa, tigecycline, tirofiban, tobramycin, tolazoline, trastuzumab, vancomycin, vasopressin, vecuronium, verapamil, vinblastine, vincristine, vinorelbine, voriconazole, zoledronic acid.

- **Y-Site Incompatibility:** alemtuzumab, amphotericin B deoxycholate, azathioprine, chlorpromazine, dantrolene, diazepam, diazoxide, fenoldopam, ganciclovir, haloperidol, papaverine, pentamidine, phenytoin, quinupristin/dalfopristin, trimethoprim/sulfamethoxazole.

Patient/Family Teaching

- Instruct patient to take bumetanide as directed. Take missed doses as soon as possible; do not double doses.
- Caution patient to change positions slowly to minimize orthostatic hypotension. Caution patient that drinking alcohol, exercising during hot weather, or standing for long periods may enhance orthostatic hypotension.
- Instruct patient to consult health care professional regarding a diet high in potassium. See Appendix J.
- Advise patient to contact health care professional of gain more than 3 lbs in one day.
- Instruct patient to notify health care professional of all Rx or OTC medications, vitamins, or herbal products being taken and to consult health care professional before taking any OTC medications concurrently with this therapy.
- Instruct patient to notify health care professional of medication regimen before treatment or surgery.
- Caution patient to use sunscreen and protective clothing to prevent photosensitivity reactions.
- Advise patient to contact health care professional immediately if rash, muscle weakness, cramps, nausea, dizziness, numbness, or tingling of extremities occurs.
- Advise patients with diabetes to monitor blood glucose closely; may cause increased levels.
- Emphasize the importance of routine follow-up examinations.
- Geri: Caution older patients or their caregivers about increased risk for falls. Suggest strategies for fall prevention.

Evaluation/Desired Outcomes

- Decrease in edema.
- Decrease in abdominal girth and weight.
- Increase in urinary output.

REMS HIGH ALERT

buprenorphine

(byoo-pre-**nor**-feen)

Belbuca, Buprenex, Butrans, ~~Probuphine~~, Sublocade, ~~Subutex~~

Classification

Therapeutic: opioid analgesics

Pharmacologic: opioid agonists/antagonists

Schedule III

Indications

IM, IV: Management of moderate to severe acute pain. **Buccal, Transdermal:** Pain that is severe enough to require daily, around-the-clock long-term opioid treatment and for which alternative treatment options (e.g. non-opioid analgesics or immediate-release opioids) are inadequate. **SL:** Treatment of opioid use disorder (preferred for induction only); suppresses withdrawal symptoms in opioid detoxification. **Subcut:** Treatment of opioid use disorder in patients who have initiated treatment with a transmucosal buprenorphine-containing product (8–24 mg/day) for ≥7 days.

Action

Binds to opiate receptors in the CNS. Alters the perception of and response to painful stimuli while producing generalized CNS depression. Has partial antagonist properties that may result in opioid withdrawal in physically dependent patients when used as an analgesic. **Therapeutic Effects: IM, IV, Transdermal:** Decreased severity of pain. **SL:** Suppression of withdrawal symptoms during detoxification and maintenance from heroin or other opioids. Produces a relatively mild withdrawal compared to other agents. **Subcut:** Continued cessation of opioid use.

Pharmacokinetics

Absorption: Well absorbed after IM and SL use; 46–65% absorbed with buccal use; 15% of transdermal dose absorbed through skin; IV administration results in complete bioavailability.

Distribution: Crosses the placenta; enters breast milk. CNS concentration is 15–25% of plasma.

Protein Binding: 96%.

Metabolism and Excretion: Mostly metabolized by the liver mostly via the CYP3A4 enzyme system; one metabolite is active; 70% excreted in feces; 27% excreted in urine.

Half-life: 2–3 hr (IV); 27 hr (buccal); 26 hr (transdermal); 37 hr (SL); 24–48 hr (subdermal); 43–60 days (subcut).

© F.A. Davis Publishing

TIME/ACTION PROFILE (analgesia)

ROUTE	ONSET	PEAK	DURATION
IM	15 min	60 min	6 hr†
IV	rapid	less than 60 min	6 hr†
SL	unknown	unknown	unknown
Transdermal	unknown	unknown	7 days
Buccal	unknown	unknown	unknown
Subcut	unknown	unknown	unknown

†4–5 hr in children.

Contraindications/Precautions

Contraindicated in: Hypersensitivity; Significant respiratory depression (transdermal, buccal); Acute or severe bronchial asthma (transdermal, buccal); Paralytic ileus (transdermal, buccal); Acute, mild, intermittent, or postoperative pain (transdermal); Long QT syndrome; Concurrent use of class I or III antiarrhythmics; Lactation: Lactation.

Use Cautiously in: ↑ intracranial pressure; Compromised respiratory function including COPD, cor pulmonale, diminished respiratory reserve, hypoxia, hypercapnia or respiratory depression of other causes; Severe renal impairment; Moderate or severe hepatic impairment (dose ↓ needed for severe impairment); Hypothyroidism; Seizure disorders; Adrenal insufficiency; Alcoholism; Biliary tract disease; Acute pancreatitis; Debilitated patients (dose ↓ required); Oral mucositis (dose ↓ required) (buccal); Undiagnosed abdominal pain; Hypokalemia, hypomagnesemia, unstable atrial fibrillation, symptomatic bradycardia, unstable HF, or myocardial ischemia; Prostatic hyperplasia; OB: Safety not established in pregnancy; prolonged use of buccal, transdermal, or SL buprenorphine during pregnancy can result in neonatal opioid withdrawal syndrome; Pedi: Safety and effectiveness not established in children <18 yr (SL and transdermal) or <2 yr (parenteral); Geri: ↑ risk of respiratory depression in older adults (dose ↓ required).

Adverse Reactions/Side Effects

CV: hypertension, hypotension, palpitations, QT interval prolongation. **Derm:** sweating, clammy feeling, erythema, pruritus, rash. **EENT:** blurred vision, diplopia, miosis (high doses). **Endo:** adrenal insufficiency. **GI:** HEPATOTOXICITY, nausea, constipation, dry mouth, ileus, vomiting. **GU:** urinary retention. **Neuro:** confusion, dysphoria, hallucinations, sedation, dizziness, euphoria, floating feeling, headache, unusual dreams. **Resp:** RESPIRATORY DEPRESSION (including central sleep apnea and sleep-related hypoxemia). **Misc:** HYPERSENSITIVITY REACTIONS (including anaphylaxis, angioedema, and bronchospasm), injection site reactions, physical dependence, psychological dependence, tolerance.

Interactions

Drug-Drug: Concurrent use with **class Ia antiarrhythmics**, **class III antiarrhythmics**, or other **QT interval prolonging medications** may ↑ risk of QT interval prolongation; avoid concurrent use. Use with **benzodiazepines** or other **CNS depressants** including other **opioids**, **non-benzodiazepine sedative/hypnotics**, **anxiolytics**, **general anesthetics**, **muscle relaxants**, **antipsychotics**, and **alcohol** may cause profound sedation, respiratory depression, coma, and death; reserve concurrent use for when alternative treatment options are inadequate. Use with extreme caution in patients receiving **MAO inhibitors** (↑ CNS and respiratory depression and hypotension—↓ buprenorphine dose by 50%; may need to ↓ **MAO inhibitor** dose; do not use transdermal formulation within 14 days of **MAO inhibitor**). May ↓ effectiveness of other **opioid analgesics**. Inhibitors of the CYP3A4 enzyme system including **itraconazole**, **ketoconazole**, **erythromycin**, **ritonavir**, **indinavir**, **saquinavir**, **atazanavir**, or **fosamprenavir** may ↑ blood levels and effects; may need to ↓ buprenorphine dose. Inducers of the CYP3A4 enzyme system including **carbamazepine**, **rifampin**, or **phenytoin** may ↓ blood levels and effects; buprenorphine dose modification may be necessary during concurrent use. Concurrent abuse of buprenorphine and **benzodiazepines** may result in coma and death. Drugs that affect serotonergic neurotransmitter systems, including **tricyclic antidepressants**, **SSRIs**, **SNRIs**, **MAO inhibitors**, **TCAs**, **tramadol**, **trazodone**, **mirtazapine**, **5–HT$_3$ receptor antagonists**, **linezolid**, **methylene blue**, and **triptans** ↑ risk of serotonin syndrome.

Drug-Natural Products: Concomitant use of **kava-kava**, **valerian**, **chamomile**, or **hops** can ↑ CNS depression.

Route/Dosage

Analgesia

IM, IV (Adults): 0.3 mg every 4–6 hr as needed. May repeat initial dose after 30 min (up to 0.3 mg every 4 hr or 0.6 mg every 6 hr); 0.6-mg doses should be given only IM.

IM, IV (Children 2–12 yr): 2–6 mcg (0.002–0.006 mg)/kg every 4–6 hr.

Transdermal (Adults): *Opioid-naïve*—Transdermal system delivering 5–20 mcg/hr applied every 7 days. Initiate with 5 mcg/hr system; each dose titration may occur after 72 hr; do not exceed dose of 20 mcg/hr (due to ↑ risk of QT interval prolongation); *Previously taking <30 mg/day of morphine or equivalent*—Initiate with 5 mcg/hr system; each dose titration may occur after 72 hr; do not exceed dose of 20 mcg/hr (due to ↑ risk of QT interval prolongation); apply patch every 7 days; *Previously taking 30–80 mg/*

© F.A. Davis Publishing

day of morphine or equivalent—Initiate with 10 mcg/hr system; each dose titration may occur after 72 hr; do not exceed dose of 20 mcg/hr (due to ↑ risk of QT interval prolongation); apply patch every 7 days; *Previously taking >80 mg/day of morphine or equivalent*—Consider use of alternate analgesic.
Buccal (Adults): *Opioid-naïve*—Initiate therapy with 75 mcg once daily or every 12 hr for ≥4 days, then ↑ dose to 150 mcg every 12 hr; may then titrate dose in increments of 150 mcg every 12 hr no more frequently than every 4 days; do not exceed dose of 450 mcg every 12 hr (based on clinical studies); *Previously taking <30 mg/day of morphine or equivalent*—Initiate therapy with 75 mcg once daily or every 12 hr for ≥4 days, then ↑ dose to 150 mcg every 12 hr; may then titrate dose in increments of 150 mcg every 12 hr no more frequently than every 4 days; do not exceed dose of 900 mcg every 12 hr (due to ↑ risk of QT interval prolongation); *Previously taking 30–89 mg/day of morphine or equivalent*—Initiate therapy with 150 mcg every 12 hr for ≥4 days; may then titrate dose in increments of 150 mcg every 12 hr no more frequently than every 4 days; do not exceed dose of 900 mcg every 12 hr (due to ↑ risk of QT interval prolongation); *Previously taking 90–160 mg/day of morphine or equivalent*—Initiate therapy with 300 mcg every 12 hr for ≥4 days; may then titrate dose in increments of 150 mcg every 12 hr no more frequently than every 4 days; do not exceed dose of 900 mcg every 12 hr (due to ↑ risk of QT interval prolongation); *Previously taking >160 mg/day of morphine or equivalent*—Consider use of alternate analgesic; *Patients with oral mucositis*—↓ initial dose by 50% then titrate dose in increments of 75 mcg every 12 hr no more frequently than every 4 days.

Hepatic Impairment

Transdermal (Adults): *Mild to moderate hepatic impairment*—Initiate with 5 mcg/hr system.

Hepatic Impairment

Buccal (Adults): *Severe hepatic impairment*—↓ initial dose by 50% then titrate dose in increments of 75 mcg every 12 hr no more frequently than every 4 days.

Treatment of Opioid Use Disorder

SL (Adults): *Induction*—8 mg once daily on Day 1, then 16 mg once daily on Day 2–4; *Maintenance*—Patients should preferably be transitioned to buprenorphine/naloxone; if patient cannot tolerate naloxone, then can use buprenorphine (usual dosage range = 4–24 mg/day); recommended target dose = 16 mg/day; dose can be ↑ or ↓ by 2–4 mg, as needed to prevent signs/symptoms of opioid withdrawal.
Subcut (Adults): 300 mg once monthly for 2 mo, then 100 mg once monthly; may ↑ maintenance dose to 300 mg once monthly if patient reports illicit opioid use or has positive urine drug screen for illicit opioid use.

Hepatic Impairment

SL (Adults): *Severe hepatic impairment*—↓ initial dose and adjustment dose by 50%.

Availability (generic available)

Buccal film (Belbuca): 75 mcg, 150 mcg, 300 mcg, 450 mcg, 600 mcg, 750 mcg, 900 mcg. **Extended-release solution for subcutaneous injection (prefilled syringes) (Sublocade):** 100 mg/0.5 mL, 300 mg/1.5 mL. **Solution for injection (Buprenex):** 300 mcg (0.3 mg)/mL. **Sublingual tablets:** 2 mg, 8 mg. **Transdermal systems (Butrans):** 5 mcg/hr, 7.5 mcg/hr, 10 mcg/hr, 15 mcg/hr, 20 mcg/hr. ***In combination with:*** naloxone (Suboxone, Zubsolv). See Appendix N.

NURSING IMPLICATIONS

Assessment

- Monitor for signs and symptoms of adrenal insufficiency (nausea, vomiting, anorexia, fatigue, weakness, dizziness, and low blood pressure) during therapy. If adrenal insufficiency is suspected, confirm with diagnostic testing. If confirmed, treat with physiologic doses of replacement corticosteroids. Wean patient off opioid to allow adrenal recovery and continue corticosteroids until adrenal function recovers. Other opioids may be tried.
- **Pain:** Assess type, location, and intensity of pain before and 1 hr after IM and 5 min (peak) after IV administration. When titrating opioid doses, increases of 25–50% should be administered until there is either a 50% reduction in the patient's pain rating on a numerical or visual analogue scale or the patient reports satisfactory pain relief. A repeat dose can be safely administered at the time of the peak if previous dose is ineffective and side effects are minimal. Single doses of 600 mcg (0.6 mg) should be administered IM. Patients requiring doses higher than 600 mcg (0.6 mg) should be converted to an opioid agonist. Buprenorphine is not recommended for prolonged use (except buccal or transdermal) or as first-line therapy for acute or cancer pain. SL formulations should not be used to relieve pain.
- An equianalgesic chart (see Appendix I) should be used when changing routes or when changing from one opioid to another.
- Assess level of consciousness, BP, pulse, and respirations before and periodically during administration, especially within first 24–72 hrs of buccal therapy. If respiratory rate is <10/min, assess level of sedation. Dose may need to be decreased by 25–50%. Buprenorphine 0.3–0.4 mg has approximately equal analgesic and respiratory depressant effects to morphine 10 mg. Monitor for respiratory depression, especially during initiation or following dose increase; serious, life-threatening, or fatal respiratory depression may occur. May cause sleep-related breathing disorders (central sleep apnea [CSA], sleep-related hypoxemia).

© F.A. Davis Publishing

- Assess previous analgesic history. Antagonistic properties may induce withdrawal symptoms (vomiting, restlessness, abdominal cramps, increased BP and temperature) in patients who are physically dependent on opioid agonists. Symptoms may occur up to 15 days after discontinuation and persist for 1–2 wk.
- Buprenorphine has a lower potential for dependence than other opioids; however, prolonged use may lead to physical and psychological dependence and tolerance. This should not prevent patient from receiving adequate analgesia. Most patients receiving buprenorphine for pain rarely develop psychological dependence. If tolerance develops, changing to an opioid agonist may be required to relieve pain.
- Assess bowel function routinely. Prevent constipation with increased intake of fluids and bulk, and laxatives to minimize constipating effects. Administer stimulant laxatives routinely if opioid use exceeds 2–3 days, unless contraindicated. Consider drugs for opioid-induced constipation.
- **Transdermal:** Assess risk for opioid addiction, abuse, or misuse prior to administration. Monitor for respiratory depression, especially during initiation or following dose increase; serious, life-threatening, or fatal respiratory depression may occur. Misuse or abuse of *Butrans* by chewing, swallowing, snorting or injecting buprenorphine extracted from transdermal system will result in the uncontrolled delivery of buprenorphine and risk of overdose and death.
- Maintain frequent contact during periods of changing analgesic requirements, including initial titration, between the prescriber, other members of the healthcare team, the patient, and the caregiver/family.
- **Treatment of Opioid Dependence:** Assess patient for signs and symptoms of opioid withdrawal before and during therapy.
- ***Lab Test Considerations:*** May cause ↑ serum amylase and lipase levels.
- Monitor liver function tests prior to and periodically during opioid dependence therapy.
- ***Toxicity and Overdose:*** If an opioid antagonist is required to reverse respiratory depression or coma, naloxone is the antidote. Dilute the 0.4-mg ampule of naloxone in 10 mL of 0.9% NaCl and administer 0.5 mL (0.02 mg) by IV push every 2 min. For children and patients weighing <40 kg, dilute 0.1 mg of naloxone in 10 mL of 0.9% NaCl for a concentration of 10 mcg/mL and administer 0.5 mcg/kg every 1–2 min. Titrate dose to avoid withdrawal, seizures, and severe pain. Naloxone may not completely reverse respiratory depressant effects of buprenorphine; may require mechanical ventilation, oxygen, IV fluids, and vasopressors.

Implementation

- Do not confuse buprenorphine with hydromorphone.
- **Pain:** Explain therapeutic value of medication before administration to enhance the analgesic effect.
- Regularly administered doses may be more effective than prn administration. Analgesic is more effective if given before pain becomes severe.
- Coadministration with non-opioid analgesics has additive effects and may permit lower opioid doses.
- For patients taking forms of long-acting buprenorphine, if acute pain management or anesthesia is needed, treat with a non-opioid analgesic, if possible. Patients requiring opioid therapy for analgesia may be treated with a high-affinity full opioid analgesic under the supervision of a physician, with particular attention to respiratory function. Higher doses may be required for analgesic effect. Monitor patient closely.
- ***REMS:*** FDA strongly encourages health care professionals to complete a REMS-compliant education program that includes all the elements of the FDA Education *Blueprint for Health Care Providers Involved in the Management or Support of Patients with Pain,* available at www.fda.gov/OpioidAnalgesicREMSBlueprint. Information on programs can be found at 1-800-503-0784 or www.opioidanalgesicrems.com.
- Discuss availability of naloxone for emergency treatment of opioid overdose with the patient and caregiver and assess the potential need for access to naloxone, both when initiating and renewing therapy, especially if patient has household members (including children) or other close contacts at risk for accidental exposure or overdose. Consider prescribing naloxone, based on the patient's risk factors for overdose, such as concomitant use of CNS depressants, a history of opioid use disorder, or prior opioid overdose. However, the presence of risk factors for overdose should not prevent the proper management of pain in any patient.
- **Buccal:** Have patient wet inside of cheek with tongue or rinse mouth with water. Apply film immediately after removal from package. Place yellow side of film against inside of cheek. Hold film in place with dry fingers for 5 sec, then leave in place on inside of cheek until fully dissolved. If chewed or swallowed, may result in lower peak concentrations and lower bioavailability. Do not administer if package seal if broken or film is cut, damaged, or changed. Avoid applying to areas of mouth with sores or lesions. To dispose of unused film, remove from foil package, drop into toilet and flush.
- **IM:** Administer IM injections deep into well-developed muscle. Rotate sites of injections.

© F.A. Davis Publishing

IV Administration

- **IV Push:** May give IV undiluted. ***High Alert:*** Administer slowly. Rapid administration may cause respiratory depression, hypotension, and cardiac arrest. ***Rate:*** Give over at least 2 min.
- **Y-Site Compatibility:** acetaminophen, acyclovir, alfentanil, allopurinol, amifostine, amikacin, aminocaproic acid, amiodarone, amphotericin B lipid complex, amphotericin B liposome, anidulafungin, argatroban, arsenic trioxide, ascorbic acid, atracurium, atropine, azithromycin, aztreonam, benztropine, bivalirudin, bleomycin, bumetanide, butorphanol, calcium chloride, calcium gluconate, carboplatin, carmustine, cefazolin, cefepime, cefotaxime, cefotetan, cefoxitin, ceftazidime, ceftriaxone, cefuroxime, chloramphenicol, chlorpromazine, cisatracurium, cisplatin, cladribine, clindamycin, cyanocobalamin, cyclophosphamide, cyclosporine, cytarabine, dacarbazine, dactinomycin, daptomycin, daunorubicin, dexamethasone, dexmedetomidine, dexrazoxane, digoxin, diltiazem, diphenhydramine, dobutamine, docetaxel, dopamine, doxorubicin hydrochloride, doxycycline, enalaprilat, ephedrine, epinephrine, epirubicin, epoetin alfa, eptifibatide, ertapenem, erythromycin, esmolol, etoposide, etoposide phosphate, famotidine, fenoldopam, fentanyl, filgrastim, fluconazole, fludarabine, foscarnet, fosphenytoin, gemcitabine, gentamicin, glycopyrrolate, granisetron, heparin, hetastarch, hydrocortisone, idarubicin, ifosfamide, imipenem/cilastatin, insulin, irinotecan, isoproterenol, ketorolac, labetalol, leucovorin calcium, levofloxacin, lidocaine, linezolid, lorazepam, magnesium sulfate, mannitol, melphalan, meperidine, mesna, methotrexate, methylprednisolone, metoclopramide, metoprolol, metronidazole, midazolam, milrinone, mitomycin, mitoxantrone, morphine, multivitamins, mycophenolate, nafcillin, nalbuphine, naloxone, nicardipine, nitroglycerin, nitroprusside, norepinephrine, octreotide, ondansetron, oxacillin, oxaliplatin, oxytocin, paclitaxel, palonosetron, pamidronate, pancuronium, papaverine, pemetrexed, penicillin G, pentamidine, phentolamine, phenylephrine, phytonadione, piperacillin/tazobactam, potassium acetate, potassium chloride, procainamide, prochlorperazine, promethazine, propofol, propranolol, protamine, pyridoxine, quinupristin/dalfopristin, remifentanil, rituximab, rocuronium, sodium acetate, succinylcholine, sufentanil, tacrolimus, theophylline, thiamine, thiotepa, tigecycline, tirofiban, tobramycin, topotecan, trastuzumab, vancomycin, vasopressin, vecuronium, verapamil, vinblastine, vincristine, vinorelbine, voriconazole, zoledronic acid.
- **Y-Site Incompatibility:** alemtuzumab, aminophylline, ampicillin, azathioprine, dantrolene, diazepam, diazoxide, doxorubicin liposomal, fluorouracil, gemtuzumab ozogamicin, indomethacin, pantoprazole, pentobarbital, phenobarbital, phenytoin, sodium bicarbonate, trimethoprim/sulfamethoxazole.
- **Transdermal:** Buprenorphine may cause withdrawal in patients who are already taking opioids. For conversion from other opioids to buprenorphine transdermal, taper current around-the-clock opioids for up to 7 days to no more than 30 mg of morphine or equivalent per day before beginning treatment with buprenorphine transdermal. May use short-acting analgesics as needed until analgesic efficacy with buprenorphine transdermal is attained. Buprenorphine transdermal may not provide adequate analgesia for patients requiring greater than 80 mg/day oral morphine equivalents.
- Apply system to flat, hairless, nonirritated, and nonirradiated site on the upper outer arm, upper chest, upper back or the side of the chest. If skin preparation is necessary, use clear water and clip, do not shave, hair. Allow skin to dry completely before application. Apply immediately after removing from package. Do not alter the system (i.e., cut) in any way before application. Remove liner from adhesive layer and press firmly in place with palm of hand for 30 sec, especially around the edges, to make sure contact is complete. Remove used system and fold so that adhesive edges are together. Flush system down toilet immediately on removal or follow the institutional policy. Apply new system to a different site. After removal, wait a minimum of 3 wk before applying to the same site. If patch falls off during 7-day dosing interval, dispose of patch and place a new patch on at a different site.
- May be titrated no less than every 72 hrs. Dose adjustments in 5 mcg/hr, 7.5 mcg/hr, or 10 mcg/hr increments may be used by using no more than two patches.
- To discontinue, taper dose gradually to prevent signs and symptoms of withdrawal; consider introduction of immediate-release opioid medication. For patients taking buprenorphine regularly for a week or more, initiate taper by a small enough increment (no more than 10% to 25% of the total daily dose) to avoid withdrawal symptoms, and proceed with dose-lowering at an interval of every 2 to 4 wk or longer. Provision of lower dose strengths may be necessary for a successful taper. Monitor for withdrawal symptoms (restlessness, lacrimation, rhinorrhea, yawning, perspiration, chills, myalgia, mydriasis, irritability, anxiety, backache, joint pain, weakness, abdominal cramps, insomnia, nausea, anorexia, vomiting, diarrhea, increased blood pressure, respiratory rate, or heart rate) during taper. If withdrawal symptoms occur, it may be necessary to pause the taper for a period of time or raise the dose of the opioid analgesic to the previous dose, and then proceed with a slower taper. Monitor for changes in mood, emergence of suicidal thoughts, or use of other substances.
- **Treatment of Opioid Use Disorder:** Must be prescribed by health care professional with special training.

© F.A. Davis Publishing

- **SL:** Induction is usually started with buprenorphine SL over 3–4 days. Initial dose should be administered at least 4 hr after last opioid dose and preferably when early signs of opioid withdrawal appear. Once patient is on a stable dose, maintenance therapy with buprenorphine/naloxone (Suboxone) is preferred for continued, unsupervised treatment.
- Administer sublingually. Usually takes 2–10 min for tablets to dissolve. If more than one tablet is prescribed, place multiple tablets under the tongue or 2 at a time until all tablets are dissolved. Do not chew or swallow; decreases amount of medication absorbed. Not used for analgesia; may cause death in opioid naïve patients.
- **Subcut:** *Sublocade* is for patients who have initiated treatment with a transmucosal buprenorphine product followed by dose adjustment for at least 7 days. Prepare and administer only by health care professional monthly with a minimum of 26 days between doses. Use syringe and needle provided by manufacturer. Remove from refrigerator at least 15 min before injection to allow to reach room temperature. Do not open foil pouch until patient has arrived. Discard if left at room temperature for >7 days. Do not administer solutions that are discolored or contain particulate matter. Pinch injection site and administer into abdomen; do not rub. May cause a lump that will decrease over several wk. Do not administer IV or IM. If discontinued, withdrawal effects will be delayed (2–5 mo) due to long half-life. Monitor patients discontinuing for withdrawal signs and symptoms. May use transmucosal buprenorphine to treat withdrawal. In patients taking *Sublocade* for 4–6 months or more, plasma and urine levels of buprenorphine may be detectable for 12 months or longer following discontinuation. Administer missed doses as soon as possible with following dose given at least 26 days later. For patients with regular therapy of 100 mg monthly, a two-month dosing interval may be used on occasion (e.g., extended travel); a single 300 mg dose may be given to cover a two-month period, then resume 100 mg monthly regimen. Caution patient that 300 mg dose may cause sedation.

Patient/Family Teaching

- ***REMS:*** Instruct patient on risk of addiction, abuse, and misuse, which could lead to death. Discuss safe use, risks, and proper storage and disposal of opioid analgesics with patients and caregivers with each Rx. *The Patient Counseling Guide* is available at www.fda.gov/OpioidAnalgesicREMSPCG. Advise patient not to share buprenorphine with others and to protect from theft or misuse. Advise patient to avoid abrupt discontinuation; may lead to withdrawal symptoms.
- Educate patients and caregivers on how to recognize respiratory depression and emphasize the importance of calling 911 or getting emergency medical help right away in the event of a known or suspected overdose. Inform patients and caregivers about various ways to obtain naloxone as permitted by individual state naloxone dispensing and prescribing requirements or guidelines (by prescription, directly from a pharmacist, or as part of a community-based program).
- Medication may cause drowsiness or dizziness. Advise patient to call for assistance when ambulating and to avoid driving or other activities requiring alertness until response to medication is known, especially within 24–48 hrs after subdermal implant insertion.
- Advise patient to avoid concurrent use of alcohol or other CNS depressants.
- Instruct patient to notify health care professional of all Rx or OTC medications, vitamins, or herbal products being taken and to consult health care professional before taking any Rx, OTC, or herbal products, especially CNS depressants.
- Advise patient and family members to inform health care professionals of physical dependence on an opioid and of buprenorphine therapy.
- Rep: Advise patient to notify health care professional if pregnancy is planned or suspected, and to avoid breast feeding during therapy. Inform patient of potential for neonatal opioid withdrawal syndrome with prolonged use during pregnancy. Chronic use of buprenorphine may impair male and female fertility. Monitor infant for signs and symptoms of neonatal opioid withdrawal syndrome (irritability, hyperactivity and abnormal sleep pattern, high pitched cry, tremor, vomiting, diarrhea, and/or failure to gain weight); usually occur in the first days after birth.
- **Pain:** Instruct patient on how and when to ask for pain medication.
- Encourage patients on bedrest to turn, cough, and deep-breathe every 2 hr to prevent atelectasis.
- Instruct patient to change positions slowly to minimize orthostatic hypotension.
- Advise patient that good oral hygiene, frequent mouth rinses, and sugarless gum or candy may decrease dry mouth.
- **Buccal:** Instruct patient on proper technique of buccal film and to avoid eating or drinking until film dissolves. Apply at same time each day. Avoid touching or moving buccal film with tongue or fingers. Do not stop using buprenorphine without consulting health care professional. Advise patient to read *Instructions for Use* prior to starting therapy and with each Rx refill in case of changes.
- Advise patient to notify health care professional if the dose does not control pain.

© F.A. Davis Publishing

- **Transdermal:** Instruct patient in correct method for application, removal, storage, and disposal of transdermal system. Wear patches for 7 days. May be worn while bathing, showering, or swimming. Do not discontinue or change dose without consulting health care professional. Instruct patient to read the *Medication Guide* prior to starting and with each Rx refill.
- Advise patients and caregivers/family members of the potential side effects. Instruct patient to notify health care professional if pain is not controlled or if bothersome side effects occur. Contact immediately if difficulty or changes in breathing, unusual deep "sighing" breathing, slow or shallow breathing, new or unusual snoring, slow heartbeat, severe sleepiness, cold, clammy skin, feeling faint, dizzy, confused, or cannot think, walk, or talk normally, or if swelling or blistering around patch occurs.
- Advise patient that fever, electric blankets, heating pads, saunas, hot tubs, and heated water beds increase release of buprenorphine from patch.
- Advise patient referred for MRI test to discuss patch with referring health care professional and MRI facility to determine if removal of patch is necessary prior to test and for directions for replacing patch.
- **Opioid Use Disorder:** Explain techniques for use to patient.
- Caution patient that buprenorphine may be a target for people who abuse drugs; store medications in a safe place to protect them from theft. Selling or giving this medication to others is against the law.
- Caution patient that injection of *Suboxone* can lead to severe withdrawal symptoms.
- Advise patient if admitted to the emergency department to inform treating health care professional and emergency room staff of physical dependence on opioids and of treatment regimen.
- Advise patient to notify health care professional promptly if faintness, dizziness, confusion, slowed breathing, skin or whites of eyes turn yellow, urine turns dark, light-colored stools, decreased appetite, nausea, or abdominal pain occur.
- **SL**: Instruct patient in correct use of medication; directions for use must be followed exactly. Medication must be used regularly, not occasionally. Take missed doses as soon as remembered; if almost time for next dose, skip missed dose and return to regular dosing schedule. Do not take 2 doses at once unless directed by health care professional. Do not discontinue use without consulting health care professional; abrupt discontinuation may cause withdrawal symptoms. If medication is discontinued, flush unused tablets down the toilet if a drug take-back option is not readily available. **Subcut** ***REMS:*** Inform patient *Sublocade* is only available through a restricted program, *Sublocade* REMS program. *Sublocade* can only be dispensed to directly to a health care provider.

Evaluation/Desired Outcomes

- Decrease in severity of pain without a significant alteration in level of consciousness or respiratory status.
- Suppression of withdrawal symptoms during detoxification and maintenance from heroin or other opioids.
- Continued cessation of opioid use.

buPROPion (byoo-**proe**-pee-on)

Aplenzin, Forfivo XL, ~~Wellbutrin~~, Wellbutrin SR, Wellbutrin XL, ~~Zyban~~

Classification

Therapeutic: antidepressants, smoking deterrents
Pharmacologic: aminoketones

Indications

Treatment of depression (with psychotherapy). Depression with seasonal affective disorder. Smoking cessation. **Unlabeled Use:** Treatment of ADHD (adults). To increase sexual desire in women.

Action

Decreases neuronal reuptake of dopamine in the CNS. Diminished neuronal uptake of serotonin and norepinephrine (less than tricyclic antidepressants). **Therapeutic Effects:** Diminished depression. Decreased craving for cigarettes.

Pharmacokinetics

Absorption: Although well absorbed, rapidly and extensively metabolized by the liver.
Distribution: Unknown.
Metabolism and Excretion: Extensively metabolized by the liver into 3 active metabolites (CYP2B6 involved in formation of one of the active metabolites).
Half-life: 14 hr (active metabolites may have longer half-lives).

TIME/ACTION PROFILE (antidepressant effect)

ROUTE	ONSET	PEAK	DURATION
PO	1–3 wk	unknown	unknown

Contraindications/Precautions

Contraindicated in: Hypersensitivity; Concurrent use of MAO inhibitors or MAO-like drugs (linezolid or methylene blue); Concurrent use of ritonavir; Seizure disorders; Arteriovenous malformation, severe head injury, CNS tumor, CNS infection, severe stroke, anorexia nervosa, bulimia, or abrupt discontinuation of alcohol, benzodiazepines, barbiturates, or antiepileptic drugs (↑ risk of seizures).
Use Cautiously in: Renal/hepatic impairment (↓ dose recommended) (Forfivo XL not recommended in patients with renal or hepatic impairment); Recent history of MI; History of suicide attempt; Unstable cardiovascular status; May ↑ risk of suicide attempt/ideation

© F.A. Davis Publishing

especially during early treatment or dose adjustment; this risk appears to be greater in adolescents or children; Psychiatric illness; Angle-closure glaucoma; OB: Use during pregnancy only if potential maternal benefit outweighs potential fetal risk; Lactation: Use while breast feeding only if potential maternal benefit justifies potential risk to infant; Geri: ↑ risk of drug accumulation; ↑ sensitivity to effects.

Exercise Extreme Caution in: Severe hepatic cirrhosis (↓ dose required); Pedi: ↑ risk of suicidal thinking and behavior. Observe carefully, especially at initiation of therapy and during ↑ or ↓ in dose.

Adverse Reactions/Side Effects

CV: hypertension. **Derm:** photosensitivity. **Endo:** hyperglycemia, hypoglycemia, syndrome of inappropriate ADH secretion. **GI:** dry mouth, nausea, vomiting, change in appetite, weight gain, weight loss. **Neuro:** HOMICIDAL THOUGHTS/BEHAVIOR, SEIZURES, SUICIDAL THOUGHTS/BEHAVIOR, agitation, headache, tremor, aggression, anxiety, delusions, depression, hallucinations, hostility, insomnia, mania, panic, paranoia, psychoses.

Interactions

Drug-Drug: Concurrent use with **MAO-inhibitors** may ↑ risk of hypertensive reactions; concurrent use contraindicated; at least 14 days should elapse between discontinuation of MAO inhibitor and initiation of bupropion (or visa versa). Concurrent use with **MAO-inhibitor like drugs**, such as **linezolid** or **methylene blue** may ↑ risk of hypertensive reactions; concurrent use contraindicated; do not start therapy in patients receiving **linezolid** or **methylene blue**; if **linezolid** or **methylene blue** need to be started in a patient receiving bupropion, immediately discontinue bupropion and monitor for 2 wk or until 24 hr after last dose of linezolid or methylene blue, whichever comes first (may resume bupropion therapy 24 hr after last dose of linezolid or methylene blue). ↑ risk of adverse reactions when used with **amantadine** or **levodopa**. ↑ risk of seizures with **phenothiazines**, **antidepressants**, **theophylline**, **corticosteroids**, **OTC stimulants/anorectics**, or cessation of **alcohol** or **benzodiazepines** (avoid or minimize alcohol use). **Ritonavir**, **lopinavir/ritonavir**, and **efavirenz** may ↓ levels; may need to ↑ bupropion dose. May ↑ **citalopram** levels. **Carbamazepine** may ↓ blood levels and effectiveness. Concurrent use with **nicotine** replacement may cause hypertension. ↑ risk of bleeding with **warfarin**. Bupropion and one of its metabolites inhibit the CYP2D6 enzyme system and may ↑ levels and risk of toxicity from **antidepressants** (SSRIs and tricyclic), **haloperidol**, **risperidone**, **thioridazine**, **beta blockers**, **flecainide**, and **propafenone**. May ↓ levels and efficacy of **tamoxifen**. May ↓ the efficacy of **tamoxifen**. May ↓ **digoxin** levels.

Route/Dosage

Depression

PO (Adults): *Immediate-release* — 100 mg twice daily initially; after 3 days may ↑ to 100 mg 3 times daily; after at least 4 wk of therapy, may ↑ up to 450 mg/day in divided doses (not to exceed 150 mg/dose; wait at least 6 hr between doses at the 300 mg/day dose or at least 4 hr between doses at the 450-mg/day dose). *12–hr sustained-release* — 150 mg once daily in the morning; after 3 days, may ↑ to 150 mg twice daily with at least 8 hr between doses; after at least 4 wk of therapy, may ↑ to a maximum daily dose of 400 mg given as 200 mg twice daily. *24–hr extended-release (Wellbutrin XL)* — 150 mg once daily in the morning, may be ↑ after 4 days to 300 mg once daily; some patients may require up to 450 mg/day as a single daily dose. *24–hr extended-release (Aplenzin)* — 174 mg once daily in the morning, may be ↑ after 4 days to 348 mg once daily; some patients may require up to 522 mg/day as a single daily dose. *24–hr extended-release (Forfivo XL)* — 450 mg once daily (should NOT be used as initial therapy; it should only be used in patients who have been receiving 300 mg/day of another bupropion formulation for at least 2 wk and require titration up to 450 mg/day or in those patients receiving 450 mg/day of another bupropion formulation).

Hepatic Impairment

PO (Adults): *Moderate-to-severe hepatic impairment (Aplenzin)* — Max dose: 174 mg every other day.

Seasonal Affective Disorder

PO (Adults): *24–hr extended-release (Wellbutrin XL)* — 150 mg/day in the morning; if dose is well tolerated, ↑ to 300 mg/day in one wk. Doses should be tapered to 150 mg/day for 2 wk before discontinuing; *24–hr extended-release (Aplenzin)* — 174 mg once daily in the morning, may be ↑ after 7 days to 348 mg once daily.

Hepatic Impairment

PO (Adults): *Moderate-to-severe hepatic impairment (Aplenzin)* — Max dose: 174 mg every other day.

Smoking cessation

PO (Adults): *12–hr sustained release* — 150 mg once daily for 3 days, then 150 mg twice daily for 7–12 wk (doses should be at least 8 hr apart).

Availability (generic available)

Immediate-release tablets: 75 mg, 100 mg. **Cost:** *Generic* — 75 mg $79.43/100, 100 mg $106.01/100. **12–hour sustained-release tablets:** 100 mg, 150 mg, 200 mg. **Cost:** *Generic* — 100 mg $51.12/180, 150 mg $59.60/180, 200 mg $52.33/180. **24–hour**

© F.A. Davis Publishing

extended-release tablets (Wellbutrin XL): 150 mg, 300 mg. **Cost:** *Generic*— 150 mg $74.84/90, 300 mg $63.94/90. **24–hour extended-release tablets (Aplenzin):** 174 mg, 348 mg, 522 mg. **Cost:** 174 mg $359.09/30, 348 mg $473.36/30, 522 mg $1,077.23/30. **24–hour extended-release tablets (Forfivo XL):** 450 mg. **Cost:** $176.40/30.

NURSING IMPLICATIONS

Assessment

- Assess mental status and mood changes in all patients, especially during initial few mo of therapy and during dose changes. Risk may be increased in children, adolescents, and adults ≤24 yrs. Inform health care professional if patient demonstrates significant increase in signs of depression (depressed mood, loss of interest in usual activities, significant change in weight and/or appetite, insomnia or hypersomnia, psychomotor agitation or retardation, increased fatigue, feelings of guilt or worthlessness, slowed thinking or impaired concentration, suicide attempt or suicidal/homicidal ideation). If so, restrict amount of drug available to patient.
- ***Lab Test Considerations:*** Monitor hepatic and renal function closely in patients with kidney or liver impairment to prevent ↑ serum and tissue bupropion concentrations.
- May cause false-positive urine test for amphetamines.

Implementation

- Do not confuse bupropion with buspirone. Do not confuse *Wellbutrin SR* with *Wellbutrin XL*.
- Administer doses in equally spaced time increments during the day to minimize the risk of seizures. Risk of seizures increases fourfold in doses >450 mg per day.
- May be initially administered concurrently with sedatives to minimize agitation. This is not usually required after the 1st wk of therapy.
- Insomnia may be decreased by avoiding bedtime doses. May require treatment during 1st wk of therapy.
- Nicotine patches, gum, inhalers, and spray may be used concurrently with bupropion.
- When converting from other brands of bupropion to *Aplenzin* 522 mg/day *Aplenzin* is equivalent to 450 mg/day bupropion HCl, 348 mg/day *Aplenzin* is equivalent to 300 mg/day bupropion HCl, and 174 mg/day *Aplenzin* is equivalent to 150 mg/day bupropion HCl.
- **PO:** ***DNC:*** Swallow sustained-release or extended-release tablets whole; do not break, crush, or chew.
- May be administered with food to lessen GI irritation.
- **Seasonal Affective Disorder:** Begin administration in autumn prior to the onset of depressive symptoms. Continue therapy through winter and begin to taper and discontinue in early spring.

Patient/Family Teaching

- Instruct patient to take bupropion as directed at the same time each day. Missed doses should be omitted. Do not double doses or take more than prescribed. May require 4 wk or longer for full effects. Do not discontinue without consulting health care professional. May require gradual reduction before discontinuation. Advise patient to read *Medication Guide* before starting and with each Rx refill in case of changes.
- May impair judgment or motor and cognitive skills. Caution patient to avoid driving and other activities requiring alertness until response to medication is known.
- Advise patient, family, and caregivers to look for suicidality, especially during early therapy or dose changes. Notify health care professional immediately if thoughts about suicide or dying, attempts to commit suicide, new or worse depression or anxiety, agitation or restlessness, panic attacks, insomnia, new or worse irritability, aggressiveness, acting on dangerous impulses, mania, or other changes in mood or behavior occur.
- Instruct patient to notify health care professional of all Rx or OTC medications, vitamins, or herbal products being taken, to avoid alcohol during therapy and to consult with health care professional before taking other medications with bupropion.
- Inform patient that frequent mouth rinses, good oral hygiene, and sugarless gum or candy may minimize dry mouth. If dry mouth persists for more than 2 wk, consult health care professional regarding use of saliva substitute.
- Advise patient to notify health care professional if rash or other troublesome side effects occur.
- Inform patient that unused shell of XL tablets may appear in stool; this is normal.
- Advise patient to use sunscreen and protective clothing to prevent photosensitivity reactions.
- Advise patient to notify health care professional of medication regimen before treatment or surgery.
- Rep: Instruct females of reproductive potential to inform health care professional if pregnancy is planned or suspected or if breast feeding. Inform patient about pregnancy exposure registry to monitor pregnancy outcomes in women exposed to antidepressants during pregnancy. Register patients by calling the National Pregnancy Registry for Antidepressants at 1-844-405-6185 or visiting online at https://womensmentalhealth.org/clinical-and-researchprograms/pregnancyregistry/antidepressants/.
- Emphasize the importance of follow-up exams to monitor progress. Encourage patient participation in psychotherapy.
- **Smoking Cessation:** Smoking should be stopped during the 2nd wk of therapy to allow for the onset of bupropion and to maximize the chances of quitting.

© F.A. Davis Publishing

- Advise patient to stop taking bupropion and contact a health care professional immediately if agitation, depressed mood, and any changes in behavior that are not typical of nicotine withdrawal, or if suicidal thoughts or behavior occur.

Evaluation/Desired Outcomes

- Increased sense of well-being.
- Renewed interest in surroundings. Acute episodes of depression may require several mo of treatment.
- Cessation of smoking.

bupropion/naltrexone

(byoo-**proe**-pee-on nal-**trex**-one)

Contrave

Classification

Therapeutic: weight control agents

Pharmacologic: aminoketones, opioid antagonists

Indications

Adjunct to calorie-reduced diet and increased physical activity for chronic weight management in obese patients (BMI ≥30 kg/m^2) or overweight patients (BMI ≥27 kg/m^2) with at least one other comorbidity (hypertension, type 2 diabetes, or dyslipidemia).

Action

Bupropion—an antidepressant that acts as a weak inhibitor of neuronal reuptake of dopamine and norepinephrine. *Naltrexone*—acts as an opioid antagonist. In combination they affect two different brain areas involved in food intake: the hypothalamic appetite regulatory center and mesolimbic dopamine circuit reward system. **Therapeutic Effects:** Decreased appetite with associated weight loss.

Pharmacokinetics

Bupropion

Absorption: Well absorbed but rapidly metabolized by the liver. Absorption is enhanced by a high-fat meal.

Distribution: Parent drug and metabolites enter breast milk.

Metabolism and Excretion: Extensively metabolized; three metabolites are pharmacologically active. Excretion is mostly renal as metabolites, minimal renal excretion of unchanged drug.

Half-life: 21 hr (longer for some metabolites).

Naltrexone

Absorption: Well absorbed orally, undergoes extensive first pass hepatic metabolism resulting in 5–40% bioavailability. Absorption is enhanced by a high-fat meal.

Distribution: Parent drug and metabolites enter breast milk.

Metabolism and Excretion: Metabolized to 6–beta-naltrexol. Both parent drug and metabolite are pharmacologically active. Excretion is mostly renal as metabolite, less than 2% as unchanged drug.

Half-life: *naltrexone*—5 hr; *6–beta-naltrexol*—13 hr.

TIME/ACTION PROFILE (weight loss)

ROUTE	ONSET	PEAK	DURATION
PO	within 4 wk	6 mos	unknown

Contraindications/Precautions

Contraindicated in: Known hypersensitivity to bupropion or naltrexone; Uncontrolled hypertension; End-stage renal disease; Severe hepatic impairment; Seizure disorders; Anorexia or bulimia; During withdrawal from or discontinuation of alcohol, benzodiazepines, barbiturates or antiepileptics; Chronic opioid/opiate agonist or partial agonist use or acute opiate withdrawal; During/within 14 days of MAO inhibitors; Concurrent use of CYP2B6 inducers; Concurrent use of other bupropion-containing medications; OB: Pregnancy (weight loss may cause fetal harm); Pedi: Not recommended for use in children.

Use Cautiously in: History of suicidal behavior/ideation; History of seizure risk (avoid administration with a high-fat meal, adhere to recommended dose); History of cardiac/cerebrovascular disease; History of angle-closure glaucoma; Diabetes mellitus (weight loss may result in hypoglycemia if treatment is not adjusted); Concurrent use of drugs that ↓ seizure threshold; Moderate or severe renal impairment (use lower dose); Moderate hepatic impairment (use lower dose); Concurrent ingestion of alcohol (avoid or reduce consumption); Lactation: Use while breast feeding only if potential maternal benefit justifies potential risk to infant; Geri: Older adults may be ↑ sensitive to adverse CNS reactions and ↓ renal elimination.

Adverse Reactions/Side Effects

CV: hypertension, tachycardia. **EENT:** angle-closure glaucoma (bupropion), tinnitus. **GI:** nausea, constipation, vomiting, abdominal pain, diarrhea, dry mouth, hepatotoxicity (naltrexone). **Derm:** hot flush, sweating. **Neuro:** tremor, HOMICIDAL THOUGHTS/BEHAVIOR, SEIZURES, SUICIDAL THOUGHTS/BEHAVIOR, headache, aggression, agitation, anxiety, delusions, depression, dizziness, dysgeusia, hallucinations, hostility, insomnia, mania, panic, paranoia, psychosis. **Misc:** allergic reactions including ANAPHYLAXIS/ANAPHYLACTOID REACTIONS.

Interactions

Drug-Drug: Concurrent or use within 14 days with **MAO inhibitors** ↑ risk of hypertensive reactions. Bupropion inhibits the CYP2D6 enzyme system and can ↑ blood levels and risk of adverse reactions from **antidepressants** including **SSRIs** and many **tricyclic anti-**

© F.A. Davis Publishing

depressants, **antipsychotics** including **haloperidol**, **risperidone**, and **thioridazine**, **beta-blockers** including **metoprolol**, and **Type 1C antiarrhythmics** including **flecainide** and **propafenone**. Dose adjustments may be necessary. Blood levels and effectiveness may be ↓ by **CYP2B6 inducers** including **carbamazepine**, **efavirenz**, **ritonavir**, **lopinavir**, **phenobarbital**, and **phenytoin**; concurrent use should be avoided. Blood levels and risk of toxicity of bupropion may be ↑ by **CYP2B6 inhibitors** including **clopidogrel** (dose should not exceed one tablet twice daily). Concurrent use of **drugs that ↓ seizure threshold** may ↑ risk of seizures. **Dopaminergic drugs** including **amantadine** and **levodopa** may ↑ risk of CNS toxicity. Concurrent ingestion of **alcohol** may ↑ risk of neuropsychiatric reactions (reduce consumption or avoid). May ↓ renal excretion of and ↑ blood levels/risk of toxicity from **amantadine**, **amiloride**, **cimetidine**, **dopamine**, **famotidine**, **memantine**, **metformin**, **pindolol**, **procainamide**, **varenicline**, and **oxaliplatin** (careful monitoring is recommended). May ↓ analgesic effects of **opioids**.

Route/Dosage

PO (Adults): *Wk 1*—one tablet in the morning; *wk 2*—one tablet in the morning and one tablet in the evening; *wk 3*—two tablets in the morning and one tablet in the evening; *wk 4 and onward*—two tablets in the morning and two tablets in the evening; *concurrent use of CYP2B6 inhibitors*—dose should not exceed one tablet twice daily.

Renal Impairment

PO (Adults): *Moderate or severe renal impairment*—Dose should not exceed one tablet in the morning and one tablet in the evening.

Hepatic Impairment

PO (Adults): *Moderate hepatic impairment*—Dose should not exceed one tablet in the morning and one tablet in the evening.

Availability

Extended-release tablets: 90 mg bupropion/8 mg naltrexone.

NURSING IMPLICATIONS

Assessment

- Monitor for weight loss and adjust concurrent medications (antihypertensives, antidiabetics, lipid-lowering agents) as needed.
- Assess mental status and mood changes, especially during initial few mo of therapy. Risk may be increased in children, adolescents, and adults ≤24 yrs. Inform health care professional if patient demonstrates significant increase in signs of depression (depressed mood, loss of interest in usual activities, insomnia or hypersomnia, psychomotor agitation or retardation, increased fatigue, feelings of guilt or worthlessness, slowed thinking or impaired concentration, irritability, hostility, suicide or homicide attempt or suicidal ideation). Restrict amount of drug available to patient.
- Monitor BP and heart rate periodically during therapy, especially in patient with hypertension.
- Monitor for signs and symptoms of anaphylactic reactions (pruritus, urticaria, hives, angioedema, dyspnea). Discontinue therapy and treat symptomatically.
- ***Lab Test Considerations:*** Monitor blood glucose prior to and during therapy in patients with type 2 diabetes; may cause hypoglycemia.
- May cause false-positive urine test for amphetamines.

Implementation

- **PO:** Administer in the morning and evening according to dose escalation schedule. ***DNC:*** Swallow tablets whole; do not break, crush, or chew.
- Do not administer with a high-fat meal; may increase risk of seizures.

Patient/Family Teaching

- Instruct patient to take medication as directed, following the dose escalation schedule. If a dose is missed, omit and wait until next scheduled dose; do not double doses. Advise patient to read *Medication Guide* before starting therapy and with each Rx refill in case of changes.
- Instruct patient to adhere to a reduced-calorie diet and increased physical activity.
- Advise patient, family, and caregivers to look for suicidality, especially during early therapy. Notify health care professional immediately if thoughts about suicide, homicide, or dying, attempts to commit suicide, new or worse depression or anxiety, agitation or restlessness, panic attacks, insomnia, new or worse irritability, aggressiveness, hostility, acting on dangerous impulses, mania, or other changes in mood or behavior occur.
- Advise patient to notify health care professional if signs and symptoms of liver damage (stomach pain lasting more than a few days, dark urine, yellowing of skin and whites of eyes, tiredness) occurs.
- Advise patients they may be less sensitive to opioids during therapy. Advise patients to notify healthcare professional of bupropion/naltrexone therapy.
- Advise patient to notify health care professional of all Rx or OTC medications, vitamins, or herbal products being taken and to consult with health care professional before taking other medications and to minimize or avoid alcohol during therapy.
- Instruct females of reproductive potential to notify health care professional if pregnancy is planned or suspected and to avoid breast feeding during therapy. Advise pregnant patients to discontinue medication as appropriate weight gain based on pre-pregnancy weight is recommended for all pregnant patients, including those who are overweight or obese, due to the weight gain that occurs in maternal tissues during pregnancy.

© F.A. Davis Publishing

Evaluation/Desired Outcomes

- Decreased appetite with associated weight loss. Evaluate therapy after 12 wk at maintenance dose. If patient has not lost 5% of baseline body weight discontinue medication; clinically meaningful weight loss is unlikely.

busPIRone (byoo-spye-rone)

~~BuSpar~~

Classification

Therapeutic: antianxiety agents

Indications

Management of anxiety.

Action

Binds to serotonin and dopamine receptors in the brain. Increases norepinephrine metabolism in the brain. **Therapeutic Effects:** Relief of anxiety.

Pharmacokinetics

Absorption: Rapidly absorbed.
Distribution: Unknown.
Protein Binding: 95% bound to plasma proteins.
Metabolism and Excretion: Extensively metabolized by the liver (CYP3A4 enzyme system); 20–40% excreted in feces.
Half-life: 2–3 hr.

TIME/ACTION PROFILE (relief of anxiety)

ROUTE	ONSET	PEAK	DURATION
PO	7–10 days	3–4 wk	unknown

Contraindications/Precautions

Contraindicated in: Hypersensitivity; Severe hepatic or renal impairment; Concurrent use of MAO inhibitors; Ingestion of large amounts of grapefruit juice.
Use Cautiously in: Patients receiving other antianxiety agents (other agents should be slowly withdrawn to prevent withdrawal or rebound phenomenon); Patients receiving other psychotropics; Lactation, OB, Pedi: Safety not established.

Adverse Reactions/Side Effects

EENT: blurred vision, nasal congestion, sore throat, tinnitus, altered taste or smell, conjunctivitis. **Resp:** chest congestion, hyperventilation, shortness of breath. **CV:** chest pain, palpitations, tachycardia, hypertension, hypotension, syncope. **GI:** nausea, abdominal pain, constipation, diarrhea, dry mouth, vomiting. **GU:** changes in libido, dysuria, urinary frequency, urinary hesitancy. **Derm:** rashes, alopecia, blisters, dry skin, easy bruising, edema, flushing, pruritus. **Endo:** irregular menses. **MS:** myalgia. **Neuro:** incoordination, numbness, paresthesia, tremor, dizziness, drowsiness, excitement, fatigue, headache, insomnia, nervousness, weakness, personality changes. **Misc:** clamminess, sweating, fever.

Interactions

Drug-Drug: Use with **MAO inhibitors** may result in hypertension and is not recommended. **Erythromycin**, **nefazodone**, **ketoconazole**, **itraconazole**, **ritonavir**, and other **inhibitors of CYP3A4** ↑ blood levels and effects of buspirone; dose reduction is recommended (↓ to 2.5 mg twice daily with erythromycin; ↓ to 2.5 mg once daily with nefazodone). **Rifampin**, **dexamethasone**, **phenytoin**, **phenobarbital**, **carbamazepine**, and other **inducers of CYP3A4** ↓ blood levels and effects of buspirone; dose adjustment may be necessary. Avoid concurrent use with **alcohol**.
Drug-Natural Products: Concomitant use of **kava-kava**, **valerian**, or **chamomile** can ↑ CNS depression.
Drug-Food: Grapefruit juice ↑ serum levels and effect; ingestion of large amounts of grapefruit juice is not recommended.

Route/Dosage

PO (Adults): 7.5 mg twice daily; ↑ by 5 mg/day every 2–4 days as needed (not to exceed 60 mg/day). Usual dose is 20–30 mg/day (in 2 divided doses).

Availability (generic available)

Tablets: 5 mg, 7.5 mg, 10 mg, 15 mg, 30 mg. **Cost:** *Generic*— 5 mg $77.12/100, 7.5 mg $109.08/100, 10 mg $134.50/100, 15 mg $201.92/100, 30 mg $218.10/100.

NURSING IMPLICATIONS

Assessment

- Assess degree and manifestations of anxiety before and periodically during therapy.
- Buspirone does not appear to cause physical or psychological dependence or tolerance. However, patients with a history of substance use disorder should be assessed for tolerance or impaired control. Restrict amount of drug available to these patients.

Implementation

- Do not confuse buspirone with bupropion.
- Patients changing from other antianxiety agents should receive gradually decreasing doses. Buspirone will not prevent withdrawal symptoms.
- **PO:** May be administered with food to minimize gastric irritation. Food slows but does not alter extent of absorption.

Patient/Family Teaching

- Instruct patient to take buspirone exactly as directed. Take missed doses as soon as possible if not just before next dose; do not double doses. Do not take more than amount prescribed.
- May cause dizziness or drowsiness. Caution patient to avoid driving or other activities requiring alertness until response to the medication is known.

© F.A. Davis Publishing

- Advise patient to avoid concurrent use of alcohol or other CNS depressants.
- Instruct patient to notify health care professional of all Rx or OTC medications, vitamins, or herbal products being taken and to consult health care professional before taking any Rx, OTC, or herbal products.
- Instruct patient to notify health care professional if any chronic abnormal movements occur (dystonia, motor restlessness, involuntary movements of facial or cervical muscles) or if pregnancy is suspected.
- Emphasize the importance of follow-up exams to determine effectiveness of medication.

Evaluation/Desired Outcomes

- Increase in sense of well-being.
- Decrease in subjective feelings of anxiety. Some improvement may be seen in 7–10 days. Optimal results take 3–4 wk of therapy. Buspirone is usually used for short-term therapy (3–4 wk). If prescribed for long-term therapy, efficacy should be periodically assessed.

HIGH ALERT

busulfan (byoo-sul-fan)

Busulfex, Myleran

Classification

Therapeutic: antineoplastics
Pharmacologic: alkylating agents

Indications

PO: Treatment of chronic myelogenous leukemia (CML) and bone marrow disorders. **IV:** With cyclophosphamide as a conditioning regimen before allogenic hematopoietic progenitor cell transplantation for CML.

Action

Disrupts nucleic acid function and protein synthesis (cell-cycle phase–nonspecific). **Therapeutic Effects:** Death of rapidly growing cells, especially malignant ones.

Pharmacokinetics

Absorption: Rapidly absorbed from the GI tract.
Distribution: Unknown.
Metabolism and Excretion: Extensively metabolized by the liver.
Half-life: 2.5 hr.

TIME/ACTION PROFILE (effects on blood counts)

ROUTE	ONSET	PEAK	DURATION
PO	1–2 wk	weeks	up to 1 mo†
IV	unknown	unknown	13 days‡

†Complete recovery may take up to 20 mo.
‡After administration of last dose.

Contraindications/Precautions

Contraindicated in: Hypersensitivity; Failure to respond to previous courses; OB: Pregnancy (may cause fetal harm); Lactation: Lactation.

Use Cautiously in: Active infections; ↓ bone marrow reserve; Obese patients (base dose on ideal body weight); Other chronic debilitating diseases; Rep: Women of reproductive potential and men with female partners of reproductive potential; Geri: Begin therapy at lower end of dose range due to ↑ frequency of impaired cardiac, hepatic, or renal function.

Adverse Reactions/Side Effects

Incidence and severity of adverse reactions and side effects are increased with IV use.

CV: *PO*— CARDIAC TAMPONADE (WITH HIGH-DOSE CYCLOPHOSPHAMIDE); *IV*, chest pain, hypotension, tachycardia, thrombosis, arrhythmias, atrial fibrillation, cardiomegaly, ECG changes, edema, heart block, heart failure, hypertension, pericardial effusion, ventricular extrasystoles. **Derm:** *PO*— itching, rash, acne, alopecia, erythema nodosum, exfoliative dermatitis, hyperpigmentation. **EENT:** *PO*— cataracts; *IV*, epistaxis, pharyngitis, ear disorders. **Endo:** *PO and IV*— hyperuricemia; *IV*, hyperglycemia; *PO*, sterility, gynecomastia. **F and E:** hypokalemia, hypomagnesemia, hypophosphatemia. **GI:** *PO*— drug-induced hepatitis, nausea, vomiting; *IV*, abdominal enlargement, anorexia, constipation, diarrhea, dry mouth, hematemesis, nausea, rectal discomfort, vomiting, abdominal pain, dyspepsia, hepatic veno-occlusive disease (↑ in allogenic transplantation), hepatomegaly, pancreatitis, stomatitis. **GU:** oliguria, dysuria, hematuria, ↓ fertility. **Hemat:** BONE MARROW DEPRESSION. **Local:** inflammation/pain at injection site. **MS:** arthralgia, myalgia, back pain. **Neuro:** *IV*— SEIZURES, CEREBRAL HEMORRHAGE/COMA, anxiety, confusion, depression, dizziness, headache, encephalopathy, mental status changes, weakness.. **Resp:** *PO*— PULMONARY FIBROSIS; *IV*, alveolar hemorrhage, asthma, atelectasis, cough, hemoptysis, hypoxia, pleural effusion, pneumonia, rhinitis, sinusitis. **Misc:** allergic reactions, chills, fever, infection.

Interactions

Drug-Drug: Concurrent or previous (within 72 hr) use of **acetaminophen** may ↓ elimination and ↑ toxicity. Concurrent use with high-dose **cyclophosphamide** in patients with thalassemia may result in cardiac tamponade. **Itraconazole**, **metronidazole**, or **deferasirox** may ↑ levels and risk of toxicity. **Phenytoin** may ↓ levels and effectiveness. Long-term continuous therapy with **thioguanine** may ↑ risk of hepatic toxicity. ↑ bone marrow suppression with other **antineoplastics** or **radiation therapy**. May ↓ the antibody response to and ↑ risk of adverse reactions from **live-virus vaccines**.

Route/Dosage

Many other regimens are used. See current protocols for up-to-date dosage.

© F.A. Davis Publishing

PO (Adults): *Induction*—1.8 mg/m²/day or 60 mcg (0.06 mg)/kg/day until WBCs <15,000/mm³. Usual dose is 4–8 mg/day (range 1–12 mg/day). *Maintenance*—1–3 mg/day.
PO (Children): 0.06–0.12 mg/kg/day or 1.8–4.6 mg/m²/day initially. Titrate dose to maintain WBC of approximately 20,000/mm³.
IV (Adults): 0.8 mg/kg every 6 hr (dose based on ideal body weight or actual weight, whichever is less; in obese patients, dosage should be based on adjusted ideal body weight) for 4 days (total of 16 doses); given in combination with cyclophosphamide.

Availability (generic available)

Tablets: 2 mg. **Solution for injection:** 6 mg/mL.

NURSING IMPLICATIONS

Assessment

- ***High Alert:*** Monitor for bone marrow depression. Assess for bleeding (bleeding gums, bruising, petechiae, guaiac stools, urine, emesis) and avoid IM injections and taking rectal temperatures. Apply pressure to venipuncture sites for at least 10 min. Assess for signs of infection (fever, chills, sore throat, cough, hoarseness, lower back or side pain, difficult or painful urination) during neutropenia. Anemia may occur. Monitor for increased fatigue, dyspnea, and orthostatic hypotension. Notify health care professional if these symptoms occur.
- Monitor intake and output ratios and daily weights. Report significant changes in totals.
- Monitor for symptoms of gout (increased uric acid, joint pain, lower back or side pain, swelling of feet or lower legs). Encourage patient to drink at least 2 L of fluid each day. Allopurinol may be given to decrease uric acid levels. Alkalinization of urine may be ordered to increase excretion of uric acid.
- Assess for pulmonary fibrosis (fever, cough, shortness of breath) periodically during and after therapy. Discontinue therapy at the first sign of pulmonary fibrosis. Usually occurs 8 mo–10 yr (average 4 yr) after initiation of therapy.
- **IV:** Premedicate patient with phenytoin before IV administration to minimize the risk of seizures.
- Administer antiemetics before IV administration and on a fixed schedule during IV administration.
- ***Lab Test Considerations:*** Monitor CBC with differential and platelet count before and weekly during therapy. The nadir of leukopenia occurs within 10–15 days and the nadir of WBC at 11–30 days. Recovery usually occurs within 12–20 wk. Notify health care professional if WBC is <15,000/mm³ or if a precipitous drop occurs. Institute thrombocytopenia precautions if platelet count is <150,000/mm³. Bone marrow depression may be severe and progressive, with recovery taking 1 mo–2 yr after discontinuation of therapy.
- Monitor serum ALT, bilirubin, alkaline phosphatase, and uric acid before and periodically during therapy. May cause ↑ uric acid levels.
- May cause false-positive cytology results of breast, bladder, cervix, and lung tissues.

Implementation

- ***High Alert:*** Fatalities have occurred with chemotherapeutic agents. Before administering, clarify all ambiguous orders; double check single, daily, and course-of-therapy dose limits; have second practitioner independently double check original order, calculations, and infusion pump settings.
- ***High Alert:*** Do not confuse Myleran with Alkeran or Leukeran.
- **PO:** Administer at the same time each day. Administer on an empty stomach to decrease nausea and vomiting.

IV Administration

- **IV:** Prepare solution in a biologic cabinet. Wear gloves, gown, and mask while handling IV medication. Discard IV equipment in specially designated containers.
- **Intermittent Infusion:** ***Dilution:*** Dilute with 10 times the volume of busulfan using 0.9% NaCl or D5W. ***Concentration:*** ≥0.5 mg/mL. When drawing busulfan from vial, use needle with 5-micron nylon filter provided, remove calculated volume from vial, remove needle and filter, replace needle and inject busulfan into diluent. Do not use polycarbonate syringes with busulfan. Only use filters provided with busulfan. Always add busulfan to diluent, not diluent to busulfan. Solution diluted with 0.9% NaCl or D5W is stable for 8 hr at room temperature and solution diluted with 0.9% NaCl is stable for 12 hr if refrigerated. Administration must be completed during this time. Solution is clear and colorless; do not administer solutions that are discolored or contain a precipitate. ***Rate:*** Administer via central venous catheter over 2 hr every 6 hr for 4 days for a total of 16 doses. Use infusion pump to administer entire dose over 2 hr.
- **Y-Site Compatibility:** acyclovir, amiodarone, amphotericin B lipid complex, amphotericin B liposome, anidulafungin, argatroban, arsenic trioxide, bivalirudin, bleomycin, caspofungin, dacarbazine, daptomycin, dexmedetomidine, dexrazoxane, diltiazem, docetaxel, ertapenem, fenoldopam, foscarnet, fosphenytoin, granisetron, hetastarch, hydromorphone, leucovorin calcium, levofloxacin, linezolid, lorazepam, meperidine, metronidazole, milrinone, moxifloxacin, octreotide, ondansetron, paclitaxel, palonosetron, pancuronium, piperacillin/tazobactam, potassium acetate, quinupristin/dalfopristin, rituximab, sodium acetate, tacrolimus, tigecycline,

© F.A. Davis Publishing

tirofiban, trastuzumab, vasopressin, vinblastine, zoledronic acid.
- **Y-Site Incompatibility:** idarubicin, thiotepa, vecuronium, voriconazole.

Patient/Family Teaching

- Instruct patient to take medication as directed, at the same time each day, even if nausea and vomiting are a problem. Consult health care professional if vomiting occurs shortly after dose is taken. If a dose is missed, do not take at all; do not double doses.
- Advise patient to notify health care professional if fever; sore throat; signs of infection; lower back or side pain; difficult or painful urination; sores in the mouth or on the lips; chills; dyspnea; persistent cough; bleeding gums; bruising; petechiae; or blood in urine, stool, or emesis occurs. Instruct patient to use soft toothbrush and electric razor. Caution patient not to drink alcoholic beverages or take products containing aspirin or NSAIDs.
- Caution patient to avoid crowds and persons with known infections. Health care professional should be informed immediately if symptoms of infection occur.
- Discuss with patient the possibility of hair loss. Explore methods of coping.
- Instruct patient not to receive any vaccinations without advice of health care professional.
- Advise patient to notify health care professional if unusual bleeding; bruising; or flank, stomach, or joint pain occurs. Advise patients on long-term therapy to notify health care professional immediately if cough, shortness of breath, and fever occur or if darkening of skin, diarrhea, dizziness, fatigue, anorexia, confusion, or nausea and vomiting become pronounced.
- Inform patient of increased risk of a second malignancy with busulfan.
- Rep: Advise female patients of reproductive potential to use effective contraception during and for 6 mo after last dose and to avoid breast feeding during therapy. Advise men with female partners of reproductive potential to use effective contraception during and for 3 mo after last dose of therapy. Women need to use contraception even if amenorrhea occurs. May impair fertility in male and female patients.

Evaluation/Desired Outcomes

- Decrease in leukocyte count to within normal limits.
- Decreased night sweats.
- Increase in appetite.
- Increased sense of well-being. Therapy is resumed when leukocyte count reaches 50,000/mm^3.

butenafine, See ANTIFUNGALS (TOPICAL).

butoconazole, See ANTIFUNGALS (VAGINAL).

© F.A. Davis Publishing

HIGH ALERT

cabazitaxel (ka-ba-zi-tax-el)

Jevtana

Classification

Therapeutic: antineoplastics
Pharmacologic: taxoids

Indications

Hormone-refractory metastatic prostate cancer previously treated with a regimen including docetaxel (used in combination with prednisone).

Action

Binds to intracellular tubulin and promotes its assembly into microtubules while inhibiting disassembly. Result is inhibition of mitosis and interphase. **Therapeutic Effects:** Death of rapidly replicating cells, particularly malignant ones, with ↓ spread of metastatic prostate cancer.

Pharmacokinetics

Absorption: IV administration results in complete bioavailability.

Distribution: Equally distributed between blood and plasma.

Metabolism and Excretion: Extensively (>95%) metabolized by the liver, 80–90% by CYP3A4/5 enzyme system. Metabolites are excreted in urine and feces. Minimal renal excretion.

Half-life: *Terminal elimination*—95 hr.

TIME/ACTION PROFILE (blood levels)

ROUTE	ONSET	PEAK	DURATION
IV	rapid	end of infusion	unknown

Contraindications/Precautions

Contraindicated in: Severe hypersensitivity to cabazitaxel or polysorbate 80; Neutrophil count ≤1,500/mm³; Hepatic impairment (total bilirubin ≥3× upper limit of normal [ULN]); Concurrent use of strong CYP3A4 inhibitors or inducers.

Use Cautiously in: Concurrent use of moderate CYP3A4 inhibitors; Patients with neutropenia or a history of pelvic radiation, adhesions, ulceration, or GI bleeding (↑ risk of GI and urinary adverse reactions); Concomitant use of steroids, NSAIDs, or antithrombotics (↑ risk of GI adverse reactions); Severe renal impairment (CCr <30 mL/min) or end-stage renal disease; Hemoglobin <10 g/dL; Lung disease (↑ risk of pulmonary toxicity); Mild or moderate hepatic impairment (dose ↓ required); Poor performance status, previous episodes of febrile neutropenia, extensive prior radiation ports, or poor nutritional status (↑ risk of complications from prolonged neutropenia); Rep: Men with female partners of reproductive potential; Pedi: Safety and effectiveness not established in children; Geri: ↑ risk of adverse reactions in older adults (especially prolonged neutropenia and febrile neutropenia).

Adverse Reactions/Side Effects

CV: arrhythmias, hypotension. **Derm:** alopecia. **F and E:** electrolyte imbalance. **GI:** DIARRHEA, ENTEROCOLITIS, GI BLEED, GI PERFORATION, ILEUS, abdominal pain, abnormal taste, anorexia, constipation, nausea, vomiting, dyspepsia. **GU:** RENAL FAILURE, hematuria, cystitis. **Hemat:** NEUTROPENIA, THROMBOCYTOPENIA, anemia, leukopenia, thrombocytopenia. **MS:** arthralgia, back pain, muscle spasms. **Neuro:** weakness, fatigue, peripheral neuropathy. **Resp:** ACUTE RESPIRATORY DISTRESS SYNDROME, INTERSTITIAL LUNG DISEASE, dyspnea. **Misc:** HYPERSENSITIVITY REACTIONS (including anaphylaxis), fever.

Interactions

Drug-Drug: **Strong CYP3A inhibitors** including **ketoconazole**, **itraconazole**, **clarithromycin**, **atazanavir**, **indinavir**, **nefazodone**, **nelfinavir**, **ritonavir**, **saquinavir**, and **voriconazole** ↑ levels and risk of toxicity; concomitant use contraindicated. **Strong CYP3A inducers** including **phenytoin**, **carbamazepine**, **rifampin**, **rifabutin**, **rifapentin**, and **phenobarbital** may ↓ levels and effectiveness; concomitant use contraindicated.

Drug-Natural Products: **St. John's wort** may ↓ levels and effectiveness; concomitant use contraindicated.

Route/Dosage

IV (Adults): 20 mg/m² every 3 wk (with prednisone 10 mg PO daily). A dose of 25 mg/m² may be considered in select patients.

Hepatic Impairment

IV (Adults): *Mild hepatic impairment (total bilirubin >1× to ≤1.5× ULN or AST >1.5× ULN)*—20 mg/m² every 3 wk (with prednisone 10 mg PO daily); *Moderate hepatic impairment (total bilirubin >1.5× to ≤3× ULN)*—15 mg/m² every 3 wk (with prednisone 10 mg PO daily); *Severe hepatic impairment (total bilirubin >3× ULN)*—Contraindicated.

Availability

Viscous solution for injection: 40 mg/mL (contains polysorbate 80); comes with diluent (5.7 mL of 13% [w/w] ethanol in water for injection).

NURSING IMPLICATIONS

Assessment

- Assess for hypersensitivity reactions (generalized rash/erythema, hypotension, bronchospasm, swelling of face). May occur within min following initiation of infusion. If severe reactions occur, discon-

© F.A. Davis Publishing

tinue infusion immediately and provide supportive therapy.
- Assess for signs and symptoms of GI toxicity (abdominal pain and tenderness, fever, persistent constipation, nausea, vomiting, severe diarrhea); may result in death due to electrolyte imbalance. Premedication is recommended. Treat with rehydration, antidiarrheal, or antiemetic therapy as needed. If Grade ≥3 diarrhea or persisting diarrhea occurs despite appropriate medication, fluid and electrolyte replacement, delay treatment until improvement or resolution, then reduce dose to 20 mg/mL.
- Assess for signs and symptoms of peripheral neuropathy (pain, burning, numbness in hands, feet, or legs) during therapy. *If Grade 2 occurs,* withhold until improvement or resolution, then reduce dose to 20 mg/mL. *If ≥Grade 3 occurs,* discontinue therapy.
- Monitor for signs and symptoms of respiratory compromise (trouble breathing, dyspnea, chest pain, cough, fever) during therapy. Interrupt therapy if new or worsening symptoms occur. Consider discontinuation.
- ***Lab Test Considerations:*** Monitor CBC weekly during cycle 1 and before each treatment cycle thereafter. Do not administer if neutrophils ≤1500/mm^3. If prolonged grade 3 neutropenia (>1 wk) despite appropriate medication including filgrastim, delay treatment until neutrophil count is >1500 mm^3, then reduce dose to 20 mg/m^2. Use filgrastim for secondary prophylaxis. Risk is ↑ in elderly patients.
- If febrile neutropenia occurs, delay therapy until improvement or resolution and neutrophil count is >1500/mm^3, then reduce dose to 20 mg/m^2. Use filgrastim for primary or secondary prophylaxis.
- Discontinue cabazitaxel if prolonged Grade 3 neutropenia, febrile neutropenia, or Grade 3 diarrhea occur at the 20 mg/m^2 dose.
- May cause hematuria.
- May cause Grade 3–4 ↑ AST, ↑ ALT, and ↑ bilirubin.

Implementation

- ***High Alert:*** Fatalities have occurred with chemotherapeutic agents. Before administering, clarify all ambiguous orders; double-check single, daily, and course-of-therapy dose limits; have second practitioner independently double-check original order and dose calculations.
- Prepare solution in a biologic cabinet. Wear gloves, gown, and mask while handling medication. Discard equipment in specially designated containers. If solution comes in contact with skin or mucosa, wash with soap and water immediately.
- Premedicate at least 30 min before each dose with antihistamine (diphenhydramine 25 mg or equivalent), corticosteroid (dexamethasone 8 mg or equivalent), and H_2 antagonist (famotidine 20 mg or equivalent). Antiemetic prophylaxis, PO or IV, is recommended.
- Begin prophylaxis with G-CSF (filgrastim) in all patients receiving a dose of 25 mg/m^2 to minimize complications due to prolonged neutropenia.

IV Administration

- Two dilutions are required. Do not use PVC infusion containers or polyurethane infusion sets for preparation or infusion.
- **First Dilution:** ***Dilution:*** Mix vial with entire contents of supplied diluent. Direct needle to inside wall of vial and inject slowly to avoid foaming. Mix gently by repeated inversions for at least 45 sec; do not shake. Let stand for a few min to allow foam to dissipate. ***Concentration:*** 10 mg/mL. **Second Dilution:** ***Dilution:*** Withdraw recommended dose from cabazitaxel solution and dilute further into a sterile 250 mL PVC-free container of 0.9% NaCl or D5W. If dose >65 mg is required, use a larger volume of infusion vehicle so concentration does not exceed 0.26 mg/mL. Gently invert container to mix. ***Concentration:*** 0.10–0.26 mg/mL. Stable for 8 hr (including 1 hr infusion) at room temperature or 24 hr if refrigerated. May crystallize over time. Do not use if crystallized, discolored, or contains particulate matter; discard. ***Rate:*** Infuse over 1 hr at room temperature through a 0.22 micrometer nominal pore size filter.
- **Y-Site Incompatibility:** Do not mix with other medication.

Patient/Family Teaching

- Instruct patient to take oral prednisone as prescribed and to notify health care professional if a dose is missed or not taken in time.
- Advise patient to notify health care professional immediately if signs or symptoms of hypersensitivity reactions; fever; sore throat; signs of infection; lower back or side pain; difficult or painful urination; sores on the mouth or on the lips; bleeding gums; bruising; petechiae; blood in urine, stool, or emesis; unusual swelling, shortness of breath, trouble breathing, chest pain, cough, or fever occur. Caution patient to avoid crowds and persons with known infections. Instruct patient to use soft toothbrush and electric razor and to avoid falls. Patient should also be cautioned not to drink alcoholic beverages or to take products containing aspirin or NSAIDs; may precipitate GI hemorrhage.
- May cause dizziness. Caution patient to avoid driving or other activities requiring alertness until response to medication is known.
- Instruct patient to notify health care professional of all Rx or OTC medications, vitamins, or herbal products being taken and consult health care professional before taking any new medications, especially St. John's wort.
- Instruct patient not to receive any vaccinations without advice of health care professional.
- Rep: Advise male patients with female partners of reproductive potential to use effective contraception

© F.A. Davis Publishing

during and for at least 3 mo after last dose of cabazitaxel. May impair fertility in males.
- Emphasize need for periodic lab tests to monitor for side effects. Advise patient to monitor temperature frequently.

Evaluation/Desired Outcomes
- ↓ in size and spread of metastatic prostate cancer.

cabotegravir (ka-boe-teg-ra-vir)
Vocabria

Classification
Therapeutic: antiretrovirals
Pharmacologic: integrase strand transfer inhibitors (INSTIs)

Indications
Short-term treatment of HIV-1 infection in patients who are virologically suppressed (HIV-1 RNA <50 copies/mL) on a stable antiretroviral regimen with no history of treatment failure and with no known or suspected resistance to either cabotegravir or rilpivirine (in combination with rilpivirine). To be used in one of the following situations: 1) As an oral lead-in therapy to assess the tolerability of cabotegravir prior to administration of cabotegravir/rilpivirine extended-release injection; or 2) As oral therapy for patients who will miss planned dosing with the cabotegravir/rilpivirine extended-release injection.

Action
Inhibits HIV-1 integrase, which is required for viral replication. **Therapeutic Effects:** Evidence of decreased viral replication and reduced viral load with slowed progression of HIV and its sequelae.

Pharmacokinetics
Absorption: Increased with high-fat meals.
Distribution: Distributed to extravascular tissues.
Protein Binding: >99%.
Metabolism and Excretion: Primarily metabolized by the uridine diphosphate glucuronosyltransferase (UGT) 1A1 enzyme system, with some involvement of UGT1A9. Primarily excreted in feces as unchanged drug (47%), with 27% excreted in urine as metabolites.
Half-life: 41 hr.

TIME/ACTION PROFILE (blood levels)

ROUTE	ONSET	PEAK	DURATION
PO	unknown	3 hr	24 hr

Contraindications/Precautions
Contraindicated in: Hypersensitivity; Concurrent use of carbamazepine, oxcarbazepine, phenobarbital, phenytoin, rifampin, or rifapentine; Lactation: Breast feeding not recommended in patients with HIV.

Use Cautiously in: Hepatic impairment; End-stage renal disease (CCr <15 mL/min); OB: Safety not established in pregnancy; Pedi: Safety and effectiveness not established in children; Geri: Use with caution in older adults, considering concurrent disease states, drug therapy, and age-related ↓ in hepatic and renal function.

Adverse Reactions/Side Effects
GI: HEPATOTOXICITY, nausea. **Neuro:** abnormal dreams, anxiety, depression, headache, insomnia, mood disturbances. **Misc:** HYPERSENSITIVITY REACTIONS (including angioedema).

Interactions
Drug-Drug: Strong UGT1A1 inducers, including **carbamazepine**, **oxcarbazepine**, **phenobarbital**, **phenytoin**, **rifampin**, **rifapentine** may significantly ↓ levels and effectiveness; concurrent use contraindicated. **Antacids** containing polyvalent cations, including **aluminum hydroxide**, **calcium carbonate**, or **magnesium hydroxide** may ↓ absorption and effectiveness of cabotegravir; administer antacids ≥2 hr before or ≥4 hr after cabotegravir.

Route/Dosage

Oral Lead-in Dosing to Assess Tolerability of Cabotegravir
PO (Adults): 30 mg once daily (taken with rilpivirine 25 mg once daily). Continue for ≥28 days to assess tolerability prior to initiating cabotegravir/rilpivirine extended-release injection therapy. The last dose of oral cabotegravir should be taken on the same day that cabotegravir/rilpivirine extended-release injection therapy is initiated.

Oral Dosing to Replace Planned Missed Doses of Cabotegravir/Rilpivirine Extended-Release Injection
PO (Adults): If a patient plans to miss a scheduled dose of cabotegravir/rilpivirine extended-release injection by >7 days, use cabotegravir 30 mg once daily (with rilpivirine 25 mg once daily) to replace up to 2 consecutive monthly injection visits. The first dose of oral therapy should be taken approximately 1 mo after the last dose of cabotegravir/rilpivirine extended-release injection and continued until the day injection dosing is restarted.

Availability
Tablets: 30 mg.

NURSING IMPLICATIONS
Assessment
- Assess patient for change in severity of HIV symptoms and for symptoms of opportunistic infections during therapy.

© F.A. Davis Publishing

- Monitor for anxiety, depression (especially in patients with a history of psychiatric illness), suicidal ideation, and paranoia during therapy.
- Monitor for signs and symptoms of hypersensitivity reactions (severe rash, or rash accompanied by fever, general malaise, fatigue, muscle or joint aches, blisters, oral blisters or lesions, conjunctivitis, facial edema, hepatitis, eosinophilia, angioedema, difficulty breathing) during therapy. Discontinue cabotegravir immediately if reactions occur.
- ***Lab Test Considerations:*** Monitor liver functions tests periodically during therapy.

Implementation

- Oral lead-in is used for at least 28 days concurrently with rilpivirine to assess the tolerability of cabotegravir prior to the initiation of cabotegravir/rilpivirine. Administer last oral dose on same day injections with cabotegravir/rilpivirine are started.
- If taking to replace a missed scheduled injection of cabotegravir/rilpivirine, take first dose of oral therapy approximately 1 mo after last injection dose and continue until the day injection dosing is restarted.
- **PO:** Administer once daily with a meal at the same time each day.

Patient/Family Teaching

- Instruct patient to take cabotegravir as directed. Take missed doses as soon as remembered. Do not stop taking cabotegravir without consulting health care professional. Instruct patient to read *Patient Information* before starting cabotegravir and with each Rx refill in case of changes.
- Advise patient to notify health care professional if signs and symptoms of allergic reaction (fever, generally ill feeling, tiredness, muscle or joint aches, trouble breathing, blisters or sores in mouth, blisters, redness or swelling of eyes, swelling of mouth, face, lips, or tongue), liver problems (yellow skin or white part of eyes, dark or "tea-colored" urine, light-colored stools, nausea or vomiting, loss of appetite, pain, aching, or tenderness on the right side of stomach area, itching) or depression (feeling sad or hopeless, feeling anxious or restless, have thoughts of hurting yourself (suicide) or have tried to hurt yourself) occur.
- Instruct patient to notify health care professional of all Rx or OTC medications, vitamins, or herbal products being taken and consult health care professional before taking any new medications.
- Rep: May cause fetal harm. Advise females of reproductive potential to use effective contraception during therapy and avoid breast feeding. Inform patient of pregnancy exposure registry that monitors pregnancy outcomes in women exposed to cabotegravir during pregnancy. Register patients by calling the Antiretroviral Pregnancy Registry (APR) at 1-800-258-4263.

Evaluation/Desired Outcomes

- Decrease in viral load and improvement in CD4 cell counts.
- Delayed progression of AIDS and decreased opportunistic infections in patients with HIV.

cabotegravir/rilpivirine

(**ka**-boe-**teg**-ra-vir/**ril**-pi-vir-een)

Cabenuva

Classification

Therapeutic: antiretrovirals

Pharmacologic: integrase strand transfer inhibitors (INSTIs), non-nucleoside reverse transcriptase inhibitors

Indications

Management of HIV-1 infection to replace the current antiretroviral regimen in patients who are virologically suppressed (HIV-1 RNA <50 copies/mL) on a stable antiretroviral regimen with no history of treatment failure and with no known or suspected resistance to either cabotegravir or rilpivirine.

Action

Cabotegravir—Inhibits HIV-1 integrase, which is required for viral replication; *Rilpivirine*—Inhibits HIV-replication by noncompetitively inhibiting HIV reverse transcriptase. **Therapeutic Effects:** Evidence of decreased viral replication and reduced viral load with slowed progression of HIV and its sequelae.

Pharmacokinetics

cabotegravir

Absorption: Increased with high-fat meals.

Distribution: Distributed to extravascular tissues.

Protein Binding: >99%.

Metabolism and Excretion: Primarily metabolized by the uridine diphosphate glucuronosyltransferase (UGT) 1A1 enzyme system, with some involvement of UGT1A9. Primarily excreted in feces as unchanged drug (47%), with 27% excreted in urine as metabolites.

Half-life: 41 hr.

rilpivirine

Absorption: Well absorbed following oral administration.

Distribution: Unknown.

Protein Binding: 99.7%.

Metabolism and Excretion: Primarily metabolized by the liver via the CYP3A isoenzyme; 25% excreted in feces unchanged, <1% excreted unchanged in urine.

Half-life: 50 hr.

© F.A. Davis Publishing

TIME/ACTION PROFILE (blood levels)

ROUTE	ONSET	PEAK	DURATION
cabotegravir IM	unknown	7 days	unknown
rilpivirine IM	unknown	3–4 days	unknown

Contraindications/Precautions

Contraindicated in: Hypersensitivity to cabotegravir or rilpivirine; Concurrent use of carbamazepine, dexamethasone (more than a single dose), oxcarbazepine, phenobarbital, phenytoin, rifabutin, rifampin, rifapentine, or St. John's wort; OB: Not recommended for use during pregnancy; Lactation: Breast feeding not recommended in patients with HIV.

Use Cautiously in: History of depression or suicide attempt; Hepatic impairment; Severe renal impairment (CCr 15–30 mL/min) or end-stage renal disease (CCr <15 mL/min); Pedi: Safety and effectiveness not established in children; Geri: Use with caution in older adults, considering concurrent disease states, drug therapy, and age-related ↓ in hepatic and renal function.

Adverse Reactions/Side Effects

Derm: DRUG REACTION WITH EOSINOPHILIA AND SYSTEMIC SYMPTOMS (DRESS), rash. **GI:** HEPATOTOXICITY, ↑ lipase, nausea. **Local:** injection site reactions. **Metab:** ↑ weight. **MS:** ↑ creatine kinase, pain. **Neuro:** SUICIDAL THOUGHTS/BEHAVIORS, depression, dizziness, fatigue, headache, insomnia, mood disturbances, negative thoughts, somnolence. **Misc:** HYPERSENSITIVITY REACTIONS (including angioedema), fever.

Interactions

Drug-Drug: Strong UGT1A1 inducers or **CYP3A inducers**, including **carbamazepine**, **oxcarbazepine**, **phenobarbital**, **phenytoin**, **rifabutin**, **rifampin**, or **rifapentine** may significantly ↓ cabotegravir and rilpivirine levels and effectiveness; concurrent use contraindicated. Use of more than a single dose of **dexamethasone** may significantly ↓ rilpivirine levels and effectiveness; concurrent use contraindicated. **Macrolide antibiotics**, including **azithromycin**, **clarithromycin**, and **erythromycin** may ↑ rilpivirine levels and risk of toxicity, including QT interval prolongation; use alternative antibiotic therapy. **QT interval prolonging drugs** may ↑ risk of QT interval prolongation and torsades de pointes. May ↓ levels and effects of **methadone**.

Drug-Natural Products: St. John's wort may significantly ↓ rilpivirine levels and effectiveness; concurrent use contraindicated.

Route/Dosage

Lead-in therapy with oral cabotegravir and oral rilpivirine must be used for at least 28 days to assess tolerability to both cabotegravir and rilpivirine prior to initiating cabotegravir/rilpivirine extended-release injection therapy.

IM (Adults): *Initiation injections*—Cabotegravir 600 mg as single injection and rilpivirine 900 mg as single injection, both administered on the final day of lead-in therapy with oral cabotegravir and oral rilpivirine. *Continuation injections*—Cabotegravir 400-mg injection and rilpivirine 600-mg injection once monthly (administer both injections during same visit). Start continuation injections 1 mo following initiation injections. Monthly injections may be given within 7 days of originally scheduled date of injection.

Availability

Extended-release suspension for injection: 400-mg/600-mg kit (200 mg/mL vial of cabotegravir and 300 mg/mL vial of rilpivirine), 600-mg/900-mg kit (200 mg/mL vial of cabotegravir and 300 mg/mL vial of rilpivirine).

NURSING IMPLICATIONS

Assessment

- Assess patient for change in severity of HIV symptoms and for symptoms of opportunistic infections during therapy.
- Monitor for anxiety, depression (especially in patients with a history of psychiatric illness), suicidal ideation, and paranoia during therapy.
- Monitor for signs and symptoms of hypersensitivity reactions (severe rash, or rash accompanied by fever, general malaise, fatigue, muscle or joint aches, blisters, oral blisters or lesions, conjunctivitis, facial edema, hepatitis, eosinophilia, angioedema, difficulty breathing) during therapy. Discontinue cabotegravir immediately if reactions occur.
- Observe patient for 10 min following injections for post-injection reactions (dyspnea, agitation, abdominal cramping, flushing, sweating, oral numbness, changes in blood pressure).
- ***Lab Test Considerations:*** Monitor liver functions tests periodically during therapy. Discontinue therapy is hepatotoxicity is suspected.

Implementation

- Lead-in therapy with oral cabotegravir and oral rilpivirine must be used for at least 28 days to assess tolerability to both cabotegravir and rilpivirine prior to initiating cabotegravir/rilpivirine extended-release injection therapy. Start injections of cabotegravir/rilpivirine on last day of PO lead-in therapy.
- **IM:** Administer cabotegravir and rilpivirine at separate gluteal (preferably ventrogluteal) injection sites (on opposite sides or 2 cm apart) during the same visit. Use needles long enough for IM injection. Allow suspensions to come to room temperature for 15 min before administration. Stable at room temperature for up to 6 hr. Shake suspensions vigor-

© F.A. Davis Publishing

ously to mix. Administer within 2 hr of drawing into syringe. Start continuation injections a month after the initiation injections.

Patient/Family Teaching

- Instruct patient in the importance of adhering to monthly schedule of injections. *Planned Missed Injections:* If a scheduled injection visit by >7 days, take daily PO therapy to replace up to 2 consecutive monthly injection visits. Take first dose of PO therapy approximately 1 mo after the last injection dose and continued until the day injection dosing is restarted. *Unplanned Missed Injections:* If monthly injections are missed or delayed by >7 days and PO therapy has not been taken in the interim, health care professional will reassess patient to determine if resumption of injection dosing remains appropriate. Instruct patient to read *Patient Information* before starting cabotegravir/rilpivirine therapy and with each injection in case of changes.
- Advise patient to notify health care professional if signs and symptoms of allergic reaction (fever, generally ill feeling, tiredness, muscle or joint aches, trouble breathing, blisters or sores in mouth, blisters, redness or swelling of eyes, swelling of mouth, face, lips, or tongue), post-injection reactions (trouble breathing, stomach cramps, sweating, numbness of mouth, feeling anxious, feeling warm, feeling lightheaded or faint, blood pressure changes), liver problems (yellow skin or white part of eyes, dark or "tea-colored" urine, light-colored stools, nausea or vomiting, loss of appetite, pain, aching, or tenderness on the right side of stomach area, itching) or depression (feeling sad or hopeless, feeling anxious or restless, have thoughts of hurting yourself (suicide) or have tried to hurt yourself) occur.
- Instruct patient to notify health care professional of all Rx or OTC medications, vitamins, or herbal products being taken and consult health care professional before taking any new medications.
- Rep: May cause fetal harm. Advise females of reproductive potential to use effective contraception during therapy and avoid breast feeding. Inform patient of pregnancy exposure registry that monitors pregnancy outcomes in women exposed to cabotegravir during pregnancy. Register patients by calling the Antiretroviral Pregnancy Registry (APR) at 1-800-258-4263.

Evaluation/Desired Outcomes

- Decrease in viral load and improvement in CD4 cell counts.
- Delayed progression of AIDS and decreased opportunistic infections in patients with HIV.

(tri-**kal**-see-um **foss**-fate)
Posture

Classification
Therapeutic: mineral and electrolyte replacements/supplements
Pharmacologic: antacids

Indications

PO, IV: Treatment and prevention of hypocalcemia. **PO:** Adjunct in the prevention of postmenopausal osteoporosis. **IV:** Emergency treatment of hyperkalemia and hypermagnesemia and adjunct in cardiac arrest or calcium channel blocking agent toxicity (calcium chloride, calcium gluconate). **Calcium carbonate:** May be used as an antacid. **Calcium acetate:** Control of hyperphosphatemia in end-stage renal disease.

Action

Essential for nervous, muscular, and skeletal systems. Maintain cell membrane and capillary permeability. Act as an activator in the transmission of nerve impulses and contraction of cardiac, skeletal, and smooth muscle. Essential for bone formation and blood coagulation. Binds to dietary phosphate to form an insoluble calcium phosphate complex, which is excreted in the

© F.A. Davis Publishing

feces, resulting in decreased serum phosphorus concentrations (calcium acetate). **Therapeutic Effects:** Replacement of calcium in deficiency states. Control of hyperphosphatemia in end-stage renal disease without promoting aluminum absorption (calcium acetate).

Pharmacokinetics

Absorption: Absorption from the GI tract requires vitamin D. IV administration results in complete bioavailability.
Distribution: Readily enters extracellular fluid. Crosses the placenta and enters breast milk.
Metabolism and Excretion: Excreted mostly in the feces; 20% eliminated by the kidneys.
Half-life: Unknown.

TIME/ACTION PROFILE (effects on serum calcium)

ROUTE	ONSET	PEAK	DURATION
PO	unknown	unknown	unknown
IV	immediate	immediate	0.5–2 hr

Contraindications/Precautions

Contraindicated in: Hypercalcemia; Renal calculi; Ventricular fibrillation; Concurrent use of calcium supplements (calcium acetate).
Use Cautiously in: Patients receiving digoxin; Severe respiratory insufficiency; Renal impairment; Cardiac disease; OB: Hypercalcemia may ↑ risk of maternal and fetal complications; Lactation: Breast feeding not expected to harm infant provided that serum calcium levels monitored.

Adverse Reactions/Side Effects

CV: CARDIAC ARREST (IV only), arrhythmias, bradycardia. **F and E:** hypercalcemia. **GI:** constipation, diarrhea (oral solution only), nausea, vomiting. **GU:** calculi, hypercalciuria. **Local:** phlebitis (IV only).
Neuro: syncope (IV only), tingling.

Interactions

Drug-Drug: Hypercalcemia ↑ the risk of **digoxin** toxicity. Chronic use with **antacids** in renal insufficiency may lead to milk-alkali syndrome. **Calcium supplements**, including calcium-containing antacids, may ↑ risk of hypercalcemia; avoid concurrent use. Ingestion by mouth ↓ the absorption of orally administered **phenytoin** and **iron salts**; take 1 hr before or 3 hr after oral calcium supplements. Excessive amounts may ↓ the effects of **calcium channel blockers**. Calcium acetate may ↓ absorption of orally administered **tetracyclines**; take ≥1 hr before calcium acetate. Calcium acetate may ↓ absorption of orally administered **fluoroquinolones**; take ≥2 hr before or 6 hr after calcium acetate. Calcium acetate may ↓ absorption of orally administered **levothyroxine**; take ≥4 hr before or 4 hr after calcium acetate. ↓ absorption of **etidronate** and **risedronate** (do not take within 2 hr of calcium supplements). Concurrent use with **diuretics (thiazide)** may result in hypercalcemia. May ↓ the ability of **sodium polystyrene sulfonate** to decrease serum potassium.
Drug-Food: Cereals, **spinach**, or **rhubarb** may ↓ the absorption of calcium supplements.

Route/Dosage

Doses are expressed in mg, g, or mEq of calcium.
PO (Adults): *Prevention of hypocalcemia, treatment of depletion, osteoporosis*—1–2 g/day. *Antacid*—0.5–1.5 g as needed (calcium carbonate only). *Hyperphosphatemia in end-stage renal disease (calcium acetate only)*—1334 mg with each meal, may ↑ gradually (in absence of hypercalcemia) to achieve target serum phosphate levels (usual dose = 2001–2668 mg with each meal).
PO (Children): *Supplementation*—45–65 mg/kg/day.
PO (Infants): *Neonatal hypocalcemia*—50–150 mg/kg (not to exceed 1 g).
IV (Adults): *Emergency treatment of hypocalcemia, cardiac standstill*—7–14 mEq. *Hypocalcemic tetany*—4.5–16 mEq; repeat until symptoms are controlled. *Hyperkalemia with cardiac toxicity*—2.25–14 mEq; may repeat in 1–2 min. *Hypermagnesemia*—7 mEq.
IV (Children): *Emergency treatment of hypocalcemia*—1–7 mEq. *Hypocalcemic tetany*—0.5–0.7 mEq/kg 3–4 times daily.
IV (Infants): *Emergency treatment of hypocalcemia*—<1 mEq. *Hypocalcemic tetany*—2.4 mEq/kg/day in divided doses.

Availability (generic available)

Calcium Acetate

Gelcaps: 667 mg (169 mg elemental Ca). **Oral solution:** 667 mg (169 mg elemental Ca)/5 mL. **Tablets:** 667 mg (169 mg elemental Ca).

Calcium Carbonate

Chewable tablets: 420 mg (168 mg Ca)[OTC], 500 mg (200 mg Ca)[OTC], 750 mg (300 mg Ca)[OTC], 1 g (400 mg Ca)[OTC], 1.25 g (500 mg Ca)[OTC]. **Oral suspension:** 1.25 g (500 mg Ca)/5 mL[OTC]. **Powder:** 6.5 g (2400 mg Ca)/packet[OTC]. **Tablets:** 600 mg (240 mg Ca)[OTC], 650 mg (260 mg Ca)[OTC], 1.25 g (500 mg Ca)[OTC], 1.5 g (600 mg Ca)[OTC].

Calcium Chloride

Solution for injection: 10% (1.36 mEq/mL).

Calcium Citrate

Tablets: 250 mg[OTC].

© F.A. Davis Publishing

Calcium Gluconate

Premixed infusion (in sodium chloride): 1 g/50 mL (4.65 mEq/50 mL), 2 g/100 mL (9.3 mEq/100 mL). **Solution for injection:** 10% (0.45 mEq/mL). **Tablets:** 500 mg (45 mg Ca) OTC.

Calcium Lactate

Tablets: 500 mg OTC, 650 mg (84.5 mg Ca) OTC.

Tricalcium Phosphate

Tablets: 600 mg (234 mg Ca) OTC.

NURSING IMPLICATIONS

Assessment

- **Calcium Supplement/Replacement:** Observe patient closely for symptoms of hypocalcemia (paresthesia, muscle twitching, laryngospasm, colic, cardiac arrhythmias, Chvostek's or Trousseau's sign). Notify health care professional if these occur. Protect symptomatic patients by elevating and padding siderails and keeping bed in low position.
- Monitor BP, pulse, and ECG frequently throughout parenteral therapy. May cause vasodilation with resulting hypotension, bradycardia, arrhythmias, and cardiac arrest. Transient increases in BP may occur during IV administration, especially in geriatric patients or in patients with hypertension.
- Assess IV site for patency. Extravasation may cause cellulitis, necrosis, and sloughing.
- Monitor patient on digoxin for signs of toxicity.
- **Antacid:** When used as an antacid, assess for heartburn, indigestion, and abdominal pain. Inspect abdomen; auscultate bowel sounds.
- ***Lab Test Considerations:*** Monitor serum calcium or ionized calcium, chloride, sodium, potassium, magnesium, albumin, and parathyroid hormone (PTH) concentrations before and periodically during therapy for treatment of hypocalcemia.
- *For patients with hyperphosphatemia*: Monitor serum calcium twice weekly during adjustment phase. If serum calcium level is >12 mg/dL, discontinue therapy and start hemodialysis as needed; lower dose or temporarily stop therapy for calcium level between 10.5 and 11.9 mg/dL.
- May cause ↓ serum phosphate concentrations with excessive and prolonged use. When used to treat hyperphosphatemia in renal failure patients, monitor phosphate levels.
- ***Toxicity and Overdose:*** Assess patient for nausea, vomiting, anorexia, thirst, severe constipation, paralytic ileus, and bradycardia. Contact health care professional immediately if these signs of hypercalcemia occur.

Implementation

- ***High Alert:*** Errors with IV calcium gluconate and chloride have occurred secondary to confusion over which salt is ordered. Clarify incomplete orders. Confusion has occurred with milligram doses of calcium chloride and calcium gluconate, which are not equal. Chloride and gluconate forms are routinely available on most hospital crash carts; specify form of calcium desired.
- Do not confuse Os-Cal (calcium carbonate) with Asacol (mesalamine).
- In arrest situations, the use of calcium chloride is now limited to patients with hyperkalemia, hypocalcemia, and calcium channel blocker toxicity.
- **PO:** Administer calcium carbonate or phosphate 1–1.5 hr after meals and at bedtime. Chewable tablets should be well chewed before swallowing. Dissolve effervescent tablets in glass of water. Follow oral doses with a full glass of water, except when using calcium carbonate as a phosphate binder in renal dialysis. Administer on an empty stomach before meals to optimize effectiveness in patients with hyperphosphatemia.
- **IM:** IM administration of calcium salts can cause severe necrosis and tissue sloughing. Do not administer IM.

IV Administration

- **IV:** IV solution should be warmed to body temperature and given through a small-bore needle in a large vein to minimize phlebitis. Do not administer through a scalp vein. May cause cutaneous burning sensation, peripheral vasodilation, and drop in BP. Patient should remain recumbent for 30–60 min after IV administration.
- If infiltration occurs, discontinue IV. May be treated with application of heat, elevation, and local infiltration of normal saline, 1% procaine HCl, or hyaluronidase.
- ***High Alert:*** Administer slowly. High concentrations may cause cardiac arrest. Rapid administration may cause tingling, sensation of warmth, and a metallic taste. Halt infusion if these symptoms occur, and resume infusion at a slower rate when they subside.
- Do not administer solutions that are not clear or that contain a precipitate.

Calcium Chloride

IV Administration

- **IV Push:** May be administered undiluted by IV push.
- **Intermittent/Continuous Infusion:** May be diluted with D5W, D10W, 0.9% NaCl, D5/0.25% NaCl, D5/0.45% NaCl, D5/0.9% NaCl, or D5/LR.
- ***Rate:*** Maximum rate for adults is 0.7–1.4 mEq/min (0.5–1 mL of 10% solution); for children, 0.5 mL/min.
- **Y-Site Compatibility:** acyclovir, alemtuzumab, alfentanil, amikacin, aminocaproic acid, aminophylline, amiodarone, anidulafungin, argatroban, ascorbic acid, atropine, azithromycin, aztreonam, benztropine, bivalirudin, bleomycin, bumetanide, buprenorphine, butorphanol, calcium gluconate, carboplatin, carmustine, caspofungin, cefotaxime, cefotetan, cefoxitin, ceftaroline, chloramphenicol, chlorpromazine, cisplatin, clindamycin, cyanocobalamin, cyclophosphamide, cyclosporine, cytarabine,

© F.A. Davis Publishing

dacarbazine, dactinomycin, daptomycin, dexmedetomidine, dexrazoxane, digoxin, diltiazem, diphenhydramine, dobutamine, docetaxel, dopamine, doxorubicin, doxycycline, enalaprilat, ephedrine, epinephrine, epirubicin, epoetin alfa, eptifibatide, ertapenem, erythromycin, esmolol, etoposide, etoposide phosphate, famotidine, fenoldopam, fentanyl, fluconazole, fludarabine, furosemide, ganciclovir, gemcitabine, gentamicin, glycopyrrolate, granisetron, heparin, hetastarch, hydromorphone, idarubicin, ifosfamide, insulin, irinotecan, isoproterenol, labetalol, leucovorin, lidocaine, linezolid, lorazepam, mannitol, meperidine, mesna, methotrexate, metoclopramide, metoprolol, metronidazole, micafungin, midazolam, milrinone, mitomycin, mitoxantrone, morphine, moxifloxacin, multivitamin, mycophenolate, nafcillin, nalbuphine, naloxone, nicardipine, nitroglycerin, nitroprusside, norepinephrine, octreotide, ondansetron, oxaliplatin, oxytocin, paclitaxel, palonosetron, pancuronium, papaverine, penicillin G, pentobarbital, phenobarbital, phenylephrine, phytonadione, piperacillin/tazobactam, potassium acetate, potassium chloride, procainamide, promethazine, propranolol, protamine, pyridoxine, rocuronium, succinylcholine, sufentanil, tacrolimus, theophylline, thiamine, thiotepa, tigecycline, tirofiban, tobramycin, topotecan, vancomycin, vasopressin, vecuronium, verapamil, vinblastine, vincristine, vinorelbine, voriconazole.

- **Y-Site Incompatibility:** amphotericin B deoxycholate, amphotericin B lipid complex, amphotericin B liposome, azathioprine, cefazolin, ceftazidime, ceftriaxone, cefuroxime, dantrolene, diazepam, diazoxide, doxorubicin liposomal, fluorouracil, folic acid, foscarnet, fosphenytoin, haloperidol, indomethacin, ketorolac, magnesium sulfate, methylprednisolone, pantoprazole, pemetrexed, phenytoin, potassium phosphates, prochlorperazine, propofol, quinupristin/dalfopristin, sodium bicarbonate, sodium phosphates, trimethoprim/sulfamethoxazole.

Calcium Gluconate

IV Administration

- **IV Push:** Administer slowly by IV push. ***Rate:*** Maximum administration rate for adults is 1.5–2 mL/min.
- **Continuous Infusion:** May be further diluted in 1000 mL of D5W, D10W, D20W, D5/0.9% NaCl, 0.9% NaCl, D5/LR, or LR.
- ***Rate:*** Administer at a rate not to exceed 200 mg/min over 12–24 hr.
- **Y-Site Compatibility:** acyclovir, aldesleukin, alemtuzumab, alfentanil, allopurinol, amifostine, amikacin, aminocaproic acid, aminophylline, anidulafungin, argatroban, arsenic trioxide, ascorbic acid, azathioprine, azithromycin, aztreonam, benztropine, bivalirudin, bleomycin, bumatanide, buprenorphine, butorphanol, calcium chloride, carboplatin, carmustine, caspofungin, cefazolin, cefepime, cefotaxime, cefotetan, ceftaroline, ceftazidime, ceftolozane/tazobactam, cefuroxime, chloramphenicol, chlorpromazine, ciprofloxacin, cisatracurium, cisplatin, cladribine, clindamycin, cyanocobalamin, cyclophosphamide, cyclosporine, cytarabine, dacarbazine, dactinomycin, daptomycin, daunorubicin, dexmedetomidine, dexrazoxane, digoxin, diltiazem, diphenhydramine, dobutamine, docetaxel, dopamine, doxacurium, doxapram, doxorubicin, doxorubicin liposomal, doxycycline, enalaprilat, epinephrine, epirubicin, epoetin alfa, eptifibatide, ertepenem, erythromycin, esmolol, etoposide, etoposide phosphate, famotidine, fenoldopam, fentanyl, filgrastim, fludarabine, fluorouracil, folic acid, furosemide, ganciclovir, gemcitabine, gentamicin, glycopyrrolate, granisetron, heparin, hetastarch, hydromorphone, idarubicin, ifosfomide, insulin regular, irinotecan, isuvuconazonium, isoproterenol, ketamine, labetalol, leucovorin calcium, levofloxacin, lidocaine, linezolid, lorazepam, magnesium sulfate, mannitol, melphalan, meperidine, meropenem/vaborbactam, mesna, metaraminol, methohexital, methotrexate, methyldopate, metoclopramide, metoprolol, micafungin, midazolam, milrinone, mitomycin, mitoxantrone, morphine, moxifloxacin, multivitamins, nafcillin, nalbuphine, naloxone, nicardipine, nitroglycerin, nitroprusside, norepinephrine, octreotide, ondansetron, oritavancin, oxaliplatin, oxytocin, paclitaxel, palonosetron, pancuronium, papaverine, penicillin G, pentamidine, pentobarbital, phenobarbital, phentolamine, phenylephrine, phytonadione, piperacillin/tazobactam, plazomicin, potassium acetate, potassium chloride, procainamide, prochlorperazine, promethazine, propofol, propranolol, protamine, pyridoxime, remifentanil, rituximab, rocuronium, sargramostim, sodium acetate, succinylcholine, sufentanil, tacrolimus, telavancin, theophylline, thiamine, thiotepa, tigecycline, tirofiban, tobramycin, tolazoline, traztuzumab, vancomycin, vasopressin, vecuronium, verapamil, vinblastine, vincristine, vinorelbine, vitamin B complex with C, voriconazole.
- **Y-Site Incompatibility:** amphotericin B deoxycholate, amphotericin B lipid complex, amphotericin B liposome, cangrelor, ceftriaxone, dantrolene, diazepam, diazoxide, foscarnet, fosphenytoin, gemtuzumab, indomethacin, methylprednisolone, minocycline, mycophenolate, oxacillin, pemetrexed, phenytoin, potassium phosphates, quinypristin/dalfopristin, sodium bicarbonate, sodium phosphates, tedizolid, topotecan, trimethoprim/sulfamethoxazole.

© F.A. Davis Publishing

Patient/Family Teaching

- Instruct patient not to take enteric-coated tablets within 1 hr of calcium carbonate; this will result in premature dissolution of the tablets.
- Do not administer concurrently with foods containing large amounts of oxalic acid (spinach, rhubarb), phytic acid (brans, cereals), or phosphorus (milk or dairy products). Administration with milk products may lead to milk-alkali syndrome (nausea, vomiting, confusion, headache). Do not take within 1–2 hr of other medications if possible.
- Instruct patients on a regular schedule to take missed doses as soon as possible, then go back to regular schedule.
- Advise patient that calcium carbonate may cause constipation. Review methods of preventing constipation (increasing bulk in diet, increasing fluid intake, increasing mobility) and using laxatives. Severe constipation may indicate toxicity.
- Advise patient to avoid excessive use of tobacco or beverages containing alcohol or caffeine.
- Advise patient to notify health care professional if pregnancy is planned or suspected, or if breast feeding. Monitor infants born to mothers with hypocalcemia for signs of hypocalcemia or hypercalcemia (neuromuscular irritability, apnea, cyanosis, and cardiac rhythm disorders).
- **Calcium Supplement:** Encourage patients to maintain a diet adequate in vitamin D (see Appendix J).
- **Osteoporosis:** Advise patients that exercise has been found to arrest and reverse bone loss. Patient should discuss any exercise limitations with health care professional before beginning program.
- **Hyperphosphatemia:** Advise patient to notify health care professional promptly if signs and symptoms of hypercalcemia (constipation, anorexia, nausea, vomiting, confusion, stupor) occur.
- Advise patient to avoid taking calcium-containing supplements, including calcium-based antacids, during therapy.

Evaluation/Desired Outcomes

- Increase in serum calcium levels.
- Decrease in the signs and symptoms of hypocalcemia.
- Resolution of indigestion.
- Control of hyperphosphatemia in patients with renal failure (calcium acetate only).

canagliflozin (kan-a-gli-**floe**-zin)

Invokana

Classification

Therapeutic: antidiabetics

Pharmacologic: sodium-glucose co-transporter 2 (SGLT2) inhibitors

Indications

Adjunct to diet and exercise in the management of type 2 diabetes mellitus. To reduce the risk of major adverse cardiovascular events in patients with type 2 diabetes mellitus and established cardiovascular disease. To reduce the risk of end-stage kidney disease (ESKD), doubling of serum creatinine, cardiovascular death, and hospitalization for HF in patients with type 2 diabetes mellitus and diabetic nephropathy with albuminuria >300 m g/day.

Action

Inhibits proximal renal tubular sodium-glucose co-transporter 2 (SGLT2), which determines reabsorption of glucose from the tubular lumen. Inhibits reabsorption of glucose, lowers renal threshold for glucose, and increases excretion of glucose in urine. **Therapeutic Effects:** Improved glycemic control. Reduction in risk of cardiovascular death, nonfatal MI, and nonfatal stroke. Reduction in risk of ESKD, doubling of serum creatinine, cardiovascular death, and HF hospitalizations.

Pharmacokinetics

Absorption: Well absorbed (65%) following oral administration.

Distribution: Extensive tissue distribution.

Protein Binding: 99%.

Metabolism and Excretion: Mostly metabolized by UDP-glucuronyl transferases (UGT) to inactive metabolites, minimal metabolism by CYP3A4 (7%). 50% excreted in feces as parent drug and metabolites, 33% as metabolites in urine, <1% excreted in urine as unchanged drug.

Half-life: 10.6 hr.

TIME/ACTION PROFILE (effects on A1C)

ROUTE	ONSET	PEAK	DURATION
PO	unknown	unknown	24 hr

Contraindications/Precautions

Contraindicated in: Hypersensitivity; Severe renal impairment (eGFR <30 mL/min/1.73 m²) (use not recommended for glycemic control); Patients on dialysis; Type 1 diabetes; Severe hepatic impairment; Lactation: Lactation.

Use Cautiously in: History of pancreatitis, pancreatic surgery, reduced caloric intake due to illness or surgery, surgical procedures or alcohol abuse (↑ risk of ketoacidosis); Hypovolemia, chronic kidney disease (eGFR <60 mL/min/1.73 m²), or concurrent use of loop diuretics (↑ risk of volume depletion or hypotension); Previous amputation, peripheral vascular disease, neuropathy, or diabetic foot infection (↑ risk of lower limb amputation); Hypotension (correct prior to treatment, especially if eGFR 30–60 mL/min, age >75 yr, or concurrent use of loop diuretics, ACE inhibitors, or ARBs); OB: Use during pregnancy only if potential maternal benefit justifies potential fetal risk; Pedi: Safety

© F.A. Davis Publishing

and effectiveness not established in children; Geri: Older adults at ↑ risk of volume depletion or hypotension.

Adverse Reactions/Side Effects

CV: hypotension. **Endo:** hypoglycemia (↑ with other medications). **F and E:** KETOACIDOSIS, hypermagnesemia, hyperphosphatemia, thirst. **GI:** abdominal pain, constipation, nausea. **GU:** NECROTIZING FASCIITIS OF PERINEUM (FOURNIER'S GANGRENE), UROSEPSIS, female mycotic infections, acute kidney injury, glucosuria, male mycotic infections, ↓ renal function, urinary tract infection (including pyelonephritis), ↑ urination, vulvovaginal pruritus. **Metab:** hyperlipidemia. **MS:** bone fractures, lower limb amputation. **Misc:** HYPERSENSITIVITY REACTIONS (including anaphylaxis or angioedema).

Interactions

Drug-Drug: Blood levels are ↓ by **UGT inducers** including **phenobarbital**, **phenytoin**, **rifampin**, and **ritonavir**; ↑ dose may be required. ↑ risk of hypoglycemia with **insulin** or **insulin secretagogues**; dose adjustments may be required. May ↑ blood levels and effects of **digoxin**; levels should be monitored. ↑ risk of hyperkalemia with **potassium-sparing diuretics** or **medications that interfere with the renin-angiotensin-aldosterone system**. Concurrent use with **loop diuretics**, may ↑ risk of hypovolemia and hypotension.

Route/Dosage

PO (Adults): 100 mg once daily initially, may be ↑ to 300 mg once daily; *Concurrent use of UGT inducers (phenobarbital, phenytoin, rifampin, ritonavir)* — If patient tolerating canagliflozin 100 mg once daily, ↑ dose to 200 mg once daily; if patient tolerating canagliflozin 200 mg once daily and requires addition glycemic control, ↑ dose to 300 mg once daily.

Renal Impairment

PO (Adults): *eGFR 30– <60 mL/min/1.73 m²* — 100 mg once daily. *eGFR <30 mL/min/1.73 m² with albuminuria >300 m g/day* — Initiation of therapy not recommended; patients already receiving therapy may continue with 100 mg once daily to reduce the risk of ESKD, doubling of serum creatinine, cardiovascular death, and hospitalization for HF. *Concurrent use of UGT inducers (phenobarbital, phenytoin, rifampin, ritonavir) and eGFR <60 mL/min/1.73 m²* — If patient tolerating canagliflozin 100 mg once daily, ↑ dose to 200 mg once daily; if patient requires additional glycemic control, consider adding another antihyperglycemic agent.

Availability

Tablets: 100 mg, 300 mg. ***In combination with:*** metformin (Invokamet); metformin XR (Invokamet XR). See Appendix N.

NURSING IMPLICATIONS

Assessment

- Observe patient for signs and symptoms of hypoglycemic reactions (abdominal pain, sweating, hunger, weakness, dizziness, headache, tremor, tachycardia, anxiety).
- Monitor for signs and symptoms of volume depletion (dizziness, feeling faint, weakness, orthostatic hypotension) after initiating therapy.
- Monitor for infection, new pain, tenderness, erythema, swelling, sores, or ulcers involving lower limbs, with fever or malaise; discontinue canagliflozin if these occur.
- ***Lab Test Considerations:*** Monitor hemoglobin A1C prior to and periodically during therapy.
- May cause ↑ uric acid levels.
- Monitor renal function prior to and periodically during therapy, especially in patients with eGFR <60 mL/min/1.73 m². May ↑ serum creatinine and ↓ eGFR.
- May cause ↑ serum potassium, magnesium, and phosphate levels. Monitor electrolytes periodically during therapy.
- May cause ↑ LDL-C. Monitor serum lipid levels periodically during therapy.
- Causes positive test for urine glucose.
- Monitor for ketoacidosis, especially during prolonged fasting for illness or surgery. May require temporary discontinuation of therapy.

Implementation

- Patients stabilized on a diabetic regimen who are exposed to stress, fever, trauma, infection, or surgery may require administration of insulin.
- Correct volume depletion prior to beginning therapy with canagliflozin.
- **PO:** Administer before the first meal of the day.

Patient/Family Teaching

- Instruct patient to take canagliflozin as directed. Take missed doses as soon as remembered, unless it is almost time for next dose; do not double doses. Advise patient to read the *Medication Guide* before starting and with each Rx refill in case of changes.
- Explain to patient that canagliflozin helps control hyperglycemia but does not cure diabetes. Therapy is usually long term.
- Instruct patient not to share this medication with others, even if they have the same symptoms; it may harm them.
- Encourage patient to follow prescribed diet, medication, preventative foot care, and exercise regimen to prevent hyperglycemic or hypoglycemic episodes.
- Review signs of hypoglycemia and hyperglycemia with patient. If hypoglycemia occurs, advise patient to take a glass of orange juice or 2–3 tsp of sugar,

© F.A. Davis Publishing

honey, or corn syrup dissolved in water, and notify health care professional.
- Instruct patient in proper testing of blood glucose and urine ketones, especially during periods of stress or illness. Inform patient that canagliflozin will cause a positive test result when testing for urine glucose. Notify health care professional if significant changes occur.
- Advise patient to notify health care professional if new pain or tenderness, sores or ulcers, or infections involving the leg or foot occur and to immediately seek care if pain or tenderness, redness, or swelling of the genitals or area from the genitals back to the rectum, along with a fever above 100.4°F or malaise occur.
- Inform patient that canagliflozin may cause yeast infections. Women may have signs and symptoms of a vaginal yeast infection (vaginal odor, white or yellow vaginal discharge [may be lumpy or look like cottage cheese], vaginal itching). Men may have signs and symptoms of a yeast infection of the penis (redness, itching, or swelling of penis; rash on penis; foul smelling discharge from penis; pain in skin around penis). Advise patient to notify health care professional if yeast infection occurs.
- Advise patient to notify health care professional promptly if rash; hives; or swelling of face, lips, or throat occur.
- Advise patient to notify health care professional of medication regimen before treatment or surgery. Holding doses for at least 3 days before surgery may be required.
- Inform patient of increased risk for urinary tract infections, hypotension, and bone fractures and discuss factors that may increase risk.
- Advise patient to notify health care professional of all Rx or OTC medications, vitamins, or herbal products being taken and to consult with health care professional before taking other medications, especially other oral hypoglycemic medications.
- Advise patient to notify health care professional if pregnancy is planned or suspected and to avoid breast feeding during therapy.

Evaluation/Desired Outcomes
- Improved hemoglobin A1C and glycemic control in adults with Type II diabetes.
- Reduction in risk of cardiovascular death, nonfatal MI, and nonfatal stroke.
- Reduction in risk of ESKD, doubling of serum creatinine, cardiovascular death, and HF hospitalizations.

candesartan, See ANGIOTENSIN II RECEPTOR ANTAGONISTS.

cangrelor (kan-grel-or)
Kengreal

Classification
Therapeutic: antiplatelet agents
Pharmacologic: platelet aggregation inhibitors

Indications
Adjunct to percutaneous coronary intervention (PCI) to ↓ risk of periprocedural MI, repeat coronary revascularization or stent thrombosis in patients not currently receiving a $P2Y_{12}$ platelet inhibitor and are not receiving a glycoprotein IIb/IIIa inhibitor.

Action
Inhibits platelet aggregation by reversibly interacting with platelet $P2Y_{12}$ADP-receptors, preventing signal transduction and platelet activation. **Therapeutic Effects:** ↓ risk of periprocedural MI, repeat coronary revascularization or stent thrombosis associated with PCI.

Pharmacokinetics
Absorption: IV administration results in complete bioavailability.
Distribution: Unknown.
Protein Binding: 97–98%.
Metabolism and Excretion: Metabolized rapidly in the bloodstream; metabolites do not have antiplatelet activity. 58% excreted by kidneys, 35% in feces.
Half-life: 3–6 min.

TIME/ACTION PROFILE (antiplatelet effect)

ROUTE	ONSET	PEAK	DURATION
IV	rapid	2 min	1 hr†

† following discontinuation.

Contraindications/Precautions
Contraindicated in: Hypersensitivity; Significant severe bleeding.
Use Cautiously in: OB: Use during pregnancy only if potential maternal benefit justifies potential fetal risk; Pedi: Safety and effectiveness in children not established.

Adverse Reactions/Side Effects
Resp: dyspnea. **Hemat:** bleeding. **Misc:** allergic reactions including ANAPHYLAXIS.

Interactions
Drug-Drug: Concurrent use of other **$P2Y_{12}$ inhibitors** including **clopidogrel**, **prasugrel**, or **ticagrelor**↑ risk of bleeding. Blocks antiplatelet effects of concurrently administered **clopidogrel** or **prasugrel**.

Route/Dosage
IV (Adults): 30 mcg/kg bolus prior to PCI, then 4 mcg/kg/min infusion for 2 hr or duration of procedure, whichever is longer; should be followed by initiation of an oral $P2Y_{12}$ platelet inhibitor.

© F.A. Davis Publishing

Availability
Lyophilized powder for injection: 50 mg/vial.

NURSING IMPLICATIONS
Assessment
- Monitor for signs and symptoms of bleeding during and following infusion.
- Monitor for signs and symptoms of hypersensitivity reaction (bronchospasm, angioedema, stridor) during therapy. Discontinue therapy and treat symptomatically.

Implementation
- **IV Push:** ***Reconstitution:*** Reconstitute each 50 mg vial with 5 mL of sterile water for injection. Swirl gently until dissolved; avoid vigorous mixing. Allow foam to settle. Solution is clear and colorless to pale yellow; do not administer solutions that are discolored or contain particulate matter. ***Dilution:*** Withdraw reconstituted solution and add to 250 mL of 0.9% NaCl or D5W. Dilute immediately. Stable for 12 hr if diluted with D5W or 24 hr if diluted with 0.9% NaCl at room temperature. Discard unused portion. ***Concentration:*** 200 mcg/mL. Patients >100 kg will require at least 2 bags. ***Rate:*** Administer rapidly over <1 min from diluted bag via IV push or pump. Ensure bolus completely administered before beginning infusion.
- **Intermittent Infusion:** Start infusion immediately after administration of bolus. ***Rate:*** 4 mcg/kg/min for at least 2 hr or duration of PCI, whichever is longer.
- **Y-Site Incompatibility:** Infusion requires a dedicated line.
- To maintain platelet inhibition, administer either ticagrelor 180 mg PO at any time during or immediately after discontinuation, or prasugrel 60 mg PO or clopidogrel 600 mg PO immediately after discontinuation of infusion; do not administer prasugrel or clopidogrel prior to discontinuation of infusion.

Patient/Family Teaching
- Caution patient to notify health care professional if bleeding occurs.
- Rep: Advise females of reproductive potential to notify health care professional if pregnancy is suspected or if breast feeding. Avoid neuraxial blockade procedures and, when possible, discontinue cangrelor 1 hr prior to labor, delivery, or neuraxial blockade.

Evaluation/Desired Outcomes
- ↓ risk of periprocedural MI, repeat coronary revascularization or stent thrombosis associated with PCI.

cannabidiol (kan-a-bi-**dye**-ol)
Epidiolex

C

Classification
Therapeutic: anticonvulsants
Pharmacologic: cannabinoids

Schedule V

Indications
Seizures associated with Lennox-Gastaut syndrome, Dravet syndrome, or tuberous sclerosis complex.

Action
Cannabidiol is a cannabinoid that naturally occurs in the *Cannabis sativa* plant. Mechanism of anticonvulsant effect unknown; does not work by interacting with cannabinoid receptors. **Therapeutic Effects:** Reduction in frequency of atonic, tonic, clonic, and tonic-clonic seizures.

Pharmacokinetics
Absorption: Extent of absorption unknown. High fat/high calorie meals increase extent of absorption.
Distribution: Extensively distributed to tissues.
Protein Binding: >94%.
Metabolism and Excretion: Primarily metabolized in the liver by the CYP2C9 and CYP3A4 isoenzymes to an active metabolite (7-OH-CBD). Primarily excreted in feces.
Half-life: 56–61 hr.

TIME/ACTION PROFILE (plasma concentrations)

ROUTE	ONSET	PEAK	DURATION
PO	unknown	2.5–5 hr	unknown

Contraindications/Precautions
Contraindicated in: Hypersensitivity to cannabidiol or sesame oil.
Use Cautiously in: Concurrent use of valproic acid or clobazam; Concurrent use of sedatives, hypnotics, or other psychoactive drugs (↑ risk of adverse effects); Elevated liver enzymes (at baseline); Moderate to severe hepatic impairment; OB: Use during pregnancy only if the potential maternal benefit justifies the potential fetal risk; Lactation: Use while breast feeding only if the potential maternal benefit justifies the potential risk to the infant; Pedi: Children <2 yr (safety and effectiveness not established); Geri: Choose dose carefully in older adults, considering concurrent disease states, drug therapy, and age-related ↓ in hepatic and renal function.

Adverse Reactions/Side Effects
Derm: rash. **EENT:** dry mouth. **GI:** ↓ appetite, diarrhea, hepatotoxicity, ↑ liver enzymes, abdominal pain,

© F.A. Davis Publishing

↓ weight. **GU:** ↑ serum creatinine. **Hemat:** anemia. **Neuro:** SUICIDAL THOUGHTS/BEHAVIORS, fatigue, insomnia, sedation, aggressive behavior, agitation, ataxia. **Misc:** HYPERSENSITIVITY REACTIONS (including angioedema), infection, physical dependence, psychological dependence (high doses or prolonged therapy).

Interactions

Drug-Drug: Concurrent use of **valproic acid** may ↑ risk of hepatotoxicity. **Moderate or strong CYP2C9 inhibitors** and **moderate or strong CYP3A4 inhibitors** may ↑ levels and risk of toxicity; consider ↓ cannabidiol dose. **Strong CYP2C9 inducers** or **strong CYP3A4 inducers** may ↓ levels and effectiveness; consider ↑ cannabidiol dose. May ↑ levels of **CYP1A2 substrates**, including **theophylline** and **tizanidine**; consider ↓ dose of CYP1A2 substrate. May ↑ levels of **CYP2B6 substrates**, including **bupropion** and **efavirenz**; consider ↓ dose of CYP2B6 substrate. May ↑ levels and risk of toxicity of **CYP2C8 substrates** and **CYP2C9 substrates**; consider ↓ dose of CYP2C8 or CYP2C9 substrate. May ↑ levels of **CYP2C19 substrates**, including **diazepam**; consider ↓ dose of CYP2C19 substrate. May ↑ levels of active metabolite of **clobazam** which may ↑ risk of toxicity associated with clobazam. May ↑ levels and risk of toxicity of **stiripentol** and **everolimus**. Additive CNS depression with **alcohol**, **antihistamines**, **barbiturates**, **benzodiazepines**, **muscle relaxants**, **opioid analgesics**, **tricyclic antidepressants**, and **sedative/hypnotics**.

Route/Dosage

Seizures Associated with Lennox-Gastaut Syndrome or Dravet Syndrome

PO (Adults and Children ≥1 yr): 2.5 mg/kg twice daily; can ↑ dose to 5 mg/kg twice daily in 1 wk. If further reduction in seizure frequency needed, may continue to ↑ dose on weekly basis (every other day if more rapid titration warranted) in increments of 2.5 mg/kg twice daily (max dose = 10 mg/kg twice daily).

Hepatic Impairment

PO (Adults and Children ≥1 yr): *Moderate hepatic impairment (Child–Pugh B)* — 1.25 mg/kg twice daily; can ↑ dose to 2.5 mg/kg twice daily in 1 wk. If further reduction in seizure frequency needed, may continue to ↑ dose on weekly basis (every other day if more rapid titration warranted) in increments of 1.25 mg/kg twice daily (max dose = 5 mg/kg twice daily); *Severe hepatic impairment (Child–Pugh C)* — 0.5 mg/kg twice daily; can ↑ dose to 1 mg/kg twice daily in 1 wk. If further reduction in seizure frequency needed, may continue to ↑ dose on weekly basis (every other day if more rapid titration warranted) in increments of 0.5 mg/kg twice daily (max dose = 2 mg/kg twice daily).

Seizures Associated with Tuberous Sclerosis Complex

PO (Adults and Children ≥1 yr): 2.5 mg/kg twice daily; can ↑ dose on weekly basis (every other day if more rapid titration warranted) in increments of 2.5 mg/kg twice daily to recommended maintenance dosage of 12.5 mg/kg twice daily.

Hepatic Impairment

PO (Adults and Children ≥1 yr): *Moderate hepatic impairment (Child–Pugh B)* — 1.25 mg/kg twice daily; can ↑ dose on weekly basis (every other day if more rapid titration warranted) in increments of 1.25 mg/kg twice daily to recommended maintenance dosage of 6.25 mg/kg twice daily; *Severe hepatic impairment (Child–Pugh C)* — 0.5 mg/kg twice daily; can ↑ dose on weekly basis (every other day if more rapid titration warranted) in increments of 0.5 mg/kg twice daily to recommended maintenance dosage of 2.5 mg/kg twice daily.

Availability

Oral solution (strawberry flavor): 100 mg/mL.

NURSING IMPLICATIONS

Assessment

- Assess location, duration, and characteristics of seizure activity. Institute seizure precautions.
- Monitor closely for notable changes in behavior that could indicate the emergence or worsening of suicidal thoughts, behavior, or depression.
- Monitor for signs and symptoms of hepatotoxicity (unexplained nausea, vomiting, right upper quadrant abdominal pain, fatigue, anorexia, jaundice and/or dark urine). If signs and symptoms occur, promptly measure serum transaminases and total bilirubin and interrupt or discontinue treatment with cannabidiol.
- Monitor for signs and symptoms of hypersensitivity reactions (pruritus, erythema, and angioedema) during therapy. Discontinue cannabidiol if symptoms occur.
- ***Lab Test Considerations:*** Obtain serum transaminases (ALT, AST) and total bilirubin levels before starting therapy. Elevations usually respond to decreased dose or discontinuation of therapy. Monitor levels at 1, 3, and 6 mo after starting therapy, within 1 mo following dose changes, and as needed thereafter. Discontinue cannabidiol if transaminase levels >3 times upper limit of normal (ULN) and bilirubin levels >2 times ULN. Also discontinue therapy if transaminase persistently >5 times ULN.

Implementation

- **PO:** Administer orally twice daily with consistency in regard to food; food may effect cannabidiol levels. Use calibrated measuring device included with cannabidiol to ensure accurate dosing. Solution is strawberry flavored clear, colorless to yellow. Store

© F.A. Davis Publishing

at room temperature; do not refrigerate or freeze. Discard 12 wk after bottle is first opened.

Patient/Family Teaching

- Instruct patient to take cannabidiol as directed. Advise patient not to stop cannabidiol without consulting health care professional; must be gradually discontinued to prevent seizures. Advise patient to read the *Medication Guide* before starting therapy and with each Rx refill in case of changes.
- May cause drowsiness. Caution patient to avoid driving or other activities requiring alertness until response to medication is known. Tell patient not to resume driving until health care professional gives clearance based on control of seizure disorder and response to medication is known.
- Advise patient to notify health care professional promptly if signs and symptoms of hepatotoxicity occur.
- Instruct patient to notify health care professional of all Rx or OTC medications, vitamins, or herbal products being taken and consult health care professional before taking any new medications and to avoid alcohol during therapy.
- Inform patients and families of risk of suicidal thoughts and behavior and advise that behavioral changes, emergency or worsening signs and symptoms of depression, unusual changes in mood, or emergence of suicidal thoughts, behavior, or thoughts of self-harm should be reported to health care professional immediately.
- Inform patients of potential for positive cannabis drug screens.
- Rep: Advise females of reproductive potential to notify health care professional if pregnancy is planned or suspected or if breast feeding. Encourage patients who become pregnant to enroll in the North American Antiepileptic Drug (NAAED) Pregnancy Registry by calling 1-888-233-2334 or on the web at www.aedpregnancyregistry.org to collect information about the safety of antiepileptic medicines during pregnancy. Enrollment must be done by patients themselves.

Evaluation/Desired Outcomes

- Decreased frequency and intensity of seizure activity.

capsaicin (kap-say-sin)

Capzasin-HP, Capzasin-P, DiabetAid Pain and Tingling Relief, Qutenza, Zostrix, Zostrix-HP

Classification

Therapeutic: nonopioid analgesics (topical)

Indications

Temporary management of pain due to rheumatoid arthritis and osteoarthritis. Treatment of pain associated with postherpetic neuralgia (topical and transdermal) or diabetic neuropathy. **Unlabeled Use:** Treatment of postmastectomy pain syndrome. Treatment of complex regional pain syndrome.

Action

Topical: May deplete and prevent the reaccumulation of a chemical (substance P) responsible for transmitting painful impulses from peripheral sites to the CNS. **Transdermal**: Initially stimulates the transient receptor potential vanilloid 1 (TRPV1) receptors on nociceptive nerve fibers in the skin; this is followed by pain relief thought to be due to a reduction in TRPV1–expressing nociceptive nerve endings. **Therapeutic Effects:** Relief of discomfort associated with painful peripheral syndromes.

Pharmacokinetics

Absorption: Unknown.
Distribution: Unknown.
Metabolism and Excretion: Unknown.
Half-life: Unknown.

TIME/ACTION PROFILE

ROUTE	ONSET	PEAK	DURATION
topical	1–2 wk	2–4 wk†	unknown
transdermal	unknown	unknown	unknown

†May take up to 6 wk for head and neck neuralgias.

Contraindications/Precautions

Contraindicated in: Hypersensitivity to capsaicin or hot peppers; Not for use near eyes or on open or broken skin.
Use Cautiously in: OB, Lactation: Safety not established; Pedi: Safety not established in children <18 yr (transdermal) or <2 yr (topical).

Adverse Reactions/Side Effects

CV: *Patch*—↑ BP. **Derm:** pain (after application of patch), transient burning. **Neuro:** ↓ sensory function. **Resp:** cough.

Interactions

Drug-Drug: None significant.

Route/Dosage

Topical (Adults and Children ≥2 yr): Apply to affected areas 3–4 times daily.
Transdermal (Adults): *Postherpetic neuralgia*—Apply up to 4 patches for 60 min (single use); may be repeated every 3 mo, as needed based on pain (should not be used more frequently than every 3 mo); *Diabetic neuropathy of feet*—Apply up to 4 patches for 30 min (single use); may be repeated every 3 mo, as needed based on pain (should not be used more frequently than every 3 mo).

© F.A. Davis Publishing

Availability (generic available)

Cream: 0.025%[OTC], 0.035%[OTC], 0.075%[OTC], 0.1%[OTC]. **Gel:** 0.025%[OTC]. **Lotion:** 0.025%[OTC]. **Topical liquid:** 0.15%[OTC]. **Transdermal patch:** 0.0225%/patch, 0.025%/patch, 0.03%/patch, 0.0375%/patch, 0.05%/patch, 8% (179 mg)/patch. ***In combination with:*** methylsalicylate (Ziks[OTC]). See Appendix N.

NURSING IMPLICATIONS

Assessment

- Assess pain intensity and location before and periodically throughout therapy.
- May cause temporary, minor reductions in sensory function. Assess patients with pre-existing sensory deficits, signs of sensory deterioration or loss, prior to each application. If sensory deterioration or loss is detected or pre-existing sensory deficit worsens, reconsider continued use of capsaicin.
- **Transdermal:** Monitor BP periodically during application.

Implementation

- Do not confuse Zostrix (capsaicin) with Zovirax (acyclovir).
- **Topical:** Apply to affected area not more than 3–4 times daily. Avoid getting medication into eyes or on broken or irritated skin. Do not bandage tightly.
- Topical lidocaine may be applied during the first 1–2 wk of treatment to reduce initial discomfort.
- **Transdermal:** Administration should be done by health care professional; do not dispense to patient. Examine area for lesions before application. Identify treatment area (painful area including areas of hypersensitivity and allodynia) and mark on the skin. If needed, clip hair (do not shave) in and around treatment area to promote patch adherence. Cut patch to size and shape of treatment area. Gently wash area with mild soap and water and dry thoroughly. Apply topical anesthetic to the entire treatment area and surrounding 1–2 cm and keep the local anesthetic in place until skin is anesthetized prior to the application of patch. Remove the topical anesthetic with a dry wipe. Gently wash treatment area with mild soap and water and dry. Administer in a well-ventilated area. Use a face mask and protective glasses during administration. Use only nitrile gloves when handling capsaicin and cleaning capsaicin residue from skin; latex gloves do not provide adequate protection. Apply patch to dry, intact skin. Apply patch within 2 hr of opening pouch. Tear pouch open along the three dashed lines and remove patch. Inspect patch and identify the outer surface backing layer with the printing on one side and the capsaicin-containing adhesive on the other side. Adhesive side of the patch is covered by a clear, unprinted, diagonally cut release liner. Cut patch before removing protective release liner. Peel a small section of the release liner back and place adhesive side of patch on treatment area. While slowly peeling back release liner from under patch with one hand, use other hand to smooth the patch down on to skin. Once patch is applied, leave in place for 60 min for postherpetic neuralgia and for 30 min for diabetic peripheral neuropathy. To ensure patch maintains contact with treatment area, a dressing, such as rolled gauze, may be used. Instruct the patient not to touch the patch or treatment area.
- Even following use of a local anesthetic prior to administration of capsaicin, patients may experience substantial procedural pain. Treat acute pain during and following application with local cooling (ice pack) and/or appropriate analgesic medication.
- Remove patches by gently and slowly rolling inward. After removal, generously apply *Cleansing Gel* to treatment area and leave on for at least 1 min. Remove *Cleansing Gel* with a dry wipe and gently wash area with mild soap and water and dry thoroughly. Aerosolization of capsaicin can occur upon rapid removal of patches. Remove patches gently and slowly by rolling adhesive side inward. If irritation of eyes or airways occurs, remove affected individual from the vicinity. Flush eyes and mucous membranes with cool water. Inhalation of airborne capsaicin can result in coughing or sneezing. Provide supportive care if shortness of breath develops. If skin not intended to be treated comes in contact with capsaicin, apply *Cleansing Gel* for 1 min and wipe off with dry gauze. After *Cleansing Gel* has been wiped off, wash area with soap and water.

Patient/Family Teaching

- **Topical:** Instruct patient on the correct method for application of capsaicin. Rub cream into affected area well so that little or no cream is left on the surface. Gloves should be worn during application or hands should be washed immediately after application. If application is to hands for arthritis, do not wash hands for at least 30 min after application.
- Advise patient to apply missed doses as soon as possible unless almost time for next dose. Pain relief lasts only as long as capsaicin is used regularly.
- Advise patient that transient burning may occur with application, especially if applied fewer than 3–4 times daily. Burning usually disappears after the first few days but may continue for 2–4 wk or longer. Burning is increased by heat, sweating, bathing in warm water, humidity, and clothing. Burning usually decreases in frequency and intensity the longer capsaicin is used. Decreasing number of daily doses will not lessen burning but may decrease amount of pain relief and may prolong period of burning.
- Caution patient to flush area with water if capsaicin gets into eyes and to wash with warm, but not hot, soapy water if capsaicin gets on other sensitive areas of the body.
- Instruct patient with herpes zoster (shingles) not to apply capsaicin cream until lesions have healed completely.

© F.A. Davis Publishing

- Advise patient to discontinue use and notify health care professional if pain persists longer than 1 mo, worsens, or if signs of infection are present.
- **Transdermal:** Inform patient that treated area may be sensitive for a few days to heat (e.g., hot showers or baths, direct sunlight, vigorous exercise).
- Advise patient that exposure of skin to capsaicin may result in transient erythema and burning sensation. Instruct patients not to touch patch and if they accidentally touch patch it may burn and/or sting.
- Instruct patient to notify health care professional immediately if irritation of eyes or airways occurs, or if any of the side effects become severe.
- If opioids are used to treat pain from patch, caution patient that opioids may cause drowsiness and to avoid driving or other activities requiring alertness until response to medication is known.
- May cause transient increases in BP. Instruct patients to inform health care professional if they have experienced any recent cardiovascular event.
- Rep: Advise females of reproductive potential to notify health care professional if pregnancy is planned or suspected or if breast feeding. Advise breast feeding patient to avoid application to nipple and areola.

Evaluation/Desired Outcomes

- Decrease in discomfort associated with:
- Postherpetic neuropathy.
- Diabetic peripheral neuropathy.
- Rheumatoid arthritis.
- Osteoarthritis. Pain relief usually begins within 1–2 wk with arthritis, 2–4 wk with neuralgias, and 4–6 wk with neuralgias of the head and neck.

captopril, See ANGIOTENSIN-CONVERTING ENZYME (ACE) INHIBITORS.

carBAMazepine

(kar-ba-**maz**-e-peen)

Carbatrol, Epitol, Equetro, Mazepine, TEGretol, TEGretol CR, TEGretol XR, Teril

Classification

Therapeutic: anticonvulsants, mood stabilizers

Indications

Treatment of tonic-clonic, mixed, and complex-partial seizures. Management of pain in trigeminal neuralgia. **Equetro only:** Acute manic or mixed episodes associated with bipolar I disorder. **Unlabeled Use:** Other forms of neurogenic pain.

Action

Decreases synaptic transmission in the CNS by affecting sodium channels in neurons. **Therapeutic Effects:** Prevention of seizures. Relief of pain in trigeminal neuralgia. Decreased mania.

Pharmacokinetics

Absorption: Absorption is slow but complete. Suspension produces earlier, higher peak, and lower trough levels.

Distribution: Widely distributed. Crosses the blood-brain barrier. Crosses the placenta rapidly and enters breast milk in high concentrations.

Protein Binding: *Carbamazepine*—75–90%; *epoxide*—50%.

Metabolism and Excretion: Extensively metabolized in the liver by cytochrome P450 3A4 to active epoxide metabolite; epoxide metabolite has anticonvulsant and antineuralgic activity.

Half-life: *Carbamazapine*—single dose—25–65 hr, chronic dosing—*Children*—8–14 hr; *Adults*—12–17 hr; *epoxide*—3⅓±9 hr.

TIME/ACTION PROFILE (anticonvulsant activity)

ROUTE	ONSET	PEAK	DURATION
PO	up to 1 mo†	4–5 hr‡	6–12 hr
PO-ER	up to 1 mo†	2–3–12 hr‡	12 hr

†Onset of antineuralgic activity is 8–72 hr.
‡Listed for tablets; peak level occurs 1.5 hr after a chronic dose of suspension.

Contraindications/Precautions

Contraindicated in: Hypersensitivity to carbamazepine or tricyclic antidepressants; Bone marrow suppression; Concomitant use or use within 14 days of MAO inhibitors; Concurrent use of nefazodone or NNRTIs that are CYP3A4 substrates; Lactation: Lactation.

Use Cautiously in: All patients (may ↑ risk of suicidal thoughts/behaviors); Cardiac or hepatic disease; Renal failure (dosing adjustment required for CCr <10 mL/min); ↑ intraocular pressure; OB: Use during pregnancy only if potential maternal benefits outweigh potential fetal risks; additional vitamin K during last wk of pregnancy has been recommended; Geri: Older men with prostatic hyperplasia may be at ↑ risk for acute urinary retention or difficulty initiating stream.

Exercise Extreme Caution in: Patients positive for HLA-B*1502 or HLA-A*3101 alleles (unless benefits clearly outweigh the risks) (↑ risk of serious skin reactions).

Adverse Reactions/Side Effects

CV: HF, edema, heart block, hypertension, hypotension, syncope. **Derm:** DRUG REACTION WITH EOSINOPHILIA AND SYSTEMIC SYMPTOMS (DRESS), STEVENS-JOHN-

© F.A. Davis Publishing

SON SYNDROME, TOXIC EPIDERMAL NECROLYSIS, nail shedding, photosensitivity, rash, urticaria. **EENT:** blurred vision, corneal opacities, nystagmus. **F and E:** syndrome of inappropriate antidiuretic hormone (SIADH), hyponatremia. **GI:** HEPATOTOXICITY, PANCREATITIS, ↑ liver enzymes, weight gain. **GU:** hesitancy, urinary retention. **Hemat:** AGRANULOCYTOSIS, APLASTIC ANEMIA, THROMBOCYTOPENIA, eosinophilia, leukopenia, lymphadenopathy. **Neuro:** SUICIDAL THOUGHTS, ataxia, drowsiness, fatigue, psychosis, sedation, vertigo. **Resp:** pneumonitis. **Misc:** chills, fever.

Interactions

Drug-Drug: May significantly ↓ levels of **nefazodone** or **NNRTIs** that are CYP3A4 substrates; concurrent use contraindicated. Concurrent or recent (within 2 wk) use of **MAO inhibitors** may result in hyperpyrexia, hypertension, seizures, and death; use contraindicated. May ↓ levels/effectiveness of **acetaminophen**, **alprazolam**, **aprepitant**, **buprenorphine**, **bupropion**, **calcium channel blockers**, **citalopram**, **clonazepam**, **corticosteroids**, **cyclosporine**, **doxycycline**, **estrogen-containing contraceptives**, **everolimus**, **haloperidol**, **imatinib**, **itraconazole**, **lamotrigine**, **levothyroxine**, **methadone**. **midazolam**, **olanzapine**, **paliperidone**, **phenytoin**, **protease inhibitors**, **risperidone**, **sertraline**, **sirolimus**, **tacrolimus**, **tadalafil**, **theophylline**, **tiagabine**, **topiramate**, **tramadol**, **trazodone**, **tricyclic antidepressants**, **valproic acid**, **warfarin**, **ziprasidone**, and **zonisamide**. May ↓ **aripiprazole** levels; double the aripiprazole dose. May ↓ **temsirolimus** and **lapatinib** levels; avoid concurrent use. **Aprepitant**, **cimetidine**, **ciprofloxacin**, **clarithromycin**, **danazol**, **dantrolene**, **diltiazem**, **erythromycin**, **fluconazole**, **fluoxetine**, **fluvoxamine**, **isoniazid**, **itraconazole**, **ketoconazole**, **loratadine**, **olanzapine**, **omeprazole**, **oxybutynin**, **protease inhibitors**, **trazodone**, **voriconazole**, and **verapamil** may ↑ carbamazepine levels; may ↑ risk of toxicity. Enzyme inducers such as **rifampin**, **phenobarbital**, and **phenytoin** may ↓ levels. May ↑ risk of hepatotoxicity from **isoniazid**. May ↑ risk of CNS toxicity from **lithium**. May ↓ effects of **nondepolarizing neuromuscular blocking agents**. May ↑ risk of toxicity from **cyclophosphamide**.

Drug-Food: **Grapefruit juice** ↑ serum levels and oral bioavailability by 40% and therefore may ↑ effects.

Route/Dosage

When converting from immediate-release to extended-release formulation, administer same total daily dose (in 2 divided doses).

Seizures

PO (Adults and Children >12 yr): 200 mg twice daily (immediate-release [IR] tablets and extended-release [ER] tablets/capsules) or 100 mg 4 times daily (suspension); ↑ by up to 200 mg/day in divided doses (every 12 hr for ER tablets; every 6–8 hr for IR tablets and suspension) every 7 days until therapeutic levels are achieved (usual range = 600–1200 mg/day); not to exceed 1000 mg/day in children 12–15 yrs old or 1200 mg/day in children 15–18 yrs old or 1600 mg/day in adults.

PO (Children 6–12 yr): 100 mg twice daily (IR tablets or ER tablets/capsules) or 50 mg 4 times daily (suspension). ↑ by up to 100 mg/day in divided doses (every 12 hr for ER tablets; every 6–8 hr for IR tablets and suspension) every 7 days until therapeutic levels are achieved (usual range = 400–800 mg/day); not to exceed 1000 mg/day.

PO (Children <6 yr): 10–20 mg/kg/day in 2–3 divided doses (IR tablets) or in 4 divided doses (suspension); may be ↑ at weekly intervals until optimal response and therapeutic levels are achieved; not to exceed 35 mg/kg/day.

Trigeminal Neuralgia

PO (Adults): 100 mg twice daily (IR or ER tablets), 200 mg once daily (ER capsules), or 50 mg 4 times daily (suspension); ↑ by up to 200 mg/day in divided doses (every 12 hr for IR tablets or ER tablets/capsules; every 6 hr for suspension) as needed until pain is relieved (usual range = 400–800 mg/day); not to exceed 1200 mg/day.

Acute Manic or Mixed Episodes Associated with Bipolar I Disorder

PO (Adults): *Equetro*—200 mg twice daily; ↑ by 200 mg/day until optimal response is achieved; not to exceed 1600 mg/day.

Availability (generic available)

Chewable tablets: 100 mg, 200 mg. **Cost:** *Generic*—$23.11/100. **Extended-release capsules (Carbatrol, Equetro):** 100 mg, 200 mg, 300 mg. **Cost:** *Generic*—All strengths $214.48/60. **Extended-release tablets (Tegretol XR):** 100 mg, 200 mg, 400 mg. **Cost:** *Generic*—200 mg $113.31/100, 400 mg $224.76/100. **Oral suspension (citrus-vanilla flavor):** 100 mg/5 mL. **Tablets:** 200 mg. **Cost:** *Generic*—$7.18/100.

NURSING IMPLICATIONS

Assessment

- Monitor closely for changes in behavior that could indicate the emergence or worsening of suicidal thoughts or behavior or depression.
- Monitor for changes in skin condition in early therapy. Stevens-Johnson syndrome and toxic epidermal necrolysis are significantly more common in patients with a particular human leukocyte antigen (HLA) allele, HLA-B*1502 (occurs almost exclusively in patients with Asian ancestry, including South Asian Indians). Screen patients of Asian ancestry for the HLA-B*1502 allele before starting treatment with carbamazepine. If positive, carbamazepine should not be started unless the expected benefit outweighs increased risk of serious skin reactions. Patients

© F.A. Davis Publishing

who have been taking carbamazepine for more than a few mo without developing skin reactions are at low risk of these events ever developing.
- Monitor for signs and symptoms of DRESS syndrome (fever, rash, and/or lymphadenopathy with organ system involvement, [hepatitis, nephritis, hematologic abnormalities, myocarditis, myositis]) resembling an acute viral infection with eosinophilia. Discontinue carbamazepine if other cause not determined.
- **Seizures:** Assess frequency, location, duration, and characteristics of seizure activity.
- **Trigeminal Neuralgia:** Assess for facial pain (location, intensity, duration). Ask patient to identify stimuli that may precipitate facial pain (hot or cold foods, bedclothes, touching face).
- **Bipolar Disorder:** Assess mental status (mood, orientation, behavior) and cognitive abilities before and periodically during therapy.
- ***Lab Test Considerations:*** Monitor CBC, including platelet count, reticulocyte count, and serum iron, at baseline, weekly during the first 2 mo, and yearly thereafter for evidence of potentially fatal blood cell abnormalities. Discontinue therapy if bone marrow depression occurs.
- Perform genetic testing for the HLA-B*1502 allele in patients of Asian ancestry prior to beginning therapy.
- Perform liver function tests, urinalysis, electrolytes, serum creatinine, and BUN at baseline and routinely performed. May cause ↑ AST, ALT, serum alkaline phosphatase, bilirubin, BUN, urine protein, and urine glucose levels.
- Monitor serum ionized calcium levels every 6 mo or if seizure frequency increases. Thyroid function tests and ionized serum calcium concentrations may be ↓ hypocalcemia ↓ seizure threshold.
- Monitor ECG and serum electrolytes before and periodically during therapy. May cause hyponatremia.
- May occasionally cause ↑ serum cholesterol, high-density lipoprotein, and triglyceride concentrations.
- May cause false-negative pregnancy test results with tests that determine human chorionic gonadotropin.
- ***Toxicity and Overdose:*** Serum blood levels should be routinely monitored during therapy. Therapeutic levels range from 4–12 mcg/mL.

Implementation

- Do not confuse carbamazepine with oxcarbazepine. Do not confuse Tegretol with Tegretol XR.
- Implement seizure precautions as indicated.
- **PO:** Administer medication with food to minimize gastric irritation. May take at bedtime to reduce daytime sedation. Tablets may be crushed if patient has difficulty swallowing. ***DNC:*** Do not crush or chew extended-release tablets.Extended-release capsules may be opened and the contents sprinkled on applesauce or other similar foods.
- Do not administer suspension simultaneously with other liquid medications or diluents; mixture produces an orange rubbery mass.

Patient/Family Teaching

- Instruct patient to take carbamazepine around the clock, as directed. Take missed doses as soon as possible but not just before next dose; do not double doses. Notify health care professional if more than one dose is missed. Discontinue gradually to prevent seizures. Instruct patient to read the *Medication Guide* before starting and with each Rx refill in case of changes.
- Advise patient to avoid grapefruit and grapefruit juice during therapy.
- May cause dizziness or drowsiness. Advise patients to avoid driving or other activities requiring alertness until response to medication is known.
- Advise patient to notify health care professional of all Rx or OTC medications, vitamins, or herbal products being taken and to consult with health care professional before taking other medications.
- Instruct patient to report behavioral changes, skin rash, fever, sore throat, mouth ulcers, easy bruising, petechiae, unusual bleeding, abdominal pain, chills, rash, pale stools, dark urine, or jaundice to health care professional immediately. Advise patient and family to notify health care professional if thoughts about suicide or dying, attempts to commit suicide; new or worse depression; new or worse anxiety; feeling very agitated or restless; panic attacks; trouble sleeping; new or worse irritability; acting aggressive; being angry or violent; acting on dangerous impulses; an extreme increase in activity and talking, other unusual changes in behavior or mood occur.
- Inform patient that coating of *Tegretol XR* is not absorbed, but is excreted in feces and may be visible in stool.
- Advise patient not to take alcohol or other CNS depressants concurrently with this medication.
- Caution patients to use sunscreen and protective clothing to prevent photosensitivity reactions.
- Inform patient that frequent mouth rinses, good oral hygiene, and sugarless gum or candy may help reduce dry mouth. Saliva substitute may be used. Consult dentist if dry mouth persists >2 wk.
- Instruct patient to notify health care professional of medication regimen before treatment or surgery.
- Rep: May be teratogenic. Advise females of reproductive potential to use a nonhormonal form of contraception while taking carbamazepine, to avoid breast feeding during therapy, and to notify health care professional if pregnancy is planned or suspected or if breast feeding. May reduce effects of estrogen-containing contraceptives. Encourage patients who become pregnant to enroll in the North

© F.A. Davis Publishing

American Antiepileptic Drug (NAAED) Pregnancy Registry by calling 1-888-233-2334 or on the web at www.aedpregnancyregistry.org. Enrollment must be done by patients themselves.
- Emphasize the importance of follow-up lab tests and eye exams to monitor for side effects.
- **Seizures:** Advise patients to carry identification describing disease and medication regimen at all times.

Evaluation/Desired Outcomes
- Absence or reduction of seizure activity.
- Decrease in trigeminal neuralgia pain. Patients with trigeminal neuralgia who are pain-free should be re-evaluated every 3 mo to determine minimum effective dose.
- Decreased mania and depressive symptoms in bipolar I disorder.

carbidopa/levodopa
(**kar**-bi-doe-pa/**lee**-voe-doe-pa)
Duopa, Duodopa, Rytary, Sinemet, ~~Sinemet CR~~

Classification
Therapeutic: antiparkinson agents
Pharmacologic: dopamine agonists

Indications
Parkinson's disease. Not useful for drug-induced extrapyramidal reactions.

Action
Levodopa is converted to dopamine in the CNS, where it serves as a neurotransmitter. Carbidopa, a decarboxylase inhibitor, prevents peripheral destruction of levodopa. **Therapeutic Effects:** Relief of tremor and rigidity in Parkinson's syndrome.

Pharmacokinetics
Absorption: Well absorbed following oral administration.
Distribution: Widely distributed. *Levodopa*—enters the CNS in small concentrations. *Carbidopa*—does not cross the blood-brain barrier but does cross the placenta. Both enter breast milk.
Metabolism and Excretion: *Levodopa*—mostly metabolized by the GI tract and liver. *Carbidopa*—30% excreted unchanged by the kidneys.
Half-life: *Levodopa*—1 hr; *carbidopa*—1–2 hr.

TIME/ACTION PROFILE (antiparkinson effects)

ROUTE	ONSET	PEAK	DURATION
Carbidopa	unknown	unknown	5–24 hr
Levodopa	10–15 min	unknown	5–24 hr or more
Carbidopa/levodopa sustained release	unknown	2 hr	12 hr

Contraindications/Precautions
Contraindicated in: Hypersensitivity; Angle-closure glaucoma; Nonselective MAO inhibitor therapy; Malignant melanoma; Undiagnosed skin lesions; Some products contain tartrazine, phenylalanine, or aspartame and should be avoided in patients with known hypersensitivity.
Use Cautiously in: History of cardiac, psychiatric, or ulcer disease; OB, Pedi: Safety not established; Lactation: May ↓ serum prolactin; levodopa enters breast milk; use while breast feeding only if potential maternal benefit justifies potential risk to infant.

Adverse Reactions/Side Effects
CV: orthostatic hypotension. **EENT:** blurred vision, mydriasis. **GI:** GI HEMORRHAGE (enteral suspension), GI ISCHEMIA (enteral suspension), GI OBSTRUCTION (enteral suspension), GI PERFORATION (enteral suspension), HEPATOTOXICITY, INTUSSUSCEPTION (enteral suspension), PANCREATITIS (enteral suspension), PERITONITIS (enteral suspension), constipation, nausea, vomiting, anorexia, bezoar (enteral suspension), dry mouth. **Derm:** melanoma. **Hemat:** hemolytic anemia, leukopenia. **MS:** dyskinesias. **Neuro:** depression, involuntary movements, anxiety, confusion, dizziness, drowsiness, hallucinations, memory loss, psychiatric problems, sudden sleep onset, urges (gambling, sexual), neuropathy. **Resp:** aspiration pneumonia (enteral suspension). **Misc:** MELANOMA, SEPSIS (enteral suspension), darkening of urine or sweat.

Interactions
Drug-Drug: Use with **nonselective MAO inhibitors** may result in hypertensive reactions; concurrent use contraindicated (MAO inhibitor must be discontinued ≥2 wk before initiating carbidopa/levodopa). ↑ risk of arrhythmias with **inhalation hydrocarbon anesthetics** (especially **halothane**; if possible discontinue 6–8 hr before anesthesia). **Phenothiazines**, **haloperidol**, **papaverine**, and **phenytoin** may ↓ effect of levodopa. Large doses of **pyridoxine** may ↓ beneficial effects of levodopa. Concurrent use with **methyldopa** may alter the effectiveness of levodopa and ↑ risk of CNS side effects. ↑ hypotension may result with concurrent **antihypertensives**. **Anticholinergics** may ↓ absorption of levodopa. ↑ risk of adverse reactions with **selegiline** or **cocaine**.
Drug-Natural Products: **Kava-kava** may ↓ levodopa effectiveness.
Drug-Food: Ingestion of foods containing large amounts of **pyridoxine** may ↓ effect of levodopa.

Route/Dosage

Carbidopa/Levodopa
PO (Adults): 25 mg carbidopa/100 mg levodopa 3 times daily; may be ↑ every 1–2 days until desired effect is achieved (max = 8 tablets of 25 mg carbidopa/100 mg levodopa/day).

© F.A. Davis Publishing

Enteral (Adults): Patients must be converted to and be on stable dose of PO immediate-release carbidopa/levodopa tablets before initiation of enteral suspension therapy. *Morning dose for Day 1 (mL) (to be administered over 10–30 min)* = (Amount of levodopa [in mg] in first dose of immediate-release carbidopa/levodopa taken by patient on previous day * 0.8); *Continuous dose for Day 1 (mL) (to be administered over 16 hr)* = Determine amount of levodopa (in mg) patient received from immediate-release carbidopa/levodopa doses throughout 16 waking hrs of previous day (do not include doses of immediate-release carbidopa/levodopa taken at night when calculating the levodopa amount). Then, subtract amount of first levodopa dose (in mg) taken by patient on previous day. Divide result by 20 to obtain the # of mL to be administered over 16 hr. Do not exceed dose of 2000 mg. At end of daily 16-hr infusion, patients will disconnect the pump from feeding tube and take their nighttime dose of oral immediate-release carbidopa/levodopa tablets. Total daily dose can be titrated after Day 1 based on patient response and tolerability.

Carbidopa/Levodopa Extended-Release (doses of all other dosage forms of carbidopa/levodopa and Rytary are not interchangeable)

PO (Adults): *Patients not currently receiving levodopa (Sinemet CR)* — 50 mg carbidopa/200 mg levodopa twice daily (minimum of 6 hr apart) initially. *Patients not currently receiving levodopa (Rytary)* — 23.75 mg carbidopa/95 mg levodopa 3 times daily × 3 days, then 36.25 mg carbidopa/145 mg levodopa 3 times daily. May continue to ↑ dose as needed (max dose = 97.5 mg carbidopa/390 mg levodopa 3 times daily). May also ↑ frequency of administration up to 5 times daily (max dose = 612.5 mg carbidopa/2450 mg levodopa/day). *Conversion from immediate-release (IR) carbidopa/levodopa to Sinemet CR* — initiate therapy with at least 10% more levodopa content/day (may need up to 30% more) given at 4–8 hr intervals while awake. Allow 3 days between dosage changes; some patients may require larger doses and shorter dosing intervals. *Conversion from IR carbidopa/levodopa to Rytary* — If taking 400–549 mg/day of IR levodopa, give 3 capsules of Rytary 23.75 mg carbidopa/95 mg levodopa 3 times daily. If taking 550–749 mg/day of IR levodopa, give 4 capsules of Rytary 23.75 mg carbidopa/95 mg levodopa 3 times daily. If taking 750–949 mg/day of IR levodopa, give 3 capsules of Rytary 36.25 mg carbidopa/145 mg levodopa 3 times daily. If taking 950–1249 mg/day of IR levodopa, give 3 capsules of Rytary 48.75 mg carbidopa/195 mg levodopa 3 times daily. If taking ≥1250 mg/day of IR levodopa, give 4 capsules of Rytary 48.75 mg carbidopa/195 mg levodopa 3 times daily or 3 capsules of Rytary 61.25 mg carbidopa/245 mg levodopa 3 times daily; may then titrate as needed (max daily dose = 612.5 mg carbidopa/2450 mg levodopa).

Availability (generic available)

Enteral suspension (Duopa): carbidopa 4.63 mg/levodopa 20 mg/mL, carbidopa 5 mg/levodopa 20 mg/mL. **Extended-release capsules (Rytary):** carbidopa 23.75 mg/levodopa 95 mg, carbidopa 36.25 mg/levodopa 145 mg, carbidopa 48.75 mg/levodopa 195 mg, carbidopa 61.25 mg/levodopa 245 mg. **Extended-release tablets:** carbidopa 25 mg/levodopa 100 mg, carbidopa 50 mg/levodopa 200 mg. **Cost:** *Generic* — 25 mg/100 mg $93.90/100, 50 mg/200 mg $180.50/100. **Immediate-release tablets:** carbidopa 10 mg/levodopa 100 mg, carbidopa 25 mg/levodopa 100 mg, carbidopa 25 mg/levodopa 250 mg. **Cost:** *Generic* — 10 mg/100 mg $25.28/100, 25 mg/100 mg $28.91/100, 25 mg/250 mg $19.22/100. **Orally disintegrating tablets (mint):** carbidopa 10 mg/levodopa 100 mg, carbidopa 25 mg/levodopa 100 mg, carbidopa 25 mg/levodopa 250 mg. **Cost:** *Generic* — 10 mg/100 mg $121.48/100, 25 mg/100 mg $137.18/100, 25 mg/250 mg $174.76/100. ***In combination with:*** entacapone (Stalevo); see Appendix N.

NURSING IMPLICATIONS

Assessment

- Assess parkinsonian symptoms (akinesia, rigidity, tremors, pill rolling, shuffling gait, mask-like face, twisting motions, and drooling) during therapy. "On-off phenomenon" may cause symptoms to appear or improve suddenly.
- Assess BP and pulse frequently during period of dose adjustment.
- **Duopa:** Monitor for signs and symptoms of GI complications (abdominal pain, prolonged constipation, nausea, vomiting, fever, melanotic stool) during therapy.
- ***Lab Test Considerations:*** May cause false-positive test results in Coombs' test.
- May cause ↑ serum glucose. Dipstick for urine ketones may reveal false-positive results.
- Monitor hepatic and renal function and CBC periodically in patients on long-term therapy. May cause ↑ AST, ALT, bilirubin, alkaline phosphatase, LDH, and serum protein-bound iodine concentrations.
- May cause ↓ hemoglobin, ↓ hematocrit, agranulocytosis, hemolytic and nonhemolytic anemia, thrombocytopenia, leukopenia, and ↑ WBC.
- ***Toxicity and Overdose:*** Assess for signs of toxicity (involuntary muscle twitching, facial grimacing, spasmodic eye winking, exaggerated protrusion of tongue, behavioral changes). Consult health care professional if symptoms occur.

© F.A. Davis Publishing

Implementation

- Do not confuse Sinemet with Janumet.
- In the carbidopa/levodopa combination, the number following the drug name represents the milligrams of each respective drug.
- In preoperative patients or patients who are NPO, confer with health care professional about continuing medication administration using oral disintegrating tablets.
- **PO:** Administer on a regular schedule. Hospitalized patients should be continued on same schedule as at home. Administer while awake, not around the clock to improve sleep and prevent side effects.
- ***DNC:*** Controlled-release tablets may be administered as whole or half tablets, but they should not be crushed or chewed.
- For *orally disintegrating tablets,* just prior to administration remove tablet from bottle with dry hands. Immediately place tablet on top of tongue. Tablet will dissolve in seconds, then swallow with saliva. Administration with liquid is not necessary.
- *For enteral administration,* administer *Duopa* into the jejunum through a percutaneous endoscopic gastrostomy with jejunal tube (PEG-J) with CADD-Legacy 1400 portable infusion pump. Take suspension out of refrigerator 20 min prior to use; must be at room temperature for use. Administer over 16 hr. If extra dose is needed, set function at 1 mL (20 mg of levodopa) when starting; may be adjusted in 0.2 mL increments. Limit to 1 extra dose every 2 hr. Frequent extra doses may cause or worsen dyskinesias. Discontinue gradually; do not stop abruptly.
- *For extended-release capsules,* administer without regard to food. . ***DNC:*** Swallow capsules whole; do not chew, divide, or crush. For patients with difficulty swallowing, open capsule and sprinkle entire contents on 1–2 tablespoons of applesauce; consume immediately. Do not store mixture for future use. Inform patients that first dose of day may be taken 1–2 hr before eating, as a high fat, high calorie meal may delay the absorption of levodopa and onset of action by 2–3 hr. Discontinue gradually; do not stop abruptly. When adjusting dose of extended-release capsules, keep dose of other Parkinson's medications stable; dose may need to be increased in patients taking COMT inhibitor. Extended-release capsules may be administered 3–5 times daily if more frequent dosing is needed and tolerated.

Patient/Family Teaching

- Instruct patient to take medication at regular intervals as directed. Do not change dose regimen or take additional antiparkinson drugs, including more carbidopa/levodopa, without consulting health care professional. Take missed doses as soon as remembered, unless next scheduled dose is within 2 hr; do not double doses.
- Explain that gastric irritation may be decreased by eating food shortly after taking medications but that high-protein meals may impair levodopa's effects. Dividing daily protein intake among all the meals may help ensure adequate protein intake and drug effectiveness. Do not drastically alter diet during carbidopa/levodopa therapy without consulting health care professional.
- May cause sudden onset of sleep, drowsiness, or dizziness. Advise patient to avoid driving and other activities that require alertness until response to drug is known.
- Caution patient to change positions slowly to minimize orthostatic hypotension. Notify health care professional if orthostatic hypotension occurs.
- Instruct patient that frequent rinsing of mouth, good oral hygiene, and sugarless gum or candy may decrease dry mouth.
- Caution patient to monitor skin lesions for any changes. Notify health care professional promptly because carbidopa/levodopa may activate malignant melanoma.
- Advise patient to notify health care professional of all Rx or OTC medications, vitamins, or herbal products being taken and to consult with health care professional before taking other medications, especially cold remedies. Large amounts of vitamin B_6 (pyridoxine) and iron may interfere with the action of levodopa.
- Inform patient that harmless darkening of saliva, urine, or sweat may occur.
- Advise patient to notify health care professional if signs and symptoms of GI complications, palpitations, urinary retention, involuntary movements, behavioral changes, severe nausea and vomiting, new skin lesions, or new or increased gambling, sexual, binge or compulsive eating, or other intense urges occur. Dose reduction may be required.
- Inform patient that sometimes a "wearing-off" effect may occur at end of dosing interval. Notify health care professional if this poses a problem to lifestyle.
- Rep: Advise female patients to notify health care professional if pregnancy is planned or suspected or if breast feeding. May inhibit lactation.

Evaluation/Desired Outcomes

- Resolution of parkinsonian signs and symptoms. Therapeutic effects usually become evident after 2–3 wk of therapy but may require up to 6 mo. Patients who take this medication for several yr may experience a decrease in the effectiveness of this drug.

carbonyl iron, See IRON SUPPLEMENTS.

© F.A. Davis Publishing

HIGH ALERT

CARBOplatin (kar-boe-pla-tin)

~~Paraplatin~~

Classification

Therapeutic: antineoplastics
Pharmacologic: alkylating agents

Indications

Advanced ovarian carcinoma (with other agents). Palliative treatment of ovarian carcinoma unresponsive to other modalities.

Action

Inhibits DNA synthesis by producing cross-linking of parent DNA strands (cell-cycle phase–nonspecific).
Therapeutic Effects: Death of rapidly replicating cells, particularly malignant ones.

Pharmacokinetics

Absorption: IV administration results in complete bioavailability.
Distribution: Unknown.
Protein Binding: Platinum is irreversibly bound to plasma proteins.
Metabolism and Excretion: Excreted mostly by the kidneys.
Half-life: *Carboplatin*—2.6–5.9 hr (increased in renal impairment); *platinum*—5 days.

TIME/ACTION PROFILE (effects on blood counts)

ROUTE	ONSET	PEAK	DURATION
IV	unknown	21 days	28 days

Contraindications/Precautions

Contraindicated in: Hypersensitivity to carboplatin, cisplatin, or mannitol; OB, Lactation: Pregnancy or lactation.
Use Cautiously in: Hearing loss; Electrolyte abnormalities; Renal impairment (dose ↓ recommended if CCr <60 mL/min); Active infections; Diminished bone marrow reserve (dose ↓ recommended); Other chronic debilitating illnesses; Geri: ↑ risk of thrombocytopenia, consider renal function in dose determination; Patients with childbearing potential; Pedi: Safety not established.

Adverse Reactions/Side Effects

EENT: ototoxicity. **GI:** abdominal pain, nausea, vomiting, constipation, diarrhea, hepatitis, stomatitis. **GU:** gonadal suppression, nephrotoxicity. **Derm:** alopecia, rash. **F and E:** hypocalcemia, hypokalemia, hypomagnesemia, hyponatremia. **Hemat:** ANEMIA, LEUKOPENIA, THROMBOCYTOPENIA. **Metab:** hyperuricemia. **Neuro:** peripheral neuropathy, weakness. **Misc:** hypersensitivity reactions including ANAPHYLACTIC-LIKE REACTIONS.

Interactions

Drug-Drug: ↑ nephrotoxicity and ototoxicity with other **nephrotoxic** and **ototoxic drugs (aminoglycosides, loop diuretics)**. ↑ bone marrow depression with other **bone marrow–depressing drugs** or **radiation therapy**. May ↓ antibody response to **live-virus vaccines** and ↑ risk of adverse reactions.

Route/Dosage

Other dosing formulas are used.
IV (Adults): *Initial treatment*—300 mg/m² with cyclophosphamide at 4-wk intervals. *Treatment of refractory tumors*—360 mg/m² as a single dose; may be repeated at 4-wk intervals, depending on response.

Renal Impairment

IV (Adults): *CCr 41–59 mL/min*—initial dose 250 mg/m²; *CCr 16–40 mL/min*—initial dose 200 mg/m².

Availability (generic available)

Solution for injection: 10 mg/mL.

NURSING IMPLICATIONS

Assessment

- Assess for nausea and vomiting; often occur 6–12 hr after therapy (1–4 hr for aqueous solution) and may persist for 24 hr. Prophylactic antiemetics may be used. Adjust diet as tolerated to maintain fluid and electrolyte balance and ensure adequate nutritional intake. May require discontinuation of therapy.
- Monitor for bone marrow depression. Assess for bleeding (bleeding gums, bruising, petechiae, guaiac stools, urine, and emesis) and avoid IM injections and rectal temperatures if platelet count is low. Apply pressure to venipuncture sites for 10 min. Assess for signs of infection during neutropenia. Anemia may occur and may be cumulative; transfusions are frequently required. Monitor for increased fatigue, dyspnea, and orthostatic hypotension.
- Monitor for signs of anaphylaxis (rash, urticaria, pruritus, facial swelling, wheezing, tachycardia, hypotension). Discontinue medication immediately and notify physician if these occur. Epinephrine and resuscitation equipment should be readily available.
- Audiometry is recommended before initiation of therapy and subsequent doses. Ototoxicity manifests as tinnitus and unilateral or bilateral hearing loss in high frequencies and becomes more frequent and severe with repeated doses. Ototoxicity is more pronounced in children.
- ***Lab Test Considerations:*** Monitor CBC, differential, and clotting studies before and weekly during therapy. The nadirs of thrombocytopenia and leukopenia occur after 21 days and recover by 30 days after a dose. Nadir of granulocyte counts usually occurs after 21–28 days and recovers by day 35. Withhold subsequent doses until neutrophil count is >2000/mm³ and platelet count is >100,000/mm³.

© F.A. Davis Publishing

- Monitor renal function and serum electrolytes before initiation of therapy and before each course of carboplatin.
- Monitor hepatic function before and periodically during therapy. May cause ↑ serum bilirubin, alkaline phosphatase, and AST concentrations.

Implementation

- ***High Alert:*** Fatalities have occurred with chemotherapeutic agents. Before administering, clarify all ambiguous orders; double-check single, daily, and course-of-therapy dose limits; have second practitioner independently double-check original order, calculations, and infusion pump settings.
- ***High Alert:*** Do not confuse carboplatin with cisplatin.
- ***High Alert:*** Carboplatin should be administered in a monitored setting under the supervision of a physician experienced in cancer chemotherapy.

IV Administration

- Solution should be prepared in a biologic cabinet. Wear gloves, gown, and mask while handling medication. Discard equipment in specially designated containers.
- Do not use aluminum needles or equipment during preparation or administration; aluminum reacts with the drug.
- **Intermittent Infusion:** ***Concentration:*** 0.5 mg/mL. Stable for 8 hr at room temperature. ***Rate:*** Infuse over 15–60 min.
- **Y-Site Compatibility:** acyclovir, alemtuzumab, alfentanil, allopurinol, amifostine, amikacin, aminocaproic acid, aminophylline, amiodarone, amphotericin B deoxycholate, amphotericin B lipid complex, amphotericin B liposome, ampicillin, ampicillin/sulbactam, anidulafungin, argatroban, atracurium, azithromycin, aztreonam, bivalirudin, bleomycin, bumetanide, buprenorphine, butorphanol, calcium chloride, calcium gluconate, caspofungin, cefazolin, cefepime, cefotaxime, cefotetan, cefoxitin, ceftazidime, ceftriaxone, cefuroxime, ciprofloxacin, cisatracurium, cisplatin, cladribine, clindamycin, cyclophosphamide, cyclosporine, cytarabine, dacarbazine, daptomycin, dexamethasone, dexmedetomidine, dexrazoxane, digoxin, diltiazem, diphenhydramine, docetaxel, dopamine, doxacurium, doxorubicin hydrochloride, doxycycline, droperidol, enalaprilat, ephedrine, ertapenem, erythromycin, esmolol, etoposide, etoposide phosphate, famotidine, fenoldopam, fentanyl, filgrastim, fluconazole, fludarabine, fluorouracil, foscarnet, fosphenytoin, furosemide, ganciclovir, gemcitabine, gentamicin, glycopyrrolate, granisetron, haloperidol, heparin, hetastarch, hydrocortisone, hydromorphone, idarubicin, ifosfamide, imipenem/cilastatin, insulin, isoproterenol, ketorolac, labetalol, levofloxacin, lidocaine, linezolid, lorazepam, magnesium sulfate, mannitol, melphalan, meperidine, meropenem, mesna, metaraminol, methotrexate, methyldopate, methylprednisolone, metoclopramide, metoprolol, metronidazole, micafungin, midazolam, milrinone, mitomycin, mitoxantrone, morphine, moxifloxacin, nafcillin, nalbuphine, naloxone, nicardipine, nitroglycerine, nitroprusside, norepinephrine, octreotide, ondansetron, oxaliplatin, paclitaxel, palonosetron, pamidronate, pancuronium, pantoprazole, pemetrexed, pentamidine, pentobarbital, phenobarbital, phenylephrine, piperacillin/tazobactam, potassium acetate, potassium chloride, potassium phosphates, prochlorperazine, promethazine, propofol, propranolol, quinupristin/dalfopristin, remifentanil, rituximab, rocuronium, sargramostim, sodium acetate, sodium bicarbonate, sodium phosphates, succinylcholine, sufentanil, tacrolimus, theophylline, thiotepa, tigecycline, tirofiban, tobramycin, trastuzumab, trimethoprim/sulfamethoxazole, vancomycin, vecuronium, verapamil, vinblastine, vincristine, vinorelbine, voriconazole, zidovudine, zoledronic acid.
- **Y-Site Incompatibility:** amphotericin B deoxycholate, chlorpromazine, diazepam, leucovorin calcium, phenytoin, procainamide, thiopental.

Patient/Family Teaching

- Instruct patient to notify health care professional promptly if fever; chills; sore throat; signs of infection; lower back or side pain; difficult or painful urination; bleeding gums; bruising; pinpoint red spots on skin; blood in stools, urine, or emesis; increased fatigue, dyspnea, or orthostatic hypotension occurs.
- Caution patient to avoid crowds and persons with known infections. Instruct patient to use soft toothbrush and electric razor and to avoid falls. Caution patients not to drink alcoholic beverages or take medication containing aspirin or NSAIDs because they may precipitate gastric bleeding.
- Instruct patient to promptly report any numbness or tingling in extremities or face, decreased coordination, difficulty with hearing or ringing in the ears, unusual swelling, or weight gain to health care professional.
- Instruct patient not to receive any vaccinations without advice of health care professional and to avoid contact with persons who have received oral polio vaccine within the past several mo.
- Advise patient of the need for contraception (if patient is not infertile as a result of surgical or radiation therapy).
- Instruct patient to inspect oral mucosa for erythema and ulceration. If ulceration occurs, advise patient to notify health care professional, rinse mouth with water after eating, and use sponge brush. Mouth pain may require treatment with opioids.
- Discuss with patient the possibility of hair loss. Explore methods of coping.
- Emphasize the need for periodic lab tests to monitor for side effects.

Evaluation/Desired Outcomes

- Decrease in size or spread of ovarian carcinoma.

© F.A. Davis Publishing

BEERS

cariprazine (kar-ip-ra-zeen)

Vraylar

Classification

Therapeutic: antipsychotics

Indications

Schizophrenia. Acute treatment of mania/mixed episodes associated with bipolar I disorder. Depressive episodes associated with bipolar I disorder.

Action

Acts as a partial agonist at dopamine D_2 receptors in the CNS and serotonin $5-HT_{1A}$; also acts an antagonist at $5-HT_{2A}$ receptors. **Therapeutic Effects:** Decreased incidence and severity of symptoms of schizophrenia. Decreased occurrence and severity of mania associated with bipolar 1 disorder.

Pharmacokinetics

Absorption: Well absorbed following oral administration.

Distribution: Unknown.

Protein Binding: 91–97%.

Metabolism and Excretion: Two metabolites, desmethyl cariprazine (DCAR) and didesmethyl cariprazine (DDCAR), have antipsychotic activity. Metabolism occurs mostly via the CYP3A4 enzyme system, with further metabolism resulting in inactive metabolites; 21% excreted urine, 1.2% as unchanged drug.

Half-life: Cariprazine—2–4 days; *DDCAR*—1–3 wk.

TIME/ACTION PROFILE (improvement in symptoms)

ROUTE	ONSET	PEAK	DURATION
PO (schizophrenia)	within 1–2 wk	4–6 wk	2 wk†
PO (mania due to bipolar 1 disorder)	within 5–7 days	2–3 wk	2 wk†

†Blood levels of drug and active metabolites following discontinuation.

Contraindications/Precautions

Contraindicated in: Hypersensitivity.

Use Cautiously in: Known cerebrovascular/cardiovascular disease, dehydration, concurrent use of diuretics/antihypertensives or syncope (↑ risk of orthostatic hypotension); Pre-existing ↓ WBC or ANC or history of drug-induced leukopenia/neutropenia; At risk of aspiration or falls; OB: Neonates exposed in the third trimester may experience extrapyramidal symptoms/withdrawal; Lactation: Use while breast feeding only if potential maternal benefit justifies potential risk to infant; Pedi: Safety and effectiveness not established; may ↑ risk of suicide attempt/ideation in children or adolescents; Geri: Elderly patients with dementia-related psychosis (↑ risk of adverse cardiovascular effects and death), consider age-related ↓ in renal/hepatic/cardiovascular function, concurrent disease states and medications (↓ initial dose recommended).

Adverse Reactions/Side Effects

CV: hypertension, orthostatic hypotension, tachycardia. **Derm:** STEVENS-JOHNSON SYNDROME, rash. **EENT:** blurred vision. **GI:** dyspepsia, nausea, ↓ appetite, constipation, diarrhea, dry mouth, dysphagia (↑ aspiration risk), ↑ liver enzymes, vomiting. **Hemat:** AGRANULOCYTOSIS, leukopenia, neutropenia. **Metab:** dyslipidemia, hyperglycemia/diabetes mellitus, weight gain. **MS:** arthralgia, back pain, extremity pain. **Neuro:** akathisia, extrapyramidal symptoms, tardive dyskinesia, SUICIDAL THOUGHTS/BEHAVIORS, drowsiness, headache, agitation, dizziness, fatigue, insomnia, restlessness.. **Resp:** cough. **Misc:** NEUROLEPTIC MALIGNANT SYNDROME, body temperature dysregulation.

Interactions

Drug-Drug: Levels, effects, and risk of toxicity ↑ by concurrent use of **strong CYP3A4 inhibitors** including **itraconazole** and **ketoconazole**; concurrent use not recommended. Levels and effectiveness may be ↓ by concurrent use of **strong CYP3A4 inducers** including **carbamazepine** and **rifampin**; concurrent use not recommended. Concurrent use of **diuretics** or **antihypertensives** may ↑ risk of orthostatic hypotension/syncope.

Route/Dosage

Schizophrenia or Acute Treatment of Mania/Mixed Episodes Associated with Bipolar I Disorder

PO (Adults): 1.5 mg once daily; may ↑ to 3 mg once daily on Day 2; further dosage adjustments can be made in increments of 1.5 mg or 3 mg depending on response/tolerability (max dose = 6 mg once daily). *Initiation of strong CYP3A4 inhibitor while on stable dose of cariprazine*—↓ dose by 50%; *Initiation of cariprazine while on stable dose of strong CYP3A4 inhibitor*—1.5 mg once daily on Day 1 and 3 (no dose on Day 2), then 1.5 mg once daily starting on Day 4; may titrate depending on response/tolerance up to max dose of 3 mg once daily.

Depressive Episodes Associated with Bipolar I Disorder

PO (Adults): 1.5 mg once daily; may ↑ to 3 mg once daily on Day 15 depending on response/tolerability (max dose = 3 mg once daily); *Initiation of strong CYP3A4 inhibitor while on stable dose of caripra-*

© F.A. Davis Publishing

zine—↓ dose by 50%; *Initiation of cariprazine while on stable dose of strong CYP3A4 inhibitor*—1.5 mg once daily on Day 1 and 3 (no dose on Day 2), then 1.5 mg once daily starting on Day 4; may titrate depending on response/tolerance up to max dose of 3 mg once daily.

Availability

Capsules: 1.5 mg, 3 mg, 4.5 mg, 6 mg.

NURSING IMPLICATIONS

Assessment

- Assess mental status (orientation, mood, behavior) before and periodically during therapy. Monitor for worsening depression and emergence of suicidal thoughts and behaviors.
- Assess weight and BMI at baseline and frequently during therapy.
- Monitor BP (sitting, standing, lying), pulse, and respiratory rate before and periodically during therapy.
- Observe patient carefully when administering medication to ensure that medication is actually taken and not hoarded or cheeked.
- Monitor for adverse reactions and patient response for several wk after starting therapy and after each dose increase. Due to long action, may not occur for several wk. Consider reducing dose or discontinuing drug if severe adverse reactions occur.
- Monitor patient for onset of akathisia (restlessness or desire to keep moving) and extrapyramidal side effects (*parkinsonian*—difficulty speaking or swallowing, loss of balance control, pill rolling of hands, masklike face, shuffling gait, rigidity, tremors; and *dystonic*—muscle spasms, twisting motions, twitching, inability to move eyes, weakness of arms or legs) periodically throughout therapy. Report these symptoms.
- Monitor for tardive dyskinesia (uncontrolled rhythmic movement of mouth, face, and extremities; lip smacking or puckering; puffing of cheeks; uncontrolled chewing; rapid or worm-like movements of tongue). Notify health care professional immediately if these symptoms occur, as these side effects may be irreversible.
- Monitor for development of neuroleptic malignant syndrome (fever, muscle rigidity, altered mental status, respiratory distress, tachycardia, seizures, diaphoresis, hypertension or hypotension, pallor, tiredness, loss of bladder control). Notify health care professional immediately if these symptoms occur.
- Assess for skin reactions (rash, toxic skin reactions, bullous exanthema).
- Assess for falls risk. Drowsiness, orthostatic hypotension, and motor and sensory instability increase risk. Institute prevention if indicated.
- ***Lab Test Considerations:*** Monitor CBC frequently during therapy in patients with pre-existing or history of low WBC. May cause leukopenia, neutropenia, or agranulocytosis. Discontinue therapy if severe neutropenia (ANC <1000 mm^3) occurs.
- Monitor fasting blood glucose and lipid profile before, soon after starting, and periodically during therapy.

Implementation

- **PO:** Administer once daily without regard to meals.

Patient/Family Teaching

- Advise patient to take medication as directed and not to skip doses or double up on missed doses. Take missed doses as soon as remembered unless almost time for the next dose. Do not stop taking cariprazine without consulting health care professional.
- Inform patient of possibility of extrapyramidal symptoms and tardive dyskinesia. Instruct patient to report these symptoms immediately.
- Advise patient to make position changes slowly to minimize orthostatic hypotension. Protect from falls.
- Medication may cause drowsiness. Caution patient to avoid driving or other activities requiring alertness until response to medication is known.
- Advise patient and family to notify health care professional of new or worse depression; new or worse anxiety; feeling very agitated or restless; panic attacks; trouble sleeping; new or worse irritability; acting aggressive; being angry or violent; acting on dangerous impulses; an extreme increase in activity and talking; other unusual changes in behavior or mood; or rash occur.
- Inform patient that cariprazine may cause weight gain. Advise patient to monitor weight periodically. Notify health care professional of significant weight gain.
- Instruct patient to notify health care professional of all Rx or OTC medications, vitamins, or herbal products being taken and to consult health care professional before taking any new medications. Caution patient to avoid taking alcohol or other CNS depressants concurrently with this medication.
- Advise patient that extremes in temperature should be avoided, because this drug impairs body temperature regulation.
- Advise patient to notify health care professional of medication regimen prior to treatment or surgery.
- Rep: Advise female patients to notify health care professional if pregnancy is planned or suspected and to avoid breast feeding during therapy. Encourage pregnant patients to enroll in registry by contacting National Pregnancy Registry for Atypical Antipsychotics at 1-866-961-2388 or visit http://womensmentalhealth.org/clinical-and-research-programs/pregnancyregistry/. Monitor neonates of women pregnant while taking cariprazine for extrapyramidal and/or withdrawal symptoms and manage symptoms appropriately.

Evaluation/Desired Outcomes

- Decrease in excitable, paranoid, or withdrawn behavior.
- Decreased occurrence and severity of mania associated with bipolar 1 disorder.

© F.A. Davis Publishing

carvedilol (kar-ve-di-lole)

Coreg, Coreg CR

Classification

Therapeutic: antihypertensives
Pharmacologic: beta blockers

Indications

Hypertension. HF (ischemic or cardiomyopathic) with digoxin, diuretics, and ACE inhibitors. Left ventricular dysfunction after myocardial infarction.

Action

Blocks stimulation of $beta_1$ (myocardial) and $beta_2$ (pulmonary, vascular, and uterine)-adrenergic receptor sites. Also has $alpha_1$ blocking activity, which may result in orthostatic hypotension. **Therapeutic Effects:** Decreased heart rate and BP. Improved cardiac output, slowing of the progression of HF and decreased risk of death.

Pharmacokinetics

Absorption: Well absorbed but rapidly undergoes extensive first-pass hepatic metabolism, resulting in 25–35% bioavailability. Food slows absorption.
Distribution: Unknown.
Protein Binding: 98%.
Metabolism and Excretion: Extensively metabolized (primarily by CYP2D6 and CYP2C9; the CYP2D6 enzyme system exhibits genetic polymorphism); ~7% of population may be poor metabolizers and may have significantly ↑ carvedilol concentrations and an ↑ risk of adverse effects); excreted in feces via bile, <2% excreted unchanged in urine.
Half-life: 7–10 hr.

TIME/ACTION PROFILE (cardiovascular effects)

ROUTE	ONSET	PEAK	DURATION
PO	within 1 hr	1–2 hr	12 hr
PO-CR	unknown	5 hr	24 hr

Contraindications/Precautions

Contraindicated in: History of serious hypersensitivity reaction (Stevens-Johnson syndrome, angioedema, anaphylaxis); Pulmonary edema; Cardiogenic shock; Bradycardia, heart block, or sick sinus syndrome (unless a pacemaker is in place); Decompensated HF requiring IV inotropic agents (wean before starting carvedilol); Severe hepatic impairment; Asthma or other bronchospastic disorders.
Use Cautiously in: HF (condition may deteriorate during initial therapy); Diabetes mellitus (may mask signs of hypoglycemia); Thyrotoxicosis (may mask symptoms); Peripheral vascular disease; History of severe allergic reactions (intensity of reactions may be ↑); Patients undergoing cataract surgery (↑ risk of intraoperative floppy iris syndrome); OB: Crosses placenta and may cause fetal/neonatal bradycardia, hypotension, hypoglycemia, or respiratory depression; Lactation: Use while breast feeding only if potential maternal benefit justifies potential risk to infant; Pedi: Safety and effectiveness not established; Geri: ↑ sensitivity to beta blockers; initial dose ↓ recommended.

Adverse Reactions/Side Effects

CV: BRADYCARDIA, HF, PULMONARY EDEMA. **Derm:** STEVENS-JOHNSON SYNDROME, TOXIC EPIDERMAL NECROLYSIS, itching, rashes, urticaria. **EENT:** blurred vision, dry eyes, intraoperative floppy iris syndrome, nasal stuffiness. **Endo:** hyperglycemia, hypoglycemia. **GI:** diarrhea, constipation, nausea. **GU:** erectile dysfunction, ↓ libido. **MS:** arthralgia, back pain, muscle cramps. **Neuro:** paresthesia, dizziness, fatigue, weakness, anxiety, depression, drowsiness, insomnia, memory loss, mental status changes, nervousness, nightmares. **Resp:** bronchospasm, wheezing. **Misc:** HYPERSENSITIVITY REACTIONS (including anaphylaxis and angioedema), drug-induced lupus syndrome.

Interactions

Drug-Drug: General anesthetics, **IV phenytoin**, **diltiazem**, and **verapamil** may cause ↑ myocardial depression. ↑ risk of bradycardia with **digoxin**. **Amiodarone** or **fluconazole** may ↑ levels. ↑ hypotension may occur with other **antihypertensives**, acute ingestion of **alcohol**, or **nitrates**. Concurrent use with **clonidine** ↑ hypotension and bradycardia. May ↑ withdrawal phenomenon from **clonidine** (discontinue carvedilol first). Concurrent administration of **thyroid preparations** may ↓ effectiveness. May alter the effectiveness of **insulins** or **oral hypoglycemic agents** (dose adjustments may be necessary). May ↓ effectiveness of **theophylline**. May ↓ beneficial $beta_1$-cardiovascular effects of **dopamine** or **dobutamine**. Use cautiously within 14 days of **MAO inhibitor** therapy (may result in hypotension/bradycardia). **Cimetidine** may ↑ toxicity from carvedilol. Concurrent **NSAIDs** may ↓ antihypertensive action. Effectiveness may be ↓ by **rifampin**. May ↑ serum **digoxin** levels. May ↑ blood levels of **cyclosporine** (monitor blood levels).

Route/Dosage

PO (Adults): *Hypertension*—6.25 mg twice daily, may be ↑ every 7–14 days up to 25 mg twice daily *or extended-release*—20 mg once daily, dose may be doubled every 7–14 days up to 80 mg once daily; *HF*—3.125 mg twice daily for 2 wk; may be ↑ to 6.25 mg twice daily. Dose may be doubled every 2 wk as tolerated (not to exceed 25 mg twice daily in patients <85 kg or 50 mg twice daily in patients >85 kg) *or extended-release*—10 mg once daily, dose may be doubled every 2 wk as tolerated up to 80 mg once daily;

© F.A. Davis Publishing

Left ventricular dysfunction after MI—6.25 mg twice daily, ↑ after 3–10 days to 12.5 twice daily then to target dose of 25 mg twice daily; some patients may require lower initial doses and slower titration *or extended-release*—20 mg once daily, dose may be doubled every 3–10 days up to 80 mg once daily.

Availability (generic available)

Extended-release capsules: 10 mg, 20 mg, 40 mg, 80 mg. **Cost:** all strengths $175.36/30. **Tablets:** 3.125 mg, 6.25 mg, 12.5 mg, 25 mg. **Cost:** *Generic*—All strengths $7.18/100.

NURSING IMPLICATIONS

Assessment

- Monitor BP and pulse frequently during dose adjustment period and periodically during therapy. Assess for orthostatic hypotension when assisting patient up from supine position. If heart rate decreases below 55 beats/min, decrease dose.
- Monitor intake and output ratios and daily weight. Assess patient routinely for evidence of fluid overload (peripheral edema, dyspnea, rales/crackles, fatigue, weight gain, jugular venous distention). Patients may experience worsening of symptoms during initiation of therapy for HF.
- **Hypertension:** Check frequency of refills to determine adherence.
- ***Lab Test Considerations:*** May cause ↑ BUN, serum lipoprotein, potassium, triglyceride, and uric acid levels.
- May cause ↑ ANA titers.
- May cause ↑ in blood glucose levels.
- ***Toxicity and Overdose:*** Monitor patients receiving beta blockers for signs of overdose (bradycardia, severe dizziness or fainting, severe drowsiness, dyspnea, bluish fingernails or palms, seizures). Notify health care professional immediately if these signs occur.

Implementation

- Do not confuse carvedilol with captopril.
- Discontinuation of concurrent clonidine should be gradual, with carvedilol discontinued first over 1–2 wk with limitation of physical activity; then, after several days, discontinue clonidine.
- **PO:** Take apical pulse before administering. If <50 bpm or if arrhythmia occurs, withhold medication and notify health care professional.
- Administer with food to minimize orthostatic hypotension.
- Administer extended-release capsules in the morning. Swallow whole; do not crush or chew. Extended-release capsules may be opened and sprinkled on cold applesauce and taken immediately; do not store mixture.
- To convert from immediate-release to extended-release product, doses of 3.125 mg twice daily can be converted to 10 mg daily; doses of 6.25 mg twice daily can be converted to 20 mg daily; doses of 12.5 mg twice daily can be converted to 40 mg daily; and doses of 25 mg twice daily can be converted to 80 mg daily.

Patient/Family Teaching

- Instruct patient to take medication as directed, at the same time each day, even if feeling well. Do not skip or double up on missed doses. Take missed doses as soon as possible up to 4 hr before next dose. Abrupt withdrawal may precipitate life-threatening arrhythmias, hypertension, or myocardial ischemia. Discontinue carvedilol slowly over 1–2 wk. Advise patient to read *Patient Information* before starting therapy and with each Rx refill in case of changes.
- Advise patient to make sure enough medication is available for weekends, holidays, and vacations. A written prescription may be kept in wallet in case of emergency.
- Teach patient and family how to check pulse and BP. Instruct them to check pulse daily and BP biweekly. Advise patient to hold dose and contact health care professional if pulse is <50 bpm or BP changes significantly.
- May cause drowsiness or dizziness. Caution patients to avoid driving or other activities that require alertness until response to the drug is known.
- Advise patient to change positions slowly to minimize orthostatic hypotension, especially during initiation of therapy or when dose is increased.
- Caution patient that this medication may increase sensitivity to cold.
- Instruct patient to notify health care professional of all Rx or OTC medications, vitamins, or herbal products being taken and to consult health care professional before taking other Rx, OTC, or herbal products, especially cold preparations, concurrently with this medication.
- Advise patients with diabetes to closely monitor blood glucose, especially if weakness, malaise, irritability, or fatigue occurs. Medication may mask some signs of hypoglycemia, but dizziness and sweating may still occur.
- Advise patient to notify health care professional if slow pulse, difficulty breathing, wheezing, cold hands and feet, dizziness, confusion, depression, rash, fever, sore throat, unusual bleeding, or bruising occurs.
- Instruct patient to inform health care professional of medication regimen before treatment or surgery.
- Advise females of reproductive potential to notify health care professional if pregnancy is planned or suspected, or if breast feeding. If carvedilol is taken during third trimester, monitor newborn for symptoms of hypotension, bradycardia, hypoglycemia, and respiratory depression and manage accordingly.
- Advise patient to carry identification describing disease process and medication regimen at all times.
- **Hypertension:** Reinforce the need to continue additional therapies for hypertension (weight loss, so-

© F.A. Davis Publishing

dium restriction, stress reduction, regular exercise, moderation of alcohol consumption, and smoking cessation). Medication controls but does not cure hypertension.

Evaluation/Desired Outcomes

- Decrease in BP without appearance of detrimental side effects.
- Decrease in severity of HF.

caspofungin (kas-po-fun-gin)

Cancidas

Classification

Therapeutic: antifungals (systemic)
Pharmacologic: echinocandins

Indications

Invasive aspergillosis refractory to, or intolerant of, other therapies. Candidemia and associated serious infections (intra-abdominal abscesses, peritonitis, pleural space infections). Esophageal candidiasis. Suspected fungal infections in febrile neutropenic patients.

Action

Inhibits the synthesis of β (1, 3)-D-glucan, a necessary component of the fungal cell wall. **Therapeutic Effects:** Death of susceptible fungi.

Pharmacokinetics

Absorption: IV administration results in complete bioavailability.
Distribution: Widely distributed to tissues.
Protein Binding: 97%.
Metabolism and Excretion: Slowly and extensively metabolized; <1.5% excreted unchanged in urine.
Half-life: Polyphasic: *β phase*—9–11 hr; *γ phase*—40–50 hr.

TIME/ACTION PROFILE

ROUTE	ONSET	PEAK	DURATION
IV	unknown	end of infusion	24 hr

Contraindications/Precautions

Contraindicated in: Hypersensitivity; Concurrent use with cyclosporine; OB: Pregnancy (may cause fetal harm).
Use Cautiously in: Moderate hepatic impairment (↓ maintenance dose recommended); Lactation: Use while breast feeding only if potential maternal benefit justifies potential risk to infant.

Adverse Reactions/Side Effects

Derm: STEVENS-JOHNSON SYNDROME, TOXIC EPIDERMAL NECROLYSIS, flushing, pruritus, rash. **GI:** diarrhea, ↑ liver enzymes, nausea, vomiting. **GU:** ↑ serum creatinine. **Local:** venous irritation at injection site. **Neuro:** headache, chills. **Resp:** bronchospasm. **Misc:** HYPERSENSITIVITY REACTIONS (including anaphylaxis and angioedema), fever.

Interactions

Drug-Drug: Concurrent use with **cyclosporine** is not recommended due to ↑ risk of hepatic toxicity. May ↓ blood levels and effects of **tacrolimus**. Blood levels and effectiveness may be ↓ by **rifampin**; maintenance dose should be ↑ to 70 mg (in patients with normal liver function). Blood levels and effectiveness also may be ↓ by **efavirenz**, **nelfinavir**, **nevirapine**, **phenytoin**, **dexamethasone**, or **carbamazepine**; an ↑ in the maintenance dose to 70 mg should be considered in patients who are not clinically responding.

Route/Dosage

IV (Adults): 70 mg initially followed by 50 mg once daily; duration determined by clinical situation and response; *Esophageal candidiasis*—50 mg once daily; duration determined by clinical situation and response.
IV (Children ≥3 mo): 70 mg/m² (max: 70 mg) initially followed by 50 mg/m² once daily (max: 70 mg/day); duration determined by clinical situation and response.
IV (Infants 1 to <3 mo and Neonates): 25 mg/m²/dose once daily.

Hepatic Impairment

IV (Adults): *Moderate hepatic impairment*—70 mg initially followed by 35 mg once daily; duration determined by clinical situation and response.

Availability (generic available)

Powder for injection (requires reconstitution and dilution): 50 mg/vial, 70 mg/vial.

NURSING IMPLICATIONS

Assessment

- Assess patient for signs and symptoms of fungal infections prior to and periodically during therapy.
- Assess for skin rash frequently during therapy. Discontinue at first sign of rash; may be life-threatening. Stevens-Johnson syndrome may develop. Treat symptomatically; may recur once treatment is stopped.
- Monitor patient for signs of anaphylaxis (rash, dyspnea, stridor, facial swelling, angioedema, pruritus, sensation of warmth, bronchospasm) during therapy.
- ***Lab Test Considerations:*** May cause ↑ serum alkaline phosphatase, serum creatinine, AST, ALT, eosinophils, and urine protein and RBCs. May also cause ↓ serum potassium, hemoglobin, hematocrit, and WBCs.

© F.A. Davis Publishing

Implementation

IV Administration

- **Intermittent Infusion:** Allow refrigerated vial to reach room temperature. *For 70-mg or 50-mg dose*— Reconstitute vials with 10.8 mL of 0.9% NaCl, sterile water for injection, bacteriostatic water for injection with methylparaben and propylparaben, or bacteriostatic water for injection with 0.9% benzyl alcohol. Use preservative-free diluents for neonates. Do not dilute with dextrose solutions. Reconstituted solution is stable for 1 hr at room temperature. ***Dilution:*** Withdraw 10 mL from vial and add to 250 mL of 0.9% NaCl, 0.45% NaCl, 0.225% NaCl, or LR. The 50-mg dose also can be diluted in 100 mL when volume restriction is necessary. Infusion is stable for 24 hr at room temperature or 48 hr if refrigerated. *For 35-mg dose*— Reconstitute a 50-mg or 70-mg vial as per the directions above. Remove the volume of drug equal to the calculated loading dose or calculated maintenance dose based on a concentration of 7 mg/mL (if reconstituted from the 70-mg vial) or a concentration of 5 mg/mL (if reconstituted from the 50-mg vial). White cake should dissolve completely. Mix gently until a clear solution is obtained. Do not use a solution that is cloudy, discolored, or contains precipitates. ***Concentration:*** 0.14–0.47 mg/mL. ***Rate:*** Infuse over 1 hr.
- **Y-Site Compatibility:** alemtuzumab, alfentanil, allopurinol, amifostine, amikacin, aminophylline, amiodarone, anidulafungin, argatroban, arsenic trioxide, atracurium, aztreonam, bleomycin, bumetanide, busulfan, butorphanol, calcium acetate, calcium chloride, calcium gluconate, carboplatin, carmustine, chlorpromazine, ciprofloxacin, cisatracurium, cisplatin, cyclophosphamide, cyclosporine, dacarbazine, dactinomycin, daptomycin, daunorubicin, dexmedetomidine, dexrazoxane, diltiazem, diphenhydramine, dobutamine, docetaxel, dopamine, doxorubicin, doxorubicin liposome, doxycycline, droperidol, epinephrine, epirubicin, erythromycin, esmolol, etoposide, etoposide phosphate, famotidine, fenoldopam, fentanyl, fluconazole, fludarabine, ganciclovir, gemcitabine, gentamicin, glycopyrrolate, granisetron, haloperidol, hydrocortisone sodium succinate, hydromorphone, idarubicin, ifosfamide, imipenem/cilastatin, insulin, irinotecan, isoproterenol, labetalol, leucovorin, levofloxacin, linezolid, magnesium sulfate, mannitol, melphalan, meperidine, meropenem, mesna, methyldopate, metoclopramide, metoprolol, midazolam, milrinone, mitomycin, mitoxantrone, morphine, moxifloxacin, mycophenolate, nalbuphine, naloxone, nicardipine, nitroglycerin, norepinephrine, octreotide, ondansetron, oxaliplatin, oxytocin, paclitaxel, palonosetron, pentamidine, phentolamine, phenylephrine, posaconazole, potassium acetate, potassium chloride, procainamide, prochlorperazine, promethazine, propranolol, quinupristin/dalfopristin, remifentanil, rocuronium, streptozocin, succinylcholine, sufentanil, tacrolimus, telavancin, theophylline, thiopental, thiotepa, tigecycline, tirofiban, tobramycin, topotecan, vancomycin, vasopressin, vecuronium, verapamil, vinblastine, vincristine, vinorelbine, voriconazole, zidovudine, zoledronic acid.
- **Y-Site Incompatibility:** aminocaproic acid, amphotericin B lipid complex, amphotericin B liposome, ampicillin, ampicillin/sulbactam, bivalirudin, blinatumomab, cefazolin, cefepime, cefotaxime, cefotetan, cefoxitin, ceftaroline, ceftazidime, ceftriaxone, cefuroxime, chloramphenicol, clindamycin, dantrolene, dexamethasone, diazepam, digoxin, enalaprilat, ephedrine, ertapenem, fluorouracil, foscarnet, fosphenytoin, furosemide, heparin, ketorolac, lidocaine, methotrexate, methylprednisolone, nafcillin, nitroprusside, pamidronate, pancuronium, pemetrexed, pentobarbital, phenobarbital, phenytoin, piperacillin/tazobactam, potassium phosphates, sodium acetate, sodium bicarbonate, sodium phosphates, trimethoprim/sulfamethoxazole.
- **Solution Incompatibility:** Solutions containing dextrose.

Patient/Family Teaching

- Explain the purpose of caspofungin to patient and family.
- Advise patient to notify health care professional immediately if symptoms of allergic reactions (rash, facial swelling, pruritus, sensation of warmth, difficulty breathing) occur.
- Advise female patient to notify health care professional if pregnancy is planned or suspected or if breast feeding.

Evaluation/Desired Outcomes

- Decrease in signs and symptoms of fungal infections. Duration of therapy is determined based on severity of underlying disease, recovery from immunosuppression, and clinical response.

cefepime (seff-e-peem)
Maxipime

Classification
Therapeutic: anti-infectives
Pharmacologic: fourth-generation cephalosporins

Indications
Treatment of the following infections caused by susceptible organisms: Uncomplicated skin and skin structure infections, Bone and joint infections, Uncomplicated and complicated urinary tract infections, Respiratory tract infections, Complicated intra-abdominal infections (with metronidazole), Septicemia. Empiric treatment of febrile neutropenic patients.

Action
Binds to the bacterial cell wall membrane, causing cell death. **Therapeutic Effects:** Bactericidal action against susceptible bacteria. **Spectrum:** Similar to that of second- and third-generation cephalosporins, but activity against staphylococci is less, whereas activity against gram-negative pathogens is greater, even for organisms resistant to first-, second-, and third-generation agents. Notable is increased action against: *Enterobacter*, *Haemophilus influenzae* (including β-lactamase-producing strains), *Escherichia coli*, *Klebsiella pneumoniae*, *Neisseria*, *Proteus*, *Providencia*, *Pseudomonas aeruginosa*, *Serratia*, *Moraxella catarrhalis* (including β-lactamase-producing strains). Not active against methicillin-resistant staphylococci or enterococci.

Pharmacokinetics
Absorption: Well absorbed after IM administration; IV administration results in complete bioavailability.
Distribution: Widely distributed. Crosses the placenta; enters breast milk in low concentrations. Some CSF penetration.
Protein Binding: 20%.
Metabolism and Excretion: 85% excreted unchanged in urine.
Half-life: *Adults*—2 hr (↑ in renal impairment); *Children 2 mo–6 yr*—1.7–1.9 hr.

TIME/ACTION PROFILE

ROUTE	ONSET	PEAK	DURATION
IM	rapid	1–2 hr	12 hr
IV	rapid	end of infusion	12 hr

Contraindications/Precautions
Contraindicated in: Hypersensitivity to cephalosporins; Serious hypersensitivity to penicillins.
Use Cautiously in: Renal impairment (↓ dosing/↑ dosing interval recommended if CCr ≤60 mL/min); History of GI disease, especially colitis; Hepatic impairment or poor nutritional status (may be at ↑ risk of bleeding); OB: Safety not established in pregnancy; Lactation: Safety not established in breast feeding; Geri: Dose adjustment due to age-related ↓ in renal function may be necessary.

Adverse Reactions/Side Effects
Derm: rash, pruritus, urticaria. **GI:** CLOSTRIDIOIDES DIFFICILE-ASSOCIATED DIARRHEA (CDAD), diarrhea, nausea, vomiting. **Hemat:** bleeding, eosinophilia, hemolytic anemia, neutropenia, thrombocytopenia. **Local:** pain at IM site, phlebitis at IV site. **Neuro:** ENCEPHALOPATHY, SEIZURES (↑ risk in renal impairment), aphasia, headache. **Misc:** HYPERSENSITIVITY REACTIONS (including anaphylaxis), fever, superinfection.

Interactions
Drug-Drug: Probenecid ↓ excretion and ↑ blood levels. Concurrent use of **loop diuretics** or **aminoglycosides** may ↑ risk of nephrotoxicity.

Route/Dosage
IM (Adults): *Mild-to-moderate uncomplicated or complicated urinary tract infections due to Escherichia coli*—0.5–1 g every 12 hr.
IV (Adults): *Moderate-to-severe pneumonia*—1–2 g every 12 hr. *Mild-to-moderate uncomplicated or complicated urinary tract infections*—0.5–1 g every 12 hr. *Severe uncomplicated or complicated urinary tract infections, moderate-to-severe uncomplicated skin and skin structure infections, complicated intra-abdominal infections*—2 g every 12 hr. *Empiric treatment of febrile neutropenia*—2 g every 8 hr.
IV (Children 1 mo–16 yr): *Uncomplicated and complicated urinary tract infections, uncomplicated skin and skin structure infections, pneumonia*—50 mg/kg every 12 hr (not to exceed 2 g/dose). *Febrile neutropenia*—50 mg/kg every 8 hr (not to exceed 2 g/dose).
IV (Neonates postnatal age ≥14 days): 50 mg/kg every 12 hr.
IV (Neonates postnatal age <14 days): 30 mg/kg every 12 hr; consider 50 mg/kg every 12 hr for *Pseudomonas* infections.

Renal Impairment
IM, IV (Adults): (See Manufacturer's specific recommendations) *CCr 30–60 mL/min*—0.5–1 g every 24 hr or 2 g every 12–24 hr; *CCr 11–29 mL/min*—0.5–2 g every 24 hr; *CCr <11 mL/min*—250 mg–1 g every 24 hr.

Availability (generic available)
Powder for injection: 500 mg, 1 g, 2 g. **Premixed infusion:** 1 g/50 mL D5W, 2 g/100 mL D5W.

© F.A. Davis Publishing

NURSING IMPLICATIONS

Assessment

- Assess patient for infection (vital signs; appearance of wound, sputum, urine, and stool; WBC) at beginning of and throughout therapy.
- Before initiating therapy, obtain a history to determine previous use of and reactions to penicillins or cephalosporins. Persons with a negative history of penicillin sensitivity may still have an allergic response.
- Obtain specimens for culture and sensitivity before initiating therapy. First dose may be given before receiving results.
- Observe patient for signs and symptoms of anaphylaxis (rash, pruritus, laryngeal edema, wheezing). Discontinue the drug and notify health care professional immediately if these symptoms occur. Keep epinephrine, an antihistamine, and resuscitation equipment close by in the event of an anaphylactic reaction.
- Monitor bowel function. Diarrhea, abdominal cramping, fever, and bloody stools should be reported to health care professional promptly as a sign of *Clostridioides difficile*-associated diarrhea (CDAD). May begin up to several wk following cessation of therapy.
- ***Lab Test Considerations:*** May cause positive results for Coombs' test in patients receiving high doses or in neonates whose mothers were given cephalosporins before delivery.
- May cause ↑ AST, ALT, bilirubin, BUN, and serum creatinine.
- May rarely cause leukopenia, neutropenia, thrombocytopenia, and eosinophilia.

Implementation

- **IM:** ***Reconstitution:*** Reconstitute IM doses with sterile or bacteriostatic water for injection, 0.9% NaCl, or D5W. May be diluted with lidocaine to minimize injection discomfort.
- Inject deep into a well-developed muscle mass; massage well.
- IM route should only be used for treatment of mild-to-moderate uncomplicated or complicated urinary tract infections due to *Escherichia coli*.

IV Administration

- **IV:** Monitor injection site frequently for phlebitis (pain, redness, swelling). Change sites every 48–72 hr to prevent phlebitis.
- If aminoglycosides are administered concurrently, administer in separate sites, if possible, at least 1 hr apart. If second site is unavailable, flush lines between medications.
- **Intermittent Infusion:** ***Reconstitution:*** Reconstitute with 5 mL sterile water, 0.9% NaCl, or D5W for the 500-mg vial, or 10 mL for the 1-g or 2-g vials. ***Dilution:*** Dilute further in 50–100 mL of D5W, 0.9% NaCl, D10W, D5/0.9% NaCl, or D5/LR. ***Concentration:*** Maximum 40 mg/mL.
- Solution is stable for 24 hr at room temperature and 7 days if refrigerated. ***Rate:*** Administer over 20–30 min.
- **Y-Site Compatibility:** amikacin, aminocaproic acid, amiodarone, amphotericin B lipid complex, ampicillin-sulbactam, anidulafungin, arsenic trioxide, azithromycin, aztreonam, bivalirudin, bleomycin, bumetanide, buprenorphine, butorphanol, calcium gluconate, carboplatin, carmustine, ceftolozane/tazobactam, cyclophosphamide, cytarabine, dactinomycin, daptomycin, dexamethasone, dexmedetomidine, docetaxel, doxorubicin liposome, eptifibatide, eravacycline, esmolol, fenoldopam, fluconazole, fludarabine, fluorouracil, foscarnet, fosphenytoin, furosemide, gentamicin, granisetron, hetastarch, hydrocortisone, hydromorphone, imipenem-cilastatin, insulin, regular, ketamine, lactated Ringer's, leucovorin calcium, levofloxacin, linezolid, lorazepam, melphalan, meropenem/vaborbactam, mesna, methadone, methotrexate, methylprednisolone, metoprolol, metronidazole, milrinone, octreotide, oxytocin, paclitaxel, palonosetron, pamidronate, pancuronium, piperacillin-tazobactam, potassium acetate, remifentanil, rocuronium, sargramostim, sodium acetate, sodium bicarbonate, sufentanil, tedizolid, telavancin, thiotepa, tigecycline, tirofiban, tobramycin, trimethoprim/sulfamethoxazole, valproate sodium, vasopressin, zidovudine, zoledronic acid.
- **Y-Site Incompatibility:** acetylcysteine, acyclovir, alemtuzumab, amphotericin B deoxycholate, amphotericin B liposome, argatroban, caspofungin, chlorpromazine, ciprofloxacin, cisplatin, dacarbazine, daunorubicin hydrochloride, dexrazoxane, diazepam, diltiazem, diphenhydramine, doxorubicin hydrochloride, droperidol, enalaprilat, epirubicin, erythromycin, etoposide, etoposide phosphate, famotidine, filgrastim, floxuridine, ganciclovir, gemcitabine, gemtuzumab ozogamicin, haloperidol, hydroxyzine, idarubicin, ifosfamide, irinotecan, isavuconazonium, labetalol, magnesium sulfate, mannitol, meperidine, metoclopramide, midazolam, mitomycin, mitoxantrone, nalbuphine, ondansetron, oxaliplatin, pantoprazole, pemetrexed, phenytoin, prochlorperazine, promethazine, quinupristin/dalfopristin, streptozocin, tacrolimus, theophylline, vecuronium, vinblastine, vincristine, vinorelbine, voriconazole.

Patient/Family Teaching

- Advise patient to report signs of superinfection (furry overgrowth on the tongue, vaginal itching or discharge, loose or foul-smelling stools) and allergy.
- Instruct patient to notify health care professional if fever and diarrhea develop, especially if stool contains blood, pus, or mucus. Advise patient not to treat diarrhea without consulting health care professional.

© F.A. Davis Publishing

- Advise females of reproductive potential to notify health care professional if pregnancy is planned or suspected or if breast feeding.

Evaluation/Desired Outcomes

- Resolution of the signs and symptoms of infection. Length of time for complete resolution depends on the organism and site of infection.

cefiderocol (sef-i-der-oh-kol)

Fetroja

Classification

Therapeutic: anti-infectives
Pharmacologic: cephalosporin derivatives

Indications

Complicated urinary tract infections (cUTI), including pyelonephritis, in patients who have limited or no alternative treatment options. Hospital-acquired bacterial pneumonia and ventilator-associated bacterial pneumonia.

Action

Functions as a siderophore and binds to extracellular free ferric iron. Iron transport systems then deliver cefiderocol across the outer membrane of gram-negative bacilli where it binds to the bacterial cell wall membrane, causing cell death. **Therapeutic Effects:** Bactericidal action against susceptible bacteria. **Spectrum:** Active against the following gram-negative bacilli: *Acinetobacter baumannii* , *Enterobacter cloacae*, *Escherichia coli*, *Klebsiella pneumoniae*, *Proteus mirabilis*, *Pseudomonas aeruginosa*, and *Serratia marcescens*.

Pharmacokinetics

Absorption: IV administration results in complete bioavailability.
Distribution: Some distribution to extracellular tissues.
Metabolism and Excretion: Undergoes minimal metabolism by liver; primarily excreted in urine (99%; 91% as unchanged drug).
Half-life: 2–3 hr.

TIME/ACTION PROFILE (plasma concentrations)

ROUTE	ONSET	PEAK	DURATION
IV	rapid	end of infusion	8 hr

Contraindications/Precautions

Contraindicated in: Known serious hypersensitivity to cefiderocol or other beta-lactams.
Use Cautiously in: Carbapenem-resistant gram-negative bacterial infections, including nosocomial pneumonia, bloodstream infections, and sepsis (↑ risk of mortality); Seizure disorders; Renal impairment (dosage ↓ required for CCr <60 mL/min); OB: Use during pregnancy only if potential maternal benefit justifies potential fetal risk; Lactation: Use while breast feeding only if potential maternal benefit justifies potential risk to infant; Pedi: Safety and effectiveness not established in children; Geri: Dose adjustment may be necessary in older adults for age-related ↓ in renal function.

Adverse Reactions/Side Effects

Derm: rash. **EENT:** thrush. **F and E:** hypokalemia. **GI:** CLOSTRIDIOIDES DIFFICILE-ASSOCIATED DIARRHEA (CDAD), constipation, diarrhea, ↑ liver enzymes, nausea, vomiting. **GU:** candiduria, vaginal candidiasis. **Local:** infusion site reactions. **Neuro:** SEIZURES, headache. **Resp:** cough. **Misc:** HYPERSENSITIVITY REACTIONS (including anaphylaxis).

Interactions

Drug-Drug: None reported.

Route/Dosage

IV (Adults): *CCr ≥120 mL/min*—2 g every 6 hr for 7–14 days; *CCr 60–119 mL/min*—2 g every 8 hr for 7–14 days.

Renal Impairment

IV (Adults): *CCr 30–59 mL/min*—1.5 g every 8 hr for 7–14 days; *CCr 15–29 mL/min*—1 g every 8 hr for 7–14 days; *CCr <15 mL/min (with or without hemodialysis)*—0.75 g every 12 hr for 7–14 days (in patients receiving hemodialysis, administer dose immediately following hemodialysis session); *Continuous renal replacement therapy*—Effluent flow rate ≥4.1 L/hr: 2 g every 8 hr for 7–14 days; effluent flow rate 3.1–4 L/hr: 1.5 g every 8 hr for 7–14 days; Effluent flow rate 2.1–3 L/hr: 2 g every 12 hr for 7–14 days; Effluent flow rate ≤2 L/hr: 1.5 g every 12 hr for 7–14 days.

Availability

Lyophilized powder for injection: 1 g/vial.

NURSING IMPLICATIONS

Assessment

- Assess for infection (vital signs, appearance of urine, WBC) at beginning of and during therapy. Monitor clinical response to therapy closely.
- Obtain a history before initiating therapy to determine previous use of and reactions to penicillins or cephalosporins. Persons with a negative history of penicillin sensitivity may still have an allergic response.
- Observe for signs and symptoms of anaphylaxis (rash, pruritus, laryngeal edema, wheezing). Notify health care professional immediately if these occur.

© F.A. Davis Publishing

- Obtain specimens for culture and sensitivity prior to therapy. First dose may be given before receiving results.
- Monitor bowel function. Diarrhea, abdominal cramping, fever, and bloody stools should be reported to health care professional promptly as a sign of *Clostridioides difficile*-associated diarrhea (CDAD). May begin up to several wk following cessation of therapy.
- ***Lab Test Considerations:*** May cause false-positive results in dipstick tests (urine protein, ketones, occult blood). Use alternate clinical laboratory methods of testing to confirm positive tests.

Implementation

- **Intermittent Infusion:** ***Reconstitution:*** Reconstitute with 10 mL 0.9% NaCl or D5W; gently shake to dissolve. Allow vial to stand until foaming has disappeared; usually 2 min. ***Dilution:*** Withdraw appropriate volume from vial and dilute in 100 mL 0.9% NaCl or D5W immediately after reconstitution. Solution is clear and colorless; do not administer solutions that are discolored, cloudy, or contain particulate matter. Reconstituted solution is stable for 1 hr at room temperature. Solution diluted in IV bag is stable for up to 6 hr at room temperature and 24 hr if refrigerated and protected from light. ***Rate:*** Infusion must be completed with 6 hr.

Patient/Family Teaching

- Explain purpose of cefiderocol and the importance of completing full course of therapy to patient. Skipping doses or not completing full course of therapy may decrease effectiveness of the immediate treatment and increase the likelihood that bacteria will develop resistance and will not be treatable by cefiderocol or other antibacterial drugs in the future.
- Advise patient to report the signs of superinfection (furry overgrowth on the tongue, vaginal itching or discharge, loose or foul-smelling stools) and allergy.
- Instruct patient to notify health care professional immediately if diarrhea, abdominal cramping, fever, or bloody stools or signs and symptoms of anaphylaxis occur and not to treat with antidiarrheals without consulting health care professional.
- Inform patient of risk of seizures, especially in patient with a seizure disorder. Advise patient to notify health care professional immediately if seizure occurs.
- Advise females of reproductive potential to notify health care professional if pregnancy is planned or suspected or if breast feeding.

Evaluation/Desired Outcomes

- Resolution of the signs and symptoms of infection.

cefixime, See CEPHALOSPORINS—THIRD GENERATION.

cefotaxime, See CEPHALOSPORINS—THIRD GENERATION.

cefoTEtan, See CEPHALOSPORINS—SECOND GENERATION.

ceftaroline (sef-**tar**-oh-leen)

Teflaro

Classification

Therapeutic: anti-infectives

Pharmacologic: cephalosporin derivatives

Indications

Acute bacterial skin/skin structure infections. Community-acquired pneumonia.

Action

Binds to bacterial cell wall membrane, causing cell death. **Therapeutic Effects:** Bactericidal action against susceptible bacteria. **Spectrum:** *Treatment of skin/skin structure infections*—Active against *Staphylococcus aureus* (including methicillin-susceptible and -resistant strains), *Streptococcus pyogenes*, *Streptococcus agalactiae*, *Escherichia coli*, *Klebsiella pneumoniae*, and *Klebsiella oxytoca*; *Treatment of community acquired pneumonia*—*Streptococcus pneumoniae* (including pneumonia with bacteremia), *Staphylococcus aureus* (methicillin-susceptible strains only), *Haemophilus influenzae*, *Klebsiella pneumoniae*, *Klebsiella oxytoca*, and *Escherichia coli*.

Pharmacokinetics

Absorption: IV administration results in complete bioavailability of parent drug.

Distribution: Unknown.

Metabolism and Excretion: Ceftaroline fosamil is rapidly converted by plasma phosphatases to ceftaroline, the active metabolite; 88% excreted in urine, 6% in feces.

Half-life: 2.6 hr (after multiple doses).

© F.A. Davis Publishing

TIME/ACTION PROFILE (blood levels)

ROUTE	ONSET	PEAK	DURATION
IV	rapid	end of infusion	12 hr

Contraindications/Precautions

Contraindicated in: Known serious hypersensitivity to cephalosporins.

Use Cautiously in: Known hypersensitivity to other beta-lactams; Renal impairment (dosage ↓ required for CCr ≤50 mL/min in adults); OB: Safety not established in pregnancy; Lactation: Use while breast feeding only if potential maternal benefit justifies potential risk to infant; Pedi: Neonates <34 wk (gestational age) or <12 days (postnatal age) (acute bacterial skin/skin structure infections) and infants <2 mo (community-acquired pneumonia) (safety and effectiveness not established); Geri: Dose adjustment may be necessary in older adults for age-related ↓ in renal function.

Adverse Reactions/Side Effects

Derm: rash. **GI:** CLOSTRIDIOIDES DIFFICILE-ASSOCIATED DIARRHEA (CDAD), diarrhea, nausea. **Hemat:** hemolytic anemia. **Local:** phlebitis at injection site. **Neuro:** ENCEPHALOPATHY, SEIZURES. **Misc:** HYPERSENSITIVITY REACTIONS (including anaphylaxis).

Interactions

Drug-Drug: None reported.

Route/Dosage

Acute Bacterial Skin/Skin Structure Infections

IV (Adults): 600 mg every 12 hr for 5–14 days.
IV (Children 2–17 yr and >33 kg): 400 mg every 8 hr for 5–14 days *or* 600 mg every 12 hr for 5–14 days.
IV (Children 2–17 yr and ≤33 kg): 12 mg/kg every 8 hr for 5–14 days.
IV (Children 2 mo–<2 yr): 8 mg/kg every 8 hr for 5–14 days.
IV (Neonates 0–<2 mo): 6 mg/kg every 8 hr for 5–14 days.

Renal Impairment

IV (Adults): *CCr >30 to ≤50 mL/min*—400 mg every 12 hr; *CCr ≥15 to ≤30 mL/min*—300 mg every 12 hr; *CCr <15 mL/min including hemodialysis*—200 mg every 12 hr.

Community-Acquired Pneumonia

IV (Adults): 600 mg every 12 hr for 5–7 days.
IV (Children 2–17 yr and >33 kg): 400 mg every 8 hr for 5–14 days *or* 600 mg every 12 hr for 5–14 days.
IV (Children 2–17 yr and ≤33 kg): 12 mg/kg every 8 hr for 5–14 days.
IV (Children 2 mo–<2 yr): 8 mg/kg every 8 hr for 5–14 days.

Renal Impairment

IV (Adults): *CCr >30 to ≤50 mL/min*—400 mg every 12 hr; *CCr ≥15 to ≤30 mL/min*—300 mg every 12 hr; *CCr <15 mL/min including hemodialysis*—200 mg every 12 hr.

Availability (generic available)

Powder for injection: 400 mg/vial, 600 mg/vial.

NURSING IMPLICATIONS

Assessment

- Assess for infection (vital signs; appearance of wound, sputum, urine, and stool; WBC) at beginning of and throughout therapy.
- Before initiating therapy, obtain a history to determine previous use of and reactions to penicillins, cephalosporins, or carbapenems. Persons with a negative history of sensitivity may still have an allergic response.
- Obtain specimens for culture and sensitivity before initiating therapy. First dose may be given before receiving results.
- Observe patient for signs and symptoms of anaphylaxis (rash, pruritus, laryngeal edema, wheezing). Discontinue the drug and notify health care professional immediately if these symptoms occur. Keep epinephrine, an antihistamine, and resuscitation equipment close by in the event of an anaphylactic reaction.
- Monitor bowel function. Diarrhea, abdominal cramping, fever, and bloody stools should be reported to health care professional promptly as a sign of *Clostridioides difficile*-associated diarrhea (CDAD). May begin up to several mo following cessation of therapy.
- ***Lab Test Considerations:*** May cause seroconversion from a negative to a positive direct Coombs' test. If anemia develops during or after therapy, perform a direct Coombs' test. If drug-induced hemolytic anemia is suspected, discontinue ceftaroline and provide supportive care.

Implementation

IV Administration

- **Intermittent Infusion:** ***Reconstitution:*** Reconstitute with 20 mL of sterile water for injection, 0.9% NaCl, D5W, or LR. ***Dilution:*** Dilute further with 50–250 mL of same diluent unless reconstituted with sterile water for injection, then use 0.9% NaCl, D5W, D2.5W, 0.45% NaCl, or LR. Mix gently to dissolve. Solution is clear to light or dark yellow; do not administer solutions that are discolored or contain particulate matter. Solution is stable for 6 hr at room temperature or 24 hr if refrigerated. ***Rate:*** Infuse over 5–60 min.
- **Y-Site Compatibility:** acyclovir, amikacin, aminophylline, amiodarone, azithromycin, bumetanide,

© F.A. Davis Publishing

calcium chloride, calcium gluconate, ceftolozane/tazobactam, ciprofloxacin, cisatracurium, clindamycin, cyclosporine, dexamethasone, digoxin, diltiazem, diphenhydramine, dopamine, enalaprilat, esomeprazole, famotidine, fentanyl, fluconazole, furosemide, gentamicin, granisetron, haloperidol, heparin, hydrocortisone, hydromorphone, insulin regular, insulin lispro, levofloxacin, lidocaine, lorazepam, mannitol, meperidine, methylprednisolone, metoclopramide, metoprolol, midazolam, milrinone, morphine, moxifloxacin, multivitamins, norepinephrine, ondansetron, pantoprazole, plazomicin, potassium chloride, promethazine, propofol, remifentanil, sodium bicarbonate, tobramycin, trimethoprim/sulfamethoxazole, vasopressin, voriconazole.

- **Y-Site Incompatibility:** caspofungin, diazepam, eravacycline, filgrastim, isavuconazonium, labetalol, meropenem/vaborbactam, potassium phosphate, sodium phosphate, tedizolid.

Patient/Family Teaching

- Explain the purpose of ceftaroline to patient. Emphasize the importance of completing therapy, even if feeling better.
- Instruct patient to notify health care professional if fever and diarrhea develop, especially if stool contains blood, pus, or mucus. Advise patient not to treat diarrhea without consulting health care professional.
- Advise females of reproductive potential to notify health care professional if pregnancy is planned or suspected or if breast feeding.

Evaluation/Desired Outcomes

- Resolution of the signs and symptoms of infection. Length of time for complete resolution depends on the organism and site of infection.

cefTAZidime, See CEPHALOSPORINS—THIRD GENERATION.

ceftazidime/avibactam

(sef-**tay**-zi-deem/a-vi-**bak**-tam)
Avycaz

Classification
Therapeutic: anti-infectives
Pharmacologic: third-generation cephalosporins, beta-lactamase inhibitors

Indications

Complicated intra-abdominal infections (in combination with metronidazole). Complicated urinary tract infections (including pyelonephritis). Hospital-acquired and ventilator-associated bacterial pneumonia.

Action

Ceftazidime—Binds to the bacterial cell wall membrane, causing cell death. *Avibactam*—Inhibits beta-lactamase, an enzyme that destroys penicillins and cephalosporins. **Therapeutic Effects:** Death of susceptible bacteria with resolution of infection. **Spectrum:** Active against *Escherichia coli*, *Klebsiella pneumoniae*, *Proteus mirabilis*, *Haemophilus influenzae*, *Enterobacter cloacae*, *Klebsiella oxytoca*, *Pseudomonas aeruginosa*, *Citrobacter freundii*, and *Serratia marcescens*.

Pharmacokinetics

Absorption: IV administration results in complete bioavailability.
Distribution: *Ceftazidime*—Widely distributed, enters breast milk in low concentrations; *avibactam*—widely distributed.
Metabolism and Excretion: *ceftazidime*—minimally metabolized, 80–90% excreted unchanged in urine; *avibactam*—minimally metabolized, mainly excreted unchanged in urine.
Half-life: *Ceftazidime*—2.8–3.3 hr (↑ in renal impairment); *avibactam*—2.2–2.7 hr.

TIME/ACTION PROFILE (blood levels)

ROUTE	ONSET	PEAK	DURATION
IV	rapid	end of infusion	8 hr (↑ in renal impairment)

Contraindications/Precautions

Contraindicated in: Known hypersensitivity to ceftazidime, other cephalosporins or avibactam-containing products; cross-sensitivity with other penicillins, carbapenems, and cephalosporins may occur.
Use Cautiously in: CCr 30–50 mL/min (efficacy may be ↓, monitor renal function frequently and adjust dose if necessary); OB: Use only if potential material benefit justifies potential fetal risk; Lactation: Use cautiously in breast-feeding women; Pedi: Safety and effectiveness not established in children <3 mo (complicated intra-abdominal infections and complicated urinary tract infections) and <18 yr (hospital-acquired and ventilator-associated bacterial pneumonia); Geri: Consider age-related impairment of renal function.

Adverse Reactions/Side Effects

F and E: hypokalemia. **GI:** CLOSTRIDIOIDES DIFFICILE-ASSOCIATED DIARRHEA (CDAD), diarrhea, nausea, vomiting. **Hemat:** eosinophilia, thrombocytopenia. **Neuro:** SEIZURES (↑ in renal impairment), anxiety, dizziness, headache. **Misc:** HYPERSENSITIVITY REACTIONS (including anaphylaxis and serious skin reactions).

Interactions

Drug-Drug: Probenecid may ↓ renal excretion of avibactam; concurrent administration is not recommended.

© F.A. Davis Publishing

Route/Dosage

Complicated Intra-abdominal Infections and Complicated Urinary Tract Infections

IV (Adults): 2.5 g (2 g ceftazidime/0.5 g avibactam) every 8 hr. Duration of therapy = 5–14 days (complicated intra-abdominal infections); 7–14 days (complicated urinary tract infections).

IV (Children ≥2 yr): 62.5 mg/kg (50 mg/kg ceftazidime/12.5 mg/kg avibactam) (max dose = 2.5 g [2 g ceftazidime/0.5 g avibactam]) every 8 hr. Duration of therapy = 5–14 days (complicated intra-abdominal infections); 7–14 days (complicated urinary tract infections).

IV (Children 6 mo–<2 yr): 62.5 mg/kg (50 mg/kg ceftazidime/12.5 mg/kg avibactam) every 8 hr. Duration of therapy = 5–14 days (complicated intra-abdominal infections); 7–14 days (complicated urinary tract infections).

IV (Children 3 mo–<6 mo): 50 mg/kg (40 mg/kg ceftazidime/10 mg/kg avibactam) every 8 hr. Duration of therapy = 5–14 days (complicated intra-abdominal infections); 7–14 days (complicated urinary tract infections).

Renal Impairment

IV (Adults): *CCr 31–50 mL/min*—1.25 g (1 g ceftazidime/0.25 g avibactam) every 8 hr; *CCr 16–30 mL/min*—0.94 g (0.75 g ceftazidime/0.19 g avibactam) every 12 hr; *CCr 6–15 mL/min*—0.94 g (0.75 g ceftazidime/0.19 g avibactam) every 24 hr; *CCr ≤5 mL/min*—0.94 g (0.75 g ceftazidime/0.19 g avibactam) every 48 hr: *Hemodialysis*—Administer dose after hemodialysis on hemodialysis days.

Renal Impairment

IV (Children ≥2 yr): *CCr 31–50 mL/min*—31.25 mg/kg (25 mg/kg ceftazidime/6.25 mg/kg avibactam) (max dose = 1.25 g [1 g ceftazidime/0.25 g avibactam]) every 8 hr; *CCr 16–30 mL/min*—23.75 mg/kg (19 mg/kg ceftazidime/4.75 mg/kg avibactam) (max dose = 0.94 g [0.75 g ceftazidime/0.19 g avibactam]) every 12 hr; *CCr 6–15 mL/min*—23.75 mg/kg (19 mg/kg ceftazidime/4.75 mg/kg avibactam) (max dose = 0.94 g [0.75 g ceftazidime/0.19 g avibactam]) every 24 hr; *CCr ≤5 mL/min*—23.75 mg/kg (19 mg/kg ceftazidime/4.75 mg/kg avibactam) (max dose = 0.94 g [0.75 g ceftazidime/0.19 g avibactam]) every 48 hr; *Hemodialysis*—Administer dose after hemodialysis or on hemodialysis days.

Hospital-acquired and Ventilator-associated Bacterial Pneumonia

IV (Adults): 2.5 g (2 g ceftazidime/0.5 g avibactam) every 8 hr. Duration of therapy = 5–14 days (complicated intra-abdominal infections); 7–14 days (complicated urinary tract infections).

Renal Impairment

IV (Adults): *CCr 31–50 mL/min*—1.25 g (1 g ceftazidime/0.25 g avibactam) every 8 hr; *CCr 16–30 mL/min*—0.94 g (0.75 g ceftazidime/0.19 g avibactam) every 12 hr; *CCr 6–15 mL/min*—0.94 g (0.75 g ceftazidime/0.19 g avibactam) every 24 hr; *CCr ≤5 mL/min*—0.94 g (0.75 g ceftazidime/0.19 g avibactam) every 48 hr: *Hemodialysis*—Administer dose after hemodialysis on hemodialysis days.

Availability

Powder for injection (requires reconstitution and dilution): ceftazidime 2 g/avibactam 0.5 g/vial.

NURSING IMPLICATIONS

Assessment

- Assess for infection (vital signs; appearance of wound, sputum, urine, and stool; WBC) at beginning of and throughout therapy.
- Before initiating therapy, obtain a history to determine previous use of and reactions to penicillins, cephalosporins, or carbapenems. Persons with a negative history of sensitivity may still have an allergic response.
- Obtain specimens for culture and sensitivity before initiating therapy. First dose may be given before receiving results.
- Observe patient for signs and symptoms of anaphylaxis (rash, pruritus, laryngeal edema, wheezing). Discontinue the drug and notify health care professional immediately if these symptoms occur. Keep epinephrine, an antihistamine, and resuscitation equipment close by in the event of an anaphylactic reaction.
- Monitor bowel function. Diarrhea, abdominal cramping, fever, and bloody stools should be reported to health care professional promptly as a sign of CDAD. May begin up to several mo following cessation of therapy.
- Monitor for signs and symptoms of encephalopathy (disturbance of consciousness including confusion, hallucinations, stupor, coma), myoclonus, and seizures during and following therapy. May require immediate treatment, dose adjustment, or discontinuation of therapy.
- ***Lab Test Considerations:*** May cause seroconversion from a negative to a positive direct Coombs' test. If anemia develops during or after therapy, perform a direct Coombs' test.
- May cause a false-positive reaction for glucose in urine with certain methods; use enzymatic glucose oxidase reactions.

Implementation

IV Administration

- **Intermittent Infusion:** Reconstitute with 10 mL of sterile water for injection. 0.9% NaCl, D5W, D5/

© F.A. Davis Publishing

0.9% NaCl, D5/0.45% NaCl, D2.5/0.9% NaCl, D2.5/0.45% NaCl, or LR. Mix gently. ***Dilution:*** Use same diluent used for reconstitution for a volume between 50 mL and 250 mL. ***Concentration:*** 40 and 10 mg/mL of ceftazidime and avibactam, respectively to 8 and 2 mg/mL of ceftazidime and avibactam, respectively. Solution ranges from clear to light yellow; do not administer solutions that are discolored or contain particulate matter. Solution is stable for 12 hr at room temperature or 24 hr if refrigerated. ***Rate:*** Infuse over 2 hr.

- **Y-Site Compatibility:** daptomycin, dexmedetomidine, dopamine, ertapenem, furosemide, gentamicin, heparin, imipenem/cilastatin, linezolid, magnesium sulfate, meropenem, norepinephrine, phenylephrine, potassium chloride, potassium phosphates, sodium bicarbonate, tobramycin, vasopressin, vecuronium.

Patient/Family Teaching

- Explain the purpose of ceftazidime/avibactam to patient.
- Instruct patient to notify health care professional if fever and diarrhea develop, especially if stool contains blood, pus, or mucus. Advise patient not to treat diarrhea without consulting health care professional.
- Advise patient to notify health care professional immediately if signs and symptoms of allergic reactions or nervous system reactions occur.
- Advise female patient to notify health care professional if pregnancy is planned or suspected or if breast feeding.

Evaluation/Desired Outcomes

- Resolution of the signs and symptoms of infection. Length of time for complete resolution depends on the organism and site of infection.

ceftolozane/tazobactam

(sef-**tol**-o-zane/taz-oh-**bak**-tam)

Zerbaxa

Classification

Therapeutic: anti-infectives

Pharmacologic: cephalosporin derivatives, beta-lactamase inhibitors

Indications

Complicated intra-abdominal infections (cIAI) (in combination with metronidazole). Complicated urinary tract infections (cUTI) (including pyelonephritis). Hospital-acquired bacterial pneumonia (HABP) and ventilator-associated bacterial pneumonia (VABP).

Action

Ceftolozane: binds to bacterial cell wall membrane, causing cell death. Spectrum is extended compared with other penicillins. Tazobactam: Inhibits beta-lactamase, an enzyme that can destroy penicillins.

Therapeutic Effects: Death of susceptible bacteria.

Spectrum: Active against *Bacteroides fragilis*, *Enterobacter cloacae*, *Escherichia coli*, *Haemophilus influenzae*, *Klebsiella oxytoca*, *Klebsiella pneumoniae*, *Proteus mirabilis*, *Pseudomonas aeruginosa*, *Serratia marcesens*, *Streptococcus anginosus*, *Streptococcus constellatus*, and *Streptococcus salivarius*.

Pharmacokinetics

Absorption: IV administration results in complete bioavailability.

Distribution: Unknown.

Metabolism and Excretion: *Ceftolozane*—minimal metabolism, excreted almost entirely (>95%) unchanged in urine; *tazobactam*—80% excreted unchanged in urine, some metabolized to an inactive M1 metabolite which is excreted unchanged in urine.

Half-life: *Ceftolozane*—2.8 hr; *tazobactam*—0.9 hr.

TIME/ACTION PROFILE

ROUTE	ONSET	PEAK	DURATION
IV	rapid	end of infusion	8 hr

Contraindications/Precautions

Contraindicated in: Known serious hypersensitivity to ceftolozane/tazbactam, piperacillin/tazobactam or other beta-lactams.

Use Cautiously in: CCr 30–<50 mL/min (effectiveness may be ↓); CCr <50 mL/min (dose adjustment recommended); OB: Use during pregnancy only if potential benefit outweighs potential risks; Lactation: Use cautiously if breast feeding; Pedi: Safety and effectiveness not established.

Adverse Reactions/Side Effects

CV: atrial fibrillation, hypotension. **Derm:** rash. **F and E:** hypokalemia. **GI:** abdominal pain, constipation, diarrhea, CLOSTRIDIOIDES DIFFICILE-ASSOCIATED DIARRHEA (CDAD), nausea, vomiting. **Hemat:** anemia, thrombocytosis. **Neuro:** anxiety, dizziness, headache, insomnia. **Misc:** HYPERSENSITIVITY REACTIONS (including anaphylaxis).

Interactions

Drug-Drug: None reported.

Route/Dosage

cIAI or cUTI

IV (Adults): 1.5 g (1 g ceftolozane/0.5 g tazobactam) every 8 hr for 4–14 days for cIAI or 7 days for cUTI.

Renal Impairment

(Adults): *CCr 30–50 mL/min*—750 mg (500 mg ceftolozane/250 mg tazobactam) every 8 hr; *CCr 15–29 mL/min*—375 mg (250 mg ceftolozane/125 mg tazobactam) every 8 hr; *End-stage renal disease on hemodialysis*—Single loading dose of 750 mg (500 mg ceftolozane/250 mg tazobactam), then 150 mg (100 mg

© F.A. Davis Publishing

ceftolozane/50 mg tazobactam) every 8 hr (on dialysis days administer as soon as possible after dialysis).

HABP or VABP

IV (Adults): 3 g (2 g ceftolozane/1 g tazobactam) every 8 hr for 8–14 days.

Renal Impairment

(Adults): *CCr 30–50 mL/min*—1.5 g (1 g ceftolozane/0.5 g tazobactam) every 8 hr; *CCr 15–29 mL/min*—750 mg (500 mg ceftolozane/250 mg tazobactam) every 8 hr; *End-stage renal disease on hemodialysis*—Single loading dose of 2.25 g (1.5 g ceftolozane/0.75 g tazobactam), then 450 mg (300 mg ceftolozane/150 mg tazobactam) every 8 hr (on dialysis days administer as soon as possible after dialysis).

Availability

Powder for injection (requires reconstitution and dilution): 1 g ceftolozane/0.5 g tazobactam/vial.

NURSING IMPLICATIONS

Assessment

- Assess for infection (vital signs; appearance of wound, sputum, urine, and stool; WBC) at beginning of and throughout therapy.
- Before initiating therapy, obtain a history to determine previous use of and reactions to penicillins, cephalosporins, or other beta-lactams. Persons with a negative history of sensitivity may still have an allergic response.
- Obtain specimens for culture and sensitivity before initiating therapy. First dose may be given before receiving results.
- Observe patient for signs and symptoms of anaphylaxis (rash, pruritus, laryngeal edema, wheezing). Discontinue the drug and notify health care professional immediately if these symptoms occur. Keep epinephrine, an antihistamine, and resuscitation equipment close by in the event of an anaphylactic reaction.
- Monitor bowel function. Diarrhea, abdominal cramping, fever, and bloody stools should be reported to health care professional promptly as a sign of (CDAD). May begin up to several mo following cessation of therapy.
- ***Lab Test Considerations:*** Monitor creatinine clearance at least daily in patients with changing renal function and adjust dose accordingly.

Implementation

IV Administration

- **Intermittent Infusion:** Reconstitute with 10 mL of sterile water for injection or 0.9% NaCl for injection; shake gently to dissolve for final volume of 11.4 mL. ***Dilution:*** Withdraw 11.4 mL for 1.5 g (1.0 g/0.5 g dose, 5.7 mL for 750 mg (500 mg/250 mg) dose, 2.9 mL for 375 mg (250 mg/125 mg) dose, or 1.2 mL for 150 mg (100 mg/50 mg) dose and add to 100 mL of 0.9% NaCl or D5W. Solution is clear, colorless to slightly yellow; do not administer solutions that are discolored or contain particulate matter. Solution is stable for 24 hr at room temperature or 7 days if refrigerated; do not freeze. ***Rate:*** Infuse over 1 hr.
- **Y-Site Compatibility:** amikacin, amiodarone, ampicillin/sulbactam, anidulafungin, azithromycin, bumetanide, calcium chloride, calcium gluconate, cefazolin, cefepime, ceftaroline, ceftazidime, ceftriaxone, cefuroxime, ciprofloxacin, cisatracurium, daptomycin, dexamethasone, dexmedetomidine, digoxin, diltiazem, diphenhydramine, dobutamine, dopamine, doxycycline, ephedrine, epinephrine, eptifibatide, ertapenem, esmolol, esomeprazole, famotidine, fentanyl, filgrastim, fosphenytoin, furosemide, gentamicin, heparin, hydrocortisone, hydromorphone, insulin regular, labetalol, levofloxacin, lidocaine, linezolid, lorazepam, magnesium sulfate, mannitol, meperidine, meropenem, mesna, metoclopramide, micafungin, midazolam, milrinone, morphine, mycophenolate, naloxone, nicardipine, nitroglycerin, nitroprusside, norepinephrine, octreotide, ondansetron, pantoprazole, penicillin G, phenylephrine, piperacillin/tazobactam, potassium chloride, potassium phosphates, rocuronium, sodium bicarbonate, sodium phosphates, tacrolimus, tigecycline, tobramycin, vancomycin, vasopressin, vecuronium.
- **Y-Site Incompatibility:** albumin human, amphotericin B lipid complex, amphotericin B liposome, caspofungin, cyclosporine, phenytoin, propofol.
- **Additive Incompatibility:** Do not mix with other drugs or solutions.

Patient/Family Teaching

- Explain the purpose of ceftolozane/tazobactam to patient.
- Instruct patient to notify health care professional if fever and diarrhea develop, especially if stool contains blood, pus, or mucus. Advise patient not to treat diarrhea without consulting health care professional.
- Advise female patient to notify health care professional if pregnancy is planned or suspected or if breast feeding.

Evaluation/Desired Outcomes

- Resolution of the signs and symptoms of infection. Length of time for complete resolution depends on the organism and site of infection.

cefTRIAXone, See CEPHALOSPORINS—THIRD GENERATION.

© F.A. Davis Publishing

cefuroxime, See CEPHALOSPORINS—SECOND GENERATION.

celecoxib (sel-e-**kox**-ib)

CeleBREX

Classification

Therapeutic: antirheumatics
Pharmacologic: COX-2 inhibitors, nonsteroidal anti-inflammatory drugs (NSAIDs)

Indications

Osteoarthritis. Rheumatoid arthritis. Ankylosing spondylitis. Juvenile rheumatoid arthritis. Acute pain. Primary dysmenorrhea.

Action

Inhibits the enzyme COX-2. This enzyme is required for the synthesis of prostaglandins. Has analgesic, anti-inflammatory, and antipyretic properties. **Therapeutic Effects:** Decreased pain and inflammation caused by osteoarthritis, rheumatoid arthritis, ankylosing spondylitis, or juvenile rheumatoid arthritis. Decreased acute pain.

Pharmacokinetics

Absorption: Bioavailability unknown.
Distribution: Extensively distributed to tissues.
Protein Binding: 97%.
Metabolism and Excretion: Mostly metabolized by the hepatic CYP2C9 isoenzyme; the CYP2C9 enzyme system exhibits genetic polymorphism; poor metabolizers may have significantly ↑ celecoxib concentrations and an ↑ risk of adverse effects; <3% excreted unchanged in urine and feces.
Half-life: 11 hr.

TIME/ACTION PROFILE (pain reduction)

ROUTE	ONSET	PEAK	DURATION
PO	24–48 hr	unknown	12–24 hr†

†After discontinuation.

Contraindications/Precautions

Contraindicated in: Hypersensitivity; Cross-sensitivity may exist with other NSAIDs, including aspirin; History of allergic-type reactions to sulfonamides; History of asthma, urticaria, or allergic-type reactions to aspirin or other NSAIDs, including the aspirin triad (asthma, nasal polyps, and severe hypersensitivity reactions to aspirin); Advanced renal disease; Severe hepatic impairment; Coronary artery bypass graft (CABG) surgery; OB: Avoid use after 30 wk gestation.
Use Cautiously in: Cardiovascular disease or risk factors for cardiovascular disease (may ↑ risk of serious cardiovascular thrombotic events, myocardial infarction, and stroke, especially with prolonged use or use of higher doses); avoid use in patients with recent MI or HF; Pre-existing renal disease, heart failure, liver dysfunction, concurrent diuretic, or ACE inhibitor therapy (↑ risk of renal impairment); History of peptic ulcer disease or GI bleeding, long duration of NSAID use, smoking, alcohol use, advanced liver disease, coagulopathy, and poor general health (↑ risk of GI bleeding); Hypertension or fluid retention; Renal impairment (may precipitate acute renal failure); Serious dehydration (correct deficits before administering); Patients who are known or suspected to be poor CYP2C9 metabolizers (↓ initial dose by 50%; in patients with juvenile rheumatoid arthritis, use alternative treatment); Pre-existing asthma; OB: Use at or after 20 wk gestation may cause fetal or neonatal renal impairment; if treatment is necessary between 20 wk and 30 wk gestation, limit use to the lowest effective dose and shortest duration possible; Pedi: Safety not established in children <2 yr or for longer than 6 mo; Geri: ↑ risk of GI bleeding in older adults.
Exercise Extreme Caution in: History of peptic ulcer disease or GI bleeding.

Adverse Reactions/Side Effects

CV: HF, MYOCARDIAL INFARCTION, STROKE, THROMBOSIS, edema, hypertension. **Derm:** DRUG REACTION WITH EOSINOPHILIA AND SYSTEMIC SYMPTOMS (DRESS), EXFOLIATIVE DERMATITIS, STEVENS-JOHNSON SYNDROME (SJS), TOXIC EPIDERMAL NECROLYSIS (TEN), rash. **F and E:** hyperkalemia. **GI:** GI BLEEDING, abdominal pain, diarrhea, dyspepsia, flatulence, nausea. **Neuro:** dizziness, headache, insomnia.

Interactions

Drug-Drug: CYP2C9 inhibitors may ↑ levels and risk of toxicity. May ↓ effectiveness of **ACE inhibitors**, **thiazide diuretics**, and **furosemide**. **Fluconazole** ↑ levels (use lowest recommended dosage). ↑ risk of GI bleeding with **anticoagulants**, **aspirin**, **clopidogrel**, **ticagrelor**, **prasugrel**, **corticosteroids**, **fibrinolytics**, **SNRIs**, or **SSRIs**. May ↑ serum **lithium** levels.

Route/Dosage

Osteoarthritis

PO (Adults): 200 mg once daily *or* 100 mg twice daily. *CYP2C9 poor metabolizers* — ↓ dose by 50%.

Hepatic Impairment

PO (Adults): *Moderate hepatic impairment (Child-Pugh Class B)* — ↓ dose by 50%.

Rheumatoid Arthritis

PO (Adults): 100–200 mg twice daily (capsules). *CYP2C9 poor metabolizers* — ↓ dose by 50%.

Hepatic Impairment

PO (Adults): *Moderate hepatic impairment (Child-Pugh Class B)* — ↓ dose by 50%.

© F.A. Davis Publishing

Ankylosing Spondylitis

PO (Adults): 200 mg once daily (capsules) *or* 100 mg twice daily (capsules); may ↑ dose after 6 wk to 400 mg/day. *CYP2C9 poor metabolizers*— ↓ dose by 50%.

Hepatic Impairment

PO (Adults): *Moderate hepatic impairment (Child-Pugh Class B)* — ↓ dose by 50%.

Juvenile Rheumatoid Arthritis

PO (Children ≥2 yr, 10–25 kg): 50 mg twice daily (capsules).
PO (Children ≥2 yr, ≥25 kg): 100 mg twice daily (capsules).

Hepatic Impairment

PO (Children ≥2 yr): *Moderate hepatic impairment (Child-Pugh Class B)* — ↓ dose by 50%.

Acute Pain or Primary Dysmenorrhea

PO (Adults): 400 mg initially, then a 200-mg dose if needed on the first day; then 200 mg twice daily as needed (capsules). *CYP2C9 poor metabolizers*— ↓ dose by 50%.

Hepatic Impairment

PO (Adults): *Moderate hepatic impairment (Child-Pugh Class B)* — ↓ dose by 50%.

Availability (generic available)

Capsules: 50 mg, 100 mg, 200 mg, 400 mg. **Cost:** 100 mg $387.18/100, 200 mg $621.67/100, 400 mg $1,576.25/180.

NURSING IMPLICATIONS

Assessment

- Assess range of motion, degree of swelling, and pain in affected joints before and periodically throughout therapy.
- Assess patient for allergy to sulfonamides, aspirin, or NSAIDs. Patients with these allergies should not receive celecoxib.
- Assess patient for skin rash frequently during therapy. Discontinue at first sign of rash; may be life-threatening. SJS may develop. Treat symptomatically; may recur once treatment is stopped.
- Monitor for signs and symptoms of DRESS (fever, rash, lymphadenopathy, facial swelling) periodically during therapy. Discontinue therapy if symptoms occur.
- ***Lab Test Considerations:*** May cause ↑ AST and ALT levels.
- May cause hypophosphatemia, hyperkalemia, and ↑ BUN.

Implementation

- Do not confuse Celebrex (celecoxib) with Celexa (citalopram) or Cerebyx (fosphenytoin).
- Use lowest effective dose for shortest period of time.
- **PO:** May be administered without regard to meals. Capsules may be opened and sprinkled on applesauce and ingested immediately with water. Mixture may be stored in the refrigerator for up to 6 hr.

Patient/Family Teaching

- Instruct patient to take celecoxib as directed. Do not take more than prescribed dose. Increasing doses does not appear to increase effectiveness. Advise patient to read *Medication Guide* before starting therapy and with each Rx refill in case of changes.
- Caution patient to avoid use of more than one NSAID or aspirin at a time; increases risk of GI toxicity. Increasing dose or adding an NSAID or aspirin does not provide increased pain relief but may increase incidence of side effects.
- Advise patient to notify health care professional promptly if signs or symptoms of GI toxicity (abdominal pain, black stools), skin rash, unexplained weight gain, or edema occurs. Patients should discontinue celecoxib and notify health care professional if signs and symptoms of hepatotoxicity (nausea, fatigue, lethargy, pruritus, jaundice, upper right quadrant tenderness, flu-like symptoms) occur.
- May cause hypertension. Instruct patient in correct technique for monitoring BP and to notify health care professional if significant changes occur.
- Inform patient of increased risk of MI and stroke. Use lowest effective dose for shortest time. Advise patient to notify health care professional immediately if signs and symptoms (shortness of breath or trouble breathing, chest pain, weakness in one part or side of body, slurred speech, swelling of the face or throat) occur.
- Rep: May cause fetal harm. Advise females of reproductive potential to notify health care professional if pregnancy is planned or suspected or if breast feeding. Advise women to avoid celecoxib in the 3rd trimester of pregnancy (after 29 wk), may cause premature closure of the fetal ductus arteriosus. Use of celecoxib after 20 wk may cause fetal renal dysfunction leading to oligohydramnios. May cause reversible infertility in women attempting to conceive; may consider discontinuing celecoxib.

Evaluation/Desired Outcomes

- Reduction in joint pain in patients with osteoarthritis.
- Reduction in joint tenderness, pain, and joint swelling in patients with rheumatoid arthritis, juvenile rheumatoid arthritis, and ankylosing spondylitis.
- Decreased pain.
- Decreased pain with dysmenorrhea.

cephalexin, See CEPHALOSPORINS—FIRST GENERATION.

© F.A. Davis Publishing

CEPHALOSPORINS—FIRST GENERATION

cefadroxil (sef-a-**drox**-ill)
~~Duricef~~

ceFAZolin (sef-**a**-zoe-lin)
~~Ancef~~

cephalexin (sef-a-**lex**-in)
Keflex

Classification
Therapeutic: anti-infectives
Pharmacologic: first-generation cephalosporins

Indications

Treatment of the following infections caused by susceptible organisms: Skin and skin structure infections (including burn wounds), Pneumonia, Urinary tract infections, Bone and joint infections, Septicemia. Not suitable for the treatment of meningitis. **Cefadroxil:** Pharyngitis and/or tonsillitis. **Cefazolin:** Perioperative prophylaxis, biliary tract infections, genital infections, bacterial endocarditis prophylaxis for dental and upper respiratory tract procedures. **Cephalexin:** Otitis media.

Action

Bind to bacterial cell wall membrane, causing cell death. **Therapeutic Effects:** Bactericidal action against susceptible bacteria. **Spectrum:** Active against many gram-positive cocci including: *Streptococcus pneumoniae*, Group A beta-hemolytic streptococci, Penicillinase-producing staphylococci. Not active against: Methicillin-resistant staphylococci, *Bacteroides fragilis*, *Enterococcus*. Active against some gram-negative rods including: *Klebsiella pneumoniae*, *Proteus mirabilis*, *Escherichia coli*.

Pharmacokinetics

Absorption: *Cefadroxil* and *cephalexin* are well absorbed following oral administration. *Cefazolin* is well absorbed following IM administration.
Distribution: Widely distributed. Cefazolin penetrates bone and synovial fluid well. All cross the placenta and enter breast milk in low concentrations. Minimal CSF penetration.
Metabolism and Excretion: Excreted almost entirely unchanged by the kidneys.
Half-life: *Cefadroxil*—60–120 min; *cefazolin*—90–150 min; *cephalexin*—50–80 min (all are ↑ in renal impairment).

TIME/ACTION PROFILE (blood levels)

ROUTE	ONSET	PEAK	DURATION
Cefadroxil PO	rapid	1.5–2 hr	12–24 hr
Cefazolin IM	rapid	0.5–2 hr	6–12 hr
Cefazolin IV	rapid	5 min	6–12 hr
Cephalexin PO	rapid	1 hr	6–12 hr

Contraindications/Precautions

Contraindicated in: Hypersensitivity to cephalosporins; Serious hypersensitivity to penicillins.
Use Cautiously in: Renal impairment (dosage ↓ and/or ↑ dosing interval recommended for: *cefadroxil* and *cephalexin*, if CCr ≤50 mL/min, and *cefazolin*, if CCr <50 mL/min (adults) or <70 mL/min (children); History of GI disease, especially colitis; Geri: Dose adjustment due to age-related ↓ in renal function may be necessary; OB, Lactation: Half-life is shorter and blood levels lower during pregnancy; have been used safely.

Adverse Reactions/Side Effects

GI: CLOSTRIDIOIDES DIFFICILE-ASSOCIATED DIARRHEA (CDAD), diarrhea, nausea, vomiting, cramps. **Derm:** STEVENS-JOHNSON SYNDROME, rashes, pruritus, urticaria. **Hemat:** agranulocytosis, eosinophilia, hemolytic anemia, neutropenia, thrombocytopenia. **Local:** pain at IM site, phlebitis at IV site. **Neuro:** SEIZURES (high doses). **Misc:** allergic reactions including ANAPHYLAXIS and SERUM SICKNESS, superinfection.

Interactions

Drug-Drug: Probenecid ↓ excretion and ↑ blood levels of renally excreted cephalosporins. Concurrent use of **loop diuretics** or **aminoglycosides** may ↑ risk of renal toxicity.

Route/Dosage

Cefadroxil

PO (Adults): *Pharyngitis and tonsillitis*—500 mg every 12 hr or 1 g every 24 hr for 10 days. *Skin and soft-tissue infections*—500 mg every 12 hr or 1 g every 24 hr. *Urinary tract infections*—500 mg–1 g every 12 hr or 1–2 g every 24 hr.
PO (Children): *Pharyngitis, tonsillitis, or impetigo*—15 mg/kg every 12 hr or 30 mg/kg every 24 hr for 10 days. *Skin and soft-tissue infections*—15 mg/kg every 12 hr. *Urinary tract infections*—15 mg/kg every 12 hr.

Renal Impairment

PO (Adults): *CCr 25–50 mL/min*—500 mg every 12 hr; *CCr 10–25 mL/min*—500 mg every 24 hr; *CCr <10 mL/min*—500 mg every 36 hr.

Cefazolin

IM, IV (Adults): *Moderate-to-severe infections*—500 mg–1 g every 6–8 hr. *Mild infections with gram-positive cocci*—250–500 mg every 8 hr. *Uncomplicated urinary tract infection*—1 g every 12 hr. *Pneumococcal pneumonia*—500 mg every 12 hr. *Severe, life-threatening infections (e.g., infective endocarditis or septicemia)*—1–1.5 g every 6 hr. *Perioperative prophylaxis*—1–2 g within 30–60 min prior to incision (an additional 500 mg–1 g should be given for surgeries ≥2 hr). 500 mg–1 g should then be given for all surgeries every 6–8 hr for 24 hr following the surgery.

© F.A. Davis Publishing

IV (Children ≥10 yr and ≥50 kg): *Perioperative prophylaxis*—2 g within 30–60 min prior to incision (an additional 500 mg–1 g should be given for surgeries ≥2 hr). 500 mg–1 g should then be given for all surgeries every 6–8 hr for 24 hr following the surgery.
IV (Children ≥10 yr and <50 kg): *Perioperative prophylaxis*—1 g within 30–60 min prior to incision (an additional 500 mg–1 g should be given for surgeries ≥2 hr). 500 mg–1 g should then be given for all surgeries every 6–8 hr for 24 hr following the surgery.
IV (Children): *Mild to moderate infections*—25–50 mg/kg/day divided into 3 or 4 equal doses. *Severe infections*—100 mg/kg/day divided into 3 or 4 equal doses.

Renal Impairment

IV (Adults): *CCr 30–49 mL/min*—1–2 g every 8–12 hr; *CCr 10–29 mL/min*—1 g every 12 hr; *CCr ≤10 mL/min*—500 mg–1 g every 24 hr. *Hemodialysis*—500 mg–1 g every 24 hr (on hemodialysis days, give dose after dialysis). *Peritoneal dialysis*—500 mg every 12 hr *or* 1 g every 24 hr.

Renal Impairment

(Children): *CCr 40–70 mL/min*—Give 60% of normal daily dose in 2 divided doses (every 12 hr). *CCr 20–40 mL/min*—Give 25% of normal daily dose in 2 divided doses (every 12 hr). *CCr 5–20 mL/min*—Give 10% of normal daily dose every 24 hr.

Cephalexin

PO (Adults): *Most infections*—250–500 mg every 6 hr. *Uncomplicated cystitis, skin and soft-tissue infections, streptococcal pharyngitis*—500 mg every 12 hr.
PO (Children): *Most infections*—25–50 mg/kg/day divided every 6–8 hr (can be administered every 12 hr in skin/skin structure infections or streptococcal pharyngitis). *Otitis media*—18.75–25 mg/kg every 6 hr (maximum = 4 g/day).

Renal Impairment

PO (Adults): *CCr 10–50 mL/min*—500 mg every 8–12 hr; *CCr <10 mL/min*—250–500 mg every 12–24 hr.

Availability

Cefadroxil (generic available)

Capsules: 500 mg. **Tablets:** 1 g. **Oral suspension (orange-pineapple flavor):** 250 mg/5 mL, 500 mg/5 mL.

Cefazolin (generic available)

Powder for injection: 500 mg/vial, 1 g/vial, 10 g/vial, 20 g/vial. **Premixed containers:** 1 g/50 mL D5W, 2 g/50 mL D5W.

Cephalexin (generic available)

Capsules: 250 mg, 500 mg, 750 mg. **Tablets:** 250 mg, 500 mg. **Oral suspension:** 125 mg/5 mL, 250 mg/5 mL.

C

NURSING IMPLICATIONS

Assessment

- Assess for infection (vital signs; appearance of wound, sputum, urine, and stool; WBC) at beginning and during therapy.
- Before initiating therapy, obtain a history to determine previous use of and reactions to penicillins or cephalosporins. Persons with a negative history of penicillin sensitivity may still have an allergic response.
- Obtain specimens for culture and sensitivity before initiating therapy. First dose may be given before receiving results.
- Observe patient for signs and symptoms of anaphylaxis (rash, pruritus, laryngeal edema, wheezing). Discontinue drug and notify health care professional immediately if these problems occur. Keep epinephrine, an antihistamine, and resuscitation equipment close by in case of an anaphylactic reaction.
- Monitor bowel function. Diarrhea, abdominal cramping, fever, and bloody stools should be reported to health care professional promptly as a sign of *Clostridioides difficile*-associated diarrhea (CDAD). May begin up to several wk following cessation of therapy.
- Assess patient for skin rash frequently during therapy. Discontinue cephalosporins at first sign of rash; may be life-threatening. Stevens-Johnson syndrome or toxic epidermal necrolysis may develop. Treat symptomatically; may recur once treatment is stopped.
- ***Lab Test Considerations:*** May cause positive results for Coombs' test in patients receiving high doses or in neonates whose mothers were given cephalosporins before delivery.
- May cause ↑ AST, ALT, alkaline phosphatase, bilirubin, LDH, BUN, and serum creatinine.
- May rarely cause leukopenia, neutropenia, agranulocytosis, thrombocytopenia, or eosinophilia.

Implementation

- Do not confuse cefazolin with cefotetan, cefoxitin, ceftazidime, or ceftriaxone. Do not confuse Keflex with Keppra.
- **PO:** Administer around the clock. May be administered on full or empty stomach. Administration with food may minimize GI irritation. Shake oral suspension well before administering. Use calibrated measuring device with liquid preparations. Refrigerate oral suspensions.

© F.A. Davis Publishing

Cefazolin

- ***Reconstitution:*** For IM, IV push, and IV intermittent infusion, reconstitute 500-mg vial and 1-g vial with 2 mL and 2.5 mL, respectively, of sterile water for injection to achieve a final concentration of 225 mg/mL or 330 mg/mL, respectively.
- **IM:** Inject deep into a well-developed muscle mass; massage well.

IV Administration

- **IV:** Monitor site frequently for thrombophlebitis (pain, redness, swelling). Change sites every 48–72 hr to prevent phlebitis.
- Do not use solutions that are cloudy or contain a precipitate.
- If aminoglycosides are administered concurrently, administer in separate sites, if possible, at least 1 hr apart. If second site is unavailable, flush line between medications.
- **IV Push:** ***Dilution:*** 0.9% NaCl, D5W, D10W, dextrose/saline combinations, D5/LR. ***Concentration:*** 100 mg/mL. May use up to 138 mg/mL in fluid-restricted patients. ***Rate:*** May administer over 3–5 min.
- **Intermittent Infusion:** ***Dilution:*** Reconstituted 500-mg or 1-g solution may be diluted in 50–100 mL of 0.9% NaCl, D5W, D10W, dextrose/saline combinations, D5/LR. Solution is stable for 24 hr at room temperature and 10 days if refrigerated. ***Concentration:*** 20 mg/mL. ***Rate:*** Administer over 10–60 min.
- **Y-Site Compatibility:** acyclovir, alfentanil, allopurinol, alprostadil, amifostine, aminocaproic acid, aminophylline, amphotericin B lipid complex, amphotericin B liposome, anidulafungin, argatroban, ascorbic acid, atracurium, atropine, azithromycin, aztreonam, benztropine, bivalirudin, bleomycin, bumetanide, buprenorphine, butorphanol, calcium gluconate, carboplatin, carmustine, cefotetan, cefoxitin, ceftazidime, ceftriaxone, cefuroxime, chloramphenicol, cisplatin, clindamycin, cyanocobalamin, cyclophosphamide, cyclosporine, cytarabine, dactinomycin, daptomycin, dexamethasone, dexmedetomidine, digoxin, diltiazem, docetaxel, doxapram, doxorubicin liposome, enalaprilat, ephedrine, epinephrine, epirubicin, epoetin alfa, eptifibatide, esmolol, etoposide, etoposide phosphate, fenoldopam, fentanyl, filgrastim, fluconazole, fludarabine, fluorouracil, folic acid, foscarnet, furosemide, gemcitabine, glycopyrrolate, granisetron, heparin, hydrocortisone, ifosfamide, imipenem/cilastatin, indomethacin, insulin, irinotecan, isoproterenol, ketamine, ketorolac, leucovorin calcium, lidocaine, linezolid, lorazepam, mannitol, melphalan, meperidine, methotrexate, methylprednisolone, metoclopramide, metoprolol, metronidazole, midazolam, milrinone, morphine, multivitamins, nafcillin, nalbuphine, naloxone, nicardipine, nitroglycerin, nitroprusside, norepinephrine, octreotide, ondansetron, oxacillin, oxaliplatin, oxytocin, paclitaxel, palonosetron, pamidronate, pancuronium, penicillin G, phenobarbital, phenylephrine, phytonadione, potassium acetate, potassium chloride, procainamide, propofol, propranolol, remifentanil, rituximab, sargramostim, sodium acetate, sodium bicarbonate, succinylcholine, sufentanil, tacrolimus, theophylline, thiamine, thiotepa, tigecycline, tirofiban, trastuzumab, vasopressin, vecuronium, verapamil, vinblastine, vincristine, vitamin B complex with C, voriconazole, warfarin, zoledronic acid.
- **Y-Site Incompatibility:** alemtuzumab, azathioprine, calcium chloride, caspofungin, cefotaxime, chlorpromazine, dantrolene, diazepam, diazoxide, diphenhydramine, dobutamine, dopamine, doxorubicin hydrochloride, doxycycline, erythromycin, ganciclovir, haloperidol, hydralazine, hydroxyzine, idarubicin, levofloxacin, mitoxantrone, mycophenolate, papaverine, pemetrexed, pentamidine, pentobarbital, phentolamine, phenytoin, prochlorperazine, promethazine, protamine, pyridoxine, quinupristin/dalfopristin, sodium citrate, tobramycin, trimethoprim/sulfamethoxazole, vinorelbine.

Patient/Family Teaching

- Instruct patient to take medication around the clock at evenly spaced times and to finish the medication completely as directed, even if feeling better. Take missed doses as soon as possible unless almost time for next dose; do not double doses. Instruct parents or caregivers to use calibrated measuring device with liquid preparations. Advise patient that sharing this medication may be dangerous.
- Advise patient to report signs of superinfection (furry overgrowth on the tongue, vaginal itching or discharge, loose or foul-smelling stools) and allergy.
- Instruct patient to notify health care professional if rash or fever and diarrhea develop, especially if diarrhea contains blood, mucus, or pus. Advise patient not to treat diarrhea without consulting health care professional.

Evaluation/Desired Outcomes

- Resolution of signs and symptoms of infection. Length of time for complete resolution depends on the organism and site of infection.
- Decreased incidence of infection when used for prophylaxis.

CEPHALOSPORINS—SECOND GENERATION

cefaclor (**sef**-a-klor)

cefoTEtan (sef-oh-**tee**-tan)
Cefotan

cefOXitin (se-**fox**-i-tin)
~~Mefoxin~~

© F.A. Davis Publishing

cefprozil (sef-**proe**-zil)
cefuroxime (se-fyoor-**ox**-eem)
~~Ceftin~~, Zinacef

Classification
Therapeutic: anti-infectives
Pharmacologic: second-generation cephalosporins

Indications
Treatment of the following infections caused by susceptible organisms: Respiratory tract infections, Skin and skin structure infections, Bone and joint infections (not cefaclor or cefprozil), Urinary tract infections (not cefprozil). **Cefotetan and cefoxitin:** Intra-abdominal and gynecologic infections. **Cefuroxime:** Meningitis, gynecologic infections, and Lyme disease. **Cefaclor, cefprozil, cefuroxime:** Otitis media. **Cefoxitin and cefuroxime:** Septicemia. **Cefotetan, cefoxitin, cefuroxime:** Perioperative prophylaxis.

Action
Bind to bacterial cell wall membrane, causing cell death. **Therapeutic Effects:** Bactericidal action against susceptible bacteria. **Spectrum:** Similar to that of first-generation cephalosporins but have ↑ activity against several other gram-negative pathogens including: *Haemophilus influenzae*, *Escherichia coli*, *Klebsiella pneumoniae*, *Morganella morganii*, *Neisseria gonorrhoeae* (including penicillinase-producing strains), *Proteus*, *Providencia*, *Serratia marcescens*, *Moraxella catarrhalis*. Not active against methicillin-resistant staphylococci or enterococci. **Cefuroxime:** Active against *Borrelia burgdorferi*. **Cefotetan and cefoxitin:** Active against *Bacteroides fragilis*.

Pharmacokinetics
Absorption: *Cefotetan, cefoxitin,* and *cefuroxime*—well absorbed following IM administration. *Cefaclor, cefprozil,* and *cefuroxime*—well absorbed following oral administration.
Distribution: Widely distributed. Penetration into CSF is poor, but adequate for cefuroxime (IV) to be used in treating meningitis. All cross the placenta and enter breast milk in low concentrations.
Metabolism and Excretion: Excreted primarily unchanged by the kidneys.
Half-life: *Cefaclor*—30–60 min; *cefotetan*—3–4.6 hr; *cefoxitin*—40–60 min; *cefprozil*—90 min; *cefuroxime*—60–120 min (all are ↑ in renal impairment).

TIME/ACTION PROFILE

ROUTE	ONSET	PEAK	DURATION
Cefaclor PO	rapid	30–60 min	6–12 hr
Cefaclor PO-CD	unknown	unknown	12 hr
Cefotetan IM	rapid	1–3 hr	12 hr
Cefotetan IV	rapid	end of infusion	12 hr
Cefoxitin IM	rapid	30 min	4–8 hr
Cefoxitin IV	rapid	end of infusion	4–8 hr
Cefprozil PO	unknown	1–2 hr	12–24 hr
Cefuroxime PO	unknown	2–3 hr	8–12 hr
Cefuroxime IM	rapid	15–60 min	6–12 hr
Cefuroxime IV	rapid	end of infusion	6–12 hr

Contraindications/Precautions
Contraindicated in: Hypersensitivity to cephalosporins; Serious hypersensitivity to penicillins.
Use Cautiously in: Renal impairment (↓ dose/↑ dosing interval recommended for: *cefotetan* if CCr ≤30 mL/min, *cefoxitin* if CCr ≤50 mL/min, *cefprozil* if CCr <30 mL/min, *cefuroxime* if CCr <30 mL/min); Patients with hepatic dysfunction, poor nutritional state, or cancer may be at ↑ risk for bleeding; History of GI disease, especially colitis; *Cefprozil (oral suspension)* contains aspartame and should be avoided in patients with phenylketonuria; Geri: Dose adjustment due to age-related ↓ in renal function may be necessary; may also be at ↑ risk for bleeding with *cefotetan* or *cefoxitin*; OB, Lactation: Have been used safely.

Adverse Reactions/Side Effects
Derm: rash, urticaria. **GI:** CLOSTRIDIOIDES DIFFICILE-ASSOCIATED DIARRHEA (CDAD), diarrhea, cramps, nausea, vomiting. **Hemat:** agranulocytosis, bleeding (↑ with cefotetan and cefoxitin), eosinophilia, hemolytic anemia, neutropenia, thrombocytopenia. **Local:** pain at IM site, phlebitis at IV site. **Neuro:** SEIZURES (high doses). **Misc:** HYPERSENSITIVITY REACTIONS (including anaphylaxis and serum sickness), superinfection.

Interactions
Drug-Drug: Probenecid ↓ excretion and ↑ blood levels. If **alcohol** is ingested within 48–72 hr of cefotetan, a disulfiram-like reaction may occur. Cefotetan may ↑ risk of bleeding with **anticoagulants**, **antiplatelet agents**, **thrombolytics**, and **NSAIDs**. **Antacids** ↓ absorption of cefaclor. Concurrent use of **aminoglycosides** or **loop diuretics** may ↑ risk of nephrotoxicity.

© F.A. Davis Publishing

Route/Dosage

Cefaclor

PO (Adults): 250–500 mg every 8 hr or 375–500 mg every 12 hr as extended-release tablets.
PO (Children >1 mo): 6.7–13.4 mg/kg every 8 hr or 10–20 mg/kg every 12 hr (up to 1 g/day).

Cefotetan

IM, IV (Adults): *Most infections*—1–2 g every 12 hr. *Severe/life-threatening infections*—2–3 g every 12 hr. *Urinary tract infections*—500 mg–2 g every 12 hr *or* 1–2 g every 24 hr. *Perioperative prophylaxis*—1–2 g 30–60 min before initial incision (one-time dose).

Renal Impairment

IM, IV (Adults): *CCr 10–30 mL/min*—Usual adult dose every 24 hr *or* ½ usual adult dose every 12 hr; *CCr <10 mL/min*—Usual adult dose every 48 hr *or* ¼ usual adult dose every 12 hr.

Cefoxitin

IM, IV (Adults): *Most infections*—1 g every 6–8 hr. *Severe infections*—1 g every 4 hr *or* 2 g every 6–8 hr. *Life-threatening infections*—2 g every 4 hr *or* 3 g every 6 hr. *Perioperative prophylaxis*—2 g 30–60 min before initial incision, then 2 g every 6 hr for up to 24 hr.
IM, IV (Children and Infants >3 mo): *Most infections*—13.3–26.7 mg/kg every 4 hr *or* 20–40 mg/kg every 6 hr. *Perioperative prophylaxis*—30–40 mg/kg within 60 min of initial incision, then 30–40 mg/kg every 6 hr for up to 24 hr.

Renal Impairment

IM, IV (Adults): *CCr 30–50 mL/min*—1–2 g every 8–12 hr; *CCr 10–29 mL/min*—1–2 g every 12–24 hr; *CCr 5–9 mL/min*—0.5–1 g every 12–24 hr; *CCr <5 mL/min*—0.5–1 g every 24–48 hr.

Cefprozil

PO (Adults): *Most infections*—250–500 mg every 12 hr *or* 500 mg every 24 hr.
PO (Children 6 mo–12 yr): *Otitis media*—15 mg/kg every 12 hr. *Acute sinusitis*—7.5–15 mg/kg every 12 hr (higher dose should be used for moderate-to-severe infections).
PO (Children 2–12 yr): *Pharyngitis/tonsillitis*—7.5 mg/kg every 12 hr. *Skin/skin structure infections*—20 mg/kg every 24 hr.

Renal Impairment

PO (Adults and Children ≥6 mo): *CCr <30 mL/min*—½ of usual dose at normal dosing interval.

Cefuroxime

PO (Adults and Children >12 yr): *Pharyngitis/tonsillitis, maxillary sinusitis, uncomplicated UTIs*—250 mg every 12 hr. *Bronchitis, uncomplicated skin/skin structure infections*—250–500 mg every 12 hr. *Gonorrhea*—1 g (single dose). *Lyme disease*—500 mg every 12 hr for 20 days.
PO (Children 3 mo–12 yr): *Otitis media, acute bacterial maxillary sinusitis, impetigo*—250 mg every 12 hr.
IM, IV (Adults): *Uncomplicated urinary tract infections, skin/skin structure infections, disseminated gonococcal infections, uncomplicated pneumonia*—750 mg every 8 hr. *Bone/joint infections, severe or complicated infections*—1.5 g every 8 hr. *Life-threatening infections*—1.5 g every 6 hr. *Meningitis*—3 g every 8 hr. *Perioperative prophylaxis*—1.5 g IV 30–60 min before initial incision; 750 mg IM/IV every 8 hr can be given when procedure prolonged. *Prophylaxis during open-heart surgery*—1.5 g IV at induction of anesthesia and then every 12 hr for 3 additional doses. *Gonorrhea*—1.5 g IM (750 mg in two sites) with 1 g probenecid PO.
IM, IV (Children and Infants >3 mo): *Most infections*—12.5–25 mg/kg every 6 hr *or* 16.7–33.3 mg/kg every 8 hr (max dose = 6 g/day). *Bone and joint infections*—50 mg/kg every 8 hr (max dose = 6 g/day). *Bacterial meningitis*—50–60 mg/kg every 6 hr *or* 66.7–80 mg/kg every 8 hr.

Renal Impairment

IM, IV (Adults): *CCr 10–29 mL/min*—Give standard dose every 24 hr; *CCr <10 mL/min (no hemodialysis)*—Give standard dose every 48 hr; *Hemodialysis*—Give an additional dose at end of each dialysis session.

Availability

Cefaclor (generic available)

Capsules: 250 mg, 500 mg. **Extended-release tablets:** 375 mg, 500 mg. **Oral suspension (strawberry):** 125 mg/5 mL, 187 mg/5 mL, 250 mg/5 mL, 375 mg/5 mL.

Cefotetan (generic available)

Powder for injection: 1 g/vial, 2 g/vial. **Premixed infusion:** 1 g/50 mL, 2 g/50 mL.

Cefoxitin (generic available)

Powder for injection: 1 g/vial, 2 g/vial, 10 g/vial.

Cefprozil (generic available)

Oral suspension (bubblegum flavor): 125 mg/5 mL, 250 mg/5 mL. **Tablets:** 250 mg, 500 mg.

Cefuroxime (generic available)

Powder for injection : 750 mg/vial, 1.5 g/vial, 7.5 g/vial. **Premixed infusion:** 750 mg/50 mL, 1.5 g/50 mL. **Tablets:** 250 mg, 500 mg.

NURSING IMPLICATIONS

Assessment

- Assess for infection (vital signs; appearance of wound, sputum, urine, and stool; WBC) at beginning and during therapy.

© F.A. Davis Publishing

- Before initiating therapy, obtain a history to determine previous use of and reactions to penicillins or cephalosporins. Persons with a negative history of penicillin sensitivity may still have an allergic response.
- Obtain specimens for culture and sensitivity before initiating therapy. First dose may be given before receiving results.
- Observe patient for signs and symptoms of anaphylaxis (rash, pruritus, laryngeal edema, wheezing). Discontinue the drug immediately if these symptoms occur. Keep epinephrine, an antihistamine, and resuscitation equipment close by in the event of an anaphylactic reaction.
- Monitor bowel function. Diarrhea, abdominal cramping, fever, and bloody stools should be reported to health care professional promptly as a sign of *Clostridioides difficile*-associated diarrhea (CDAD). May begin up to several wk following cessation of therapy.
- ***Lab Test Considerations:*** May cause positive results for Coombs' test in patients receiving high doses or in neonates whose mothers were given cephalosporins before delivery.
- *Cefotetan*—monitor prothrombin time and assess patient for bleeding (guaiac stools; check for hematuria, bleeding gums, ecchymosis) daily in high-risk patients; may cause hypoprothrombinemia.
- May cause ↑ AST, ALT, alkaline phosphatase, bilirubin, LDH, BUN, and serum creatinine.
- *Cefoxitin* may cause falsely ↑ test results for serum and urine creatinine; do not obtain serum samples within 2 hr of administration.
- May rarely cause leukopenia, neutropenia, agranulocytosis, thrombocytopenia, and eosinophilia.

Implementation

- Do not confuse cefotetan with cefazolin, cefoxitin, ceftazidime, or ceftriaxone.
- **PO:** Administer around the clock. May be administered on full or empty stomach. Administration with food may minimize GI irritation. Shake oral suspension well before administering.
- Administer cefaclor extended-release tablets with food; do not crush, break, or chew.
- Do not administer *cefaclor* within 1 hr of antacids.
- *Cefuroxime* tablets should be swallowed whole, not crushed; crushed tablets have a strong, persistent bitter taste. Tablets may be taken without regard to meals.
- **IM:** ***Reconstitution:*** Reconstitute IM doses with sterile or bacteriostatic water for injection or 0.9% NaCl for injection. May be diluted with lidocaine to minimize injection discomfort.
- Inject deep into a well-developed muscle mass; massage well.

IV Administration

- **IV:** Change sites every 48–72 hr to prevent phlebitis. Monitor site frequently for thrombophlebitis (pain, redness, swelling).
- If aminoglycosides are administered concurrently, administer in separate sites if possible, at least 1 hr apart. If second site is unavailable, flush line between medications.

Cefotetan

- **IV Push:** ***Reconstitution:*** Reconstitute each gram with at least 10 mL of sterile or bacteriostatic water for injection, 0.9% NaCl, or D5W. Do not use preparations containing benzyl alcohol for neonates. ***Concentration:*** 95 mg/mL. ***Rate:*** Administer slowly over 3–5 min.
- **Intermittent Infusion:** ***Dilution:*** Reconstituted solution may be further diluted in 50–100 mL of D5W or 0.9% NaCl. Solution may be colorless or yellow. Solution is stable for 24 hr at room temperature or 96 hr if refrigerated. ***Concentration:*** 10–40 mg/mL. ***Rate:*** Administer over 20–30 min.
- **Y-Site Compatibility:** acyclovir, alfentanil, allopurinol, amifostine, aminocaproic acid, aminophylline, amphotericin B lipid complex, anidulafungin, argatroban, arsenic trioxide, ascorbic acid, atropine, azithromycin, aztreonam, benztropine, bivalirudin, bleomycin, bumetanide, buprenorphine, butorphanol, calcium chloride, calcium gluconate, carboplatin, carmustine, cefazolin, cefotaxime, cefoxitin, ceftriaxone, cefuroxime, chloramphenicol, cisplatin, clindamycin, cyanocobalamin, cyclophosphamide, cyclosporine, cytarabine, dacarbazine, dactinomycin, daptomycin, dexamethasone, dexmedetomidine, dexrazoxane, digoxin, diltiazem, docetaxel, dopamine, doxorubicin liposomal, enalaprilat, ephedrine, epinephrine, epoetin alfa, eptifibatide, etoposide, etoposide phosphate, fenoldopam, fentanyl, filgrastim, fluconazole, fludarabine, fluorouracil, folic acid, foscarnet, fosphenytoin, furosemide, gemcitabine, glycopyrrolate, granisetron, heparin, hetastarch, hydrocortisone, hydromorphone, ifosfamide, imipenem/cilastatin, irinotecan, isoproterenol, ketorolac, lactated Ringer's injection, leucovorin calcium, levofloxacin, lidocaine, linezolid, lorazepam, magnesium sulfate, mannitol, melphalan, mesna, methotrexate, methylprednisolone, metoclopramide, metoprolol, metronidazole, milrinone, mitoxantrone, morphine, multivitamins, nafcillin, nalbuphine, naloxone, nitroglycerin, nitroprusside, norepinephrine, octreotide, oxacillin, oxaliplatin, oxytocin, paclitaxel, palonosetron, pamidronate, pancuronium, penicillin G, phenylephrine, phytonadione, potassium acetate, potassium chloride, procainamide, propofol, propranolol, pyridoxine, remifentanil, rituximab, rocuronium, sargramostim,

© F.A. Davis Publishing

sodium acetate, succinylcholine, sufentanil, tacrolimus, theophylline, thiamine, thiotepa, tigecycline, tirofiban, topotecan, vasopressin, vecuronium, verapamil, vinblastine, vincristine, voriconazole, zoledronic acid.

- **Y-Site Incompatibility:** alemtuzumab, amiodarone, amphotericin B deoxycholate, amphotericin B liposome, azathioprine, caspofungin, chlorpromazine, dantrolene, daunorubicin hydrochloride, diazepam, diphenhydramine, dobutamine, doxorubicin hydrochloride, doxycycline, epirubicin, erythromycin, esmolol, ganciclovir, gemtuzumab ozogamicin, gentamicin, haloperidol, hydralazine, hydroxyzine, idarubicin, indomethacin, labetalol, minocycline, mitomycin, mycophenolate, pantoprazole, papaverine, pemetrexed, pentamidine, pentobarbital, phenobarbital, phentolamine, phenytoin, prochlorperazine, promethazine, protamine, quinupristin/dalfopristin, sodium bicarbonate, tobramycin, trastuzumab, trimethoprim/sulfamethoxazole, vinorelbine.

Cefoxitin

- **IV Push:** ***Reconstitution:*** Reconstitute each gram with at least 10 mL of sterile or bacteriostatic water for injection, 0.9% NaCl, or D5W. Do not use preparations containing benzyl alcohol for neonates. ***Concentration:*** 200 mg/mL. ***Rate:*** Administer slowly over 3–5 min.
- **Intermittent Infusion:** ***Dilution:*** Reconstituted solution may be further diluted in 50–100 mL of D5W, D10W, 0.9% NaCl, dextrose/saline combinations, D5/LR, Ringer's or LR. Stable for 24 hr at room temperature and 1 wk if refrigerated. Darkening of powder does not alter potency. ***Concentration:*** 40 mg/mL. ***Rate:*** Administer over 30–60 min.
- **Continuous Infusion:** May be diluted in 500–1000 mL for continuous infusion.
- **Y-Site Compatibility:** acetaminophen, acyclovir, alfentanil, amifostine, aminocaproic acid, aminophylline, amphotericin B lipid complex, amphotericin B liposome, anidulafungin, argatroban, arsenic trioxide, ascorbic acid, atropine, azithromycin, aztreonam, benztropine, bivalirudin, bleomycin, bumetanide, buprenorphine, butorphanol, calcium chloride, calcium gluconate, cangrelor, carboplatin, carmustine, cefazolin, cefotaxime, cefotetan, ceftazidime, ceftriaxone, cefuroxime, chloramphenicol, cisplatin, clindamycin, cyanocobalamin, cyclophosphamide, cyclosporine, cytarabine, dacarbazine, dactinomycin, daptomycin, dexamethasone, dexmedetomidine, dexrazoxane, digoxin, diltiazem, docetaxel, dopamine, doxorubicin liposome, enalaprilat, ephedrine, epinephrine, epoetin alfa, eptifibatide, esmolol, etoposide, etoposide phosphate, fentanyl, fluconazole, fludarabine, fluorouracil, folic acid, foscarnet, fosphenytoin, furosemide, gemcitabine, glycopyrrolate, granisetron, heparin, hydrocortisone, hydromorphone, ifosfamide, imipenem/cilastatin, indomethacin, irinotecan, isoproterenol, ketorolac, lactated Ringer's injection, leucovorin calcium, lidocaine, linezolid, lorazepam, magnesium sulfate, mannitol, meperidine, mesna, methotrexate, metoclopramide, metoprolol, metronidazole, midazolam, milrinone, mitomycin, morphine, multivitamins, nafcillin, nalbuphine, naloxone, nitroglycerin, nitroprusside, norepinephrine, octreotide, ondansetron, oxacillin, oxaliplatin, oxytocin, paclitaxel, palonosetron, pamidronate, pantoprazole, penicillin G, phenylephrine, phytonadione, plazomicin, potassium acetate, potassium chloride, procainamide, propofol, propranolol, pyridoxine, remifentanil, rituximab, rocuronium, sodium acetate, succinylcholine, sufentanil, tacrolimus, theophylline, thiamine, thiotepa, tigecycline, tirofiban, topotecan, vasopressin, vecuronium, verapamil, vinblastine, vincristine, voriconazole, zoledronic acid.
- **Y-Site Incompatibility:** alemtuzumab, azathioprine, caspofungin, chlorpromazine, dantrolene, daunorubicin hydrochloride, diazepam, diazoxide, diphenhydramine, dobutamine, doxorubicin hydrochloride, doxycycline, epirubicin, erythromycin, fenoldopam, filgrastim, ganciclovir, gemtuzumab ozogamicin, haloperidol, hetastarch, hydralazine, hydroxyzine, idarubicin, insulin, regular, labetalol, levofloxacin, methylprednisolone, minocycline, mitoxantrone, mycophenolate, papaverine, pemetrexed, pentamidine, pentobarbital, phenobarbital, phentolamine, phenytoin, prochlorperazine, promethazine, protamine, quinupristin/dalfopristin, sodium bicarbonate, trastuzumab, trimethoprim/sulfamethoxazole, vinorelbine.

Cefuroxime

- **IV Push:** ***Reconstitution:*** Reconstitute 750 mg vial with 8.3 mL, 1.5 g vial with 16 mL, and 7.5 g vial with 77 mL of sterile water for injection, respectively. Do not use preparations containing benzyl alcohol for neonates. ***Rate:*** Administer slowly over 3–5 min.
- **Intermittent Infusion:** ***Dilution:*** Dilute further in 50–100 mL of 0.9% NaCl, D5W, or 0.45% NaCl. Stable for 24 hr at room temperature and 7 days if refrigerated. ***Concentration:*** 10–40 mg/mL. ***Rate:*** Administer over 15–60 min.
- **Continuous Infusion:** May also be diluted in 500–1000 mL 0.9% NaCl, D5W, D10W, D5/0.9% NaCl, D5/.45 NaCl, or 1/6 M sodium lactate injection for continuous infusion.
- **Y-Site Compatibility:** acyclovir, alfentanil, allopurinol, amifostine, aminocaproic acid, aminophylline, amphotericin B lipid complex, amphotericin B liposome, anidulafungin, argatroban, arsenic trioxide, ascorbic acid, atracurium, atropine, aztreonam, benztropine, bivalirudin, bleomycin, bumetanide, buprenorphine, butorphanol, calcium gluconate, cangrelor, carboplatin, carmustine, cefazolin, cefo-

© F.A. Davis Publishing

taxime, cefotetan, cefoxitin, ceftazidime, ceftolozane/tazobactam, ceftriaxone, chloramphenicol, cisplatin, clindamycin, cyclophosphamide, cyanocobalamin, cyclophosphamide, cyclosporine, cytarabine, dacarbazine, dactinomycin, daptomycin, dexmedetomidine, dexrazoxane, digoxin, diltiazem, docetaxel, dopamine, doxorubicin liposomal, enalaprilat, ephedrine, epinephrine, epoetin alfa, eptifibatide, erythromycin, esmolol, etoposide, etoposide phosphate, famotidine, fenoldopam, fentanyl, fludarabine, fluorouracil, folic acid, foscarnet, fosphenytoin, furosemide, gemcitabine, gemtuzumab ozogamicin, glycopyrrolate, granisetron, heparin, hetastarch, hydrocortisone, hydromorphone, ifosfamide, imipenem/cilastatin, indomethacin, insulin, regular, irinotecan, isoproterenol, ketamine, ketorolac, leucovorin calcium, levofloxacin, lidocaine, linezolid, lorazepam, mannitol, melphalan, meperidine, meropenem/vaborbactam, mesna, methotrexate, methylprednisolone, metoclopramide, metoprolol, milrinone, morphine, multivitamins, nafcillin, nalbuphine, naloxone, nitroglycerin, nitroprusside, norepinephrine, octreotide, ondansetron, oxacillin, oxaliplatin, oxytocin, paclitaxel, palonosetron, pamidronate, pancuronium, pemetrexed, penicillin G, phenylephrine, phytonadione, plazomicin, potassium acetate, potassium chloride, procainamide, propofol, propranolol, pyridoxine, remifentanil, rituximab, rocuronium, sargramostim, sodium acetate, succinylcholine, sufentanil, tacrolimus, tedizolid, theophylline, thiamine, thiotepa, tigecycline, tirofiban, topotecan, trastuzumab, vasopressin, vecuronium, verapamil, vinblastine, vincristine, voriconazole, zoledronic acid.

- **Y-Site Incompatibility:** alemtuzumab, azathioprine, calcium chloride, caspofungin, chlorpromazine, dantrolene, daunorubicin, daunorubicin hydrochloride, dexamethasone, diazepam, diphenhydramine, dobutamine, doxorubicin hydrochloride, doxycycline, epirubicin, filgrastim, ganciclovir, haloperidol, hydralazine, hydroxyzine, idarubicin, isavuconazonium, labetalol, magnesium sulfate, midazolam, minocycline, mitomycin, mitoxantrone, mycophenolate, nicardipine, papaverine, pentamidine, pentobarbital, phenobarbital, phentolamine, phenytoin, prochlorperazine, promethazine, protamine, quinupristin/dalfopristin, sodium bicarbonate, trimethoprim/sulfamethoxazole, vinorelbine.

Patient/Family Teaching

- Instruct patient to take medication around the clock at evenly spaced times and to finish the medication completely, even if feeling better. Take missed doses as soon as possible unless almost time for next dose; do not double doses. Use calibrated measuring device with liquid preparations. Advise patient that sharing of this medication may be dangerous.
- Advise patient to report signs of superinfection (furry overgrowth on the tongue, vaginal itching or discharge, loose or foul-smelling stools) and allergy.
- Caution patients that concurrent use of alcohol with *cefotetan* may cause a disulfiram-like reaction (abdominal cramps, nausea, vomiting, headache, hypotension, palpitations, dyspnea, tachycardia, sweating, flushing). Alcohol and alcohol-containing medications should be avoided during and for several days after therapy.
- Instruct patient to notify health care professional if fever and diarrhea develop, especially if stool contains blood, pus, or mucus. Advise patient not to treat diarrhea without consulting health care professional.
- Advise females of reproductive potential to notify health care professional if pregnancy is planned or suspected, or if breast feeding.

Evaluation/Desired Outcomes

- Resolution of signs and symptoms of infection. Length of time for complete resolution depends on the organism and site of infection.
- Decreased incidence of infection when used for prophylaxis.

CEPHALOSPORINS—THIRD GENERATION

cefdinir (**sef**-di-nir)
~~Omnicef~~

cefixime (sef-**ik**-seem)
Suprax

cefotaxime (sef-oh-**taks**-eem)
~~Claforan~~

cefpodoxime (sef-poe-**dox**-eem)

cefTAZidime (sef-**tay**-zi-deem)
Fortaz, Tazicef

cefTRIAXone (sef-try-**ax**-one)
~~Rocephin~~

Classification
Therapeutic: anti-infectives
Pharmacologic: third-generation cephalosporins

Indications

Treatment of the following infections caused by susceptible organisms: Skin and skin structure infections

© F.A. Davis Publishing

(not cefixime), Urinary and gynecologic infections (not cefdinir), Respiratory tract infections (not cefdinir). **Cefotaxime, ceftazidime, ceftriaxone:** Meningitis and bone/joint infections. **Cefotaxime, ceftazidime, ceftriaxone:** Intra-abdominal infections and septicemia. **Cefdinir, cefixime, cefpodoxime, ceftriaxone:** Otitis media. **Cefotaxime, ceftriaxone:** Perioperative prophylaxis. **Ceftazidime:** Febrile neutropenia. **Cefotaxime, ceftriaxone:** Lyme disease.

Action

Bind to the bacterial cell wall membrane, causing cell death. **Therapeutic Effects:** Bactericidal action against susceptible bacteria. **Spectrum:** Similar to that of second-generation cephalosporins, but activity against staphylococci is less, whereas activity against gram-negative pathogens is greater, even for organisms resistant to first- and second-generation agents. Notable is increased action against: *Enterobacter*, *Haemophilus influenzae*, *Escherichia coli*, *Klebsiella pneumoniae*, *Neisseria gonorrhoeae*, *Citrobacter*, *Morganella*, *Proteus*, *Providencia*, *Serratia*, *Moraxella catarrhalis*, *Borrelia burgdorferi*. Some agents have activity against *N. meningitidis* (cefotaxime, ceftazidime, ceftriaxone). Some agents have enhanced activity against *Pseudomonas aeruginosa* (ceftazidime). Not active against methicillin-resistant staphylococci or enterococci. Some agents have activity against anaerobes, including *Bacteroides fragilis* (cefotaxime, ceftriaxone).

Pharmacokinetics

Absorption: *Cefotaxime, ceftazidime,* and *ceftriaxone* are well absorbed after IM administration. *Cefixime* 40–50% absorbed after oral administration (oral suspension); *cefdinir* 16–25% absorbed after oral administration. *Cefpodoxime proxetil* is a prodrug that is converted to its active component in GI tract during absorption (50% absorbed).

Distribution: Widely distributed. Cross the placenta; enter breast milk in low concentrations. CSF penetration better than with first- and second-generation agents.

Protein Binding: *Ceftriaxone* ≥90%.

Metabolism and Excretion: *Cefdinir* and *ceftazidime*>85% excreted in urine. *Cefpodoxime*—30% excreted in urine. *Ceftriaxone* and *cefotaxime*—partly metabolized and partly excreted in the urine. *Cefixime*—50% excreted unchanged in urine, ≥10% in bile.

Half-life: *Cefdinir*—1.7 hr; *cefixime*—3–4 hr; *cefotaxime*—1–1.5 hr; *cefpodoxime*—2–3 hr; *ceftazidime*—2 hr; *ceftriaxone*—6–9 hr (all except *ceftriaxone* are ↑ in renal impairment).

TIME/ACTION PROFILE

ROUTE	ONSET	PEAK	DURATION
Cefdinir PO	rapid	2–4 hr	12–24 hr
Cefixime PO	rapid	2–6 hr	24 hr
Cefotaxime IM	rapid	0.5 hr	4–12 hr
Cefotaxime IV	rapid	end of infusion	4–12 hr
Cefpodoxime PO	unknown	2–3 hr	12 hr
Ceftazidime IM	rapid	1 hr	6–12 hr
Ceftazidime IV	rapid	end of infusion	6–12 hr
Ceftriaxone IM	rapid	1–2 hr	12–24 hr
Ceftriaxone IV	rapid	end of infusion	12–24 hr

Contraindications/Precautions

Contraindicated in: Hypersensitivity to cephalosporins; Serious hypersensitivity to penicillins; Pedi: Premature neonates up to a postmenstrual age of 41 wk (ceftriaxone only); Pedi: Hyperbilirubinemic neonates (may lead to bilirubin encephalopathy); Pedi: Neonates ≤28 days requiring calcium-containing IV solutions (↑ risk of precipitation formation).

Use Cautiously in: Renal impairment (↓ dosing/↑ dosing interval recommended for: *cefdinir* if CCr <30 mL/min, *cefixime* if CCr ≤60 mL/min, *cefotaxime* if CCr <20 mL/min, *cefpodoxime* if CCr <30 mL/min, *ceftazidime* if CCr ≤50 mL/min); Combined severe hepatic and renal impairment (dose ↓/↑ dosing interval recommended for *ceftriaxone*); Diabetes (*cefdinir* suspension contain sucrose); Phenylketonuria (*cefixime* chewable tablets contain aspartame); History of GI disease, especially colitis; OB, Lactation: Have been used safely; Pedi: ↑ risk of urolithiasis and acute renal failure (ceftriaxone only); Geri: Dose adjustment due to age-related ↓ in renal function may be necessary.

Adverse Reactions/Side Effects

Derm: STEVENS-JOHNSON SYNDROME, rash, urticaria. **GI:** CLOSTRIDIOIDES DIFFICILE ASSOCIATED DIARRHEA (CDAD), diarrhea, nausea, vomiting, cholelithiasis (ceftriaxone), cramps, pancreatitis (ceftriaxone). **GU:** acute renal failure (ceftriaxone), hematuria, urolithiasis (ceftriaxone), vaginal moniliasis. **Hemat:** agranulocytosis, bleeding, eosinophilia, hemolytic anemia, lymphocytosis, neutropenia, thrombocytopenia, thrombocytosis. **Local:** pain at IM site, phlebitis at IV site. **Neuro:** SEIZURES (high doses), headache. **Misc:** HYPERSENSITIVITY REACTIONS (including anaphylaxis and serum sickness), superinfection.

Interactions

Drug-Drug: Probenecid ↓ excretion and ↑ serum levels (cefdinir, cefixime, cefotaxime, cefpodoxime, ceftriaxone). Concurrent use of **loop diuretics**, **aminoglycosides**, or **NSAIDs** may ↑ risk of nephrotoxic-

© F.A. Davis Publishing

ity. **Antacids** ↓ absorption of cefdinir and cefpodoxime. **Iron supplements** ↓ absorption of cefdinir. **H_2-receptor antagonists** ↓ absorption of cefpodoxime. Cefixime may ↑ **carbamazepine** levels. Ceftriaxone should not be administered concomitantly with any calcium-containing solutions. Ceftriaxone may ↑ risk of bleeding with **warfarin**.

Route/Dosage

Cefdinir

PO (Adults ≥13 yr): 300 mg every 12 hr *or* 600 mg every 24 hr (use every 12 hr dosing only for community-acquired pneumonia or skin and skin structure infections).
PO (Children 6 mo–12 yr): 7 mg/kg every 12 hr (use only for skin/skin structure infections) *or* 14 mg/kg every 24 hr; dose should not exceed 600 mg/day.

Renal Impairment

PO (Adults and Children ≥13 yr): *CCr <30 mL/min*—300 mg every 24 hr.

Renal Impairment

PO (Children 6 mo–12 yr): *CCr <30 mL/min*—7 mg/kg every 24 hr.

Cefixime

PO (Adults and Children >12 yr or >45 kg): *Most infections*—400 mg once daily; *Gonorrhea*—400 mg single dose.
PO (Children 6 mo–12 yr): 8 mg/kg once daily *or* 4 mg/kg every 12 h.

Renal Impairment

PO (Adults): *CCr 21–60 mL/min*—75% of standard dose once daily; *CCr ≤20 mL/min*—50% of standard dose once daily.

Cefotaxime

IM, IV (Adults and Children >12 yr): *Most uncomplicated infections*—1 g every 12 hr. *Moderate or severe infections*—1–2 g every 6–8 hr. *Life-threatening infections*—2 g every 4 hr (maximum dose = 12 g/day). *Gonococcal urethritis/cervicitis or rectal gonorrhea in females*—500 mg IM (single dose). *Rectal gonorrhea in males*—1 g IM (single dose). *Perioperative prophylaxis*—1 g 30–90 min before initial incision (one-time dose).
IM, IV (Children 1 mo–12 yr): *<50 kg*—100–200 mg/kg/day divided every 6–8 hr. *Meningitis*—200 mg/kg/day divided every 6 hr. *Invasive pneumococcal meningitis*—225–300 mg/kg/day divided every 6–8 hr. *≥50 kg*—see adult dosing.
IV (Neonates 1–4 wk): 50 mg/kg every 6–8 hr.
IV (Neonates ≤1 wk): 50 mg/kg every 8–12 hr.

Renal Impairment

(Adults): *CCr <20 mL/min*—↓ dose by 50%.

Cefpodoxime

PO (Adults): *Most infections*—200 mg every 12 hr. *Skin and skin structure infections*—400 mg every 12 hr. *Urinary tract infections/pharyngitis*—100 mg every 12 hr. *Gonorrhea*—200 mg single dose.
PO (Children 2 mo–12 yr): *Pharyngitis/tonsillitis/otitis media/acute maxillary sinusitis*—5 mg/kg every 12 hr (not to exceed 200 mg/dose).

Renal Impairment

PO (Adults): *CCr <30 mL/min*—↑ dosing interval to every 24 hr.

Ceftazidime

IM, IV (Adults and Children ≥12 yr): *Pneumonia and skin/skin structure infections*—500 mg–1 g every 8 hr. *Bone and joint infections*—2 g every 12 hr. *Severe and life-threatening infections*—2 g every 8 hr. *Complicated urinary tract infections*—500 mg every 8–12 hr. *Uncomplicated urinary tract infections*—250 mg every 12 hr. *Cystic fibrosis lung infection caused by* P. aeruginosa—30–50 mg/kg every 8 hr (maximum dose = 6 g/day).
IM, IV (Children 1 mo–12 yr): 33.3–50 mg/kg every 8 hr (maximum dose = 6 g/day).
IM, IV (Neonates ≤4 wk): 50 mg/kg every 8–12 hr.

Renal Impairment

IM, IV (Adults): *CCr 31–50 mL/min*—1 g every 12 hr; *CCr 16–30 mL/min*—1 g every 24 hr; *CCr 6–15 mL/min*—500 mg every 24 hr; *CCr <5 mL/min*—500 mg every 48 hr.

Ceftriaxone

IM, IV (Adults): *Most infections*—1–2 g every 12–24 hr. *Gonorrhea*—250 mg IM (single dose). *Meningitis*—2 g every 12 hr. *Perioperative prophylaxis*—1 g 30–120 min before initial incision (single dose).
IM, IV (Children): *Most infections*—25–37.5 mg/kg every 12 hr *or* 50–75 mg/kg every 24 hr; dose should not exceed 2 g/day. *Meningitis*—100 mg/kg every 24 hr *or* 50 mg/kg every 12 hr; dose should not exceed 4 g/day. *Acute otitis media*—50 mg/kg IM single dose; dose should not exceed 1 g. *Uncomplicated gonorrhea*—125 mg IM (single dose).

Availability

Cefdinir (generic available)

Capsules: 300 mg. **Oral suspension (strawberry):** 125 mg/5 mL, 250 mg/5 mL. **Cost:** *Generic*—125 mg/5 mL $51.00/60 mL, 250 mg/5 mL $99.48/60 mL.

Cefixime (generic available)

Capsules: 400 mg. **Chewable tablets (contain aspartame):** 100 mg, 150 mg, 200 mg. **Cost:** 100 mg

© F.A. Davis Publishing

$170.77/10, 200 mg $341.51/10. **Oral suspension (strawberry):** 100 mg/5 mL, 200 mg/5 mL, 500 mg/5 mL. **Cost:** 100 mg/5 mL $170.77/50 mL, 200 mg/5 mL $341.55/50 mL, 500 mg/5 mL $170.77/10 mL. **Tablets:** 400 mg. **Cost:** $1008.49/50.

Cefotaxime (generic available)

Powder for injection (requires reconstitution and dilution): 500 mg/vial, 1 g/vial, 2 g/vial, 10 g/vial.

Cefpodoxime (generic available)

Oral suspension (lemon creme): 50 mg/5 mL, 100 mg/5 mL. **Cost:** *Generic*— 50 mg/5 mL $35.28/50 mL, 100 mg/5 mL $86.17/50 mL. **Tablets:** 100 mg, 200 mg. **Cost:** *Generic*— 100 mg $134.74/20, 200 mg $169.14/20.

Ceftazidime (generic available)

Powder for injection (requires reconstitution and dilution): 500 mg/vial, 1 g/vial, 2 g/vial, 6 g/vial. **Premixed infusion:** 1 g/50 mL, 2 g/50 mL.

Ceftriaxone (generic available)

Powder for injection (requires reconstitution and dilution): 250 mg/vial, 500 mg/vial, 1 g/vial, 2 g/vial, 10 g/vial, 100 g/vial. **Premixed infusion:** 1 g/50 mL, 2 g/50 mL.

NURSING IMPLICATIONS

Assessment

- Assess for infection (vital signs; appearance of wound, sputum, urine, and stool; WBC) at beginning of and throughout therapy.
- Before initiating therapy, obtain a history to determine previous use of and reactions to penicillins or cephalosporins. Persons with a negative history of penicillin sensitivity may still have an allergic response.
- Obtain specimens for culture and sensitivity before initiating therapy. First dose may be given before receiving results.
- Observe for signs and symptoms of anaphylaxis (rash, pruritus, laryngeal edema, wheezing). Discontinue drug and notify health care professional immediately if these symptoms occur. Keep epinephrine, an antihistamine, and resuscitation equipment close by in the event of an anaphylactic reaction.
- Monitor bowel function. Diarrhea, abdominal cramping, fever, and bloody stools should be reported to health care professional promptly as a sign of *Clostridioides difficile*-associated diarrhea (CDAD). May begin up to several wk following cessation of therapy.
- Assess patient for skin rash frequently during therapy. Discontinue at first sign of rash; may be life-threatening. Stevens-Johnson syndrome may develop. Treat symptomatically; may recur once treatment is stopped.
- Pedi: Assess newborns for jaundice and hyperbilirubinemia before making decision to use ceftriaxone (should not be used in jaundiced or hyperbilirubinemic neonates).
- ***Lab Test Considerations:*** May cause positive results for Coombs' test in patients receiving high doses or in neonates whose mothers were given cephalosporins before delivery.
- May cause ↑ AST, ALT, alkaline phosphatase, bilirubin, LDH, BUN, and serum creatinine.
- May rarely cause leukopenia, neutropenia, agranulocytosis, thrombocytopenia, eosinophilia, lymphocytosis, and thrombocytosis.

Implementation

- Do not confuse ceftazidime with cefazolin, cefoxitin, cefotetan, or ceftriaxone.
- **PO:** Administer around the clock. May be administered on full or empty stomach. Administration with food may minimize GI irritation. Shake oral suspension well before administering. Administer *cefpodoxime tablets* with meals to enhance absorption (suspension may be administered without regard to meals.
- *Cefixime oral suspension* should be used to treat otitis media (results in higher peak concentrations than tablets).
- Do not administer *cefdinir* or *cefpodoxime* within 2 hr before or after an antacid. Do not administer *cefpodoxime* within 2 hr before or after an H_2 receptor antagonist. Do not administer *cefdinir* within 2 hr before or after iron supplements.
- **IM:** ***Reconstitution:*** Reconstitute IM doses with sterile or bacteriostatic water for injection or 0.9% NaCl for injection. May be diluted with lidocaine to minimize injection discomfort. Do not administer lidocaine-containing ceftriaxone IV.
- Inject deep into a well-developed muscle mass; massage well.

IV Administration

- **IV:** Monitor injection site frequently for phlebitis (pain, redness, swelling). Change sites every 48–72 hr to prevent phlebitis.
- If aminoglycosides are administered concurrently, administer in separate sites, if possible, at least 1 hr apart. If second site is unavailable, flush lines between medications.

Cefotaxime

- **IV Push:** ***Reconstitution:*** Reconstitute 500–mg, 1–g and 2–g vials in at least 10 mL of sterile water for injection. ***Concentration:*** 50 mg/mL (500 mg), 95 mg/mL (1 g), and 180 mg/mL (2 g).Do not use preparations containing benzyl alcohol for neonates. ***Rate:*** Administer slowly over 3–5 min.
- **Intermittent Infusion:** ***Dilution:*** Reconstituted solution may be further diluted in D5W, D10W, lactated Ringer's solution, D5/0.25% NaCl, D5/0.45% NaCl, D5/0.9% NaCl, or 0.9% NaCl. ***Concentration:*** 20–60 mg/mL. Solution may appear light yellow to amber. Solution is stable for 24 hr at room

© F.A. Davis Publishing

temperature and 5 days if refrigerated. ***Rate:*** Administer over 20–30 min.

- **Y-Site Compatibility:** acyclovir, alfentanil, alprostadil, amifostine, amikacin, aminocaproic acid, aminophylline, amphotericin B lipid complex, anidulafungin, argatroban, arsenic trioxide, ascorbic acid, atracurium, atropine, aztreonam, benztropine, bivalirudin, bleomycin, bumetanide, buprenorphine, butorphanol, calcium chloride, calcium gluconate, cangrelor, carboplatin, carmustine, cefotetan, cefoxitin, ceftriaxone, cefuroxime, cisplatin, clindamycin, cyanocobalamin, cyclophosphamide, cyclosporine, cytarabine, dactinomycin, daptomycin, dexamethasone, dexmedetomidine, dexrazoxane, digoxin, diltiazem, dimenhydrinate, docetaxel, dopamine, doxorubicin liposomal, doxycycline, enalaprilat, ephedrine, epinephrine, epirubicin, epoetin alfa, eptifibatide, erythromycin, esmolol, etoposide, etoposide phosphate, famotidine, fenoldopam, fentanyl, fludarabine, fluorouracil, folic acid, foscarnet, fosphenytoin, furosemide, glycopyrrolate, granisetron, heparin, hetastarch, hydrocortisone, hydromorphone, ifosfamide, imipenem/cilastatin, indomethacin, insulin, isoproterenol, ketamine, ketorolac, leucovorin calcium, lidocaine, linezolid, lorazepam, magnesium sulfate, mannitol, melphalan, meperidine, mesna, methotrexate, metoclopramide, metoprolol, midazolam, milrinone, morphine, multivitamins, nafcillin, nalbuphine, naloxone, nicardipine, nitroglycerin, nitroprusside, norepinephrine, octreotide, ondansetron, oxacillin, oxaliplatin, oxytocin, paclitaxel, palonosetron, pamidronate, pancuronium, penicillin G, phenylephrine, phytonadione, potassium acetate, potassium chloride, procainamide, propofol, propranolol, pyridoxine, remifentanil, rituximab, rocuronium, sargramostim, sodium acetate, succinylcholine, sufentanil, tacrolimus, theophylline, thiamine, thiotepa, tigecycline, tirofiban, tobramycin, topotecan, vasopressin, verapamil, vinblastine, vinorelbine, voriconazole, zoledronic acid.
- **Y-Site Incompatibility:** alemtuzumab, allopurinol, amiodarone, amphotericin B liposome, azathioprine, caspofungin, cefazolin, ceftazidime, chloramphenicol, chlorpromazine, dacarbazine, dantrolene, daunorubicin, diazepam, diphenhydramine, dobutamine, doxorubicin, filgrastim, ganciclovir, gemcitabine, haloperidol, hydralazine, hydroxyzine, idarubicin, irinotecan, labetalol, methylprednisolone, minocycline, mitomycin, mitoxantrone, mycophenolate, pantoprazole, papaverine, pemetrexed, pentamidine, pentobarbital, phenobarbital, phenytoin, prochlorperazine, promethazine, protamine, quinupristin/dalfopristin, sodium bicarbonate, trastuzumab, trimethoprim/sulfamethoxazole, vecuronium.

Ceftazidime

- **IV Push:** ***Reconstitution:*** Reconstitute 500–mg, 1–g and 2–g vials with 5.3 mL, 10 mL or 10 mL, respectively, of sterile water for injection. ***Concentration:*** 100 mg/mL (500 mg), 100 mg/mL (1 g), and 170 mg/mL (2 g). Do not use preparations containing benzyl alcohol for neonates. ***Rate:*** Administer slowly over 3–5 min.
- **Intermittent Infusion:** ***Dilution:*** Reconstituted solution may be further diluted in at least 1 g/10 mL of 0.9% NaCl, D5W, D10W, dextrose/saline combinations, or LR. Dilution causes CO_2 to form inside vial, resulting in positive pressure; vial may require venting after dissolution to preserve sterility of vial. Not required with L-arginine formulation (Ceftaz). Solution may appear yellow to amber; darkening does not alter potency. Solution is stable for 18 hr at room temperature and 7 days if refrigerated. ***Concentration:*** 40 mg/mL. ***Rate:*** Administer over 15–30 min.
- **Y-Site Compatibility:** acyclovir, alfentanil, allopurinol, amifostine, aminocaproic acid, aminophylline, amphotericin B lipid complex, anakinra, anidulafungin, argatroban, atropine, aztreonam, benztropine, bivalirudin, bleomycin, bumetanide, buprenorphine, butorphanol, calcium gluconate, cangrelor, carboplatin, carmustine, cefazolin, cefotetan, cefoxitin, ceftriaxone, cefuroxime, ciprofloxacin, cisplatin, clindamycin, cyanocobalamin, cyclophosphamide, cyclosporine, cytarabine, dacarbazine, dactinomycin, daptomycin, dexamethasone, dexmedetomidine, dexrazoxane, digoxin, diltiazem, dimenhydrinate, docetaxel, dopamine, enalaprilat, ephedrine, epinephrine, epoetin alfa, eptifibatide, esmolol, etoposide, etoposide phosphate, famotidine, fenoldopam, fentanyl, filgrastim, fludarabine, fluorouracil, folic acid, foscarnet, fosphenytoin, furosemide, gemcitabine, glycopyrrolate, granisetron, heparin, hetastarch, hydrocortisone, hydromorphone, ibuprofen, ifosfamide, imipenem/cilastatin, indomethacin, insulin, irinotecan, isoproterenol, ketamine, ketorolac, labetalol, leucovorin calcium, levofloxacin, lidocaine, linezolid, lorazepam, magnesium sulfate, mannitol, melphalan, meperidine, mesna, methotrexate, methylprednisolone, metoclopramide, metoprolol, metronidazole, milrinone, mitomycin, morphine, multivitamins, nafcillin, nalbuphine, naloxone, nitroglycerin, norepinephrine, octreotide, oxacillin, oxaliplatin, oxytocin, paclitaxel, palonosetron, pamidronate, pancuronium, penicillin G, phenobarbital, phentolamine, phenylephrine, phytonadione, potassium acetate, potassium chloride, procainamide, propranolol, pyridoxine, remifentanil, rituximab, rocuronium, sodium acetate, sodium bicarbonate, succinylcholine, sufentanil, tacrolimus, telavancin, thiotepa, tigecycline, tirofiban,

© F.A. Davis Publishing

trastuzumab, vasopressin, vecuronium, vinblastine, vincristine, vinorelbine, voriconazole, zidovudine, zoledronic acid.

- **Y-Site Incompatibility:** acetylcysteine, alemtuzumab, amiodarone, amphotericin B liposome, ascorbic acid, azathioprine, calcium chloride, caspofungin, cefotaxime, chloramphenicol, chlorpromazine, dantrolene, daunorubicin, diazepam, diazoxide, diphenhydramine, doxorubicin, doxorubicin liposome, doxycycline, epirubicin, ganciclovir, haloperidol, hydralazine, hydroxyzine, idarubicin, midazolam, mitoxantrone, mycophenolate, nitroprusside, papaverine, pemetrexed, pentamidine, phenytoin, prochlorperazine, promethazine, protamine, quinupristin/dalfopristin, thiamine, topotecan, trimethoprim/sulfamethoxazole, verapamil, warfarin.

Ceftriaxone

- **Intermittent Infusion:** ***Reconstitution:*** Reconstitute each 250-mg vial with 2.4 mL, each 500-mg vial with 4.8 mL, each 1-g vial with 9.6 mL, and each 2-g vial with 19.2 mL of sterile water for injection, 0.9% NaCl, or D5W for a concentration of 100 mg/mL. ***Dilution:*** Solution should be further diluted in 50–100 mL of 0.9% NaCl, D5W, D10W, D5/0.45% NaCl, or D5/0.9% NaCl. Solution may appear light yellow to amber. Solution is stable for 3 days at room temperature. ***Concentration:*** 40 mg/mL. ***Rate:*** Infuse over 30 min.
- **Y-Site Compatibility:** acetaminophen, acyclovir, alfentanil, allopurinol, amifostine, aminocaproic acid, aminophylline, amphotericin B lipid complex, amphotericin B liposome, anidulafungin, argatroban, atropine, aztreonam, benztropine, bivalirudin, bumetanide, buprenorphine, butorphanol, cangrelor, carboplatin, carmustine, cefazolin, cefotaxime, cefotetan, cefoxitin, ceftazidime, cefuroxime, cisatracurium, cisplatin, cyanocobalamin, cyclophosphamide, cyclosporine, cytarabine, dactinomycin, daptomycin, dexamethasone, dexmedetomidine, dexrazoxane, digoxin, diltiazem, docetaxel, dopamine, doxorubicin liposome, doxycycline, enalaprilat, ephedrine, epinephrine, epoetin alfa, eptifibatide, erythromycin, esmolol, etoposide, etoposide phosphate, fenoldopam, fentanyl, fludarabine, fluorouracil, folic acid, foscarnet, fosphenytoin, furosemide, gemcitabine, glycopyrrolate, granisetron, heparin, hydrocortisone, hydromorphone, ifosfamide, indomethacin, insulin, isoproterenol, ketorolac, levofloxacin, lidocaine, linezolid, lorazepam, mannitol, melphalan, meperidine, mesna, methotrexate, methylprednisolone, metoclopramide, metoprolol, metronidazole, midazolam, milrinone, morphine, multivitamins, nafcillin, nalbuphine, naloxone, nicardipine, nitroglycerin, nitroprusside, norepinephrine, octreotide, oxacillin, oxaliplatin, oxytocin, paclitaxel, palonosetron, pamidronate, pantoprazole, pemetrexed, penicillin G, phenobarbital, phentolamine, phenylephrine, phytonadione, potassium acetate, potassium chloride, procainamide, propranolol, pyridoxine, remifentanil, rituxumab, rocuronium, sargramostim, sodium acetate, sodium bicarbonate, succinylcholine, sufentanil, tacrolimus, telavancin, theophylline, thiamine, thiotepa, tigecycline, tirofiban, topotecan, trastuzumab, vasopressin, vecuronium, verapamil, vinblastine, vincristine, voriconazole, warfarin, zidovudine, zoledronic acid.
- **Y-Site Incompatibility:** alemtuzumab, ascorbic acid, azathioprine, calcium chloride, calcium gluconate, caspofungin, chloramphenicol, chlorpromazine, clindamycin, dacarbazine, dantrolene, daunorubicin, diazepam, diazoxide, diphenhydramine, dobutamine, doxorubicin, epirubicin, filgrastim, ganciclovir, haloperidol, hetastarch, hydralazine, hydroxyzine, idarubicin, imipenem/cilastatin, irinotecan, labetalol, leucovorin calcium, mitoxantrone, mycophenolate, papaverine, pentamidine, pentobarbital, phenytoin, prochlorperazine, promethazine, protamine, quinupristin/dalfopristin, tobramycin, trimethoprim/sulfamethoxazole, vinorelbine. Calcium-containing solutions, including parenteral nutrition, should not be mixed or co-administered, even via different infusion lines at different sites in patients <28 days old. In older patients, flush line thoroughly between infusions.

Patient/Family Teaching

- Instruct patient to take medication around the clock and to finish the medication completely, even if feeling better. Take missed doses as soon as possible unless almost time for next dose; do not double doses. Advise patient that sharing of this medication may be dangerous.
- Pedi: Instruct parents or caregivers to use calibrated measuring device with liquid preparations.
- Advise patient to report signs of superinfection (furry overgrowth on the tongue, vaginal itching or discharge, loose or foul-smelling stools) and allergy.
- Instruct patient to notify health care professional if rash, fever, and diarrhea develop, especially if stool contains blood, pus, or mucus. Advise patient not to treat diarrhea without consulting health care professional.
- Advise females of reproductive potential to notify health care professional if pregnancy is planned or suspected, or if breast feeding.

Evaluation/Desired Outcomes

- Resolution of the signs and symptoms of infection. Length of time for complete resolution depends on the organism and site of infection.
- Decreased incidence of infection when used for prophylaxis.

© F.A. Davis Publishing

ceritinib (se-ri-ti-nib)

Zykadia

Classification

Therapeutic: antineoplastics
Pharmacologic: kinase inhibitors

Indications

Anaplastic lymphoma kinase (ALK)-positive, metastatic non-small cell lung cancer (NSCLC).

Action

Acts as a tyrosine kinase inhibitor, inhibiting anaplastic lymphoma kinase as well as other kinases, resulting in decreased growth of certain malignant cell lines.

Therapeutic Effects: Slowed progression of metastatic NSCLC.

Pharmacokinetics

Absorption: Absorption follows oral administration; food significantly ↑ absorption and may ↑ risk of adverse reactions.

Distribution: Slight preference to distribute from plasma into red blood cells.

Metabolism and Excretion: Metabolized in the liver (mostly by CYP3A) and is a substrate of P-glycoprotein (P-gp); 68% eliminated unchanged in feces, 1.3% in urine.

Half-life: 41 hr.

TIME/ACTION PROFILE (clinical response)

ROUTE	ONSET	PEAK	DURATION
PO	unknown	4–6 hr (blood level)	7.1–7.4 mo

Contraindications/Precautions

Contraindicated in: OB: Pregnancy (may cause fetal harm); Lactation: Lactation; Congenital long QT syndrome.

Use Cautiously in: Moderate to severe hepatic impairment/severe renal impairment (CCr <30 mL/min); HF, bradycardia, electrolyte abnormalities, or concurrent use of QT prolonging medications; Concurrent use of strong CYP3A4 inhibitors; Rep: Women of reproductive potential and men with female partners of reproductive potential; Pedi: Safety and effectiveness not established.

Adverse Reactions/Side Effects

CV: BRADYCARDIA, TORSADES DE POINTES, QT interval prolongation. **Derm:** rash. **Endo:** hyperglycemia. **F and E:** hypophosphatemia. **GI:** HEPATOTOXICITY, PANCREATITIS, abdominal pain, ↓ appetite, constipation, diarrhea, esophagitis/reflux/dysphagia, ↑ lipase, ↑ liver enzymes, nausea, vomiting. **GU:** ↑ serum creatinine. **Hemat:** anemia. **Neuro:** fatigue. **Resp:** INTERSTITIAL LUNG DISEASE/PNEUMONITIS.

Interactions

Drug-Drug: Concurrent use of strong **CYP3A inhibitors** including **ketoconazole**, **nefazodone**, and **ritonavir** ↑ levels and risk of toxicity; avoid concurrent use; if unavoidable, ↓ ceritinib dose. Strong **CYP3A inducers**, including **carbamazepine**, **phenytoin**, and **rifampin** may ↓ levels and effectiveness; avoid concurrent use. May ↑ levels and risk of toxicity of CYP3A substrates, including **midazolam**; avoid concurrent use; if unavoidable, ↓ dose of CYP3A substrate. May ↑ levels and risk of toxicity of CYP2C9 substrates, including **warfarin**; avoid concurrent use; if unavoidable, ↓ dose of CYP2C9 substrate. **Beta-blockers**, **diltiazem**, **verapamil**, **digoxin**, and **clonidine** may ↑ risk of bradycardia; avoid concurrent use, if possible. Concurrent use of **QT interval prolonging medications** may ↑ risk of QT interval prolongation and torsades de pointes.

Drug-Natural Products: St. John's wort ↓ levels and effectiveness; avoid concurrent use.

Drug-Food: Grapefruit/grapefruit juice ↑ levels and the risk of toxicity; avoid concurrent ingestion.

Route/Dosage

PO (Adults): 450 mg once daily; continue until disease progression or unacceptable toxicity; *Concurrent use of strong CYP3A inhibitors*— ↓ dose by ⅓, rounded to the nearest 150-mg strength.

Hepatic Impairment

PO (Adults): *Severe hepatic impairment*— ↓ dose by ⅓, rounded to the nearest 150-mg strength.

Availability

Tablets: 150 mg.

NURSING IMPLICATIONS

Assessment

- Assess for signs and symptoms of interstitial lung disease or pneumonitis (trouble breathing, shortness of breath, fever, cough with or without mucus, chest pain). If these symptoms occur, discontinue therapy permanently.
- Monitor ECG periodically during therapy. *If QTc interval is >500 msec on at least 2 separate ECGs,* hold ceritinib until QTc interval <481 msec or recovery to baseline if QTc ≥481 msec, then resume ceritinib with a 150-mg dose reduction. *If QTc interval prolongation occurs in combination with torsades de pointes or polymorphic ventricular tachycardia or signs and symptoms of serious arrhythmia,* discontinue ceritinib permanently.
- *If symptomatic bradycardia that is not life-threatening occurs,* hold ceritinib until recovery to asymptomatic bradycardia or a heart rate ≥60 bpm,

© F.A. Davis Publishing

evaluate concurrent medications causing bradycardia, and adjust dose of ceritinib. *If clinically significant bradycardia requiring intervention or life-threatening bradycardia in patients taking concurrent medication known to cause bradycardia or a medication known to cause hypotension occurs,* hold ceritinib until recovery to asymptomatic bradycardia or a heart rate ≥60 bpm. *If concurrent medication can be adjusted or discontinued,* resume ceritinib with a 150-mg dose reduction and frequent monitoring. *If life-threatening bradycardia occurs in patients not taking medications known to cause bradycardia or hypotension,* discontinue ceritinib permanently.

- Assess for nausea, vomiting, diarrhea. If severe or intolerable nausea, vomiting, or diarrhea continue despite optimal antiemetic or antidiarrheal therapy, hold ceritinib until improved; then resume with a 150-mg dose reduction.
- ***Lab Test Considerations:*** Test patient for ALK positivity in tumor specimens through an FDA approved test prior to starting therapy.
- Monitor liver function tests at least monthly. *If ALT or AST >5 times the upper limit of normal (ULN) and total bilirubin is ≤2 × ULN,* hold ceritinib until recovery to baseline or ≤3 × ULN, then resume ceritinib with a 150-mg dose reduction. *If ALT or AST >3 × ULN and total bilirubin is >2 × ULN in the absence of cholestasis or hemolysis,* permanently discontinue ceritinib.
- Monitor fasting blood glucose prior to and periodically during therapy. *If persistent hyperglycemia >250 mg/dL despite anti-hyperglycemic therapy,* hold ceritinib until hyperglycemia is adequately controlled, then resume with a 150-mg dose reduction. *If adequate hyperglycemic control cannot be achieved,* discontinue therapy.
- May cause ↓ hemoglobin and serum phosphate; ↑ creatinine.
- Monitor serum lipase and amylase prior to and periodically during therapy. May cause ↑ serum lipase and amylase. *If ↑ lipase or amylase >2 × upper ULN,* hold ceritinib and monitor serum lipase and amylase. *When recovery to <1.5 × ULN,* resume with 150-mg dose reduction.

Implementation

- **PO:** Administer on an empty stomach, at least 1 hr before or 2 hr after meals.

Patient/Family Teaching

- Instruct patient to take ceritinib as directed. Take missed doses as soon as remembered unless within 12 hr of next dose. If vomiting occurs, do not administer additional dose, continue with next scheduled dose. Instruct patient to read *Patient Information* prior to starting therapy and with each Rx refill in case of changes.
- Inform patient to avoid consuming grapefruit and grapefruit juice during therapy.
- Advise patient to notify health care professional if nausea, vomiting, and diarrhea is severe or persistent; if signs and symptoms of hepatotoxicity (feeling tired, itchy skin, skin or whites of eyes turn yellow, nausea and vomiting, decreased appetite, pain on right side of stomach, dark or brown, tea-colored urine, bleed or bruise easily); pneumonitis; QTc interval prolongation or bradycardia (new chest pain, changes in heartbeat, palpitations, dizziness, fainting, or changes in or use of a new heart or BP medication); hyperglycemia (increased thirst, increased hunger, headaches, trouble thinking or concentration, urinating often, blurred vision, tiredness, breath smells like fruit), or pancreatitis (upper abdominal pain that may spread to the back and get worse with eating) occur.
- Instruct patient to notify health care professional of all Rx or OTC medications, vitamins, or herbal products being taken and to consult health care professional before taking other Rx, OTC, or herbal products, especially St. John's Wort.
- Rep: May be teratogenic. Advise female patient of reproductive potential to use effective contraceptives during and for 6 mo and to avoid breast feeding during and for 2 wk following completion of therapy. Advise patient to notify health care provider if pregnancy is planned or suspected. Advise males with female partners of reproductive potential to use condoms during therapy and for 3 mo following completion of therapy.

Evaluation/Desired Outcomes

- Slowed progression of metastatic NSCLC.

certolizumab (ser-toe-liz-u-mab)
Cimzia

Classification
Therapeutic: gastrointestinal anti-inflammatories, antirheumatics
Pharmacologic: tumor necrosis factor blockers, DMARDs, monoclonal antibodies

Indications

Moderately-to-severely active Crohn's disease when response to conventional therapy has been inadequate. Moderately-to-severely active rheumatoid arthritis. Active psoriatic arthritis. Active ankylosing spondylitis. Moderate-to-severe plaque psoriasis in patients who are not candidates for systemic therapy or phototherapy. Active non-radiographic axial spondyloarthritis with objective signs of inflammation.

Action

Neutralizes tumor necrosis factor (TNF), a prime mediator of inflammation; pegylation provides a long duration of action. **Therapeutic Effects:** Decreased signs/symptoms of Crohn's disease. Decreased pain and swelling, decreased rate of joint destruction and im-

© F.A. Davis Publishing

proved physical function in rheumatoid arthritis. Decreased joint swelling and pain in psoriatic arthritis. Decreased spinal pain and inflammation in ankylosing spondylitis. Reduced severity of plaques. Decreased pain and swelling, reduced C-reactive protein levels, and improved physical function in axial spondyloarthritis.

Pharmacokinetics

Absorption: 80% absorbed following SC administration.
Distribution: Unknown.
Metabolism and Excretion: Unknown.
Half-life: 14 days.

TIME/ACTION PROFILE (blood levels)

ROUTE	ONSET	PEAK	DURATION
Subcut	unknown	50–120 hr	2–4 wk

Contraindications/Precautions

Contraindicated in: Hypersensitivity; Active infection (including localized); Concurrent use of anakinra.
Use Cautiously in: History of chronic or recurrent infection or underlying illness/treatment predisposing to infection; History of exposure to tuberculosis; History of opportunistic infection; Patients residing, or who have resided, where tuberculosis, histoplasmosis, coccidioidomycoses, or blastomycosis is endemic; History of demyelinating disorders (may exacerbate); History of heart failure; Geri: May ↑ risk of infections; OB: Use in pregnancy only if clearly needed; Lactation: Breast feed only if potential benefits justify potential risk to fetus; Pedi: Safety not established; ↑ risk of lymphoma (including hepatosplenic T-cell lymphoma [HSTCL] in patients with Crohn's disease), leukemia, and other malignancies.

Adverse Reactions/Side Effects

Derm: psoriasis, skin reactions (rarely severe). **Hemat:** hematologic reactions. **MS:** arthralgia. **Misc:** HYPERSENSITIVITY REACTIONS (including anaphylaxis, angioedema, serum sickness, and urticaria), INFECTIONS (including reactivation tuberculosis, hepatitis B reactivation, and other opportunistic infections due to bacterial, invasive fungal, viral, mycobacterial, and parasitic pathogens), MALIGNANCY (including lymphoma, HSTCL, leukemia, and skin cancer), lupus-like syndrome.

Interactions

Drug-Drug: Concurrent use with **anakinra** ↑ risk of serious infections (contraindicated). Concurrent use with **azathioprine** and/or **methotrexate** may ↑ risk of HSTCL. May ↓ antibody response to or ↑ risk of adverse reactions to **live vaccines** (contraindicated).

Route/Dosage

Crohn's Disease

Subcut (Adults): 400 mg (given as two 200-mg injections) initially, repeat 2 and 4 wk later; may be followed by maintenance dose of 400 mg (given as two 200-mg injections) every 4 wk.

Rheumatoid Arthritis or Psoriatic Arthritis

Subcut (Adults): 400 mg (given as two 200-mg injections) initially, repeat 2 and 4 wk later; then maintenance dose of 200 mg every 2 wk (400 mg [given as two 200-mg injections] every 4 wk may be used alternatively).

Ankylosing Spondylitis or Non-Radiographic Axial Spondyloarthritis

Subcut (Adults): 400 mg (given as two 200-mg injections) initially, repeat 2 and 4 wk later; then maintenance dose of 200 mg every 2 wk or 400 mg (given as two 200-mg injections) every 4 wk.

Plaque Psoriasis

Subcut (Adults): 400 mg (given as two 200-mg injections) every 2 wk; *Patients ≤90 kg*—may consider giving 400 mg (given as two 200-mg injections) initially, then repeat 2 and 4 wk later; then maintenance dose of 200 mg every 2 wk.

Availability

Lyophilized powder for injection (requires reconstitution): 200 mg/vial. **Solution for injection (prefilled syringes):** 200 mg/mL.

NURSING IMPLICATIONS

Assessment

- **Crohn's Disease:** Assess abdominal pain and frequency, quantity, and consistency of stools at beginning and during therapy.
- **Arthritis/Ankylosing Spondylitis:** Assess pain and range of motion before and periodically during therapy.
- Assess for signs of infection (fever, sore throat, dyspnea, WBC) prior to and during therapy. Monitor all patients for active TB (persistent cough, wasting, weight loss, low grade fever) during therapy, even if initial test was negative. Do not begin certolizumab during an active infection, including chronic or localized infections. If infection develops, monitor closely and discontinue certolizumab if infection becomes serious.
- Evaluate patients at risk for hepatitis B virus (HBV) infection for prior evidence of HBV infection before initiating therapy. Monitor carriers of HBV closely for clinical and lab signs of active HBV infection during and for several mo following discontinuation of therapy. If HBV reactivation occurs, discontinue certolizumab and initiate antiviral therapy.

© F.A. Davis Publishing

- Monitor for signs of hypersensitivity reactions (angioedema, dyspnea, hypotension, rash, serum sickness, urticaria). If reactions occur, discontinue certolizumab and treat symptomatically.
- Assess for signs and symptoms of systemic fungal infections (fever, malaise, weight loss, sweats, cough, dyspnea, pulmonary infiltrates, serious systemic illness with or without concomitant shock). Ascertain if patient lives in or has traveled to areas of endemic mycoses. Consider empiric antifungal treatment for patients at risk of histoplasmosis and other invasive fungal infections until the pathogens are identified. Consult with an infectious diseases specialist. Consider stopping certolizumab until the infection has been diagnosed and adequately treated.
- ***Lab Test Considerations:*** May cause anemia, leukopenia, pancytopenia, and thrombocytopenia.
- Monitor CBC with differential periodically during therapy. May cause leukopenia, neutropenia, thrombocytopenia, and pancytopenia. Discontinue certolizumab if symptoms of blood dyscrasias (persistent fever) occur.
- May cause ↑ liver enzymes.
- May cause erroneously ↑ aPTT.

Implementation

- Perform test for latent TB. If positive for latent TB, active TB in whom an adequate course of treatment cannot be confirmed, and for patients with a negative test for TB who have risk factors for tuberculosis infection, begin treatment for TB prior to starting certolizumab therapy. Monitor for TB throughout therapy, even if latent TB test is negative.
- Allow vial to sit at room temperature for 30 min prior to reconstituting; do not use other warming methods. Reconstitute vial by adding 1 mL of sterile water for injection, using a 20-gauge needle, for a concentration of 200 mg/mL. Gently swirl so all powder comes into contact with sterile water; do not shake. Leave vial undisturbed for as long as 30 min to fully reconstitute. Solution is clear and colorless to pale yellow; do not administer solutions that are cloudy, discolored or contain particulate matter. Do not leave reconstituted solution at room temperature for >2 hr prior to injection. May be refrigerated for up to 24 hr prior to injection; do not freeze.
- **Subcut:** Allow solution to sit at room temperature for 30 min prior to injection; do not use other warming methods. Give 400-mg dose as two injections of 200 mg each. Using a new 20-gauge needle for each vial, withdraw reconstituted solution into 2 separate syringes each containing 1 mL (200 mg/mL) of certolizumab. Switch each 20-gauge needle to a 23-gauge needle and inject the full contents of each syringe subcut into separate sides of the abdomen or thigh. Avoid areas of skin tenderness, bruising, redness or hardness, or scars or stretch marks.
- Assess for latex allergies. Needle shield inside the removable cap of prefilled syringes contains a derivative of natural rubber latex.

Patient/Family Teaching

- Advise patient of potential benefits and risks of certolizumab. Instruct patient in correct technique for injection, and care and disposal of equipment. Advise patient to read the *Medication Guide* prior to starting therapy.
- Inform patient of risk of infection. Advise patient to notify health care professional if symptoms of infection (fever, cough, flu-like symptoms, or open cuts or sores), including TB or reactivation of HBV infection, occur.
- Counsel patient about possible risk of lymphoma and other malignancies while receiving certolizumab.
- Advise patient to notify health care professional if signs of hypersensitivity reactions (rash, swollen face, difficulty breathing), or new or worsening medical conditions such as heart or neurological disease or autoimmune disorders occur and to report signs of bone marrow depression (bruising, bleeding, or persistent fever).
- Advise patient to notify health care professional of all Rx or OTC medications, vitamins, or herbal products being taken and to consult with health care professional before taking other medications.
- Rep: Advise patient to notify health care professional if pregnancy is planned or suspected or if breast feeding. Encourage women who become pregnant to enroll in the MotherToBaby Pregnancy Studies conducted by the Organization of Teratology Information Specialists (OTIS). The OTIS AutoImmune Diseases Study at 1-877-311-8972 or visit http://mothertobaby.org/pregnancy-studies/.

Evaluation/Desired Outcomes

- Decrease in signs and symptoms of Crohn's disease.
- Decreased pain and swelling with decreased rate of joint destruction in patients with rheumatoid arthritis.
- Decreased joint swelling and pain in psoriatic arthritis.
- Decreased spinal pain and inflammation in ankylosing spondylitis.
- Reduced severity of plaques.
- Decreased pain and swelling, reduced C-reactive protein levels, and improved physical function in axial spondyloarthritis.

cetirizine (se-ti-ra-zeen)

Quzyttir, ✱Reactine, ZyrTEC

Classification

Therapeutic: allergy, cold, and cough remedies, antihistamines

Pharmacologic: piperazines (peripherally selective)

© F.A. Davis Publishing

Indications

PO: Relief of allergic symptoms caused by histamine release including: Seasonal and perennial allergic rhinitis, Chronic urticaria. **IV**: Acute urticaria.

Action

Antagonizes the effects of histamine at H_1-receptor sites; does not bind to or inactivate histamine. Anticholinergic effects are minimal and sedation is dose related.

Therapeutic Effects: Decreased symptoms of histamine excess (sneezing, rhinorrhea, ocular tearing and redness, pruritus).

Pharmacokinetics

Absorption: Well absorbed following oral administration. IV administration results in complete bioavailability.

Distribution: Unknown.

Protein Binding: 93%.

Metabolism and Excretion: Excreted primarily unchanged by the kidneys.

Half-life: 7.4–9 hr (↓ in children to 6.2 hr, ↑ in renal impairment up to 19–21 hr).

TIME/ACTION PROFILE (antihistaminic effects)

ROUTE	ONSET	PEAK	DURATION
PO	30 min	4–8 hr	24 hr
IV	unknown	unknown	unknown

Contraindications/Precautions

Contraindicated in: Hypersensitivity to cetirizine, levocetirizine, hydroxyzine or any component; Pedi: Children <6 yr with renal or hepatic impairment.

Use Cautiously in: Patients with hepatic or renal impairment (dose ↓ recommended if CCr ≤31 mL/min or hepatic function is impaired); OB: Use during pregnancy only if potential maternal benefit justifies potential fetal risk; Lactation: Use while breast feeding only if potential maternal benefit justifies potential risk to infant; Pedi: Children <6 mo (safety and effectiveness not established); Geri: Initiate at lower doses in older adults.

Adverse Reactions/Side Effects

Derm: acute generalized exanthematous pustulosis. **EENT:** pharyngitis. **GI:** dry mouth. **Neuro:** dizziness, drowsiness (significant with oral doses >10 mg/day), fatigue.

Interactions

Drug-Drug: Additive CNS depression may occur with **alcohol**, **opioid analgesics**, or **sedative/hypnotics**. **Theophylline** may ↓ clearance and ↑ toxicity.

Route/Dosage

PO (Adults and Children ≥6 yr): 5–10 mg given once or divided twice daily.

PO (Children 2–5 yr): 2.5 mg once daily initially, may be ↑ to 5 mg once daily or 2.5 mg every 12 hr.

PO (Children 1–2 yr): 2.5 mg once daily initially; may be ↑ to 2.5 mg every 12 hr.

PO (Children 6–12 mo): 2.5 mg once daily.

IV (Adults and Children ≥12 yr): 10 mg every 24 hr as needed.

IV (Children 6–11 yr): 5–10 mg every 24 hr as needed.

IV (Children 6 mo–5 yr): 2.5 mg every 24 hr as needed.

Hepatic/Renal Impairment

PO (Adults and Children ≥12 yr): *CCr ≤31 mL/min, hepatic impairment or hemodialysis*— 5 mg once daily.

Hepatic/Renal Impairment

PO (Children 6–11 yr): start therapy at <2.5 mg/day.

Availability (generic available)

Capsules: 10 mg^{OTC}. **Chewable tablets (grape):** 5 mg^{OTC}, 10 mg^{OTC}. **Orally disintegrating tablets:** 10 mg. **Solution for injection:** 10 mg/mL. **Syrup (banana-grape and bubblegum flavors):** 1 mg/mL^{OTC}. **Tablets:** 5 mg^{OTC}, 10 mg^{OTC}, 🍁 20 mg. ***In combination with:*** pseudoephedrine (Zyrtec-D 12 hr) (See Appendix N).

NURSING IMPLICATIONS

Assessment

- Assess allergy symptoms (rhinitis, conjunctivitis, hives) before and periodically during therapy.
- Assess lung sounds and character of bronchial secretions. Maintain fluid intake of 1500–2000 mL/day to decrease viscosity of secretions.
- **IV:** Assess severity of urticaria before and periodically after injection.
- ***Lab Test Considerations:*** May cause false-negative result in allergy skin testing.

Implementation

- Do not confuse cetirizine with sertraline or stavudine. Do not confuse Zyrtec (cetirizine) with Zerit (Stavudine), Lipitor (atorvastatin), Zocor (simvastatin), Zyprexa (olanzapine), Zyrtec-D (cetirizine/pseudoephedrine), Zyrtec Itchy Eye Drops (ketotifen fumarate).
- **PO:** Administer once daily without regard to food.

IV Administration

- **IV Push:** Administer undiluted. Solution is clear and colorless; do not administer solutions that are cloudy, discolored, or contain precipitate matter. ***Rate:*** Administer IV push over 1–2 min.

© F.A. Davis Publishing

Patient/Family Teaching

- Instruct patient to take medication as directed.
- May cause dizziness and drowsiness. Caution patient to avoid driving or other activities requiring alertness until response to medication is known.
- Advise patient to avoid taking alcohol or other CNS depressants concurrently with this drug.
- Advise patient that good oral hygiene, frequent rinsing of mouth with water, and sugarless gum or candy may minimize dry mouth. Patient should notify dentist if dry mouth persists >2 wk.
- Instruct patient to contact health care professional if rash or dizziness occurs or if symptoms persist.
- Advise females of reproductive potential to notify health care professional if pregnancy is planned or suspected or if breast feeding.

Evaluation/Desired Outcomes

- Decrease in allergic symptoms.

cetuximab (se-tux-i-mab)

Erbitux

Classification

Therapeutic: antineoplastics
Pharmacologic: monoclonal antibodies

Indications

Locally or regionally advanced squamous cell carcinoma of the head and neck (in combination with radiation therapy). Recurrent or metastatic squamous cell carcinoma of the head and neck progressing after platinum-based therapy. Recurrent or metastatic squamous cell carcinoma of the head and neck (in combination with platinum-based therapy with 5-fluorouracil). *K-ras* wild-type, epidermal growth factor receptor (EGFR)-expressing metastatic colorectal cancer in patients who have not responded to irinotecan and oxaliplatin or are intolerant to irinotecan. *K-ras* wild-type, EGFR-expressing metastatic colorectal cancer in patients who have not responded to irinotecan alone (in combination with irinotecan). First-line treatment of *K-ras* wild-type, EGFR-expressing metastatic colorectal cancer (in combination with irinotecan, 5-fluorouracil, and leucovorin [FOLFIRI]). Metastatic colorectal cancer with a BRAF V600E mutation (in combination with encorafenib).

Action

Binds specifically to EGFR, thereby preventing the binding of endogenous epidermal growth factor . This prevents cell growth and differentiation processes.
Therapeutic Effects: Decreased tumor growth and spread.

Pharmacokinetics

Absorption: IV administration results in complete bioavailability.
Distribution: Unknown.
Metabolism and Excretion: Unknown.
Half-life: 97–114 hr.

TIME/ACTION PROFILE

ROUTE	ONSET	PEAK	DURATION
IV	unknown	unknown	unknown

Contraindications/Precautions

Contraindicated in: Hypersensitivity to cetuximab or murine (mouse) proteins; *RAS*-mutant metastatic colorectal cancer or unknown *RAS* mutation status (↑ mortality and tumor progression); OB: Pregnancy (may cause fetal harm); Lactation: Lactation.
Use Cautiously in: Exposure to sunlight (may exacerbate dermatologic toxicity); History of tick bites, red meat allergy, or in presence of IgE antibodies directed against galactose-α-1,3-galactose (alpha-gal) (↑ risk of anaphylaxis); Rep: Women of reproductive potential; Pedi: Safety and effectiveness not established in children.

Adverse Reactions/Side Effects

Most adverse reactions reflect combination therapy with irinotecan.
CV: CARDIOPULMONARY ARREST, SUDDEN CARDIAC DEATH.
Derm: STEVENS-JOHNSON SYNDROME (SJS), TOXIC EPIDERMAL NECROLYSIS (TEN), acneform dermatitis, hypertrichosis, nail disorder, pruritus, skin desquamation, skin infection. **EENT:** conjunctivitis, ulcerative keratitis. **F and E:** dehydration, hypomagnesemia, peripheral edema. **GI:** abdominal pain, constipation, diarrhea, nausea, vomiting, anorexia, stomatitis. **GU:** ↓ fertility (females), renal failure. **Hemat:** anemia, leukopenia. **MS:** back pain. **Metab:** ↓ weight. **Neuro:** malaise, depression, headache, insomnia. **Resp:** PULMONARY EMBOLISM, cough, dyspnea, interstitial lung disease. **Misc:** INFUSION REACTIONS (including anaphylaxis), fever, desquamation of mucosal epithelium.

Interactions

Drug-Drug: None reported.

Route/Dosage

Head and Neck Cancer with Radiation

IV (Adults): 400 mg/m² administered 1 wk prior to initiation of radiation therapy, followed by 250 mg/m² once weekly for the duration of radiation therapy or until disease progression or unacceptable toxicity (complete infusion 1 hr prior to radiation therapy).

Head and Neck Cancer Monotherapy or in Combination with Platinum-Based Therapy and 5-Fluorouracil

IV (Adults): *Monotherapy (weekly regimen)* — 400 mg/m² initially, followed by 250 mg/m² once weekly until disease progression or unacceptable toxicity. *Monotherapy (biweekly regimen)* — 500 mg/m² every 2 wks until disease progression or unacceptable toxicity. *Combination therapy with platinum-based ther-*

© F.A. Davis Publishing

apy and 5-fluorouracil (weekly regimen) — 400 mg/m² initially, followed by 250 mg/m² once weekly until disease progression or unacceptable toxicity (complete infusion 1 hr to prior to administering platinum-based therapy with 5-fluorouracil). *Combination therapy with platinum-based therapy and 5-fluorouracil (biweekly regimen)* — 500 mg/m² every 2 wk until disease progression or unacceptable toxicity (complete infusion 1 hr prior to administering platinum-based therapy with 5-fluorouracil).

Colorectal Cancer

IV (Adults): *Monotherapy (weekly regimen)* — 400 mg/m² initially, followed by 250 mg/m² once weekly until disease progression or unacceptable toxicity. *Monotherapy (biweekly regimen)* — 500 mg/m² every 2 wk until disease progression or unacceptable toxicity. *Combination therapy with irinotecan or FOLFIRI (weekly regimen)* — 400 mg/m² initially, followed by 250 mg/m² once weekly until disease progression or unacceptable toxicity (complete infusion 1 hr prior to administering irinotecan or FOLFIRI). *Combination therapy with irinotecan or FOLFIRI (biweekly regimen)* — 500 mg/m² every 2 wk until disease progression or unacceptable toxicity (complete infusion 1 hr prior to administering irinotecan or FOLFIRI). *Combination therapy with encorafenib* — 400 mg/m² initially, followed by 250 mg/m² once weekly until disease progression or unacceptable toxicity.

Availability

Solution for injection: 2 mg/mL.

NURSING IMPLICATIONS

Assessment

- Assess for infusion reaction (rapid onset of airway obstruction [bronchospasm, stridor, hoarseness], urticaria, hypotension, loss of consciousness, myocardial infarction, cardiopulmonary arrest) for at least 1 hr following infusion. Longer observation periods may be required for those who experience infusion reactions. Risk of anaphylactic reactions may be increased in patients with a history of tick bites, red meat allergy, or in the presence of IgE antibodies directed against galactose-α-1,3-galactose (alpha-gal). Most reactions occur during first dose, but may also occur in later doses. For severe reactions, immediately stop infusion and discontinue cetuximab permanently. Epinephrine, corticosteroids, IV antihistamines, bronchodilators, and oxygen should be available for reactions. Mild to moderate reactions (chills, fever, dyspnea) may be managed by slowing rate of infusion and administration of antihistamines. *If infusion reaction is Grade 1 or 2,* reduce infusion rate by 50%. *If infusion reaction is Grade 3 or 4,* discontinue immediately and permanently.
- Assess for acute onset or worsening of pulmonary symptoms. Delay infusion 1–2 wk; if condition improves, continue at dose that was being administered at the time of occurrence. If no improvement in 2 wk or interstitial lung disease is confirmed, discontinue cetuximab and treat appropriately.
- Assess for dermatologic toxicities (acneform rash, skin drying and fissuring, inflammatory and infectious sequelae [blepharitis, cheilitis, cellulitis, cyst]). Treat symptomatically. Acneform rash usually occurs within initial 2 wk of therapy and resolves following cessation, but may continue up to 28 days following therapy. *For 1st occurrence of dermatologic toxicities; Grade 3 or 4,* delay infusion 1–2 wk; if improvement, continue at 250 mg/m², if no improvement, discontinue cetuximab. *For 2nd occurrence; Grade 3 or 4,* delay infusion 1–2 wk; if improvement, reduce dose to 200 mg/m², if no improvement, discontinue cetuximab. *For 3rd occurrence; Grade 3 or 4,* delay infusion 1–2 wk; if improvement, reduce dose to 150 mg/m², if no improvement, discontinue cetuximab. *For 4th occurrence; Grade 3 or 4,* discontinue cetuximab.
- ***Lab Test Considerations:*** Verify negative pregnancy test before starting therapy.
- Determine Ras mutation and EGFR-expression status using FDA-approved tests prior to initiating treatment. Only patients whose tumors are *K-ras* wild-type should receive cetuximab. Determine BRAF V600E mutation before use for metastatic colon cancer. Information on FDA-approved tests for the detection of *K-ras* or BRAF V600E mutations in CRC in patients with metastatic CRC is available at: http://www.fda.gov/CompanionDiagnostics.
- Consider testing patients for alpha-gal IgE antibodies using FDA-cleared methods before starting therapy. Negative results for alpha-gal antibodies do not rule out the risk of severe infusion reactions.
- May cause anemia and leukopenia.
- Monitor serum electrolytes, especially serum magnesium, potassium, and calcium, closely during and periodically for at least 8 wk following infusion. May cause hypomagnesemia, hypocalcemia, and hypokalemia; may occur from days to mo after initiation of therapy. May require electrolyte replacement. May lead to cardiopulmonary arrest and sudden death.

Implementation

- Premedicate with histamine$_1$ antagonist (diphenhydramine 50 mg) 30–60 min prior to first dose; base subsequent administration on presence and severity of infusion reactions.

IV Administration

- Administer through a low protein binding 0.22-micrometer in-line filter placed as proximal to patient as possible. Solution should be clear and colorless

© F.A. Davis Publishing

and may contain a small amount of white amorphous cetuximab particles. Do not shake or dilute.
- Can be administered via infusion pump or syringe pump. Cetuximab should be piggybacked to the patient's infusion line.
- Observe patient for 1 hr following infusion.
- **Intermittent Infusion:** *For administration via infusion pump:* Draw up volume of a vial using vented spike needle or other transfer device. Transfer to a sterile evacuated container or bag. Repeat with new needle for each vial until calculated volume is in container. Affix infusion line and prime with cetuximab before starting infusion.
- *For administration via syringe pump:* Draw up volume of a vial using sterile syringe attached to an appropriate vented spike needle. Place syringe into syringe driver of a syringe pump and set rate. Connect infusion line and prime with cetuximab. Use a new needle and filter for each vial. ***Dilution:*** Do not dilute. ***Concentration:*** 2 mg/mL. ***Rate:*** Administer over 2 hr at a rate not to exceed 10 mg/min. Use 0.9% NaCl to flush line at end of infusion.
- Cetuximab infusion must be completed 1 hr prior to FOLFIRI (irinotecan, 5-fluorouracil, leucovorin) regimen. May infuse subsequent weekly infusions over 1 hr.

Patient/Family Teaching
- Explain purpose of cetuximab and potential side effects to patient.
- Advise patient to notify health care professional promptly if dermatologic changes (itchy, dry, scaly, or cracking skin, and inflammation, infection or swelling at base of nails or loss of the nails), conjunctivitis, blepharitis, or decreased vision, and signs and symptoms of pulmonary toxicity (new or worsening cough, chest pain, shortness of breath), infusion reactions (fever, chills, or breathing problems) promptly. Risk for infusion reactions in patients who have had a tick bite or red meat allergy.
- Caution patient to wear sunscreen and hats and limit sun exposure during therapy during and for 2 mo following last dose of cetuximab.
- Rep: May cause fetal harm. Advise females of reproductive potential to use effective contraception during and for 2 mo after last dose of therapy and to avoid breast feeding during and for 2 mo following therapy. May impair female fertility.

Evaluation/Desired Outcomes
- Decreased tumor growth and spread.

chlorothiazide, See DIURETICS (THIAZIDE).

chlorthalidone (thiazide-like), See DIURETICS (THIAZIDE).

cholecalciferol, See VITAMIN D COMPOUNDS.

ciclesonide, See CORTICOSTEROIDS (NASAL).

ciclopirox, See ANTIFUNGALS (TOPICAL).

cilostazol (sil-**os**-tah-zol)
~~Pletal~~

Classification
Therapeutic: antiplatelet agents
Pharmacologic: platelet aggregation inhibitors

Indications
Reduction of the symptoms of intermittent claudication as measured by increased walking distance.

Action
Inhibits the enzyme cyclic adenosine monophosphate (cAMP) phosphodiesterase III (PDE III), which results in increased cAMP in platelets and blood vessels, producing inhibition of platelet aggregation and vasodilation. **Therapeutic Effects:** Reduced symptoms of intermittent claudication with improved walking distance.

Pharmacokinetics
Absorption: Slowly absorbed after oral administration.
Distribution: Unknown.
Protein Binding: 95–98% bound to plasma proteins; one active metabolite is 97.4% bound, the other is 66% bound.
Metabolism and Excretion: Extensively metabolized by the liver, two metabolites have platelet aggregation inhibitory activity; metabolites are mostly excreted by the kidneys.
Half-life: *Cilostazol and its active metabolites*—11–13 hr.

TIME/ACTION PROFILE (symptom reduction)

ROUTE	ONSET	PEAK	DURATION
PO	2–4 wk	up to 12 wk	unknown

Contraindications/Precautions
Contraindicated in: Hypersensitivity; HF; OB: Potential for congenital defects, stillbirth, and low birth weight; Lactation: Potential risk to nursing infants; discontinue or bottle feed.
Use Cautiously in: Pedi: Safety not established.

© F.A. Davis Publishing

Adverse Reactions/Side Effects
CV: hypotension, left ventricular outflow obstruction, palpitations, tachycardia. **GI:** diarrhea. **Neuro:** headache, dizziness.

Interactions
Drug-Drug: Concurrent administration of **ketoconazole**, **itraconazole**, **erythromycin**, **diltiazem**, **fluconazole**, **miconazole**, **fluvoxamine**, **fluoxetine**, **nefazodone**, **sertraline**, or **omeprazole** ↓ metabolism and ↑ levels and activity of cilostazol (use lower doses). Concurrent use with **aspirin** has additive effects on platelet function.
Drug-Food: Grapefruit juice inhibits metabolism and ↑ effects; concurrent use should be avoided.

Route/Dosage
PO (Adults): 100 mg twice daily (50 mg twice daily if receiving inhibitors of cilostazol metabolism).

Availability (generic available)
Tablets: 50 mg, 100 mg.

NURSING IMPLICATIONS
Assessment
- Assess patient for intermittent claudication before and periodically during therapy.
- ***Lab Test Considerations:*** May occasionally cause anemia, hyperlipemia, hyperuricemia, and albuminuria. May prolong bleeding time.

Implementation
- **PO:** Administer on an empty stomach, 1 hr before or 2 hr after meals.

Patient/Family Teaching
- Instruct patient to take cilostazol on an empty stomach, exactly as directed.
- Advise patient to avoid grapefruit juice during therapy.
- May cause dizziness. Caution patient to avoid driving or other activities requiring alertness until response to medication is known.
- Advise patient to avoid smoking; nicotine constricts blood vessels.

Evaluation/Desired Outcomes
- Relief from cramping in calf muscles, buttocks, thighs, and feet during exercise.
- Improvement in walking endurance. Therapeutic effects may be seen in 2–4 wk.

cimetidine, See HISTAMINE H_2 ANTAGONISTS.

cinacalcet (sin-a-kal-set)
Sensipar

Classification
Therapeutic: hypocalcemics
Pharmacologic: calcimimetic agents

C

Indications
Secondary hyperparathyroidism in patients with chronic kidney disease (CKD) on dialysis. Hypercalcemia caused by parathyroid carcinoma. Severe hypercalcemia in patients with primary hyperparathyroidism who are unable to undergo parathyroidectomy.

Action
Increases sensitivity of calcium-sensing receptors located on the surface of chief cells of parathyroid gland to levels of extracellular calcium. This decreases parathyroid hormone production with resultant decrease in serum calcium. **Therapeutic Effects:** Decreased bone turnover and fibrosis. Decreased serum calcium.

Pharmacokinetics
Absorption: Well absorbed following oral administration, absorption is enhanced by food and further enhanced by a high fat meal.
Distribution: Unknown.
Protein Binding: 93–97%.
Metabolism and Excretion: Highly metabolized by CYP3A4, CYP2D6, and CYP1A2 enzyme systems; 80% excreted in urine as metabolites, 15% in feces.
Half-life: 30–40 hr.

TIME/ACTION PROFILE (effect on PTH levels)

ROUTE	ONSET	PEAK	DURATION
PO	rapid	2–6 hr	6–12 hr

Contraindications/Precautions
Contraindicated in: Hypersensitivity; Hypocalcemia.
Use Cautiously in: History of seizure disorder (↑ risk of seizures with hypocalcemia); Chronic kidney disease patients who are not being dialyzed (↑ risk of hypocalcemia); Intact parathyroid hormone (iPTH) level <150 pg/mL (dose ↓ or discontinuation may be warranted); Moderate or severe hepatic impairment; Congenital long QT syndrome, QT interval prolongation, family history of long QT syndrome or sudden cardiac death, or concurrent use of QT interval prolonging medications; OB: Safety not established; Lactation: Use while breast feeding only if potential maternal benefit justifies potential risk to infant; Pedi: Safety not established.

© F.A. Davis Publishing

Adverse Reactions/Side Effects

CV: ARRHYTHMIA, TORSADES DE POINTES, HF exacerbation, hypotension, QT interval prolongation. **F and E:** HYPOCALCEMIA. **GI:** nausea, vomiting. **Metab:** adynamic bone disease. **Neuro:** seizures.

Interactions

Drug-Drug: Concurrent use of **QT interval prolonging medications** may ↑ risk of QT interval prolongation and/or torsade de pointes, especially in patients with hypocalcemia. Inhibits CYP2D6 and may ↑ levels of **flecainide**, **vinblastine**, **thioridazine**, **metoprolol**, **carvedilol**, and most **tricyclic antidepressants**; dose adjustments may be necessary. **Strong CYP3A4 inhibitors** including **ketoconazole**, **itraconazole**, and **erythromycin** may ↑ levels and risk of toxicity; monitoring and dose adjustment may be necessary.

Route/Dosage

Secondary Hyperparathyroidism in CKD Patients on Dialysis

PO (Adults): 30 mg once daily; may ↑ dose every 2–4 wk (dose range 30–180 mg once daily) based on iPTH levels. *Switching from etecalcetide*—Discontinue etecalcetide for ≥4 wk and ensure corrected serum calcium is at or above lower limit of normal prior to starting cinacalcet.

Parathyroid Carcinoma or Primary Hyperparathyroidism

PO (Adults): 30 mg twice daily; may ↑ every 2–4 wk up to 90 mg 3–4 times daily based on serum calcium levels.

Availability (generic available)

Tablets: 30 mg, 60 mg, 90 mg.

NURSING IMPLICATIONS

Assessment

- Monitor for signs and symptoms of hypocalcemia (paresthesias, myalgias, cramping, tetany, convulsions) during therapy. If calcium levels decrease to below normal, serum calcium may be increased by adjusting dose (see Lab Test Considerations) and providing supplemental serum calcium, initiating or increasing dose of calcium-based phosphate binder or vitamin D.
- Monitor ECG for prolonged QT interval periodically during therapy.
- ***Lab Test Considerations:*** Monitor serum calcium and phosphorus levels within 1 wk after initiation of therapy or dose adjustment and monthly for patients with hyperparathyroidism or every 2 mo for patients with parathyroid carcinoma once maintenance dose has been established, especially in patients with a history of seizure disorder. Therapy should not be initiated in patients with serum calcium less than the lower limit of normal (8.4 mg/dL).
- If serum calcium ↓ below 8.4 mg/dL but remains above 7.5 mg/dL, or if symptoms of hypocalcemia occur, use calcium-containing phosphate binders and/or vitamin D sterols to ↑ serum calcium. If serum calcium ↓ below 7.5 mg/dL, or if symptoms of hypocalcemia persist and the dose of vitamin D cannot be ↑, withhold administration of cinacalcet until serum calcium levels reach 8.0 mg/dL, and/or symptoms of hypocalcemia resolve. Re-initiate therapy using next lowest dose of cinacalcet.
- Monitor serum iPTH levels 1 to 4 wk after initiation of therapy or dose adjustment, and every 1 to 3 mo after maintenance dose has been established. If iPTH levels ↓ below 150–300 pg/mL, reduce dose or discontinue cinacalcet. Assess iPTH levels no earlier than 12 hr after dose.
- Monitor liver function tests in patients with moderate to severe hepatic impairment during therapy.

Implementation

- Cinacalcet may be used alone or in combination with vitamin D and/or phosphate binders.
- **PO:** Administer with food or shortly after a meal. Take tablets whole; do not crush, break, or chew.

Patient/Family Teaching

- Instruct patient to take cinacalcet as directed.
- Advise patient to report signs and symptoms of hypocalcemia, GI bleeding (black tarry stools, abdominal pain), nausea and vomiting to health care professional promptly.
- Advise females of reproductive potential to notify health care professional if pregnancy is planned or suspected, or if breast feeding.
- Emphasize the importance of follow-up lab tests to monitor safely and efficacy.

Evaluation/Desired Outcomes

- Decreased serum calcium levels.

ciprofloxacin, See FLUOROQUINOLONES.

HIGH ALERT

CISplatin (sis-**pla**-tin)

~~Platinol~~

Classification

Therapeutic: antineoplastics
Pharmacologic: alkylating agents

Indications

Metastatic testicular and ovarian carcinoma. Advanced bladder cancer. Head and neck cancer. Cervical cancer. Lung cancer. Other tumors.

Action

Inhibits DNA synthesis by producing cross-linking of parent DNA strands (cell-cycle phase–nonspecific).

© F.A. Davis Publishing

Therapeutic Effects: Death of rapidly replicating cells, particularly malignant ones.

Pharmacokinetics

Absorption: IV administration results in complete bioavailability.
Distribution: Widely distributed; accumulates for months; enters breast milk.
Metabolism and Excretion: Excreted mainly by the kidneys.
Half-life: 30–100 hr.

TIME/ACTION PROFILE (effects on blood counts)

ROUTE	ONSET	PEAK	DURATION
IV	unknown	18–23 days	39 days

Contraindications/Precautions

Contraindicated in: Hypersensitivity; OB, Lactation: Pregnancy or lactation.
Use Cautiously in: Hearing loss; Renal impairment (dosage ↓ recommended); HF; Electrolyte abnormalities; Active infections; Bone marrow depression; Geri: ↑ risk of nephrotoxicity and peripheral neuropathy; Rep: Women of reproductive potential.

Adverse Reactions/Side Effects

EENT: ototoxicity, tinnitus. **GI:** HEPATOTOXICITY, nausea, vomiting, diarrhea. **GU:** nephrotoxicity, sterility. **Derm:** alopecia. **F and E:** hypocalcemia, hypokalemia, hypomagnesemia. **Hemat:** LEUKOPENIA, THROMBOCYTOPENIA, anemia. **Local:** phlebitis at IV site. **Metab:** hyperuricemia. **Neuro:** peripheral neuropathy, REVERSIBLE POSTERIOR LEUKOENCEPHALOPATHY SYNDROME (RPLS), SEIZURES, malaise, weakness.. **Misc:** anaphylactoid reactions.

Interactions

Drug-Drug: ↑ risk of nephrotoxicity and ototoxicity with other **nephrotoxic** and **ototoxic drugs (aminoglycosides, loop diuretics)**. ↑ risk of hypokalemia and hypomagnesemia with **loop diuretics** and **amphotericin B**. May ↓ **phenytoin** levels. ↑ bone marrow depression with other **antineoplastics** or **radiation therapy**. May ↓ antibody response to **live-virus vaccines** and ↑ adverse reactions.

Route/Dosage

Other regimens are used.
IV (Adults): *Metastatic testicular tumors*— 20 mg/m² daily for 5 days repeated every 3–4 wk. *Metastatic ovarian cancer*— 75–100 mg/m², repeat every 4 wk in combination with cyclophosphamide *or* 100 mg/m² every 3 wk if used as a single agent. *Advanced bladder cancer*— 50–70 mg/m² every 3–4 wk as a single agent.

Availability (generic available)

Injection: 1 mg/mL.

NURSING IMPLICATIONS

Assessment

- Monitor vital signs frequently during administration. Report significant changes.
- Monitor intake and output and specific gravity frequently during therapy. To reduce risk of nephrotoxicity, maintain urinary output of at least 100 mL/hr for 4 hr before initiating and for at least 24 hr after administration.
- Encourage patient to drink 2000–3000 mL/day of water to promote excretion of uric acid. Allopurinol and alkalinization of urine may be used to help prevent uric acid nephropathy.
- Assess patency of IV site frequently during therapy. Cisplatin may cause severe irritation and necrosis of tissue if extravasation occurs. If a large amount of highly concentrated cisplatin solution extravasates, mix 4 mL of 10% sodium thiosulfate with 6 mL of sterile water or 1.6 mL of 25% sodium thiosulfate with 8.4 mL of sterile water and inject 1–4 mL (1 mL for each mL extravasated) through existing line or cannula. Inject subcut if needle has been removed. Sodium thiosulfate inactivates cisplatin.
- Severe and protracted nausea and vomiting usually occur 1–4 hr after a dose; vomiting may last for 24 hr. Administer parenteral antiemetic agents 30–45 min before therapy and routinely around the clock for the next 24 hr. Monitor amount of emesis and notify health care professional if emesis exceeds guidelines to prevent dehydration. Nausea and anorexia may persist for up to 1 wk.
- Monitor for bone marrow depression. Assess for bleeding (bleeding gums, bruising, petechiae, stools, urine, and emesis) and avoid IM injections and taking rectal temperatures if platelet count is low. Apply pressure to venipuncture sites for 10 min. Assess for signs of infection during neutropenia. Anemia may occur. Monitor for increased fatigue, dyspnea, and orthostatic hypotension.
- Monitor for signs of anaphylaxis (facial edema, wheezing, dizziness, fainting, tachycardia, hypotension). Discontinue medication immediately and report symptoms. Epinephrine and resuscitation equipment should be readily available.
- Medication may cause ototoxicity and neurotoxicity. Assess patient frequently for dizziness, tinnitus, hearing loss, loss of coordination, loss of taste, or numbness and tingling of extremities; may be irreversible. Notify health care professional promptly if these occur. Audiometry should be performed before initiation of therapy and before subsequent doses. Hearing loss is more frequent with children and usually occurs first with high frequencies and may be unilateral or bilateral.
- Monitor for inadvertent cisplatin overdose. Doses >100 m g/m²/cycle once every 3–4 wk are rarely

© F.A. Davis Publishing

used. Differentiate daily doses from total dose/cycle. Symptoms of high cumulative doses include muscle cramps (localized, painful involuntary skeletal muscle contractions of sudden onset and short duration) and are usually associated with advanced stages of peripheral neuropathy.

- Monitor for signs of RPLS (headache, seizure, lethargy, confusion, blindness). Hypertension may or may not be present. May occur within 16 hr to 1 yr of initiation of therapy. Treat hypertension if present and discontinue cisplatin therapy. Symptoms usually resolve within days.
- ***Lab Test Considerations:*** Monitor CBC with differential and platelet count before and routinely throughout therapy. The nadir of leukopenia, thrombocytopenia, and anemia occurs within 18–23 days and recovery 39 days after a dose. Withhold further doses until WBC is >4000/mm^3 and platelet count is >100,000/mm^3.
- Monitor BUN, serum creatinine, and CCr before initiation of therapy and before each course of cisplatin to detect nephrotoxicity. May cause ↑ BUN and creatinine and ↓ calcium, magnesium, phosphate, sodium, and potassium levels that usually occur 2nd wk after a dose. Do not administer additional doses until BUN is <25 mg/dL and serum creatinine is <1.5 mg/dL. May cause ↑ uric acid level, which usually peaks 3–5 days after a dose.
- May cause transient ↑ serum bilirubin and AST concentrations.
- May cause positive Coombs' test result.

Implementation

- ***High Alert:*** Fatalities have occurred with chemotherapeutic agents. Before administering, clarify all ambiguous orders; double-check single, daily, and course-of-therapy dose limits; have second practitioner independently double-check original order, calculations, and infusion pump settings.
- Do not confuse cisplatin with carboplatin. To prevent confusion, orders should include generic and brand names. Administer under supervision of a physician experienced in use of cancer chemotherapeutic agents.
- Solution should be prepared in a biologic cabinet. Wear gloves, gown, and mask while handling medication. If powder or solution comes in contact with skin or mucosa, wash thoroughly with soap and water. Discard equipment in specially designated containers.
- Hydrate patient with at least 1–2 L of IV fluid 8–12 hr before initiating therapy with cisplatin. Amifostine may be administered to minimize nephrotoxicity.
- Do not use aluminum needles or equipment during preparation or administration. Aluminum reacts with this drug, forms a black or brown precipitate, and renders the drug ineffective.
- Unopened vials of powder and constituted solution must not be refrigerated.

IV Administration

- **Intermittent Infusion:** Solution should be clear and colorless; discard if turbid or if it contains precipitates.
- ***Dilution:*** Dilution in 2 L of 5% dextrose in 0.3% or 0.45% NaCl containing 37.5 g of mannitol is recommended. ***Concentration:*** Keep under 0.5 mg/mL to prevent tissue necrosis. ***Rate:*** Variable. Administer over 6–8 hr. Maximum rate 1 mg/min.
- **Continuous Infusion:** Has been administered as continuous infusion over 24 hr to 5 days with resultant decrease in nausea and vomiting. ***High Alert:*** Clarify dose to ensure cumulative dose is not confused with daily dose; errors may be fatal.
- **Y-Site Compatibility:** acyclovir, alfentanil, allopurinol, amikacin, aminophylline, amiodarone, ampicillin, ampicillin/sulbactam, anidulafungin, argatroban, azithromycin, aztreonam, bivalirudin, bleomycin, bumetanide, buprenorphine, butorphanol, calcium chloride, calcium gluconate, carmustine, caspofungin, cefazolin, cefotaxime, cefotetan, ceftazidime, ceftriaxone, cefuroxime, chlorpromazine, ciprofloxacin, cisatracurium, cladribine, clindamycin, cyclophosphamide, cyclosporine, cytarabine, dactinomycin, daptomycin, daunorubicin hydrochloride, dexamethasone, dexmedetomidine, dexrazoxane, digoxin, diltiazem, diphenhydramine, dobutamine, docetaxel, dopamine, doxacurium, doxorubicin, doxorubicin liposome, doxycycline, droperidol, enalaprilat, ephedrine, epinephrine, epirubicin, ertapenem, erythromycin, esmolol, etoposide, etoposide phosphate, famotidine, fenoldopam, fentanyl, filgrastim, fluconazole, fludarabine, fluorouracil, foscarnet, fosphenytoin, furosemide, ganciclovir, gemcitabine, gentamicin, glycopyrrolate, granisetron, haloperidol, heparin, hetastarch, hydrocortisone, hydromorphone, idarubicin, ifosfamide, imipenem/cilastatin, indomethacin, irinotecan, isoproterenol, ketorolac, labetalol, leucovorin calcium, levofloxacin, levorphanol, lidocaine, linezolid, lorazepam, magnesium sulfate, mannitol, melphalan, meperidine, meropenem, methotrexate, methylprednisolone, metoclopramide, metoprolol, metronidazole, midazolam, milrinone, mitomycin, mitoxantrone, moxifloxacin, nafcillin, naloxone, nicardipine, nitroglycerin, nitroprusside, norepinephrine, octreotide, ondansetron, oxaliplatin, paclitaxel, palonosetron, pamidronate, pancuronium, pemetrexed, pentamidine, pentobarbital, phenobarbital, phenylephrine, phenytoin, potassium acetate, potassium chloride, potassium phosphates, procainamide, prochlorperazine, promethazine, propofol, propranolol, quinupristin/dalfopristin, remifentanil, rituximab, sargramostim, sodium acetate, sodium bicarbonate, sodium phosphates, succinylcholine, sufentanil, tacrolimus, theophylline, thiopental, tigecycline, tirofiban, tobramycin, topotecan, trastuzumab, vancomycin, vasopressin, vecuronium, verapamil, vinblastine,

© F.A. Davis Publishing

vincristine, vinorelbine, voriconazole, zidovudine, zoledronic acid.
- **Y-Site Incompatibility:** amifostine, amphotericin B deoxycholate, amphotericin B lipid complex, amphotericin B liposome, cefepime, dantrolene, diazepam, insulin, pantoprazole, piperacillin/tazobactam, thiotepa.

Patient/Family Teaching

- Instruct patient to report pain at injection site immediately.
- Instruct patient to notify health care professional promptly if fever; chills; cough; hoarseness; sore throat; signs of infection; lower back or side pain; painful or difficult urination; bleeding gums; bruising; petechiae; blood in stools, urine, or emesis; increased fatigue; dyspnea; or orthostatic hypotension occurs. Caution patient to avoid crowds and persons with known infections. Instruct patient to use soft toothbrush and electric razor and to avoid falls. Caution patient not to drink alcoholic beverages or take medication containing aspirin or NSAIDs; may precipitate gastric bleeding.
- Instruct patient to report promptly any numbness or tingling in extremities or face, difficulty with hearing or tinnitus, unusual swelling, or joint pain.
- Instruct patient not to receive any vaccinations without advice of health care professional.
- Advise patient of the need for contraception, although cisplatin may cause infertility.
- Emphasize the need for periodic lab tests to monitor for side effects.

Evaluation/Desired Outcomes

- Decrease in size or spread of malignancies. Therapy should not be administered more frequently than every 3–4 wk, and only if lab values are within acceptable parameters and patient is not exhibiting signs of ototoxicity or other serious adverse effects.

citalopram (si-tal-oh-pram)

CeleXA

Classification

Therapeutic: antidepressants
Pharmacologic: selective serotonin reuptake inhibitors (SSRIs)

Indications

Depression. **Unlabeled Use:** Premenstrual dysphoric disorder (PMDD). Obsessive-compulsive disorder (OCD). Panic disorder. Generalized anxiety disorder (GAD). Post-traumatic stress disorder (PTSD). Social anxiety disorder (social phobia).

Action

Selectively inhibits the reuptake of serotonin in the CNS.
Therapeutic Effects: Antidepressant action.

Pharmacokinetics

Absorption: 80% absorbed after oral administration.
Distribution: Enters breast milk.
Metabolism and Excretion: Mostly metabolized by the liver (10% by CYP3A4 and 2C19 enzymes); the CYP2C19 enzyme system exhibits genetic polymorphism (2% of Whites, 4% of Blacks, and 14% of Asians may be poor metabolizers and may have significantly ↑ citalopram concentrations and an ↑ risk of adverse effects). Excreted unchanged in the urine.
Half-life: 35 hr.

TIME/ACTION PROFILE (antidepressant effect)

ROUTE	ONSET	PEAK	DURATION
PO	1–4 wk	unknown	unknown

Contraindications/Precautions

Contraindicated in: Hypersensitivity; Concurrent use of MAO inhibitors or MAO-like drugs (linezolid or methylene blue); Concurrent use of pimozide; Congenital long QT syndrome, bradycardia, hypokalemia, hypomagnesemia, recent myocardial infarction, decompensated heart failure (↑ risk of QT interval prolongation); Concurrent use of QT interval prolonging drugs.
Use Cautiously in: History of mania; History of suicide attempt/ideation (↑ risk during early therapy and during dose adjustment); History of seizure disorder; Illnesses or conditions that are likely to result in altered metabolism or hemodynamic responses; Severe renal or hepatic impairment (maximum dose of 20 mg/day in patients with hepatic impairment); Poor metabolizers of CYP2C19 (↑ risk of QT interval prolongation) (maximum dose of 20 mg/day); Concurrent use of CYP2C19 inhibitors (↑ risk of QT interval prolongation) (maximum dose of 20 mg/day); Angle-closure glaucoma; OB: Use during pregnancy only if potential maternal benefit justifies potential fetal risk; Lactation: Use while breast feeding only if potential maternal benefit justifies potential risk to infant; Pedi: May ↑ risk of suicide attempt/ideation especially during early treatment or dose adjustment in children/adolescents; safety and effectiveness not established in children); Geri: ↓ dose recommended in older adults (maximum dose of 20 mg/day in patients >60 yr).

Adverse Reactions/Side Effects

CV: TORSADES DE POINTES, postural hypotension, QT interval prolongation, tachycardia. **Derm:** sweating, photosensitivity, pruritus, rash. **EENT:** abnormal accommodation. **GI:** abdominal pain, anorexia, diarrhea, dry mouth, dyspepsia, flatulence, ↑ saliva, nausea, altered taste, ↑ appetite, vomiting. **GU:** amenorrhea, ↓ libido, delayed/absent orgasm, dysmenorrhea, ejaculatory delay/failure, erectile dysfunction, polyuria. **F and E:** hyponatremia. **Metab:** weight loss, weight gain.

© F.A. Davis Publishing

MS: arthralgia, myalgia. **Neuro:** NEUROLEPTIC MALIGNANT SYNDROME, SUICIDAL THOUGHTS, apathy, confusion, drowsiness, insomnia, tremor, weakness, agitation, amnesia, anxiety, ↓ libido, dizziness, fatigue, impaired concentration, ↑ depression, migraine headache, paresthesia. **Resp:** cough. **Misc:** SEROTONIN SYNDROME, fever, yawning.

Interactions

Drug-Drug: May cause serious, potentially fatal reactions when used with **MAO inhibitors**; concurrent use contraindicated; allow at least 14 days between citalopram and **MAO inhibitors**. Concurrent use with **MAO-inhibitor like drugs**, such as **linezolid** or **methylene blue**, may ↑ risk of serotonin syndrome; concurrent use contraindicated; do not start therapy in patients receiving **linezolid** or **methylene blue**; if **linezolid** or **methylene blue** need to be started in a patient receiving citalopram, immediately discontinue citalopram and monitor for signs/symptoms of serotonin syndrome for 2 wk or until 24 hr after last dose of linezolid or methylene blue, whichever comes first (may resume citalopram therapy 24 hr after last dose of linezolid or methylene blue). Concurrent use with **pimozide** may result in prolongation of the QT interval and is contraindicated. **QT interval prolonging drugs** may ↑ the risk of QT interval prolongation and torsades de pointes (concurrent use should be avoided). **CYP2C19 inhibitors**, including **cimetidine** may ↑ levels and the risk of toxicity (maximum dose = 20 mg/day). Drugs that affect serotonergic neurotransmitter systems, including **tricyclic antidepressants**, **SNRIs**, **fentanyl**, **buspirone**, **tramadol**, **amphetamines**, and **triptans** ↑ risk of serotonin syndrome. Use cautiously with other **centrally acting drugs** (including **alcohol**, **antihistamines**, **opioid analgesics**, and **sedative/hypnotics**; concurrent use with **alcohol** is not recommended). Serotonergic effects may be ↑ by **lithium** (concurrent use should be carefully monitored). **Ketoconazole**, **itraconazole**, **erythromycin**, and **omeprazole** may ↑ levels. **Carbamazepine** may ↓ blood levels. May ↑ levels of **metoprolol**. Use cautiously with **tricyclic antidepressants** due to unpredictable effects on serotonin and norepinephrine reuptake. ↑ risk of bleeding with **aspirin**, **NSAIDs**, **clopidogrel**, or **warfarin**.

Drug-Natural Products: ↑ risk of serotonergic side effects including serotonin syndrome with **St. John's wort** and **SAMe**.

Route/Dosage

PO (Adults): 20 mg once daily initially, may be ↑ in 1 wk to 40 mg/day (maximum dose); *CYP2C19 poor metabolizers or concurrent use of CYP2C19 inhibitor*—Not to exceed 20 mg day.

PO (Geriatric Patients): 20 mg once daily initially (not to exceed 20 mg/day in patients >60 yr).

Hepatic Impairment

PO (Adults): 20 mg once daily (not to exceed 20 mg/day).

Availability (generic available)

Tablets: 10 mg, 20 mg, 40 mg. **Cost:** *Generic*—10 mg $7.11/100, 20 mg $9.73/100, 40 mg $10.83/100.

Oral solution (peppermint flavor): 10 mg/5 mL. **Cost:** *Generic*—10 mg/5 mL $117.50/240 mL.

NURSING IMPLICATIONS

Assessment

- Screen patient for a personal or family history of bipolar disorder, mania, or hypomania before starting therapy; may precipitate a mixed/manic episode.
- Monitor mood changes during therapy.
- Assess for suicidal tendencies, especially during early therapy and dose changes. Restrict amount of drug available to patient. Risk may be increased in children, adolescents, and adults ≤24 yr. After starting therapy, children, adolescents, and young adults should be seen by health care professional at least weekly for 4 wk, every 3 wk for the next 4 wk, and on advice of health care professional thereafter.
- Assess sexual function before starting citalopram. Assess for changes in sexual function during treatment, including timing of onset; patient may not report.
- Assess for serotonin syndrome (mental changes [agitation, hallucinations, coma], autonomic instability [tachycardia, labile BP, hyperthermia], neuromuscular aberrations [hyperreflexia, incoordination], and/or GI symptoms [nausea, vomiting, diarrhea]), especially in patients taking other serotonergic drugs (SSRIs, SNRIs, triptans).
- ***Lab Test Considerations:*** Monitor electrolytes (potassium and magnesium) in patients at risk for electrolyte imbalances prior to and periodically during therapy.

Implementation

- Do not confuse with Celebrex (celecoxib), Cerebyx (fosphenytoin), or Zyprexa (olanzapine).
- **PO:** Administer as a single dose in the morning or evening without regard to food.

Patient/Family Teaching

- Instruct patient to take citalopram as directed. Take missed doses as soon as remembered unless almost time for next dose; do not double doses. Do not stop abruptly; may cause anxiety, irritability, high or low mood, feeling restless or changes in sleep habits, headache, sweating, nausea, dizziness, electric shock-like sensations, shaking, and confusion. Advise patient to read the *Medication Guide* prior to starting therapy and with each refill in case of changes.
- May cause drowsiness, dizziness, impaired concentration, and blurred vision. Caution patient to avoid driving and other activities requiring alertness until response to the drug is known.

© F.A. Davis Publishing

- Instruct patient to notify health care professional of all Rx or OTC medications, vitamins, or herbal products being taken and to consult health care professional before taking any other Rx, OTC, or herbal products, especially alcohol or other CNS depressants and St. John's wort.
- Caution patient to change positions slowly to minimize dizziness.
- Advise patient, family, and caregivers to look for suicidality, especially during early therapy or dose changes. Notify health care professional immediately if thoughts about suicide or dying, attempts to commit suicide, new or worse depression or anxiety, agitation or restlessness, panic attacks, insomnia, new or worse irritability, aggressiveness, acting on dangerous impulses, mania, or other changes in mood or behavior or if symptoms of serotonin syndrome occur.
- Advise patient to use sunscreen and wear protective clothing to prevent photosensitivity reactions.
- Inform patient that frequent mouth rinses, good oral hygiene, and sugarless gum or candy may minimize dry mouth. If dry mouth persists for more than 2 wk, consult health care professional regarding use of saliva substitute.
- Inform patient that citalopram may cause symptoms of sexual dysfunction. In males, ejaculatory delay or failure, decreased libido, and erectile dysfunction may occur. In female patients, may result in decreased libido and delayed or absent orgasm. Advise patient to notify health care professional if symptoms occur.
- Rep: Instruct females of reproductive potential to notify health care professional if pregnancy is planned or suspected or if breast feeding. If used during pregnancy, should be tapered during 3rd trimester to avoid neonatal serotonin syndrome. Monitor infants exposed to citalopram for excess sedation, restlessness, agitation, poor feeding, poor weight gain, respiratory distress; may ↑ risk of persistent pulmonary hypertension of the newborn. Inform patient of pregnancy exposure registry that monitors pregnancy outcomes in women exposed to antidepressants during pregnancy. Register patients by calling the National Pregnancy Registry for Antidepressants at 1-844-405-6185 or visiting online at https://womensmentalhealth.org/clnical-and-researchprograms/pregnancyregistry/antidepressants/.
- Emphasize the importance of follow-up exams to monitor progress.

Evaluation/Desired Outcomes

- Increased sense of well-being.
- Renewed interest in surroundings. May require 1–4 wk of therapy to obtain antidepressant effects.

clindamycin (klin-da-mye-sin)

Cleocin, Cleocin T, Clinda-Derm, Clinda-T, Clindagel, Clindesse, Clindets, Dalacin C, Dalacin T, Evoclin

Classification

Therapeutic: anti-infectives

C

Indications

PO, IM, IV: Treatment of: Skin and skin structure infections, Respiratory tract infections, Septicemia, Intra-abdominal infections, Gynecologic infections, Osteomyelitis, Endocarditis prophylaxis. **Topical:** Severe acne. **Vag:** Bacterial vaginosis. **Unlabeled Use: PO, IM, IV:** Treatment of *Pneumocystis jiroveci* pneumonia, CNS toxoplasmosis, and babesiosis.

Action

Inhibits protein synthesis in susceptible bacteria at the level of the 50S ribosome. **Therapeutic Effects:** Bactericidal or bacteriostatic, depending on susceptibility and concentration. **Spectrum:** Active against most gram-positive aerobic cocci, including: Staphylococci, *Streptococcus pneumoniae*, other streptococci, but not enterococci. Has good activity against those anaerobic bacteria that cause bacterial vaginosis, including *Bacteroides fragilis*, *Gardnerella vaginalis*, *Mobiluncus* spp., *Mycoplasma hominis*, and *Corynebacterium*. Also active against *Pneumocystis jirovecii*, *Propionibacterium acnes*, and *Toxoplasma gondii*.

Pharmacokinetics

Absorption: Well absorbed following PO/IM administration. Minimal absorption following topical/vaginal use.

Distribution: Widely distributed. Does not significantly cross blood-brain barrier. Crosses the placenta; enters breast milk.

Protein Binding: 94%.

Metabolism and Excretion: Mostly metabolized by the liver (by CYP3A4).

Half-life: Neonates: 3.6–8.7 hr; Infants up to 1 yr: 3 hr; Children and adults: 2–3 hr.

TIME/ACTION PROFILE (blood levels)

ROUTE	ONSET	PEAK	DURATION
PO	rapid	60 min	6–8 hr
IM	rapid	1–3 hr	6–8 hr
IV	rapid	end of infusion	6–8 hr

Contraindications/Precautions

Contraindicated in: Hypersensitivity; Regional enteritis or ulcerative colitis (topical foam); Previous *Clostridioides difficile*-associated diarrhea (CDAD);

© F.A. Davis Publishing

Severe liver impairment; Diarrhea; Known alcohol intolerance (topical solution, suspension).

Use Cautiously in: OB: Safety not established for topical administration; systemic administration during 2nd and 3rd trimesters not associated with ↑ risk of congenital abnormalities; approved for vaginal use in 3rd trimester of pregnancy; injection contains benzyl alcohol which can cross placenta; Lactation: Appears in breast milk (when given PO or IV) and exposes infant to drug and its side effects; not known whether appears in breast milk after vaginal or topical administration; Pedi: Injection contains benzyl alcohol which can cause gasping syndrome in infants and neonates.

Adverse Reactions/Side Effects

CV: arrhythmias, hypotension. **Derm:** DRUG REACTION WITH EOSINOPHILIA AND SYSTEMIC SYMPTOMS (DRESS), ERYTHEMA MULTIFORME, STEVENS-JOHNSON SYNDROME, TOXIC EPIDERMAL NECROLYSIS, rash, urticaria. **GI:** CLOSTRIDIOIDES DIFFICILE-ASSOCIATED DIARRHEA (CDAD), diarrhea, bitter or metallic taste, nausea, vomiting. **Local:** local irritation (topical products), phlebitis at IV site. **Neuro:** dizziness, headache, vertigo. **Misc:** HYPERSENSITIVITY REACTIONS (including anaphylaxis).

Interactions

Drug-Drug: May enhance the neuromuscular blocking action of other **neuromuscular blocking agents**. **CYP3A4 inhibitors** may ↑ levels. **CYP3A4 inducers**, including **rifampin**, may ↓ levels and lead to therapeutic failure. **Topical:** Concurrent use with **irritants**, **abrasives**, or **desquamating agents** may result in additive irritation.

Route/Dosage

PO (Adults): *Most infections*—150–450 mg every 6 hr. *Pneumocystis jiroveci pneumonia*—1200–1800 mg/day in divided doses with 15–30 mg primaquine/day (unlabeled). *CNS toxoplasmosis*—1200–2400 mg/day in divided doses with pyrimethamine 50–100 mg/day (unlabeled); *Bacterial endocarditis prophylaxis*—600 mg 1 hr before procedure.

PO (Children >1 mo): 10–30 mg/kg/day divided every 6–8 hr; maximum dose 1.8 g/day. *Bacterial endocarditis prophylaxis*—20 mg/kg 1 hr before procedure.

IM, IV (Adults): *Most infections*—300–600 mg every 6–8 hr *or* 900 mg every 8 hr (up to 4.8 g/day IV has been used; single IM doses of >600 mg are not recommended). *Pneumocystis jiroveci pneumonia*—2400–2700 mg/day in divided doses with primaquine (unlabeled). *Toxoplasmosis*—1200–4800 mg/day in divided doses with pyrimethamine. *Bacterial endocarditis prophylaxis*—600 mg 30 min before procedure.

IM, IV (Children >1 mo): 20–40 mg/kg/day (based on total body weight) divided every 6–8 hr; maximum dose: 4.8 g/day. *Bacterial endocarditis prophylaxis*—20 mg/kg 30 min before procedure; maximum dose: 600 mg.

Vag (Adults and Adolescents): *Cleocin, Clindamax*—1 applicatorful (5 g) at bedtime for 3 or 7 days (7 days in pregnant patients); *Clindesse*—one applicatorful (5 g) single dose; *or* 1 suppository (100 mg) at bedtime for 3 nights.

Topical (Adults and Adolescents): *Solution*—1% solution/suspension applied twice daily (range 1–4 times daily). *Foam, gel*—1% foam or gel applied once daily.

Availability (generic available)

Capsules: 75 mg, 150 mg, 300 mg. **Oral suspension:** 75 mg/5 mL. **Solution for injection:** 150 mg/mL. **Premixed infusion (in 0.9% NaCl):** 300 mg/50 mL, 600 mg/50 mL, 900 mg/50 mL. **Topical:** 1% lotion, gel, foam, solution, suspension, single-use applicators. **Vaginal cream:** 2%. **Vaginal suppositories (ovules):** 100 mg. ***In combination with:*** benzoyl peroxide (Acanya, BenzaClin, Onexton), tretinoin (Veltin, Ziana); (see Appendix N).

NURSING IMPLICATIONS

Assessment

- Assess for infection (vital signs; appearance of wound, sputum, urine, and stool; WBC) at beginning of and during therapy.
- Obtain specimens for culture and sensitivity prior to initiating therapy. First dose may be given before receiving results.
- Monitor bowel elimination. Report diarrhea, abdominal cramping, fever, and bloody stools to health care professional promptly as a sign of *Clostridioides difficile*-associated diarrhea (CDAD). May begin up to several wk following the cessation of therapy.
- Assess patient for hypersensitivity (skin rash, urticaria).
- ***Lab Test Considerations:*** Monitor CBC; may cause transient ↓ in leukocytes, eosinophils, and platelets.
- May cause ↑ alkaline phosphatase, bilirubin, CK, AST, and ALT concentrations.

Implementation

- Do not confuse Clindesse with Clindets.
- **PO:** Administer with a full glass of water. May be given with or without meals. Shake liquid preparations well. Do not refrigerate. Stable for 14 days at room temperature.
- **IM:** Inject undiluted. Do not administer >600 mg in a single IM injection.

IV Administration

- **Intermittent Infusion:** ***Dilution:*** Vials must be diluted before use. Dilute a dose of 300 mg or 600 mg in 50 mL and a dose of 900 mg or 1200 mg in 100 mL. Compatible diluents include D5W, 0.9% NaCl, D5/0.9% NaCl, D5/0.45% NaCl, or LR. Admixed solution stable for 16 days at room temperature. Premixed infusion is already diluted and ready to use. ***Concentration:*** Not to exceed 18 mg/mL.

© F.A. Davis Publishing

Rate: Infuse over 10–60 min. Not to exceed 30 mg/min. Hypotension and cardiopulmonary arrest have been reported following rapid IV administration.

- **Y-Site Compatibility:** acetaminophen, acyclovir, alemtuzumab, alfentanil, amifostine, amikacin, aminocaproic acid, aminophylline, amiodarone, amphotericin B lipid complex, amphotericin B liposome, anakinra, anidulafungin, argatroban, arsenic trioxide, ascorbic acid, atropine, aztreonam, benztropine, bivalirudin, bleomycin, bumetanide, buprenorphine, butorphanol, calcium chloride, calcium gluconate, cangrelor, carboplatin, carmustine, cefazolin, cefotaxime, cefotetan, cefoxitin, ceftaroline, ceftazidime, cefuroxime, chloramphenicol, cisatracurium, cisplatin, cyanocobalamin, cyclophosphamide, cyclosporine, cytarabine, dacarbazine, dactinomycin, daptomycin, dexamethasone, dexmedetomidine, dexrazoxane, digoxin, diltiazem, diphenhydramine, dobutamine, docetaxel, dopamine, doxorubicin, doxorubicin liposomal, doxycycline, enalaprilat, ephedrine, epinephrine, epirubicin, epoetin alfa, eptifibatide, esmolol, etoposide, etoposide phosphate, famotidine, fenoldopam, fentanyl, fludarabine, fluorouracil, folic acid, foscarnet, fosphenytoin, furosemide, gemcitabine, gemtuzumab ozogamicin, gentamicin, glycopyrrolate, granisetron, heparin, hetastarch, hydrocortisone, hydromorphone, ifosfamide, imipenem/cilastatin, indomethacin, insulin regular, irinotecan, isoproterenol, ketamine, ketorolac, leucovorin calcium, levofloxacin, lidocaine, linezolid, lorazepam, magnesium sulfate, mannitol, melphalan, meperidine, mesna, methotrexate, methylprednisolone, metoclopramide, metoprolol, milrinone, morphine, multivitamins, nafcillin, nalbuphine, naloxone, nitroglycerin, nitroprusside, norepinephrine, octreotide, ondansetron, oxacillin, oxaliplatin, oxytocin, paclitaxel, palonosetron, pamidronate, pancuronium, pemetrexed, penicillin G, phenobarbital, phenylephrine, phytonadione, piperacillin/tazobactam, potassium acetate, potassium chloride, procainamide, propofol, propranolol, protamine, pyridoxine, remifentanil, rituximab, rocuronium, sargramostim, sodium acetate, sodium bicarbonate, succinylcholine, sufentanil, tacrolimus, theophylline, thiamine, thiotepa, tigecycline, tirofiban, tobramycin, vancomycin, vasopressin, vecuronium, verapamil, vinblastine, vincristine, vinorelbine, vitamin B complex with C, voriconazole, zidovudine, zoledronic acid.
- **Y-Site Incompatibility:** allopurinol, azathioprine, caspofungin, ceftriaxone, chlorpromazine, dantrolene, daunorubicin, diazepam, filgrastim, ganciclovir, haloperidol, hydroxyzine, idarubicin, minocycline, mitomycin, mitoxantrone, mycophenolate, papaverine, pentamidine, pentobarbital, phentolamine, phenytoin, prochlorperazine, promethazine, quinupristin/dalfopristin, topotecan, trastuzumab, trimethoprim/sulfamethoxazole.
- **Vag:** Applicators are supplied for vaginal administration. When treating bacterial vaginosis, concurrent treatment of male partner is not usually necessary.
- **Topical:** Contact with eyes, mucous membranes, and open cuts should be avoided during topical application. If accidental contact occurs, rinse with copious amounts of cool water.
- Wash affected areas with warm water and soap, rinse, and pat dry prior to application. Apply to entire affected area.

Patient/Family Teaching

- Instruct patient to take medication around the clock at evenly spaced times and to finish completely as directed, even if feeling better. Take missed doses as soon as possible unless almost time for next dose. Do not double doses. Advise patient that sharing of this medication may be dangerous.
- Instruct patient to notify health care professional immediately if diarrhea, abdominal cramping, fever, or bloody stools occur and not to treat with antidiarrheals without consulting health care professional.
- Advise patient to report signs of superinfection (furry overgrowth on the tongue, vaginal or anal itching or discharge).
- Notify health care professional if no improvement within a few days.
- Patients with a history of rheumatic heart disease or valve replacement need to be taught the importance of antimicrobial prophylaxis before invasive medical or dental procedures.
- Rep: Advise female patient of reproductive potential to notify health care professional if pregnancy is planned or suspected or if breast feeding. Use with caution during 1st trimester. If breast feeding, alternate drugs are preferred. If breast feeding continued, monitor infant for diarrhea, thrush, and diaper rash.
- **IV:** Inform patient that bitter or metallic taste occurring with IV administration is not clinically significant.
- **Vag:** Instruct patient on proper use of vaginal applicator. Insert high into vagina at bedtime. Instruct patient to remain recumbent for at least 30 min following insertion. Advise patient to use sanitary napkin to prevent staining of clothing or bedding. Continue therapy during menstrual period.
- Advise patient to refrain from vaginal sexual intercourse during treatment.
- Caution patient that mineral oil in clindamycin cream may weaken latex or rubber contraceptive devices. Such products should not be used within 72 hr of vaginal cream.

© F.A. Davis Publishing

- **Topical:** Caution patient applying topical clindamycin that solution is flammable (vehicle is isopropyl alcohol). Avoid application while smoking or near heat or flame.
- Advise patient to notify health care professional if excessive drying of skin occurs.
- Advise patient to wait 30 min after washing or shaving area before applying.

Evaluation/Desired Outcomes

- Resolution of the signs and symptoms of infection. Length of time for complete resolution depends on the organism and site of infection.
- Endocarditis prophylaxis.
- Improvement in acne vulgaris lesions. Improvement should be seen in 6 wk but may take 8–12 wk for maximum benefit.

clobetasol, See CORTICOSTEROIDS (TOPICAL/LOCAL).

clocortolone, See CORTICOSTEROIDS (TOPICAL/LOCAL).

BEERS

clonazePAM (kloe-**na**-ze-pam)

KlonoPIN, Rivotril

Classification

Therapeutic: anticonvulsants
Pharmacologic: benzodiazepines

Schedule IV

Indications

Treatment of Lennox-Gastaut, akinetic, or myoclonic seizures. Panic disorder with or without agoraphobia. **Unlabeled Use:** Uncontrolled leg movements during sleep. Neuralgias. Infantile spasms. Sedation. Adjunct management of acute mania, acute psychosis, or insomnia.

Action

Anticonvulsant effects may be due to presynaptic inhibition. Produces sedative effects in the CNS, probably by stimulating inhibitory GABA receptors. **Therapeutic Effects:** Prevention of seizures. Decreased manifestations of panic disorder.

Pharmacokinetics

Absorption: Well absorbed from the GI tract.
Distribution: Probably crosses the blood-brain barrier and the placenta.
Protein Binding: 85%.
Metabolism and Excretion: Mostly metabolized by the liver.
Half-life: 18–50 hr.

TIME/ACTION PROFILE (anticonvulsant activity)

ROUTE	ONSET	PEAK	DURATION
PO	20–60 min	1–2 hr	6–12 hr

Contraindications/Precautions

Contraindicated in: Hypersensitivity to clonazepam or other benzodiazepines; Severe hepatic impairment; OB: Pregnancy (may cause fetal harm); Lactation: Lactation.

Use Cautiously in: All patients (may ↑ risk of suicidal thoughts/behaviors); Angle-closure glaucoma; Obstructive sleep apnea; Chronic respiratory disease; History of porphyria; Pedi: Children <18 yr (panic disorder) (safety and effectiveness not established); Geri: May experience excessive sedation at usual doses; ↓ dose recommended.

Adverse Reactions/Side Effects

CV: palpitations. **Derm:** rash. **GI:** constipation, diarrhea, hepatitis, weight gain. **GU:** dysuria, nocturia, urinary retention. **Hemat:** anemia, eosinophilia, leukopenia, thrombocytopenia. **Neuro:** ataxia, hypotonia, SUICIDAL THOUGHTS, behavioral changes, drowsiness, fatigue, slurred speech, ataxia, sedation, abnormal eye movements, diplopia, nystagmus. **Resp:** ↑ secretions. **Misc:** fever, physical dependence, psychological dependence, tolerance.

Interactions

Drug-Drug: Use with **opioids** or other **CNS depressants**, including other **benzodiazepines**, **nonbenzodiazepine sedative/hypnotics**, **anxiolytics**, **general anesthetics**, **muscle relaxants**, **antipsychotics**, and **alcohol** may cause profound sedation, respiratory depression, coma, and death; reserve concurrent use for when alternative treatment options are inadequate. **Cimetidine**, **hormonal contraceptives**, **disulfiram**, **fluoxetine**, **isoniazid**, **ketoconazole**, **metoprolol**, **propranolol**, or **valproic acid** may ↓ metabolism and ↑ toxicity of clonazepam. May ↓ efficacy of **levodopa**. **Rifampin** or **barbiturates** may ↑ metabolism and ↓ effectiveness. Sedative effects may be ↓ by **theophylline**. May ↑ serum **phenytoin** levels. **Phenytoin** may ↓ levels.

Drug-Natural Products: Concomitant use of **kava-kava**, **valerian**, or **chamomile** can ↑ CNS depression.

Route/Dosage

PO (Adults): 0.5 mg 3 times daily; may ↑ by 0.5–1 mg every 3 days. Total daily maintenance dose not to exceed 20 mg. *Panic disorder*—0.125 mg twice daily; ↑ after 3 days toward target dose of 1 mg/day (some patients may require up to 4 mg/day).

PO (Children ≤10 yr or ≤30 kg): Initial daily dose 0.01–0.03 mg/kg/day (not to exceed 0.05 mg/kg/day) given in 2–3 equally divided doses; ↑ by no more than 0.25–0.5 mg every 3 days until therapeutic blood levels are reached (not to exceed 0.2 mg/kg/day).

© F.A. Davis Publishing

Availability (generic available)

Tablets: 0.25 mg, 0.5 mg, 1 mg, 2 mg. **Cost:** *Generic*—0.5 mg $11.77/100, 1 mg $11.25/100, 2 mg $15.59/100. **Orally disintegrating tablets:** 0.125 mg, 0.25 mg, 0.5 mg, 1 mg, 2 mg. **Cost:** *Generic*—0.125 mg $77.93/60, 0.25 mg $77.93/60, 0.5 mg $77.80/60, 1 mg $88.91/60, 2 mg $123.19/60.

NURSING IMPLICATIONS

Assessment

- Observe and record intensity, duration, and location of seizure activity.
- Assess degree and manifestations of anxiety and mental status (orientation, mood, behavior) prior to and periodically during therapy.
- Assess need for continued treatment regularly.
- Assess patient for drowsiness, unsteadiness, and clumsiness. These symptoms are dose related and most severe during initial therapy; may decrease in severity or disappear with continued or long-term therapy.
- Monitor closely for notable changes in behavior that could indicate the emergence or worsening of suicidal thoughts or behavior or depression.
- Assess risk for addiction, abuse, or misuse prior to administration and periodically during therapy.
- ***Lab Test Considerations:*** Patients on prolonged therapy should have CBC and liver function test results evaluated periodically. May cause an ↑ in serum bilirubin, AST, and ALT.
- May cause ↓ thyroidal uptake of ^{123}I, and ^{131}I.
- ***Toxicity and Overdose:*** Therapeutic serum concentrations are 20–80 mg/mL. Flumazenil antagonizes clonazepam toxicity or overdose (may induce seizures in patients with history of seizure disorder or who are on tricyclic antidepressants).

Implementation

- Do not confuse clonazepam with alprazolam, clonidine, clozapine, clobazam, or lorazepam. Do not confuse Klonopin with clonidine.
- Institute seizure precautions for patients on initial therapy or undergoing dose manipulations.
- **PO:** Administer with food to minimize gastric irritation. Tablets may be crushed if patient has difficulty swallowing. Administer largest dose at bedtime to avoid daytime sedation. Taper by 0.25 mg every 3 days to decrease signs and symptoms of withdrawal. Some patients may require longer taper period (months).
- Orally disintegrating tablets should be left in the package until use. Remove from the blister pouch. Do not push tablet through the blister; peel open the blister pack with dry hands and place tablet on tongue. Tablet will dissolve rapidly and be swallowed with saliva. No liquid is needed to take the orally disintegrating tablet.
- Gradually taper to discontinue or reduce the dose to reduce risk of withdrawal reactions, increased seizure frequency, and status epilepticus. Taper by decreasing total daily dose on a weekly basis until discontinued. If patient develops withdrawal symptoms, pause taper or increase dose to previous tapered dose level; decrease dose more slowly. Some patients may require longer tapering period (weeks to >12 mo).

Patient/Family Teaching

- Instruct patient to take medication exactly as directed. Take missed doses within 1 hr or omit; do not double doses. Abrupt withdrawal of clonazepam may cause status epilepticus, tremors, nausea, vomiting, and abdominal and muscle cramps. Instruct patient to read the *Medication Guide* before starting and with each Rx refill; changes may occur.
- Advise patient that clonazepam is usually prescribed for short-term use and does not cure underlying problems.
- Advise patient that clonazepam is a drug with known abuse potential. Protect it from theft, and never give to anyone other than the individual for whom it was prescribed. Store out of sight and reach of children, and in a location not accessible by others.
- Advise patient to not share medication with others.
- May cause drowsiness or dizziness. Advise patient to avoid driving or other activities requiring alertness until response to drug is known.
- Instruct patient to notify health care professional of all Rx or OTC medications, vitamins, or herbal products being taken and to consult health care professional before taking any other Rx, OTC, or herbal products. Caution patient to avoid taking alcohol or other CNS depressants, including opioids, concurrently with this medication.
- Advise patient to notify health care professional of medication regimen prior to treatment or surgery.
- Instruct patient and family to notify health care professional of unusual tiredness, bleeding, sore throat, fever, clay-colored stools, yellowing of skin, or behavioral changes. Advise patient and family to notify health care professional if thoughts about suicide or dying, attempts to commit suicide; new or worse depression; new or worse anxiety; feeling very agitated or restless; panic attacks; trouble sleeping; new or worse irritability; acting aggressive; being angry or violent; acting on dangerous impulses; an extreme increase in activity and talking; other unusual changes in behavior or mood occur.
- Rep: Advise female patients to notify health care professional if pregnancy is planned or suspected or if breast feeding. Monitor infants exposed to clonazepam during 2nd and 3rd trimester or immediately prior to or during childbirth for decreased fetal

© F.A. Davis Publishing

movement and/or fetal heart rate variability, "floppy infant syndrome," dependence, and symptoms of withdrawal (hypertonia, hyperreflexia, hypoventilation, irritability, tremors, diarrhea, vomiting); may occur shortly after delivery up to 3 wk after birth. Monitor breast-fed infants for sedation and poor sucking. Encourage pregnant patients to enroll in North American Antiepileptic Drug (NAAED) Pregnancy Registry to collect information about safety of antiepileptic drugs during pregnancy. To enroll, patients can call 1-888-233-2334.

- Patient on anticonvulsant therapy should carry identification at all times describing disease process and medication regimen.
- Emphasize the importance of follow-up exams to determine effectiveness of the medication.

Evaluation/Desired Outcomes

- Decrease or cessation of seizure activity without undue sedation. Dose adjustments may be required after several mo of therapy.
- Decrease in frequency and severity of panic attacks.
- Relief of leg movements during sleep.
- Decrease in pain from neuralgia.

BEERS

cloNIDine (klon-i-deen)

Catapres, Catapres-TTS, Duraclon, Kapvay

Classification

Therapeutic: antihypertensives
Pharmacologic: adrenergics (centrally acting)

Indications

PO, Transdermal: Mild to moderate hypertension. **PO:** Attention-deficit hyperactivity disorder (ADHD) (as monotherapy or as adjunctive to stimulants) (Kapvay only). **Epidural:** Management of cancer pain unresponsive to opioids alone. **Unlabeled Use:** Management of opioid withdrawal. Adjunctive treatment of neuropathic pain.

Action

Stimulates alpha-adrenergic receptors in the CNS, which results in decreased sympathetic outflow inhibiting cardioacceleration and vasoconstriction centers. Prevents pain signal transmission to the CNS by stimulating alpha-adrenergic receptors in the spinal cord. **Therapeutic Effects:** Decreased BP. Decreased pain. Improvement in ADHD symptoms.

Pharmacokinetics

Absorption: Well absorbed from the GI tract and skin. Enters systemic circulation following epidural use. **Distribution:** Widely distributed; enters CNS. Crosses the placenta readily; enters breast milk in high concentrations. **Metabolism and Excretion:** Mostly metabolized by the liver; 40–60% eliminated unchanged in urine. **Half-life:** *Neonates*—44–72 hr; *Children*—8–12 hr; *Adults: Plasma*—12–16 hr (↑ in renal impairment); *CNS*—1.3 hr.

TIME/ACTION PROFILE (PO, TD = antihypertensive effect; epidural = analgesia)

ROUTE	ONSET	PEAK	DURATION
PO	30–60 min	1–3 hr	8–12 hr
Transdermal	2–3 days	unknown	7 days†
Epidural	unknown	unknown	unknown

†8 hr following removal of patch.

Contraindications/Precautions

Contraindicated in: Hypersensitivity; *Epidural*—injection site infection, anticoagulant therapy, or bleeding problems.

Use Cautiously in: Serious cardiac or cerebrovascular disease; Renal insufficiency; OB: Use during pregnancy only if potential maternal benefit justifies potential fetal risk; Lactation: Use while breast feeding only if potential maternal benefit justifies potential risk to infant; Pedi: Safety and efficacy not established for ADHD in children <6 yr; evaluation for cardiac disease should precede initiation of therapy for ADHD in children; Geri: Appear on Beers list due to ↑ risk of orthostatic hypotension and adverse CNS effects in geriatric patients (↓ dose recommended).

Adverse Reactions/Side Effects

CV: AV block, bradycardia, hypotension (↑ with epidural), palpitations. **Derm:** rash, sweating. **F and E:** sodium retention. **EENT:** dry eyes. **GI:** dry mouth, constipation, nausea, vomiting. **GU:** erectile dysfunction, ↓ fertility. **Metab:** weight gain. **Neuro:** drowsiness, depression, dizziness, hallucinations, nervousness, nightmares, paresthesia. **Misc:** withdrawal phenomenon.

Interactions

Drug-Drug: Additive sedation with **CNS depressants**, including **alcohol**, **antihistamines**, **opioid analgesics**, and **sedative/hypnotics**. Additive hypotension with other **antihypertensives** and **nitrates**. Additive bradycardia with **beta blockers**, **diltiazem**, **verapamil**, or **digoxin**. **MAO inhibitors**, **amphetamines**, or **tricyclic antidepressants** may ↓ antihypertensive effect. Withdrawal phenomenon may be ↑ by discontinuation of **beta blockers**. Epidural clonidine prolongs the effects of epidurally administered **local anesthetics**. May ↓ effectiveness of **levodopa**.

Route/Dosage

PO (Adults and Adolescents ≥12 yr): *Hypertension (immediate-release)*—100 mcg (0.1 mg) twice daily, ↑ by 100–200 mcg (0.1–0.2 mg)/day every 2–4 days; usual maintenance dose is 200–600 mcg (0.2–0.6 mg)/day in 2–3 divided doses (up to 2.4 mg/day). *Urgent treatment of hypertension (immediate-release)*—200 mcg (0.2 mg) loading dose, then 100 mcg (0.1 mg) every hr until BP is controlled or 800

© F.A. Davis Publishing

mcg (0.8 mg) total has been administered; follow with maintenance dosing; *Opioid withdrawal (immediate-release)* — 300 mcg (0.3 mg) – 1.2 mg/day, may be ↓ by 50%/day for 3 days, then discontinued or ↓ by 100–200 mcg (0.1–0.2 mg)/day.
PO (Geriatric Patients): *Hypertension (immediate-release)* — 100 mcg (0.1 mg) at bedtime initially, ↑ as needed.
PO (Children): *Hypertension (immediate-release)* — Initial 5–10 mcg/kg/day divided into 2 or 3 doses, then ↑ gradually to 5–25 mcg/kg/day in divided doses every 6 hr; maximum dose: 0.9 mg/day. *ADHD (Kapvay-extended release) (children >6 yr)* — 0.1 mg once daily at bedtime; after 1 wk, ↑ dose to 0.1 mg in AM and at bedtime; after 1 wk, ↑ dose to 0.1 mg in AM and 0.2 mg at bedtime; after 1 wk, ↑ dose to 0.2 mg in AM and at bedtime (max dose = 0.4 mg/day). *ADHD (Immediate-release) (children >6 yr, <45 kg)* — 0.05 mg once daily at bedtime; then ↑ every 3–7 days to 0.05 mg twice daily; then 0.05 mg 3 times daily; then 0.05 mg 4 times daily. *Neuropathic pain (immediate-release)* — 2 mcg/kg/dose every 4–6 hr then ↑ gradually over days up to 4 mcg/kg/dose every 4–6 hr.
PO (Neonates): *Neonatal abstinence syndrome* — 0.5–1 mcg/kg/dose every 4–6 hr. Once stabilized taper by 0.25 mcg/kg/dose every 6 hr.
Transdermal (Adults): *Hypertension* — Transdermal system delivering 100–300 mcg (0.1–0.3 mg)/24 hr applied every 7 days. Initiate with 100 mcg (0.1 mg)/24 hr system; dosage increments may be made every 1–2 wk when system is changed.
Transdermal (Children): Once stable oral dose is reached, children may be switched to a transdermal system equivalent closest to the total daily oral dose.
Epidural (Adults): 30 mcg/hr initially; titrated according to need.
Epidural (Children): 0.5 mcg/kg/hr initially; titrated according to need up to 2 mcg/kg/hr.

Availability (generic available)

Extended-release tablets (Kapvay): 0.1 mg. **Cost:** All strengths $366.60/60. **Immediate-release tablets:** 25 mcg (0.025 mg), 100 mcg (0.1 mg), 200 mcg (0.2 mg), 300 mcg (0.3 mg). **Cost:** *Generic* — 0.1 mg $6.80/100, 0.2 mg $6.99/100, 0.3 mg $6.99/100. **Solution for epidural injection (Duraclon):** 100 mcg/mL, 500 mcg/mL. **Transdermal systems:** 0.1 mg/24 hr, 0.2 mg/24 hr, 0.3 mg/24 hr. **Cost:** *Generic* — 0.1 mg/24 hr $132.49/4 patches, 0.2 mg/24 hr $223.06/4 patches, 0.3 mg/24 hr $309.44/4 patches.

NURSING IMPLICATIONS

Assessment

- **Hypertension:** Monitor intake and output ratios and daily weight, and assess for edema daily, especially at beginning of therapy.
- Monitor BP and pulse prior to starting, frequently during initial dose adjustment and dose increases and periodically throughout therapy. Titrate slowly in patients with cardiac conditions or those taking other sympatholytic drugs. Report significant changes.
- **Pain:** Assess location, character, and intensity of pain prior to, frequently during first few days, and routinely throughout administration.
- Monitor for fever as potential sign of catheter infection.
- **Opioid Withdrawal:** Monitor patient for signs and symptoms of opioid withdrawal (tachycardia, fever, runny nose, diarrhea, sweating, nausea, vomiting, irritability, stomach cramps, shivering, unusually large pupils, weakness, difficulty sleeping, gooseflesh).
- **ADHD:** Assess attention span, impulse control, and interactions with others.
- ***Lab Test Considerations:*** May cause transient ↑ in blood glucose levels.
- May cause ↓ urinary catecholamine and vanillylmandelic acid (VMA) concentrations; these may ↑ on abrupt withdrawal.
- May cause weakly positive Coombs' test result.

Implementation

- Do not confuse clonidine with clonazepam (Klonopin) or clozapine.
- Do not substitute between clonidine products on a mg-per-mg basis, because of differing pharmacokinetic profiles.
- In the perioperative setting, continue clonidine up to 4 hr prior to surgery and resume as soon as possible thereafter. Do not interrupt *transdermal clonidine* during surgery. Monitor BP carefully.
- **PO:** Administer last dose of the day at bedtime. May be taken without regard for food.
- ***DNC:*** Swallow extended-release tablets whole; do not crush, break, or chew.
- **Transdermal:** Transdermal system should be applied once every 7 days. May be applied to any hairless site; avoid cuts or calluses. Absorption is greater when placed on chest or upper arm and decreased when placed on thigh. Rotate sites. Wash area with soap and water; dry thoroughly before application. Apply firm pressure over patch to ensure contact with skin, especially around edges. Remove old system and discard. System includes a protective adhesive overlay to be applied over medication patch to ensure adhesion, should medication patch loosen.
- **Epidural:** Dilute 500 mcg/mL with 0.9% NaCl for a concentration of 100 mcg/mL. Do not administer solutions that are discolored or contain a precipitate. Discard unused portion.

© F.A. Davis Publishing

Patient/Family Teaching

- Instruct patient to take clonidine at the same time each day, even if feeling well. Take missed dose as soon as remembered. If dose of extended-release product is missed, omit dose and take next dose as scheduled. Do not take more than the prescribed daily dose in any 24 hr. If more than 1 oral dose in a row is missed or if transdermal system is late in being changed by 3 or more days, consult health care professional. All routes of clonidine should be gradually discontinued over 2–4 days to prevent rebound hypertension. Advise patients taking oral and transdermal forms to read *Patient Information* before starting and with each Rx refill in case of changes.
- Advise patient to make sure enough medication is available for weekends, holidays, and vacations. A written prescription may be kept in wallet in case of emergency.
- May cause drowsiness, which usually diminishes with continued use. Advise patient to avoid driving or other activities requiring alertness until response to medication is known.
- Caution patient to avoid sudden changes in position to decrease orthostatic hypotension. Use of alcohol, standing for long periods, exercising, and hot weather may increase orthostatic hypotension.
- If dry mouth occurs, frequent mouth rinses, good oral hygiene, and sugarless gum or candy may decrease effect. If dry mouth continues for more than 2 wk, consult health care professional.
- Caution patients with contact lenses that clonidine may cause dryness of eyes.
- Caution patient to avoid concurrent use of alcohol or other CNS depressants with this medication.
- Instruct patient to notify health care professional of all Rx or OTC medications, vitamins, or herbal products being taken and to consult health care professional before taking any other Rx, OTC, or herbal products, especially cough, cold, or allergy remedies.
- Advise patient to notify health care professional of medication regimen prior to treatment or surgery.
- Advise patient to notify health care professional if itching or redness of skin (with transdermal patch), mental depression, swelling of feet and lower legs, paleness or cold feeling in fingertips or toes, or vivid dreams or nightmares occur. May require discontinuation of therapy, especially with depression.
- **Hypertension:** Encourage patient to comply with additional interventions for hypertension (weight reduction, low-sodium diet, discontinuation of smoking, moderation of alcohol consumption, regular exercise, and stress management). Medication helps control but does not cure hypertension.
- Instruct patient and family on proper technique for BP monitoring. Advise them to check BP at least weekly and report significant changes.
- **Transdermal:** Instruct patient on proper application of transdermal system. Do not cut or trim unit. Transdermal system can remain in place during bathing or swimming.
- Advise patient referred for MRI test to discuss patch with referring health care professional and MRI facility to determine if removal of patch is necessary prior to test and for directions for replacing patch.
- Pedi: Advise parents to notify school nurse of medication regimen.
- **ADHD:** Rep: Advise female patient of reproductive potential to notify health care professional if pregnancy is planned or suspected or if breast feeding. There is a pregnancy exposure registry that monitors pregnancy outcomes in women exposed to ADHD medications during pregnancy. Register patients by calling the National Pregnancy Registry for ADHD Medications at 1-866-961-2388 or visiting https://womensmentalhealth.org/adhd-medications/.

Evaluation/Desired Outcomes

- Decrease in BP.
- Decrease in severity of pain.
- Decrease in the signs and symptoms of opioid withdrawal.
- Improved attention span and social interactions in ADHD.

clopidogrel (kloh-**pid**-oh-grel)

Plavix

Classification

Therapeutic: antiplatelet agents

Pharmacologic: platelet aggregation inhibitors

Indications

Acute coronary syndrome (ST-segment elevation MI, non-ST-segment elevation MI, or unstable angina). Patients with established peripheral arterial disease, recent MI, or recent stroke.

Action

Inhibits platelet aggregation by irreversibly inhibiting the binding of ATP to platelet receptors. **Therapeutic Effects:** Reduction in risk of MI and stroke.

Pharmacokinetics

Absorption: Well absorbed following oral administration; rapidly metabolized to an active antiplatelet compound. Parent drug has no antiplatelet activity.

Distribution: Unknown.

Protein Binding: *Clopidogrel*—98%; *active metabolite*—94%.

Metabolism and Excretion: Rapidly and extensively converted by the liver (CYP2C19) to its active metabolite, which is then eliminated 50% in urine and 45% in feces; 2% of Whites, 4% of Blacks, and 14% of Asians have CYP2C19 genotype that results in re-

© F.A. Davis Publishing

duced metabolism of clopidogrel (poor metabolizers) into its active metabolite (may result in ↓ antiplatelet effects).

Half-life: 6 hr (active metabolite 30 min).

TIME/ACTION PROFILE (effects on platelet function)

ROUTE	ONSET	PEAK	DURATION
PO	within 24 hr	3–7 days	5 days†

†Following discontinuation.

Contraindications/Precautions

Contraindicated in: Hypersensitivity to clopidogrel or prasugrel; Pathologic bleeding (peptic ulcer, intracranial hemorrhage); Concurrent use of omeprazole or esomeprazole; CYP2C19 poor metabolizers.

Use Cautiously in: Patients at risk for bleeding (trauma, surgery, or other pathologic conditions); History of GI bleeding/ulcer disease; Severe hepatic impairment; Hypersensitivity to another thienopyridine (prasugrel); OB: Use should not be withheld, if needed for emergent treatment of stroke or MI during pregnancy. Discontinue use 5 to 7 days prior to labor, delivery, or neuraxial blockade, if possible, due to ↑ risk of maternal bleeding and hemorrhage; Lactation: Use while breast feeding only if potential maternal benefit justifies potential risk to infant; Pedi: Safety and effectiveness not established in children.

Adverse Reactions/Side Effects

Incidence of adverse reactions similar to that of aspirin. **CV:** chest pain, edema, hypertension. **Derm:** ACUTE GENERALIZED EXANTHEMATOUS PUSTULOSIS, DRUG RASH WITH EOSINOPHILIA AND SYSTEMIC SYMPTOMS, STEVENS-JOHNSON SYNDROME, TOXIC EPIDERMAL NECROLYSIS, pruritus, purpura, rash. **EENT:** epistaxis. **GI:** GI BLEEDING, abdominal pain, diarrhea, dyspepsia, gastritis. **Hemat:** BLEEDING, NEUTROPENIA, THROMBOTIC THROMBOCYTOPENIC PURPURA. **Metab:** hypercholesterolemia. **MS:** arthralgia, back pain. **Neuro:** depression, dizziness, fatigue, headache. **Resp:** cough, dyspnea, eosinophilic pneumonia. **Misc:** HYPERSENSITIVITY REACTIONS (including anaphylaxis), fever.

Interactions

Drug-Drug: Concurrent **eptifibatide**, **tirofiban**, **aspirin**, **NSAIDs**, **heparin**, **LMWHs**, **thrombolytic agents**, **SSRIs**, **SNRIs**, **prasugrel**, or **warfarin** may ↑ risk of bleeding. **Strong CYP2C19 inducers**, including **rifampin**, may ↑ risk of bleeding; avoid concurrent use. May ↓ metabolism and ↑ effects of **phenytoin**, **repaglinide**, **tamoxifen**, **torsemide**, **fluvastatin**, and many **NSAIDs**; avoid concurrent use with **repaglinide**. Concurrent use with the CYP2C19 inhibitors, **omeprazole**, or **esomeprazole** may ↓ antiplatelet effects; avoid concurrent use; may consider using **H_2 antagonist** or **pantoprazole**. **Opioids** may ↓ absorption of clopidogrel and its active metabolite and ↓ antiplatelet effects; consider using parenteral antiplatelet in patients with acute coronary syndrome if concurrent use of opioids needed.

Drug-Natural Products: ↑ bleeding risk with **anise**, **arnica**, **chamomile**, **clove**, **fenugreek**, **feverfew**, **garlic**, **ginger**, **ginkgo**, **Panax ginseng**, and others.

C

Route/Dosage

Recent MI, Stroke, or Peripheral Arterial Disease

PO (Adults): 75 mg once daily.

Acute Coronary Syndrome

PO (Adults): 300 mg initially, then 75 mg once daily; aspirin 75–325 mg once daily should be given concurrently.

Availability (generic available)

Tablets: 75 mg, 300 mg. **Cost:** *Generic*—75 mg $23.46/90.

NURSING IMPLICATIONS

Assessment

- Assess patient for symptoms of stroke, peripheral vascular disease, or MI periodically during therapy.
- Monitor patient for signs of thrombotic thrombocytopenic purpura (thrombocytopenia, microangiopathic hemolytic anemia, neurologic findings, renal dysfunction, fever). May rarely occur, even after short exposure (<2 wk). Requires prompt treatment.
- ***Lab Test Considerations:*** Monitor bleeding time during therapy. Prolonged bleeding time, which is time- and dose-dependent, is expected.
- Monitor CBC with differential and platelet count periodically during therapy. Neutropenia and thrombocytopenia may rarely occur.
- May cause ↑ serum bilirubin, hepatic enzymes, total cholesterol, nonprotein nitrogen, and uric acid concentrations.

Implementation

- Do not confuse Plavix (clopidogrel) with Paxil (paroxetine) or Pradaxa (dabigatran).
- Discontinue clopidogrel 5–7 days before planned surgical procedures. If clopidogrel must be temporarily discontinued, restart as soon as possible. Premature discontinuation of therapy may increase risk of cardiovascular events.
- **PO:** Administer once daily without regard to food.

Patient/Family Teaching

- Instruct patient to take medication exactly as directed. Take missed doses as soon as possible unless almost time for next dose; do not double doses.

© F.A. Davis Publishing

Do not discontinue clopidogrel without consulting health care professional; may increase risk of cardiovascular events. Advise patient to read the *Medication Guide* before starting clopidogrel and with each Rx refill in case of changes.

- Advise patient to notify health care professional promptly if signs and symptoms of bleeding (unexpected bleeding or bleeding that lasts a long time; blood in urine [pink, red, or brown urine], red or black stools [looks like tar], bruises without known cause or get larger; cough up blood or blood clots; vomit blood or vomit looks like coffee grounds); fever, weakness, chills, sore throat, rash, unusual bleeding or bruising, extreme skin paleness, purple skin patches, yellowing of skin or eyes, or neurological changes occur.
- Advise patient to notify health care professional of medication regimen prior to treatment or surgery.
- Caution patient to avoid taking omeprazole or esomeprazole during therapy. Consult health care professional for other options.
- Instruct patient to notify health care professional of all Rx or OTC medications, vitamins, or herbal products being taken and to consult health care professional before taking any other Rx, OTC, or herbal products, especially those containing aspirin or NSAIDs or proton pump inhibitors.
- Rep: Advise female patient to notify health care professional if pregnancy is planned or suspected, or if breast feeding. Therapy should not be withheld because of potential concerns regarding effects of clopidogrel on the fetus. Use during labor or delivery increases risk of maternal bleeding and hemorrhage. Avoid neuraxial blockade during clopidogrel use due to risk of spinal hematoma. When possible, discontinue clopidogrel 5 to 7 days prior to labor, delivery, or neuraxial blockade.

Evaluation/Desired Outcomes

- Prevention of stroke, MI, and vascular death in patients at risk.

clotrimazole, See ANTIFUNGALS (TOPICAL) and ANTIFUNGALS (VAGINAL).

BEERS REMS

cloZAPine (kloe-za-peen)

Clozaril, ~~FazaClo~~, Versacloz

Classification

Therapeutic: antipsychotics

Indications

Schizophrenia unresponsive to or intolerant of standard therapy with other antipsychotics (treatment refractory). To reduce recurrent suicidal behavior in schizophrenic patients.

Action

Binds to dopamine receptors in the CNS. Also has anticholinergic and alpha-adrenergic blocking activity. Produces fewer extrapyramidal reactions and less tardive dyskinesia than standard antipsychotics but carries high risk of hematologic abnormalities. **Therapeutic Effects:** Diminished schizophrenic behavior. Diminished suicidal behavior.

Pharmacokinetics

Absorption: Well absorbed after oral administration.
Distribution: Rapid and extensive distribution; crosses blood-brain barrier and placenta.
Protein Binding: 95%.
Metabolism and Excretion: Mostly metabolized on first pass through the liver (by CYP1A2, CYP2D6, and CYP3A4 isoenzymes); ⛓ (the CYP2D6 enzyme system exhibits genetic polymorphism; ~7% of population may be poor metabolizers and may have significantly ↑ clozapine concentrations and an ↑ risk of adverse effects).
Half-life: 8–12 hr.

TIME/ACTION PROFILE (antipsychotic effect)

ROUTE	ONSET	PEAK	DURATION
PO	unknown	wk	4–12 hr

Contraindications/Precautions

Contraindicated in: Hypersensitivity; Bone marrow depression; Severe CNS depression/coma; Uncontrolled epilepsy; Clozapine-induced agranulocytosis or severe granulocytopenia; Lactation: Lactation.

Use Cautiously in: Long QT syndrome; Risk factors for QT interval prolongation or ventricular arrhythmias (i.e., recent myocardial infarction, heart failure, arrhythmias); Concurrent use of CYP1A2, CYP2D6, or CYP3A4 inhibitors or QT-interval prolonging drugs; Hypokalemia or hypomagnesemia; Presence/history of constipation, urinary retention, or prostatic hypertrophy; Angle-closure glaucoma; Malnourished or dehydrated patients, patients with cardiovascular, cerebrovascular, hepatic, or renal disease, or patients on antihypertensives (use lower initial dose, titrate more slowly); Risk factors for stroke (↑ risk of stroke in patients with dementia); Diabetes; Seizure disorder; Patients at risk for falls; OB: Neonates at ↑ risk for extrapyramidal symptoms and withdrawal after delivery when exposed during the 3rd trimester; use only if potential maternal benefit justifies potential fetal risk; Pedi: Children <16 yr (safety and effectiveness not established); Geri: ↑ risk of mortality in elderly patients treated for dementia-related psychosis.

Adverse Reactions/Side Effects

CV: CARDIAC ARREST, DEEP VEIN THROMBOSIS, HF, MITRAL VALVE INCOMPETENCE, MYOCARDITIS, TORSADE DE POINTES, VENTRICULAR ARRHYTHMIAS, hypotension, tachycardia, bradycardia, ECG changes, hypertension, syncope, QT interval prolongation. **Derm:** rash, sweating. **EENT:**

© F.A. Davis Publishing

visual disturbances. **GI:** GI OBSTRUCTION, HEPATOTOXICITY, INTESTINAL ISCHEMIA/INFARCTION, PARALYTIC ILEUS, constipation, abdominal discomfort, dry mouth, ↑ salivation, nausea, vomiting, weight gain. **GU:** nocturnal enuresis. **Endo:** hyperglycemia, hyperlipidemia, weight gain. **Hemat:** AGRANULOCYTOSIS, LEUKOPENIA. **Neuro:** extrapyramidal reactions, NEUROLEPTIC MALIGNANT SYNDROME, SEIZURES, dizziness, sedation. **Resp:** PULMONARY EMBOLISM. **Misc:** fever.

Interactions

Drug-Drug: ↑ anticholinergic effects with other **anticholinergic drugs**, including **antihistamines**, **quinidine**, **disopyramide**, and **antidepressants**; avoid concurrent use. Concurrent use with strong **CYP1A2 inhibitors**, including **fluvoxamine** or **ciprofloxacin** may ↑ levels; ↓ clozapine dose to ⅓ of the original dose during concurrent use. Concurrent use with moderate or weak **CYP1A2 inhibitors**, including **oral contraceptives** or **caffeine** may ↑ levels; consider ↓ clozapine dose. Concurrent use with **CYP2D6 inhibitors** or **CYP3A4 inhibitors**, including **cimetidine**, **escitalopram**, **erythromycin**, **paroxetine**, **bupropion**, **fluoxetine**, **quinidine**, **duloxetine**, **terbinafine**, or **sertraline** may ↑ levels; consider ↓ clozapine dose. Concurrent use with **CYP1A2 inducers** or **CYP3A4 inducers**, including **nicotine**, **carbamazepine**, **phenytoin**, or **rifampin** may ↓ levels; concurrent use with strong CYP3A4 inducers not recommended. ↑ CNS depression with **alcohol**, **antidepressants**, **antihistamines**, **opioid analgesics**, or **sedative/hypnotics**. ↑ hypotension with **nitrates**, acute ingestion of **alcohol**, or **antihypertensives**. ↑ risk of bone marrow suppression with **antineoplastics** or **radiation therapy**. Use with **lithium** ↑ risk of adverse CNS reactions, including seizures. ↑ risk of QT interval prolongation with other **agents causing QT interval prolongation**.

Drug-Natural Products: Caffeine-containing herbs (**cola nut**, **tea**, **coffee**) may ↑ serum levels and side effects. **St. John's wort** may ↓ blood levels and efficacy.

Route/Dosage

PO (Adults): 12.5 mg 1–2 times daily initially; ↑ by 25–50 mg/day over a period of 2 wk up to target dose of 300–450 mg/day. May then be ↑ by up to 100 mg/day once or twice weekly (not to exceed 900 mg/day). Treatment should be continued for at least 2 yr in patients with suicidal behavior.

Availability (generic available)

Oral suspension: 50 mg/mL. **Orally disintegrating tablets (mint):** 12.5 mg, 25 mg, 100 mg, 150 mg, 200 mg. **Tablets:** 25 mg, 50 mg, 100 mg, 200 mg.

NURSING IMPLICATIONS

Assessment

- Monitor patient's mental status (orientation, mood, behavior) before and periodically during therapy. Titrate slowly and monitor closely; may cause orthostatic hypotension, bradycardia, syncope, and cardiac arrest.
- Monitor BP (sitting, standing, lying) and pulse rate before and frequently during initial dose titration.
- Assess weight and BMI initially and periodically during therapy. Refer as appropriate for nutritional/weight management and medical management.
- Observe patient carefully when administering medication to ensure that medication is actually taken and not hoarded or cheeked.
- Monitor for signs of myocarditis (unexplained fatigue, dyspnea, tachypnea, fever, chest pain, palpitations, other signs and symptoms of heart failure, ECG changes, such as ST-T wave abnormalities, arrhythmias, or tachycardia during first mo of therapy). If these occur, clozapine should be discontinued and not restarted.
- Monitor patient for onset of akathisia (restlessness or desire to keep moving) and extrapyramidal side effects (*parkinsonian*—difficulty speaking or swallowing, loss of balance control, pill-rolling motion of hands, mask-like face, shuffling gait, rigidity, tremors and dystonic muscle spasms, twisting motions, twitching, inability to move eyes, weakness of arms or legs) every 2 mo during therapy and 8–12 wk after therapy has been discontinued. Notify health care professional if these symptoms occur; reduction in dose or discontinuation of medication may be necessary. Trihexyphenidyl or benzotropine may be used to control these symptoms.
- Monitor for possible tardive dyskinesia (uncontrolled rhythmic movement of mouth, face, and extremities; lip smacking or puckering; puffing of cheeks; uncontrolled chewing; rapid or worm-like movements of tongue). Report these symptoms immediately; may be irreversible.
- Monitor frequency and consistency of bowel movements and assess for symptoms of hypomotility (nausea, vomiting, abdominal distension, abdominal pain). Symptoms range from constipation to paralytic ileus; risk increased with use of other anticholinergic medications. Increasing bulk and fluids in the diet, and laxatives may help to minimize constipation. Prophylactic laxatives may be used for high risk patients.
- Clozapine lowers the seizure threshold. Institute seizure precautions for patients with history of seizure disorder.
- Transient fevers may occur, especially during first 3 wk of therapy. Fever is usually self-limiting but may require discontinuation of medication. Also, monitor

© F.A. Davis Publishing

for development of neuroleptic malignant syndrome (fever, respiratory distress, tachycardia, seizures, diaphoresis, hypertension or hypotension, pallor, tiredness). Notify health care professional immediately if these symptoms occur.

- Assess respiratory status during therapy. If deep-vein thrombosis, acute dyspnea, chest pain, or other respiratory signs and symptoms occur, consider pulmonary embolism.
- Assess for falls risk. Drowsiness, orthostatic hypotension, and motor and sensory instability increase risk. Institute prevention if indicated.
- Monitor for signs and symptoms of hepatotoxicity (fatigue, malaise, anorexia, nausea, jaundice, hyperbilirubinemia, coagulopathy, hepatic encephalopathy). May require permanent discontinuation if combined with elevated transaminases.
- ***Lab Test Considerations:*** Monitor WBC, absolute neutrophil count (ANC), and differential count before starting therapy. ANC must be ≥1500/mm³ for the general population and ≥1000/mm³ for patients with documented Benign Ethnic Neutropenia (BEN) for patient to begin therapy. Monitor ANC weekly for the first 6 mo, then biweekly for the second 6 mo, then, if maintained within acceptable parameters, monthly after 12 mo. *If mild neutropenia (ANC 1000–1499/mm³) occurs,* continue therapy and monitor ANC 3 times/wk until ANC ≥1500/mm³. Once ANC ≥1500/mm³, return to patient's last ANC monitoring interval. *If moderate neutropenia (ANC 500–999/mm³) occurs,* recommend hematology consultation. Interrupt therapy for suspected clozapine-induced neutropenia. Resume therapy once ANC ≥1000/mm³. Monitor ANC daily until ANC ≥1000/mm³ then 3 times/wk until ANC ≥1500/mm³. Once ANC ≥1500/mm³, check ANC weekly for 4 wk, then return to patient's last ANC monitoring interval. *If severe neutropenia (<500/mm³) occurs,* recommend hematology consultation. Interrupt therapy for suspected clozapine-induced neutropenia. Do not rechallenge unless benefit outweighs risk. Monitor ANC daily until ANC ≥1000/mm³, then 3 times/wk until ANC ≥1500/mm³. If patient rechallenged, resume therapy as a new patient using normal monitoring once ANC ≥1500/mm³. For patients with **Benign Ethnic Neutropenia (BEN)**, obtain at least 2 baseline ANC levels before starting therapy. Monitor ANC weekly for the first 6 mo, then biweekly for the second 6 mo, then, if maintained within acceptable parameters, monthly after 12 mo. *If neutropenia (ANC 500–999/mm³) occurs,* recommend hematology consultation and continue therapy. Monitor ANC 3 times/wk until ANC ≥1000/mm³ or at patient's known baseline. Once ANC ≥1000/mm³, check ANC weekly for 4 wk, then return to patient's last ANC monitoring interval. *If severe neutropenia (<500/mm³) occurs,* recommend hematology consultation. Interrupt therapy for suspected clozapine-induced neutropenia. Do not rechallenge. Monitor ANC daily until ANC ≥500/mm³, then 3 times/wk until ANC ≥patient's baseline. If patient rechallenged, resume therapy as a new patient using normal monitoring once ANC ≥1000/mm³ or at patient's baseline.
- Assess fasting blood glucose and cholesterol levels initially and throughout therapy.
- Monitor liver function tests periodically during therapy or if clinical signs of hepatotoxicity occur.
- ***Toxicity and Overdose:*** Overdose is treated with activated charcoal and supportive therapy. Monitor patient for several days because of risk of delayed effects.
- Avoid use of epinephrine and its derivatives when treating hypotension, and avoid quinidine and procainamide when treating arrhythmias.

Implementation

- Do not confuse clozapine with clonazepam or clonidine. Do not confuse Clozaril with Colazal.
- ***REMS:*** Because of the risk of severe neutropenia, clozapine is only available through a restricted program called *Clozapine REMS Program*. Health care professionals must be trained and certified to prescribe clozapine. Patients must be enrolled in the program and comply with ANC testing and monitoring requirements. Pharmacies dispensing clozapine must be trained and certified with program and must dispense only to patients eligible to receive clozapine.
- **PO:** Administer capsules with food or milk to decrease gastric irritation.
- Leave oral disintegrating tablet in blister until time of use. Do not push tablet through foil. Just before use, peel foil and gently remove disintegrating tablet. Immediately place tablet in mouth and allow to disintegrate and swallow with saliva. If ½ tablet dose used, destroy other half of tablet.
- Oral solution may be taken without regard to food. Shake bottle for suspension for 10 sec prior to withdrawing. Use oral syringes and oral adaptor provided for accurate dosing. Do not store dose in syringe; wash between doses.

Patient/Family Teaching

- Instruct patient to take medication as directed. If clozapine is stopped for >2 days, do not restart medication, notify health care professional for new dosing instructions. Patients on long-term therapy may need to discontinue gradually over 1–2 wk.
- ***REMS:*** Explain purpose and procedures of *Clozapine REMS Program* to patient.
- Inform patient of possibility of extrapyramidal symptoms. Instruct patient to report these symptoms immediately.
- Inform patient that cigarette smoking can decrease clozapine levels. Risk for relapse increases if patient begins or increases smoking.
- Advise patient to change positions slowly to minimize orthostatic hypotension. Protect from falls.

© F.A. Davis Publishing

- May cause seizures and drowsiness. Caution patient to avoid driving or other activities requiring alertness while taking clozapine.
- Instruct patient to notify health care professional of all Rx or OTC medications, vitamins, or herbal products being taken and to consult health care professional before taking any other medications. Caution patient to avoid concurrent use of alcohol and other CNS depressants.
- Instruct patient to use frequent mouth rinses, good oral hygiene, and sugarless gum or candy to minimize dry mouth.
- Advise patient to notify health care professional of medication regimen before treatment or surgery.
- Instruct patient to notify health care professional promptly if unexplained fatigue, dyspnea, tachypnea, chest pain, palpitations, sore throat, fever, lethargy, weakness, malaise, constipation, or flu-like symptoms occur.
- Rep: Advise females of reproductive potential to notify health care professional if pregnancy is planned or suspected, or if breast feeding. Consider early screening for gestational diabetes if used during pregnancy. Neonates exposed to antipsychotic drugs during third trimester are at risk for extrapyramidal and/or withdrawal symptoms following delivery. Monitor neonates for symptoms of agitation, hypertonia, hypotonia, tremor, somnolence, respiratory distress, excessive sedation, and feeding difficulties.
- Advise patient of need for continued medical follow-up for psychotherapy, eye exams, and laboratory tests.

Evaluation/Desired Outcomes

- Decreased positive symptoms (delusions, hallucinations) of schizophrenia.
- Decrease in negative symptoms (social withdrawal; flat, blunt affect) of schizophrenia.

cobimetinib (koe-bi-**me**-ti-nib)

Cotellic

Classification

Therapeutic: antineoplastics
Pharmacologic: kinase inhibitors

Indications

Treatment of metastatic/unresectable melanoma with the BRAF V600E or V600K mutation (in combination with vemurafenib).

Action

Inhibits the activity of mitogen-activated extracellular kinase (MEK) 1 and 2 which are enzymes that normally promote cellular proliferation. **Therapeutic Effects:** Decreased progression of melanoma.

Pharmacokinetics

Absorption: 46% absorbed following oral administration.
Distribution: Extensively distributed to tissues.
Protein Binding: 95%.
Metabolism and Excretion: Mostly metabolized by the liver (via CYP3A4 enzyme system and glucuronidation). 6.6% excreted in feces unchanged; 20% excreted in urine (mostly as metabolites).
Half-life: 44 hr.

TIME/ACTION PROFILE (blood levels)

ROUTE	ONSET	PEAK	DURATION
PO	unknown	2.4 hr	unknown

Contraindications/Precautions

Contraindicated in: Concurrent use of strong or moderate CYP3A4 inhibitors or inducers; OB: May cause fetal harm; Lactation: Breast feeding should be avoided during treatment and for 2 wk after therapy.
Use Cautiously in: Left ventricular ejection fraction <50%; Severe renal impairment (CCr <30 mL/min); Rep: Women of childbearing potential (use effective contraception); Pedi: Safety and effectiveness not established.

Adverse Reactions/Side Effects

CV: CARDIOMYOPATHY, hypertension. **Derm:** alopecia, erythema, photosensitivity, rash. **EENT:** retinopathy. **F and E:** hyperkalemia, hypocalcemia, hypokalemia, hyponatremia, hypophosphatemia. **GI:** HEPATOTOXICITY, diarrhea, hypoalbuminemia, nausea, stomatitis, vomiting. **GU:** ↑ serum creatinine, ↓ fertility. **Hemat:** HEMORRHAGE, anemia, lymphopenia, thrombocytopenia. **MS:** ↑ creatine kinase, RHABDOMYOLYSIS. **Misc:** MALIGNANCY, fever.

Interactions

Drug-Drug: Strong or moderate CYP3A4 inhibitors, including **itraconazole**, may ↑ levels; avoid concurrent use. Strong or moderate CYP3A4 inducers, including **carbamazepine**, **efavirenz**, **phenytoin**, and **rifampin**, may ↓ levels; avoid concurrent use.
Drug-Natural Products: St. John's wort may ↓ levels; avoid concurrent use.

Route/Dosage

PO (Adults): 60 mg once daily for days 1–21 of each 28-day cycle; continue until disease progression or unacceptable toxicity; *Concurrent short-term use of moderate CYP3A4 inhibitor*— 20 mg once daily; resume 60 mg once daily once 3A4 inhibitor discontinued (avoid use of strong or moderate CYP3A4 inhibitor if patient already taking reduced dose of 20–40 mg once daily).

© F.A. Davis Publishing

Availability

Tablets: 20 mg.

NURSING IMPLICATIONS

Assessment

- Assess skin prior to starting therapy and every 2 mo during and for 6 mo following therapy for new lesions. If new lesions appear, evaluate and remove as needed. If Grade 2 (intolerable), Grade 3, or Grade 4 rash or other skin reactions occur, withhold or reduce dose.
- Monitor for bleeding and hemorrhage periodically during therapy. *If Grade 3 hemorrhage occurs,* withhold therapy for up to 4 wk. If improved to Grade 0 or 1, resume at next lower dose. If not improved within 4 wk, permanently discontinue. *If Grade 4 hemorrhage occurs,* permanently discontinue therapy.
- Monitor left ventricular ejection fraction (LVEF) prior to initiation, 1 mo after initiation, and every 3 mo until discontinuation. *If asymptomatic, absolute ↓ LVEF from baseline of >10% and <institutional lower limit of normal (LLN),* withhold therapy for 2 wk; repeat LVEF. *Resume at next lower dose if all of following are present:* LVEF is ≥LLN and absolute ↓ from baseline LVEF ≤10%. *Discontinue permanently if any of following are present:* LVEF is <LLN or absolute ↓ from baseline LVEF >10%. *If symptomatic LVEF ↓ from baseline,* withhold therapy for up to 4 wk, repeat LVEF. *Resume at next lower dose if all of following are present:* symptoms resolve and LVEF is ≥LLN and absolute ↓ from baseline LVEF is ≤10%. *Discontinue permanently if any of following are present:* symptoms persist, or LVEF <LLN, or absolute ↓ from baseline LVEF >10%. If restarting cobimetinib after a dose reduction or interruption, evaluate LVEF at approximately 2 wk, 4 wk, 10 wk, and 16 wk, and as clinically indicated.
- Perform ophthalmological evaluations periodically during therapy and if patient reports new or worsening visual disturbances. *If serious retinopathy occurs,* withhold therapy for up to 4 wk. If signs and symptoms improve, resume at next lower dose. If not improved or symptoms recur at lower dose within 4 wk, permanently discontinue. *If retinal vein occlusion occurs,* permanently discontinue therapy.
- Assess for photosensitivity during therapy. *If Grade 2 (intolerable), Grade 3, or Grade 4 photosensitivity occurs,* withhold therapy up to 4 wk. If improved to Grade 0 or 1, resume at next lower dose. If not improved within 4 wk, permanently discontinue.
- ***Lab Test Considerations:*** May cause ↑ AST, ALT, alkaline phosphatase, and GGT. Monitor liver function tests before initiation and monthly during therapy, and as clinically indicated. *For 1st occurrence of Grade 4 hepatotoxicity,* withhold therapy up to 4 wk. If improved to Grade 0 or 1, resume at next lower dose. If not improved to Grade 0 or 1 within 4 wk, permanently discontinue. *If Grade 4 hepatotoxicity recurs,* discontinue therapy permanently.
- Obtain CPK and serum creatinine levels at baseline and periodically during therapy. If Grade 4 CPK ↑ or any CPK ↑ and myalgia occur, withhold therapy up to 4 wk. If improved to Grade 3 or lower, resume at next lower dose level. If not improved within 4 wk, permanently discontinue.
- May cause hypophosphatemia, hyponatremia, hypoalbuminemia, hypokalemia, hyperkalemia, and hypocalcemia.
- May cause anemia, lymphopenia, and thrombocytopenia.

Implementation

- **PO:** Administer three 20-mg tablets once daily without regard to food.

Patient/Family Teaching

- Instruct patient to take cobimetinib as directed. If dose is missed or vomiting occurs after dose, do not repeat, take next dose as scheduled.
- Advise patient to notify health care professional immediately if skin changes (new wart, skin sore that bleeds or does not heal, change in size or color of mole), signs and symptoms of bleeding (blood in urine, red or black stools, unusual or excessive vaginal bleeding, bleeding of gums, abdominal pain, headache, dizziness, feeling weak), cardiomyopathy (persistent coughing or wheezing, tiredness, shortness of breath, increased heart rate, swelling of ankles and feet), eye problems (blurred vision, halos, distorted vision, other vision changes, partly missing vision), liver injury (yellowing of skin or white of eyes, feeling tired or weak, dark or brown [tea color] urine, loss of appetite, nausea or vomiting), rhabdomyolysis (muscle aches, dark, reddish urine, muscle spasms, weakness), or rash occur.
- Advise patient to avoid sun exposure, wear protective clothing and use a broad-spectrum UVA/UVB sunscreen and lip balm (SPF ≥30) when outdoors. May require dose reduction or discontinuation.
- Advise patient to notify health care professional of all Rx or OTC medications, vitamins, or herbal products being taken and to consult with health care professional before taking other medications, especially St. John's wort.
- Rep: May be teratogenic. Advise patient use effective contraception and avoid breast feeding during and for at least 2 wk following therapy. May reduce fertility in females and males of reproductive potential.

Evaluation/Desired Outcomes

- Decrease in progression of melanoma.

© F.A. Davis Publishing

REMS HIGH ALERT

codeine (koe-deen)

Classification

Therapeutic: allergy, cold, and cough remedies, antitussives, opioid analgesics
Pharmacologic: opioid agonists

Schedule II, III, IV, V (depends on content)

Indications

Management of mild to moderate pain. Antitussive (in smaller doses).

Action

Binds to opiate receptors in the CNS. Alters the perception of and response to painful stimuli while producing generalized CNS depression. Decreases cough reflex. Decreases GI motility. **Therapeutic Effects:** Decreased severity of pain. Suppression of the cough reflex.

Pharmacokinetics

Absorption: 50% absorbed from the GI tract.
Distribution: Widely distributed. Crosses the placenta; enters breast milk.
Protein Binding: 7%.
Metabolism and Excretion: Mostly metabolized by the liver (primarily via CYP2D6); 10% converted to morphine; the CYP2D6 enzyme system exhibits genetic polymorphism (some patients [1–10% Whites, 3% African Americans, 16–28% North Africans/Ethiopians/Arabs] may be ultra-rapid metabolizers and may have ↑ morphine concentrations and an ↑ risk of adverse effects); 5–15% excreted unchanged in urine.
Half-life: 2.5–4 hr.

TIME/ACTION PROFILE (analgesia)

ROUTE	ONSET	PEAK	DURATION
PO	30–45 min	60–120 min	4 hr

Contraindications/Precautions

Contraindicated in: Hypersensitivity; Significant respiratory depression; Acute or severe bronchial asthma (in unmonitored setting or in absence of resuscitative equipment); Known or suspected GI obstruction (including paralytic ileus); Concurrent use of MAO inhibitors (or use within the past 14 days); Ultra-rapid CYP2D6 metabolizers of codeine; Lactation: Avoid use in breast feeding (↑ risk of drowsiness and respiratory depression in infant); Pedi: Children <12 yr, children <18 yr following tonsillectomy and/or adenoidectomy, and children 12–18 yr who are postoperative, have obstructive sleep apnea, obesity, or severe pulmonary disease, neuromuscular disease; or are taking other medications that cause respiratory depression (↑ risk of respiratory depression and death).
Use Cautiously in: Head trauma; ↑ intracranial pressure; Severe renal, hepatic, or pulmonary disease; Hypothyroidism; Adrenal insufficiency; Alcoholism; Prostatic hyperplasia; Undiagnosed abdominal pain; Geri: Geriatric or debilitated patients (dose ↓ required; more susceptible to CNS depression, constipation); OB: Has been used during labor; respiratory depression may occur in the newborn.

Adverse Reactions/Side Effects

CV: hypotension, bradycardia. **Derm:** flushing, sweating. **EENT:** blurred vision, diplopia, miosis. **GI:** constipation, nausea, vomiting. **GU:** urinary retention. **Neuro:** confusion, sedation, dysphoria, euphoria, floating feeling, hallucinations, headache, unusual dreams. **Resp:** RESPIRATORY DEPRESSION (including central sleep apnea and sleep-related hypoxemia). **Misc:** physical dependence, psychological dependence, tolerance.

Interactions

Drug-Drug: **MAO inhibitors** ↑ risk of adverse reactions; concurrent use or use within previous 14 days contraindicated. Additive CNS depression with **alcohol**, **antidepressants**, **antihistamines**, **benzodiazepines**, and **sedative/hypnotics**. **CYP3A4 inhibitors**, including **erythromycin**, **clarithromycin**, **ketoconazole**, **itraconazole**, and **protease inhibitors** may ↑ levels and risk of respiratory depression. **CYP3A4 inducers** may ↓ levels. **CYP2D6 inhibitors**, including **amiodarone** and **quinidine** may ↓ analgesic effects. **Mixed agonist/antagonist analgesics**, including **nalbuphine** or **butorphanol** and **partial agonist analgesics**, including **buprenorphine**, may ↓ meperidine's analgesic effects and/or precipitate opioid withdrawal in physically dependent patients. Drugs that affect serotonergic neurotransmitter systems, including **tricyclic antidepressants**, **SSRIs**, **SNRIs**, **MAO inhibitors**, **TCAs**, **tramadol**, **trazodone**, **mirtazapine**, **5–HT_3 receptor antagonists**, **linezolid**, **methylene blue**, and **triptans** ↑ risk of serotonin syndrome.
Drug-Natural Products: Concomitant use of **kava-kava**, **valerian**, **skullcap**, **chamomile**, or **hops** can ↑ CNS depression.

Route/Dosage

PO (Adults): *Analgesic*—15–60 mg every 4 hr as needed (not to exceed 360 mg/day). *Antitussive*—10–20 mg every 4–6 hr as needed (not to exceed 120 mg/day). *Antidiarrheal*—30 mg up to 4 times daily.

= Canadian drug name. = Genetic implication. ~~Strikethrough~~ = Discontinued.
*CAPITALS indicates life-threatening; underlines indicate most frequent.

© F.A. Davis Publishing

Renal Impairment

(Adults): *CCr 10–50 mL/min*—Administer 75% of the dose; *CCr <10 mL/min*—Administer 50% of the dose.

Availability (generic available)

Tablets: 15 mg, 30 mg, 60 mg. **Oral solution:** 25 mg/5 mL. ***In combination with:*** antihistamines, decongestants, antipyretics, caffeine, butalbital, and nonopioid analgesics. See Appendix N.

NURSING IMPLICATIONS

Assessment

- Assess BP, pulse, and respirations before and periodically during administration. If respiratory rate is <10/min, assess level of sedation. Physical stimulation may be sufficient to prevent significant hypoventilation. Dose may need to be decreased by 25–50%. Initial drowsiness will diminish with continued use. Monitor for respiratory depression, especially during initiation or following dose increase; serious, life-threatening, or fatal respiratory depression may occur. May cause sleep-related breathing disorders (central sleep apnea [CSA], sleep-related hypoxemia).
- Assess bowel function routinely. Prevention of constipation should be instituted with increased intake of fluids, bulk, and laxatives to minimize constipating effects. Stimulant laxatives should be administered routinely if opioid use exceeds 2–3 days, unless contraindicated. Consider drugs for opioid induced constipation.
- Assess risk for opioid addiction, abuse, or misuse prior to administration.
- **Pain:** Assess type, location, and intensity of pain before and 1 hr (peak) after administration. When titrating opioid doses, increases of 25–50% should be administered until there is either a 50% reduction in the patient's pain rating on a numerical or visual analogue scale or the patient reports satisfactory pain relief. A repeat dose can be safely administered at the time of the peak if previous dose is ineffective and side effects are minimal.
- An equianalgesic chart (see Appendix I) should be used when changing routes or when changing from one opioid to another.
- Prolonged use may lead to physical and psychological dependence and tolerance. This should not prevent patient from receiving adequate analgesia. Most patients who receive codeine for pain do not develop psychological dependence. If progressively higher doses are required, consider conversion to a stronger opioid.
- **Cough:** Assess cough and lung sounds during antitussive use.
- ***Lab Test Considerations:*** May cause ↑ plasma amylase and lipase concentrations.
- ***Toxicity and Overdose:*** If an opioid antagonist is required to reverse respiratory depression or coma, naloxone is the antidote. Dilute the 0.4-mg ampule of naloxone in 10 mL of 0.9% NaCl and administer 0.5 mL (0.02 mg) by IV push every 2 min. For children and patients weighing <40 kg, dilute 0.1 mg of naloxone in 10 mL of 0.9% NaCl for a concentration of 10 mcg/mL and administer 0.5 mcg/kg every 2 min. Titrate dose to avoid withdrawal, seizures, and severe pain.

Implementation

- ***High Alert:*** Accidental overdosage of opioid analgesics has resulted in fatalities. Before administering, clarify all ambiguous orders.
- Explain therapeutic value of medication before administration to enhance the analgesic effect.
- Regularly administered doses may be more effective than prn administration. Analgesic is more effective if given before pain becomes severe.
- Coadministration with nonopioid analgesics may have additive analgesic effects and permit lower doses.
- ***REMS:*** FDA strongly encourages health care professionals to complete a REMS-compliant education program that includes all the elements of the FDA Education *Blueprint for Health Care Providers Involved in the Management or Support of Patients with Pain,* available at www.fda.gov/OpioidAnalgesicREMSBlueprint. Information on programs can be found at 1-800-503-0784 or www.opioidanalgesicrems.com., Discuss availability of naloxone for emergency treatment of opioid overdose with the patient and caregiver and assess the potential need for access to naloxone, both when initiating and renewing therapy, especially if patient has household members (including children) or other close contacts at risk for accidental exposure or overdose. Consider prescribing naloxone, based on the patient's risk factors for overdose, such as concomitant use of CNS depressants, a history of opioid use disorder, or prior opioid overdose. However, the presence of risk factors for overdose should not prevent the proper management of pain in any patient., When combined with nonopioid analgesics (aspirin, acetaminophen) #2 = 15 mg, #3 = 30 mg, #4 = 60 mg codeine. Codeine as an individual drug is a Schedule II substance. In combination with other drugs, tablet form is Schedule III, and elixir or cough suppressant is Schedule V (see Appendix H).
- **PO:** Oral doses may be administered with food or milk to minimize GI irritation.
- If administered regularly for ≥1 wk, discontinue by tapering dose gradually by a small enough increment (no >10% to 25% of total daily dose) to avoid withdrawal symptoms, and proceed with dose-lowering at an interval of every 2 to 4 wk or longer. Monitor for withdrawal symptoms (restlessness, lacrimation, rhinorrhea, yawning, perspiration, chills, myalgia, mydriasis, irritability, anxiety, backache,

© F.A. Davis Publishing

joint pain, weakness, abdominal cramps, insomnia, nausea, anorexia, vomiting, diarrhea, increased blood pressure, respiratory rate, or heart rate) during taper. If withdrawal symptoms occur, it may be necessary to pause the taper for a period of time or raise the dose of the opioid analgesic to the previous dose, and then proceed with a slower taper. Monitor for changes in mood, emergence of suicidal thoughts, or use of other substances.

Patient/Family Teaching

- Instruct patient on how and when to ask for and take pain medication. Do not stop abruptly without consulting health care professional.
- Advise patient that codeine is a drug with known abuse potential. Protect it from theft, and never give to anyone other than the individual for whom it was prescribed.
- ***REMS:*** Instruct patient on risk of addiction, abuse, and misuse, which could lead to death. Discuss safe use, risks, and proper storage and disposal of opioid analgesics with patients and caregivers with each Rx. The Patient Counseling Guide (PCG) is available at www.fda.gov/OpioidAnalgesicREMSPCG. Advise patient not to share codeine with others and to protect from theft or misuse.
- Advise patient that codeine is a drug with known abuse potential. Protect it from theft, and never give to anyone other than the individual for whom it was prescribed. Store out of sight and reach of children, and in a location not accessible by others.
- Educate patients and caregivers on how to recognize respiratory depression and emphasize the importance of calling 911 or getting emergency medical help right away in the event of a known or suspected overdose. Inform patients and caregivers about various ways to obtain naloxone as permitted by individual state naloxone dispensing and prescribing requirements or guidelines (by prescription, directly from a pharmacist, or as part of a community-based program).
- May cause drowsiness or dizziness. Advise patient to call for assistance when ambulating or smoking. Caution ambulatory patient to avoid driving or other activities requiring alertness until response to medication is known.
- Advise patient to change positions slowly to minimize orthostatic hypotension.
- Caution patient to avoid concurrent use of alcohol or other CNS depressants with this medication.
- Encourage patient to turn, cough, and breathe deeply every 2 hr to prevent atelectasis.
- Advise patient that good oral hygiene, frequent mouth rinses, and sugarless gum or candy may decrease dry mouth.
- Rep: Advise patient to notify health care professional if pregnancy is planned or suspected, or if breast feeding. Inform patient of potential for neonatal opioid withdrawal syndrome with prolonged use during pregnancy. Monitor neonate for signs and symptoms of withdrawal symptoms (irritability, hyperactivity and abnormal sleep pattern, high pitched cry, tremor, vomiting, diarrhea, and/or failure to gain weight); usually occur the first days after birth. Monitor infants exposed to codeine through breast milk for excess sedation and respiratory depression.

Evaluation/Desired Outcomes

- Decrease in severity of pain without a significant alteration in level of consciousness or respiratory status.
- Suppression of cough.
- Control of diarrhea.

HIGH ALERT

colchicine (kol-chi-seen)

Colcrys, Gloperba, Mitigare

Classification

Therapeutic: antigout agents

Indications

Prophylaxis and treatment of acute attacks of gouty arthritis (oral solution is only for prophylaxis). Familial Mediterranean fever.

Action

Interferes with the functions of WBCs in initiating and perpetuating the inflammatory response to monosodium urate crystals. **Therapeutic Effects:** Decreased pain and inflammation in acute attacks of gout. Reduced number of attacks of gout and familial Mediterranean fever.

Pharmacokinetics

Absorption: 45% absorbed from the GI tract, then re-enters GI tract from biliary secretions, when more absorption may occur.

Distribution: Concentrates in WBCs.

Metabolism and Excretion: Partially metabolized by the liver by CYP3A4; also a substrate for P-glycoprotein. Secreted in bile back into GI tract; eliminated in the feces. 40–65% excreted in the urine as unchanged drug.

Half-life: 27–31 hr.

TIME/ACTION PROFILE (anti-inflammatory activity)

ROUTE	ONSET	PEAK	DURATION
PO	12 hr	24–72 hr	unknown

Contraindications/Precautions

Contraindicated in: Hypersensitivity; Use of P-glycoprotein inhibitors or strong CYP3A4 inhibitors in pa-

© F.A. Davis Publishing

tients with renal or hepatic impairment; Renal and hepatic impairment.

Use Cautiously in: Renal impairment (dose ↓ suggested if CCr <80 mL/min); OB: Use during pregnancy only if potential maternal benefit justifies potential fetal risk; Lactation: Use while breast feeding only if potential maternal benefit justifies potential risk to infant; Pedi: Safety and effectiveness for gout in children not established; Geri: Elderly or debilitated patients (toxicity may be cumulative).

Adverse Reactions/Side Effects

Derm: alopecia. **GI:** diarrhea, nausea, vomiting, abdominal pain. **Hemat:** AGRANULOCYTOSIS, APLASTIC ANEMIA, leukopenia, thrombocytopenia. **Neuro:** peripheral neuritis.

Interactions

Drug-Drug: Concurrent use of strong **CYP3A4 inhibitors**, including **atazanavir**, **clarithromycin**, **darunavir/ritonavir**, **indinavir**, **itraconazole**, **ketoconazole**, **lopinavir/ritonavir**, **nefazodone**, **nelfinavir**, **ritonavir**, **saquinavir**, or **tipranavir/ritonavir**, may ↑ levels and risk of toxicity; ↓ colchicine dose in patients with normal renal or hepatic function; concurrent use in patients with renal or hepatic impairment is contraindicated. Concurrent use of **P-glycoprotein inhibitors**, including **cyclosporine** or **ranolazine** may ↑ levels and risk of toxicity; ↓ colchicine dose in patients with normal renal or hepatic function; concurrent use in patients with renal or hepatic impairment is contraindicated. Moderate **CYP3A4 inhibitors**, including **aprepitant**, **diltiazem**, **erythromycin**, **fluconazole**, **fosamprenavir**, or **verapamil** may ↑ levels and risk of toxicity; ↓ colchicine dose. Additive bone marrow depression may occur with **bone marrow depressants** or **radiation therapy**. ↑ risk of rhabdomyolysis with **HMG-CoA reductase inhibitors**, **gemfibrozil**, **fenofibrate**, or **digoxin**. Additive adverse GI effects with **NSAIDs**. May cause reversible malabsorption of **vitamin B_{12}**.

Drug-Food: Grapefruit juice may ↑ levels and risk of toxicity; ↓ colchicine dose.

Route/Dosage

Treatment of Acute Gout Attacks

PO (Adults): 1.2 mg initially, then 0.6 mg 1 hr later (maximum dose of 1.8 mg in 1 hr); *Concomitant use of strong CYP3A4 inhibitors in patients with normal renal and hepatic function (atazanavir, clarithromycin, darunavir/ritonavir, indinavir, itraconazole, ketoconazole, lopinavir/ritonavir, nefazodone, nelfinavir, ritonavir, saquinavir, tipranavir/ritonavir)* — 0.6 mg × 1 dose, then 0.3 mg 1 hr later (do not repeat treatment course for ≥3 days); *Concomitant use of moderate CYP3A4 inhibitors (aprepitant, diltiazem, erythromycin, fluconazole, fosamprenavir, grapefruit juice, verapamil)* — 1.2 mg × 1 dose (do not repeat for ≥3 days); *Concomitant use of P-glycoprotein inhibitors (cyclosporine, ranolazine) in patients with normal renal and hepatic function* — 0.6 mg × 1 dose (do not repeat for ≥3 days).

Renal Impairment

PO (Adults): *CCr <30 mL/min* — 1.2 mg initially, then 0.6 mg 1 hr later; do not repeat treatment course for ≥2 wk; *Dialysis* — 0.6 mg × 1 dose; do not repeat treatment course for ≥2 wk.

Prevention of Acute Gout Attacks

PO (Adults): 0.6 mg once or twice daily; *Concomitant use of strong CYP3A4 inhibitors (atazanavir, clarithromycin, darunavir/ritonavir, indinavir, itraconazole, ketoconazole, lopinavir/ritonavir, nefazodone, nelfinavir, ritonavir, saquinavir, tipranavir/ritonavir) or P-glycoprotein inhibitors (cyclosporine, ranolazine) in patients with normal renal and hepatic function* — if original dose was 0.6 mg twice daily, ↓ to 0.3 mg once daily; if original dose was 0.6 mg once daily, ↓ to 0.3 mg every other day; *Concomitant use of moderate CYP3A4 inhibitors (aprepitant, diltiazem, erythromycin, fluconazole, fosamprenavir, grapefruit juice, verapamil)* — if original dose was 0.6 mg twice daily, ↓ to 0.3 mg twice daily or 0.6 mg once daily; if original dose was 0.6 mg once daily, ↓ to 0.3 mg once daily.

Renal Impairment

PO (Adults): *CCr <30 mL/min* — 0.3 mg once daily; *Dialysis* — 0.3 mg twice weekly.

Familial Mediterranean Fever

PO (Adults and Children >12 yr): 1.2–2.4 mg/day (in 1–2 divided doses); may ↑ or ↓ dose in 0.3-mg/day increments based on safety and efficacy; *Concomitant use of strong CYP3A4 inhibitors (atazanavir, clarithromycin, darunavir/ritonavir, indinavir, itraconazole, ketoconazole, lopinavir/ritonavir, nefazodone, nelfinavir, ritonavir, saquinavir, tipranavir/ritonavir) or P-glycoprotein inhibitors (cyclosporine, ranolazine) in patients with normal renal and hepatic function* — Do not exceed 0.6 mg/day (may be given as 0.3 mg twice daily); *Concomitant use of moderate CYP3A4 inhibitors (aprepitant, diltiazem, erythromycin, fluconazole, fosamprenavir, grapefruit juice, verapamil)* — Do not exceed 1.2 mg/day (may be given as 0.6 mg twice daily).

PO (Children 6–12 yr): 0.9–1.8 mg/day (in 1–2 divided doses).

PO (Children 4–6 yr): 0.3–1.8 mg/day (in 1–2 divided doses).

Renal Impairment

PO (Adults): *CCr 30–50 mL/min* — dose ↓ may be necessary; *CCr <30 mL/min or dialysis* — 0.3 mg/day.

Availability (generic available)

Capsules: 0.6 mg. **Oral solution (cherry flavor):** 0.6 mg/5 mL. **Tablets:** 0.6 mg. ***In combination with:*** probenecid (Col-Probenecid). See Appendix N.

© F.A. Davis Publishing

NURSING IMPLICATIONS

Assessment

- Monitor intake and output ratios. Fluids should be encouraged to promote a urinary output of at least 2000 mL/day.
- **Gout:** Assess involved joints for pain, mobility, and edema throughout therapy. During initiation of therapy, monitor for drug response every 1–2 hr.
- **Familial Mediterranean fever:** Assess for signs and symptoms of familial Mediterranean fever (abdominal pain, chest pain, fever, chills, recurrent joint pain, red and swollen skin lesions) periodically during therapy.
- ***Lab Test Considerations:*** In patients receiving prolonged therapy, monitor baseline and periodic CBC; report significant ↓ in values. May cause ↓ platelet count, leukopenia, aplastic anemia, and agranulocytosis.
- May cause ↑ in AST and alkaline phosphatase.
- May cause false-positive results for urine hemoglobin.
- May interfere with results of urinary 17-hydroxycorticosteroid concentrations.
- ***Toxicity and Overdose: High Alert:*** Assess patient for toxicity (muscle pain or weakness, tingling or numbness in fingers or toes; pale or gray color to lips, tongue, or palms of hands; severe diarrhea or vomiting; unusual bleeding, bruising, sore throat, fatigue, malaise, or weakness or tiredness). If these symptoms occur, discontinue colchicine and treat symptomatically.

Implementation

- Do not confuse colchicine with Cortrosyn.
- Intermittent therapy with 3 days between courses may be used to decrease risk of toxicity.
- **PO:** Administer without regard to meals.
- Use an accurate measuring device for solution; a teaspoon is not accurate. Solution is slightly hazy, red liquid with a cherry odor.

Patient/Family Teaching

- Instruct patient to take colchicine as directed. Review medication administration schedule. Take missed doses as soon as remembered unless almost time for next dose. Do not double doses.
- Instruct patients taking prophylactic doses not to increase to therapeutic doses during an acute attack to prevent toxicity. An NSAID or corticosteroid, preferably via intrasynovial injection, should be used to treat acute attacks.
- Advise patient to avoid grapefruit and grapefruit juice during therapy; may increase risk of toxicity.
- Advise patient to follow recommendations of health care professional regarding weight loss, diet, and alcohol consumption.
- Instruct patient to report muscle pain or weakness, tingling or numbness in fingers or toes; pale or gray color to lips, tongue, or palms of hands; severe diarrhea or vomiting; unusual bleeding, bruising, sore throat, fatigue, malaise, or weakness or tiredness promptly. Hold colchicine if symptoms of toxicity occur.
- Instruct patient to notify health care professional of all Rx or OTC medications, vitamins, or herbal products being taken and to notify health care professional before taking any other Rx, OTC, or herbal products.
- Surgery may precipitate an acute attack of gout. Advise patient to confer with health care professional regarding dose 3 days before surgical or dental procedures.
- Rep: Advise females of reproductive potential to notify health care professional if pregnancy is planned or suspected or if breast feeding. Inform males with female partners of reproductive potential that colchicine may cause infertility that reverses when colchicine is stopped.

Evaluation/Desired Outcomes

- Decrease in pain and swelling in affected joints within 12 hr.
- Relief of symptoms within 24–48 hr.
- Prevention of acute gout attacks.
- Reduced number of attacks of familial Mediterranean fever.

colesevelam (koe-le-**sev**-e-lam)

Lodalis, Welchol

Classification

Therapeutic: lipid-lowering agents
Pharmacologic: bile acid sequestrants

Indications

Adjunctive therapy to diet and exercise for the reduction of LDL cholesterol in patients with primary hypercholesterolemia; may be used alone or in combination with statins. Adjunctive therapy to diet and exercise for the reduction of LDL cholesterol in children 10–17 yr with heterozygous familial hypercholesterolemia if diet therapy fails (LDL cholesterol remains ≥190 mg/dL or remains ≥160 mg/dL [with family history of premature cardiovascular disease or ≥2 risk factors for cardiovascular disease]); may be used alone or in combination with statin. Adjunctive therapy to diet and exercise to improve glycemic control in patients with type 2 diabetes.

Action

Binds bile acids in the GI tract. Results in increased clearance of cholesterol. Mechanism for lowering

© F.A. Davis Publishing

blood glucose unknown. **Therapeutic Effects:** Decreased cholesterol and blood glucose.

Pharmacokinetics

Absorption: Not absorbed; action is primarily local in the GI tract.
Distribution: Unknown.
Metabolism and Excretion: Unknown.
Half-life: Unknown.

TIME/ACTION PROFILE (cholesterol-lowering effect)

ROUTE	ONSET	PEAK	DURATION
PO	24–48 hr	2 wk	unknown

Contraindications/Precautions

Contraindicated in: Hypersensitivity; Bowel obstruction; Triglycerides >500 mg/dL; History of pancreatitis due to hypertriglyceridemia.
Use Cautiously in: Triglycerides >300 mg/dL; Dysphagia, swallowing disorders, severe GI motility disorders, or major GI tract surgery; Phenylketonuria (oral suspension packets contain phenylalanine); OB: Safety not established; not systemically absorbed; use during pregnancy not expected to result in fetal exposure; Lactation: Not systemically absorbed; not expected to be present in breast milk; Pedi: Children <10 yr (safety not established).

Adverse Reactions/Side Effects

GI: constipation, dyspepsia.

Interactions

Drug-Drug: May ↓ absorption of **glyburide**, **glimepiride**, **glipizide**, **levothyroxine**, **olmesartan**, **phenytoin**, **cyclosporine**, **warfarin**, and **estrogen-containing oral contraceptives** (give ≥4 hr before colesevelam). May ↑ levels of **metformin extended-release**.

Route/Dosage

Hyperlipidemia

PO (Adults and Children 10–17 yr): 6 tablets once daily *or* 3 tablets twice daily *or* one 3.75-g packet once daily.

Type 2 Diabetes

PO (Adults): 6 tablets once daily *or* 3 tablets twice daily *or* one 3.75-g packet once daily.

Availability (generic available)

Granules for oral suspension: 3.75 g/packet (contains 27 mg phenylalanine). **Tablets:** 625 mg.

NURSING IMPLICATIONS

Assessment

- **Hypercholesterolemia:** Obtain a diet history, especially in regard to fat consumption.
- **Type 2 Diabetes:** Observe patient for signs and symptoms of hypoglycemic reactions (sweating, hunger, weakness, dizziness, tremor, tachycardia, anxiety).
- ***Lab Test Considerations:*** Monitor serum total cholesterol, LDL, and triglyceride levels before initiating, 4–6 wk after starting, and periodically during therapy. May cause hypertriglyceridemia.
- Monitor serum glucose and glycosylated hemoglobin periodically during therapy in patients with diabetes.

Implementation

- Patients stabilized on a diabetic regimen who are exposed to stress, fever, trauma, infection, or surgery may require administration of insulin.
- **PO:** Administer once or twice daily with meals. Colesevelam should be taken with a liquid. For oral suspension, empty the entire contents of one packet into a glass or cup. Add 1 cup (8 oz) of water, fruit juice, or a diet soft drink; do not take in dry form to avoid esophageal distress.

Patient/Family Teaching

- Instruct patient to take medication as directed; do not skip doses or double up on missed doses.
- Advise patients taking oral vitamin supplementation or oral contraceptives to take their vitamins at least 4 hr prior to colesevelam, especially those taking warfarin. Colesevelam may decrease absorption of fat-soluble vitamins A, D, E, and K.
- Instruct patient to consume a diet that promotes bowel regularity. Patients should be instructed to promptly discontinue colesevelam and notify health care professional if severe abdominal pain or severe constipation or symptoms of acute pancreatitis (severe abdominal pain with or without nausea and vomiting) occur.
- Instruct patient to notify health care professional of all Rx or OTC medications, vitamins, or herbal products being taken and consult health care professional before taking other Rx, OTC, or herbal products.
- Rep: Insulin is the recommended method of controlling blood sugar during pregnancy. Counsel females of reproductive potential that colesevelam may reduce efficacy of oral contraceptives; advise patients to take oral contraceptives at least 4 hr prior to taking colesevelam or use a form of contraception other than oral contraceptives and to notify health care professional promptly if pregnancy is planned or suspected.
- **Hypercholesterolemia:** Advise patient that this medication should be used in conjunction with diet restrictions (fat, cholesterol, carbohydrates, alcohol), exercise, and cessation of smoking.
- **Diabetes:** Explain to patient that this medication controls hyperglycemia but does not cure diabetes. Therapy is long term.
- Review signs of hypoglycemia and hyperglycemia with patient. If hypoglycemia occurs, advise patient to drink a glass of orange juice or ingest 2–3 tsp of sugar, honey, or corn syrup dissolved in water or an

© F.A. Davis Publishing

appropriate number of glucose tablets and notify health care professional.
- Encourage patient to follow prescribed diet, medication, and exercise regimen to prevent hypoglycemic or hyperglycemic episodes.
- Instruct patient in proper testing of serum glucose and ketones. These tests should be closely monitored during periods of stress or illness and health care professional notified if significant changes occur.
- Advise patient to carry a form of sugar (sugar packets, candy) and identification describing disease process and medication regimen at all times.

Evaluation/Desired Outcomes
- Decrease in serum total cholesterol, LDL cholesterol, apolipoprotein, and blood glucose levels.
- Control of blood glucose levels without the appearance of hypoglycemic or hyperglycemic episodes.

conivaptan (con-i-**vap**-tan)
Vaprisol

Classification
Therapeutic: electrolyte modifiers
Pharmacologic: vasopressin antagonists

Indications
To increase serum sodium in hospitalized patients with euvolemic or hypervolemic hyponatremia.

Action
Antagonizes vasopressin at V_2 receptor sites in renal collecting ducts, resulting in excretion of free water.
Therapeutic Effects: Increased serum sodium concentrations. Improved fluid status.

Pharmacokinetics
Absorption: IV administration results in complete bioavailability.
Distribution: Unknown.
Protein Binding: 99% protein bound.
Metabolism and Excretion: Metabolized solely by the CYP3A4 enzyme system. 83% excreted in feces as metabolites, 12% in urine (as metabolites).
Half-life: 5 hr.

TIME/ACTION PROFILE

ROUTE	ONSET	PEAK	DURATION
IV	unknown	12 hr	end of infusion

Contraindications/Precautions
Contraindicated in: Hypersensitivity; Hypovolemic hyponatremia; Concurrent use of ketoconazole, itraconazole, clarithromycin, ritonavir, or indinavir; Lactation: Avoid breast feeding.
Use Cautiously in: Moderate or severe hepatic impairment (↓ dose recommended); Severe renal impairment (not recommended if CCr <30 mL/min); OB: Safety not established; Pedi: Safety and effectiveness not established.

Adverse Reactions/Side Effects
CV: hypertension, hypotension. **GI:** diarrhea. **GU:** ↓ fertility (females), polyuria. **F and E:** dehydration, hypokalemia, hypomagnesemia, hyponatremia. **Local:** infusion reactions. **Neuro:** headache, confusion, insomnia. **Misc:** fever, thirst.

Interactions
Drug-Drug: Blood levels and effects are ↑ by **ketoconazole**, **itraconazole**, **clarithromycin**, **ritonavir**, or **indinavir**; concurrent use is contraindicated. ↑ blood levels and may ↑ effects of **midazolam**, **simvastatin**, **lovastatin**, **amlodipine**, and **other drugs metabolized by CYP3A4**; careful monitoring recommended. May ↑ **digoxin** levels.

Route/Dosage
IV (Adults): 20 mg loading dose initially, followed by 20 mg/day as a continuous infusion for 2–4 days. May titrate conivaptan up to 40 mg/day as a continuous infusion if serum sodium is not rising at desired rate. Total duration of therapy should not exceed 4 days.

Hepatic Impairment
(Adults): *Moderate or severe hepatic impairment*—10-mg loading dose initially, followed by 10 mg/day as a continuous infusion for 2–4 days; may titrate up to 20 mg/day as a continuous infusion if serum sodium is not rising at desired rate.

Availability
Premixed infusion: 20 mg/100 mL D5W.

NURSING IMPLICATIONS
Assessment
- Monitor injection site during administration. Frequently causes erythema, pain, swelling, and phlebitis. May require discontinuation of therapy.
- Monitor vital signs frequently during therapy. Discontinue therapy if patient becomes hypovolemic and hypotensive. Therapy may be resumed at a reduced dose once patient is euvolemic and no longer hypotensive, if patient remains hyponatremic.
- Assess neurologic status during administration. Overly rapid rise in serum sodium may cause neurologic sequelae.
- ***Lab Test Considerations:*** Monitor serum sodium concentration frequently during therapy. If serum sodium rises at an undesirably rapid rate (>12 mEq/L/24 hr), discontinue administration of conivaptan. If serum sodium continues to rise, do not resume therapy. If hyponatremia persists or recurs (after discontinuation for rapid rise of serum sodium) and patient has no evidence of neurologic se-

© F.A. Davis Publishing

quelae from rapid increase, conivaptan may be resumed at a reduced dose.
- May cause hyperglycemia, hypoglycemia, hypokalemia, hypomagnesemia, and hyponatremia.

Implementation

IV Administration
- Administer IV through large veins and rotate infusion site every 24 hr to minimize risk of vascular irritation.

Loading Dose

- **Intermittent Infusion:** ***Dilution:*** Premixed containers require no further dilution. ***Concentration:*** 0.2 mg/mL. ***Rate:*** Administer over 30 min.

Continuous Infusion

- **Continuous Infusion:** ***Dilution:*** Premixed containers require no further dilution. ***Concentration:*** 0.2 mg/mL. ***Rate:*** Administer continuous infusion at a rate of 20 mg/24 hr. If patient requires 40 mg/24 hr continuous infusion, infuse 20 mg over 12 hr, followed by 20 mg over 12 hr.
- **Additive Incompatibility:** Do not admix with LR, furosemide, or combine with any other product in the same IV line or bag.

Patient/Family Teaching

- Explain purpose of medication to patient.
- Instruct patient to notify health care professional if pain or redness occurs at infusion site.

Evaluation/Desired Outcomes

- Restoration of normal fluid and electrolyte balance.

CONTRACEPTIVES, HORMONAL

MONOPHASIC ORAL CONTRACEPTIVES

ethinyl estradiol/desogestrel

Classification
Therapeutic: contraceptive hormones

Indications

Prevention of pregnancy. Regulation of menstrual cycle. Emergency contraception (some products). Treatment

© F.A. Davis Publishing

of heavy menstrual bleeding in women who choose to use intrauterine contraception as their method of contraception (Mirena). Treatment of heavy menstrual bleeding in women who choose to use an oral contraceptive as their method of contraception (Natazia). Treatment of premenstrual dysphoric disorder (Beyaz, Yaz, Yasmin). Management of acne in women >14 yr who desire contraception, have no health problems, and have failed topical treatment. Increase folate levels in women who desire oral contraception to reduce the risk of neural tube defects in a pregnancy that occurs while taking or shortly after discontinuing the product.

Action

Monophasic Oral Contraceptives: Provide a fixed dosage of estrogen/progestin over a 21-day cycle. Ovulation is inhibited by suppression of follicle-stimulating hormone (FSH) and luteinizing hormone (LH). May alter cervical mucus and the endometrial environment, preventing penetration by sperm and implantation of the egg. **Biphasic Oral Contraceptives:** Ovulation is inhibited by suppression of FSH and LH. May alter cervical mucus and the endometrial environment, preventing penetration by sperm and implantation of the egg. In addition, smaller dose of progestin in phase 1 allows for proliferation of endometrium. Larger amount in phase 2 allows for adequate secretory development. **Triphasic Oral Contraceptives:** Ovulation is inhibited by suppression of FSH and LH. May alter cervical mucus and the endometrial environment, preventing penetration by sperm and implantation of the egg. Varying doses of estrogen/progestin may more closely mimic natural hormonal fluctuations. **Fourphasic Oral Contraceptives:** Ovulation is inhibited by suppression of FSH and LH. May alter cervical mucus and the endometrial environment, preventing penetration by sperm and implantation of the egg. Doses of estrogen decrease while doses of progestin increase over the 28-day cycle. **Extended-cycle:** Provides continuous estrogen/progestin for 84 days (365 days for Lybrel), then off for 7 days (low-dose estrogen-only tablet taken during these 7 days with LoSeasonique and Seasonique), resulting in 4 menstrual periods/yr (no periods/yr for Lybrel). **Progressive Estrogen:** Contains constant amount of progestin with 3 progressive doses of estrogen. **Progestin-Only Contraceptives/Contraceptive Implant/Intrauterine Levonorgestrel/Medroxyprogesterone Injection:** Mechanism not clearly known. May alter cervical mucus and the endometrial environment, preventing penetration by sperm and implantation of the egg. Ovulation may also be suppressed. **Emergency Contraceptive Pills (ECPs):** Inhibit ovulation/fertilization; may also alter tubal transport of sperm/egg and prevent implantation. **Vaginal Ring, Transdermal Patch:** Inhibits ovulation, decreases sperm entry into uterus, decreases likelihood of implantation. **Anti-acne effect:** Combination of estrogen/progestin may increase sex hormone binding globulin (SHBG) resulting in decreased unbound testosterone, which may be a cause of acne. **Therapeutic Effects:** Prevention of pregnancy. Decreased severity of acne. Decrease in menstrual blood loss. Decrease in premenstrual disphoric disorder. Decrease in vasomotor symptoms or symptoms of vulvar and vaginal atrophy due to menopause. Increase in folate levels and prevention of neural tube defects.

Pharmacokinetics

Absorption: *Ethinyl estradiol*—rapidly absorbed; *Norethindrone*—65% absorbed; *Desogestrel and levonorgestrel*—100% absorbed; *Dienogest*—91% absorbed. Others are well absorbed after oral administration. Slowly absorbed from implant, subcutaneous or IM injection. Some absorption follows intrauterine implantation.

Distribution: Unknown.

Protein Binding: *Ethinyl estradiol*—97–98%; *Drospirenone*—97%; *Dienogest*—90%; *Ulipristal*—>94%.

Metabolism and Excretion: *Ethinyl estradiol and norethindrone*—undergo extensive first-pass hepatic metabolism. *Mestranol*—is rapidly converted to ethinyl estradol. *Desogestrel*—is rapidly metabolized to 3-keto-desogestrel, the active metabolite. Most agents are metabolized by the liver.

Half-life: *Ethinyl estradiol*—6–20 hr; *Levonorgestrel*—45 hr; *Norethindrone*—5–14 hr; *Desogestrel (metabolite)*—38 ± 20 hr; *Drospirenone*—30 hr; *Norgestimate (metabolite)*—12–20 hr; *Dienogest*—11 hr; *others*—unknown; *Ulipristal*—32 hr.

TIME/ACTION PROFILE (prevention of pregnancy)

ROUTE	ONSET	PEAK	DURATION
PO	1 mo	1 mo	1 mo†
Implant	1 mo	1 mo	5 yr
Intrauterine system	1 mo	1 mo	5 yr
IM	1 mo	1 mo	3 mo
Subcut	unknown	1 wk	3 mo

†Only during mo of taking contraceptive.

Contraindications/Precautions

Contraindicated in: Hypersensitivity; History of cigarette smoking and age >35 yr (↑ risk of cardiovascular or thromboembolic phenomenon); History of deep vein thrombosis or pulmonary embolism; Inherited or acquired coagulopathies; Cerebrovascular disease; Coronary artery disease; Thrombogenic valvular heart disease or thrombogenic heart rhythms; Major surgery with extended periods of immobility; Diabetes and >35 yr old; diabetes with hypertension, vascular disease, or end-organ damage; or diabetes for >20 yr; Headache with focal neurological symptoms or migraine headaches with aura; Women >35 yr old with migraine headaches; Uncontrolled hypertension or hypertension with vascular disease; Breast cancer, endometrial cancer, or any other estrogen- or progestin-

© F.A. Davis Publishing

sensitive cancer (current or history of); Abnormal genital bleeding; Cholestatic jaundice of pregnancy or jaundice with prior contraceptive use; Hepatic adenoma or carcinoma; Hypersensitivity to and parabens (injectable only); Concurrent use of combinations containing ombitasvir/paritaprevir/ritonavir (with or without dasubavir) (↑ risk of liver enzyme elevations); *Drosperinone-containing products only*—Renal impairment, liver disease, or adrenal insufficiency (↑ risk of hyperkalemia); *Intrauterine levonorgestrel only*—Intrauterine anomaly, postpartum endometriosis, multiple sexual partners, pelvic inflammatory disease, liver disease, genital actinomycosis, immunosuppression, IV drug abuse, untreated genitourinary infection, history of ectopic pregnancy; *Ethinyl estradiol/levonorgestrel and ethinyl estradiol/norelgestromin transdermal patches only*—Body mass index ≥30 kg/m^2 (↑ risk of venous thromboembolism); OB: Pregnancy; Lactation: Avoid use; ↑ risk of uterine rupture/perforation with intrauterine levonorgestrel.

Use Cautiously in: Presence of other cardiovascular risk factors (obesity, hyperglycemia, hypertension); History or family history of hypertriglyceridemia (↑ risk of pancreatitis); Diabetes mellitus, bleeding disorders, concurrent anticoagulant therapy or headaches; Hereditary angioedema; Chloasma; *Ethinyl estradiol/norelgestromin transdermal patch only*—Weight >90 kg (↓ effectiveness); *Ethinyl estradiol/levonorgestrel transdermal patch only*—Body mass index 25–<30 kg/m (↓ effectiveness); Pedi: Avoid use before menarche.

Adverse Reactions/Side Effects

CV: THROMBOEMBOLISM, edema, hypertension, Raynaud's phenomenon, thrombophlebitis. **Derm:** melasma, rash. **EENT:** contact lens intolerance, optic neuritis, retinal thrombosis. **Endo:** hyperglycemia. **F and E:** *Drosperinone-containing products only*—hyperkalemia. **GI:** PANCREATITIS, abdominal cramps, bloating, cholestatic jaundice, gallbladder disease, liver tumors, nausea, vomiting. **GU:** amenorrhea, breakthrough bleeding, dysmenorrhea, spotting, *Intrauterine levonorgestrel only*—uterine imbedment/uterine rupture. **MS:** *Injectable medroxyprogesterone only*—bone loss. **Neuro:** depression, headache. **Misc:** HYPERSENSITIVITY REACTIONS (including anaphylaxis and angioedema), weight change.

Interactions

Drug-Drug: Oral contraceptive efficacy may be ↓ by **penicillins**, **chloramphenicol**, **barbiturates**, chronic **alcohol** use, **carbamazepine**, **oxcarbazepine**, **bosentan**, **felbamate**, systemic **corticosteroids**, **phenytoin**, **topiramate**, **primidone**, **modafinil**, **rifampin**, **rifabutin**, **nelfinavir**, **ritonavir**, **darunavir/ritonavir**, **fosamprenavir/ritonavir**, **lopinavir/ritonavir**, **tipranavir/ritonavir**, **nevirapine**, **efavirenz**, **colesevelam**, or **tetracyclines**. **CYP3A4 inducers**, including **barbiturates**, **bosentan**, **carbamazepine**, **oxcarbazepine**, **phenytoin**, **topiramate**, **felbamate**, **rifampin** may ↓ effectiveness of ulipristal; avoid concomitant use. May ↑ effects/risk of toxicity of some **benzodiazepines**, **beta blockers**, **corticosteroids**, **cyclosporine**, **tizanidine**, **theophylline**, and **voriconazole**. ↑ risk of hepatotoxicity with **dantrolene** (estrogen only). **Indinavir**, **atazanavir/ritonavir**, **etravirine**, **itraconazole**, **ketoconazole**, **fluconazole**, **voriconazole**, **rosuvastatin**, and **atorvastatin** may ↑ effects/risk of toxicity. **Smoking** ↑ risk of thromboembolic phenomena (estrogen only). May ↓ levels of **acetaminophen**, **temazepam**, **lamotrigine**, **lorazepam**, **oxazepam**, or **morphine**. Concurrent use of combinations containing **ombitasvir/paritaprevir/ritonavir** with ethinyl estradiol-containing products may ↑ risk of elevated liver enzymes; avoid concurrent use. *Drosperinone-containing products only*—concurrent use with **NSAIDs**, **potassium-sparing diuretics**, **potassium supplements**, **ACE inhibitors**, **aldosterone receptor antagonists**, or **angiotensin II receptor antagonists** may result in hyperkalemia. *Drosperinone-containing products only*—concurrent use with strong **CYP3A4 inhibitors**, including **ketoconazole**, **itraconazole**, **voriconazole**, **protease inhibitors**, or **clarithromycin** may ↑ risk of hyperkalemia; consider monitoring K+ concentrations. Ulipristal may ↑ levels of **P-glycoprotein substrates**, including **dabigatran** and **digoxin**.

Drug-Natural Products: Concomitant use with **St. John's wort** may ↓ contraceptive efficacy and cause breakthrough bleeding and irregular menses.

Drug-Food: **Grapefruit juice** may ↑ effects/risk of toxicity.

Route/Dosage

Monophasic Oral Contraceptives

PO (Adults): On 21-day regimen, take first tablet on first Sunday after menses begins (take on Sunday if menses begins on Sunday) for 21 days, then skip 7 days and begin again. Regimen may also be started on first day of menses, continue for 21 days, then skip 7 days and begin again. Some regimens contain 7 placebo tablets, so that 1 tablet is taken every day for 28 days.

Biphasic Oral Contraceptives

PO (Adults): Given in 2 phases. First phase is 10 days of smaller amount of progestin. Second phase is larger amount of progestin. Amount of estrogen remains constant for same length of time (total of 21 days), then skip 7 days and begin again. Some regimens contain 7 placebo tablets for 28-day regimen.

© F.A. Davis Publishing

Triphasic Oral Contraceptives

PO (Adults): Progestin amount varies throughout 21-day cycle. Estrogen component stays the same or may vary. Some regimens contain 7 placebo tablets for 28-day regimen.

Fourphasic Oral Contraceptives

PO (Adults): Given in 4 phases. First phase contains higher amount of estrogen and no progestin. Second and third phases contain lower amount of estrogen, and increasing amounts of progestin. Fourth phase contains low dose of estrogen only. Also contains 2 placebo tablets to complete 28-day regimen.

Extended-Cycle Contraceptive

PO (Adults): *Daysee, LoSeasonique, Quartette, Seasonale* and *Seasonique*. Start taking first active pill on first Sunday after menses begins (if first day is Sunday, begin then), continue for 84 days of active pill, followed by 7 days of placebo tablets (low-dose estrogen tablets for Daysee, LoSeasonique, Quartette, and Seasonique), then resume 84/7 cycle again. For *Lybrel*, begin taking the first pill during the first day of the menstrual cycle and start the next pack the day after the previous pack ends.

Progestin-Only Oral Contraceptives

PO (Adults): Start on first day of menses. Taken daily and continuously.

Progressive Estrogen Oral Contraceptives

PO (Adults): Estrogen amount increases every 7 days throughout 21-day cycle. Progestin component stays the same. Some regimens contain 7 placebo tablets for 28-day regimen.

Emergency Contraceptive

PO (Adults and Adolescents): *Levonorgestrel*1 tablet within 72 hr of unprotected intercourse; *Lo/Ovral*—4 white tablets within 72 hr of unprotected intercourse followed by 4 more white tablets 12 hr later; *Levlen*—4 light orange tablets within 72 hr of unprotected intercourse followed by 4 more light orange tablets 12 hr later; *Tri-Levlen*—4 yellow tablets within 72 hr of unprotected intercourse followed by 4 more yellow tablets 12 hr later; *Ulipristal*—1 tablet as soon as possible within 120 hr (5 days) after unprotected intercourse or known/suspected contraceptive failure.

Injectable Contraceptive

medroxyprogesterone (Depo-Provera)

IM (Adults): 150 mg within first 5 days of menses or within 5 days postpartum, if not breast feeding. If breast feeding, give 6 wk postpartum; repeat every 3 mo.

medroxyprogesterone (Depo-Sub Q Provera 104)

Subcut (Adults): 104 mg within first 5 days of menses or within 5 days postpartum, if not breast feeding. If breast feeding, give 6 wk postpartum; repeat every 12–14 wk.

Intrauterine Contraceptive

Intrauterine (Adults): Insert one device into uterine cavity within 7 days of menses or immediately after 1st trimester abortion. Skyla should be removed or replaced after 3 yr. Kyleena, should be removed or replaced after 5 yr. Mirena should be removed or replaced after 5 yr (for treatment of heavy menstrual bleeding) or 7 yr (contraception). Liletta should be removed or replaced after 6 yr.

Vaginal Ring Contraceptive

Vag (Adults): One ring inserted on or prior to day 5 of menstrual cycle. Ring is left in place for 3 wk, then removed for 1 wk, then a new ring is inserted.

Transdermal Patch

Transdermal (Adults): *Ethinyl estradiol/norelgestromin transdermal patch*—Patch is applied on day 1 of menstrual cycle (or convenient day in first wk), changed weekly thereafter for 3 wk. Wk 4 is patch-free. Cycle is then repeated. *Ethinyl estradiol/levonorgestrel transdermal patch*—Patch is applied during first 24 hr of menstruation and then changed weekly thereafter for 3 wk. Wk 4 is patch-free. Cycle is then repeated.

Acne

PO (Adults): *Ortho Tri-Cyclen*—Take daily for 21 days, off for 7 days.

Availability

Combination Estrogen/Progestin Oral Contraceptives (generic available)

Oral contraceptive tablets: Usually in monthly packs with enough (21) active tablets to complete a 28-day cycle. Some contain 7 inert tablets to complete the cycle with or without supplemental iron, Beyaz and Safyral—contain 0.451 mg of levomefolate calcium/tablet.

Extended-Cycle Contraceptive

Tablets: *LoSeasonique*—active tablets containing 0.02 mg ethinyl estradiol, 0.1 mg levonorgestrel, and 7 tablets containing 0.01 mg ethinyl estradiol; *Quartette*—42 tablets containing 0.02 mg ethinyl estradiol and 0.15 mg levonorgestrel, 21 tablets containing 0.025 mg ethinyl estradiol and 0.15 mg levonorgestrel, 21 tablets containing 0.03 mg ethinyl estradiol and 0.15 mg levonorgestrel, and 7 tablets containing 0.01 mg ethinyl estradiol; *Seasonale*—84 active tablets containing 0.03 mg ethinyl estradiol and 0.15 mg levonorgestrel and 7 inactive tablets; *Daysee* and *Seasonique*—active tablets containing 0.03 mg ethinyl estradiol, 0.15 mg levonorgestrel, and 7 tablets containing 0.01 mg ethinyl estradiol; *Lybrel*—28 active tablets containing 0.09 mg levonorgestrel and 0.02 mg ethinyl estradiol.

© F.A. Davis Publishing

Levonorgestrel (generic available)

Emergency contraceptive: 1.5 mg OTC. **Intrauterine system (Kyleena):** contains 19.5 mg levonorgestrel (releases 9 mcg/day). **Intrauterine system (Liletta):** contains 52 mg levonorgestrel (releases 14.7 mcg/day). **Intrauterine system (Mirena):** contains 52 mg levonorgestrel (releases 20 mcg/day). **Intrauterine system (Skyla):** contains 13.5 mg levonorgestrel (releases 14 mcg/day).

Etonorgestrel

Implant: Rod contains 68 mg etonogestrel.

Ulipristal

Tablets: 30 mg.

Medroxyprogesterone (generic available)

Injectable IM: 150 mg/mL. **Injectable Subcutaneous:** 104 mg/0.65 mL (in prefilled syringes).

Vaginal Ring Contraceptive

Ring: delivers 0.015 mg ethinyl estradiol and 0.120 mg etonogestrel/day.

Transdermal Patch

Patch (Xulane or Onsura): contains 0.53 mg ethinyl estradiol and 4.86 mg of norelgestromin; releases 35 mcg ethinyl estradiol/150 mcg norelgestromin per 24 hr. **Patch (Twirla):** contains 2.3 mg ethinyl estradiol and 2.6 mg of levonorgestrel; releases 30 mcg ethinyl estradiol/120 mcg levonorgestrel per 24 hr.

NURSING IMPLICATIONS

Assessment

- Assess BP before and periodically during therapy.
- Exclude the possibility of pregnancy on the basis or history and/or physical exam or a pregnancy test before administering emergency contraceptives.
- **Acne:** Assess skin lesion before and periodically during therapy.
- **Menopausal Symptoms:** Assess vasomotor symptoms or symptoms of vulvar and vaginal atrophy due to menopause prior to and periodically during therapy.
- ***Lab Test Considerations:*** Monitor hepatic function periodically during therapy.
- *Estrogens only*—May cause ↑ serum glucose, sodium, triglyceride, VHDL, total cholesterol, prothrombin, and factors VII, VIII, IX, and X levels. May cause ↓ LDL and antithrombin III levels.
- May cause false interpretations of thyroid function tests.
- *Progestins only*—May cause ↑ LDL concentrations. May cause ↓ serum alkaline phosphatase and HDL concentrations.
- *Drosperidone-containing contraceptives*—monitor serum potassium during first treatment cycle in women on long-term treatment with strong CYP3A4 inhibitors; may ↑ serum potassium concentration.

Implementation

- Do not confuse Ortho Tri-Cyclen with Ortho Tri-Cyclen Lo. Do not confuse Yasmin with Yaz.
- **PO:** Oral doses may be administered with or immediately after food to reduce nausea. Chewable tablets may be swallowed whole or chewed; if chewed follow with 8 oz of liquid.
- For extended-cycle tablets, *Jolessa, Quasense, Seasonale, Seasonique,* or *LoSeasonique*—take active tablets for 84 days followed by the placebo tablets for 7 days; for *Lybrel*—Take 1 pill each day for 28 days, then start the next set of pills daily for the next 28 days.
- For *Emergency Contraception:* Tablets are taken as soon as possible and within 72 hr after unprotected intercourse. Two doses are taken 12 hr apart. Emergency contraception products are available without a prescription to all women of child-bearing age.
- *Ulipristal:* Administer 1 tablet as soon as possible within 120 hr (5 days) after unprotected intercourse or a known or suspected contraceptive failure. May be taken without regard to food. If vomiting occurs within 3 hr of dose, may repeat. May be taken at any time during the menstrual cycle. Ulipristal may be less effective in women with a body mass index >30 kg/m^2.
- **Subcut:** Shake vigorously before use to form a uniform suspension. Inject slowly (over 5–7 sec) at a 45° angle into fatty area of anterior thigh or abdomen every 12 to 14 wk. If more than 14 wk elapse between injections, rule out pregnancy prior to administration. Do not rub area after injection.
- When switching from other hormonal contraceptives, administer within dosing period (7 days after taking last active pill, removing patch or ring, or within the dosing period for IM injection).
- **IM:** Shake vial vigorously just before use to ensure uniform suspension. Administer deep IM into gluteal or deltoid muscle. If period between injections is >14 wk, determine that patient is not pregnant before administering the drug.
- Injectable medroxyprogesterone may lead to bone loss, especially in women younger than 21 yr. Injectable medroxyprogesterone should be used for >2 yr only if other methods of contraception are inadequate. If used long term, women should use supplemental calcium and vitamin D, and monitor bone mineral density.
- **Intrauterine system:** Health care providers are advised to become thoroughly familiar with the insertion instructions before attempting insertion. Following insertion counsel patient on what to expect following insertion. Give patient *Follow-up Reminder Card* provided with product. Discuss expected bleeding patterns during the first mo of use. Prescribe analgesics, if indicated. Patients should be

© F.A. Davis Publishing

reexamined and evaluated 4 to 12 wk after insertion and once a yr thereafter, or more frequently if clinically indicated.

Patient/Family Teaching

- Instruct patient to take oral medication as directed at the same time each day. Pills should be taken in proper sequence and kept in the original container. Advise patient not to skip pills even if not having sex very often. Advise patient to read *Patient Guide* before starting and with each Rx refill in case of changes.
- *If single daily dose is missed:* Take as soon as remembered; if not until next day, take 2 tablets and continue on regular dosing schedule. *If 2 days in a row are missed:* Take 2 tablets a day for the next 2 days and continue on regular dosing schedule, using a 2nd method of birth control for the remaining cycle. *If 3 days in a row are missed:* Discontinue medication and use another form of birth control until period begins or pregnancy is ruled out; then begin a new cycle of tablets. *For 28-day dosing schedule:* If schedule is followed for first 21 days and 1 dose is missed of the last 7 tablets, it is important to take the 1st tablet of next month's cycle on the regularly scheduled day. Advise patient taking *Natazia* to follow *Patient Guide* for what to do if a pill is missed.
- Advise patient taking *Jolessa, Quasense, Seasonale, Sesonique,* or *LoSeasonique extended-cycle tablets* that withdrawal bleeding should occur during the 7 days following discontinuation of the active tablets. If withdrawal bleeding does not occur, notify health care professional. Advise patient taking *Lybrel* that no withdrawal bleeding should occur.
- For initial use of *Jolessa, Quasense, Seasonale, Seasonique,* or *LoSeasonique extended cycle tablets*, caution patient to use a nonhormonal method of contraception until she has taken the first 7 days of active tablets. Each 91-day cycle should start on the same day of the wk. If started later than the proper day or 2 or more days are missed, a 2nd nonhormonal method of contraception should be used until she has taken the pink tablet for 7 days. Transient spotting or bleeding may occur. If bleeding is persistent or prolonged, notify health care professional.
- Advise patient taking extended cycle tablets that spotting or light bleeding may occur, especially during first 3 mo. Continue medication; notify health care professional if bleeding lasts >70 days.
- Advise patient of the need to use another form of contraception for the first 3 wk when beginning to use *oral contraceptives*.
- Instruct patient to notify health care professional of all Rx or OTC medications, vitamins, or herbal products being taken and consult health care professional before taking any new medications.
- Advise patient that a 2nd method of birth control should also be used during each cycle in which any of the following are used: *Oral contraceptives*—ampicillin, corticosteroids, antiretroviral protease inhibitors, barbiturates, carbamazepine, chloramphenicol, dihydroergotamine, corticosteroids (systemic), mineral oil, oral neomycin, oxcarbazapine, penicillin V, phenylbutazone, primidone, rifampin, sulfonamides, tetracyclines, topiramate, bosentan, or valproic acid.
- Explain dose schedule and maintenance routine. Discontinuing medication suddenly may cause withdrawal bleeding.
- If nausea becomes a problem, advise patient that eating solid food often provides relief. If nausea persists or vomiting or diarrhea occur, use a nonhormonal method of contraception and notify health care professional.
- Advise patient to report signs and symptoms of fluid retention (swelling of ankles and feet, weight gain), thromboembolic disorders (pain, swelling, tenderness in extremities, headache, chest pain, blurred vision), mental depression, hepatic dysfunction (yellowed skin or eyes, pruritus, dark urine, light-colored stools), or abnormal vaginal bleeding. Women with a strong family history of breast cancer, fibrocystic breast disease, abnormal mammograms, or cervical dysplasia should be monitored for breast cancer at least yearly. Risk of thromboembolism is highest in 1st yr of use and increased when a combination hormonal contraceptive is restarted after a break in use of at least 4 wk.
- Instruct patient to stop taking medication and notify health care professional if pregnancy is suspected.
- Caution patient that cigarette smoking during estrogen therapy may increase risk of serious side effects, especially for women over age 35.
- Caution patients to use sunscreen and protective clothing to prevent increased pigmentation.
- Caution patient that hormonal contraceptives do not protect against HIV or other sexually transmitted diseases.
- Advise patient to notify health care professional of medication regimen before treatment or surgery.
- Emphasize the importance of routine follow-up physical exams including BP; breast, abdomen, and pelvic examinations; and Papanicolaou smears every 6–12 mo.
- **Emergency Contraception:** Instruct patient to take emergency contraceptive as directed. Advise patient that they should not take emergency contraceptives if they know or suspect they are pregnant; emergency contraceptives are not for use to end an existing pregnancy. Advise patient to contact health care professional if they vomit within 3 hr after taking ulipristal.
- Inform patient that *ulipristal* may reduce the effectiveness of hormonal contraceptives. Advise patient to use a nonhormonal contraceptive during that menstrual cycle. Advise patient to wait at least 5 days

© F.A. Davis Publishing

after taking *ulipristal* to resume taking hormonal contraceptives.

- Advise patient to notify health care professional and consider the possibility of pregnancy if their period is delayed by more than 1 wk beyond the expected date after taking *ulipristal*.
- Inform patient that emergency contraceptives are not to be used as a routine form of contraception or to be used repeatedly within the same menstrual cycle.
- Advise patient to notify health care professional if severe lower abdominal pain occurs 3–5 wk after taking *ulipristal* to be evaluated for an ectopic pregnancy.
- Advise female patients to avoid breast feeding if taking *ulipristal*.
- **IM Subcut:** Advise patient to maintain adequate amounts of dietary calcium and vitamin D to help prevent bone loss.
- **Transdermal:** Instruct patient on application of patch. First patch should be applied within 24 hr of menstrual period. If applied after Day 1 of menstrual period, a nonhormonal method of contraception should be used for the next 7 days. Day of application becomes *Patch Change Day*. Patches are worn for 1 wk and changed on the same day of each wk for 3 wk. Wk 4 is patch-free. Withdrawal bleeding is expected during this time.
- Apply patch to clean, dry, intact, healthy skin on buttock, abdomen, upper outer arm, or upper torso in a place where it won't be rubbed by tight clothing. Do not place on skin that is red, irritated, or cut, and do not place on breasts. Do not apply make-up, creams, lotions, powders, or other topical products to area of patch application.
- To apply patch, open foil pouch by tearing along edge using fingers. Peel pouch apart and open flat. Grasp a corner of the patch firmly and remove gently from foil pouch. Use fingernail to lift one corner of the patch and peel patch **and** the plastic liner off the foil liner. Do not remove clear liner as patch is removed. Peel away half of the clear liner without touching sticky surface. Apply the sticky surface and remove the rest of the liner. Press down firmly with palm of hand for 10 sec; make sure the edges stick well.
- On *Patch Change Day* remove patch and apply new one immediately. Used patch still contains some active hormones; fold in half so it sticks to itself and throw away. Apply new patches to a new spot to prevent skin irritation; may be applied in same anatomic area.
- Following patch-free wk, apply a new patch on *Patch Change Day*, the day after Day 28, no matter when the menstrual cycle begins.
- If patch becomes partially or completely detached for less than 1 day, reapply patch or apply new patch. If patch is detached for more than 1 day, apply a new patch immediately and use a nonhormonal form of contraception for the next 7 days. Cycle will now start over with a new *Patch Change Day*. If patch is no longer sticky, apply a new patch; do not use tape or wraps to keep patch in place.
- If patch is not changed on *Patch Change Day* in the first wk of the cycle, apply new patch immediately upon remembering and use a nonhormonal method of contraception for next 7 days. If patch change is missed for 1 or 2 days during Wk 2 or 3, apply new patch immediately and apply next patch on usual *Patch Change Day*. No backup contraception is needed. If patch change is missed for more than 2 days during Wk 2 or 3, stop the cycle and start a new 4-wk contraceptive cycle by applying new patch immediately and using a nonhormonal method of contraception for the next 7 days. If patch is not removed on *Patch Change Day* in Wk 4, remove as soon as remembered and start next cycle on usual *Patch Change Day*. No additional contraception is needed.
- Advise patient referred for MRI test to discuss patch with referring health care professional and MRI facility to determine if removal of patch is necessary prior to test and for directions for replacing patch.
- **NuvaRing:** *If a hormonal contraceptive was not used in the past mo*, insert *NuvaRing* between Days 1 and 5 of the menstrual cycle (Day 1 = first day of menstrual period), even if bleeding has not finished. Use a nonhormonal method of birth control other than a diaphragm during the first 7 days of ring use. *If switching from a combination estrogen/progesterone oral contraceptive*, insert *NuvaRing* any time during first 7 days after last tablet and no later than the day a new pill cycle would have started. No extra birth control is needed. *If switching from a mini-pill*, start using *NuvaRing* on any day of the mo; do not skip days between last pill and first day of *NuvaRing* use. *If switching from an implant*, start using *NuvaRing* on same day implant is removed. *If switching from an injectable contraceptive*, start using *NuvaRing* on the day when next injection is due. *If switching from a progestin-containing IUD*, start using *NuvaRing* on the same day as IUD is removed. A nonhormonal method of contraception, other than the diaphragm, should be used for the first 7 days of *NuvaRing* use when switching from the mini-pill, implant, injectable contraceptive, or IUD.
- *NuvaRing* comes in a reclosable foil pouch. Instruct patient to wash hands, then remove *NuvaRing* from pouch; keep pouch for ring disposal. Using a position of comfort (lying down, squatting, or standing

© F.A. Davis Publishing

with one leg up), hold *NuvaRing* between thumb and index finger and press opposite sides of the ring together. Gently push folded ring into vagina. Exact position is not important for function of *NuvaRing*. Most women do not feel *NuvaRing* once it is in place. If discomfort is felt, *NuvaRing* may not be inserted far enough into vagina; use finger to push further into vagina. *There is no danger of NuvaRing being pushed in too far or getting lost*. Once inserted, leave *NuvaRing* in place for 3 wk.

- Remove ring 3 wk after insertion on same day and time of insertion. Remove by hooking finger under forward rim or by holding ring between index and middle finger and pulling out. Place ring in foil pouch and dispose; do not throw in toilet. Menstrual period will usually start 2–3 days after ring is removed and may not have finished before next ring is inserted. To continue contraceptive protection, new ring must be inserted 1 wk after last one was removed, even if menstrual period has not stopped.
- If *NuvaRing* slips out of vagina and has been out less than 3 hr, contraceptive protection is still in place. *NuvaRing* can be rinsed in cool to tepid water and should be reinserted as soon as possible. If ring is lost, insert a new ring and continue same schedule as lost ring. If *NuvaRing* has been out of vagina for more than 3 hr, a nonhormonal method of contraception, other than a diaphragm, should be used for the next 7 days.
- *If NuvaRing has been left in for an extra wk or less (4 wk total or less)*, remove and insert a new ring after a 1-wk ring-free break. If *NuvaRing* has been left in place for more than 4 wk, woman should check to be sure she is not pregnant. A nonhormonal method of contraception, other than a diaphragm, must be used for the next 7 days.
- Advise patient to avoid using other female barrier contraceptives (diaphragm, cervical cap, female condom) with *Nuvaring*.
- **Intrauterine system:** Advise patient to notify health care professional if pelvic pain or pain during sex, unusual vaginal discharge or genital sores, unexplained fever, exposure to sexually transmitted infections, very severe or migraine headaches, yellowing of skin or whites of the eyes, very severe vaginal bleeding or bleeding that lasts a long time occurs, if a menstrual period is missed, or if *Mirena*'s threads cannot be felt.

Evaluation/Desired Outcomes

- Prevention of pregnancy.
- Regulation of the menstrual cycle.
- Decrease in menstrual blood loss.
- Decrease in acne.
- Decrease in symptoms of premenstrual dysphoric disorder.
- Decrease in vasomotor symptoms or symptoms of vulvar and vaginal atrophy due to menopause.

CORTICOSTEROIDS (INHALATION)

beclomethasone (be-kloe-**meth**-a-sone)
QVAR, QVAR Redihaler

budesonide (byoo-**dess**-oh-nide)
Pulmicort Flexhaler, Pulmicort Nebuamp, Pulmicort Respules, Pulmicort Turbuhaler

fluticasone (floo-**ti**-ka-sone)
Aermony Respiclick, Armonair Digihaler, Arnuity Ellipta, Flovent Diskus, Flovent HFA

mometasone (mo-**met**-a-sone)
Asmanex HFA, Asmanex Twisthaler

Classification
Therapeutic: anti-asthmatics, anti-inflammatories (steroidal)
Pharmacologic: corticosteroids (inhalation)

Indications

Maintenance treatment of asthma as prophylactic therapy. May decrease the need for or eliminate use of systemic corticosteroids in patients with asthma.

Action

Potent, locally acting anti-inflammatory and immune modifier. **Therapeutic Effects:** Decreased frequency and severity of asthma attacks. Improves asthma symptoms.

Pharmacokinetics

Absorption: *Beclomethasone*—20%; *budesonide*—6–13% (Flexhaler), 6% (Respules); *fluticasone*—<7% (aerosol), 8–14% (powder); *mometasone*—<1%. Action is primarily local after inhalation.
Distribution: 10–25% is deposited in airways if a spacer device is not used. All cross the placenta and enter breast milk in small amounts.
Metabolism and Excretion: *Beclomethasone*—after inhalation, beclomethasone dipropionate is converted to beclomethasone monopropionate, an active metabolite that adds to its potency, primarily excreted in feces (<10% excreted in urine; *Budesonide, fluticasone, mometasone*—metabolized by the liver (primarily by CYP3A4) after absorption from lungs; *Budesonide*—60% excreted in urine, 40% in feces; *fluticasone*—primarily excreted in feces (<5% excreted in urine); *mometasone*—75% excreted in feces.
Half-life: *Beclomethasone*—2.8 hr; *budesonide*—2–3.6 hr; *fluticasone*—7.8 hr (propionate); 24 hr (furoate); *mometasone*—5 hr.

© F.A. Davis Publishing

TIME/ACTION PROFILE (improvement in symptoms)

ROUTE	ONSET	PEAK	DURATION
Inhalation	within 24 hr‡	1–4 wk†	unknown

†Improvement in pulmonary function; ↓ airway responsiveness may take longer.
‡2–8 days for budesonide respule.

Contraindications/Precautions

Contraindicated in: Some products contain alcohol or lactose and should be avoided in patients with known hypersensitivity or intolerance; Acute attack of asthma/status asthmaticus.

Use Cautiously in: Active untreated infections; Diabetes or glaucoma; Underlying immunosuppression (due to disease or concurrent therapy); Systemic corticosteroid therapy (should not be abruptly discontinued when inhalation therapy is started; additional corticosteroids needed in stress or trauma); Hepatic impairment (fluticasone); OB, Lactation: Safety not established; Pedi: Prolonged or high-dose therapy may lead to complications.

Adverse Reactions/Side Effects

EENT: dysphonia, hoarseness, cataracts, glaucoma, nasal congestion, pharyngitis, sinusitis. **Endo:** adrenal suppression (↑ dose, long-term therapy only), ↓ growth (children), ↓ bone mineral density. **GI:** diarrhea, dry mouth, dyspepsia, esophageal candidiasis, taste disturbances, nausea. **MS:** back pain. **Neuro:** headache, agitation, depression, dizziness, fatigue, insomnia, restlessness.. **Resp:** bronchospasm, cough, wheezing. **Misc:** CHURG-STRAUSS SYNDROME, HYPERSENSITIVITY REACTIONS (including anaphylaxis, laryngeal edema, urticaria, and bronchospasm).

Interactions

Drug-Drug: Strong **CYP3A4 inhibitors**, including **ritonavir**, **atazanavir**, **clarithromycin**, **conivaptan**, **indinavir**, **itraconazole**, **ketoconazole**, **lopinavir**, **nefazodone**, **nelfinavir**, **saquinavir**, and **voriconazole** ↓ metabolism and ↑ levels of budesonide, mometasone, and fluticasone; concurrent use with fluticasone not recommended.

Route/Dosage

Beclomethasone

Inhaln (Adults and Children ≥12 yr): *No prior treatment with inhaled corticosteroid*—40–80 mcg twice daily (max dose = 320 mcg twice daily); *Prior treatment with inhaled corticosteroid*—40–320 mcg twice daily (starting dose should be based on dose of previous inhaled corticosteroid and disease severity) (max dose = 320 mcg twice daily).
Inhaln (Children 4–11 yr): *No prior treatment with inhaled corticosteroid*—40 mcg twice daily (max = 80 mcg twice daily); *Prior treatment with inhaled corticosteroid*—40 mcg twice daily (max = 80 mcg twice daily).

Budesonide (Pulmicort Flexhaler)

Inhaln (Adults): 180–360 mcg twice daily (not to exceed 720 mcg twice daily).
Inhaln (Children ≥6 yr): 180–360 mcg twice daily (not to exceed 360 mcg twice daily).

Budesonide (Pulmicort Respules)

Inhaln (Children 1–8 yr): *Previously on bronchodilators alone*—0.5 mg once daily or 0.25 mg twice daily (not to exceed 0.5 mg/day); *Previously on other inhaled corticosteroids*—0.5 mg once daily or 0.25 mg twice daily (not to exceed 1 mg/day); *Previously on oral corticosteroids*—1 mg once daily or 0.5 mg twice daily (not to exceed 1 mg/day).

Fluticasone (Aerosol Inhaler)

Inhaln (Adults and Children ≥12 yr): *Previously on bronchodilators alone*—88 mcg twice daily initially, may be ↑ up to 440 mcg twice daily; *Previously on other inhaled corticosteroids*—88–220 mcg twice daily initially, may be ↑ up to 440 mcg twice daily; *Previously on oral corticosteroids*—440 mcg twice daily initially, may be ↑ up to 880 mcg twice daily.
Inhaln (Children 4–11 yr): 88 mcg twice daily (not to exceed 88 mcg twice daily).

Fluticasone (Dry Powder Inhaler)

Inhaln (Adults and Children ≥12 yr): *No prior treatment with inhaled corticosteroid*—Propionate (Flovent Diskus): 100 mcg twice daily initially, may ↑ dose in 2 wk if not adequately responding (max dose = 1,000 mcg twice daily); Propionate (Armonair Digihaler): 55 mcg twice daily initially, may ↑ dose in 2 wk if not adequately responding (max dose = 232 mcg twice daily); Furoate: 100 mcg once daily, may ↑ dose in 2 wk to 200 mcg once daily if not adequately responding (max dose = 200 mcg once daily); *Prior treatment with inhaled corticosteroid*—Propionate (Armonair Digihaler): 55–232 mcg twice daily (starting dose should be based on dose of previous inhaled corticosteroid and disease severity) (max dose = 232 mcg twice daily); Furoate: 100–200 mcg once daily (max dose = 200 mcg once daily).
Inhaln (Children 5–11 yr): Furoate: 50 mcg once daily.
Inhaln (Children 4–11 yr): *No prior treatment with inhaled corticosteroid*—Propionate (Flovent Diskus): 50 mcg twice daily initially, may ↑ dose in 2 wk to 100 mcg twice daily if not adequately responding (max dose = 100 mcg twice daily).

Mometasone (Aerosol Inhaler)

Inhaln (Adults and Children ≥12 yr): *Previously on medium-dose inhaled corticosteroids*—Two

© F.A. Davis Publishing

100-mcg inhalations twice daily; *Previously on high-dose inhaled corticosteroids or oral corticosteroids*— Two 200-mcg inhalations twice daily (not to exceed 800 mcg/day).

Mometasone (Dry Powder Inhaler)

Inhaln (Adults and Children ≥12 yr): *Previously on bronchodilators or other inhaled corticosteroids*— 220 mcg once daily in evening, up to 440 mcg/day as a single dose or 2 divided doses; *Previously on oral corticosteroids*— 440 mcg twice daily (not to exceed 880 mcg/day).
Inhaln (Children 4–11 yr): 110 mcg once daily in evening (not to exceed 110 mcg/day).

Availability

Beclomethasone

Inhalation aerosol: 40 mcg/metered inhalation in 10.6-g canister (delivers 120 metered inhalations), 50 mcg/metered inhalation in 6.5-g canister (delivers 100 metered inhalations) and 12.4-g canister (delivers 200 metered inhalations), 80 mcg/metered inhalation in 10.6-g canister (delivers 120 metered inhalations), 100 mcg/metered inhalation in 6.5-g canister (delivers 100 metered inhalations) and 12.4-g canister (delivers 200 metered inhalations). **Cost:** 40 mcg/metered inhalation $130.16/inhaler, 80 mcg/metered inhalation $173.67/inhaler.

Budesonide (generic available)

Inhalation powder (Flexhaler): 90 mcg/metered inhalation (delivers 60 metered inhalations), 180 mcg/metered inhalation (delivers 120 metered inhalations). **Cost:** 90 mcg/metered inhalation $143.87/inhaler, 180 mcg/metered inhalation $192.65/inhaler. **Inhalation powder (Turbuhaler):** 100 mcg/metered inhalation (delivers 200 metered inhalations), 200 mcg/metered inhalation (delivers 200 metered inhalations), 400 mcg/metered inhalation (delivers 200 metered inhalations). **Inhalation suspension (Respules):** 0.25 mg/2 mL in single-dose ampules (5 ampules/envelope), 0.5 mg/2 mL in single-dose ampules (5 ampules/envelope), 1 mg/2 mL in single-dose ampules (5 ampules/envelope). ***In combination with:*** formoterol (Symbicort). See Appendix N.

Fluticasone

Inhalation aerosol (propionate) (Flovent-HFA): 44 mcg/metered inhalation in 10.6-g canisters (delivers 120 metered inhalations), 50 mcg/metered inhalation in 13-g canisters (delivers 120 metered inhalations), 110 mcg/metered inhalation in 12-g canisters (delivers 120 metered inhalations), 125 mcg/metered inhalation in 7.5-g canisters (delivers 60 metered inhalations) and 13-g canisters (delivers 120 metered inhalations), 220 mcg/metered inhalation in 12-g canisters (delivers 120 metered inhalations), 250 mcg/metered inhalation in 7.5-g canisters (delivers 60 metered inhalations) and 13-g canisters (delivers 120 metered inhalations). **Cost:** 44 mcg/inhalation $137.82/inhaler, 110 mcg/inhalation $181.43/inhaler, 220 mcg/inhalation $278.14/inhaler. **Powder for inhalation (propionate) (Flovent Diskus):** 50 mcg/blister, 100 mcg/blister, 250 mcg/blister, 500 mcg/blister. **Cost:** 50 mcg $144.47/60 blisters, 250 mcg $134.71/28 blisters. **Powder for inhalation (propionate) (Armonair Digihaler):** 55 mcg/metered inhalation (delivers 60 metered inhalations), 113 mcg/metered inhalation (delivers 60 metered inhalations), 232 mcg/metered inhalation (delivers 60 metered inhalations). **Powder for inhalation (furoate) (Arnuity Ellipta):** 50 mcg/blister, 100 mcg/blister, 200 mcg/blister. ***In combination with:*** salmeterol (Advair Diskus, Advair HFA, AirDuo RespiClick, Wixhela Inhub); vilanterol (Breo Ellipta); umeclidinium and vilanterol (Trelegy Ellipta). See Appendix N.

Mometasone

Inhalation aerosol (Asmanex HFA): 50 mcg/metered inhalation in 13-g canisters (120 metered inhalations), 100 mcg/metered inhalation in 13-g canisters (120 metered inhalations), 200 mcg/metered inhalation in 13-g canisters (120 metered inhalations). **Powder for inhalation (Asmanex Twisthaler):** 100 mcg/metered inhalation (30 metered inhalations), 110 mcg (delivers 100 mcg/metered inhalation; in packages of 7 and 30 inhalation units), 200 mcg/metered inhalation (60 metered inhalations), 220 mcg (delivers 200 mcg/metered inhalation; in packages of 14, 30, 60, and 120 inhalation units), 400 mcg/metered inhalation (30 and 60 metered inhalations). **Cost:** 110 mcg $88.75/7 inhalation units, 110 mcg $157.90/30 inhalation units, 220 mcg $88.75/14 inhalation units, 220 mcg $170.47/30 inhalation units, 220 mcg $200.32/60 inhalation units, 220 mcg $287.09/120 inhalation units.

NURSING IMPLICATIONS

Assessment

- Monitor respiratory status and lung sounds. Assess pulmonary function tests periodically during and for several mo after a transfer from systemic to inhalation corticosteroids.
- Assess patients changing from systemic corticosteroids to inhalation corticosteroids for signs of adrenal insufficiency (anorexia, nausea, weakness, fatigue, hypotension, hypoglycemia) during initial therapy and periods of stress. If these signs appear, notify health care professional immediately; condition may be life-threatening.
- Monitor for withdrawal symptoms (joint or muscular pain, lassitude, depression) during withdrawal from oral corticosteroids.
- Monitor growth rate in children receiving chronic therapy; use lowest possible dose.
- May cause decreased bone mineral density during prolonged therapy. Monitor patients with increased risk (prolonged immobilization, family history of osteoporosis, postmenopausal status, tobacco use, ad-

© F.A. Davis Publishing

vanced age, poor nutrition, chronic use of drugs that can reduce bone mass [anticonvulsants, oral corticosteroids]) for fractures.

- Monitor for signs and symptoms of hypersensitivity reactions (rash, pruritus, swelling of face and neck, dyspnea) periodically during therapy.
- ***Lab Test Considerations:*** Periodic adrenal function tests may be ordered to assess degree of hypothalamic-pituitary-adrenal (HPA) axis suppression in chronic therapy. Children and patients using higher than recommended doses are at highest risk for HPA suppression.
- May cause ↑ serum and urine glucose concentrations if significant absorption occurs.

Implementation

- Do not confuse Flovent with Flonase.
- After desired clinical effect has been obtained, attempts should be made to decrease dose to lowest amount required to control symptoms. Gradually decrease dose every 2–4 wk as long as desired effect is maintained. If symptoms return, dose may briefly return to starting dose.
- **Inhaln:** Allow at least 1 min between inhalations.

Patient/Family Teaching

- Advise patient to take medication as directed. Take missed doses as soon as remembered unless almost time for next dose. Instruct patient to read the *Patient Information and Instructions for Use* before using and with each Rx refill, in case of new information. Advise patient not to discontinue medication without consulting health care professional; gradual decrease is required.
- Advise patients using inhalation corticosteroids and bronchodilator to use bronchodilator first and to allow 5 min to elapse before administering the corticosteroid, unless otherwise directed by health care professional.
- Advise patient that inhalation corticosteroids should not be used to treat an acute asthma attack but should be continued even if other inhalation agents are used.
- Patients using inhalation corticosteroids to control asthma may require systemic corticosteroids for acute attacks. Advise patient to use regular peak flow monitoring to determine respiratory status.
- Caution patient to avoid smoking, known allergens, and other respiratory irritants.
- Advise patient to notify health care professional if sore throat or sore mouth occurs.
- Advise patient to stop using medication and notify health care professional immediately if signs and symptoms of hypersensitivity reactions occur.
- Advise females of reproductive potential to notify health care professional if pregnancy is planned or suspected or if breast feeding.
- Instruct patient whose systemic corticosteroids have been recently reduced or withdrawn to carry a warning card indicating the need for supplemental systemic corticosteroids in the event of stress or severe asthma attack unresponsive to bronchodilators.
- Advise patient to have regular eye exams. May increase risk for eye problems (glaucoma, cataracts, blurred vision).
- **Metered-Dose Inhaler:** Instruct patient in proper use of metered-dose inhaler. Most inhalers require priming before first use. Shake inhaler well. Exhale completely, and then close lips firmly around mouthpiece. While breathing in deeply and slowly, press down on canister. Hold breath for as long as possible to ensure deep instillation of medication. Remove inhaler from mouth and breathe out gently. Allow 1–2 min between inhalations. Rinse mouth with water or mouthwash after each use to minimize fungal infections, dry mouth, and hoarseness. Clean mouthpiece weekly with clean, dry tissue or cloth. Do not place in water (see Appendix C).
- **Pulmicort Flexhaler:** Advise patient to follow instructions supplied. Before first-time use, prime unit by turning cover and lifting off; hold upright with mouthpiece up and twist brown grip fully to right, then fully to left until it clicks. To administer dose, hold upright, twist brown grip fully to right, then fully to left until it clicks. Turn head away from inhaler and exhale (do not blow into inhaler). Do not shake inhaler. Place mouthpiece between lips and inhale deeply and forcefully. Remove inhaler from mouth and exhale (do not exhale into mouthpiece). Repeat procedure if 2nd dose required. Replace cover; rinse mouth with water (do not swallow).
- **Pulmicort Respules:** Administer with a jet nebulizer connected to adequate air flow, equipped with a mouthpiece or face mask. Adjust face mask to avoid exposing eyes to nebulized medication. Wash face after use of face mask. Ultrasonic nebulizers are not adequate for administration and not recommended. Store respules upright, away from heat and protected from light. Do not refrigerate or freeze. Respules are stable for 2 wk at room temperature after opening aluminum foil envelope. Open respules must be used promptly. Unused respules should be returned to aluminum foil envelope.
- **Flovent Diskus/Arnuity Ellipta:** Do not use with a spacer. Exhale completely and then close lips firmly around mouthpiece. While breathing in deeply and slowly, press down on canister. Hold breath for as long as possible to ensure deep instillation of medication. Remove inhaler from mouth and breathe out gently. Allow 1–2 min between inhalations. After inhalation, rinse mouth with water and spit out (see Appendix C). Never wash the mouthpiece or any part of the Diskus inhaler. Discard Diskus inhaler device

© F.A. Davis Publishing

(Flovent Diskus) 6 wk (50-mcg strength) or 2 mo (100-mcg and 250-mcg strengths) or blister tray (Arnuity Ellipta) 6 wk after removal from protective foil overwrap pouch or after all blisters have been used (whichever comes first).

- **Asmanex Twisthaler:** Advise patient to remove cap while device is in upright position. To administer dose, exhale fully, then place mouthpiece between lips and inhale deeply and forcefully. Remove device from mouth and hold breath for 10 sec before exhaling (do not exhale into mouthpiece). Wipe the mouthpiece dry, if necessary, and replace the cap on the device. Rinse mouth with water. Advise patient to discard twisthaler 45 days from opening or when dose counter reads "00," whichever comes first.

Evaluation/Desired Outcomes

- Decreased frequency and severity of asthma attacks.
- Improvement in symptoms of asthma.

CORTICOSTEROIDS (NASAL)

beclomethasone (be-kloe-**meth**-a-sone)
Beconase AQ, QNASL, Rivanase AQ

budesonide (byoo-**dess**-oh-nide)
Rhinocort Allergy, Rhinocort Aqua, Rhinocort Turbuhaler

ciclesonide (sye-**kles**-oh-nide)
Omnaris, Zetonna

flunisolide (floo-**niss**-oh-lide)
Nasalide

fluticasone (floo-**ti**-ka-sone)
Avamys, Flonase Allergy Relief, Flonase Sensimist, Xhance

mometasone (moe-**met**-a-sone)
Nasonex

triamcinolone (trye-am-**sin**-oh-lone)
Nasacort Allergy 24 HR, Nasacort AQ

Classification
Therapeutic: anti-inflammatories (steroidal)
Pharmacologic: corticosteroids (nasal)

Indications

Seasonal or perennial allergic rhinitis. Nonallergic rhinitis (fluticasone). Treatment of nasal polyps.

Action

Potent, locally acting anti-inflammatory and immune modifier. **Therapeutic Effects:** ↓ in symptoms of allergic or nonallergic rhinitis. ↓ in symptoms of nasal polyps.

Pharmacokinetics

Absorption: *Beclomethasone*—27–44% absorbed; *budesonide*—34% absorbed; *flunisolide*—50% absorbed; *ciclesonide, fluticasone, mometasone*—negligible absorption. Action of all agents is primarily local following nasal use.

Distribution: All agents cross the placenta and enter breast milk in small amounts.

Metabolism and Excretion: Following absorption from nasal mucosa, corticosteroids are rapidly and extensively metabolized by the liver.

Half-life: *Beclomethasone*—2.7 hr; *budesonide*—2–3 hr; *ciclesonide*—unknown; *flunisolide*—1–2 hr; *fluticasone*—7.8 hr; *mometasone*—5.8 hr; *triamcinolone*—3–5.4 hr.

TIME/ACTION PROFILE (improvement in symptoms)

ROUTE	ONSET	PEAK	DURATION
Beclomethasone	1–3 days	up to 2 wk	unknown
Budesonide	1–2 days	2 wk	unknown
Ciclesonide	1–2 days	2–5 wk	unknown
Flunisolide	few days	up to 3 wk	unknown
Fluticasone	few days	unknown	unknown
Mometasone	within 2 days	1–2 wk	unknown
Triamcinolone	few days	3–4 days	unknown

Contraindications/Precautions

Contraindicated in: Some products contain alcohol, propylene, or polyethylene glycol and should be avoided in patients with known hypersensitivity or intolerance.

Use Cautiously in: Active untreated infections; Diabetes or glaucoma; Underlying immunosuppression (due to disease or concurrent therapy); Systemic corticosteroid therapy (should not be abruptly discontinued when intranasal therapy is started); History of ↑ intraocular pressure, glaucoma, or cataracts; Recent nasal trauma, septal ulcers, or surgery (wound healing may be impaired by nasal corticosteroids); OB, Lactation, Pedi: Pregnancy, lactation, or children <12 yr (beclomethasone [QNASL]), <6 yr (beclomethasone [Beconase AQ], budesonide, ciclesonide, flunisolide) <4 yr (fluticasone [Flonase Allergy Relief]) or <2 yr (fluticasone [Flonase Sensimist], mometasone, triamcinolone) (safety not established; prolonged or high-dose therapy may lead to complications).

Adverse Reactions/Side Effects

Derm: rash (fluticasone), urticaria (fluticasone). **EENT:** blurred vision, cataracts, epistaxis, glaucoma, ↑ intraocular pressure, nasal burning, nasal congestion, nasal irritation, nasal perforation, nasal ulceration, pharyngitis, rhinorrhea, sneezing, tearing eyes. **Endo:** adrenal suppression (high-dose, long-term therapy only), growth suppression (children). **GI:** dry mouth, esophageal candidiasis, nausea, vomiting. **Neuro:**

© F.A. Davis Publishing

dizziness, headache. **Resp:** bronchospasm, cough. **Misc:** HYPERSENSITIVITY REACTIONS (including anaphylaxis and angioedema).

Interactions

Drug-Drug: Strong CYP3A4 inhibitors, including **atazanavir**, **clarithromycin**, **cobicistat**, **indinavir**, **itraconazole**, **ketoconazole**, **nefazodone**, **nelfinavir**, **ritonavir**, and **saquinavir** may ↑ levels of budesonide, ciclesonide, fluticasone, and mometasone and ↑ the risk of adverse reactions.

Route/Dosage

Beclomethasone

Intranasal (Adults and Children ≥12 yr): *Beconase AQ*—1–2 sprays in each nostril twice daily (not to exceed 2 metered sprays in each nostril twice daily); *QNASL*—2 sprays in each nostril once daily.
Intranasal (Children 6–12 yr): 1–2 sprays in each nostril twice daily; once adequate control achieved, ↓ dose to 1 spray in each nostril twice daily.

Budesonide

Intranasal (Adults and Children ≥12 yr): 1 spray in each nostril once daily (not to exceed 4 sprays in each nostril once daily). For OTC use, administer 2 sprays in each nostril once daily; once symptoms improve, ↓ to 1 spray in each nostril once daily.
Intranasal (Children 6–11 yr): 1 spray in each nostril once daily (not to exceed 2 sprays in each nostril once daily).

Ciclesonide

Intranasal (Adults and Children ≥12 yr): *Omnaris (for perennial allergic rhinitis only)*—2 sprays in each nostril once daily (not to exceed 2 sprays in each nostril/day); *Zetonna*—1 spray in each nostril once daily (not to exceed 1 spray in each nostril/day).
Intranasal (Adults and Children ≥6 yr): *Omnaris (for seasonal allergic rhinitis only)*—2 sprays in each nostril once daily (not to exceed 2 sprays in each nostril/day).

Flunisolide

Intranasal (Adults and Children >14 yr): 2 sprays in each nostril twice daily, may be ↑ to 2 sprays in each nostril 3 times daily if greater effect needed after 4–7 days (not to exceed 8 sprays in each nostril/day).
Intranasal (Children 6–14 yr): 1 spray in each nostril 3 times daily or 2 sprays in each nostril twice daily (not to exceed 4 sprays in each nostril/day).

Fluticasone

Intranasal (Adults): *Fluticasone Rx*—2 sprays in each nostril once daily or 1 spray in each nostril twice daily (not to exceed 2 sprays in each nostril/day); after several days, attempt to ↓ dose to 1 spray in each nostril once daily.
Intranasal (Adults and Children ≥12 yr): *Flonase Sensimist (OTC) and Flonase Allergy Relief (OTC)*—2 sprays in each nostril once daily; after 1 wk, may adjust to 1–2 sprays in each nostril once daily; discuss with health care professional if need to continue longer than 6 mo.
Intranasal (Children 4–11 yr): *Flonase Allergy Relief (OTC)*—1 spray in each nostril once daily; discuss with health care professional if need to continue longer than 2 mo.
Intranasal (Children ≥4 yr): *Fluticasone Rx*—1 spray in each nostril once daily; may ↑ to 2 sprays in each nostril once daily if no response; once symptoms controlled, attempt to ↓ dose to 1 spray in each nostril once daily.
Intranasal (Children 2–11 yrs): *Flonase Sensimist (OTC)*—1 spray in each nostril once daily; discuss with health care professional if need to continue longer than 2 mo.

Mometasone

Intranasal (Adults and Children >12 yr): *Treatment of seasonal and perennial allergic rhinitis*—2 sprays in each nostril once daily (not to exceed 2 sprays in each nostril once daily).
Intranasal (Adults): *Nasal polyps*—2 sprays in each nostril twice daily (not to exceed 2 sprays in each nostril twice daily).
Intranasal (Children 2–11 yr): *Treatment of seasonal and perennial allergic rhinitis*—1 spray in each nostril once daily.

Triamcinolone

Intranasal (Adults and Children ≥12 yr): 2 sprays in each nostril once daily; not to be used in children for longer than 2 mo.
Intranasal (Children 6–11 yr): 1 spray in each nostril once daily (not to exceed 2 sprays in each nostril/day); not to be used for longer than 2 mo.
Intranasal (Children 2–5 yr): 1 spray in each nostril once daily not to be used for longer than 2 mo.

Availability

Beclomethasone

Nasal spray (Beconase AQ): 42 mcg/metered spray in 25-g bottles (delivers 180 metered sprays). **Cost:** $173.37/bottle. **Nasal spray (QNASL):** 40 mcg/metered spray in 4.9-g bottles (delivers 60 metered sprays), 80 mcg/metered spray in 8.7-g bottles (delivers 120 metered sprays). **Cost:** $139.94/bottle.

Budesonide (generic available)

Nasal spray (Rhinocort Allergy): 32 mcg/metered spray in 5-mL bottle (delivers 60 metered sprays)[OTC], and 8.43-mL bottle (delivers 120 metered sprays)[OTC].

© F.A. Davis Publishing

Nasal spray (Rhinocort Aqua): 32 mcg/metered spray in 8.6-g canister (delivers 120 metered sprays), 5-mL bottle (delivers 60 metered sprays), 8.43-mL bottle (delivers 120 metered sprays), and 🍁 64 mcg/metered spray (delivers 120 metered sprays). **Cost:** $153.97/bottle. **Nasal spray (Rhinocort Turbuhaler):** 🍁 100 mcg/metered spray (delivers 200 metered sprays).

Ciclesonide

Nasal spray (Omnaris): 50 mcg/metered spray in 12.5-g bottle (delivers 120 metered sprays). **Cost:** $152.07/bottle. **Nasal spray (Zetonna):** 37 mcg/actuation in 6.1-g bottle (delivers 60 metered sprays). **Cost:** $159.43/bottle.

Flunisolide (generic available)

Nasal solution: 25 mcg/metered spray in 25-mL bottle (delivers 200 metered sprays). **Cost:** *Generic*—$44.56/bottle.

Fluticasone (generic available)

Nasal spray : 50 mcg/metered spray in 16-g bottle (delivers 120 metered sprays). **Cost:** *Generic*—$19.52/bottle. **Nasal spray (Flonase Allergy Relief):** 50 mcg/metered spray in 9.9-mL bottle (delivers 60 metered sprays)[OTC]. **Nasal spray (Flonase Sensimist):** 27.5 mcg/spray in 9.9-mL bottle (delivers 60 metered sprays). **Nasal spray (Avamys):** 🍁 27.5 mcg/spray in 4.5-g bottle (delivers 30 metered sprays) and 10-g bottle (delivers 120 metered sprays). **Nasal spray (Xhance):** 93 mcg/spray in 16-mL bottle (delivers 120 metered sprays). ***In combination with:*** azelastine (Dymista); see Appendix N.

Mometasone (generic available)

Nasal spray (scent-free): 50 mcg/metered spray in 17-g bottle (delivers 120 metered sprays). **Cost:** $162.27/bottle.

Triamcinolone (generic available)

Nasal spray: 55 mcg/metered spray in 6.7-mL bottle (delivers 30 metered sprays)[OTC], 10.8-mL bottle (delivers 60 metered sprays) [OTC], and 16.9-mL bottle (delivers 120 metered sprays) [OTC]. **Cost:** *Generic*—$86.05/bottle.

NURSING IMPLICATIONS

Assessment

- Monitor degree of nasal stuffiness, amount and color of nasal discharge, and frequency of sneezing.
- Monitor for signs of adverse effects on nasal mucosa (nasal discomfort, epistaxis, nasal ulceration, *Candida albicans* infection, nasal septal perforation, impaired wound healing) periodically during therapy. Avoid use in patients with recent nasal ulcers, nasal surgery, or nasal trauma.
- Patients on long-term therapy should have periodic otolaryngologic examinations to monitor nasal mucosa and passages for infection or ulceration.
- Monitor growth rate in children receiving chronic therapy; use lowest possible dose.
- ***Lab Test Considerations:*** Periodic adrenal function tests may be ordered to assess degree of hypothalamic-pituitary-adrenal (HPA) axis suppression in chronic therapy. Children and patients using higher than recommended doses are at highest risk for HPA suppression.

Implementation

- Do not confuse Flonase with Flovent.
- After desired clinical effect is obtained, decrease dose to lowest effective amount. Gradually decrease dose every 2–4 wk as long as desired effect is maintained. If symptoms return, dose may briefly return to starting dose.
- **Intranasal:** Patients also using a nasal decongestant should be given decongestant 5–15 min before corticosteroid nasal spray. If patient is unable to breathe freely through nasal passages, instruct patient to blow nose gently in advance of medication administration.

Patient/Family Teaching

- Advise patient to take medication as directed. Take missed doses as soon as remembered unless almost time for next dose.
- Caution patient not to exceed maximal daily dose of nasal spray.
- Instruct patient in correct technique for administering nasal spray (see Appendix C). Most nasal sprays include directions with pictures. Instruct patient to read patient information sheet prior to use. Most nasal sprays require priming prior to first use or use after 7 days. Shake well before use. Warn patient that temporary nasal stinging may occur.
- Instruct patient to gently blow nose to clear nostrils prior to administering dose.
- Instruct patient to stop medication and notify health care professional immediately if signs of anaphylaxis (rash, hives, difficulty breathing, swollen lips or throat) or if changes in vision occur.
- Instruct patient to notify health care professional of all Rx or OTC medications, vitamins, or herbal products being taken and consult health care professional before taking other Rx, OTC, or herbal products.
- Advise females of reproductive potential to notify health care professional if pregnancy is planned or suspected or if breast feeding.
- Instruct patient to notify health care professional if symptoms do not improve within 1 mo, if symptoms worsen, or if sneezing or nasal irritation occurs.

Evaluation/Desired Outcomes

- Resolution of nasal stuffiness, discharge, and sneezing in seasonal or perennial allergic rhinitis or nonallergic rhinitis.
- Reduction in symptoms of nasal polyps.

© F.A. Davis Publishing

CORTICOSTEROIDS (SYSTEMIC)

short-acting corticosteroids

cortisone (**kor**-ti-sone)

hydrocortisone
(hye-droe-**kor**-ti-sone)
Alkindi Sprinkle, Cortef, Cortenema, Solu-CORTEF

intermediate-acting corticosteroids

methylPREDNISolone

~~Orapred~~, Orapred ODT, Pediapred, Prelone

predniSONE (**pred**-ni-sone)
Rayos, Winipred

triamcinolone
(trye-am-**sin**-oh-lone)
Aristospan, Kenalog, Trispan, Zilretta

long-acting corticosteroids

betamethasone
(bay-ta-**meth**-a-sone)
~~Betaject~~, Celestone Soluspan, ~~Celestone~~

budesonide (byoo-**dess**-oh-nide)
Cortiment, Entocort EC, Ortikos, Uceris

dexamethasone
(dex-a-**meth**-a-sone)
Decadron, Hemady

Classification
Therapeutic: anti-asthmatics, corticosteroids
Pharmacologic: corticosteroids (systemic)

Indications

Cortisone, hydrocortisone: Management of adrenocortical insufficiency. **Betamethasone, dexamethasone, hydrocortisone, prednisolone, prednisone, methylprednisolone, triamcinolone:** Used systemically and locally in a wide variety of chronic diseases including: Inflammatory, Allergic, Hematologic, Neoplastic, Autoimmune disorders. **Methylprednisolone, prednisone:** With other immunosuppressants in the prevention of organ rejection in transplantation surgery. Asthma. **Dexamethasone:** Cerebral edema: Diagnostic agent in adrenal disorders. Multiple myeloma (in combination with other anti-myeloma agents). **Budesonide (Entocort EC):** Treatment of mild to moderate Crohn's disease involving ileum and/or ascending colon. **Budesonide (Entocort EC):** Maintenance of clinical remission for up to 3 mo of mild to moderate Crohn's disease involving ileum and/or ascending colon. **Budesonide (Uceris):** Induction of remission of active, mild to moderate ulcerative colitis. **Unlabeled Use:** Short-term administration to high-risk mothers before delivery to prevent respiratory distress syndrome in the newborn (betamethasone, dexamethasone). Adjunctive therapy of hypercalcemia (prednisone, prednisolone, methylprednisolone). Management of acute spinal cord injury (methylprednisolone). Adjunctive management of nausea and vomiting from chemotherapy (dexamethasone, prednisone, prednisolone, methylprednisolone). Management of croup (dexamethasone). Treatment of airway edema prior to extubation (dexamethasone). Facilitation of ventilator weaning in neonates with bronchopulmonary dysplasia (dexamethasone).

Action

In pharmacologic doses, all agents suppress inflammation and the normal immune response. All agents have numerous intense metabolic effects (see Adverse Reactions/Side Effects). Suppress adrenal function at chronic doses of *betamethasone*—0.6 mg/day; *cortisone, hydrocortisone*—20 mg/day; *dexamethasone*—0.75 mg/day; *methylprednisolone, triamcinolone*—4 mg/day; *prednisone/prednisolone*—5 mg/day. **Cortisone, hydrocortisone:** Replace endogenous cortisol in deficiency states. **Cortisone, hydrocortisone:** Have potent mineralocorticoid (sodium-retaining) activity. **Prednisolone, prednisone:** Have minimal mineralocorticoid activity. **Betamethasone, dexamethasone, methylprednisolone, triamcinolone:** Have negligible mineralocorticoid activity. **Budesonide:** Local anti-inflammatory activity in the lumen of the GI tract. **Therapeutic Effects:** Suppression of inflammation and modification of the normal immune response. Replacement therapy in adrenal insufficiency. **Budesonide:** Improvement in symptoms/sequelae of Crohn's disease and induction of remission of ulcerative colitis.

Pharmacokinetics

Absorption: Well absorbed after oral administration (except budesonide). Sodium phosphate and sodium succinate salts are rapidly absorbed after IM administration. Acetate and acetonide salts are slowly but completely absorbed after IM administration. Absorption from local sites (intra-articular, intralesional) is slow but complete. Bioavailability of budesonide is 9–21%.
Distribution: All are widely distributed, cross the placenta, and probably enter breast milk.

© F.A. Davis Publishing

Metabolism and Excretion: All are metabolized mostly by the liver to inactive metabolites. *Cortisone* is converted by the liver to hydrocortisone. *Prednisone* is converted by the liver to prednisolone, which is then metabolized by the liver.

Half-life: *Betamethasone*—3–5 hr (plasma), 36–54 hr (tissue). *Budesonide*—2.0–3.6 hr. *Cortisone*—0.5 hr (plasma), 8–12 hr (tissue). *Dexamethasone*—3–4.5 hr (plasma), 36–54 hr (tissue). *Hydrocortisone*—1.5–2 hr (plasma), 8–12 hr (tissue). *Methylprednisolone*—>3.5 hr (plasma), 18–36 hr (tissue). *Prednisolone*—2.1–3.5 hr (plasma), 18–36 hr (tissue). *Prednisone*—3.4–3.8 hr (plasma), 18–36 hr (tissue). *Triamcinolone*—2–5 hr (plasma), 18–36 hr (tissue).

TIME/ACTION PROFILE (anti-inflammatory activity)

ROUTE	ONSET	PEAK	DURATION
Betamethasone IM (acetate/sodium phosphate)	1–3 hr	unknown	1 wk

Hydrocortisone IV (sodium succinate)	rapid	unknown	unknown
Methylprednisolone PO	unknown	1–2 hr	1.25–1.5 days
Methylprednisolone IM (acetate)	6–48 hr	4–8 days	1–4 wk
Methylprednisolone IM, IV (sodium succinate)	rapid	unknown	unknown
Prednisolone PO	unknown	1–2 hr	1.25–1.5 days
Prednisone PO	unknown	1–2 hr	1.25–1.5 days
Triamcinolone IM (acetonide)	24–48 hr	unknown	1–6 wk
Triamcinolone Intralesional (hexacetonide)	slow	unknown	4 days–4 wk

Contraindications/Precautions

Contraindicated in: Active untreated infections (may be used in patients being treated for some forms of meningitis); Lactation: Avoid chronic use; Known alcohol, bisulfite, cow's milk, or tartrazine hypersensitivity or intolerance (some products contain these and should be avoided in susceptible patients); Administration of live virus vaccines.

Use Cautiously in: Chronic treatment (will lead to adrenal suppression; use lowest possible dose for shortest period of time); Hypothyroidism; Immunosuppression; Cirrhosis; Stress (surgery, infections); supplemental doses may be needed; Potential infections may mask signs (fever, inflammation); Traumatic brain injury (high doses may be associated with ↑ mortality); OB: Safety not established; Pedi: Children (chronic use will result in ↓ growth; use lowest possible dose for shortest period of time); Pedi: Neonates (avoid use of benzyl alcohol containing injectable preparations; use preservative-free formulations).

Adverse Reactions/Side Effects

Adverse reactions/side effects are much more common with high-dose/long-term therapy.

CV: hypertension. **Derm:** acne, ↓ wound healing, ecchymoses, fragility, hirsutism, petechiae. **EENT:** cataracts, ↑ intraocular pressure. **Endo:** PHEOCHROMOCYTOMA, adrenal suppression, cushingoid appearance (moon face, buffalo hump), hyperglycemia. **F and E:** fluid retention (long-term high doses), hypokalemia, hypokalemic alkalosis. **GI:** PEPTIC ULCERATION, anorexia, nausea, vomiting. **Hemat:** THROMBOEMBOLISM, leukocytosis, thrombophlebitis. **Metab:** weight gain. **MS:** muscle wasting, osteoporosis, avascular necrosis of joints, muscle pain. **Neuro:** depression, euphoria, headache, ↑ intracranial pressure (children only), personality changes, psychoses, restlessness. **Misc:** ↑ susceptibility to infection.

Interactions

Drug-Drug: ↑ risk of hypokalemia with **thiazide** and **loop diuretics**, or **amphotericin B**. Hypokalemia may ↑ risk of **digoxin** toxicity. May increase requirement for **insulin** or **oral hypoglycemic agents**. **Phenytoin**, **phenobarbital**, and **rifampin** ↑ metabolism; may ↓ effectiveness. **Hormonal contraceptives** may ↓ metabolism. ↑ risk of adverse GI effects with **NSAIDs** (including aspirin). At chronic doses that suppress adrenal function, may ↓ antibody response to and ↑ risk of adverse reactions from **live-virus vaccines**. May ↑ serum concentrations of **cyclosporine** and **tacrolimus**. May ↑ risk of tendon rupture from **fluoroquinolones**. **Antacids** ↓ absorption of prednisone and dexamethasone. **CYP3A4 inhibitors**, including **clarithromycin**, **cobicistat**, **itraconazole**, **ketoconazole**, or **ritonavir** may ↑ levels and the risk of toxicity. May ↓ **isoniazid** levels and effectiveness. May antagonize the effects of **anticholinergic agents** in myasthenia gravis.

Drug-Food: **Grapefruit juice** ↑ serum levels and effects of budesonide (avoid concurrent use).

© F.A. Davis Publishing

Route/Dosage

Betamethasone

IM (Adults): 0.5–9 mg as betamethasone sodium phosphate/acetate suspension. *Prevention of respiratory distress syndrome in newborn*—12 mg daily for 2–3 days before delivery (unlabeled).
IM (Children): *Adrenocortical insufficiency*—17.5 mcg/kg/day (500 mcg/m²/day) in 3 divided doses every 3rd day or 5.8–8.75 mcg/kg (166–250 mcg/m²)/day as a single dose.

Budesonide

PO (Adults): *Active Crohn's disease (Entocort EC or Ortikos)*—9 mg once daily in the morning for ≤8 wk; may repeat 8-wk course for recurring episodes. *Maintenance of remission of Crohn's disease (Entocort EC or Ortikos)*—6 mg once daily for up to 3 mo; once symptoms are controlled, taper to complete cessation; *Induction of remission of ulcerative colitis (Uceris)*—9 mg once daily for up to 8 wk; once symptoms are controlled, taper to complete cessation.
PO (Children 8–17 yr and >25 kg): *Active Crohn's disease (Entocort EC)*—9 mg once daily in the morning for up to 8 wk, then 6 mg once daily in the morning for 2 wk.

Hepatic Impairment

(Adults): *Moderate hepatic impairment (Child-Pugh Class B)*—3 mg once daily in the morning.

Cortisone

PO (Adults): 25–300 mg/day in divided doses every 12–24 hr.
PO (Children): *Adrenocortical insufficiency*—0.7 mg/kg/day (20–25 mg/m²/day) in divided doses every 8 hr. *Other uses*—2.5–10 mg/kg/day (75–300 mg/m²/day) in divided doses every 6–8 hr.

Dexamethasone

PO, IM, IV (Adults): *Anti-inflammatory*—0.75–9 mg daily in divided doses every 6–12 hr. *Airway edema or extubation*—0.5–2 mg/kg/day divided every 6 hr; begin 24 hr prior to extubation and continue for 24 hr post-extubation. *Cerebral edema*—10 mg IV, then 4 mg IM or IV every 6 hr until maximal response achieved, then switch to PO regimen and taper over 5–7 days.
PO, IM, IV (Children): *Airway edema or extubation*—0.5–2 mg/kg/day divided every 6 hr; begin 24 hr prior to extubation and continue for 24 hr post-extubation. *Anti-inflammatory*—0.08–0.3 mg/kg/day or 2.5–10 mg/m²/day divided every 6–12 hr. *Physiologic replacement*—0.03–0.15 mg/kg/day or 0.6–0.75 mg/m²/day divided every 6–12 hr.
PO (Adults): *Suppression test*—1 mg at 11 PM or 0.5 mg every 6 hr for 48 hr. *Multiple myeloma*—20–40 mg once daily on specific days (based on protocol being used).
IV (Children): *Chemotherapy-induced emesis*—5–20 mg given 15–30 min before treatment; *Cerebral edema*—Loading dose 1–2 mg/kg followed by 1–1.5 mg/kg/day divided every 4–6 hr for 5 days (not to exceed 16 mg/day); then taper over 1–6 wk; *Bacterial meningitis*—0.6 mg/kg/day divided every 6 hr for 4 days (start at time of first antibiotic dose).
IV, PO (Adults): *Chemotherapy-induced emesis*—10–20 mg given 15–30 min before each treatment or 10 mg every 12 hr on each treatment day; *Delayed nausea/vomiting*—4–10 mg PO 1–2 times/day for 2–4 days *or* 8 mg PO every 12 hr for 2 days, then 4 mg PO every 12 hr for 2 days *or* 20 mg PO 1 hr before chemotherapy, then 10 mg PO every 12 hr after chemotherapy, then 8 mg PO every 12 hr for 2 days, then 4 mg PO every 12 hr for 2 days.
IS (Adults): 0.4–6 mg/day.

Hydrocortisone

PO (Adults): 20–240 mg/day in 1–4 divided doses.
PO (Children): *Adrenocortical insufficiency/replacement therapy*—8–10 mg/m²/day in 2–3 divided doses; *Anti-inflammatory or immunosuppressive*—2.5–10 mg/kg/day or 75–300 mg/m²/day in 3–4 divided doses.
IM, IV (Adults): 100–500 mg every 2–6 hr (range 100–8000 mg/day).
IM, IV (Children): *Adrenocortical insufficiency*—0.186–0.28 mg/kg/day (10–12 mg/m²/day) in 3 divided doses. *Other uses*—0.666–4 mg/kg (20–120 mg/m²) every 12–24 hr.
Rect (Adults): *Retention enema*—100 mg nightly for 21 days or until remission occurs.

Methylprednisolone

PO (Adults): *Multiple sclerosis*—160 mg/day for 7 days, then 64 mg every other day for 1 mo. *Other uses*—2–60 mg/day as a single dose or in 2–4 divided doses. *Asthma exacerbations*—120–180 mg/day in divided doses 3–4 times/day for 48 hr, then 60–80 mg/day in 2 divided doses.
PO (Children): *Anti-inflammatory/Immunosuppressive*—0.5–1.7 mg/kg/day (5–25 mg/m²/day) in divided doses every 6–12 hr. *Asthma exacerbations*—1 mg/kg every 6 hr for 48 hr, then 1–2 mg/kg/day (maximum: 60 mg/day) divided twice daily.
IM, IV (Adults): *Most uses: methylprednisolone sodium succinate*—40–250 mg every 4–6 hr. *High-dose "pulse" therapy: methylprednisolone sodium succinate*—30 mg/kg IV every 4–6 hr for up to 72 hr. *Status asthmaticus: methylprednisolone sodium succinate*—2 mg/kg IV, then 0.5–1 mg/kg IV every 6 hr for up to 5 days. *Multiple sclerosis: methylprednisolone sodium succinate*—160 mg/day for 7 days,

© F.A. Davis Publishing

then 64 mg every other day for 1 mo. *Adjunctive therapy of* P. jiroveci *pneumonia in AIDS patients: methylprednisolone sodium succinate*—30 mg twice daily for 5 days, then 30 mg once daily for 5 days, then 15 mg once daily for 10 days. *Acute spinal cord injury: methylprednisolone sodium succinate*—30 mg/kg IV over 15 min initially, followed in 45 min with a continuous infusion of 5.4 mg/kg/hr for 23 hr (unlabeled).
IM, IV (Children): *Anti-inflammatory/Immunosuppressive*—0.5–1.7 mg/kg/day (5–25 mg/m²/day) in divided doses every 6–12 hr. *Acute spinal cord injury: methylprednisolone sodium succinate*—30 mg/kg IV over 15 min initially, followed in 45 min with a continuous infusion of 5.4 mg/kg/hr for 23 hr (unlabeled). *Status asthmaticus*—2 mg/kg IV, then 0.5–1 mg/kg IV every 6 hr. *Lupus nephritis*—30 mg/kg IV every other day for 6 doses.
IM (Adults): *Methylprednisolone acetate*—40–120 mg daily, weekly, or every 2 wk.

Prednisolone

PO (Adults): *Most uses*—5–60 mg/day as a single dose or in divided doses. *Multiple sclerosis*—200 mg/day for 7 days, then 80 mg every other day for 1 mo. *Asthma exacerbations*—120–180 mg/day in divided doses 3–4 times/day for 48 hr, then 60–80 mg/day in 2 divided doses.
PO (Children): *Anti-inflammatory/Immunosuppressive*—0.1–2 mg/kg/day in 1–4 divided doses; *Nephrotic syndrome*—2 mg/kg/day (60 mg/m²/day) in 1–3 divided doses daily (maximum dose: 80 mg/day) until urine is protein-free for 4–6 wk, followed by 2 mg/kg/dose (40 mg/m²/dose) every other day in the morning; gradually taper off over 4–6 wk; *Asthma exacerbations*—1 mg/kg every 6 hr for 48 hr, then 1–2 mg/kg/day (maximum: 60 mg/day) divided twice daily.

Prednisone

PO (Adults): *Most uses*—5–60 mg/day as a single dose or in divided doses. *Multiple sclerosis*—200 mg/day for 1 wk, then 80 mg every other day for 1 mo. *Adjunctive therapy of* P. jiroveci *pneumonia in AIDS patients*—40 mg twice daily for 5 days, then 40 mg once daily for 5 days, then 20 mg once daily for 10 days.
PO (Children): *Nephrotic syndrome*—2 mg/kg/day initially given in 1–3 divided doses (maximum 80 mg/day) until urine is protein-free for 4–6 wk. Maintenance dose of 2 mg/kg/day every other day in the morning, gradually taper off after 4–6 wk. *Asthma exacerbation*—1 mg/kg every 6 hr for 48 hr, then 1–2 mg/kg/day (maximum 60 mg/day) in divided doses twice daily.

Triamcinolone

IM (Adults): *Triamcinolone acetonide*—40–80 mg every 4 wk.
Intra-articular (Adults): *Triamcinolone hexacetonide*—2–20 mg every 3–4 wk (dose depends on size of joint to be injected, amount of inflammation, and amount of fluid present); *Triamcinolone acetonide*—32 mg as a single dose into the knee joint.
IM (Children): *Triamcinolone acetonide*—40 mg every 4 wk or 30–200 mcg/kg (1–6.25 mg/m²) every 1–7 days.

Availability

Betamethasone (generic available)

Suspension for injection (sodium phosphate and acetate): 6 mg (total)/mL.

Budesonide (generic available)

Delayed-release capsules (Entocort EC): 3 mg. **Cost:** *Generic*—$397.88/30. **Extended-release capsules (Ortikos):** 6 mg, 9 mg. **Extended-release tablets (Uceris):** 9 mg. **Cost:** $1,482.00/30.

Cortisone (generic available)

Tablets: 25 mg. **Cost:** *Generic*—$108.00/100.

Dexamethasone (generic available)

Tablets: 0.5 mg, 0.75 mg, 1 mg, 1.5 mg, 2 mg, 4 mg, 6 mg, 20 mg. **Cost:** *Generic*—0.5 mg $20.76/100, 0.75 mg $36.39/100, 1 mg $35.00/100, 1.5 mg $27.14/100, 2 mg $68.54/100, 4 mg $64.25/100, 6 mg $107.07/100. **Elixir (raspberry flavor):** 0.5 mg/5 mL. **Cost:** *Generic*—$63.68/237 mL. **Oral solution (cherry flavor):** 0.5 mg/5 mL, 1 mg/mL. **Cost:** *Generic*—0.5 mg/5 mL $63.69/240 mL, 1 mg/mL $23.74/30 mL. **Solution for injection (sodium phosphate):** 4 mg/mL, 10 mg/mL.

Hydrocortisone (generic available)

Tablets: 5 mg, 10 mg, 20 mg. **Cost:** *Generic*—5 mg $16.95/50, 10 mg $57.30/100, 20 mg $78.81/100. **Oral granules (Alkindi Sprinkle):** 0.5 mg, 1 mg, 2 mg, 5 mg. **Enema:** 100 mg/60 mL. **Cost:** *Generic*—$48.80/480 mL. **Lyophilized powder for injection (sodium succinate):** 100 mg/vial, 250 mg/vial, 500 mg/vial, 1 g.

Methylprednisolone (generic available)

Powder for injection (sodium succinate): 40 mg/vial, 125 mg/vial, 500 mg/vial, 1 g/vial, 2 g/vial. **Suspension for injection (acetate):** 20 mg/mL, 40 mg/mL, 80 mg/mL. **Tablets:** 2 mg, 4 mg, 8 mg, 16 mg, 32 mg. **Cost:** *Generic*—4 mg $142.93/100, 8 mg $50.26/25, 16 mg $155.29/50, 32 mg $115.62/25.

Prednisolone (generic available)

Oral solution: 5 mg/5 mL, 10 mg/5 mL, 15 mg/5 mL, 20 mg/5 mL, 25 mg/5 mL. **Cost:** *Generic*—5 mg/5 mL $98.09/120 mL, 15 mg/5 mL $25.80/237 mL, 25 mg/5 mL $186.00/237 mL. **Orally disintegrating tablets (grape flavor):** 10 mg, 15 mg, 30 mg. **Cost:** 10 mg $394.84/48, 15 mg $593.71/48, 30 mg $846.02/48.

Prednisone (generic available)

Delayed-release tablets: 1 mg, 2 mg, 5 mg. **Oral solution:** 5 mg/5 mL, 5 mg/mL. **Cost:** *Generic*—1 mg/mL $24.45/120 mL, 5 mg/mL $42.32/30 mL. **Tablets:**

© F.A. Davis Publishing

1 mg, 2.5 mg, 5 mg, 10 mg, 20 mg, 50 mg. **Cost:** *Generic*—1 mg $11.04/30, 2.5 mg $7.41/30, 5 mg $8.32/30, 10 mg $10.84/30, 50 mg $13.77/30.

Triamcinolone (generic available)

Extended-release suspension for intra-articular injection (acetonide) (requires reconstitution) (Zilretta): 32 mg/vial. **Suspension for intra-articular injection (hexacetonide):** 5 mg/mL, 20 mg/mL. **Suspension for intramuscular injection (acetonide):** 10 mg/mL, 40 mg/mL, 80 mg/mL.

NURSING IMPLICATIONS

Assessment

- These drugs are indicated for many conditions. Assess involved systems before and periodically during therapy.
- Assess for signs of adrenal insufficiency (hypotension, weight loss, weakness, nausea, vomiting, anorexia, lethargy, confusion, restlessness) before and periodically during therapy.
- Monitor intake and output ratios and daily weights. Observe patient for peripheral edema, steady weight gain, rales/crackles, or dyspnea. Notify health care professional if these occur.
- Children should have periodic evaluations of growth; may slow growth.
- **Cerebral Edema:** Assess for changes in level of consciousness and headache during therapy.
- **Budesonide:** Assess signs of Crohn's disease and ulcerative colitis (diarrhea, crampy abdominal pain, fever, bleeding from rectum) during therapy. Monitor frequency and consistency of bowel movements periodically during therapy.
- **Rect:** Assess symptoms of ulcerative colitis (diarrhea, bleeding, weight loss, anorexia, fever, leukocytosis) periodically during therapy.
- ***Lab Test Considerations:*** Verify negative pregnancy test before starting therapy with *Hemady*.
- Monitor serum electrolytes and glucose. May cause hyperglycemia, especially in persons with diabetes. May cause hypokalemia. Patients on prolonged therapy should routinely have CBC, serum electrolytes, and serum and urine glucose evaluated. May ↓ WBCs. May ↓ serum potassium and calcium and ↑ serum sodium concentrations.
- Guaiac-test stools. Promptly report presence of guaiac-positive stools.
- May ↑ serum cholesterol and lipid values. May ↓ uptake of thyroid ^{123}I or ^{131}I.
- Suppress reactions to allergy skin tests.
- Periodic adrenal function tests may be ordered to assess degree of hypothalamic-pituitary-adrenal axis suppression in systemic and chronic topical therapy.
- **Dexamethasone Suppression Test: :** To diagnose Cushing's syndrome: Obtain baseline cortisol level; administer dexamethasone at 11 PM and obtain cortisol levels at 8 AM the next day. Normal response is a ↓ cortisol level.
- Alternative method: Obtain baseline 24-hr urine for 17-hydroxycorticosteroid concentrations, then begin 48-hr administration of dexamethasone. Second 24-hr urine for 17-hydroxycorticosteroid is obtained after 24 hr of dexamethasone.

Implementation

- Do not confuse prednisone with prednisolone. Do not confuse Solu-Cortef with Solu-Medrol.
- If dose is ordered daily or every other day, administer in the morning to coincide with the body's normal secretion of cortisol.
- Periods of stress, such as surgery, may require supplemental systemic corticosteroids.
- Patients with mild to moderate Crohn's disease may be switched from oral prednisolone without adrenal insufficiency by gradually decreasing prednisolone doses and adding budesonide.
- **PO:** Administer with meals to minimize GI irritation.
- ***DNC:*** Swallow *Ortikos* (budesonide) tablets whole; do not crush or chew. Other tablets may be crushed and administered with food or fluids for patients with difficulty swallowing. ***DNC:*** Capsules and extended-release tablets should be swallowed whole; do not open, crush, break, or chew.
- *Entocort EC* (budesonide) capsules can be opened and contents sprinkled onto 1 tbsp of applesauce for patients unable to swallow capsule. Applesauce must not be hot and must be soft enough to swallow without chewing. Mix granules with applesauce and consume entire contents within 30 min of mixing. Do not chew or crush the granules. Do not save the applesauce and granules for future use. Follow with a glass (8 oz) of cool water to ensure complete swallowing of granules.
- *Alkindi Sprinkle* (hydrocortisone) are granules in capsules. Do not swallow capsules; do not crush or chew granules. Do not use with NG or gastric tubes; may cause blockage of tube. To open capsule, hold capsule so that printed strength is at the top and tap to ensure all granules are in the lower half of the capsule. Squeeze bottom of capsule gently and twist off top of capsule. Granules may be poured directly onto patient's tongue, poured onto a spoon and placed in patient's mouth, or sprinkled onto a spoonful of cold or room temperature soft food (yogurt or fruit puree). Swallow granules within 5 min to avoid bitter taste as the outer taste masking cover can dissolve. Tap capsule to ensure all granules are removed. Avoid wetting capsule on the tongue or soft food; may result in granules remaining in capsule. Immediately follow administration with fluids (water, milk, breast milk, formula) to ensure all granules are swallowed. Do not add granules to liquid;

© F.A. Davis Publishing

may result in reductions of dose administered and may result in a bitter taste.
- Use calibrated measuring device to ensure accurate dose of liquid forms.
- For orally disintegrating tablets (ODT), remove tablet from blister just prior to dosing. Peel blister pack open, and place tablet on tongue; may be swallowed whole or allowed to dissolve in mouth, with or without water. Tablets are friable; do not cut, split, or break.
- Avoid consumption of grapefruit juice during therapy with budesonide or methylprednisolone.
- **IM Subcut:** Shake suspension well before drawing up. IM doses should not be administered when rapid effect is desirable. Do not dilute with other solution or admix. Do not administer suspensions IV.

Dexamethasone

IV Administration
- **IV Push:** ***Dilution:*** May be given undiluted. ***Concentration:*** 4–10 mg/mL. ***Rate:*** Administer over 1–4 min if dose is <10 mg.
- **Intermittent Infusion:** ***Dilution:*** High-dose therapy should be added to D5W or 0.9% NaCl solution. Solution is clear and colorless to light yellow; use diluted solution within 24 hr. ***Concentration:*** Up to 10 mg/mL. ***Rate:*** Administer infusions over 15–30 min.
- **Y-Site Compatibility:** acetaminophen, acyclovir, alfentanil, allopurinol, amifostine, amikacin, aminocaproic acid, aminophylline, amphotericin B deoxycholate, amphotericin B lipid complex, amphotericin B liposome, anidulafungin, argatroban, arsenic trioxide, ascorbic acid, atracurium, atropine, azithromycin, aztreonam, benztropine, bivalirudin, bleomycin, bumetanide, buprenorphine, butorphanol, cangrelor, carboplatin, carmustine, cefazolin, cefepime, cefotaxime, cefotetan, cefoxitin, ceftaroline, ceftazidime, ceftolozane/tazobactam, ceftriaxone, chloramphenicol, cisatracurium, cisplatin, cladribine, clindamycin, cyanocobalamin, cyclophosphamide, cyclosporine, cytarabine, dacarbazine, dactinomycin, daptomycin, dexmedetomidine, digoxin, diltiazem, dimenhydrinate, docetaxel, dopamine, doxorubicin, doxorubicin liposomal, edetate calcium disodium, enalaprilat, ephedrine, epinephrine, epoetin alfa, eptifibatide, ertapenem, etoposide, etoposide phosphate, famotidine, fentanyl, filgrastim, fluconazole, fludarabine, fluorouracil, folic acid, fosaprepitant, foscarnet, fosphenytoin, furosemide, ganciclovir, gemcitabine, glycopyrrolate, granisetron, heparin, hetastarch, hydrocortisone, hydromorphone, ifosfamide, imipenem/cilastatin, indomethacin, insulin, regular, irinotecan, isavuconazonium, isoproterenol, ketorolac, leucovorin calcium, levofloxacin, lidocaine, linezolid, lorazepam, mannitol, melphalan, meropenem, meropenem/vaborbactam, mesna, methohexital, methylprednisolone, metoclopramide, metoprolol, metronidazole, milrinone, mitomycin, morphine, moxifloxacin, multivitamin, nafcillin, nalbuphine, naloxone, nitroglycerin, nitroprusside, norepinephrine, octreotide, ondansetron, oxaliplatin, oxytocin, paclitaxel, palonosetron, pamidronate, pancuronium, pemetrexed, penicillin G, pentobarbital, phenobarbital, phenylephrine, phytonadione, piperacillin/tazobactam, plazomicin, potassium acetate, potassium chloride, procainamide, prochlorperazine, propofol, propranolol, pyridoxine, remifentanil, rituximab, sargramostim, sodium acetate, sodium bicarbonate, succinylcholine, sufentanil, tacrolimus, tedizolid, telavancin, theophylline, thiamine, thiotepa, tigecycline, tirofiban, trastuzumab, vancomycin, vasopressin, vecuronium, verapamil, vinblastine, vincristine, vinorelbine, vitamin B complex with C, voriconazole, zidovudine, zoledronic acid.
- **Y-Site Incompatibility:** alemtuzumab, amiodarone, blinatumomab, caspofungin, cefuroxime, ciprofloxacin, dacarbazine, dantrolene, daunorubicin hydrochloride, diazepam, diphenhydramine, dobutamine, doxycycline, epirubicin, esmolol, fenoldopam, gemtuzumab ozogamicin, haloperidol, hydroxyzine, idarubicin, labetalol, magnesium sulfate, midazolam, minocycline, mitoxantrone, mycophenolate, nicardipine, pantoprazole, papaverine, pentamidine, phenytoin, prochlorperazine, protamine, quinapristin/dalfopristin, tobramycin, topotecan, trimethoprim/sulfamethoxazole.

Hydrocortisone

IV Administration
- **IV Push:** ***Reconstitution:*** Reconstitute with provided solution (i.e., Act-O-Vials) or 2 mL of bacteriostatic water or saline for injection. ***Concentration:*** 50 mg/mL. ***Rate:*** Administer each 100 mg over at least 30 sec. Doses 500 mg and larger should be infused over at least 10 min.
- **Intermittent/Continuous Infusion:** ***Dilution:*** May be added to 50–1000 mL of D5W, 0.9% NaCl, or D5/0.9% NaCl. Diluted solutions should be used within 24 hr. ***Concentration:*** 1–5 mg/mL. Concentrations of up to 60 mg/mL have been used in fluid restricted adults. ***Rate:*** Administer over 20–30 min or at prescribed rate.
- **Hydrocortisone sodium succinate: Y-Site Compatibility:** acetaminophen, acyclovir, alemtuzumab, alfentanil, allopurinol, amifostine, amikacin, aminophylline, amphotericin B deoxycholate, amphotericin B lipid complex, amphotericin B liposome, anidulafungin, argatroban, ascorbic acid, atracurium, atropine, azithromycin, aztreonam, benztropine, bivalirudin, bleomycin, bumetanide, buprenorphine, butorphanol, cangrelor, carboplatin, carmustine, caspofungin, cefazolin, cefepime, cefotaxime, cefotetan, cefoxitin, ceftaroline, ceftazidime, ceftriaxone, cefuroxime, chloramphenicol, chlorpromazine, cisatracurium, cisplatin, cladribine, clindamycin, cya-

nocobalamin, cyclophosphamide, cyclosporine, cytarabine, dactinomycin, daptomycin, daunorubicin hydrochloride, defibrotide, dexamethasone, dexmedetomidine, dexrazoxane, digoxin, docetaxel, dopamine, doxorubicin hydrochloride, doxorubicin liposome, droperidol, enalaprilat, ephedrine, epinephrine, epirubicin, epoetin alfa, eptifibatide, ertapenem, erythromycin, estrogens, conjugated, etoposide, famotidine, fenoldopam, fentanyl, filgrastim, fluconazole, fludarabine, fluorouracil, folic acid, foscarnet, fosphenytoin, furosemide, gemcitabine, glycopyrrolate, granisetron, heparin, hetastarch, hydromorphone, ifosfamide, imipenem/cilastatin, indomethacin, insulin, irinotecan, isoproterenol, ketamine, ketorolac, leucovorin calcium, levofloxacin, lidocaine, linezolid, lorazepam, mannitol, melphalan, meropenem/vaborbactam, mesna, methotrexate, methylergonovine, metoclopramide, metoprolol, metronidazole, milrinone, mitoxantrone, morphine, moxifloxacin, multivitamins, nafcillin, naloxone, neostigmine, nitroglycerin, nitroprusside, norepinephrine, octreotide, ondansetron, oxacillin, oxaliplatin, oxytocin, paclitaxel, palonosetron, pamidronate, pancuronium, pantoprazole, pemetrexed, penicillin G, pentobarbital, phenobarbital, phentolamine, phenylephrine, phytonadione, piperacillin/tazobactam, plazomicin, potassium acetate, potassium chloride, procainamide, prochlorperazine, propofol, propranolol, pyridostigmine, remifentanil, rituximab, scopolamine, sodium acetate, sodium bicarbonate, succinylcholine, sufentanil, tacrolimus, tedizolid, telavancin, theophylline, thiotepa, tigecycline, tirofiban, topotecan, trastuzumab, vasopressin, vecuronium, verapamil, vinblastine, vincristine, vinorelbine, voriconazole, zoledronic acid.

- **Y-Site Incompatibility:** amiodarone, ampicillin/sulbactam, azathioprine, ciprofloxacin, dantrolene, diazepam, diazoxide, dobutamine, doxycycline, ganciclovir, gemtuzumab ozogamicin, haloperidol, idarubicin, labetalol, midazolam, mycophenolate, nalbuphine, pentamidine, phenytoin, protamine, pyridoxine, quinupristin/dalfopristin, rocuronium, sargramostim, thiamine, trimethoprim/sulfamethoxazole.

Methylprednisolone sodium succinate

IV Administration

- **IV Push:** ***Reconstitution:*** Reconstitute with provided solution (Act-O-Vials, Univials) or 2 mL of bacteriostatic water (with benzyl alcohol) for injection. Use preservative-free diluent for use in neonates. Acetate injection is not for IV use. ***Concentration:*** Maximum concentration 125 mg/mL. ***Rate:*** Low dose (<1.8 mg/kg or <125 mg/dose): May be administered IV push over 1 to several min. Moderate dose (2 mg/kg or 250 mg/dose): give over 15–30 min. High dose (15 mg/kg or 500 mg/dose): give over 30 min. Doses 15 mg/kg or 1 g give over 1 hr.
- **Intermittent/Continuous Infusion:** ***Dilution:*** May be diluted further in D5W, 0.9% NaCl, or D5/0.9% NaCl and administered as intermittent or continuous infusion at the prescribed rate. ***Concentration:*** Maximum 2.5 mg/mL. Solution may form a haze upon dilution.
- **Y-Site Compatibility:** acetaminophen, acyclovir, alfentanil, alprostadil, amifostine, amikacin, aminophylline, amphotericin B deoxycholate, amphotericin B lipid complex, amphotericin B liposome, anidulafungin, argatroban, arsenic trioxide, ascorbic acid, atracurium, atropine, azithromycin, aztreonam, benztropine, bivalirudin, bleomycin, bumetanide, buprenorphine, butorphanol, cangrelor, carboplatin, carmustine, cefazolin, cefepime, cefotetan, ceftaroline, ceftazidime, ceftriaxone, cefuroxime, chloramphenicol, chlorpromazine, cisplatin, cladribine, clindamycin, cyanocobalamin, cyclophosphamide, cyclosporine, cytarabine, dactinomycin, daptomycin, dexamethasone, dexmedetomidine, digoxin, dobutamine, dopamine, doxorubicin liposome, enalaprilat, ephedrine, epinephrine, epoetin alfa, eptifibatide, ertapenem, erythromycin, etoposide, fentanyl, fluconazole, fludarabine, fluorouracil, folic acid, fosaprepitant, furosemide, gentamicin, glycopyrrolate, granisetron, hetastarch, hydromorphone, ifosfamide, imipenem/cilastatin, insulin, isoproterenol, ketorolac, labetalol, levofloxacin, linezolid, lorazepam, mannitol, melphalan, meropenem/vaborbactam, mesna, methotrexate, metoclopramide, metoprolol, metronidazole, milrinone, morphine, moxifloxacin, multivitamin, nafcillin, naloxone, nitroglycerin, nitroprusside, norepinephrine, octreotide, oxaliplatin, oxytocin, pamidronate, pancuronium, pemetrexed, penicillin G, pentobarbital, phenobarbital, phenylephrine, piperacillin/tazobactam, potassium acetate, procainamide, prochlorperazine, propranolol, remifentanil, rituximab, sodium acetate, sodium bicarbonate, succinylcholine, sufentanil, tacrolimus, tedizolid, theophylline, thiotepa, tirofiban, tobramycin, topotecan, trastuzumab, vasopressin, verapamil, vincristine, voriconazole, zoledronic acid.
- **Y-Site Incompatibility:** alemtuzumab, allopurinol, ampicillin/sulbactam, blinatumomab, calcium chloride, calcium gluconate, caspofungin, cefotaxime, cefoxitin, ciprofloxacin, dacarbazine, dantrolene, daunorubicin hydrochloride, dexrazoxane, diazepam, diazoxide, diphenhydramine, docetaxel, doxycycline, epirubicin, etoposide phosphate, fenoldopam, filgrastim, foscarnet, ganciclovir, gemcitabine, gemtuzumab ozogamicin, haloperidol, hydralazine,

idarubicin, irinotecan, isavuconazonium, magnesium sulfate, mitoxantrone, mycophenolate, nalbuphine, paclitaxel, palonosetron, pantoprazole, papaverine, pentamidine, phenytoin, promethazine, propofol, protamine, pyridoxine, quinupristin/dalfopristin, rocuronium, sargramostim, thiamine, trimethoprim/sulfamethoxazole, vancomycin, vecuronium, vinorelbine.

Patient/Family Teaching

- Instruct patient on correct technique of medication administration. Advise patient to take medication as directed. Take missed doses as soon as remembered unless almost time for next dose. Do not double doses. Stopping the medication suddenly may result in adrenal insufficiency (anorexia, nausea, weakness, fatigue, dyspnea, hypotension, hypoglycemia). If these signs appear, notify health care professional immediately. This can be life threatening. Advise patient to read *Patient Information* before starting and with each Rx refill in case of changes.
- Advise patient to avoid consumption of grapefruit juice during therapy with *budesonide* or *methylprednisolone*; may increase blood levels.
- Corticosteroids cause immunosuppression and may mask symptoms of infection. Instruct patient to avoid people with known contagious illnesses and to report possible infections immediately.
- *Prelone* syrup should not be refrigerated and *Pediapred* solution may be refrigerated.
- Caution patient to avoid vaccinations without first consulting health care professional.
- Review side effects with patient. Instruct patient to inform health care professional promptly if severe abdominal pain or tarry stools occur. Patient should also report unusual swelling, weight gain, tiredness, bone pain, bruising, nonhealing sores, visual disturbances, or behavior changes. Advise patient to notify health care professional if signs and symptoms of hypercorticism (acne, thicker or more hair on body and face; bruise easily; fatty pad or hump between shoulders [buffalo hump]; rounding of face [moon face]; pink or purple stretch marks on skin of abdomen, thighs, breasts and arms; ankle swelling), adrenal suppression (tiredness, weakness, nausea and vomiting, low blood pressure), worsening of allergies (eczema, rhinitis), and infection (fever, chills, pain, feeling tired, aches, nausea and vomiting). May worsen existing tuberculosis, fungal, bacterial, viral, or parasitic infections, or ocular herpes simplex.
- Instruct patient to notify health care professional of all Rx or OTC medications, vitamins, or herbal products being taken and to consult health care professional before taking any Rx, OTC, or herbal products.
- Instruct patient to notify health care professional immediately if exposed to chicken pox or measles.
- Advise patient to notify health care professional of medication regimen before treatment or surgery.
- Discuss possible effects on body image. Explore coping mechanisms.
- Instruct patient to inform health care professional if symptoms of underlying disease return or worsen.
- Rep: Advise females of reproductive potential to notify health care professional if pregnancy is planned or suspected or if breast feeding. *Hemady* may cause fetal harm. Advise females taking *Hemady* to use effective contraception during and for at least one month after last dose. Monitor infants born to mothers who have received substantial doses of corticosteroids during pregnancy for signs of hypoglycemia and hypoadrenalism. Advise women not to breast feed during and for 2 wks after last dose. May impair male fertility.
- Advise patient to carry identification describing disease process and medication regimen in the event of emergency in which patient cannot relate medical history.
- Explain need for continued medical follow-up to assess effectiveness and possible side effects of medication. Periodic lab tests and eye exams may be needed.
- **Long-term Therapy:** Encourage patient to eat a diet high in protein, calcium, and potassium, and low in sodium and carbohydrates (see Appendix J). Alcohol should be avoided during therapy; may ↑ risk of GI irritation.
- If rectal dose used 21 days, decrease to every other night for 2–3 wk to decrease gradually.

Evaluation/Desired Outcomes

- Decrease in presenting symptoms with minimal systemic side effects.
- Suppression of the inflammatory and immune responses in autoimmune disorders, allergic reactions, and neoplasms.
- Management of symptoms in adrenal insufficiency.
- Improvement of symptoms/sequelae of Crohn's disease and ulcerative colitis (decreased frequency of liquid stools, decreased abdominal complaints, improved sense of well being).
- Improvement in symptoms of ulcerative colitis. Clinical symptoms usually improve in 3–5 days. Mucosal appearance may require 2–3 mo to improve.
- Induction of remission of ulcerative colitis.
- Treatment of adults with multiple myeloma.

Classification
Therapeutic: anti-inflammatories (steroidal)
Pharmacologic: corticosteroids (topical)

Indications
Moderate to severe plaque psoriasis. Inflammation and pruritus associated with corticosteroid-responsive dermatoses.

Action
Suppress normal immune response and inflammation.
Therapeutic Effects: Suppression of dermatologic inflammation and immune processes. Clearing of plaques.

Pharmacokinetics
Absorption: Minimal. Prolonged use on large surface areas, application of large amounts, or use of occlusive dressings may ↑ systemic absorption.
Distribution: Remain primarily at site of action.
Metabolism and Excretion: Usually metabolized in skin; some have been modified to resist local metabolism and have a prolonged local effect.
Half-life: *Betamethasone*—3–5 hr (plasma), 36–54 hr (tissue). *Dexamethasone*—3–4.5 hr (plasma), 36–54 hr (tissue). *Hydrocortisone*—1.5–2 hr (plasma), 8–12 hr (tissue). *Triamcinolone*—2–>5 hr (plasma), 18–36 hr (tissue).

TIME/ACTION PROFILE (response depends on condition being treated)

ROUTE	ONSET	PEAK	DURATION
Topical	min–hr	hr–days	hr–days

Contraindications/Precautions
Contraindicated in: Hypersensitivity or known intolerance to corticosteroids or components of vehicles (ointment or cream base, preservative, alcohol); Untreated bacterial or viral infections.
Use Cautiously in: Hepatic impairment; Diabetes mellitus, cataracts, glaucoma, or tuberculosis (use of large amounts of high-potency agents may worsen condition); Patients with pre-existing skin atrophy; OB, Lactation: Chronic use at high dosages may result in adrenal suppression in mother and growth suppression in children; Pedi: Children may be more susceptible to adrenal and growth suppression. Clobetasol not recommended for children <18 yr (cream, lotion, shampoo, spray) or <12 yr (foam, gel, ointment, solution); desoximetasone not recommended for children <10 yr (cream, ointment, gel) or <18 yr (spray); halobetasol not recommended for children <12 yr.

Adverse Reactions/Side Effects
Derm: allergic contact dermatitis, atrophy, burning, dryness, edema, folliculitis, hypersensitivity reactions, hypertrichosis, hypopigmentation, irritation, macera-

© F.A. Davis Publishing

tion, miliaria, perioral dermatitis, secondary infection, striae. **EENT:** cataracts, glaucoma. **Misc:** adrenal suppression (↑ dose, long-term therapy).

Interactions

Drug-Drug: None significant.

Route/Dosage

Topical (Adults and Children): 1–4 times daily (depends on product, preparation, and condition being treated).

Rect (Adults): hydrocortisone *Aerosol foam*—90 mg 1–2 times/day for 2–3 wk; then adjusted.

Availability

Alclometasone (generic available)

Cream: 0.05%. **Cost:** *Generic*—$97.51/45 g. **Ointment:** 0.05%. **Cost:** *Generic*—$50.47/15 g.

$10.11/80 g, 0.1% $5.58/15 g, 0.5% $10.10/15 g.
Spray: 0.147 mg/g. ***In combination with:*** acetic acid, antifungals, anti-infectives, antihistamines, urea, and benzoyl peroxide in various otic and topical preparations. See Appendix N.

NURSING IMPLICATIONS

Assessment

- Assess affected skin before and daily during therapy. Note degree of inflammation, pruritus, and/or plaques. Notify health care professional if symptoms of infection (increased pain, erythema, purulent exudate) develop.
- ***Lab Test Considerations:*** Adrenal function tests may be ordered to assess degree of hypothalamic-pituitary-adrenal (HPA) axis suppression in long-term topical therapy. Children and patients with dose applied to a large area, using an occlusive dressing, or using high-potency products are at highest risk for HPA suppression.
- May cause ↑ serum and urine glucose concentrations if significant absorption occurs.

Implementation

- Choice of vehicle depends on site and type of lesion. Ointments are more occlusive and preferred for dry, scaly lesions. Creams should be used on oozing or intertriginous areas, where the occlusive action of ointments might cause folliculitis or maceration. Creams may be preferred for esthetic reasons even though they may dry skin more than ointments. Gels, aerosols, lotions, and solutions are useful in hairy areas.
- **Topical:** Apply *ointments, creams,* or *gels* sparingly as a thin film to clean, slightly moist skin. Wear gloves. Apply occlusive dressing only if specified by health care professional.
- Apply *lotion, solution,* or *gel* to hair by parting hair and applying a small amount to affected area. Rub in gently. Protect area from washing, clothing, or rubbing until medication has dried. Hair may be washed as usual but not right after applying medication.
- Use *aerosols* by shaking well and spraying on affected area, holding container 3–6 in. away. Spray for about 2 sec to cover an area the size of a hand. Do not inhale. If spraying near face, cover eyes.
- Shake *Sernivo spray* before using. Spray affected area and rub in gently. Discontinue if control not achieved or after 4 wk of use.

Patient/Family Teaching

- Instruct patient on correct technique of medication administration. Emphasize importance of avoiding the eyes. Apply missed doses as soon as remembered unless almost time for the next dose.
- Caution patient to use only as directed. Avoid using cosmetics, bandages, dressings, or other skin products over the treated area unless directed by health care professional.
- Advise parents of pediatric patients not to apply tight-fitting diapers or plastic pants on a child treated in the diaper area; these garments work as an occlusive dressing and may cause more of the drug to be absorbed.
- Advise patient to consult health care professional before using medicine for condition other than indicated.
- Rep: Caution women that medication should not be used extensively, in large amounts, or for protracted periods if they are pregnant or planning to become pregnant. Advise female patients of reproductive potential to notify health care professional if pregnancy is planned or suspected, or if breast feeding.
- Instruct patient to inform health care professional if symptoms of underlying disease return or worsen or if symptoms of infection develop.
- **Fluticasone:** Advise patient to avoid excessive natural or artificial exposure (tanning booth, sun lamp) to areas where lotion is applied.

Evaluation/Desired Outcomes

- Resolution of skin inflammation, pruritus, or other dermatologic conditions.
- Clearing of plaques in plaque psoriasis.

cortisone, See CORTICOSTEROIDS (SYSTEMIC).

crisaborole (kris-a-**bor**-ole)

Eucrisa

Classification
Therapeutic: anti-inflammatories
Pharmacologic: phosphodiesterase type 4 inhibitors

Indications

Mild to moderate atopic dermatitis.

Action

Inhibits phosphodiesterase 4 (PDE-4) resulting in ↑ intracellular cyclic adenosine monophosphate levels.
Therapeutic Effects: Decreased severity of atopic dermatitis.

Pharmacokinetics

Absorption: Minimal systemic absorption through intact skin.
Distribution: Local distribution after topical administration.
Protein Binding: 97%.

© F.A. Davis Publishing

Metabolism and Excretion: Metabolized through liver into inactive metabolites; metabolites excreted in urine.
Half-life: Unknown.

TIME/ACTION PROFILE (improvement in symptoms)

ROUTE	ONSET	PEAK	DURATION
Topical	8 days	unknown	unknown

Contraindications/Precautions
Contraindicated in: Hypersensitivity.
Use Cautiously in: OB, Lactation: Safety not established; Pedi: Children <3 mo (safety and effectiveness not established).

Adverse Reactions/Side Effects
Derm: burning, stinging. **Misc:** hypersensitivity reactions.

Interactions
Drug-Drug: None known.

Route/Dosage
Topical (Adults and Children ≥3 mo): Apply a thin layer to affected areas twice daily.

Availability
Ointment: 2%.

NURSING IMPLICATIONS
Assessment
- Assess skin lesions periodically during therapy.

Implementation
- **Topical:** Apply a thin layer to affected areas twice daily. Do not apply to ophthalmic, oral, or vaginal areas. Wash hands after applying ointment.

Patient/Family Teaching
- Instruct patient or parent to apply as directed. For topical use only.
- Advise patient or parent to discontinue therapy and notify health care professional if signs and symptoms of hypersensitivity (pruritus, swelling, erythema) at application site or a distant site occur.
- Instruct patient to notify health care professional of all Rx or OTC medications, vitamins, or herbal products being taken and consult health care professional before taking any new medications.
- Rep: Advise female patient to notify health care professional if pregnancy is planned or suspected or if breast feeding.

Evaluation/Desired Outcomes
- Decreased severity of atopic dermatitis.

crizanlizumab
(**kriz**-an-**liz**-ue-mab)
Adakveo

Classification
Therapeutic: none assigned
Pharmacologic: monoclonal antibodies, selectin inhibitors

Indications
Vaso-occlusive crises in patients with sickle cell disease.

Action
Binds to P-selectin on the surface of the activated endothelium and platelets to prevent their interaction with endothelial cells, platelets, red blood cells, and white blood cells. **Therapeutic Effects:** Reduction in frequency of vaso-occlusive crises.

Pharmacokinetics
Absorption: IV administration results in complete bioavailability.
Distribution: Minimally distributed to extravascular tissues.
Metabolism and Excretion: Metabolized by catabolic pathways into smaller peptides; excretion pathway unknown.
Half-life: 7.6 days.

TIME/ACTION PROFILE (plasma concentrations)

ROUTE	ONSET	PEAK	DURATION
IV	unknown	unknown	unknown

Contraindications/Precautions
Contraindicated in: None reported.
Use Cautiously in: OB: Use during pregnancy only if potential maternal benefit justifies potential fetal risk; Lactation: Use while breast feeding only if potential maternal benefit justifies potential risk to infant; Pedi: Children <16 yr (safety and effectiveness not established).

Adverse Reactions/Side Effects
Derm: pruritus. **GI:** abdominal pain, nausea, diarrhea, vomiting. **MS:** arthralgia, back pain, myalgia. **Local:** infusion-site reaction. **Misc:** fever, infusion-related reactions.

Interactions
Drug-Drug: None reported.

Route/Dosage
IV (Adults and Children ≥16 yr): 5 mg/kg initially, then in 2 wk, and then every 4 wk thereafter.

Availability
Solution for injection: 10 mg/mL.

© F.A. Davis Publishing

NURSING IMPLICATIONS

Assessment

- Monitor frequency of vaso-occlusive crises during therapy.
- Monitor for signs and symptoms of infusion-related reactions (severe pain, fever, chills, nausea, vomiting, fatigue, dizziness, pruritus, urticaria, sweating, shortness of breath, wheezing) during and within 24 hr of infusion. For mild to moderate reactions, interrupt infusion or slow rate of infusion. Begin symptomatic therapy (acetaminophen, NSAIDs, opioids, antihistamines, intravenous fluids, and/or oxygen therapy). Consider premedication and/or reduce infusion rate of subsequent infusions. Discontinue therapy for severe reactions.
- ***Lab Test Considerations:*** May interfere with automated platelet counts (platelet clumping), in particular when blood samples are collected in tubes containing ethylenediaminetetraacetic acid (EDTA). Run blood samples within 4 hrs of blood collection or collect blood samples in tubes containing citrate. When needed, estimate platelet count via peripheral blood smear.

Implementation

- **Intermittent Infusion:** Obtain number of vials needed; one vial for every 10 mL crizanlizumab. Allow vials to reach room temperature for up to 4 hr before preparing. Solution is clear to opalescent, colorless, or may have a slightly brownish-yellow tint; do not use solutions with particulate matter. ***Dilution:*** Dilute in 0.9% NaCl or D5W to a total volume of 100 mL in an infusion bag of either polyvinyl chloride (PVC), polyethylene (PE), or polypropylene (PP) by withdrawing the volume to be added. Gently invert to mix; do not shake. Solution is stable for up to 4.5 hr at room temperature, including infusion time and up to 24 hr if refrigerated and protected from light. ***Rate:*** Infuse over 30 min through a sterile, nonpyrogenic 0.2 micron inline filter. Flush the line with at least 25 mL of 0.9% NaCl or D5W following infusion.
- **Y-Site Incompatibility:** Do not mix or coadminister with other drugs through the same IV line.

Patient/Family Teaching

- Explain the purpose of crizanlizumab to patient. Do not stop receiving crizanlizumab without consulting health care professional. If an appointment is missed, contact health care professional as soon as possible to reschedule. Advise patient to read *Medication Guide* before starting and periodically during therapy in case of changes.
- Advise patient to notify health care professional if signs and symptoms of infusion reactions (fever, chills or shivering, nausea, vomiting, tiredness, dizziness, sweating, hives, itching, shortness of breath, wheezing) occur.
- Instruct patient to inform health care professional of crizanlizumab therapy before blood tests due to potential interference with laboratory tests used to measure platelet counts.
- Advise patient to notify health care professional of all Rx or OTC medications, vitamins, or herbal products being taken and to consult with health care professional before taking other medications.
- Rep: May cause fetal harm. Advise patient to notify health care professional if pregnancy is planned or suspected or if breast feeding.

Evaluation/Desired Outcomes

- Decreased frequency of vaso-occlusive crises in patients with sickle cell disease.

crizotinib (kriz-oh-ti-nib)

Xalkori

Classification

Therapeutic: antineoplastics
Pharmacologic: kinase inhibitors

Indications

Metastatic non-small cell lung cancer (NSCLC) that is positive for anaplastic lymphoma kinase (ALK) or ROS1. Relapsed or refractory, systemic anaplastic large cell lymphoma (ALCL) that is positive for ALK.

Action

Inhibits receptor tyrosine kinases including anaplastic lymphoma kinase (ALK), Hepatocyte Growth Factor Receptor (HGFR, c-Met), ROS1, and Recepteur d'Origine Nantais (RON). **Therapeutic Effects:** Decreased spread of lung cancer and improved survival. Decreased spread of systemic ALCL.

Pharmacokinetics

Absorption: 43% absorbed following oral administration.
Distribution: Extensively distributed to tissues.
Metabolism and Excretion: Mostly metabolized by the liver (CYP3A4/5 isoenzymes); also acts as an inhibitor of CYP3A. 53% excreted in feces unchanged, 2.3% eliminated unchanged in urine.
Half-life: 42 hr.

TIME/ACTION PROFILE (blood levels)

ROUTE	ONSET	PEAK	DURATION
PO	unknown	4–6 hr	unknown

Contraindications/Precautions

Contraindicated in: Concurrent use of strong CYP3A inhibitors or inducers; Congenital long QT syndrome; OB: Pregnancy (may cause fetal harm); Lactation: Lactation.

© F.A. Davis Publishing

Use Cautiously in: Heart failure, bradyarrhythmias, electrolyte abnormalities, concurrent medications that prolong QT interval (↑ risk of arrhythmias); Asian patients (↑ blood levels); Moderate or severe hepatic impairment (↓ dose); Severe renal impairment; Rep: Women of reproductive potential and men with female sexual partners of reproductive potential; Pedi: Safety and effectiveness not established in children.

Adverse Reactions/Side Effects

CV: bradycardia, edema, chest pain, QT interval prolongation. **Derm:** rash. **EENT:** visual disturbances. **Endo:** ↓ testosterone. **GI:** HEPATOTOXICITY, constipation, diarrhea, nausea, stomatitis, vomiting, abdominal pain, esophagitis, ↓ appetite. **GU:** ↓ fertility, renal impairment. **Neuro:** neuropathy, dysgeusia, fatigue, headache, insomnia. **Resp:** INTERSTITIAL LUNG DISEASE/PNEUMONITIS. **Misc:** fever.

Interactions

Drug-Drug: Strong CYP3A inhibitors including **atazanavir**, **clarithromycin**, **indinavir**, **itraconazole**, **ketoconazole**, **nefazodone**, **nelfinavir**, **ritonavir**, **saquinavir**, and **voriconazole** may ↑ levels; concurrent use should be avoided; if concurrent use unavoidable, ↓ crizotinib dose. **Strong CYP3A inducers** including **carbamazepine**, **phenobarbital**, **phenytoin**, **rifabutin**, and **rifampin** may ↓ levels and effectiveness; concurrent use should be avoided. May ↑ levels of **alfentanil**, **cyclosporine**, **dihydroergotamine**, **ergotamine**, **fentanyl**, **pimozide**, **quinidine**, **sirolimus**, and **tacrolimus**; avoid concurrent use. **Beta-blockers**, **verapamil**, **diltiazem**, **digoxin**, and **clonidine** may ↑ risk of bradycardia; avoid concurrent use, if possible.

Drug-Natural Products: Concurrent use of **St. John's wort** may ↓ levels and effectiveness and should be avoided.

Drug-Food: Grapefruit or **grapefruit juice** may ↑ levels and should be avoided.

Route/Dosage

Non-Small Cell Lung Cancer

PO (Adults): 250 mg twice daily. Continue until disease progression or unacceptable toxicity. *Concurrent use of strong CYP3A4 inhibitor*—250 mg once daily. Continue until disease progression or unacceptable toxicity.

Renal Impairment

PO (Adults): *CCr <30 mL/min (not on dialysis)*—250 mg once daily. Continue until disease progression or unacceptable toxicity.

Hepatic Impairment

PO (Adults): *Moderate hepatic impairment (AST and total bilirubin >1.5× and ≤3× ULN)*—200 mg twice daily. Continue until disease progression or unacceptable toxicity. *Severe hepatic impairment (AST and total bilirubin >3× ULN)*—250 mg once daily. Continue until disease progression or unacceptable toxicity.

Systemic Anaplastic Large Cell Lymphoma

PO (Children ≥1 yr and body surface area [BSA] ≥1.70 m²): 500 mg twice daily. Continue until disease progression or unacceptable toxicity. *Concurrent use of strong CYP3A4 inhibitor*—250 mg twice daily. Continue until disease progression or unacceptable toxicity.

PO (Children ≥1 yr and BSA 1.52–1.69 m²): 450 mg twice daily. Continue until disease progression or unacceptable toxicity. *Concurrent use of strong CYP3A4 inhibitor*—200 mg twice daily. Continue until disease progression or unacceptable toxicity.

PO (Children ≥1 yr and BSA 1.17–1.51 m²): 400 mg twice daily. Continue until disease progression or unacceptable toxicity. *Concurrent use of strong CYP3A4 inhibitor*—200 mg once daily. Continue until disease progression or unacceptable toxicity.

PO (Children ≥1 yr and BSA 0.81–1.16 m²): 250 mg twice daily. Continue until disease progression or unacceptable toxicity. *Concurrent use of strong CYP3A4 inhibitor*—250 mg once daily. Continue until disease progression or unacceptable toxicity.

PO (Children ≥1 yr and BSA 0.60–0.80 m²): 200 mg twice daily. Continue until disease progression or unacceptable toxicity. *Concurrent use of strong CYP3A4 inhibitor*—Permanently discontinue crizotinib.

Renal Impairment

PO (Children ≥1 yr and BSA ≥1.70 m²): *CCr <30 mL/min (not on dialysis)*—250 mg twice daily. Continue until disease progression or unacceptable toxicity.

Renal Impairment

PO (Children ≥1 yr and BSA ≥1.17–1.69 m²): *CCr <30 mL/min (not on dialysis)*—200 mg twice daily. Continue until disease progression or unacceptable toxicity.

Renal Impairment

PO (Children ≥1 yr and BSA ≥0.81–1.16 m²): *CCr <30 mL/min (not on dialysis)*—250 mg once daily. Continue until disease progression or unacceptable toxicity.

Renal Impairment

PO (Children ≥1 yr and BSA 0.60–0.80 m²): *CCr <30 mL/min (not on dialysis)*—Permanently discontinue therapy.

Hepatic Impairment

PO (Children ≥1 yr and BSA ≥1.70 m²): *Moderate hepatic impairment (AST and total bilirubin >1.5× and ≤3× ULN)*—400 mg twice daily. Continue until disease progression or unacceptable toxicity. *Severe hepatic impairment (AST and total bilirubin >3× ULN)*—250 mg twice daily. Continue until disease progression or unacceptable toxicity.

© F.A. Davis Publishing

Hepatic Impairment

PO (Children ≥1 yr and BSA ≥1.17–1.69 m²): *Moderate hepatic impairment (AST and total bilirubin >1.5× and ≤3× ULN)* — 250 mg twice daily. Continue until disease progression or unacceptable toxicity. *Severe hepatic impairment (AST and total bilirubin >3× ULN)* — 200 mg twice daily. Continue until disease progression or unacceptable toxicity.

Hepatic Impairment

PO (Children ≥1 yr and BSA ≥0.81–1.16 m²): *Moderate hepatic impairment (AST and total bilirubin >1.5× and ≤3× ULN)* — 200 mg twice daily. Continue until disease progression or unacceptable toxicity. *Severe hepatic impairment (AST and total bilirubin >3× ULN)* — 250 mg once daily. Continue until disease progression or unacceptable toxicity.

Hepatic Impairment

PO (Children ≥1 yr and BSA 0.60–0.80 m²): *Moderate hepatic impairment (AST and total bilirubin >1.5× and ≤3× ULN)* — 250 mg once daily. Continue until disease progression or unacceptable toxicity. *Severe hepatic impairment (AST and total bilirubin >3× ULN)* — Permanently discontinue therapy.

Availability

Capsules: 200 mg, 250 mg.

NURSING IMPLICATIONS

Assessment

- Assess respiratory function (lung sounds, dyspnea, oxygen saturation) periodically during therapy.
- Monitor for signs and symptoms of pneumonitis (difficulty breathing, shortness of breath, cough with or without mucus, fever) periodically during therapy. *If any Grade of pneumonitis occurs,* permanently discontinue.
- Assess for signs and symptoms of neuropathy (burning, dysesthesia, hyperesthesia, hypoesthesia, neuralgia, paresthesia, peripheral neuropathy sensory and motor) periodically during therapy. Usually Grade 1.
- Monitor ECG periodically during therapy in patients with HF, bradyarrhythmias, electrolyte imbalances, or taking medications that may prolong QT interval. *If QTc >500 msec on at least 2 separate ECGs,* hold until recovery to baseline or to a QTc <481 msec, then resume at next lower dose. *If QTc >500 msec or ≥60 msec change from baseline with torsade de pointes or polymorphic ventricular tachycardia or signs/symptoms of serious arrhythmia,* permanently discontinue. *If symptomatic bradycardia occurs,* hold dose until heart rate returns to ≥60 bpm. Evaluate concomitant medications; if contributing medication is identified and dose reduced or discontinued, return to previous dose of crizotinib once heart rate is ≥60 bpm and/or bradycardia is asymptomatic. If no contributing medication is identified or dose modifications are not made, resume crizotinib at a reduced dose once heart rate ≥60 bpm and/or bradycardia is asymptomatic. *If bradycardia is life-threatening and no contributing medication identified,* discontinue crizotinib. If contributing medication is identified and dose is reduced or discontinued, reduce crizotinib dose to 250 mg once daily with frequent monitoring once heart rate ≥60 bpm and/or bradycardia is asymptomatic.
- Monitor vision during therapy. If visual symptoms Grade 1 (mild symptoms) or Grade 2 (moderate symptoms affecting ability to perform age-appropriate activities of daily living), monitor symptoms and report any symptoms to an eye specialist. Consider dose reduction for Grade 2 visual disorders. If visual loss (Grade 3 or 4 Ocular Disorder, marked decrease in vision) occurs, hold crizotinib pending evaluation of severe visual loss. For Grade 3 or 4 ocular disorders, with no other cause found on evaluation permanently discontinue crizotinib. Perform an ophthalmological evaluation consisting of best corrected visual acuity, retinal photographs, visual fields, optical coherence tomography (OCT), and other evaluations as appropriate for new onset of severe visual loss.
- Monitor for signs and symptoms of GI toxicity (diarrhea, nausea, vomiting, stomatitis) during therapy. Antiemetics are recommended before and during therapy. *If Grade 3 nausea (inadequate oral intake for >3 days, intervention required) occurs,* hold crizotinib until resolved, then resume at next lower dose. *If Grade 3 vomiting (>6 episodes in 24 hrs for >3 days, intervention required [tube feeding or hospitalization]) or Grade 4 vomiting (life-threatening consequences, urgent intervention indicated) occurs,* hold crizotinib until resolved, then resume at next lower dose level. *If Grade 3 diarrhea (increase of ≥7 stools per day over baseline; incontinence; hospitalization indicated) or Grade 4 (life-threatening consequences, urgent intervention indicated) occurs,* hold crizotinib until resolved, then resume at next lower dose level.
- ***Lab Test Considerations:*** Test patient for ALK or ROS1 positivity in tumor specimens through an FDA approved test http://www.fda.gov/companiondiagnostics prior to starting therapy.
- Verify negative pregnancy test prior to starting therapy.
- Monitor CBC with differential monthly and as clinically indicated; more frequently if Grade 3 or 4 toxicities occur. *If ANC <0.5 × 10⁹/L and 1st occurrence,* hold dose until ANC recovery to 1.0 × 10⁹ /L,

© F.A. Davis Publishing

then resume at the next lower dose. *If 2nd occurrence,* permanently discontinue crizotinib if patient develops febrile neutropenia or infection. For uncomplicated Grade 4 neutropenia, permanently discontinue or hold dose until ANC recovery to 1.0×10^9 /L, then resume at next lower dose. *If platelet count 25–50 $\times 10^9$/L,* hold crizotinib until recovery to platelet count $>50 \times 10^9$ /L and bleeding resolves, then resume at same dose. *If platelet count <25 $\times 10^9$/L,* hold until recovery to platelet count $>50 \times 10^9$/L, then resume at next lower dose. Permanently discontinue for recurrence. *If hemoglobin <8 g/dL,* hold crizotinib until recovery to hemoglobin ≥8 g/dL, then resume at same dose. *If anemia is life-threatening and urgent intervention needed,* hold until recovery to hemoglobin ≥8 g/dL, then resume at next lower dose. Permanently discontinue for recurrence.

- Monitor liver function tests every 2 wk during first 2 mo, then monthly and as clinically indicated; more frequently if Grade 2, 3, 4 abnormalities occur. *If ALT or AST ↑ >5 × upper limit of normal (ULN) with total bilirubin ≤ 1.5 times ULN,* hold crizotinib until recovery to baseline or ≤ 3 × ULN, then resume at next lower dose. *If ALT or AST ↑ >3 × ULN with concurrent total bilirubin ↑ >1.5 × ULN (in the absence of cholestasis or hemolysis),* permanently discontinue crizotinib. *If Grade 3 or 4 AST or ALT ↑ with Grade ≤1 total bilirubin occurs,* hold until recovery to Grade ≤1 or baseline, then resume at 200 mg twice daily.

Implementation

- **Recommended dose reductions:** *1st dose reduction,* 200 mg twice daily. *2nd dose reduction,* 250 mg once daily. *If unable to tolerate 250 mg of crizotinib once daily,* permanently discontinue crizotinib.
- **PO:** Administer twice daily without regard to food. ***DNC:*** Swallow capsules whole, do not crush, dissolve, or open.

Patient/Family Teaching

- Instruct patient to take crizotinib as directed; do not change dose or stop taking without consulting health care professional. If vomiting occurs, do not take extra dose, just take next dose at regular scheduled time. Take missed doses as soon as remembered unless <6 hr until next dose. If <6 hr to next dose, skip dose and return to regular schedule; do not double doses. Advise patient to read the *Patient Information* before starting and with each Rx refill in case of changes.
- Advise patient to avoid eating grapefruit or drinking grapefruit juice during therapy.
- Caution patient that dizziness and visual disorders may occur. Advise patient to avoid driving or other activities requiring alertness until response to medication is known. Visual disturbances generally start within 2 wk of therapy. Instruct patient to notify health care professional if flashes of light, blurry vision, light sensitivity, or new or worse vitreous floaters occur; ophthalmological evaluation should be considered.
- Advise patient to notify health care professional immediately if signs and symptoms of liver problems (weakness, fatigue, anorexia, nausea, vomiting, abdominal pain [especially RUQ abdominal pain], jaundice, dark urine, generalized pruritus, bleeding); lung problems (trouble breathing or shortness of breath, cough with or without mucus, fever); or heart problems (dizziness or fainting, abnormal heartbeats) occur.
- Inform patient that nausea, diarrhea, vomiting, and constipation are common side effects and usually occur during first few days of therapy. Standard antiemetic, antidiarrheal, and laxative medications are usually effective.
- Instruct patient to notify health care professional of all Rx or OTC medications, vitamins, or herbal products being taken and consult health care professional before taking any new medications, especially St. John's wort.
- Rep: May be teratogenic. Advise females of reproductive potential to use effective contraception and to avoid breast feeding during and for at least 45 days following last dose of therapy. Because of potential for genotoxicity, advise males with female partners of reproductive potential to use condoms during treatment and for at least 90 days after final dose. May cause reduced fertility in females and males of reproductive potential; may be irreversible.

Evaluation/Desired Outcomes

- Decreased spread of non-small cell lung cancer.
- Decreased spread of systemic ALCL.

cyanocobalamin, See VITAMIN B_{12} PREPARATIONS.

BEERS

cyclobenzaprine

(sye-kloe-**ben**-za-preen)

Amrix, ~~Flexeril~~

Classification

Therapeutic: skeletal muscle relaxants (centrally acting)

Indications

Management of acute painful musculoskeletal conditions associated with muscle spasm. **Unlabeled Use:** Management of fibromyalgia.

Action

Reduces tonic somatic muscle activity at the level of the brainstem. Structurally similar to tricyclic antidepressants. **Therapeutic Effects:** Reduction in muscle spasm and hyperactivity without loss of function.

© F.A. Davis Publishing

Pharmacokinetics

Absorption: Well absorbed from the GI tract.
Distribution: Unknown.
Protein Binding: 93%.
Metabolism and Excretion: Mostly metabolized by the liver.
Half-life: 1–3 days.

TIME/ACTION PROFILE (skeletal muscle relaxation)

ROUTE	ONSET	PEAK†	DURATION
PO	within 1 hr	3–8 hr	12–24 hr
Extended release	unknown	unknown	24 hr

†Full effects may not occur for 1–2 wk.

Contraindications/Precautions

Contraindicated in: Hypersensitivity; Should not be used within 14 days of MAO inhibitor therapy; Immediate period after MI; Severe or symptomatic cardiovascular disease; Cardiac conduction disturbances; Hyperthyroidism.
Use Cautiously in: Cardiovascular disease; OB: Use only if potential maternal benefit justifies potential fetal risk; Lactation: Use while breast feeding only if potential maternal benefit justifies potential risk to infant; Pedi: Children <15 yr (safety and effectiveness not established); Geri: Appears on Beers list. Poorly tolerated due to anticholinergic effects.

Adverse Reactions/Side Effects

CV: arrhythmias. **EENT:** dry mouth, blurred vision. **GI:** constipation, dyspepsia, nausea, unpleasant taste. **GU:** urinary retention. **Neuro:** dizziness, drowsiness, confusion, fatigue, headache, nervousness.

Interactions

Drug-Drug: Additive CNS depression with other **CNS depressants**, including **alcohol**, **antihistamines**, **opioid analgesics**, and **sedative/hypnotics**. Additive anticholinergic effects with **drugs possessing anticholinergic properties**, including **antihistamines**, **antidepressants**, **atropine**, **disopyramide**, **haloperidol**, and **phenothiazines**. Avoid use within 14 days of **MAO inhibitors** (hyperpyretic crisis, seizures, and death may occur). Drugs that affect serotonergic neurotransmitter systems, including **tricyclic antidepressants**, **SSRIs**, **SNRIs**, **fentanyl**, **buspirone**, **tramadol**, and **triptans** ↑ risk of serotonin syndrome.
Drug-Natural Products: Concomitant use of **kava-kava**, **valerian**, **chamomile**, or **hops** can ↑ CNS depression.

Route/Dosage

PO (Adults and Children ≥15 yo): *Acute painful musculoskeletal conditions*—Immediate-release: 10 mg 3 times daily (range 20–40 mg/day in 2–4 divided doses; not to exceed 60 mg/day); Extended-release: 15–30 mg once daily. *Fibromyalgia*—5–40 mg at bedtime (unlabeled).

Availability (generic available)

Extended-release capsules (Amrix): 15 mg, 30 mg. **Cost:** All strengths $1,437.60/60. **Tablets:** 5 mg, 7.5 mg, 10 mg. **Cost:** *Generic*—5 mg $9.43/100, 10 mg $8.32/100.

NURSING IMPLICATIONS

Assessment

- Assess patient for pain, muscle stiffness, and range of motion before and periodically throughout therapy.
- Geri: Assess geriatric patients for anticholinergic effects (sedation and weakness).
- Assess for serotonin syndrome (mental changes [agitation, hallucinations, coma], autonomic instability [tachycardia, labile BP, hyperthermia], neuromuscular aberrations [hyperreflexia, incoordination], and/or GI symptoms [nausea, vomiting, diarrhea]), especially in patients taking other serotonergic drugs (SSRIs, SNRIs, triptans).

Implementation

- **PO:** May be administered with meals to minimize gastric irritation.
- Swallow extended-release capsules whole; do not open, crush, or chew. Capsules may be opened and contents sprinkled onto applesauce; swallow immediately without chewing. Rinse mouth to make sure contents have been swallowed.

Patient/Family Teaching

- Instruct patient to take medication as directed, at the same time each day; do not take more than the prescribed amount. Take missed doses within 1 hr of time ordered; otherwise, return to normal dose schedule. Do not double doses. Do not stop abruptly, may cause nausea, headache, and malaise; discontinue gradually.
- Medication may cause drowsiness, dizziness, and blurred vision. Caution patient to avoid driving or other activities requiring alertness until response to drug is known.
- Advise patient to avoid concurrent use of alcohol or other CNS depressants with this medication.
- If constipation becomes a problem, advise patient that increasing fluid intake and bulk in diet and stool softeners may alleviate this condition.
- Instruct patient to notify health care professional of all Rx or OTC medications, vitamins, or herbal products being taken and to consult health care professional before taking any other Rx, OTC, or herbal products.
- Advise patient to notify health care professional if symptoms of urinary retention (distended abdomen,

© F.A. Davis Publishing

feeling of fullness, overflow incontinence, voiding small amounts) occur.
- Instruct patient to notify health care professional immediately if signs and symptoms of serotonin syndrome, irregular or abnormal heartbeat, fast heartbeat, or allergic reaction (difficulty breathing, hives, swelling of face or tongue, itching) occur.
- Inform patient that good oral hygiene, frequent mouth rinses, and sugarless gum or candy may help relieve dry mouth.
- Advise female of reproductive potential to notify health care professional if pregnancy is planned or suspected or if breast feeding.

Evaluation/Desired Outcomes

- Relief of muscular spasm in acute skeletal muscle conditions. Maximum effects may not be evident for 1–2 wk. Use is usually limited to 2–3 wk; however, has been effective for at least 12 wk in the management of fibromyalgia.

HIGH ALERT

cyclophosphamide

(sye-kloe-**fos**-fa-mide)

~~Cytoxan~~, Procytox

Classification

Therapeutic: antineoplastics, immunosuppressants

Pharmacologic: alkylating agents

Indications

Alone or with other modalities in the management of: Hodgkin's disease, Malignant lymphomas, Multiple myeloma, Leukemias, Mycosis fungoides, Neuroblastoma, Ovarian carcinoma, Breast carcinoma, and a variety of other tumors. Minimal change nephrotic syndrome in children. **Unlabeled Use:** Severe active rheumatoid arthritis or granulomatosis with polyangiitis.

Action

Interferes with DNA replication and RNA transcription, ultimately disrupting protein synthesis (cell-cycle phase–nonspecific). **Therapeutic Effects:** Death of rapidly replicating cells, particularly malignant ones. Also has immunosuppressant action in smaller doses.

Pharmacokinetics

Absorption: Inactive parent drug is well absorbed from the GI tract. Converted to active drug by the liver.
Distribution: Widely distributed. Limited penetration of the blood-brain barrier. Crosses the placenta; enters breast milk.
Metabolism and Excretion: Converted to active drug by the liver; 30% eliminated unchanged by the kidneys.
Half-life: 4–6.5 hr.

TIME/ACTION PROFILE (effects on blood counts)

ROUTE	ONSET	PEAK	DURATION
PO, IV	7 days	7–15 days	21 days

Contraindications/Precautions

Contraindicated in: Hypersensitivity; OB: Pregnancy (may cause fetal harm); Lactation: Lactation.
Use Cautiously in: Active infections; Bone marrow depression; Other chronic debilitating illnesses; Rep: Women of reproductive potential.

Adverse Reactions/Side Effects

CV: MYOCARDIAL FIBROSIS, hypotension. **Derm:** alopecia. **Endo:** gonadal suppression, syndrome of inappropriate antidiuretic hormone (SIADH). **GI:** anorexia, nausea, vomiting. **GU:** HEMORRHAGIC CYSTITIS, hematuria, ↓ fertility. **Hemat:** LEUKOPENIA, thrombocytopenia, anemia. **Metab:** hyperuricemia. **Resp:** PULMONARY FIBROSIS. **Misc:** secondary neoplasms.

Interactions

Drug-Drug: Phenobarbital or **rifampin** may ↑ toxicity of cyclophosphamide. Concurrent **allopurinol** or **thiazide diuretics** may exaggerate bone marrow depression. May prolong neuromuscular blockade from **succinylcholine**. Cardiotoxicity may be additive with other **cardiotoxic agents** (e.g., **cytarabine**, **daunorubicin**, **doxorubicin**). May ↓ serum **digoxin** levels. Additive bone marrow depression with other **antineoplastics** or **radiation therapy**. May potentiate the effects of **warfarin**. May ↓ antibody response to **live-virus vaccines** and ↑ risk of adverse reactions. Prolongs the effects of **cocaine**.

Route/Dosage

Many regimens are used.
PO (Adults): 1–5 mg/kg/day.
PO (Children): *Induction*—2–8 mg/kg/day (60–250 mg/m²/day) in divided doses for 6 days or longer. *Maintenance*—2–5 mg/kg (50–150 mg/m²/day) twice weekly.
IV (Adults): 40–50 mg/kg in divided doses over 2–5 days *or* 10–15 mg/kg every 7–10 days *or* 3–5 mg/kg twice weekly *or* 1.5–3 mg/kg/day. Other regimens may use larger doses.
IV (Children): *Induction*—2–8 mg/kg/day (60–250 mg/m²/day) in divided doses for 6 days or longer. Total dose for 7 days may be given as a single weekly dose. *Maintenance*—10–15 mg/kg every 7–10 days or 30 mg/kg every 3–4 wk.

Availability (generic available)

Capsules: 25 mg, 50 mg. **Lyophilized powder for injection:** 200 mg/vial, 500 mg/vial, 1 g/vial, 2 g/vial. **Solution for injection:** 200 mg/mL.

© F.A. Davis Publishing

NURSING IMPLICATIONS

Assessment

- Monitor BP, pulse, respiratory rate, and temperature frequently during administration. Report significant changes.
- Monitor urinary output frequently during therapy. To reduce the risk of hemorrhagic cystitis and to promote excretion of uric acid, fluid intake should be at least 3000 mL/day for adults and 1000–2000 mL/day for children. May be administered with mesna. Alkalinization of the urine may be used to help prevent uric acid nephropathy.
- Monitor for bone marrow depression. Assess for bleeding (bleeding gums, bruising, petechiae, guaiac stools, urine, and emesis) and avoid IM injections and taking rectal temperatures if platelet count is low. Apply pressure to venipuncture sites for 10 min. Assess for signs of infection during neutropenia. Anemia may occur. Monitor for increased fatigue, dyspnea, and orthostatic hypotension.
- Assess nausea, vomiting, and appetite. Weigh weekly. Antiemetics may be given 30 min before administration of medication to minimize GI effects. Anorexia and weight loss can be minimized by feeding frequent light meals.
- Assess cardiac and respiratory status for dyspnea, rales/crackles, cough, weight gain, edema. Pulmonary toxicity may occur after prolonged therapy. Cardiotoxicity may occur early in therapy and is characterized by symptoms of HF.
- ***Lab Test Considerations:*** Monitor CBC with differential and platelet count before and periodically during therapy. The nadir of leukopenia occurs in 7–12 days (recovery in 17–21 days). Leukocytes should be maintained at 2500–4000/mm^3. May also cause thrombocytopenia (nadir 10–15 days), and rarely causes anemia.
- Monitor BUN, serum creatinine, and uric acid before and frequently during therapy to detect nephrotoxicity.
- Monitor ALT, AST, LDH, and serum bilirubin before and frequently during therapy to detect hepatotoxicity.
- Urinalysis should be evaluated before initiating therapy and frequently during therapy to detect hematuria or change in specific gravity indicative of SIADH.
- May suppress positive reactions to skin tests for *Candida*, mumps, *Trichophyton*, and tuberculin purified-protein derivative (PPD). May also produce false-positive results in Papanicolaou smears.

Implementation

- ***High Alert:*** Fatalities have occurred with chemotherapeutic agents. Before administering, clarify all ambiguous orders; double-check single, daily, and course-of-therapy dose limits; have second practitioner independently double-check original order, calculations, and infusion pump settings.
- Do not confuse cyclophosphamide with cyclosporine.
- **PO:** Administer in the morning. ***DNC:*** Swallow tablets whole; do not crush, break, or chew.

IV Administration

- **IV:** Solution should be prepared in a biologic cabinet. Wear gloves, gown, and mask while handling medication. If powder or solution comes in contact with skin or mucosa, wash thoroughly with soap and water. Discard equipment in specially designated containers.
- **IV Push:** ***Reconstitution:*** Reconstitute each 100 mg with 5 mL of 0.9% NaCl. Swirl gently to dissolve. Do not reconstitute with sterile water for injection; results in a hypotonic solution not suitable for IV push. ***Concentration:*** 20 mg/mL. Administer reconstituted solution undiluted. ***Rate:*** Inject very slowly.
- **Intermittent Infusion:** ***Reconstitution:*** Reconstitute each 100 mg with 5 mL of 0.9% NaCl or sterile water for injection. Swirl gently to dissolve. Use solution reconstituted with sterile water for injection immediately; solution reconstituted with 0.9% NaCl may be stored at room temperature for 24 hr or if refrigerated for 6 days. Do not administer solutions that contain clear or yellow viscous liquid. ***Dilution:*** May be further diluted in up to 250 mL of D5W, D5/0.9% NaCl, or 0.45% NaCl. ***Concentration:*** minimum 2 mg/mL. ***Rate:*** Infuse very slowly. May reduce rate-dependent adverse reactions (facial swelling, headache, nasal congestion, scalp burning).
- **Y-Site Compatibility:** acyclovir, alemtuzumab, alfentanil, allopurinol, amifostine, amikacin, aminocaproic acid, aminophylline, amiodarone, amphotericin B lipid complex, amphotericin B liposome, ampicillin/sulbactam, anidulafungin, argatroban, arsenic trioxide, atracurium, azithromycin, aztreonam, bivalirudin, bleomycin, bumetanide, buprenorphine, butorphanol, calcium chloride, calcium gluconate, carboplatin, carmustine, caspofungin, cefazolin, cefepime, cefotaxime, cefotetan, cefoxitin, ceftazidime, ceftriaxone, cefuroxime, chloramphenicol, chlorpromazine, ciprofloxacin, cisatracurium, cisplatin, cladribine, clindamycin, cyclosporine, cytarabine, dacarbazine, dactinomycin, daptomycin, daunorubicin hydrochloride, dexamethasone, dexmedetomidine, dexrazoxane, digoxin, diltiazem, diphenhydramine, dobutamine, docetaxel, dopamine, doxorubicin, doxorubicin liposome, doxycycline, droperidol, enalaprilat, ephedrine, epinephrine, epirubicin, ertapenem, erythromycin, esmolol, etoposide, etoposide phosphate, famotidine, fenoldopam, fentanyl, filgrastim, fluconazole, fludarabine,

© F.A. Davis Publishing

fluorouracil, foscarnet, fosphenytoin, furosemide, ganciclovir, gemcitabine, gentamicin, granisetron, haloperidol, heparin, hetastarch, hydralazine, hydrocortisone, hydromorphone, idarubicin, imipenem/cilastatin, insulin regular, irinotecan, isoproterenol, ketorolac, labetalol, leucovorin calcium, levofloxacin, lidocaine, linezolid, lorazepam, magnesium sulfate, mannitol, melphalan, meperidine, meropenem, mesna, methotrexate, methylprednisolone, metoclopramide, metoprolol, metronidazole, midazolam, milrinone, mitomycin, mitoxantrone, morphine, moxifloxacin, nafcillin, nalbuphine, naloxone, nicardipine, nitroglycerin, nitroprusside, norepinephrine, octreotide, ondansetron, oxacillin, oxaliplatin, oxytocin, paclitaxel, palonosetron, pamidronate, pancuronium, pantoprazole, pemetrexed, penicillin G, pentamidine, pentobarbital, phenobarbital, phentolamine, phenylephrine, piperacillin/tazobactam, potassium acetate, potassium chloride, potassium phosphate, procainamide, prochlorperazine, promethazine, propofol, propranolol, quinupristin/dalfopristin, remifentanil, rituximab, rocuronium, sargramostim, sodium acetate, sodium bicarbonate, sodium phosphate, succinylcholine, sufentanil, tacrolimus, theophylline, thiopental, thiotepa, tigecycline, tirofiban, tobramycin, topotecan, trastuzumab, trimethoprim/sulfamethoxazole, vancomycin, vasopressin, vecuronium, verapamil, vinblastine, vincristine, vinorelbine, voriconazole, zidovudine, zoledronic acid.

- **Y-Site Incompatibility:** amphotericin B deoxycholate, diazepam, gemtuzumab, ozogamicin, phenytoin.

Patient/Family Teaching

- Instruct patient to take dose in early morning. Emphasize need for adequate fluid intake for 72 hr after therapy. Patient should void frequently to decrease bladder irritation from metabolites excreted by the kidneys. Report hematuria immediately. If a dose is missed, contact health care professional. Advise caregivers to use gloves when handling capsules. If capsule opens, wash hands thoroughly.
- Instruct patient to notify health care professional promptly if fever; sore throat; signs of infection; lower back or side pain; difficult or painful urination; sores in the mouth or on the lips; yellow discoloration of skin or eyes; bleeding gums; bruising; petechiae; blood in urine, stool, or emesis; unusual swelling of ankles or legs; joint pain; shortness of breath; cough; palpitations; weight gain of more than 5 lb in 24 hr; dizziness; loss of consciousness or confusion occurs. Caution patient to avoid crowds and persons with known infections. Instruct patient to use soft toothbrush and electric razor and to avoid falls. Patient should also be cautioned not to drink alcoholic beverages or to take products containing aspirin or NSAIDs; may precipitate GI hemorrhage.
- Discuss with patient the possibility of hair loss. Explore methods of coping. May also cause darkening of skin and fingernails.
- Instruct patient not to receive any vaccinations without advice of health care professional.
- Rep: May be teratogenic. Advise females of reproductive potential use highly effective contraceptive measures for up to 1 yr after completion and to avoid breast feeding. Advise males with female partners of reproductive potential to wear condoms during and for at least 4 mo after completion of therapy. Advise patient or notify health care professional if pregnancy is planned or suspected. Inform patient that this medication may cause sterility and menstrual irregularities or cessation of menses.

Evaluation/Desired Outcomes

- Decrease in size or spread of malignant tumors.
- Improvement of hematologic status in patients with leukemia. Maintenance therapy is instituted if leukocyte count remains between 2500 and 4000/mm^3 and if patient does not demonstrate serious side effects.
- Management of minimal change nephrotic syndrome in children.

cycloSPORINE†

(**sye**-kloe-spor-een)

Gengraf, Neoral, SandIMMUNE

Classification

Therapeutic: immunosuppressants, antirheumatics (DMARD)

Pharmacologic: polypeptides (cyclic)

†See Appendix B for ophthalmic use

Indications

PO, IV: Prevention and treatment of rejection in renal, cardiac, and hepatic transplantation (with corticosteroids). **PO:** Treatment of severe active rheumatoid arthritis (Neoral only). Treatment of severe recalcitrant psoriasis in adult nonimmunocompromised patients (Neoral only). **Unlabeled Use:** Management of recalcitrant ulcerative colitis. Treatment of steroid-resistant nephrotic syndrome. Treatment of severe steroid-resistant autoimmune disease. Prevention and treatment of graft vs. host disease in bone marrow transplant patients.

Action

Inhibits normal immune responses (cellular and humoral) by inhibiting interleukin-2, a factor necessary for initiation of T-cell activity. **Therapeutic Effects:** Prevention of rejection reactions. Slowed progression of rheumatoid arthritis or psoriasis.

Pharmacokinetics

Absorption: Erratically absorbed (range 10–60%) after oral administration, with significant first-pass me-

© F.A. Davis Publishing

tabolism by the liver. Microemulsion (Neoral) has better bioavailability.

Distribution: Widely distributed, mainly into extracellular fluid and blood cells. Crosses the placenta; enters breast milk.

Protein Binding: 90–98%.

Metabolism and Excretion: Extensively metabolized by the liver by CYP3A4 (first pass); excreted in bile, small amounts excreted unchanged in urine.

Half-life: Children — 7 hr; adults — 19 hr.

TIME/ACTION PROFILE (blood levels)

ROUTE	ONSET	PEAK	DURATION
PO	unknown†	2–6 hr	unknown
IV	unknown	end of infusion	unknown

†Onset of action in rheumatoid arthritis is 4–8 wk and may last 4 wk after discontinuation; for psoriasis, onset is 2–6 wk and lasts 6 wk following discontinuation.

Contraindications/Precautions

Contraindicated in: Hypersensitivity to cyclosporine or polyoxyethylated castor oil (vehicle for IV form); Disulfiram therapy or known alcohol intolerance (IV and oral liquid dose forms contain alcohol); Patients with psoriasis receiving immunosuppressants or radiation; Renal impairment (in patients with rheumatoid arthritis or psoriasis); Uncontrolled hypertension; OB, Lactation: Should not be given unless benefits outweigh risks.

Use Cautiously in: Severe hepatic impairment (dose ↓ recommended); Renal impairment (frequent dose changes may be necessary); Active infection; Pedi: Larger or more frequent doses may be required.

Adverse Reactions/Side Effects

CV: hypertension. **Derm:** hirsutism, acne, psoriasis. **F and E:** hyperkalemia, hypomagnesemia. **GI:** HEPATOTOXICITY, diarrhea, nausea, vomiting, abdominal discomfort, anorexia, pancreatitis. **GU:** nephrotoxicity. **Hemat:** anemia, leukopenia, thrombocytopenia. **Metab:** hyperlipidemia, hyperuricemia. **Neuro:** hyperesthesia, paresthesia, POSTERIOR REVERSIBLE ENCEPHALOPATHY SYNDROME, PROGRESSIVE MULTIFOCAL LEUKOENCEPHALOPATHY, SEIZURES, tremor, confusion, flushing, headache, psychiatric problems. **MS:** lower extremity pain. **Misc:** MALIGNANCY, gingival hyperplasia, hypersensitivity reactions, infection (including activation of latent viral infections such as BK virus-associated nephropathy).

Interactions

Drug-Drug: **Azithromycin**, **clarithomycin**, **allopurinol**, **amiodarone**, **bromocriptine**, **colchicine**, **danazol**, **digoxin**, **diltiazem**, **erythromycin**, **fluconazole**, **fluoroquinolones**, **imatinib**, **itraconazole**, **ketoconazole**, **voriconazole**, **metoclopramide**, **methylprednisolone**, **nefazodone**, **nicardipine**, **protease inhibitors**, **quinupristin/dalfopristin**, **verapamil**, or **hormonal contraceptives** may ↑ serum levels and risk of toxicity. ↑ immunosuppression with other **immunosuppressants** (cyclophosphamide, azathioprine, corticosteroids). **Carbamazepine**, **nafcillin**, **octreotide**, **orlistat**, **oxcarbazepine**, **phenobarbital**, **phenytoin**, **rifampin**, **rifabutin**, or **terbinafine** may ↓ levels and effect. **Bosentan** may significantly ↓ levels; avoid concurrent use. ↑ risk of hyperkalemia with **potassium-sparing diuretics**, **potassium supplements**, or **ACE inhibitors**. May ↑ levels and risk of toxicity of **aliskiren**, **bosentan**, **colchicine**, **digoxin**, **etoposide**, **HMG-CoA reductase inhibitors**, **methotrexate**, **nifedipine**, **repaglinide**, and **sirolimus**. May ↑ levels and risk of toxicity of **ambrisentan**; do not titrate dose of ambrisentan up to maximum daily dose. May ↑ levels of and risk of bleeding with **dabigatran**; avoid concurrent use. May ↓ antibody response to **live-virus vaccines** and ↑ risk of adverse reactions; avoid concurrent use. Concurrent use with **tacrolimus** should be avoided. ↑ risk of renal impairment with **ciprofloxacin**, **aminoglycosides**, **vancomycin**, **trimethoprim/sulfamethoxazole**, **melphalan**, **amphotericin B**, **ketoconazole**, **colchicine**, **NSAIDS**, **cimetidine**, or **fibric acid derivatives**.

Drug-Natural Products: Concomitant use with **echinacea** and **melatonin** may interfere with immunosuppression. Use with **St. John's wort** may cause ↓ serum levels and organ rejection for transplant patients.

Drug-Food: Concurrent ingestion of **grapefruit or grapefruit juice** may ↑ serum levels and should be avoided. **Food** ↓ absorption of microemulsion products (Neoral).

Route/Dosage

Doses are adjusted on the basis of serum level monitoring.

Prevention of Transplant Rejection (Sandimmune)

PO (Adults and Children): 14–18 mg/kg/dose 4–12 hr before transplant then 5–15 mg/kg/day divided every 12–24 hr postoperatively, taper by 5% weekly to maintenance dose of 3–10 mg/kg/day.

IV (Adults and Children): 5–6 mg/kg/dose 4–12 hr before transplant, then 2–10 mg/kg/day in divided doses every 8–24 hr; change to PO as soon as possible.

Prevention of Transplant Rejection (Neoral)

PO (Adults and Children): 4–12 mg/kg/day divided every 12 hr (dose varies depending on organ transplanted).

© F.A. Davis Publishing

Rheumatoid Arthritis (Neoral only)

PO (Adults and Children): 2.5 mg/kg/day given in 2 divided doses; may ↑ by 0.5–0.75 mg/kg/day after 8 and 12 wk, up to 4 mg/kg/day. ↓ dose by 25–50% if adverse reactions occur.

Severe Psoriasis (Neoral only)

PO (Adults): 2.5 mg/kg/day given in 2 divided doses, for at least 4 wk; then may ↑ by 0.5 mg/kg/day every 2 wk, up to 4 mg/kg/day. ↓ dose by 25–50% if adverse reactions occur.

Autoimmune Diseases (Neoral only)

PO (Adults and Children): 1–3 mg/kg/day.

Availability (generic available)

Microemulsion soft gelatin capsules (Gengraf, Neoral): 25 mg, 50 mg, 100 mg. **Microemulsion oral solution (Gengraf, Neoral):** 100 mg/mL. **Soft gelatin capsules (Sandimmune):** 25 mg, 100 mg. **Oral solution (Sandimmune):** 100 mg/mL. **Solution for injection (Sandimmune):** 50 mg/mL.

NURSING IMPLICATIONS

Assessment

- Monitor serum creatinine level, intake and output ratios, daily weight, and BP during therapy. Report significant changes.
- Assess for any new signs or symptoms that may be suggestive of progressive multifocal leukoencephalopathy (PML), an opportunistic infection of the brain caused by the Jakob Cruzfeldt (JC) virus, that may be fatal; withhold dose and notify health care professional promptly. PML symptoms may begin gradually (hemiparesis, apathy, confusion, cognitive deficiencies, and ataxia) and may include deteriorating renal function and renal graft loss.
- Monitor for signs and symptoms of posterior reversible encephalopathy syndrome (PRES) (impaired consciousness, convulsions, visual disturbances including blindness, loss of motor function, movement disorders and psychiatric disturbances, papilloedema, visual impairment). Usually reversible with discontinuation of cyclosporine. Occurs more often in patients with liver transplant than kidney transplant.
- **Prevention of Transplant Rejection:** Assess for symptoms of organ rejection throughout therapy.
- **IV:** Monitor patient for signs and symptoms of hypersensitivity (wheezing, dyspnea, flushing of face or neck) continuously during at least the first 30 min of each treatment and frequently thereafter. Oxygen, epinephrine, and equipment for treatment of anaphylaxis should be available with each IV dose.
- **Arthritis:** Assess pain and limitation of movement prior to and during administration.
- Prior to initiating therapy, perform a physical exam including BP on 2 occasions to determine baseline. Monitor BP every 2 wk during initial 3 mo, then monthly if stable. If hypertension occurs, dose should be reduced.
- **Psoriasis:** Assess skin lesions prior to and during therapy.
- ***Lab Test Considerations:*** Measure serum creatinine, BUN, CBC, magnesium, potassium, uric acid, and lipids at baseline, every 2 wk during initial therapy, and then monthly if stable. Nephrotoxicity may occur; report significant increases.
- May cause hepatotoxicity; monitor for ↑ AST, ALT, alkaline phosphatase, amylase, and bilirubin.
- May cause ↑ serum potassium and uric acid levels and ↓ serum magnesium levels.
- Serum lipid levels may be ↑.
- ***Toxicity and Overdose:*** Evaluate serum cyclosporine levels periodically during therapy. Dose may be adjusted daily, in response to levels, during initiation of therapy. Guidelines for desired serum levels will vary among institutions.

Implementation

- Do not confuse cyclosporine with cyclophosphamide or cycloserine. Do not confuse Sandimmune (cyclosporine) with Sandostatin (octreotide).
- Given with other immunosuppressive agents. Protect transplant patients from staff and visitors who may carry infection. Maintain protective isolation as indicated.
- Microemulsion products (Neoral) and other products (Sandimmune) are not interchangeable.
- **PO:** Draw up oral solution in the pipette provided with the medication. Mix oral solution with milk, chocolate milk, apple juice, or orange juice, preferably at room temperature. Stir well and drink at once. Use a glass container and rinse with more diluent to ensure that total dose is taken. Administer oral doses with meals. Wipe pipette dry; do not wash after use.

IV Administration

- **Intermittent Infusion:** ***Dilution:*** Dilute each 1 mL (50 mg) of IV concentrate immediately before use with 20–100 mL of D5W or 0.9% NaCl for injection. Solution is stable for 24 hr in D5W. In 0.9% NaCl, it is stable for 6 hr in a polyvinylchloride container and 12 hr in a glass container at room temperature. ***Concentration:*** 2.5 mg/mL. ***Rate:*** Infuse slowly over 2–6 hr via infusion pump.
- **Continuous Infusion:** May be administered over 24 hr.
- **Y-Site Compatibility:** alemtuzumab, alfentanil, amikacin, aminocaproic acid, aminophylline, amiodarone, amphotericin B lipid complex, anidulafungin, argatroban, ascorbic acid, atropine, azithromycin, aztreonam, benztropine, bivalirudin, bleomycin, bumetanide, buprenorphine, butorphanol, calcium chloride, calcium gluconate, carboplatin, carmustine, caspofungin, cefazolin, cefotaxime, cefotetan, cefoxitin, ceftaroline, ceftazidime, ceftriaxone, cefuroxime, chloramphenicol, chlorpromazine, cisplatin, clindamycin, cyclophosphamide, cytarabine, dacarbazine, dactinomycin, daptomycin, daunorubicin

© F.A. Davis Publishing

hydrochloride, dexamethasone, dexmedetomidine, dexrazoxane, digoxin, diltiazem, diphenhydramine, dobutamine, docetaxel, dopamine, doxorubicin hydrochloride, doxorubicin liposomal, doxycycline, enalaprilat, ephedrine, epinephrine, epirubicin, epoetin alfa, ertapenem, erythromycin, esmolol, etoposide, etoposide phosphate, famotidine, fenoldopam, fentanyl, fluconazole, fludarabine, fluorouracil, folic acid, foscarnet, fosphenytoin, furosemide, ganciclovir, gemcitabine, gentamicin, glycopyrrolate, granisetron, heparin, hetastarch, hydrocortisone, hydromorphone, ifosfamide, imipenem/cilastatin, indomethacin, irinotecan, isoproterenol, ketorolac, labetalol, leucovorin calcium, levofloxacin, lidocaine, linezolid, lorazepam, mannitol, meperidine, meropenem, methotrexate, methylprednisolone, metoclopramide, metoprolol, metronidazole, micafungin, midazolam, milrinone, mitoxantrone, morphine, moxifloxacin, multivitamins, nafcillin, nicardipine, nitroglycerin, nitroprusside, norepinephrine, octreotide, ondansetron, oxacillin, oxaliplatin, oxytocin, paclitaxel, palonosetron, pamidronate, pancuronium, papaverine, pemetrexed, penicillin G, pentamidine, phentolamine, phenylephrine, phytonadione, piperacillin/tazobactam, potassium acetate, potassium chloride, procainamide, prochlorperazine, promethazine, propofol, propranolol, protamine, pyridoxine, quinupristin/dalfopristin, sargramostim, sodium acetate, sodium bicarbonate, succinylcholine, sufentanil, tacrolimus, theophylline, thiamine, thiotepa, tigecycline, tirofiban, tobramycin, tolazoline, topotecan, vancomycin, vasopressin, vecuronium, verapamil, vinblastine, vincristine, vinorelbine, zoledronic acid.

- **Y-Site Incompatibility:** amphotericin B liposome, cyanocobalamin, dantrolene, diazepam, idarubicin, nalbuphine, pentobarbital, phenobarbital, phenytoin, rituximab, trastuzumab, trimethoprim/sulfamethoxazole, voriconazole.

Patient/Family Teaching

- Instruct patient to take medication at the same time each day with meals, as directed. Take missed doses as soon as remembered within 12 hr. Do not skip doses or double up on missed doses. Do not discontinue medication without advice of health care professional.
- Reinforce the need for lifelong therapy to prevent transplant rejection. Review symptoms of rejection for transplanted organ, and stress need to notify health care professional immediately if they occur.
- Instruct patients and/or parents to notify health care professional if diarrhea develops; decreases absorption of cyclosporine and can result in rejection.
- Instruct patient to avoid grapefruit and grapefruit juice to prevent interaction with cyclosporine.
- Advise patient of common side effects (nephrotoxicity, ↑ BP, hand tremors, increased facial and body hair, gingival hyperplasia). Advise patients that if hair growth is excessive, depilatories or waxing can be used.
- Teach patient the correct method for monitoring BP. Instruct patient to notify health care professional of significant changes in BP or if hematuria, increased frequency, cloudy urine, decreased urine output, fever, sore throat, tiredness, or unusual bruising occurs.
- Instruct patient on proper oral hygiene. Meticulous oral hygiene and dental examinations for teeth cleaning and plaque control every 3 mo will help decrease gingival inflammation and hyperplasia.
- Instruct patient to notify health care professional of all Rx or OTC medications, vitamins, or herbal products being taken and consult health care professional before taking other Rx, OTC, or herbal products or receiving any vaccinations while taking this medication.
- Advise patient to notify health care professional if pregnancy is planned or suspected, or if breast feeding.
- Emphasize the importance of follow-up exams and lab tests.

Evaluation/Desired Outcomes

- Prevention of rejection of transplanted tissues.
- Decrease in severity of pain in patients with rheumatoid arthritis.
- Increased ease of joint movement in patients with rheumatoid arthritis.
- Decrease in progression of psoriasis.

HIGH ALERT

cytarabine (sye-**tare**-a-been)
cytosine arabinoside, Cytosar, ~~Cytosar-U~~

Classification
Therapeutic: antineoplastics
Pharmacologic: antimetabolites

Indications

IV: Used mainly in combination chemotherapeutic regimens for the treatment of leukemias and non-Hodgkin's lymphomas. **IT:** Prophylaxis and treatment of meningeal leukemia.

Action

Inhibits DNA synthesis by inhibiting DNA polymerase (cell-cycle S-phase–specific). **Therapeutic Effects:** Death of rapidly replicating cells, particularly malignant ones.

© F.A. Davis Publishing

Pharmacokinetics

Absorption: Absorption occurs from subcut sites, but blood levels are lower than with IV administration; IT administration results in negligible systemic exposure.

Distribution: Widely distributed; IV- and subcut-administered cytarabine crosses the blood-brain barrier but not in sufficient quantities. Crosses the placenta.

Metabolism and Excretion: Metabolized mostly by the liver; <10% excreted unchanged by the kidneys. Metabolism to inactive drug in the CSF is negligible because the enzyme that metabolizes it is present in very low concentrations in the CSF.

Half-life: *IV, subcut*—1–3 hr; *IT*—100–236 hr.

TIME/ACTION PROFILE (IV, subcut—effects on WBCs; IT—levels in CSF)

ROUTE	ONSET	PEAK	DURATION
Subcut, IV (1st phase)	24 hr	7–9 days	12 days
Subcut, IV (2nd phase)	15–24 days	15–24 days	25–34 days
IT	rapid	5 hr	14–28 days

Contraindications/Precautions

Contraindicated in: Hypersensitivity; OB, Lactation: Pregnancy or lactation; Active meningeal infection (IT only).

Use Cautiously in: Active infections; ↓ bone marrow reserve; Renal/hepatic impairment; Other chronic debilitating illnesses; Rep: Women of reproductive potential.

Adverse Reactions/Side Effects

EENT: corneal toxicity (high dose), hemorrhagic conjunctivitis (high dose), visual disturbances (including blindness). **Resp:** PULMONARY EDEMA (high dose). **CV:** edema. **GI:** HEPATOTOXICITY, nausea, vomiting, severe GI ulceration (high dose), stomatitis. **GU:** urinary incontinence. **Derm:** alopecia, rash. **Endo:** sterility. **Hemat:** *(less with IT use)*—anemia, leukopenia, thrombocytopenia. **Metab:** hyperuricemia. **Neuro:** *Intrathecal only*—CHEMICAL ARACHNOIDITIS, abnormal gait, CNS dysfunction (high dose), confusion, drowsiness, headache. **Misc:** cytarabine syndrome, fever.

Interactions

Drug-Drug: ↑ bone marrow depression with other **antineoplastics** or **radiation therapy**. ↑ risk of cardiomyopathy when used in high-dose regimens with **cyclophosphamide**. May ↓ antibody response to **live-virus vaccines** and ↑ risk of adverse reactions. May ↓ absorption of **digoxin** tablets. May ↓ the efficacy of **gentamicin** when used to treat *Klebsiella pneumoniae* infections. Recent treatment with **asparaginase** may ↑ risk of pancreatitis. ↑ neurotoxicity with concurrently administered **IT antineoplastics** (IT only).

Route/Dosage

Dose regimens vary widely.

IV (Adults): *Induction dose*—200 mg/m²/day for 5 days every 2 wk as a single agent *or* 2–6 mg/kg/day (100–200 mg/m²/day) as a single daily dose *or* in 2–3 divided doses for 5–10 days or until remission occurs as part of combination chemotherapy. *Maintenance*—70–200 mg/m²/day for 2–5 days monthly. *Refractory leukemias/lymphomas*—3 g/m² every 12 hr for up to 12 doses.

Subcut (Adults): *Maintenance*—1–1.5 mg/kg every 1–4 wk.

IT (Adults): Usual dose = 30 mg/m² every 4 days; range = 5–75 mg/m² once daily for 4 days or every 4 days until CNS findings normalize, followed by one additional treatment.

Availability (generic available)

Powder for injection: 100 mg, 500 mg, 1 g, 2 g. **Solution for injection:** 20 mg/mL, 100 mg/mL. ***In combination with:*** daunorubicin (Vyxeos). See Appendix N.

NURSING IMPLICATIONS

Assessment

- Monitor for bone marrow depression. Assess for bleeding (bleeding gums, bruising, petechiae, guaiac stools, urine, and emesis) and avoid IM injections and taking rectal temperatures if platelet count is low. Apply pressure to venipuncture sites for 10 min. Assess for signs of infection during neutropenia. Anemia may occur. Monitor for increased fatigue, dyspnea, and orthostatic hypotension.
- Monitor intake and output ratios and daily weights. Report significant changes in totals.
- Monitor for symptoms of gout (increased uric acid, joint pain, edema). Encourage patient to drink at least 2 L of fluid each day. Allopurinol may decrease uric acid levels. Alkalinization of urine may increase excretion of uric acid.
- Assess nutritional status. Nausea and vomiting may occur within 1 hr of administration, especially if IV dose is administered rapidly, less severe if medication is infused slowly. Administering an antiemetic prior to and periodically throughout therapy and adjusting diet as tolerated may help maintain fluid and electrolyte balance and nutritional status.
- Monitor patient for development of *cytarabine* or *ara-C syndrome* (fever, myalgia, bone pain, chest pain, maculopapular rash, conjunctivitis, malaise), which usually occurs 6–12 hr following administration. Corticosteroids may be used for treatment or prevention. If patient responds to corticosteroids, continue cytarabine and corticosteroids.
- Assess patient for respiratory distress and pulmonary edema. Occurs with high doses rarely; may be fatal.
- Monitor patient for signs of anaphylaxis (rash, dyspnea, swelling). Epinephrine, corticosteroids, and resuscitation equipment should be readily available.

© F.A. Davis Publishing

- **IT:** CSF flow should be evaluated prior to IT therapy. Administer directly into CSF via an intraventricular reservoir or by direct injection into the lumbar sac slowly over 1–5 min. Following administration by lumbar puncture, patient should lie flat for 1 hr. Chemical arachnoiditis (nausea, vomiting, headache, fever, back pain, CSF pleocytosis and neck rigidity, neck pain, or meningism) is an expected side effect of IT cytarabine. Incidence and severity of symptoms may be decreased with coadministration of dexamethasone. 4 mg bid, PO or IV, for 5 days beginning on day of injection.
- Monitor patients receiving IT therapy continuously for the development of neurotoxicity (myelopathy, personality changes, dysarthria, ataxia, confusion, somnolence, coma). If neurotoxicity develops, decrease amount of subsequent doses and discontinue if neurotoxicity persists. Risk may be increased if cytarabine is administered intrathecally and IV within a few days.
- ***Lab Test Considerations:*** Monitor CBC with differential and platelet count prior to and frequently during therapy. Leukocyte counts begin to drop within 24 hr of administration. The initial nadir occurs in 7–9 days. After a small ↑ in the count, the second, deeper nadir occurs 15–24 days after administration. Platelet counts begin to ↓ 5 days after a dose, with a nadir at 12–15 days. Leukocyte and platelet counts usually begin to ↑ 10 days after the nadirs. Therapy is usually withdrawn if leukocyte count is $<1000/mm^3$ or platelet count is $<50{,}000/mm^3$. Bone marrow aspirations are recommended every 2 wk until remission occurs.
- Monitor renal (BUN and serum creatinine) and hepatic function (AST, ALT, bilirubin, alkaline phosphatase, and LDH) prior to and routinely during therapy.
- May cause ↑ uric acid concentrations.

Implementation

- ***High Alert:*** Fatalities have occurred with chemotherapeutic agents. Before administering, clarify all ambiguous orders; double-check single, daily, and course-of-therapy dose limits; have second practitioner independently double-check original order, calculations, and infusion pump settings.
- ***High Alert:*** Do not confuse high-dose and regular therapy. Fatalities have occurred with high-dose therapy.
- Solution should be prepared in a biologic cabinet. Wear gloves, gown, and mask while handling IV medication. Discard IV equipment in specially designated containers.
- May be given subcut, direct IV, intermittent IV, continuous IV, or IT.
- **IV Subcut:** Reconstitute 100-mg vials with 5 mL of bacteriostatic water for injection with benzyl alcohol 0.9% for a concentration of 20 mg/mL. Reconstitute 500-mg vials with 10 mL for a concentration of 50 mg/mL, 1-g vials with 10 mL, and 2-g vials with 20 mL for a concentration of 100 mg/mL. Reconstituted solution is stable for 48 hr. Do not administer a cloudy or hazy solution.

IV Administration

- **IV Push:** ***Dilution:*** Administer undiluted. ***Concentration:*** 100 mg/mL. ***Rate:*** Administer each 100 mg over 1–3 min.
- **Intermittent Infusion:** ***Dilution:*** May be further diluted in 0.9% NaCl, D5W, D10W, D5/0.9% NaCl, Ringer's solution, LR, or D5/LR. ***Concentration:*** Dilute doses in 100 mL of diluent. ***Rate:*** Infuse over 15–30 min.
- **Continuous Infusion:** Rate and concentration for IV infusion are ordered individually.
- **Y-Site Compatibility:** acyclovir, alemtuzumab, alfentanil, amifostine, amikacin, aminocaproic acid, aminophylline, amphotericin B lipid complex, amphotericin B liposome, ampicillin, ampicillin/sulbactam, anidulafungin, argatroban, azithromycin, aztreonam, bivalirudin, bleomycin, bumetanide, buprenorphine, butorphanol, calcium chloride, calcium gluconate, carboplatin, carmustine, cefazolin, cefepime, cefotaxime, cefotetan, cefoxitin, ceftazidime, ceftriaxone, cefuroxime, chlorpromazine, ciprofloxacin, cisatracurium, cisplatin, cladribine, clindamycin, cyclophosphamide, cyclosporine, dacarbazine, daunorubicin, dexamethasone, dexmedetomidine, dexrazoxane, digoxin, diltiazem, diphenhydramine, dobutamine, docetaxel, dopamine, doxorubicin, doxorubicin liposome, doxycycline, droperidol, enalaprilat, ephedrine, epinephrine, ertapenem, erythromycin, esmolol, etoposide, etoposide phosphate, famotidine, fenoldopam, fentanyl, filgrastim, fluconazole, fludarabine, foscarnet, fosphenytoin, furosemide, gemcitabine, gentamicin, granisetron, haloperidol, heparin, hydrocortisone, hydromorphone, idarubicin, ifosfamide, imipenem/cilastatin, insulin, irinotecan, isoproterenol, ketorolac, labetalol, leucovorin, levofloxacin, levorphanol, lidocaine, linezolid, lorazepam, magnesium sulfate, mannitol, melphalan, meperidine, meropenem, mesna, methohexital, methotrexate, methylprednisolone, metoclopramide, metoprolol, metronidazole, midazolam, milrinone, mitoxantrone, morphine, moxifloxacin, nalbuphine, naloxone, nicardipine, nitroglycerin, nitroprusside, norepinephrine, octreotide, ondansetron, oxaliplatin, paclitaxel, palonosetron, pamidronate, pancuronium, pantoprazole, pemetrexed, pentamidine, pentobarbital, phenobarbital, phenylephrine, piperacillin/tazobactam, potassium acetate, potassium chloride, potassium phosphate, procainamide, prochlorperazine, promethazine, propofol, propranolol, quinupristin/

© F.A. Davis Publishing

dalfopristin, remifentanil, rituximab, rocuronium, sargramostim, sodium acetate, sodium bicarbonate, sodium phosphate, succinylcholine, sufentanil, tacrolimus, theophylline, thiopental, thiotepa, tigecycline, tirofiban, tobramycin, trastuzumab, trimethoprim/sulfamethoxazole, vancomycin, vasopressin, vecuronium, verapamil, vincristine, vinorelbine, voriconazole, zidovudine, zoledronic acid.

- **Y-Site Incompatibility:** allopurinol, amiodarone, amphotericin B deoxycholate, daptomycin, diazepam, ganciclovir, phenytoin.
- **IT: Reconstitute IT doses with preservative-free 0.9% NaCl or autologous spinal fluid. Use immediately to prevent bacterial contamination. Instruct patient to lie flat for 1 hr following IT injection. Monitor for immediate toxic reactions.**

Patient/Family Teaching

- Caution patient to avoid crowds and persons with known infections. Report symptoms of infection (fever, chills, cough, hoarseness, sore throat, lower back or side pain, painful or difficult urination) immediately.
- Instruct patient to report unusual bleeding. Advise patient of thrombocytopenia precautions (use soft toothbrush and electric razor, avoid falls, do not drink alcoholic beverages or take medication containing aspirin or NSAIDs; may precipitate gastric bleeding).
- Instruct patient to inspect oral mucosa for redness and ulceration. If mouth sores occur, advise patient to use sponge brush and rinse mouth with water after eating and drinking. Stomatitis may require treatment with opioid analgesics.
- Instruct patient not to receive any vaccinations without advice of health care professional.
- Rep: Advise patient that this medication may have teratogenic effects. Contraception should be used during therapy and for at least 4 mo after therapy is concluded.
- Emphasize the need for periodic lab tests to monitor for side effects.
- **IT:** Inform patient about the expected side effects (headache, nausea, vomiting, fever) and about early signs of neurotoxicity. Instruct patient to notify health care professional if these signs occur.

Evaluation/Desired Outcomes

- Improvement of hematopoietic values in leukemias.
- Decrease in size and spread of the tumor in non-Hodgkin's lymphomas. Therapy is continued every 2 wk until patient is in complete remission or thrombocyte count or leukocyte count falls below acceptable levels.
- Treatment of lymphomatous meningitis.

© F.A. Davis Publishing

dabigatran (da-bi-gat-ran)

Pradaxa

Classification

Therapeutic: anticoagulants
Pharmacologic: thrombin inhibitors

Indications

Reduction in the risk of stroke/systemic embolization associated with nonvalvular atrial fibrillation (AF). Treatment of venous thromboembolic events (including deep vein thrombosis [DVT] or pulmonary embolism [PE]) in patients who have been treated with a parenteral anticoagulant for ≥5 days. Reduction in the risk of recurrence of VTE in patients who have been previously treated. Prevention of DVT and PE following hip replacement surgery.

Action

Acts as a direct inhibitor of thrombin. **Therapeutic Effects:** Reduced risk of thrombotic sequelae (stroke and systemic embolism) in nonvalvular AF. Reduced risk of recurrent PE and DVT. Resolution of DVT and PE.

Pharmacokinetics

Absorption: 3–7% absorbed following oral administration. Bioavailability of oral pellets higher than that of capsules in adults.
Distribution: Unknown.
Metabolism and Excretion: Of the amount absorbed, mostly excreted by kidneys (80%); 86% of ingested dose is eliminated in feces due to poor bioavailability.
Half-life: 12–17 hr.

TIME/ACTION PROFILE (effects on coagulation)

ROUTE	ONSET	PEAK	DURATION
PO	within hrs	unknown	2 days†

†Following discontinuation, 3–5 days in renal impairment.

Contraindications/Precautions

Contraindicated in: Hypersensitivity; Active pathologic bleeding; Concurrent use of P-glycoprotein (P-gp) inducers; Prosthetic heart valves (mechanical or bioprosthetic); Triple-positive antiphospholipid syndrome (↑ risk of thrombosis); OB: Pregnancy; Lactation: Lactation.
Use Cautiously in: Neuroaxial spinal anesthesia or spinal puncture, especially if concurrent with an indwelling epidural catheter, drugs affecting hemostasis, history of traumatic/repeated spinal puncture or spinal deformity (↑ risk of spinal hematoma); Concurrent medications/pre-existing conditions that ↑ bleeding risk (other anticoagulants, antiplatelet agents, fibrinolytics, heparins, chronic NSAID use, labor and delivery); Renal impairment; Surgical procedures (discontinue 1–2 days prior if CCr ≥50 mL/min or 3–4 days prior if CCr <50 mL/min; Rep: Women of reproductive potential; Pedi: Safety and effectiveness in children <3 mo (treatment and reduction in risk of VTE) and <18 yr (all other indications) not established; Geri: ↑ risk of bleeding in older adults.

Adverse Reactions/Side Effects

GI: abdominal pain, diarrhea, dyspepsia, gastritis, esophageal ulceration, nausea. **Hemat:** BLEEDING, thrombocytopenia. **Misc:** HYPERSENSITIVITY REACTIONS (including anaphylaxis and angioedema).

Interactions

Drug-Drug: Concurrent use of other **anticoagulants**, **antiplatelet agents**, **fibrinolytics**, **heparins**, **prasugrel**, **clopidogrel**, or chronic use of **NSAIDs** ↑ risk of bleeding. Concurrent use of **P-gp inducers** including **rifampin** ↓ levels and effectiveness; avoid concurrent use. **P-gp inhibitors**, including **dronedarone**, **ketoconazole (systemic)**, **verapamil**, **quinidine**, and **ticagrelor** may ↑ levels and the risk of bleeding; concomitant use should be avoided in patients with CCr 15–30 mL/min.

Route/Dosage

Do not interchange capsules and oral pellets on a milligram-to-milligram basis and do not combine these dose forms to achieve the total dose.

Reduction in Risk of Stroke/Systemic Embolism in Nonvalvular Atrial Fibrillation

PO (Adults): *Capsules* — 150 mg twice daily.

Renal Impairment

PO (Adults): *CCr 30–50 mL/min and taking dronedarone or systemic ketoconazole* — Capsules: 75 mg twice daily; *CCr <30 mL/min and taking P-gp inhibitor* — Avoid concomitant use; *CCr 15–30 mL/min* — Capsules: 75 mg twice daily; *CCr <15 mL/min or on dialysis* — Not recommended.

Treatment of and Reduction in Risk of Recurrence of Deep Vein Thrombosis or Pulmonary Embolism

Capsules

PO (Adults): 150 mg twice daily.
PO (Children 8–<18 yr and ≥81 kg actual body weight): 260 mg (one 150-mg capsule + one 110-mg capsule *or* one 110-mg capsule + two 75-mg capsules) twice daily.
PO (Children 8–<18 yr and 61–<81 kg actual body weight): 220 mg (two 110-mg capsules) twice daily.

© F.A. Davis Publishing

PO (Children 8–<18 yr and 41–<61 kg actual body weight): 185 mg (one 110-mg capsule + one 75-mg capsule) twice daily.
PO (Children 8–<18 yr and 26–<41 kg actual body weight): 150 mg (one 150-mg capsule *or* two 75-mg capsules) twice daily.
PO (Children 8–<18 yr and 16–<26 kg actual body weight): 110 mg (one 110-mg capsule) twice daily.
PO (Children 8–<18 yr and 11–<16 kg actual body weight): 75 mg (one 75-mg capsule) twice daily.

Oral Pellets

PO (Children 2–<12 yr and ≥41 kg actual body weight): 260 mg (one 110-mg pkt + one 150-mg pkt) twice daily.
PO (Children 2–<12 yr and 21–<41 kg actual body weight): 220 mg (two 110-mg pkts) twice daily.
PO (Children 2–<12 yr and 16–<21 kg actual body weight): 170 mg (one 20-mg pkt + one 150-mg pkt) twice daily.
PO (Children 2–<12 yr and 13–<16 kg actual body weight): 140 mg (one 30-mg pkt + one 110-mg pkt) twice daily.
PO (Children 2–<12 yr and 11–<13 kg actual body weight): 110 mg (one 110-mg pkt) twice daily.
PO (Children 2–<12 yr and 9–<11 kg actual body weight): 90 mg (one 40-mg pkt + one 50-mg pkt) twice daily.
PO (Children 2–<12 yr and 7–<9 kg actual body weight): 70 mg (one 30-mg pkt + one 40-mg pkt) twice daily.
PO (Children 18 mo-<2 yr and 21–<26 kg actual body weight): 180 mg (one 30-mg pkt + one 150-mg pkt) twice daily.
PO (Children 12 mo-<2 yr and 16–<21 kg actual body weight): 140 mg (one 30-mg pkt + one 110-mg pkt) twice daily.
PO (Children 11 mo-<2 yr and 13–<16 kg actual body weight): 140 mg (one 30-mg pkt + one 110-mg pkt) twice daily.
PO (Children 10 mo-<11 mo and 13–<16 kg actual body weight): 100 mg (two 50-mg pkts) twice daily.
PO (Children 18 mo-<2 yr and 11–<13 kg actual body weight): 110 mg (one 110-mg pkt) twice daily.
PO (Children 8 mo-<18 mo and 11–<13 kg actual body weight): 100 mg (two 50-mg pkts) twice daily.
PO (Children 11 mo-<2 yr and 9–<11 kg actual body weight): 90 mg (one 40-mg pkt + one 50-mg pkt) twice daily.
PO (Children 6–<11 mo and 9–<11 kg actual body weight): 80 mg (two 40-mg pkts) twice daily.
PO (Children 5–<6 mo and 9–<11 kg actual body weight): 60 mg (two 30-mg pkts) twice daily.
PO (Children 9 mo-<2 yr and 7–<9 kg actual body weight): 70 mg (one 30-mg pkt + one 40-mg pkt) twice daily.
PO (Children 4–<9 mo and 7–<9 kg actual body weight): 60 mg (two 30-mg pkts) twice daily.
PO (Children 3–<4 mo and 7–<9 kg actual body weight): 50 mg (one 50-mg pkt) twice daily.
PO (Children 5 mo–<2 yr and 5–<7 kg actual body weight): 50 mg (one 50-mg pkt) twice daily.
PO (Children 3–<5 mo and 5–<7 kg actual body weight): 40 mg (one 40-mg pkt) twice daily.
PO (Children 3–<10 mo and 4–<5 kg actual body weight): 40 mg (one 40-mg pkt) twice daily.
PO (Children 3–<6 mo and 3–<4 kg actual body weight): 30 mg (one 30-mg pkt) twice daily.

Renal Impairment

PO (Adults): *CCr <50 mL/min and taking P-gp inhibitor*—Avoid concomitant use; *CCr <30 mL/min or on dialysis*—Not recommended.

Renal Impairment

(Children 8–<18 yr and ≥11 kg): *eGFR <50 mL/min/1.73 m²*—Not recommended.

Prevention of Deep Vein Thrombosis and Pulmonary Embolism Following Hip Replacement Surgery

PO (Adults): *Capsules*—110 mg taken 1–4 hr after surgery and once hemostasis achieved, then 220 mg once daily for 28–35 days; if unable to start on day of surgery, once hemostasis achieved, start with 220 mg once daily.

Renal Impairment

PO (Adults): *CCr <50 mL/min and taking P-gp inhibitor*—Avoid concomitant use; *CCr ≤30 mL/min or on dialysis*—Not recommended.

Availability (generic available)

Capsules: 75 mg, 110 mg, 150 mg. **Oral pellets:** 20 mg/pkt, 30 mg/pkt, 40 mg/pkt, 50 mg/pkt, 110 mg/pkt, 150 mg/pkt.

NURSING IMPLICATIONS

Assessment

- Assess for symptoms of stroke or peripheral vascular disease periodically during therapy.
- Assess for symptoms of bleeding and blood loss; may be fatal. If reversal of anticoagulant effect is required, may use idarucizumab.
- ***Lab Test Considerations:*** Use aPTT or ecarin clotting time (ECT), not INR, to assess anticoagulant activity, if needed.
- Monitor renal function prior to and periodically during therapy. Patients with renal impairment may require dose reduction or discontinuation.

Implementation

- Do not confuse dabigatran with vigabatrin. Do not confuse Pradaxa (dabigatran) with Plavix (clopidogrel).
- Do not exchange capsule for oral pellets. Doses are not equal.

© F.A. Davis Publishing

- When *converting from warfarin*, discontinue warfarin and start dabigatran when INR is <2.0.
- When *converting from dabigatran to warfarin*, adjust starting time based on CCr. For *CCr >50 mL/min*, start warfarin 3 days before discontinuing dabigatran. For *CCr 31–50 mL/min*, start warfarin 2 days before discontinuing dabigatran. For *CCr 15–30 mL/min*, start warfarin 1 day before discontinuing dabigatran. For *CCr <15 mL/min*, no recommendations can be made. INR will better reflect warfarin's effect after dabigatran has been stopped for at least 2 days.
- When *converting from parenteral anticoagulants*, start dabigatran up to 2 hr before next dose of parenteral drug is due or at time of discontinuation of parenteral therapy.
- When *converting from dabigatran to parenteral anticoagulants*, wait 12 hrs (CCr ≥30 mL/min) or 24 hr (CCr <30 mL/min) after last dose of dabigatran before initiating parenteral anticoagulant therapy.
- *For surgery*, discontinue dabigatran 1–2 days (CCr ≥50 mL/min) or 3–5 days (CCr <50 mL/min) before invasive or surgical procedures; consider longer times for major surgery, spinal puncture, or placement of a spinal or epidural catheter. If surgery cannot be delayed, bleeding risk is ↑. Assess bleeding risk with ECT or aPTT if ECT is not available.
- **PO:** Administer twice daily, at the same time each day, about 12 hr apart with a full glass of water without regard to food. ***DNC:*** Swallow capsule whole; do not open, crush, or chew; may result in increased exposure.
- Administer pellets immediately after mixing or within 30 min after mixing. If not administered within 30 min of mixing, discard dose, and prepare a new dose. Mix pellets with 2 teaspoons of soft food (baby rice cereal prepared with water, mashed carrots, apple sauce, mashed banana) at room temperature or spoon pellets directly into mouth and swallowed apple juice or added to 1–2 oz of apple juice for drinking. Do not administer pellets via syringes or feeding tubes, or with milk, milk products, or soft foods containing milk products.
- If dabigatran is discontinued, consider starting another anticoagulant; discontinuation of dabigatran increases risk of thromboembolic events.

Patient/Family Teaching

- Instruct patient to take dabigatran as directed. Take missed doses as soon as remembered within 6 hr. If <6 hr until next dose, skip dose and take next dose when scheduled; do not double doses. Do not discontinue without consulting health care professional. If temporarily discontinued, restart as soon as possible. Store dabigatran at room temperature. After opening bottle, use within 4 mo; discard unused dabigatran after 4 mo. Advise patient to read *Medication Guide* before starting therapy and with each Rx refill in case of changes.
- Inform patient that they may bleed more easily or longer than usual. Advise patient to notify health care professional immediately if signs of bleeding (unusual bruising; pink or brown urine; red or black, tarry stools; coughing up blood; vomiting blood; pain or swelling in a joint; headache; dizziness; weakness; recurring nose bleeds; unusual bleeding from gums; heavier than normal menstrual bleeding; dyspepsia; abdominal pain; epigastric pain) occur.
- Advise patient to notify health care professional of medication regimen prior to treatment or surgery.
- Instruct patient to notify health care professional of all Rx or OTC medications, vitamins, or herbal products being taken and consult health care professional before taking any new medications.
- Rep: Advise females of reproductive potential to notify health care professional if pregnancy is planned or suspected and to avoid breast feeding during therapy. May increase risk of bleeding in the fetus and neonate. Monitor neonates for bleeding. May increase risk of uterine bleeding; advise patient to notify health care professional if significant uterine bleeding occurs.

Evaluation/Desired Outcomes

- Reduction in the risk of stroke and systemic embolism.
- Reduced risk of recurrent PE and DVT.
- Resolution of DVT and PE.

dabrafenib (da-braf-e-nib)

Tafinlar

Classification

Therapeutic: antineoplastics
Pharmacologic: kinase inhibitors

Indications

Metastatic/unresectable melanoma in patients with the BRAF V600E mutation. Metastatic/unresectable melanoma in patients with the BRAF V600E or V600K mutation (in combination with trametinib). Adjuvant treatment of melanoma in patients with the BRAF V600E or V600K mutation and lymph node involvement following complete resection (in combination with trametinib). Metastatic non–small-cell lung cancer (NSCLC) in patients with the BRAF V600E mutation (in combination with trametinib). Locally advanced or metastatic anaplastic thyroid cancer (ATC) in patients with the BRAF V600E mutation and no satisfactory locoregional treatment options (in combination with trametinib).

© F.A. Davis Publishing

Action
Inhibits kinase, an enzyme that promotes cell proliferation. **Therapeutic Effects:** Decreased spread/progression of melanoma, NSCLC, and ATC.

Pharmacokinetics
Absorption: Well absorbed (95%) following oral administration.
Distribution: Unknown.
Protein Binding: 99.7%.
Metabolism and Excretion: Mostly metabolized by CYP2C8 and CYP3A4 enzyme systems; two metabolites (hydroxy-dabrafenib and desmethyl-1–dabrafenib) have antineoplastic activity. Excreted as metabolites in feces (72%) and urine (23%).
Half-life: *Dabrafenib*—8 hr; *hydroxy-dabrafenib*—10 hr, *desmethyl-1–dabrafenib*—21–22 hr.

TIME/ACTION PROFILE (progression-free survival)

ROUTE	ONSET	PEAK	DURATION
PO	within 1 mo	1–2 mo	8 mo

Contraindications/Precautions
Contraindicated in: Concurrent use of CYP3A4/CYP2C8 inhibitors or inducers (may significantly alter levels and effects); OB: Pregnancy (may cause fetal harm); Lactation: Lactation.
Use Cautiously in: BRAF Wild-type melanoma (may ↑ proliferation); History of glucose-6–phosphate dehydrogenase deficiency (may cause hemolytic anemia); Diabetes; Moderate or severe hepatic impairment; Moderate or severe renal impairment; Rep: Women of reproductive potential and men with female partners of reproductive potential; Pedi: Safety and effectiveness in children not established.

Adverse Reactions/Side Effects
CV: HF, THROMBOEMBOLISM. **Derm:** DRUG REACTION WITH EOSINOPHILIA AND SYSTEMIC SYMPTOMS (DRESS), STEVENS-JOHNSON SYNDROME, alopecia, hyperkeratosis, palmar-plantar erythrodysesthesia, papilloma, cutaneous squamous cell carcinoma. **EENT:** iritis, retinal detachment, uveitis. **Endo:** hyperglycemia. **F and E:** hypophosphatemia, hyponatremia. **GI:** constipation, pancreatitis. **Hemat:** BLEEDING. **MS:** arthralgia, back pain, myalgia. **Neuro:** headache, fatigue. **Resp:** cough, nasopharyngitis. **Misc:** MALIGNANCY, fever including serious febrile reactions, ↑ alkaline phosphatase, chills, tumor promotion.

Interactions
Drug-Drug: Concurrent use of strong inhibitors of CYP3A4 or CYP2C8, including **ketoconazole**, **nefazodone**, **clarithromycin**, and **gemfibrozil** ↑ levels and the risk of toxicity and should be avoided. Careful monitoring for toxicity is required. Concurrent use of **strong inducers of CYP3A4 or CYP2C8** including **carbamazepine**, **phenobarbital**, **phenytoin**, and **rifampin** ↓ levels and may ↓ effectiveness. Careful monitoring for decreased results is required. **Drugs that ↑ gastric pH** including **antacids**, **H_2–receptor antagonists** and **proton pump inhibitors** may ↓ levels and effectiveness. May ↓ effectiveness of other **CYP3A4 substrates** and **CYP2C9 substrates**, including **midazolam**, **warfarin**, **dexamethasone**, and **hormonal contraceptives**.
Drug-Natural Products: St. John's wort ↓ levels and may ↓ effectiveness; concurrent use should be avoided.

Route/Dosage
PO (Adults): 150 mg twice daily until disease progression or unacceptable toxicity.

Availability
Capsules: 50 mg, 75 mg.

NURSING IMPLICATIONS
Assessment
- Perform skin examinations prior to starting therapy and every 2 mo during and for 6 mo after completion of therapy. *If intolerable Grade 2 skin toxicity, Grade 3, or Grade 4 occurs,* hold dabrafenib for up to 3 wk. If improved, resume at a lower dose. If not improved, permanently discontinue.
- Monitor temperature. *If fever is 101.3°F to 104°F,* hold dabrafenib until fever resolves, then resume at same dose. *If fever is >104°F or complicated by rigors, hypotension, dehydration, or renal failure*, hold until fever resolves, then resume at a reduced dose.
- Monitor for signs and symptoms of ocular toxicities (blurred vision, loss of vision, other vision changes, see color dots, halo around objects, swelling, redness, photophobia, eye pain). May require steroid and mydriatic ophthalmic drops. *If iritis occurs,* do not modify dabrafenib dose. If severe uveitis or mild to moderate uveitis that does not respond to ocular therapy, hold dabrafenib for up to 6 wk. If improved to Grade 0–1, resume at same or lower dose. If not improved, permanently discontinue therapy.
- Monitor cardiac function (LVEF) by ECG or multigated acquisition (MUGA) scan before starting therapy with dabrafenib with trametinib, 1 mo after initiation of therapy, and then at 2- to 3-mo intervals during therapy. *If symptomatic HF occurs with absolute decrease in LVEF >20% from baseline that is below LLN,* hold dabrafenib until improved to institutional LLN and absolute decrease to ≤10% compared to baseline, then resume at same dose.
- Monitor for signs and symptoms of venous thromboembolism (shortness of breath, chest pain, arm or leg swelling, cool or pale arm or leg) during therapy. *If uncomplicated deep vein thrombosis (DVT) or pulmonary embolus (PE) occurs,* do not modify dabrafenib dose. Withhold trametinib for up to 3 wk. If improved to Grade 0–1, resume at lower dose. If not improved, permanently discontinue. *If*

© F.A. Davis Publishing

life-threatening PE occurs, permanently discontinue dabrafenib and trametinib.

- Monitor for signs and symptoms of interstitial lung disease or pneumonitis (cough, dyspnea, hypoxia, pleural effusion, infiltrates) during therapy. If signs and symptoms occur, do not modify dabrafenib dose; permanently discontinue trametinib.
- Assess for bleeding (headaches, dizziness, feeling weak, coughing up blood or blood clots, vomiting blood or vomit looks like "coffee grounds," red or black stools that look like tar) during therapy. *If Grade 3 hemorrhagic event occurs,* withhold dabrafenib and trametinib for up to 3 wk, if improved resume at lower level. *If Grade 4 hemorrhagic event occurs,* permanently discontinue dabrafenib and trametinib.
- ***Lab Test Considerations:*** Verify negative pregnancy test prior to starting therapy.
- Confirm presence of BRAF V600E mutation in tumor specimens prior to therapy with dabrafenib and confirm the presence of BRAF V600E or V600K mutation in tumor specimens prior to therapy with dabrafenib and trametinib. Information on FDA-approved tests for the detection of BRAF V600 mutations in melanoma and NSCLC is available at: http://www.fda.gov/CompanionDiagnostics. No FDA approved test for detection of BRAF V600E mutation in ATC is available.
- May cause hyperglycemia requiring increase in dose of or initiation of insulin or oral hypoglycemic agents. Monitor serum glucose levels in patients with pre-existing diabetes or hyperglycemia.
- May cause hypophosphatemia, ↑ alkaline phosphatase, and hyponatremia.
- Monitor for hemolytic anemia in patients with glucose-6–phosphate dehydrogenase (G6PD) deficiency.

Implementation

- Evidence of BRAF V600E or V600K mutation status must be confirmed prior to starting therapy with dabrafenib for melanoma or NSCLC.
- Dose reduction recommendations: 1st dose reduction, 100 mg PO twice daily; 2nd dose reduction, 75 mg PO twice daily; 3rd dose reduction, 50 mg PO twice daily. If patient is unable to tolerate 50 mg twice daily, permanently discontinue dabrafenib.
- **PO:** Administer twice daily about 12 hr apart. Administer on an empty stomach at least 1 hr before or 2 hr after a meal. ***DNC:*** Swallow capsules whole; do not open, crush, break, or chew.
- When administered with trametinib, administer once-daily dose of trametinib at same time each day with either morning or evening dose of dabrafenib.

Patient/Family Teaching

- Instruct patient to take dabrafenib as directed at least 1 hr before or 2 hr after meals. Take missed doses as soon as remembered unless within 6 hr of next dose, then skip missed dose and take regularly scheduled dose. Advise patient to read *Medication Guide* before starting therapy and with each Rx refill in case of changes.
- Inform patient that dabrafenib increases risk of developing new cutaneous malignancies. Notify health care professional immediately if new lesions (wart, skin sore, or reddish bump that bleeds or does not heal) or changes in size or color of existing moles or lesions occur.
- Advise patient to notify health care professional of all Rx or OTC medications, vitamins, or herbal products being taken and to consult with health care professional before taking other medications, especially St. John's wort.
- Inform patient of potential side effects. Advise patient to notify health care professional if fever, signs and symptoms of hyperglycemia (increased thirst, urinating more often than normal, breath smells like fruit), or eye problems, bleeding, thromboembolism, heart failure (heart pounding or racing, shortness of breath, swelling of ankles and feet, feeling lightheaded) occur.
- Rep: Advise females of reproductive potential and males (including those who have had vasectomies) with female partner of reproductive potential to use a highly effective form of contraception during and for at least 2 wk after last dose of dabrafenib. Use a nonhormonal form of contraception; dabrafenib may decrease effectiveness of hormonal contraceptives. Advise patient to notify health care professional if pregnancy is suspected and to avoid breast feeding during and for 2 wk after last dose. Advise patients to seek counseling on fertility and family planning prior to beginning therapy; may permanently impair fertility in females and males.

Evaluation/Desired Outcomes

- Decrease in progression of malignant melanoma, NSCLC, and ATC.

HIGH ALERT

dacarbazine (da-**kar**-ba-zeen)

DTIC, DTIC-Dome

Classification

Therapeutic: antineoplastics
Pharmacologic: alkylating agents

Indications

Treatment of metastatic malignant melanoma (single agent). Treatment of Hodgkin's disease as second-line therapy (with other agents).

© F.A. Davis Publishing

Action

Disrupts DNA and RNA synthesis (cell-cycle phase–nonspecific). **Therapeutic Effects:** Death of rapidly growing tissue cells, especially malignant ones.

Pharmacokinetics

Absorption: IV administration results in complete bioavailability.
Distribution: Large volume of distribution; probably concentrates in liver; some CNS penetration.
Metabolism and Excretion: 50% metabolized by the liver, 50% excreted unchanged by the kidneys.
Half-life: 5 hr (↑ in renal and hepatic dysfunction).

TIME/ACTION PROFILE (effects on blood counts)

ROUTE	ONSET	PEAK	DURATION
IV (WBCs)	16–20 days	21–25 days	3–5 days
IV (platelets)	unknown	16 days	3–5 days

Contraindications/Precautions

Contraindicated in: Hypersensitivity; OB, Lactation: Pregnancy or lactation.
Use Cautiously in: Active infections; Bone marrow depression; Pedi: Children (safety not established); Renal dysfunction; Hepatic dysfunction.

Adverse Reactions/Side Effects

GI: HEPATIC NECROSIS, anorexia, nausea, vomiting, diarrhea, hepatic vein thrombosis. **Derm:** alopecia, facial flushing, photosensitivity, rash. **Endo:** gonadal suppression. **Hemat:** anemia, leukopenia, thrombocytopenia. **Local:** pain at IV site, phlebitis at IV site, tissue necrosis. **MS:** myalgia. **Neuro:** facial paresthesia.
Misc: ANAPHYLAXIS, fever, flu-like syndrome, malaise.

Interactions

Drug-Drug: Additive bone marrow depression with other **antineoplastics**. **Carbamazepine**, **phenobarbital**, and **rifampin** may ↑ metabolism and ↓ effectiveness. Blood levels may be ↑ with **amiodarone**, **ciprofloxacin**, **fluvoxamine**, **ketoconazole**, **ofloxacin**, **isoniazid**, or **miconazole**. May ↓ antibody response to **live-virus vaccines** and ↑ risk of adverse reactions.

Route/Dosage

Other regimens are used.
IV (Adults): *Malignant melanoma*—2–4.5 mg/kg/day for 10 days administered every 4 wk *or* 250 mg/m²/day for 5 days administered every 3 wk. *Hodgkin's disease*—150 mg/m²/day for 5 days (in combination with other agents) administered every 4 wk *or* 375 mg/m² (in combination with other agents) administered every 15 days.

Availability

Powder for injection: 200 mg.

NURSING IMPLICATIONS

Assessment

- Monitor vital signs prior to and frequently during therapy.
- Monitor for bone marrow depression. Assess for bleeding (bleeding gums, bruising, petechiae, guaiac stools, urine, and emesis) and avoid IM injections and rectal temperatures if platelet count is low. Apply pressure to venipuncture sites for 10 min. Assess for signs of infection during neutropenia. Anemia may occur. Monitor for increased fatigue, dyspnea, and orthostatic hypotension.
- Monitor IV site closely. Dacarbazine is an irritant. Instruct patient to notify health care professional immediately if discomfort at IV site occurs. Discontinue IV immediately if infiltration occurs. Applications of hot packs may relieve pain, burning sensation, and irritation at injection site.
- Monitor intake and output, appetite, and nutritional intake. Assess for nausea and vomiting, which may be severe and last 1–12 hr. Administration of an antiemetic prior to and periodically during therapy, restricting oral intake for 4–6 hr prior to administration, and adjusting diet as tolerated may help maintain fluid and electrolyte balance and nutritional status. Nausea usually decreases on subsequent doses.
- ***Lab Test Considerations:*** Monitor CBC and differential prior to and periodically throughout therapy. The nadir of thrombocytopenia occurs in 16 days. The nadir of leukopenia occurs in 3–4 wk. Recovery begins in 5 days. Withhold dose and notify physician if platelet count is <100,000/mm³ or leukocyte count is <4000/mm³.
- Monitor for increased AST, ALT, BUN, and serum creatinine. May cause hepatic necrosis.

Implementation

- ***High Alert:*** Fatalities have occurred with chemotherapeutic agents. Before administering, clarify all ambiguous orders; double-check single, daily, and course-of-therapy dose limits; have second practitioner independently double-check original order, calculations, and infusion pump settings.

IV Administration

- Prepare solution in a biologic cabinet. Wear gloves, gown, and mask while handling medication. Discard equipment in designated containers.
- Reconstitute each 200-mg vial with 19.7 mL of sterile water for injection. Solution is colorless or clear yellow. Do not use solution that has turned pink. ***Concentration:*** 10 mg/mL. Solution is stable for 8 hr at room temperature and for 72 hr if refrigerated.
- **Intermittent Infusion:** ***Dilution:*** Further dilute with up to 250 mL of D5W or 0.9% NaCl. Stable for 24 hr if refrigerated or 8 hr at room temperature. ***Rate:*** Administer over 30–60 min.
- **Y-Site Compatibility:** amifostine, aztreonam, bivalirudin, caspofungin, daptomycin, dexmedetomi-

© F.A. Davis Publishing

dine, docetaxel, doxorubicin liposome, ertapenem, etoposide phosphate, fenoldopam, filgrastim, fludarabine, granisetron, hetastarch, levofloxacin, melphalan, octreotide, ondansetron, oxaliplatin, paclitaxel, palonosetron, quinupristin/dalfopristin, sargramostim, thiotepa, tigecycline, tirofiban, vinorelbine, voriconazole.

- **Y-Site Incompatibility:** allopurinol, amphotericin B liposome, cefepime, pantoprazole, pemetrexed, piperacillin/tazobactam.

Patient/Family Teaching

- Instruct patient to notify health care professional if fever; chills; sore throat; signs of infection; bleeding gums; bruising; petechiae; abdominal pain; yellowing of eyes; or blood in urine, stool, or emesis occurs. Caution patient to avoid crowds and persons with known infections. Instruct patient to use soft toothbrush and electric razor. Patients should be cautioned not to drink alcoholic beverages or take products containing aspirin or NSAIDs; may increase GI irritation.
- May cause photosensitivity. Instruct patient to avoid sunlight or wear protective clothing and use sunscreen for 2 days after therapy.
- Instruct patient to inform health care professional if flu-like syndrome occurs. Symptoms include fever, myalgia, and general malaise. May occur after several courses of therapy. Usually occurs 1 wk after administration. May persist for 1–3 wk. Acetaminophen may be used for relief of symptoms.
- Discuss with patient the possibility of hair loss. Explore coping strategies.
- Advise patient of the need for a nonhormonal method of contraception.
- Instruct patient not to receive any vaccinations without advice of health care professional.

Evaluation/Desired Outcomes

- Decrease in size and spread of malignant melanoma or Hodgkin's lymphoma.

dalbavancin (dal-ba-**van**-sin)

Dalvance, Xydalba

Classification

Therapeutic: anti-infectives
Pharmacologic: lipoglycopeptides

Indications

Treatment of acute bacterial skin/skin structure infections due to susceptible bacteria.

Action

Binds to bacterial cell wall resulting in cell death.

Therapeutic Effects: Bactericidal action against susceptible bacteria with resolution of infection.

Spectrum: Active against *Staphylococcus aureus* (including methicillin-susceptible and methicillin-resistant strains), *Streptococcus agalactiae*, *Streptococcus dysgalactiae*, *Streptococcus anginosus* (including *S. anginosus*, *S. intermedius*, and *S. constellatus*), *Streptococcus pyogenes*, and *Enterococcus faecalis* (only isolates susceptible to vancomycin).

Pharmacokinetics

Absorption: IV administration results in complete bioavailability.

Distribution: Penetrates tissues and fluids.

Metabolism and Excretion: 33% eliminated unchanged in urine, 12% eliminated as inactive metabolite, 20% excreted in feces.

Half-life: 346 hr.

TIME/ACTION PROFILE (blood levels)

ROUTE	ONSET	PEAK	DURATION
IV	unknown	end of infusion	1 wk

Contraindications/Precautions

Contraindicated in: Hypersensitivity.

Use Cautiously in: Renal impairment (dose adjustment required for adults with CCr <30 mL/min and not receiving hemodialysis); Moderate to severe hepatic impairment; OB: Safety not established in pregnancy; Lactation: Safety not established in breast feeding; Geri: Consider age-related ↓ in renal function.

Adverse Reactions/Side Effects

Derm: pruritus, rash. **GI:** CLOSTRIDIOIDES DIFFICILE-ASSOCIATED DIARRHEA (CDAD), ↑ liver enzymes, nausea. **Neuro:** headache. **Misc:** HYPERSENSITIVITY REACTIONS (including anaphylaxis), infusion reactions (including infusion-related reaction resembling vancomycin flushing syndrome).

Interactions

Drug-Drug: None noted.

Route/Dosage

IV (Adults): 1500 mg as a single dose *or* 1000 mg followed 1 wk later by 500 mg.

IV (Children 6–<18 yr): *CCr ≥30 mL/min/1.73 m²* — 18 mg/kg (max dose = 1500 mg) as a single dose.

IV (Children Birth–<6 yr): *CCr ≥30 mL/min/1.73 m²* — 22.5 mg/kg (max dose = 1500 mg) as a single dose.

Renal Impairment

IV (Adults): *CCr <30 mL/min (with no hemodialysis)* — 1125 mg as a single dose *or* 750 mg followed 1 wk later by 375 mg.

Availability

Lyophilized powder for injection: 500 mg/vial.

= Canadian drug name. = Genetic implication. ~~Strikethrough~~ = Discontinued.
*CAPITALS indicates life-threatening; underlines indicate most frequent.

© F.A. Davis Publishing

NURSING IMPLICATIONS

Assessment

- Assess for infection (vital signs; appearance of wound, sputum, urine, and stool; WBC) at beginning of and during therapy.
- Obtain specimens for culture and sensitivity prior to therapy. First dose may be given before receiving results.
- Monitor bowel function. Diarrhea, abdominal cramping, fever, and bloody stools should be reported to health care professional promptly as a sign of *Clostridioides difficile*-associated diarrhea (CDAD). May begin up to 2 mo following cessation of therapy.
- Monitor for infusion reactions (infusion-related reaction resembling vancomycin flushing syndrome—flushing of upper body, urticaria, pruritus, rash, back pain). May resolve with stopping or slowing infusion.
- ***Lab Test Considerations:*** Monitor hepatic function tests. May cause ↑ ALT, AST, and bilirubin.

Implementation

IV Administration

- **Intermittent Infusion:** ***Reconstitution:*** Reconstitute with 25 mL of sterile water or D5W in each 500-mg vial. Alternate gentle swirling and inverting to avoid foaming, until completely dissolved. Do not shake. Reconstituted vial contains a clear colorless to yellow solution. Do not administer solutions that are discolored or contain particulate matter. Transfer reconstituted solution into D5W. ***Concentration:*** 1 mg/mL to 5 mg/mL. Discard unused solution. May be refrigerated or kept at room temperature; do not freeze. Infuse within 48 hr of reconstitution. Do not administer solutions containing particulate matter. ***Rate:*** Infuse over 30 min.
- **Y-Site Incompatibility:** Do not infuse with other medications or electrolytes. Saline solutions may cause precipitation. Flush line before and after infusion with D5W.

Patient/Family Teaching

- Explain purpose of dalbavancin to patient.
- Instruct patient to notify health care professional if signs and symptoms of hypersensitivity reactions (rash, hives, dyspnea, facial swelling) occur.
- Instruct patient to notify health care professional immediately if diarrhea, abdominal cramping, fever, or bloody stools occur and not to treat with antidiarrheals without consulting health care professionals.
- Advise patient to notify health care professional of all Rx or OTC medications, vitamins, or herbal products being taken and to consult with health care professional before taking other medications.
- Advise females of reproductive potential to notify health care professional if pregnancy is planned or suspected or if breast feeding.
- Instruct the patient to notify health care professional if symptoms do not improve.

Evaluation/Desired Outcomes

- Resolution of the signs and symptoms of infection. Length of time for complete resolution depends on the organism and site of infection.

dalfampridine

(dal-**fam**-pri-deen)

Ampyra, ✱Fampyra

Classification

Therapeutic: anti-multiple sclerosis agents

Pharmacologic: potassium channel blockers

Indications

Treatment of multiple sclerosis, to improve walking speed.

Action

Acts as a potassium channel blocker, which may increase conduction of action potentials. **Therapeutic Effects:** Increased walking speed in patients with multiple sclerosis.

Pharmacokinetics

Absorption: Rapidly and completely absorbed (96%).

Distribution: Unknown.

Metabolism and Excretion: 96% eliminated in urine, 0.5% in feces.

Half-life: 5.2–6.5 hr.

TIME/ACTION PROFILE (improvement in walking speed)

ROUTE	ONSET	PEAK	DURATION
PO	unknown	3–4 hr	24 hr

Contraindications/Precautions

Contraindicated in: Hypersensitivity; History of seizures; Moderate/severe renal impairment (CCr ≤50 mL/min) (↑ risk of seizures).

Use Cautiously in: Mild renal impairment (CCr 51–80 mL/min) (↑ risk of seizures); OB: Safety not established in pregnancy; Lactation: Safety not established in breast feeding; Pedi: Safety and effectiveness not established in children; Geri: Consider age-related ↓ in renal function.

Adverse Reactions/Side Effects

EENT: nasopharyngitis, pharyngolaryngeal pain. **GI:** constipation, dyspepsia, nausea. **GU:** urinary tract infection. **MS:** back pain. **Neuro:** SEIZURES, dizziness, headache, insomnia, weakness, balance disorder, multiple sclerosis relapse, paresthesia. **Misc:** ANAPHYLAXIS.

Interactions

Drug-Drug: Cimetidine may ↑ levels and ↑ risk of seizures.

Route/Dosage

PO (Adults): 10 mg twice daily.

© F.A. Davis Publishing

Availability (generic available)
Extended-release tablets: 10 mg.

NURSING IMPLICATIONS

Assessment
- Assess walking speed in patients with multiple sclerosis prior to and periodically during therapy.
- Monitor for seizures during therapy, risk increases with increased dose. If seizure occurs, discontinue therapy.
- Monitor for signs and symptoms of anaphylaxis (dyspnea, wheezing, urticaria, angioedema of the throat or tongue) during therapy.
- ***Lab Test Considerations:*** Monitor CCr prior to and at least yearly during therapy; renal impairment may require dose reduction or discontinuation.

Implementation
- Administer tablets twice daily approximately 12 hr apart without regard to food. ***DNC:*** Swallow tablets whole; do not break, crush, chew, or dissolve.

Patient/Family Teaching
- Instruct patient to take dalfampridine as directed, with approximately 12 hr between tablets. If a dose is missed, omit and take next scheduled dose on time; do not double doses. May increase risk of seizures. Advise patient to read *Medication Guide* prior to beginning therapy and with each Rx refill in case of changes.
- Instruct patient to notify health care professional of all Rx or OTC medications, vitamins, or herbal products being taken and consult health care professional before taking any new medications.
- If a seizure or signs or symptoms of anaphylaxis occur, advise patient to notify health care professional immediately, to discontinue dalfampridine, and to not restart medication.
- Advise females of reproductive potential to notify health care professional if pregnancy is planned or suspected or if breast feeding.

Evaluation/Desired Outcomes
- Improved walking and increased walking speed in patients with multiple sclerosis.

dalteparin, See HEPARINS (LOW MOLECULAR WEIGHT).

dantrolene (dan-troe-leen)
Dantrium, Revonto, Ryanodex

Classification
Therapeutic: skeletal muscle relaxants (direct acting)

Indications
PO: Treatment of spasticity associated with: Spinal cord injury, stroke, cerebral palsy, multiple sclerosis. Prophylaxis of malignant hyperthermia. **IV:** Emergency treatment of malignant hyperthermia. Prevention of malignant hyperthermia in patients at high risk. **Unlabeled Use:** Management of neuroleptic malignant syndrome.

Action
Acts directly on skeletal muscle, causing relaxation by decreasing calcium release from sarcoplasmic reticulum in muscle cells. Prevents intense catabolic process associated with malignant hyperthermia. **Therapeutic Effects:** Reduction of muscle spasticity. Treatment and prevention of malignant hyperthermia.

Pharmacokinetics
Absorption: 35% absorbed after oral administration. IV administration results in complete bioavailability.
Distribution: Unknown.
Metabolism and Excretion: Almost entirely metabolized by the liver.
Half-life: 8.7–11.4 hr.

TIME/ACTION PROFILE (effects on spasticity)

ROUTE	ONSET	PEAK	DURATION
PO	1 wk	unknown	6–12 hr
IV	rapid	rapid	unknown

Contraindications/Precautions
Contraindicated in: No contraindications to IV form in treatment of malignant hyperthermia; Situations in which spasticity is used to maintain posture or balance; Lactation: Lactation.
Use Cautiously in: Cardiac, pulmonary, or previous liver disease; Women and patients >35 yr (↑ risk of hepatotoxicity); OB: Use during pregnancy only if potential maternal benefit justifies potential fetal risk; Geri: Use lowest possible dose in older adults (may have ↑ risk of hepatotoxicity).

Adverse Reactions/Side Effects
CV: changes in BP, heart failure, tachycardia. **Derm:** flushing, pruritus, sweating, urticaria. **EENT:** excessive lacrimation, visual disturbances. **GI:** HEPATOTOXICITY, diarrhea, anorexia, cramps, dysphagia, GI bleeding, nausea, vomiting. **GU:** crystalluria, dysuria, frequency, erectile dysfunction, incontinence, nocturia. **Hemat:** anemia, aplastic anemia, eosinophilia, leukopenia, thrombocytopenia. **Local:** irritation at IV site, phlebitis. **MS:** myalgia. **Neuro:** drowsiness, muscle weakness, confusion, dizziness, headache, insomnia, malaise, nervousness. **Resp:** dyspnea, pleural effusions, respiratory depression. **Misc:** ANAPHYLAXIS, chills, drooling, fever.

© F.A. Davis Publishing

Interactions

Drug-Drug: Calcium channel blockers may ↑ risk of cardiovascular collapse; avoid concomitant use. Additive CNS depression with **CNS depressants**, including **alcohol**, **antihistamines**, **opioid analgesics**, **sedative/hypnotics**, and parenteral **magnesium sulfate**. ↑ risk of hepatotoxicity with other **hepatotoxic agents** or **estrogens**. ↑ risk of arrhythmias with **verapamil**. ↑ neuromuscular blocking effects of **vecuronium**.

Drug-Natural Products: Concomitant use of **kava-kava**, **valerian**, **chamomile**, or **hops** can ↑ CNS depression.

Route/Dosage

PO (Adults): *Spasticity*—25 mg once daily for 7 days, then 25 mg 2 times daily for 7 days, then 50 mg 3 times daily for 7 days, then 100 mg 3 times daily; may ↑ to 100 mg 4 times daily, if needed. *Prevention of malignant hyperthermia*—4–8 mg/kg/day in 3–4 divided doses for 1–2 days before procedure, last dose 3–4 hr preop. *Posthyperthermic crisis follow-up*—4–8 mg/kg/day in 3–4 divided doses for 1–3 days after IV treatment.

PO (Children >5 yr): *Spasticity*—0.5 mg/kg once daily for 7 days, then 0.5 mg/kg 3 times daily for 7 days, then 1 mg/kg 3 times daily for 7 days, then 2 mg/kg 3 times daily (not to exceed 400 mg/day). *Prevention of malignant hyperthermia*—4–8 mg/kg/day in 3–4 divided doses for 1–2 days before procedure, last dose 3–4 hr preop. *Posthyperthermic crisis follow-up*—4–8 mg/kg/day in 3–4 divided doses for 1–3 days after IV treatment.

IV (Adults and Children): *Treatment of malignant hyperthermia*—at least 1 mg/kg, continued until symptoms ↓ or a cumulative dose of 10 mg/kg has been given. If symptoms reappear, dose may be repeated. *Prevention of malignant hyperthermia*—2.5 mg/kg given 75 min before surgery.

Availability (generic available)

Capsules: 25 mg, 50 mg, 100 mg. **Powder for injection:** 20 mg/vial, 250 mg/vial.

NURSING IMPLICATIONS

Assessment

- Assess bowel function periodically. Persistent diarrhea may warrant discontinuation of therapy.
- **Muscle Spasticity:** Assess neuromuscular status and muscle spasticity prior to and periodically during therapy to determine response.
- **Malignant Hyperthermia:** Assess previous anesthesia history of all surgical patients. Also assess for family history of reactions to anesthesia (malignant hyperthermia or perioperative death).
- Monitor ECG, vital signs, electrolytes, and urine output continuously when administering IV for malignant hyperthermia.
- Monitor patient for difficulty swallowing and choking during meals on the day of administration.
- ***Lab Test Considerations:*** Monitor liver function frequently during therapy. Liver function abnormalities (↑ AST, ALT, alkaline phosphatase, bilirubin, GGT) may require discontinuation of therapy.
- Evaluate renal function and CBC before and periodically during therapy in patients receiving prolonged therapy.

Implementation

- **PO:** If gastric irritation becomes a problem, may be administered with food. Oral suspensions may be made by opening capsules and adding them to fruit juices or other liquids. Drink immediately after mixing.
- Oral dose is not indicated for neuroleptic malignant syndrome.

IV Administration

- ***Reconstitution:*** Reconstitute each 20 mg of **Dantrium** with 60 mL of sterile water for injection (without a bacteriostatic agent). Shake until solution is clear. Solution must be used within 6 hr. Protect diluted solution from direct light.
- ***Reconstitution:*** Reconstitute **Ryanodex** by adding 5 mL of sterile water for injection; do not reconstitute with other solutions. Shake vial to ensure uniform orange suspension.Do not administer solutions that are discolored or contain particulate matter. Solution is stable for 6 hr at room temperature.

Treatment of Malignant Hyperthermia

- **IV Push:** Administer reconstituted solution without further dilution. ***Rate:*** Administer each single dose by rapid continuous IV push through Y-tubing. Follow immediately with subsequent doses as indicated. Medication is very irritating to tissues; observe infusion site frequently to avoid extravasation.

Prevention of Malignant Hyperthermia

- **IV Push:** Rates of products for prevention differ. ***Rate:*** Inject **Ryanodex** over at least 1 min starting 75 min before surgery into catheter with free flowing 0.9% NaCl or D5W or into a patent indwelling catheter; flush before and after injection.
- **Intermittent Infusion:** Reconstitute required number of **Dantrium** vials as above and transfer to a larger volume sterile plastic bag (do not use glass bottles). ***Rate:*** Administer over 1 hr beginning 75 min before anesthesia.
- **Y-Site Compatibility:** acyclovir, paclitaxel, palonosetron.
- **Y-Site Incompatibility:** alemtuzumab, alfentanil, amikacin, aminophylline, amphotericin B deoxycholate, amphotericin B lipid complex, ampicillin, ampicillin/sulbactam, anidulafungin, argatroban, arsenic trioxide, ascorbic acid, atropine, azathioprine, aztreonam, benztropine, bivalirudin, bleomycin, bumetanide, buprenorphine, butorphanol, calcium chloride, calcium gluconate, carmustine, caspofungin, cefotaxime, cefotetan, cefoxitin, ceftazidime,

© F.A. Davis Publishing

ceftriaxone, cefuroxime, chloramphenicol, chlorpromazine, cisplatin, clindamycin, cyanocobalamin, cyclosporine, dactinomycin, daptomycin, daunorubicin hydrochloride, dexamethasone, dexrazoxane, diazepam, diazoxide, digoxin, diltiazem, diphenhydramine, dobutamine, docetaxel, dopamine, doxorubicin liposome, doxycycline, enalaprilat, ephedrine, epinephrine, epoetin alfa, ertapenem, erythromycin, esmolol, etoposide, etoposide phosphate, famotidine, fenoldopam, fentanyl, fluconazole, fludarabine, folic acid, foscarnet, fosphenytoin, furosemide, ganciclovir, gemcitabine, gemtuzumab ozogamicin, gentamicin, glycopyrrolate, granisetron, haloperidol, heparin, hetastarch, hydralazine, hydrocortisone, hydromorphone, hydroxyzine, idarubicin, imipenem/cilastatin, indomethacin, insulin, irinotecan, isoproterenol, ketorolac, labetalol, leucovorin calcium, lidocaine, linezolid, lorazepam, magnesium sulfate, mannitol, meperidine, mesna, methylprednisolone, metoclopramide, metoprolol, metronidazole, midazolam, milrinone, mitoxantrone, morphine, moxifloxacin, multivitamins, mycophenolate, nafcillin, nalbuphine, naloxone, nitroglycerin, nitroprusside, norepinephrine, octreotide, ondansetron, oxacillin, oxaliplatin, oxytocin, pamidronate, pancuronium, pantoprazole, papaverine, pemetrexed, penicillin G, pentamidine, pentobarbital, phenobarbital, phentolamine, phenylephrine, phenytoin, phytonadione, piperacillin/tazobactam, potassium acetate, potassium chloride, procainamide, prochlorperazine, promethazine, propranolol, protamine, pyridoxine, sodium acetate, sodium bicarbonate, succinylcholine, sufentanil, tacrolimus, theophylline, thiamine, thiotepa, tigecycline, tirofiban, tobramycin, topotecan, trimethoprim/sulfamethoxazole, vancomycin, vasopressin, vecuronium, verapamil, vinblastine, vinorelbine, voriconazole, zoledronic acid.

Patient/Family Teaching

- Advise patient not to take more medication than the amount prescribed, to minimize risk of hepatotoxicity and other side effects. If a dose is missed, do not take unless remembered within 1 hr. Do not double doses.
- May cause dizziness, drowsiness, visual disturbances, and muscle weakness. Advise patient to avoid driving and other activities requiring alertness until response to drug is known. After IV dose for surgery, patients may experience decreased grip strength, leg weakness, light-headedness, and difficulty swallowing for up to 48 hr. Caution patients to avoid activities requiring alertness and to use caution when walking down stairs and eating during this period.
- Advise patient to avoid taking alcohol or other CNS depressants concurrently with this medication.
- Instruct patient to notify health care professional if rash; itching; yellow eyes or skin; dark urine; or clay-colored, bloody, or black, tarry stools occur or if nausea, weakness, malaise, fatigue, or diarrhea persists. May require discontinuation of therapy.
- Advise patient to wear sunscreen and protective clothing to prevent photosensitivity reactions.
- Rep: Advise females of reproductive potential to notify health care professional if pregnancy is planned or suspected and to avoid breast feeding during and for 3 days after last dose. Monitor infants breast fed during therapy for respiratory depression and muscle weakness.
- Emphasize the importance of follow-up exams to check progress in long-term therapy and blood tests to monitor for side effects.
- **Malignant Hyperthermia:** Patients with malignant hyperthemia should carry identification describing disease process at all times.

Evaluation/Desired Outcomes

- Relief of muscle spasm in musculoskeletal conditions. One wk or more may be required to see improvement; if there is no observed improvement in 45 days, the medication is usually discontinued.
- Prevention of or decrease in temperature and skeletal rigidity in malignant hyperthermia.

dapagliflozin (dap-a-gli-**floe**-zin)

Farxiga, Forxiga

Classification

Therapeutic: antidiabetics
Pharmacologic: sodium-glucose co-transporter 2 (SGLT2) inhibitors

Indications

Adjunct to diet and exercise in the management of type 2 diabetes mellitus. To reduce the risk of hospitalization for HF in patients with type 2 diabetes mellitus and established cardiovascular disease or multiple cardiovascular risk factors. To reduce the risk of cardiovascular death and hospitalization for HF in patients with New York Heart Association (NYHA) class II-IV HF with reduced ejection fraction (HFrEF). To reduce the risk of sustained eGFR decline, end-stage kidney disease, cardiovascular death, and hospitalization for HF in patients with chronic kidney disease at risk of progression.

Action

Inhibits proximal renal tubular sodium-glucose cotransporter 2 (SGLT2), which determines reabsorption of glucose from the tubular lumen. Inhibits reabsorption of glucose, lowers renal threshold for glucose and increases excretion of glucose in urine. **Therapeutic Effects:** Improved glycemic control. Reduction in risk

© F.A. Davis Publishing

of HF hospitalizations in patients with type 2 diabetes mellitus. Reduction in risk of cardiovascular death and HF hospitalizations in patients with NYHA II-IV HFrEF. Reduction in risk of sustained eGFR decline, end-stage kidney disease, cardiovascular death, and HF hospitalizations in patients with chronic kidney disease at risk of progression.

Pharmacokinetics

Absorption: 78% absorbed following oral administration.
Distribution: Unknown.
Metabolism and Excretion: Extensively metabolized by UGT1A9 to inactive metabolites which are primarily excreted in urine. 15% excreted in feces as unchanged drug.
Half-life: 12.9 hr.

TIME/ACTION PROFILE (decrease in HbA1c)

ROUTE	ONSET	PEAK	DURATION
PO	within 4 wk	12 wk	unknown

Contraindications/Precautions

Contraindicated in: Hypersensitivity; Moderate renal impairment (eGFR <45 mL/min/1.73 m²) (use not recommended to improve glycemic control in patients with type 2 diabetes mellitus); Dialysis; Type 1 diabetes; Diabetic ketoacidosis; Active bladder cancer; OB: Not recommended for use during 2nd and 3rd trimesters of pregnancy (may cause adverse renal effects in infant); Lactation: Lactation.

Use Cautiously in: History of pancreatitis, pancreatic surgery, reduced caloric intake due to illness or surgery, or alcohol abuse (↑ risk of ketoacidosis); Renal impairment (eGFR <60 mL/min/1.73 m²), age >65 yr, or concurrent use of loop diuretics (↑ risk of hypovolemia and hypotension); History of bladder cancer; Polycystic kidney disease or recent history of immunosuppressive therapy for kidney disease (use not recommended for treatment of chronic kidney disease); OB: Use during 1st trimester of pregnancy only if potential maternal benefit justifies potential fetal risk (other agents recommended in pregnancy); Pedi: Safety and effectiveness not established in children; Geri: ↑ risk of renal impairment and adverse reactions related to ↓ intravascular volume in older adults.

Adverse Reactions/Side Effects

Endo: hypoglycemia (↑ with other medications). **F and E:** KETOACIDOSIS, hyperphosphatemia, hypovolemia. **GU:** NECROTIZING FASCIITIS OF PERINEUM (FOURNIER'S GANGRENE), UROSEPSIS, acute kidney injury, genital mycotic infections, ↑ urination, renal impairment, urinary tract infection (including pyelonephritis). **Misc:** HYPERSENSITIVITY REACTIONS (including anaphylaxis or angioedema).

Interactions

Drug-Drug: ↑ risk of hypoglycemia with **insulin** or **insulin secretagogues**; dose adjustments may be required. Concurrent use with **loop diuretics**, may ↑ risk of hypovolemia and associated complications.

Route/Dosage

Type 2 Diabetes Mellitus (for Glycemic Control)

PO (Adults): *eGFR ≥45 mL/min/1.73 m²* — 5 mg once daily, may ↑ to 10 mg once daily, if needed.

Renal Impairment

PO (Adults): *eGFR <45 mL/min/1.73 m²* — Use not recommended; *Dialysis* — Contraindicated.

Type 2 Diabetes (for Reduction in Risk of HF Hospitalizations), NYHA Class II-IV HFrEF, or Chronic Kidney Disease

PO (Adults): *eGFR 25–45 mL/min/1.73 m²* — 10 mg once daily.

Renal Impairment

PO (Adults): *eGFR <25 mL/min/1.73 m²* — Initiation of therapy not recommended; however, patients currently taking dapagliflozin may continue with 10 mg once daily; *Dialysis* — Contraindicated.

Availability

Tablets: 5 mg, 10 mg. ***In combination with:*** metformin XR (Xigduo XR); saxagliptin (Qtern). See Appendix N.

NURSING IMPLICATIONS

Assessment

- Observe for signs and symptoms of hypoglycemic reactions (sweating, hunger, weakness, dizziness, tremor, tachycardia, anxiety), especially in patients taking insulin or other hypoglycemic agents.
- Assess volume status and correct before starting dapagliflozin. Patients with impaired renal function (eGFR less than 60 mL/min/1.73 m²), older adults, or patients on loop diuretics may be at increased risk for volume depletion or hypotension. Monitor BP after initiating and periodically during therapy; may cause hypotension.
- Monitor for signs and symptoms of urinary tract infection (burning during urination, frequent urination, urgency, pain in pelvis, blood in urine, fever, back pain, nausea, vomiting) during therapy. Treat promptly.
- Monitor for infection, new pain, tenderness, erythema, swelling, sores, or ulcers involving genital or perianal area, with fever or malaise; assess for necrotizing fasciitis. If suspected, start treatment immediately with broad-spectrum antibiotics and, if necessary, surgical debridement. Discontinue dapagliflozin if these occur.
- ***Lab Test Considerations:*** Monitor serum glucose and glycosylated hemoglobin periodically during therapy to evaluate effectiveness of treatment. May cause ketoacidosis.

© F.A. Davis Publishing

- Evaluate renal function prior to starting and periodically during therapy; may cause ↑ serum creatinine and ↓ eGFR.
- May cause an ↑ hematocrit and serum phosphorous.
- Will cause urine to test positive for glucose.
- Monitor for ketoacidosis, especially during prolonged fasting for illness or surgery. Consider temporarily discontinuing therapy for at least 3 days prior to surgery.
- ***Toxicity and Overdose:*** Overdose is manifested by symptoms of hypoglycemia. Mild hypoglycemia may be treated with administration of oral glucose. Treat severe hypoglycemia with IV D50W followed by continuous IV infusion of more dilute dextrose solution at a rate sufficient to keep serum glucose at approximately 100 mg/dL.

Implementation

- Do not confuse Farxiga (dapagliflozin) with Fetzima (levomilnacipran).
- Patients stabilized on a diabetic regimen who are exposed to stress, fever, trauma, infection, or surgery may require administration of insulin.
- **PO:** Administer once daily in the morning without regard to food.

Patient/Family Teaching

- Instruct patient to take medication at same time each day. Take missed doses as soon as remembered unless almost time for next dose; do not double doses. Advise patient to read *Medication Guide* before starting and with each Rx refill in case of changes.
- Explain to patient that this medication controls hyperglycemia but does not cure diabetes. Therapy is long term.
- Inform patient dapagliflozin may cause dehydration and hypotension. Maintain adequate hydration and notify health care professional if dizziness, fainting, weakness, or orthostatic hypotension occur.
- Advise patient to notify health care professional if signs and symptoms of urinary tract infections or genital mycotic infections; females (vaginal odor, white or yellowish vaginal discharge, vaginal itching), males (rash or redness of glans or foreskin of penis, foul-smelling discharge from penis, pain in skin around penis) occur. Instruct patient on treatment options and when to notify health care professional.
- Review signs of hypoglycemia and hyperglycemia with patient. If hypoglycemia occurs, advise patient to drink a glass of orange juice or ingest 2–3 tsp of sugar, honey, or corn syrup dissolved in water or an appropriate number of glucose tablets and notify health care professional.
- Encourage patient to follow prescribed diet, medication, and exercise regimen to prevent hypoglycemic or hyperglycemic episodes.
- Instruct patient in proper testing of serum glucose and ketones, especially during periods of stress or illness. Inform patient that dapagliflozin will cause a positive test result when testing for urine glucose. Notify health care professional if significant changes occur.
- Advise patient to notify health care professional immediately if new pain or tenderness, sores or ulcers, or infections involving the leg or foot occur and to immediately seek care if pain or tenderness, redness, or swelling of the genitals or area from the genitals back to the rectum, along with a fever above 100.4°F or malaise occur.
- Advise patient to notify health care professional of all Rx or OTC medications, vitamins, or herbal products being taken and to consult with health care professional before taking other medications.
- Advise patient to inform health care professional of medication regimen prior to treatment or surgery.
- Advise patient to notify health care professional promptly if signs and symptoms of hypersensitivity reactions (rash; raised red patches on skin; swelling of face, lips, tongue, throat; difficulty breathing or swallowing) or bladder cancer (blood or red color in urine, painful urination) occur.
- Advise patient to carry a form of sugar (sugar packets, candy) and identification describing disease process and medication regimen at all times.
- Rep: Insulin is the recommended method of controlling blood sugar during pregnancy. Advise patient to notify health care professional if pregnancy is planned or suspected and to avoid breast feeding during therapy.
- Emphasize the importance of routine follow-up exams.

Evaluation/Desired Outcomes

- Control of blood glucose levels without the appearance of hypoglycemic or hyperglycemic episodes.
- Reduction in risk of HF hospitalizations.
- Reduction in risk of sustained eGFR decline, end-stage kidney disease, cardiovascular death, and HF hospitalizations in patients with chronic kidney disease at risk of progression.

DAPTOmycin (dap-to-**mye**-sin)

Cubicin, Cubicin RF

Classification

Therapeutic: anti-infectives

Pharmacologic: cyclic lipopeptide antibacterial agents

Indications

Complicated skin and skin structure infections caused by Gram-positive bacteria. *Staphylococcus aureus* bac-

© F.A. Davis Publishing

teremia, including right-sided infective endocarditis caused by methicillin-susceptible and methicillin-resistant strains (in adults). *Staphylococcus aureus* bacteremia (in pediatric patients).

Action

Causes rapid depolarization of membrane potential following binding to bacterial membrane; this results in inhibition of protein, DNA, and RNA synthesis.
Therapeutic Effects: Death of bacteria with resolution of infection. **Spectrum:** Active against *Staphylococcus aureus* (including methicillin-resistant strains), *Streptococcus pyogenes*, *Streptococcus agalactiae*, some *Streptococcus dysgalactiae*, and *Enterococcus faecalis* (vancomycin-susceptible strains).

Pharmacokinetics

Absorption: IV administration results in complete bioavailability.
Distribution: Unknown.
Protein Binding: 92%.
Metabolism and Excretion: Metabolism not known; mostly excreted by kidneys.
Half-life: 8.1 hr.

TIME/ACTION PROFILE

ROUTE	ONSET	PEAK	DURATION
IV	rapid	end of infusion	24 hr

Contraindications/Precautions

Contraindicated in: Hypersensitivity.
Use Cautiously in: CCr <30 mL/min (dose ↓ required); Moderate-to-severe renal impairment (may have ↓ clinical response); OB: Safety not established in pregnancy; Lactation: Safety not established in breast feeding; Pedi: Children <1 yr (↑ risk of muscular, neuromuscular, and CNS effects; avoid use); Geri: Older adults may have ↓ clinical response with ↑ risk of adverse reactions.

Adverse Reactions/Side Effects

CV: hypertension, hypotension. **Derm:** DRUG RASH WITH EOSINOPHILIA AND SYSTEMIC SYMPTOMS (DRESS), pruritus, rash. **GI:** CLOSTRIDIOIDES DIFFICILE-ASSOCIATED DIARRHEA (CDAD), constipation, diarrhea, nausea, vomiting, ↑ liver enzymes. **GU:** renal impairment. **Hemat:** anemia. **Local:** injection site reactions. **MS:** ↑ creatine kinase. **Neuro:** dizziness. **Resp:** EOSINOPHILIC PNEUMONIA, dyspnea. **Misc:** ANGIOEDEMA, fever.

Interactions

Drug-Drug: Tobramycin ↑ blood levels. Concurrent **HMG-CoA reductase inhibitors** may ↑ the risk of myopathy.

Route/Dosage

Complicated Skin/Skin Structure Infections

IV (Adults): 4 mg/kg every 24 hr for 7–14 days.
IV (Children 12–17 yr): 5 mg/kg every 24 hr for up to 14 days.
IV (Children 7–11 yr): 7 mg/kg every 24 hr for up to 14 days.
IV (Children 2–6 yr): 9 mg/kg every 24 hr for up to 14 days.
IV (Children 1–<2 yr): 10 mg/kg every 24 hr for up to 14 days.

Renal Impairment

IV (Adults): *CCr <30 mL/min*—4 mg/kg every 48 hr for 7–14 days; *Hemodialysis and CAPD*—4 mg/kg every 48 hr for 7–14 days with dose administered after hemodialysis on hemodialysis days.

Staphylococcus aureus Bacteremia/ Right-Sided Infective Endocarditis

IV (Adults): 6 mg/kg every 24 hr for 2–6 wk.

Renal Impairment

IV (Adults): *CCr <30 mL/min*—6 mg/kg every 48 hr for 2–6 wk; *Hemodialysis and CAPD*—6 mg/kg every 48 hr for 2–6 wk with dose administered after hemodialysis on hemodialysis days.

Staphylococcus aureus Bacteremia

IV (Children 12–17 yr): 7 mg/kg every 24 hr for up to 42 days.
IV (Children 7–11 yr): 9 mg/kg every 24 hr for up to 42 days.
IV (Children 1–6 yr): 12 mg/kg every 24 hr for up to 42 days.

Availability (generic available)

Lyophilized powder for injection: 350 mg/vial, 500 mg/vial.

NURSING IMPLICATIONS

Assessment

- Assess for infection (vital signs; appearance of wound, sputum, urine, and stool; WBC) at beginning of and throughout therapy.
- Monitor bowel function. Diarrhea, abdominal cramping, fever, and bloody stools should be reported to health care professional promptly as a sign of *Clostridioides difficile*-associated diarrhea (CDAD). May begin up to several wk following cessation of therapy.
- Monitor for signs and symptoms of eosinophilic pneumonia (new onset or worsening fever, dyspnea, difficulty breathing, new infiltrates on chest imaging studies). Discontinue daptomycin if symptoms occur.
- Monitor for signs and symptoms of DRESS (fever, rash, lymphadenopathy, and/or facial swelling), associated with involvement of other organ systems

© F.A. Davis Publishing

(hepatitis, nephritis, hematologic abnormalities, myocarditis, myositis) during therapy. May resemble an acute viral infection. Eosinophilia is often present. Discontinue therapy if signs occur.

- Monitor for development of muscle pain or weakness, particularly of distal extremities. Discontinue daptomycin in patients with unexplained signs and symptoms of myopathy in conjunction with CK elevation >1000 units/L, or in patients without reported symptoms who have marked elevations in CK >2000 units/L. Consider temporarily suspending agents associated with rhabdomyolysis (HMG-CoA reductase inhibitors) in patients receiving daptomycin.
- ***Lab Test Considerations:*** Monitor CK weekly, more frequently in patients with unexplained ↑. Discontinue daptomycin if CK >1000 units/L and signs and symptoms of myopathy occur. In patients with renal insufficiency, monitor both renal function and CK more frequently.
- May cause false prolongation of PT and ↑ INR.
- Monitor renal function prior to and periodically during therapy. If new or worsening renal impairment occurs, evaluate renal function. If tubulointerstitial nephritis is suspected, discontinue daptomycin and begin treatment.

Implementation

- Do not confuse daptomycin with dactinomycin. Do not confuse Cubicin with Cubicin RF.

IV Administration

Cubicin

- **IV Push:** ***Reconstitution:*** Reconstitute 500-mg vial with 10 mL of 0.9% NaCl inserted toward wall of vial. Rotate vial gently to wet powder. Allow to stand for 10 min undisturbed. Swirl vial gently to completely reconstitute solution. Reconstituted vials are stable for 12 hr at room temperature or 48 hr if refrigerated. ***Concentration:*** 50 mg/mL. ***Rate:*** Administer over 2 min (for adults only).
- **Intermittent Infusion:** *Adults:* ***Dilution:*** Dilute further in 50 mL of 0.9% NaCl. Solution is stable for 12 hr at room temperature or 48 hr if refrigerated. Do not administer solutions that are cloudy or contain a precipitate. ***Rate:*** Infuse over 30 min. Do not infuse daptomycin with ReadyMED elastomeric infusion pumps due to incompatibility.
- **Intermittent Infusion:** *Children 1–6 yrs:* ***Dilution:*** Dilute further into a 25 mL IV infusion bag of 0.9% NaCl. ***Rate:*** Infuse over 60 min at a rate of 0.42 mL/min.
- **Intermittent Infusion:** *Children 7–17 yrs:* ***Dilution:*** Dilute further into a 50 mL IV infusion bag of 0.9% NaCl. ***Rate:*** Infuse over 30 min at a rate of 1.67 mL/min.

Cubicin RF

- **IV Push:** ***Reconstitution:*** Reconstitute with 10 mL of sterile water for injection or bacteriostatic water for injection through center of rubber stopper into vial. Use a beveled sterile transfer needle that is 21 gauge or smaller, pointing transfer needle toward the wall of the vial. Rotate or swirl vial to mix. ***Concentration:*** 50 mg/mL. Do not use saline solutions to reconstitute. Remove reconstituted solution from vial using a beveled sterile needle that is 21 gauge or smaller. If reconstituted with sterile water for injection, solution is stable for 1 day at room temperature or 3 days if refrigerated. If reconstituted with bacteriostatic water for injection, solution is stable for 2 days at room temperature or 3 days if refrigerated. Do not administer solutions that are cloudy or contain particulate matter. ***Rate:*** Inject over 2 min (for adults only).
- **Intermittent Infusion:** *Adults:* ***Dilution:*** Dilute further into a 50-mL IV infusion bag of 0.9% NaCl. If reconstituted with sterile water, solution is stable for 19 hr at room temperature or 3 days if refrigerated. If reconstituted with bacteriostatic water, solution is stable for 2 days at room temperature or 5 days if refrigerated. ***Rate:*** Infuse over 30 min.
- **Intermittent Infusion:** *Children 1–6 yrs:* ***Dilution:*** Dilute further into a 25-mL IV infusion bag of 0.9% NaCl. ***Rate:*** Infuse over 60 min at a rate of 0.42 mL/min.
- **Intermittent Infusion:** *Children 7–17 yrs:* ***Dilution:*** Dilute further into a 50-mL IV infusion bag of 0.9% NaCl. ***Rate:*** Infuse over 30 min at a rate of 1.67 mL/min.
- **Y-Site Compatibility:** alfentanil, amifostine, amikacin, aminocaproic acid, aminophylline, amiodarone, amphotericin B liposome, ampicillin, ampicillin/sulbactam, argatroban, arsenic trioxide, azithromycin, aztreonam, bivalirudin, bleomycin, bumetanide, buprenorphine, busulfan, butorphanol, calcium chloride, calcium gluconate, cangrelor, carboplatin, carmustine, caspofungin, cefazolin, cefepime, cefotaxime, cefotetan, cefoxitin, ceftazidime, ceftriaxone, cefuroxime, chloramphenicol, chlorpromazine, ciprofloxacin, cisatracurium, cisplatin, clindamycin, cyclophosphamide, cyclosporine, dacarbazine, dactinomycin, daunorubicin hydrochloride, dexamethasone sodium phosphate, dexmedetomidine, dexrazoxane, digoxin, diltiazem, diphenhydramine, dobutamine, docetaxel, dopamine, doxorubicin hydrochloride, doxorubicin liposome, doxycycline, droperidol, enalaprilat, ephedrine, epinephrine, epirubicin, eptifibatide, ertapenem, erythromycin, esmolol, etoposide, etoposide phosphate, famotidine, fenoldopam, fentanyl, fluconazole, fludarabine, fluorouracil, foscarnet, fosphenytoin, furosemide, ganci-

© F.A. Davis Publishing

clovir, gentamicin, glycopyrrolate, granisetron, haloperidol, heparin, hydralazine, hydrocortisone, hydromorphone, idarubicin, ifosfamide, insulin, regular, irinotecan, isavuconazonium, isoproterenol, ketorolac, labetalol, leucovorin calcium, levofloxacin, lidocaine, linezolid, lorazepam, magnesium sulfate, mannitol, melphalan, meperidine, meropenem, mesna, methylprednisolone sodium succinate, metoclopramide, metoprolol, midazolam, milrinone, mitoxantrone, morphine, moxifloxacin, mycophenolate, nafcillin, nalbuphine, naloxone, nicardipine, nitroprusside, norepinephrine, octreotide, ondansetron, oxaliplatin, oxytocin, paclitaxel, palonosetron, pamidronate, pancuronium, pemetrexed, pentamidine, phenobarbital, phentolamine, phenylephrine, piperacillin/tazobactam, potassium acetate, potassium chloride, potassium phosphate, procainamide, prochlorperazine, promethazine, propranolol, quinupristin/dalfopristin, rocuronium, sargramostim, sodium acetate, sodium bicarbonate, sodium phosphate, succinylcholine, tacrolimus, theophylline, thiotepa, tigecycline, tirofiban, tobramycin, topotecan, trimethoprim/sulfamethoxazole, vasopressin, vecuronium, verapamil, vinblastine, vincristine, vinorelbine, voriconazole, zidovudine, zoledronic acid.

- **Y-Site Incompatibility:** acyclovir, alemtuzumab, allopurinol, amphotericin B lipid complex, blinatumomab, cytarabine, D5W, dantrolene, fosfomycin, gemcitabine, gemtuzumab ozogamicin, imipenem/cilastatin, meropenem/vaborbactam, methotrexate, metronidazole, minocycline, mitomycin, nitroglycerin, pantoprazole, pentobarbital, phenytoin, plazomicin, remifentanil, strepozocin, sufentanil, thiopental, vancomycin.

Patient/Family Teaching

- Inform patient of purpose of daptomycin.
- Instruct patient to notify health care professional if fever and diarrhea develop, especially if stool contains blood, pus, or mucus. Advise patient not to treat diarrhea without consulting health care professional.
- May cause dizziness. Caution patient to avoid driving or other activities requiring alertness until response to medication is known.
- Advise patient to notify health care professional immediately if weakness, numbness, or tingling in forearms and lower legs, or signs and symptoms of eosinophilic pneumonia or DRESS occur.
- Advise patient to notify health care professional of all Rx or OTC medications, vitamins, or herbal products being taken and to consult with health care professional before taking other medications.
- Advise females of reproductive potential to notify health care professional if pregnancy is planned or suspected, or if breast feeding.

Evaluation/Desired Outcomes

- Resolution of the signs and symptoms of infection. Length of time for complete resolution depends on the organism and site of infection.

darbepoetin (dar-be-**poh**-e-tin)

Aranesp

Classification

Therapeutic: antianemics

Pharmacologic: hormones (rDNA), erythropoiesis stimulating agents (ESA)

Indications

Anemia associated with chronic kidney disease (CKD). Chemotherapy-induced anemia in patients with nonmyeloid malignancies when there is ≥2 additional mo of planned chemotherapy.

Action

Stimulates erythropoiesis (production of red blood cells). **Therapeutic Effects:** Maintains and may elevate red blood cell counts, decreasing the need for transfusions.

Pharmacokinetics

Absorption: 30–50% following subcut administration; IV administration results in complete bioavailability.

Distribution: Confined to the intravascular space.

Metabolism and Excretion: Unknown.

Half-life: *Subcut*—49 hr; *IV*—21 hr.

TIME/ACTION PROFILE (↑ in RBCs)

ROUTE	ONSET	PEAK	DURATION
IV, Subcut	2–6 wk	unknown	unknown

Contraindications/Precautions

Contraindicated in: Hypersensitivity; Uncontrolled hypertension; Patients with cancer receiving hormonal agents, biologic products, or radiotherapy, unless also receiving concomitant myelosuppressive chemotherapy; Patients receiving chemotherapy when anticipated outcome is cure; Patients with cancer receiving myelosuppressive chemotherapy in whom the anemia can be managed by transfusion; Patients who require immediate correction of anemia when RBC transfusions can be used instead.

Use Cautiously in: Cardiovascular disease or stroke; Underlying hematologic diseases, including hemolytic anemia, sickle-cell anemia, thalassemia, and porphyria (safety not established); OB, Lactation: Safety not established.

Adverse Reactions/Side Effects

CV: HF, MI, STROKE, THROMBOEMBOLIC EVENTS (especially with hemoglobin >11 g/dL), edema, hypertension, hypotension, chest pain. **Derm:** ERYTHEMA MULTIFORME, STEVENS-JOHNSON SYNDROME, TOXIC EPIDERMAL

© F.A. Davis Publishing

NECROLYSIS, pruritus. **GI:** abdominal pain, nausea, diarrhea, vomiting, constipation. **Hemat:** pure red cell aplasia. **MS:** myalgia, arthralgia, back pain, limb pain. **Neuro:** SEIZURES, dizziness, fatigue, headache, weakness. **Resp:** cough, dyspnea, bronchitis. **Misc:** ALLERGIC REACTIONS (including anaphylaxis and angioedema), ↑ MORTALITY AND ↑ TUMOR GROWTH (WITH HEMOGLOBIN ≥12 G/DL), fever, sepsis.

Interactions

Drug-Drug: None reported.

Route/Dosage

Anemia due to Chronic Kidney Disease

(Do not initiate if hemoglobin ≥10 g/dL; should only consider initiating therapy in patients not on dialysis if rate of hemoglobin decline indicates likelihood of requiring a red blood cell transfusion and a goal is to reduce the risk of alloimmunization and/or red blood cell transfusion risks).

IV, Subcut (Adults): *Starting treatment with darbepoetin (no previous epoetin)*—0.45 mcg/kg once weekly or 0.75 mcg/kg every 2 wk (for patients on dialysis); 0.45 mcg/kg every 4 wk (for patients not on dialysis); use lowest dose sufficient to ↓ the need for red blood cell transfusions (do not exceed hemoglobin of 10 g/dL [patients not on dialysis] or 11 g/dL [patients on dialysis]); if Hgb ↑ by >1.0 g/dL in 2 wk, ↓ dose by 25%; if Hgb ↑ by <1.0 g/dL after 4 wk of therapy (with adequate iron stores), ↑ dose by 25%; do not ↑ dose more frequently than every 4 wk. *Conversion from epoetin to darbepoetin*—weekly epoetin dose <2500 units = 6.25 mcg/wk darbepoetin, weekly epoetin dose 2500–4999 units = 12.5 mcg/wk darbepoetin, weekly epoetin dose 5000–10,999 units = 25 mcg/wk darbepoetin, weekly epoetin dose 11,000–17,999 units = 40 mcg/wk darbepoetin, weekly epoetin dose 18,000–33,999 units = 60 mcg/wk darbepoetin, weekly epoetin dose 34,000–89,999 units = 100 mcg/wk darbepoetin, weekly epoetin dose >90,000 units = 200 mcg/wk darbepoetin.

IV, Subcut (Children): *Starting treatment with darbepoetin (no previous epoetin)*—0.45 mcg/kg once weekly (may also start with 0.75 mcg/kg every 2 wk in patients not on dialysis); use lowest dose sufficient to ↓ the need for red blood cell transfusions (do not exceed hemoglobin of 12 g/dL; if Hgb ↑ by >1.0 g/dL in 2 wk, ↓ dose by 25%; if Hgb ↑ by <1.0 g/dL after 4 wk of therapy (with adequate iron stores), ↑ dose by 25%; do not ↑ dose more frequently than every 4 wk.

Anemia due to Chemotherapy

(Use only for chemotherapy-related anemia and discontinue when chemotherapy course is completed; do not initiate if hemoglobin ≥10 g/dL.).

Subcut (Adults): 2.25 mcg/kg weekly or 500 mcg every 3 wk; target Hgb should not exceed 12 g/dL. If Hgb ↑ by >1.0 g/dL in 2 wk or or reaches a level needed to avoid red blood cell transfusions, ↓ dose by 40%; if Hgb ↑ by <1.0 g/dL after 6 wk of therapy, ↑ dose to 4.5 mcg/kg weekly.

Availability

Solution for injection (single-dose vials): 25 mcg/1 mL, 40 mcg/1 mL, 60 mcg/1 mL, 100 mcg/1 mL, 200 mcg/1 mL, 300 mcg/1 mL. **Solution for injection (prefilled syringes):** 10 mcg/0.4 mL, 25 mcg/0.42 mL, 40 mcg/0.4 mL, 60 mcg/0.3 mL, 100 mcg/0.5 mL, 150 mcg/0.3 mL, 200 mcg/0.4 mL, 300 mcg/0.6 mL, 500 mcg/1 mL.

D

NURSING IMPLICATIONS

Assessment

- Monitor BP before and during therapy. Inform health care professional if severe hypertension is present or if BP begins to increase. Additional antihypertensive therapy may be required during initiation of therapy.
- Monitor response for symptoms of anemia (fatigue, dyspnea, pallor).
- Monitor dialysis shunts (thrill and bruit) and status of artificial kidney during hemodialysis. May need to increase heparin dose to prevent clotting. Monitor patients with underlying vascular disease for impaired circulation.
- Monitor for allergic reactions (rash, utricaria). Discontinue darbepoetin if signs of anaphylaxis (dyspnea, laryngeal swelling) occur.
- Assess patient for skin rash frequently during therapy. Discontinue darbepoetin at first sign of rash; may be life-threatening. Stevens-Johnson syndrome or toxic epidermal necrolysis may develop. Treat symptomatically; may recur once treatment is stopped.
- **Lab Test Considerations:** May cause ↑ in WBCs and platelets. May ↓ bleeding times.
- Monitor serum ferritin, transferrin, and iron levels prior to and during therapy to assess need for concurrent iron therapy. Administer supplemental iron therapy if transferrin saturation <20% or serum ferritin is <100 mcg/mL.
- Monitor hemoglobin weekly until the hemoglobin level is stable and sufficient to minimize the need for RBC transfusion after starting therapy and after each dose adjustment.
- Monitor hemoglobin before and weekly during initial therapy, for 4 wk after a change in dose, and regularly after target range has been reached and maintenance dose is determined. Monitor other hematopoietic parameters (CBC with differential and platelet count) before and periodically during therapy. *If hemoglobin ↑ of more than 1.0 g/dL in any 2-wk period or hemoglobin reaches a level needed*

© F.A. Davis Publishing

to avoid RBC transfusion, ↓ dose by 40%. *If hemoglobin exceeds a level needed to avoid RBC transfusion,* withhold dose until hemoglobin approaches level where RBC transfusions may be required and reinitiate at a dose 40% below the previous dose. *If hemoglobin ↑ by less than 1 g/dL and remains below 10 g/dL after 6 wk of therapy,* ↑ dose to 4.5 mcg/kg/wk (if on weekly therapy) or do not adjust dose (if on every 3 wk schedule). *If there is no response as measured by hemoglobin levels or if RBC transfusions are still required after 8 wk of therapy,* following completion of a chemotherapy course, discontinue darbepoetin. Hemoglobin >11 g/dL increases the likelihood of life-threatening cardiovascular complications, cardiac arrest, neurologic events (seizures, stroke), hypertensive reactions, HF, vascular thrombosis/ischemia/infarction, acute MI, and fluid overload/edema.

- If ↑ in hemoglobin is less than 1 g/dL over 4 wk and iron stores are adequate, dose may be ↑ by 25% of previous dose. Use the lowest dose possible to avoid transfusions.
- Monitor renal function studies and electrolytes closely; resulting increased sense of well-being may lead to decreased compliance with other therapies for renal failure.
- **Anemia of Chronic Kidney Disease:** Monitor hemoglobin at least weekly until stable, then at least monthly. Do not increase dose more frequently than once every 4 wk. Decreases in dose can be made more frequently. Avoid frequent dose adjustments. *If hemoglobin ↑ >1 g/dL in a 2-wk period,* ↓ dose by 25% or more. *If hemoglobin ↑ by <1 g/dL over 4 wk (and iron stores are adequate),* ↑ dose by 25%. *If no response after 12 wk of escalation,* further dose ↑ is unlikely to improve response and may increase risks. Use lowest dose that will maintain Hgb level sufficient to reduce need for transfusions.
- **Adults with Anemia of Chronic Kidney Disease on Dialysis**: Start darbepoetin when hemoglobin >10 g/dL. If hemoglobin ≥11 g/dL, reduce or hold dose. **Adults with Anemia of Chronic Kidney Disease not on Dialysis**: Start darbepoetin only when hemoglobin <10 g/dL AND rate of hemoglobin decline indicates likelihood of requiring a RBC transfusion AND reducing risk of alloimmunization and/or other RBC transfusion-related risks is a goal. If hemoglobin level >10 g/dL, reduce or hold dose, and use lowest darbepoetin dose sufficient to reduce need for RBC transfusions. **Children with Anemia of Chronic Kidney Disease**: Start epoetin only when hemoglobin <10 g/dL. If hemoglobin level >12 g/dL, reduce or hold dose. Monitor renal function studies and electrolytes closely; resulting increased sense of well-being may lead to decreased compliance with other therapies for renal failure. Increases in BUN, serum creatinine, uric acid, phosphorus, and potassium may occur.

Implementation

- Transfusions are still required for severe symptomatic anemia. Supplemental iron should be initiated with darbepoetin and continued during therapy. Correct deficiencies of folic acid or vitamin B_{12} prior to therapy.
- Institute seizure precautions in patients who experience greater than a 1.0 g/dL increase in hemoglobin in a 2-wk period or exhibit any change in neurologic status.
- *For conversion from epoetin alfa to darbepoetin,* if epoetin was administered 2–3 times/wk, administer darbepoetin once a wk. If patient was receiving epoetin once/wk, darbepoetin may be administered once every 2 wk. Route of administration should remain consistent.
- Dose adjustments should not be more frequent than once/mo.
- Do not shake vial; inactivation of medication may occur. Do not administer vials containing solution that is discolored or contains particulate matter. Discard vial immediately after withdrawing dose. Do not pool unused portions.
- **Subcut:** This route is often used for patients not requiring dialysis.

IV Administration

- **IV Push:** Administer undiluted. ***Rate:*** May be administered as direct injection or bolus over 1–3 min into IV tubing or via venous line at end of dialysis session.
- **Y-Site Incompatibility:** Do not administer in conjunction with other drugs or solutions.

Patient/Family Teaching

- Instruct patient to read the *Medication Guide* prior to beginning therapy and with each Rx refill in case of changes. Inform patients of risks and benefits of darbepoetin.
- Discuss ways of preventing self-injury in patients at risk for seizures. Driving and activities requiring continuous alertness should be avoided.
- Advise patient to stop darbopoetin and notify health care professional immediately if severe skin reactions (skin rash with itching, blisters, skin sores, peeling, areas of skin coming off) or signs and symptoms of serious allergic reactions (rash, itching, shortness of breath, wheezing, dizziness and fainting due to drop in blood pressure, swelling around mouth or eyes, fast pulse, sweating) occur.
- Inform patient that use of darbepoetin may result in shortened overall survival and/or ↓ time to tumor progression. May also cause MI or stroke. Advise patient to notify health care professional immediately if chest pain; trouble breathing or shortness of breath; pain in legs, with or without swelling; a cool or pale arm or leg; sudden confusion, trouble speaking, or trouble understanding others' speech; sudden numbness or weakness in face, arm, or leg, especially on one side of body; sudden trouble seeing;

© F.A. Davis Publishing

sudden trouble walking, dizziness, loss of balance or coordination; loss of consciousness (fainting); or hemodialysis vascular access stops working.

- Advise patient to notify health care professional of darbopoetin prior to surgery.
- Advise patient to notify health care professional if pregnancy is planned or suspected or if breast feeding.
- **Anemia of Chronic Kidney Disease**: Stress importance of compliance with dietary restrictions, medications, and dialysis. Foods high in iron and low in potassium include liver, pork, veal, beef, mustard and turnip greens, peas, eggs, broccoli, kale, blackberries, strawberries, apple juice, watermelon, oatmeal, and enriched bread. Darbepoetin will result in increased sense of well-being, but it does not cure underlying disease.
- **Home Care Issues:** Home dialysis patients determined to be able to safely and effectively administer darbepoetin should be taught proper dose, administration technique with syringe, auto-injector or IV use, and disposal of equipment. *Information for Patients and Caregivers* should be provided to patient along with medication.

Evaluation/Desired Outcomes

- Increase in hemoglobin not to exceed 11 g/dL with improvement in symptoms of anemia in patients with chronic renal failure or with chemotherapy-induced anemia.

darifenacin (dar-i-**fen**-a-sin)

Enablex

Classification

Therapeutic: urinary tract antispasmodics
Pharmacologic: anticholinergics

Indications

Overactive bladder with symptoms (urge incontinence, urgency, frequency).

Action

Acts as a muscarinic (cholinergic) receptor antagonist; antagonizes bladder smooth muscle contraction.

Therapeutic Effects: Decreased symptoms of overactive bladder.

Pharmacokinetics

Absorption: 15–19% absorbed.
Distribution: Unknown.
Protein Binding: 98%.
Metabolism and Excretion: Extensively metabolized in the liver by the CYP2D6 isoenzyme, with some metabolism by the CYP3A4 isoenzyme; the CYP2D6 enzyme system exhibits genetic polymorphism (~7% of population may be poor metabolizers and may have significantly ↑ darifenacin concentrations and an ↑ risk of adverse effects). 60% excreted renally as metabolites, 40% in feces as metabolites.
Half-life: 13–19 hr.

TIME/ACTION PROFILE

ROUTE	ONSET	PEAK	DURATION
PO	unknown	7 hr	24 hr

Contraindications/Precautions

Contraindicated in: Hypersensitivity; Urinary retention; Gastric retention; Uncontrolled angle-closure glaucoma; Severe hepatic impairment.
Use Cautiously in: Concurrent use of CYP3A4 inhibitors (use lower dose/clinical monitoring may be necessary); Moderate hepatic impairment (lower dose recommended); Bladder outflow obstruction; GI obstructive disorders, ↓ GI motility, severe constipation or ulcerative colitis; Myasthenia gravis; Angle-closure glaucoma; OB: Safety not established in pregnancy; Lactation: Safety not established in breast feeding; Pedi: Safety and effectiveness not established in children.

Adverse Reactions/Side Effects

EENT: blurred vision. **GI:** constipation, dry mouth, dyspepsia, nausea. **Metab:** heat intolerance. **Neuro:** confusion, dizziness, drowsiness, hallucinations, headache. **Misc:** ANGIOEDEMA.

Interactions

Drug-Drug: Strong CYP3A4 inhibitors, including **ketoconazole**, **itraconazole**, **ritonavir**, **nelfinavir**, **clarithromycin**, and **nefazodone** may ↑ levels and risk of toxicity; daily dose should not exceed 7.5 mg. Concurrent use of **moderate CYP3A4 inhibitors**, especially those with narrow therapeutic indices, including **flecainide**, **thioridazine**, and **tricyclic antidepressants**, should be undertaken with caution.

Route/Dosage

PO (Adults): 7.5 mg once daily, may ↑ after 2 wk to 15 mg once daily.

Availability (generic available)

Extended-release tablets: 7.5 mg, 15 mg. **Cost:** All strengths $599.48/90.

NURSING IMPLICATIONS

Assessment

- Monitor voiding pattern and assess symptoms of overactive bladder (urinary urgency, urinary incontinence, urinary frequency) to and periodically during therapy.

Implementation

- Do not confuse Enablex (darifenacin) with Effexor XR (venlafaxine).

© F.A. Davis Publishing

- **PO:** Administer once daily without regard to food. *DNC:* Extended-release tablets must be swallowed whole; do not break, crush, or chew.

Patient/Family Teaching

- Instruct patient to take darifenacin as directed. If a dose is missed, skip dose and take next day; do not take 2 doses in same day. Advise patient to read *Patient Information* before starting therapy and with each Rx refill in case of changes.
- Do not share darifenacin with others; may be dangerous.
- Inform patient of potential anticholinergic side effects (constipation, urinary retention, blurred vision, heat prostration in a hot environment).
- May cause dizziness, drowsiness, confusion, and blurred vision. Caution patient to avoid driving and other activities that require alertness until response to medication is known.
- Instruct patient to notify health care professional of all Rx or OTC medications, vitamins, or herbal products being taken and consult health care professional before taking any new medications.
- Advise females of reproductive potential to notify health care professional if pregnancy is planned or suspected or if breast feeding.

Evaluation/Desired Outcomes

- Decrease in symptoms of overactive bladder (urge urinary incontinence, urgency, frequency).

darunavir/cobicistat/emtricitabine/tenofovir alafenamide

(da-**roo**-na-veer/koe-**bik**-i-stat/em-tri-**si**-ti-been/te-**noe**-fo-veer al-a-**fen**-a-mide)

Symtuza

Classification

Therapeutic: antiretrovirals, pharmacoenhancers

Pharmacologic: protease inhibitors, enzyme inhibitors, nucleoside reverse transcriptase inhibitors

Indications

HIV-1 infection in patients who have no prior antiretroviral treatment history or who are virologically suppressed (HIV-1 RNA less than 50 copies/mL) on a stable antiretroviral regimen for ≥6 mo and have no known substitutions associated with resistance to darunavir or tenofovir.

Action

Darunavir—Inhibits HIV-1 protease, selectively inhibiting the cleavage of HIV-encoded specific polyproteins in infected cells. This prevents the formation of mature virus particles. *Cobicistat*—Strongly inhibits CYP3A enzymes, enhancing systemic exposure to darunavir. *Emtricitabine*—Phosphorylated intracellularly where it inhibits HIV reverse transcriptase, resulting in viral DNA chain termination. *Tenofovir alafenamide*—Phosphorylated intracellularly where it inhibits HIV reverse transcriptase resulting in disruption of DNA synthesis. **Therapeutic Effects:** Increased CD4 cell counts and decreased viral load with subsequent slowed progression of HIV infection and its sequelae.

Pharmacokinetics

Darunavir

Absorption: Food enhances oral absorption.
Distribution: Unknown.
Protein Binding: 95%.
Metabolism and Excretion: Extensively metabolized by CYP3A; 41% excreted unchanged in feces, 8% in urine.
Half-life: 9.4 hr.

Cobicistat

Absorption: Absorption follows oral administration.
Distribution: Unknown.
Protein Binding: 97–98%.
Metabolism and Excretion: Metabolized by CYP3A and to a small extent by CYP2D6; 86.2% excreted in feces, 8.2% in urine.
Half-life: 3.2 hr.

Emtricitabine

Absorption: 93% absorbed following oral administration.
Distribution: Unknown.
Metabolism and Excretion: Not significantly metabolized; 86% excreted in urine, 14% in feces.
Half-life: 7.5 hr.

Tenofovir Alafenamide

Absorption: Tenofovir alafenamide is a prodrug, which is hydrolyzed into tenofovir, the active component; absorption enhanced by high-fat meals.
Distribution: Unknown.
Metabolism and Excretion: Tenofovir is phosphorylated to tenofovir diphosphate (active metabolite); 32% excreted in feces, <1% in urine.
Half-life: 0.5 hr.

TIME/ACTION PROFILE (plasma concentrations)

ROUTE	ONSET	PEAK	DURATION
Darunavir	unknown	3 hr	24 hr
Cobicistat	unknown	3 hr	24 hr
Emtricitabine PO	rapid	1.5 hr	24 hr
Tenofovir PO	unknown	0.5 hr	24 hr

Contraindications/Precautions

Contraindicated in: Concurrent use of alfuzosin, carbamazepine, dronedarone, colchicine (in renal/hepatic impairment), elbasvir/grazoprevir, ergot derivatives, ivabradine, lomitapide, lovastatin, lurasidone,

© F.A. Davis Publishing

midazolam (PO), naloxegol, phenobarbital, phenytoin, pimozide, ranolazine, rifampin, sildenafil (Revatio), simvastatin, triazolam, or St. John's wort; Severe renal impairment (CCr <30 mL/min); Severe hepatic impairment (Child-Pugh Class C); OB: Pregnancy (significantly lower concentrations of darunavir and cobicistat during 2nd and 3rd trimesters); Lactation: Breast feeding is not recommended in patients with HIV.

Use Cautiously in: Hepatitis B or C infection or hepatic impairment; Sulfonamide allergy; Hemophilia (↑ risk of bleeding); Pedi: Children <40 kg (safety and effectiveness not established); Geri: Consider age-related impairment in hepatic function, concurrent chronic disease states and drug therapy.

Adverse Reactions/Side Effects

Derm: ACUTE GENERALIZED EXANTHEMATOUS PUSTULOSIS, DRUG REACTION WITH EOSINOPHILIA AND SYSTEMIC SYMPTOMS (DRESS), STEVENS-JOHNSON SYNDROME (SJS), TOXIC EPIDERMAL NECROLYSIS (TEN), rash. **Endo:** Graves' disease, hyperglycemia. **GI:** ACUTE EXACERBATION OF HEPATITIS B, HEPATOTOXICITY, LACTIC ACIDOSIS/HEPATOMEGALY WITH STEATOSIS, abdominal pain, autoimmune hepatitis, diarrhea, flatulence, nausea. **GU:** acute renal failure, Fanconi syndrome, proximal renal tubulopathy. **Metab:** body fat redistribution, hyperlipidemia. **MS:** polymyositis. **Neuro:** fatigue, Guillain-Barré syndrome, headache. **Misc:** immune reconstitution syndrome.

Interactions

Drug-Drug: ↑ levels and risk of toxicity from **alfuzosin**, **dronedarone**, **elbasvir/grazoprevir**, **ergot derivatives (dihydroergotamine, ergotamine, methylergonovine)**, **ivabradine**, **lomitapide**, **lovastatin**, **lurasidone**, **midazolam (oral)**, **pimozide**, **ranolazine**, **sildenafil (Revatio)**, **simvastatin**, and **triazolam**; concurrent use contraindicated. May ↑ **naloxegol** levels which can precipitate opioid withdrawal symptoms; concurrent use contraindicated. **Strong CYP3A4 inducers**, including **carbamazepine**, **phenobarbital**, **phenytoin**, and **rifampin** may ↓ cobicistat, darunavir, and tenofovir levels and their effectiveness; concurrent use contraindicated. ↑ levels/risk of adverse reactions with **colchicine**; concurrent use in patients with renal/hepatic impairment contraindicated; for others ↓ dose (*for gout flare*—0.6 mg followed by 0.3 mg one hr later, may repeat no sooner than 3 days, *for prophylaxis of gout flare*—if dose was originally 0.6 mg twice daily, ↓ to 0.3 mg once daily, if original regimen was 0.6 mg once daily, ↓ to 0.3 mg every other day, *for treatment of familial Mediterranean fever*—dose should not exceed 0.6 mg once daily or 0.3 mg twice daily). **Clarithromycin** and **erythromycin** may ↑ levels of darunavir and cobicistat; consider alternative anti-infectives. ↑ levels/risk of toxicity with **dasatinib**, **nilotinib**, **vinblastine**, and **vincristine**; careful monitoring for toxicity and dose adjustments recommended. May ↑ bleeding risk with **apixaban** and **rivaroxaban**; may need to adjust apixaban dose; avoid concurrent use with rivaroxaban. Effect on **warfarin** is not known; monitor INR. **Oxcarbazepine** and **eslicarbazepine** may ↓ cobicistat and tenofovir levels and their effectiveness; consider alternative anticonvulsant or antiretroviral therapy. May ↑ levels of **clonazepam**; careful anticonvulsant monitoring recommended. May ↑ levels/effects of **tricyclic antidepressants** and **trazodone**; careful dosing of antidepressants recommended (effect on **SSRIs** is unknown). May ↑ levels of **ketoconazole**, **isavuconazonium**, and **itraconazole**; effect on **voriconazole** unknown; concurrent use with voriconazole not recommended. Effects are unknown with **artemether/lumefantrine**; monitor for ↓ antimalarial activity or QT prolongation. ↑ levels/effects/risk of adverse reaction including neutropenia and uveitis with **rifabutin**; lower rifabutin dose to 150 mg every other day. **Rifapentine** ↓ darunavir and tenofovir levels; concurrent use not recommended. May ↑ levels/effects of **neuroleptics that are metabolized by CYP3A or CYP2D6**, including **perphenazine**, **risperidone**, and **thioridazine**; ↓ dose of neuroleptic may be necessary. May ↑ levels of **quetiapine**; if taking quetiapine when initiating therapy, consider alternative antiretroviral therapy or ↓ quetiapine dose to ⅙ of the original dose and monitor for adverse effects. ↑ levels/effects of **beta-blockers metabolized by CYP2D6**, including **metoprolol**, **carvedilol**, and **timolol**; clinical monitoring recommended. ↑ levels/effects of **calcium channel blockers metabolized by CYP3A**, including **amlodipine**, **diltiazem**, **felodipine**, **nifedipine**, or **verapamil**; careful monitoring recommended. ↑ level and risk of toxicity with **antiarrhythmics** including **amiodarone**, **disopyramide**, **flecainide**, **mexiletine**, **propafenone**, and **quinidine**; careful monitoring and titration is recommended. May ↑ levels and risk of toxicity with **digoxin**; closely monitor digoxin levels and adjust dose as needed. **Dexamethasone** may ↓ levels of cobicistat and darunavir; consider use of alternative corticosteroid, such as prednisone or prednisolone. May ↑ levels of **corticosteroids** (all routes of administration) primarily metabolized by the CYP3A isoenzyme (e.g. **betamethasone**, **budesonide**, **ciclesonide**, **fluticasone**, **methylprednisolone**, **mometasone**, or **triamcinolone** which may ↑ the risk of Cushing's disease and adrenal suppression; consider alternative corticosteroid such as beclomethasone, prednisone, or prednisolone. Concurrent use with **bosentan** may result in ↑ levels/toxicity of bosentan and ↓ levels darunavir and cobicistat; dose alteration is required (*initiating bosentan in patients already receiving darunavir/cobicistat/emtricitabine/tenofovir alafenamide for ≥10 days*—bosentan 62.5 mg daily or

© F.A. Davis Publishing

every other day, depending on tolerance; *initiating darunavir/cobicistat/emtricitabine/tenofovir alafenamide in patient already receiving bosentan*—discontinue bosentan for 10 days, resume bosentan at 62.5 mg daily or every other day, depending on tolerance). May ↑ levels of **glecaprevir/pibrentasvir**; concurrent use not recommended. Nephrotoxic agents, including **NSAIDs**, ↑ risk of nephrotoxicity; avoid concurrent use. May ↓ levels and contraceptive efficacy of some combined **hormonal contraceptives**; additional or alternative methods of nonhormonal contraception recommended. May ↑ risk of hyperkalemia when used with **drospirenone**. ↑ levels and risk of toxicity from **immunosuppressants metabolized by CYP3A**, including **cyclosporine**, **everolimus**, **sirolimus**, and **tacrolimus**; therapeutic monitoring recommended. May ↑ levels of **irinotecan**; discontinue darunavir/cobicistat/emtricitabine/tenofovir alafenamide ≥1 wk before starting irinotecan therapy. ↑ levels of **salmeterol** and may ↑ risk of serious adverse cardiovascular events; concurrent use is not recommended. ↑ levels and risk of myopathy from **atorvastatin**, **fluvastatin**, **pitavastatin**, **pravastatin**, or **rosuvastatin**; use lowest dose of these agents; do not exceed atorvastatin or rosuvastatin dose of 20 mg/day. May ↑ levels/risk of respiratory depression with opioids, including **buprenorphine**, **buprenorphine/naloxone**, **fentanyl**, **oxycodone**, and **tramadol**; carefully monitor for **opioid** effects, dose adjustment of opioid may be necessary. May ↑ levels and risk of adverse cardiovascular, ophthalmic, and genitourinary effects of **PDE-5 inhibitors**, including **avanafil**, **sildenafil**, **tadalafil**, and **vardenafil**; **avanafil** use is not recommended, *sildenafil*—use for pulmonary hypertension is contraindicated, when used for erectile dysfunction single dose should not exceed 25 mg/48 hr; *tadalafil*—for pulmonary hypertension-initiating tadalafil in patients receiving darunavir/cobicistat/emtricitabine/tenofovir alafenamide for ≥7 days—20 mg once daily initially, may be titrated to 40 mg once daily, initiating darunavir/cobicistat/emtricitabine/tenofovir alafenamide in patients receiving tadalafil—discontinue tadalafil 24 hr prior to initiating therapy, after 7 days reinstitute tadalafil at 20 mg once daily, may be ↑ to 40 mg once daily; for erectile dysfunction single dose should not exceed 10 mg/72 hr; *vardenafil*—for erectile dysfunction single dose should not exceed 2.5 mg/72 hr. May ↑ levels and risk of bleeding with **ticagrelor**; concurrent use not recommended. May ↓ antiplatelet effects of **clopidogrel**; concurrent use not recommended. ↑ levels/effects and risk of excess sedation/respiratory depression from some **sedative/hypnotics metabolized by CYP3A** including **buspirone**, **diazepam**, and **parenteral midazolam**; concurrent with **other sedative/hypnotics metabolized by CYP3A** should be undertaken with caution; dose ↓ may be necessary. May ↑ **fesoterodine** and **solifenacin** levels; should not exceed fesoterodine dose of 4 mg once daily or solifenacin dose of 5 mg once daily.

Drug-Natural Products: St. John's wort may ↓ cobicistat, darunavir, and tenofovir levels and their effectiveness; concurrent use contraindicated.

Route/Dosage

PO (Adults and Children ≥40 kg): One tablet (darunavir 800 mg/cobicistat 150 mg/emtricitabine 200 mg/tenofovir alafenamide 10 mg) once daily.

Availability

Tablets: darunavir 800 mg/cobicistat 150 mg/emtricitabine 200 mg/tenofovir alafenamide 10 mg.

NURSING IMPLICATIONS

Assessment

- Assess patient for change in severity of HIV symptoms and for symptoms of opportunistic infections during therapy.
- Assess for allergy to sulfonamides.
- Monitor for development of rash. May cause SJS or TEN. Discontinue therapy if severe or if accompanied with fever, general malaise, fatigue, muscle or joint aches, blisters, oral lesions, conjunctivitis, hepatitis, and/or eosinophilia.
- ***Lab Test Considerations:*** Monitor viral load and CD4 count before and routinely during therapy to determine response.
- Assess for hepatitis B virus (HBV). *Symtuza* is not approved for administration in patients with HIV and HBV. If therapy is discontinued, may cause severe exacerbation of hepatitis B. Monitor liver function in co-infected patients for several mo after stopping therapy.
- Monitor liver function tests prior to, during, and following therapy. May cause ↑ LDL cholesterol, total cholesterol, and triglyceride concentrations. Lactic acidosis may occur with hepatic toxicity causing hepatic steatosis; may be fatal, especially in women. Discontinue therapy if symptoms occur.
- Monitor serum creatinine, CCr, urine glucose, and urine protein prior to and periodically during therapy and when clinically indicated. In patients with chronic kidney disease, assess serum creatinine, creatinine clearance, serum phosphorus, urine glucose, and urine protein prior to and periodically during therapy. May cause hypophosphatemia in patients with renal impairment.
- May cause hyperglycemia and glycosuria.

Implementation

- **PO:** Administer once daily with food. For patients who are unable to swallow the whole tablet, may be split into two pieces using a tablet-cutter, and consume entire dose immediately after splitting.

Patient/Family Teaching

- Instruct patient on the importance of taking medication as directed, even if feeling better. Do not take more than prescribed amount and do not stop taking without consulting health care professional. Dis-

© F.A. Davis Publishing

continuing therapy may lead to severe exacerbations. Take missed doses as soon as remembered unless almost time for next dose; do not double doses. Advise patient to read *Patient Information* prior to starting therapy and with each Rx refill in case of changes. Caution patient not to share or trade *Symtuza* with others.

- Inform patient of importance of hepatitis B testing before starting antiretroviral therapy.
- Inform patient that *Symtuza* does not cure AIDS and may reduce the risk of transmission of HIV to others through sexual contact or blood contamination. Caution patient to use a condom and avoid sharing needles or donating blood to prevent spreading HIV to others.
- Advise patient to notify health care professional immediately if symptoms of lactic acidosis (nausea, vomiting, unusual or unexpected stomach discomfort, unusual muscle pain, difficulty breathing, feeling cold, especially in arms and legs, dizziness, fast or irregular heartbeat, and weakness or tiredness), liver problems (yellow skin or whites of eyes, dark urine, light colored stools, loss of appetite, nausea, stomach pain), or signs of immune reconstitution syndrome (signs and symptoms of an infection or inflammation) occur.
- Instruct patient to notify health care professional of all Rx or OTC medications, vitamins, or herbal products being taken and consult health care professional before taking any new medications, especially St. John's wort.
- Inform patient that redistribution and accumulation of body fat may occur, causing central obesity, dorsocervical fat enlargement (buffalo hump), peripheral wasting, breast enlargement, and cushingoid appearance. The cause and long-term effects are not known.
- Rep: Advise females of reproductive potential to notify health care professional if pregnancy is planned or suspected. Encourage pregnant women to enroll in the Antiretroviral Pregnancy Registry by calling 1-800-258-4263 to monitor pregnancy outcomes. Advise female patient that pregnancy is not recommended during *Symtuza*™ and avoid breast feeding during therapy.
- Emphasize the importance of regular follow-up exams and blood counts to determine progress and monitor for side effects.

Evaluation/Desired Outcomes

- Delayed progression of AIDS and decreased opportunistic infections in patients with HIV.
- Decrease in viral load and improvement in CD4 cell counts.

HIGH ALERT

DAUNOrubicin hydrochloride

(daw-noe-**roo**-bi-sin **hye**-dro-**klor**-ide)

Cerubidine

D

Classification

Therapeutic: antineoplastics
Pharmacologic: anthracyclines

Indications

In combination with other antineoplastics in the treatment of leukemias.

Action

Forms a complex with DNA, which subsequently inhibits its DNA and RNA synthesis (cell-cycle phase-nonspecific). **Therapeutic Effects:** Death of rapidly replicating cells, particularly malignant ones. Also has immunosuppressive properties.

Pharmacokinetics

Absorption: Administered IV only, resulting in complete bioavailability.
Distribution: Widely distributed. Crosses the placenta.
Metabolism and Excretion: Extensively metabolized by the liver. Converted partially to a compound that also has antineoplastic activity (daunorubicinol); 40% eliminated by biliary excretion.
Half-life: *Daunorubicin* — 18.5 hr. *Daunorubicinol* — 26.7 hr.

TIME/ACTION PROFILE (effects on blood counts)

ROUTE	ONSET	PEAK	DURATION
IV	7–10 days	10–14 days	21 days

Contraindications/Precautions

Contraindicated in: Hypersensitivity to daunorubicin or any other components in the formulation; Symptomatic HF/arrhythmias; OB: Pregnancy (may cause fetal harm); Lactation: Lactation.
Use Cautiously in: Active infections or decreased bone marrow reserve; May reactivate skin lesions produced by previous radiation therapy; Hepatic or renal impairment (dosage ↓ recommended if serum creatinine >3 mg/dL or serum bilirubin >1.2 m g/dL); Patients who have received previous anthracycline therapy or who have underlying cardiovascular disease (↑ risk of cardiotoxicity); Rep: Women of reproductive potential; Geri: Geriatric patients or patients with other chronic debilitating illnesses (dose ↓ recommended for patients ≥60 yr).

© F.A. Davis Publishing

Adverse Reactions/Side Effects

CV: CARDIOTOXICITY, arrhythmias. **Derm:** alopecia. **EENT:** rhinitis, abnormal vision, sinusitis. **GI:** nausea, vomiting, esophagitis, hepatoxicity, stomatitis. **GU:** red urine, gonadal suppression. **Hemat:** anemia, leukopenia, thrombocytopenia. **Local:** phlebitis at IV site. **Metab:** hyperuricemia. **Misc:** chills, fever.

Interactions

Drug-Drug: Additive myelosuppression with other **antineoplastics**. May ↓ antibody response to **live-virus vaccines** and ↑ risk of adverse reactions. **Cyclophosphamide** and **trastuzumab** ↑ risk of cardiotoxicity; avoid use of daunorubicin for up to 7 mo after discontinuing trastuzumab. May ↑ risk of hepatotoxicity with other **hepatotoxic agents**.

Route/Dosage

Other dose regimens are used. In adults, cumulative dose should not exceed 550 mg/m² (450 mg/m² if previous chest radiation).

IV (Adults <60 yr): 45 mg/m²/day for 3 days in first course, then for 2 days of second course (as part of combination regimen).

IV (Adults ≥60 yr): 30 mg/m²/day for 3 days in first course, then for 2 days of second course (as part of combination regimen).

IV (Children >2 yr): 25 mg/m² once weekly (as part of combination regimen). In children <2 yr or BSA <0.5 m², dose should be determined on a mg/kg basis.

Availability (generic available)

Powder for injection (requires reconstitution and dilution): 🍁 20 mg/vial. **Solution for injection (requires dilution):** 5 mg/mL.

NURSING IMPLICATIONS

Assessment

- Monitor vital signs before and frequently during therapy.
- Monitor for bone marrow depression. Assess for bleeding (bleeding gums; bruising; petechiae; guaiac stools, urine, and emesis) and avoid IM injections and taking rectal temperatures if platelet count is low. Apply pressure to venipuncture sites for 10 min. Assess for signs of infection during neutropenia. Anemia may occur. Monitor for increased fatigue, dyspnea, and orthostatic hypotension.
- Assess IV site frequently for inflammation or infiltration. Instruct patient to notify nurse immediately if pain or irritation at injection site occurs. If extravasation occurs, infusion must be stopped and restarted in another vein to avoid damage to subcut tissue. Notify health care professional immediately. Daunorubicin is a vesicant. Standard treatments include local injections of steroids and application of ice compresses.
- Monitor intake and output, appetite, and nutritional intake. Assess for nausea and vomiting, which, although mild, may persist for 24–48 hr. Administration of an antiemetic before and periodically during therapy and adjusting diet as tolerated may help maintain fluid and electrolyte balance and nutritional status. Encourage fluid intake of 2000–3000 mL/day. Allopurinol and alkalinization of the urine may be used to help prevent urate stone formation.
- Assess for evidence of cardiotoxicity, which manifests as HF (peripheral edema, dyspnea, rales/crackles, weight gain, jugular venous distention) and usually occurs 1–6 mo after initiation of therapy. Obtain chest x ray, echocardiography, ECGs, and radionuclide angiography determination of ejection fraction before each course of therapy and periodically during therapy. A 30% decrease in QRS voltage and decrease in systolic ejection fraction are early signs of cardiotoxicity. Patients who receive total cumulative doses >550/mm², who have a history of cardiac disease, or who have received mediastinal radiation are at greater risk of developing cardiotoxicity. May be irreversible and fatal, but usually responds to early treatment.
- ***Lab Test Considerations:*** Monitor uric acid levels periodically during therapy.
- Monitor CBC and differential before and frequently during therapy. The leukocyte count nadir occurs 10–14 days after administration. Recovery usually occurs within 21 days after administration of daunorubicin.
- Monitor AST, ALT, LDH, and serum bilirubin prior to each course of therapy. May cause transiently ↑ serum alkaline phosphatase, bilirubin, and AST concentrations.
- Monitor renal function before each course of therapy.

Implementation

- ***High Alert:*** Fatalities have occurred with chemotherapeutic agents. Before administering, clarify all ambiguous orders; double-check single, daily, and course-of-therapy dose limits; have second practitioner independently double-check original order, calculations, and infusion pump settings.
- Do not confuse daunorubicin hydrochloride with doxorubicin, or idarubicin. To prevent confusion, orders should include generic and brand name.

IV Administration

- Solution should be prepared in a biologic cabinet. Wear gloves, gown, and mask while handling IV medication. Discard IV equipment in specially designated containers.
- **IV:** Reconstitute each 20 mg with 4 mL of sterile water for injection for a concentration of 5 mg/mL. Shake gently to dissolve. Reconstituted medication is stable for 24 hr at room temperature, 48 hr if refrigerated. Protect from sunlight.
- Do not use aluminum needles when reconstituting or injecting daunorubicin, as aluminum darkens the solution.

© F.A. Davis Publishing

- **IV Push:** ***Dilution:*** Dilute further in 10–15 mL of 0.9% NaCl. Administer IV push through Y-site into free-flowing infusion of 0.9% NaCl or D5W. ***Rate:*** Administer over at least 2–3 min. Rapid administration rate may cause facial flushing or erythema along the vein.
- **Intermittent Infusion:** ***Dilution:*** May also be diluted in 50–100 mL of 0.9% NaCl. ***Rate:*** Administer 50 mL over 10–15 min or 100 mL over 30–45 min.
- **Y-Site Compatibility:** alemtuzumab, alfentanil, amifostine, amikacin, amiodarone, anidulafungin, argatroban, arsenic trioxide, atracurium, bivalirudin, bleomycin, bumetanide, buprenorphine, butorphanol, calcium chloride, calcium gluconate, carboplatin, carmustine, caspofungin, chlorpromazine, ciprofloxacin, cisatracurium, cisplatin, cyclophosphamide, cyclosporine, cytarabine, dacarbazine, dactinomycin, daptomycin, dexmedetomidine, dexrazoxane, digoxin, diltiazem, diphenhydramine, dobutamine, docetaxel, dopamine, doxycycline, droperidol, enalaprilat, ephedrine, epinephrine, erythromycin, esmolol, etoposide, etoposide phosphate, famotidine, fenoldopam, fentanyl, filgrastim, fluconazole, gemcitabine, gentamicin, glycopyrrolate, granisetron, haloperidol, hetastarch, hydralazine, hydrocortisone, hydromorphone, idarubicin, imipenem/cilastatin, insulin regular, irinotecan, isoproterenol, labetalol, leucovorin calcium, lidocaine, linezolid, lorazepam, magnesium sulfate, mannitol, melphalan, meperidine, meropenem, metaraminol, methotrexate, methyldopate, metoclopramide, metoprolol, metronidazole, midazolam, milrinone, mitomycin, morphine, moxifloxacin, nalbuphine, naloxone, nitroglycerin, norepinephrine, octreotide, ondansetron, oxaliplatin, paclitaxel, palonosetron, pancuronium, pentamidine, phentolamine, phenylephrine, potassium acetate, potassium choride, potassium phosphates, procainamide, prochlorperazine, promethazine, propranolol, quinupristin/dalfopristin, remifentanil, rituximab, sodium acetate, sodium bicarbonate, sodium phosphates, streptozocin, succinylcholine, sufentanil, tacrolimus, theophylline, thiotepa, tigecycline, tobramycin, tolazoline, topotecan, trastuzumab, vancomycin, vecuronium, verapamil, vinblastine, vincristine, vinorelbine, voriconazole, zidovudine, zoledronic acid.
- **Y-Site Incompatibility:** acyclovir, allopurinol, aminophylline, amphotericin B lipid complex, amphotericin B liposome, ampicillin, ampicillin/sulbactam, aztreonam, cefazolin, cefepime, cefotaxime, cefotetan, cefoxitin, ceftazidime, ceftriaxone, cefuroxime, chloramphenicol, clindamycin, dantrolene, dexamethasone, diazepam, ertapenem, fludarabine, foscarnet, fosphenytoin, furosemide, ganciclovir, heparin, indomethacin, ketorolac, levofloxacin, methohexital, methylprednisolone, mitoxantrone, nafcillin, nitroprusside, pantoprazole, pemetrexed, pentobarbital, phenobarbital, phenytoin, piperacillin/tazobactam, thiopental, trimethoprim/sulfamethoxazole.
- **Additive Incompatibility:** Manufacturer does not recommend admixing daunorubicin hydrochloride.

D

Patient/Family Teaching

- Instruct patient to notify health care professional if fever; chills; sore throat; signs of infection; bleeding gums; bruising; petechiae; or blood in urine, stool, or emesis occurs. Caution patient to avoid crowds and persons with known infections. Instruct patient to use soft toothbrush and electric razor. Patient should be cautioned not to drink alcoholic beverages or take products containing aspirin or NSAIDs.
- Instruct patient to inspect oral mucosa for erythema and ulceration. If ulceration occurs, advise patient to use sponge brush and rinse mouth with water after eating and drinking. Stomatitis pain may require management with opioid analgesics. Period of highest risk is 3–7 days after administration of dose.
- Instruct patient to notify health care professional immediately if irregular heartbeat, shortness of breath, or swelling of lower extremities occurs.
- Discuss with patient possibility of hair loss. Explore methods of coping. Regrowth of hair usually begins within 5 wk after discontinuing therapy.
- Inform patient that medication may turn urine reddish color for 1–2 days after administration.
- Instruct patient not to receive any vaccinations without advice of health care professional.
- Rep: Inform patient that this medication may have teratogenic effects. Advise females of reproductive potential and males with a partner of reproductive potential to use effective contraception during therapy and for at least 4 mo after last dose and to avoid breast feeding during therapy. Inform patient that daunorubicin may cause irreversible gonadal suppression.
- Emphasize the need for periodic lab tests to monitor for side effects.

Evaluation/Desired Outcomes

- Improvement of hematologic status in patients with leukemia.

deferoxamine

(de-fer-**ox**-a-meen)

Desferal

Classification

Therapeutic: antidotes

Pharmacologic: heavy metal antagonists

© F.A. Davis Publishing

Indications
Acute toxic iron ingestion. Secondary iron overload syndromes associated with multiple transfusion therapy.

Action
Chelates unbound iron, forming a water-soluble complex (ferrioxamine) in plasma that is easily excreted by the kidneys. **Therapeutic Effects:** Removal of excess iron. Also chelates aluminum.

Pharmacokinetics
Absorption: Poorly absorbed after oral administration. Well absorbed after IM administration and subcut administration.
Distribution: Appears to be widely distributed.
Metabolism and Excretion: Metabolized by tissues and plasma enzymes. Unchanged drug and chelated form excreted by the kidneys; 33% of iron removed is eliminated in the feces via biliary excretion.
Half-life: 1 hr.

TIME/ACTION PROFILE (effects on hematologic parameters)

ROUTE	ONSET	PEAK	DURATION
IV	rapid	unknown	unknown
IM	unknown	unknown	unknown
Subcut	unknown	unknown	unknown

Contraindications/Precautions
Contraindicated in: Severe renal disease; Anuria; OB: Rep: Early pregnancy or childbearing potential (however, may be used safely in pregnant patients with moderate-to-severe acute iron intoxication).
Use Cautiously in: Pedi: Children <3 yr (safety not established).

Adverse Reactions/Side Effects
EENT: blurred vision, cataracts, ototoxicity. **CV:** hypotension, tachycardia. **GI:** abdominal pain, diarrhea. **GU:** red urine. **Derm:** erythema, flushing, urticaria. **Local:** induration at injection site, pain at injection site. **MS:** leg cramps. **Misc:** allergic reactions, fever, shock after rapid IV administration.

Interactions
Drug-Drug: Ascorbic acid may ↑ effectiveness of deferoxamine but may also ↑ cardiac iron toxicity.

Route/Dosage
Acute Iron Ingestion
IM, IV (Adults and Children ≥3 yr): 1 g, then 500 mg every 4 hr for 2 doses. Additional doses of 500 mg every 4–12 hr may be needed (not to exceed 6 g/24 hr).

Chronic Iron Overload
IM, IV (Adults and Children ≥3 yr): 500 mg–1 g daily IM; additional doses of 2 g should be given IV for each unit of blood transfused (not to exceed 1 g/day in absence of transfusions; 6 g/day if patient receives transfusions).
Subcut (Adults and Children ≥3 yr): 1–2 g/day (20–40 mg/kg/day) infused over 8–24 hr.

Availability (generic available)
Powder for injection: 500 mg/vial, 2 g/vial.

NURSING IMPLICATIONS
Assessment
- In acute poisoning, assess time, amount, and type of iron preparation ingested.
- Monitor signs of iron toxicity: early acute (abdominal pain, bloody diarrhea, emesis), late acute (decreased level of consciousness, shock, metabolic acidosis).
- Monitor vital signs closely, especially during IV administration. Report hypotension, erythema, urticaria, or signs of allergic reaction. Keep epinephrine, an antihistamine, and resuscitation equipment close by in the event of an anaphylactic reaction.
- May cause oculotoxicity or ototoxicity. Report decreased visual acuity or hearing loss. Audiovisual exams should be performed every 3 mo in patients with chronic iron overload.
- Monitor intake and output and urine color. Inform health care professional if patient is anuric. Chelated iron is excreted primarily by the kidneys; urine may turn red.
- ***Lab Test Considerations:*** Monitor serum iron, total iron binding capacity (TIBC), ferritin levels, and urinary iron excretion before and periodically during therapy.
- Monitor liver function studies to assess damage from iron poisoning.

Implementation
- IM route is preferred in acute iron intoxication unless patient is in shock.
- Reconstitute 500-mg vial with 2 mL and 2-g vial with 8 mL of sterile water for injection for a concentration of 213 mg/mL. Dissolve powder completely before administration. Solution is yellow and is stable for 1 wk after reconstitution if protected from light. Discard unused portion.
- Used in conjunction with induction of emesis or gastric aspiration and lavage with sodium bicarbonate, and supportive measures for shock and metabolic acidosis in acute poisoning.
- **IM:** Administer deep IM and massage well. Rotate sites. IM administration may cause transient severe pain.
- **Subcut:** Reconstitute 500-mg vial with 5 mL and 2-g vial with 20 mL of sterile water for injection. ***Concentration:*** 95 mg/mL. Subcut route used to treat chronically elevated iron therapy is administered into abdominal subcut tissue via infusion pump for 8–24 hr per treatment.

IV Administration
- **IV:** Reconstitute 500-mg vial with 5 mL and 2-g vial with 20 mL of sterile water for injection. ***Concentration:***

© F.A. Davis Publishing

95 mg/mL. ***Dilution:*** D5W, 0.9% NaCl, 0.45% NaCl, or LR. Dissolve powder completely before administration. Solution is clear and colorless to slightly yellow. Administer within 3 hr of reconstitution; 24 hr if prepared under laminar flow hood. Discard unused portion. ***Rate:*** Maximum infusion rate is 15 mg/kg/hr for first 1000 mg. May be followed by 500 mg infused over 4 hr at a slower rate not to exceed 125 mg/hr. Rapid infusion rate may cause hypotension, erythema, urticaria, wheezing, convulsions, tachycardia, or shock.

- May be administered at the same time as blood transfusion in persons with chronically elevated serum iron levels. Use separate site for administration.

Patient/Family Teaching

- Reinforce need to keep iron preparations, all medications, and hazardous substances out of the reach of children.
- Reassure patient that red coloration of urine is expected and reflects excretion of excess iron.
- May cause dizziness or impairment of vision or hearing. Caution patient to avoid driving or other activities requiring alertness until response from medication is known.
- Advise patient not to take vitamin C preparations without consulting health care professional, because tissue toxicity may increase.
- Encourage patients requiring chronic therapy to keep follow-up appointments for lab tests. Eye and hearing exams may be monitored every 3 mo.

Evaluation/Desired Outcomes

- Return of serum iron concentrations to a normal level (50–150 mcg/100 mL).

delafloxacin, See FLUOROQUINOLONES.

REMS

denosumab (de-**no**-su-mab)

Prolia, Xgeva

Classification

Therapeutic: bone resorption inhibitors
Pharmacologic: monoclonal antibodies

Indications

Prolia. Treatment of osteoporosis in postmenopausal women who are at high risk for fracture or those who have failed/are intolerant of conventional osteoporosis therapy. To increase bone mass in men with osteoporosis who are at high risk for fracture or those who have failed/are intolerant of conventional osteoporosis therapy. Treatment of glucocorticoid-induced osteoporosis in men and women at high risk for fracture who are initiating or continuing systemic glucocorticoids at a daily dosage of ≥7.5 mg of prednisone and are expected to remain on glucocorticoids for ≥6 mo. To increase bone mass in men receiving androgen deprivation therapy for nonmetastatic prostate cancer who are at high risk for fracture. To increase bone mass in women receiving adjuvant aromatase inhibitor therapy for breast cancer who are at high risk for fracture. **Xgeva**. Prevention of skeletal-related events in patients with multiple myeloma and in patients with bone metastases from solid tumors. Giant cell tumor of bone that is unresectable or where surgical resection is likely to result in severe morbidity. Treatment of hypercalcemia of malignancy that is refractory to bisphosphonate therapy.

Action

A monoclonal antibody that binds specifically to the human receptor activator of nuclear factor kappa-B-ligand (RANKL), which is required for formation, function, and survival of osteoclasts. Binding inhibits osteoclast formation, function, and survival. **Therapeutic Effects:** ↓ bone resorption with ↓ occurrence of fractures (vertebral, nonvertebral, hip) or other skeletal-related events (e.g., radiation therapy to bone, surgery to bone, spinal cord compression). ↑ bone mass.

Pharmacokinetics

Absorption: Well absorbed following subcutaneous administration.
Distribution: Unknown.
Metabolism and Excretion: Unknown.
Half-life: 25.4 days.

TIME/ACTION PROFILE (effects on bone resorption)

ROUTE	ONSET	PEAK	DURATION
Subcut	1 mo	unknown†	12 mo‡

†Maximum ↓ in serum calcium occurs at 10 days.
‡Following discontinuation.

Contraindications/Precautions

Contraindicated in: Hypersensitivity; Hypocalcemia (correct before administering); adequate supplemental calcium and vitamin D required; OB: Pregnancy (may cause fetal harm); Lactation: Lactation (↓ mammary gland development and lactation).

Use Cautiously in: Conditions associated with hypocalcemia including hypoparathyroidism, previous thyroid/parathyroid surgery, malabsorption syndromes, history of small intestinal excision, inadequate/no calcium supplementation, renal impairment/hemodialysis (CCr <30 mL/min and/or on dialysis); monitoring of calcium levels and calcium and vitamin D intake recommended; Invasive dental procedures, cancer, receiving chemotherapy, corticosteroids, or angiogenesis in-

© F.A. Davis Publishing

hibitors, poor oral hygiene, diabetes, gingival infections, periodontal disease, dental disease, anemia, coagulopathy, infection, or poorly-fitting dentures (may ↑ risk of jaw osteonecrosis); History of osteoporosis or prior fractures (↑ risk of multiple vertebral fractures upon drug discontinuation); Concurrent use of immunosuppressants or diseases resulting in immunosuppression (↑ risk of infection); Rep: Women of reproductive potential; Pedi: Safety and effectiveness not established; Geri: May be more sensitive to drug effects.

Adverse Reactions/Side Effects

Derm: dermatitis, eczema, rashes. **F and E:** hypocalcemia, hypophosphatemia, hypercalcemia. **GI:** PANCREATITIS, diarrhea, nausea. **GU:** cystitis. **Metab:** hypercholesterolemia. **MS:** back pain, extremity pain, musculoskeletal pain, atypical femoral fracture, osteonecrosis of the jaw, suppression of bone turnover. **Neuro:** headache. **Resp:** dyspnea, cough. **Misc:** HYPERSENSITIVITY REACTIONS (including anaphylaxis), infection.

Interactions

Drug-Drug: Concurrent use of **immunosuppressants** ↑ risk of infection. Concurrent use of **calcimimetic drugs** may ↑ risk of hypocalcemia.

Route/Dosage

Prolia

Subcut (Adults): 60 mg every 6 mo.

Xgeva

Subcut (Adults): *Multiple myeloma or bone metastasis from solid tumors*— 120 mg every 4 wk; *Giant cell tumor of bone*— 120 mg every 4 wk, with additional doses of 120 mg given on Days 8 and 15 of first mo of therapy; *Hypercalcemia of malignancy*— 120 mg every 4 wk, with additional doses of 120 mg given on Days 8 and 15 of first mo of therapy.

Availability

Solution for injection (Prolia) (prefilled syringe): 60 mg/mL. **Solution for injection (Xgeva):** 120 mg/1.7 mL.

NURSING IMPLICATIONS

Assessment

- Assess patients via bone density study for low bone mass before and periodically during therapy.
- Perform a routine oral exam prior to initiation of therapy. Dental exam with appropriate preventative dentistry should be considered prior to therapy. Patients with history of tooth extraction, poor oral hygiene, gingival infections, diabetes, or use of a dental appliance or those taking immunosuppressive therapy, angiogenesis inhibitors, or systemic corticosteroids are at greater risk for osteonecrosis of the jaw.
- Monitor for signs and symptoms of hypersensitivity reactions (hypotension, dyspnea, upper airway edema, lip swelling, rash, pruritus, urticaria). Treat symptomatically and discontinue medication if symptoms occur.
- ***Lab Test Considerations:*** Verify negative pregnancy status of patient before starting therapy.
- Assess serum calcium, phosphorous, and magnesium levels before and periodically during therapy, especially during first wk of therapy. Correct hypocalcemia and vitamin D deficiency before starting therapy. May cause mild, transient ↑ of calcium and phosphate. Supplement with calcium, magnesium, and vitamin D as needed.
- May cause hypercalcemia within the yr following discontinuation. Monitor for signs and symptoms of hypercalcemia, assess serum calcium periodically, re-evaluate the patient's calcium and vitamin D supplementation requirements and manage as clinically.
- May cause anemia.
- May cause hypercholesterolemia.

Implementation

- Grey needle cap on single-use prefilled *Prolia* syringe should not be handled by people sensitive to latex.
- **Subcut:** Remove from refrigerator and bring to room temperature by standing in original container for 15–30 min prior to administration; do not warm in any other way. Do not shake. Administer using a 27-gauge needle in the upper arm, upper thigh, or abdomen. Solution is clear and colorless to pale yellow, and may contain trace amounts of translucent to white proteinaceous particles. Do not use if solution is discolored or contains many particles. Manually activate the green safety guard *after* the injection is given, not before.
- Patients should receive calcium 1000 mg and 400 IU vitamin D daily.

Patient/Family Teaching

- Explain the purpose of denosumab to patient. If a dose is missed, administer injection as soon as possible.
- Advise patient once treatment is stopped there may be an increased risk of having broken bones in the spine, especially in patients who have had a fracture or who have had osteoporosis. Advise patients not to interrupt therapy without their health care professional advice.
- Advise patient to eat a balanced diet and consult health care professional about the need for supplemental calcium and vitamin D (see Appendix J).
- Advise patient to notify health care professional immediately if signs of hypersensitivity, hypocalcemia (spasms, twitches, or cramps in muscles; numbness or tingling in fingers, toes, or around mouth), infection (fever, chills, skin that is red, swollen, hot, or tender to touch; severe abdominal pain, frequent or urgent need to urinate or burning during urination), or skin reactions (redness, itching, rash, dry or leathery feeling, blisters that ooze or become crusty,

© F.A. Davis Publishing

peeling), or osteonecrosis of the jaw (pain, numbness, swelling of or drainage from the jaw, mouth, or teeth) occur.
- Encourage patient to participate in regular exercise and to modify behaviors that ↑ the risk of osteoporosis (stop smoking, reduce alcohol consumption).
- Advise patient to take good care of teeth and gums (brush and floss regularly) and to inform health care professional of therapy prior to dental surgery.
- Inform patient of increased risk of fractures upon discontinuation. If denosumab is discontinued, consider another bone resorption inhibitor.
- Rep: Instruct female of reproductive potential to use highly effective contraception during and for at least 5 mo after therapy is completed. Advise patient to notify health care professional if pregnancy is planned or suspected or if breast feeding.

Evaluation/Desired Outcomes
- Reversal of the progression of osteoporosis with ↓ fractures and other sequelae.
- ↑ bone mass.
- Decreased growth of giant cell tumors.
- Reduction in hypercalcemia of malignancy that is refractory to bisphosphonate therapy.

BEERS

desipramine
(dess-**ip**-ra-meen)
Norpramin

Classification
Therapeutic: antidepressants
Pharmacologic: tricyclic antidepressants

Indications
Depression. **Unlabeled Use:** Chronic pain syndromes. Anxiety. Insomnia.

Action
Potentiates the effect of serotonin and norepinephrine in the CNS. Has significant anticholinergic properties.
Therapeutic Effects: Antidepressant action (may develop only over several wk).

Pharmacokinetics
Absorption: Well absorbed from the GI tract.
Distribution: Widely distributed.
Protein Binding: 90–92%.
Metabolism and Excretion: Mostly metabolized by the liver (CYP2D6 isoenzyme); one metabolite is pharmacologically active (2-hydroxydesipramine); the CYP2D6 enzyme system exhibits genetic polymorphism; ~7% of population may be poor metabolizers (PMs) and may have significantly ↑ desipramine concentrations and an ↑ risk of adverse effects. Small amounts enter breast milk.
Half-life: 12–27 hr.

TIME/ACTION PROFILE (antidepressant effect)

ROUTE	ONSET	PEAK	DURATION
PO	2–3 wk	2–6 wk	days–wk

D

Contraindications/Precautions
Contraindicated in: Angle-closure glaucoma; Recent MI, heart failure, known history of QTc prolongation.
Use Cautiously in: Patients with pre-existing cardiovascular disease; Family history of sudden death, cardiac arrhythmias, or conduction disturbances; Prostatic hyperplasia (↑ susceptibility to urinary retention); History of seizures (threshold may be ↓ seizures may precede the development of cardiac arrhythmias or death); May ↑ risk of suicide attempt/ideation especially during early treatment or dose adjustment; risk may be greater in children or adolescents; OB: Use during pregnancy only if potential maternal benefit outweighs risk to fetus; Lactation: Use during breast feeding only if potential maternal benefit outweighs risk to infant; Pedi: Children <12 yr (safety not established); Geri: ↑ sensitivity to effects.

Adverse Reactions/Side Effects
CV: ARRHYTHMIAS, hypotension, ECG changes. **Derm:** photosensitivity. **EENT:** blurred vision, dry eyes, dry mouth. **Endo:** changes in blood glucose, gynecomastia. **GI:** constipation, drug-induced hepatitis, paralytic ileus, ↑ appetite, weight gain. **GU:** urinary retention, ↓ libido. **Hemat:** blood dyscrasias. **Neuro:** drowsiness, fatigue.

Interactions
Drug-Drug: Desipramine is metabolized in the liver by the cytochrome P450 2D6 enzyme and its action may be affected by drugs that compete for metabolism or alter the activity of this enzyme including other **antidepressants**, **phenothiazines**, **carbamazepine**, **class 1C antiarrthythmics** (**propafenone** or **flecainide**); when used concurrently dose ↓ of one or the other or both may be necessary. Concurrent use of other drugs that inhibit the activity of the enzyme, including **cimetidine**, **quinidine**, **amiodarone**, and **ritonavir**, may result in ↑ effects. May cause hypotension, tachycardia, and potentially fatal reactions when used with **MAO inhibitors** (avoid concurrent use—discontinue 2 wk prior to). Concurrent use with **SSRI antidepressants** may result in ↑ toxicity and should be avoided (fluoxetine should be stopped 5 wk before). Concurrent use with **clonidine** may result in hypertensive crisis and should be avoided. **Phenytoin** may ↓ levels and effectiveness; ↑ doses of desipramine may be required to treat depression. Concurrent use with **levodopa** may result in delayed/↓ absorption of levodopa or hypertension. Blood levels and effects may be ↓ by

© F.A. Davis Publishing

rifampin, **carbamazepine**, and **barbiturates**. Concurrent use with **moxifloxacin** ↑ risk of adverse cardiovascular reactions. ↑ CNS depression with other **CNS depressants** including **alcohol**, **antihistamines**, **clonidine**, **opioid analgesics**, and **sedative/hypnotics**. **Barbiturates** may alter blood levels and effects. **Adrenergic** and **anticholinergic** side effects may be ↑ with other **agents having these properties**. **Hormonal contraceptives** ↑ levels and may cause toxicity. **Cigarette smoking** may ↑ metabolism and alter effects.

Drug-Natural Products: Concomitant use of **kava-kava**, **valerian**, or **chamomile** can ↑ CNS depression. ↑ anticholinergic effects with **jimson weed** and **scopolia**.

Route/Dosage

PO (Adults): 100–200 mg/day as a single dose or in divided doses (up to 300 mg/day).
PO (Geriatric Patients): 25–50 mg/day in divided doses (up to 150 mg/day).
PO (Children >12 yr): 25–50 mg/day in divided doses, may ↑ as needed up to 100 mg/day.
PO (Children 6–12 yr): 10–30 mg/day (1–5 mg/kg/day) in divided doses.

Availability (generic available)

Tablets: 10 mg, 25 mg, 50 mg, 75 mg, 100 mg, 150 mg.

NURSING IMPLICATIONS

Assessment

- Obtain weight and BMI initially and periodically throughout therapy.
- Assess fasting blood glucose and cholesterol levels for overweight/obese individuals.
- Refer as appropriate for nutrition/weight management and medical management.
- Monitor BP and pulse prior to and during initial therapy. Notify health care professional of decreases in BP (10–20 mm Hg) or sudden increase in pulse rate. Monitor ECG prior to and periodically during therapy in patients taking high doses or with a history of cardiovascular disease.
- **Depression:** Monitor mental status (orientation, mood, behavior) frequently. Assess for suicidal tendencies, especially during early therapy. Restrict amount of drug available to patient.
- Assess mental status and mood changes, especially during initial few mo of therapy and during dose changes. Risk may be increased in children, adolescents, and adults ≤24 yrs. Inform health care professional if patient demonstrates significant increase in signs of depression (depressed mood, loss of interest in usual activities, significant change in weight and/or appetite, insomnia or hypersomnia, psychomotor agitation or retardation, increased fatigue, feelings of guilt or worthlessness, slowed thinking or impaired concentration, suicide attempt or suicidal ideation). Restrict amount of drug available to patient.
- **Pain:** Assess intensity, quality, and location of pain periodically during therapy.
- ***Lab Test Considerations:*** Assess leukocyte and differential blood counts, liver function, and serum glucose periodically. May cause an ↑ serum bilirubin and alkaline phosphatase. May cause bone marrow depression. Serum glucose may be ↑ or ↓.
- Serum levels may be monitored in patients who fail to respond to usual therapeutic dose.

Implementation

- Do not confuse despiramine with disopyramide.
- Begin dose increases at bedtime due to sedation. Dose titration is a slow process; may take wk to mo. May give entire dose at bedtime.
- Taper to avoid withdrawal effects. Reduce dose by half for 3 days then reduce again by half for 3 days, then discontinue.
- **PO:** Administer medication with or immediately after a meal to minimize gastric upset. Tablet may be crushed and given with food or fluids.

Patient/Family Teaching

- Instruct patient to take medication as directed. Take missed doses as soon as possible unless almost time for next dose; if regimen is a single dose at bedtime, do not take in the morning because of side effects. Advise patient that drug effects may not be noticed for at least 2 wk. Abrupt discontinuation may cause nausea; vomiting; diarrhea; headache; trouble sleeping, with vivid dreams; and irritability. Instruct patient to read the *Medication Guide* prior to starting and with each Rx refill in case of changes.
- May cause drowsiness and blurred vision. Caution patient to avoid driving and other activities requiring alertness until response to drug is known.
- Orthostatic hypotension, sedation, and confusion are common during early therapy, especially in the elderly. Protect patient from falls. Institute fall precautions. Advise patient to make position changes slowly.
- Advise patient to avoid alcohol or other CNS depressant drugs during and for 3–7 days after therapy has been discontinued.
- Advise patient, family, and caregivers to look for suicidality, especially during early therapy or dose changes. Notify health care professional immediately if thoughts about suicide or dying, attempts to commit suicide, new or worse depression or anxiety, agitation or restlessness, panic attacks, insomnia, new or worse irritability, aggressiveness, acting on dangerous impulses, mania, or other changes in mood or behavior occur.
- Instruct patient to notify health care professional if urinary retention, dry mouth, or constipation persists. Sugarless candy or gum may diminish dry mouth, and an increase in fluids or bulk may prevent constipation. If symptoms persist, dose reduc-

© F.A. Davis Publishing

tion or discontinuation may be necessary. Consult health care professional if dry mouth persists for more than 2 wk.
- Caution patient to use sunscreen and protective clothing to prevent photosensitivity reactions.
- Inform patient of need to monitor dietary intake. Increase in appetite may lead to undesired weight gain.
- Alert patient that medication may turn urine blue-green in color.
- Advise patient to notify health care professional of medication regimen prior to treatment or surgery.
- Advise female patients to notify health care professional if pregnancy is planned or suspected or if breast feeding. Enroll pregnant patients in National Pregnancy Registry for Antidepressants at 1-844-405-6185 or http://womensmentalhealth.org/clinical-and-researchprograms/pregnancyregistry/antidepressants to monitor pregnancy outcomes in women exposed to antidepressants.
- Therapy for depression is usually prolonged. Emphasize the importance of follow-up exams to monitor effectiveness and side effects and to improve coping skills.

Evaluation/Desired Outcomes

- Increased sense of well-being.
- Renewed interest in surroundings.
- Increased appetite.
- Improved energy level.
- Improved sleep.
- Decrease in chronic pain symptoms.
- Full therapeutic effects may be seen 2–6 wk after initiating therapy.

BEERS

desmopressin

(des-moe-**press**-in)

DDAVP, DDAVP Melt, DDAVP Rhinyle, Nocdurna, Octostim

Classification

Therapeutic: hormones
Pharmacologic: antidiuretic hormones

Indications

PO, SL, Subcut, IV, Intranasal: Treatment of central diabetes insipidus caused by a deficiency of vasopressin. **IV:** Controls bleeding in certain types of hemophilia and von Willebrand's disease. **Intranasal, SL:** Nocturia due to nocturnal polyuria in patients who awaken ≥2 times per night to void (Nocdurna only). **PO, SL:** Primary nocturnal enuresis.

Action

An analogue of naturally occurring vasopressin (antidiuretic hormone). Primary action is enhanced reabsorption of water in the kidneys. **Therapeutic Effects:** Prevention of nocturnal enuresis. Reduction in number of episodes of nocturia. Maintenance of appropriate body water content in diabetes insipidus. Control of bleeding in certain types of hemophilia or von Willebrand's disease.

Pharmacokinetics

Absorption: <1% absorbed following oral or SL administration; nasal solution 10–20% absorbed; nasal spray 3–4% absorbed.
Distribution: Distribution not fully known. Enters breast milk.
Metabolism and Excretion: Primarily excreted in urine.
Half-life: *PO*—1.5–2.5 hr; *SL*—2.8 hr; *IV*—75 min (↑ in renal impairment); *Intranasal*—1.8–3.5 hr.

TIME/ACTION PROFILE (PO, intranasal = antidiuretic effect; IV = effect on factor VIII activity)

ROUTE	ONSET	PEAK	DURATION
PO	1 hr	4–7 hr	unknown
SL	unknown	unknown	unknown
Intranasal	1 hr	1–5 hr	8–20 hr
IV	within min	15–30 min	3 hr†

†4–24 hr in mild hemophilia A.

Contraindications/Precautions

Contraindicated in: Hypersensitivity; Hypersensitivity to chlorobutanol; Patients with severe type I, type IIB, or platelet-type (pseudo) von Willebrand's disease, hemophilia A with factor VIII levels <5%, or hemophilia B; Renal impairment (CCr <50 mL/min); Current or a history of hyponatremia; Polydipsia (Nocdurna only); Concurrent use with loop diuretics or systemic/inhaled glucocorticoids (Nocdurna only); Known or suspected syndrome of inappropriate antidiuretic hormone secretion (Nocdurna only); Conditions that can lead to electrolyte or fluid imbalances, including gastroenteritis, salt-wasting nephropathies, or infection (Nocdurna only); HF (NYHA class II-IV) (Nocdurna only); Uncontrolled hypertension (Nocdurna only).
Use Cautiously in: Angina pectoris; Hypertension; Patients at risk for hyponatremia; Patients at risk for ↑ intracranial hypertension (Nocdurna only); Urinary retention (Nocdurna only); Women (↑ risk of hyponatremia; require ↓ dose) (Nocdurna only); Patients who require use of other intranasal medications; Geri: ↑ risk of hyponatremia; OB, Lactation: Safety not established; Nocdurna not recommended for treatment of nocturia in pregnancy; Pedi: Safety and effectiveness not established (Nocdurna only).

© F.A. Davis Publishing

Adverse Reactions/Side Effects

CV: edema, hypertension, hypotension, tachycardia (large IV doses only). **Derm:** flushing. **EENT:** *intranasal*—epistaxis, nasal congestion, nasal discomfort, rhinitis, sneezing. **F and E:** HYPONATREMIA, fluid retention. **GI:** dry mouth, mild abdominal cramps, nausea. **GU:** vulval pain. **Local:** phlebitis at IV site. **MS:** back pain. **Neuro:** SEIZURES, dizziness, drowsiness, headache, listlessness. **Resp:** dyspnea.

Interactions

Drug-Drug: Loop diuretics, **systemic glucocorticoids**, or **inhaled glucocorticoids** ↑ risk of severe hyponatremia; concurrent use with Nocdurna contraindicated. **Carbamazepine**, **chlorpromazine**, **lamotrigine**, **NSAIDs**, **opioids**, **SSRIs**, **sulfonylureas**, **TCAs**, or **thiazide diuretics** may ↑ risk of fluid retention and hyponatremia. **Demeclocycline**, **lithium**, or **norepinephrine** may diminish the antidiuretic response to desmopressin. Large doses may enhance the effects of **vasopressors**.

Route/Dosage

Primary Nocturnal Enuresis

PO (Adults and Children ≥6 yr): 0.2 mg at bedtime; may be titrated up to 0.6 mg at bedtime to achieve desired response.
SL (Adults and Children): 120 mcg 1 hr before bedtime; may be titrated up to 360 mcg at bedtime to achieve desired response.

Diabetes Insipidus

PO (Adults and Children): 0.05 mg twice daily; adjusted as needed (usual range: 0.1–1.2 mg/day for adults or 0.1–0.8 mg/day for children in 2–3 divided doses).
SL (Adults and Children): 60 mcg 3 times daily; adjusted as needed (usual range: 120–720 mcg/day in 2–3 divided doses).
Intranasal (Adults and Children ≥12 yr): *DDAVP*—5–40 mcg (0.0.05–0.4 mL) in 1–3 divided doses.
Intranasal (Children 3 mo–12 yr): *DDAVP*—5–30 mcg (0.05–0.3 mL) in 1–2 divided doses.
Subcut, IV (Adults and Children ≥12 yr): 2–4 mcg/day in 2 divided doses.
Subcut, IV (Children <12 yr): 0.1–1 mcg/day in 1–2 divided doses.

Hemophilia A/von Willebrand's Disease

IV (Adults and Children >3 mo): 0.3 mcg/kg, repeated as needed.

Nocturia

SL (Adults): *Women*—27.7 mcg 1 hr before bedtime (US dose); 25 mcg at bedtime (Canadian dose); *Men*—55.3 mcg 1 hr before bedtime (US dose); 50 mcg at bedtime (Canadian dose).

Availability (generic available)

Nasal spray : 10 mcg/spray in 5-mL bottle (contains 50 sprays). **Solution for injection:** 4 mcg/mL. **Sublingual tablet (Nocdurna):** 25 mcg, 27.7 mcg, 50 mcg, 55.3 mcg, 60 mcg, 120 mcg, 240 mcg. **Tablets:** 0.1 mg, 0.2 mg.

NURSING IMPLICATIONS

Assessment

- **Nocturnal Enuresis:** Monitor frequency of enuresis during therapy. Use cautiously in patients at risk for water intoxication with hyponatremia.
- Do not use intranasal form for nocturnal enuresis.
- **Nocturia**: Assess for possible causes of nocturia (adults who awaken at least 2 times per night to void), including excessive fluid intake before bedtime, and address other treatable causes of nocturia.
- **Diabetes Insipidus:** Monitor urine and plasma osmolality and urine volume frequently. Assess patient for symptoms of dehydration (excessive thirst, dry skin and mucous membranes, tachycardia, poor skin turgor). Weigh patient daily and assess for edema.
- **Hemophilia:** Monitor plasma factor VIII coagulant, factor VIII antigen, and ristocetin cofactor. May also assess activated partial thromboplastin time (aPTT) for hemophilia A and skin bleeding time for von Willebrand's disease. Assess patient for signs of bleeding.
- Monitor BP and pulse during IV infusion.
- Monitor intake and output and adjust fluid intake (especially in children and elderly) to avoid overhydration in patients receiving desmopressin for hemophilia.
- ***Lab Test Considerations:*** Begin *Nocdurna* with a normal serum sodium level. Assess serum sodium concentration is normal before starting or resuming *Nocdurna*, within 1 wk, 1 mo after starting and periodically during therapy. Patients ≥65 yrs and older and patients at ↑ risk of hyponatremia may require more frequent monitoring. May need to hold or discontinue therapy if hyponatremia occurs.
- *Nocdurna:* Obtain a 24-hr urine collection to confirm diagnosis of nocturnal polyuria before starting therapy.
- ***Toxicity and Overdose:*** Signs and symptoms of water intoxication include confusion, drowsiness, headache, weight gain, difficulty urinating, seizures, and coma.
- Treatment of overdose includes decreasing dose and, if symptoms are severe, administration of furosemide.

Implementation

- Do not confuse desmopressin with vasopressin.
- IV desmopressin has 10 times the antidiuretic effect of intranasal desmopressin.
- **PO:** Begin oral doses 12 hr after last intranasal dose. Monitor response closely.

© F.A. Davis Publishing

- **SL:** Administer 1 hr before bedtime. Place tablet under tongue until dissolved completely. *Nocdurna:* Limit fluid intake for at least 1 hr before until 8 hrs after administration. Use without fluid reduction may lead to fluid retention and hyponatremia.
- **Diabetes Insipidus:** Parenteral dose for antidiuretic effect is administered IV push or subcut.
- **Hemophilia:** Parenteral dose for control of bleeding is administered via IV infusion. If used preoperatively, administer 30 min prior to procedure.

IV Administration

- **IV Push:** (for diabetes insipidus). ***Dilution:*** Administer undiluted. ***Concentration:*** 4 mcg/mL. ***Rate:*** Administer over 1 min.
- **Intermittent Infusion (for hemophilia and von Willebrand's disease): *Dilution:*** Dilute each dose in 50 mL of 0.9% NaCl for adults and children >10 kg and in 10 mL in children weighing <10 kg. ***Concentration:*** Maximum 0.5 mcg/mL. ***Rate:*** Infuse slowly over 15–30 min.
- **Y-Site Compatibility:** naloxone.
- **Intranasal:** If intranasal dose is used preoperatively, administer 2 hr before procedure.

Patient/Family Teaching

- Advise patient to notify health care professional if bleeding is not controlled or if headache, dyspnea, heartburn, nausea, abdominal cramps, vulval pain, or severe nasal congestion or irritation occurs.
- Caution patient to avoid concurrent use of alcohol with this medication.
- Advise female of reproductive potential to notify health care professional if pregnancy is planned or suspected or if breast feeding.
- **Diabetes Insipidus:** If nasal spray is used, prime pump prior to first use by pressing down 4 times. Caution patient that nasal spray should not be used beyond the labeled number of sprays; subsequent sprays may not deliver accurate dose. Do not attempt to transfer remaining solution to another bottle. Instruct patient to take missed doses as soon as remembered but not if it is almost time for the next dose. Do not double doses. Advise patient that rhinitis or upper respiratory infection may decrease effectiveness of this therapy. If increased urine output occurs, patient should contact health care professional for dosage adjustment. Patients with diabetes insipidus should carry identification at all times describing disease process and medication regimen.
- **Nocturia:** Instruct patient to place tablet under tongue 1 hr before bedtime and empty bladder immediately before bedtime.
- Advise patient to limit fluid intake before bedtime and to avoid caffeine and alcohol before bedtime.
- Advise patient to notify health care professional immediately if signs and symptoms of hyponatremia (headache, feeling restless, drowsiness, muscle cramps, nausea or vomiting, fatigue, dizziness, change in mental condition [hallucinations, confusion, decreased awareness or alertness] occur.
- Instruct patient to notify health care professional if fever, infection, or diarrhea occurs. May need to hold medication.
- Instruct patient to notify health care professional of all Rx or OTC medications, vitamins, or herbal products being taken and to consult with health care professional before taking other medications.

Evaluation/Desired Outcomes

- Decreased frequency of nocturnal enuresis.
- Decrease in urine volume.
- Relief of polydipsia.
- Increased urine osmolality.
- Control of bleeding in hemophilia and von Willebrand's disease.
- Reduced frequency of episodes of nocturia.

desonide, See CORTICOSTEROIDS (TOPICAL/LOCAL).

desoximetasone, See CORTICOSTEROIDS (TOPICAL/LOCAL).

desvenlafaxine

(**des**-ven-la-**fax**-een)

~~Khedezla~~, Pristiq

Classification

Therapeutic: antidepressants

Pharmacologic: selective serotonin/norepinephrine reuptake inhibitors

Indications

Major depressive disorder.

Action

Inhibits serotonin and norepinephrine reuptake in the CNS. **Therapeutic Effects:** Decrease in depressive symptomatology, with fewer relapses/recurrences.

Pharmacokinetics

Absorption: 80% absorbed following oral administration.

Distribution: Enters breast milk.

Metabolism and Excretion: 55% metabolized by the liver, 45% excreted unchanged in urine.

Half-life: 10 hr.

© F.A. Davis Publishing

TIME/ACTION PROFILE (blood levels)

ROUTE	ONSET	PEAK	DURATION
PO	unknown	7.5 hr	24 hr

Contraindications/Precautions

Contraindicated in: Hypersensitivity to venlafaxine or desvenlafaxine; Concurrent use of MAO inhibitors or MAO-like drugs (linezolid or methylene blue); Should not be used concurrently with venlafaxine.

Use Cautiously in: Untreated cerebrovascular or cardiovascular disease, including untreated hypertension (control BP before initiating therapy); Bipolar disorder (may activate mania/hypomania); Renal impairment (consider modifications, dose should not exceed 50 mg/day, especially in moderate to severe renal impairment); History of seizures or neurologic impairment; Hepatic impairment (dose should not exceed 100 mg/day); Angle-closure glaucoma; OB: Safety not established in pregnancy; Lactation: Use while breast feeding only if potential maternal benefit justifies potential risk to infant; Pedi: ↑ risk of suicidal thinking and behavior (suicidality) in children and adolescents with major depressive disorder and other psychiatric disorders. Observe closely for suicidality and behavior changes; Geri: Consider age-related ↓ in renal function, ↓ body mass, concurrent disease states, and medications.

Adverse Reactions/Side Effects

CV: hypertension. **Derm:** ERYTHEMA MULTIFORME (EM), STEVENS-JOHNSON SYNDROME (SJS), TOXIC EPIDERMAL NECROLYSIS (TEN), sweating. **EENT:** ↑ intraocular pressure, mydriasis. **F and E:** hyponatremia. **GI:** PANCREATITIS, ↓ appetite, constipation, nausea. **GU:** ↓ libido, delayed/absent orgasm, ejaculatory delay/failure, erectile dysfunction. **Hemat:** ↑ risk of bleeding. **Metab:** hypercholesterolema, hyperlipidemia. **Neuro:** NEUROLEPTIC MALIGNANT SYNDROME, SEIZURES, SUICIDAL THOUGHTS, anxiety, dizziness, drowsiness, insomnia, headache, teeth grinding, vertigo. **Resp:** eosinophilic pneumonia, interstitial lung disease. **Misc:** SEROTONIN SYNDROME.

Interactions

Drug-Drug: Concurrent use with **MAO inhibitors** may result in serious, potentially fatal reactions (wait at least 2 wk after stopping MAO inhibitor before initiating desvenlafaxine; wait at least 1 wk after stopping desvenlafaxine before starting an MAO inhibitor). Concurrent use with **MAO-inhibitor like drugs**, such as **linezolid** or **methylene blue** may ↑ risk of serotonin syndrome; concurrent use contraindicated; do not start therapy in patients receiving **linezolid** or **methylene blue**; if **linezolid** or **methylene blue** need to be started in a patient receiving desvenlafaxine, immediately discontinue desvenlafaxine and monitor for signs/symptoms of serotonin syndrome for 2 wk or until 24 hr after last dose of linezolid or methylene blue, whichever comes first (may resume desvenlafaxine therapy 24 hr after last dose of linezolid or methylene blue). ↑ risk of bleeding with **NSAIDs**, **aspirin**, **warfarin**, or **clopidogrel**. Use cautiously with other **CNS-active drugs**, including **alcohol** or **sedative/hypnotics**; effects of combination are unknown. Drugs that affect serotonergic neurotransmitter systems, including **tricyclic antidepressants**, **SNRIs**, **fentanyl**, **buspirone**, **tramadol**, **amphetamines**, and **triptans** ↑ risk of serotonin syndrome. **Ketoconazole** may ↑ the effects of desvenlafaxine. May ↑ levels of CYP2D6 substrates, including **desipramine**, **atomoxetine**, **dextromethorphan**, **metoprolol**, **nebivolol**, **perphenazine**, and **tolterodine**; if using desvenlafaxine at dose of 400 mg/day, ↓ dose of CYP2D6 substrate by 50%.

Route/Dosage

PO (Adults): 50 mg once daily (range = 50–400 mg/day).

Renal Impairment

PO (Adults): *CCr 30–50 mL/min*—50 mg once daily; *CCr <30 mL/min*—50 mg every other day or 25 mg once daily.

Hepatic Impairment

PO (Adults): *Moderate-to-severe hepatic impairment*—50 mg once daily (not to exceed 100 mg/day).

Availability (generic available)

Extended-release tablets: 25 mg, 50 mg, 100 mg.
Cost: *Generic*—All strengths $174.14/30.

NURSING IMPLICATIONS

Assessment

- Assess mental status and mood changes, especially during initial few mo of therapy and during dose changes. Inform health care professional if patient demonstrates significant increase in signs of depression (depressed mood, loss of interest in usual activities, significant change in weight and/or appetite, insomnia or hypersomnia, psychomotor agitation or retardation, increased fatigue, feelings of guilt or worthlessness, slowed thinking or impaired concentration, suicide attempt or suicidal ideation).
- Assess suicidal tendencies, especially in early therapy. Restrict amount of drug available to patient. Risk may be increased in children, adolescents, and adults ≤24 yr.
- Monitor BP before and periodically during therapy. Sustained hypertension may be dose related; decrease dose or discontinue therapy if this occurs.
- Monitor appetite and nutritional intake; weigh weekly. Report continued weight loss. Adjust diet as tolerated to support nutritional status.
- Assess for serotonin syndrome (mental changes [agitation, hallucinations, coma], autonomic instability [tachycardia, labile BP, hyperthermia], neuromuscular aberrations [hyperreflexia, incoordination], and/or GI symptoms [nausea, vomiting, diarrhea]),

© F.A. Davis Publishing

especially in patients taking other serotonergic drugs (SSRIs, SNRIs, triptans).
- Assess patient for skin rash frequently during therapy. Discontinue at first sign of rash; may be life-threatening. SJS may develop. Treat symptomatically; may recur once treatment is stopped.
- Assess sexual function before starting desvenlafaxine. Assess for changes in sexual function during treatment, including timing of onset; patient may not report.
- ***Lab Test Considerations:*** May cause ↑ fasting serum total cholesterol, LDL, cholesterol, and triglycerides.
- May cause transient proteinuria, not usually associated with ↑ BUN or serum creatinine.
- May cause hyponatremia.
- May cause false-positive immunoassay screening tests for phencyclidine (PCP) and amphetamine.

Implementation

- Do not confuse Pristiq (desvenlafaxine) with Prilosec (omeprazole).
- **PO:** Administer at the same time each day, with or without food. Swallow tablets whole; do not crush, break, chew, or dissolve.

Patient/Family Teaching

- Instruct patient to take medication exactly as directed at the same time each day. Take missed doses as soon as possible unless almost time for next dose. Do not double doses or discontinue abruptly; gradually decrease before discontinuation to prevent dizziness, nausea, headache, irritability, insomnia, diarrhea, anxiety, fatigue, abnormal dreams, and hyperhidrosis.
- Advise patient, family, and caregivers to look for suicidality, especially during early therapy or dose changes. Notify health care professional immediately if thoughts about suicide or dying, attempts to commit suicide, new or worse depression or anxiety, agitation or restlessness, panic attacks, insomnia, new or worse irritability, aggressiveness, acting on dangerous impulses, mania, or other changes in mood or behavior or if symptoms of serotonin syndrome occur.
- May cause drowsiness or dizziness. Caution patient to avoid driving or other activities requiring alertness until response to the drug is known.
- Caution patient to avoid taking alcohol or other CNS-depressant drugs during therapy and of increased risk of bleeding with concomitant use of NSAIDs, aspirin, or other drugs that affect coagulation. Instruct patient to notify health care professional of all Rx or OTC medications, vitamins, or herbal products being taken, especially St. John's wort, and to consult health care professional before taking other Rx, OTC, or herbal products.
- Instruct patient to notify health care professional if signs of allergy (rash, hives, swelling, difficulty breathing) occur.
- Inform patient that desvenlafaxine may cause symptoms of sexual dysfunction. In males, ejaculatory delay or failure, decreased libido, and erectile dysfunction may occur. In female patients, may result in decreased libido and delayed or absent orgasm. Advise patient to notify health care professional if symptoms occur.
- Inform patient that remains of tablet may pass into stool, but medication has already been absorbed.
- Advise females of reproductive potential to notify health care professional if pregnancy is planned or suspected or if breast feeding. Exposure to desvenlafaxine in mid to late pregnancy may increase risk for preeclampsia and exposure near delivery may increase risk of postpartum, hemorrhage. Fetal exposure late in pregnancy may lead to increased risk for neonatal complications requiring prolonged hospitalization, respiratory support, and tube feeding. Monitor neonates exposed to desvenlafaxine in the third trimester for drug discontinuation syndrome. Inform patient of pregnancy exposure registry to monitor pregnancy outcomes in women exposed to antidepressants during pregnancy. Register patients by calling the National Pregnancy Registry for Antidepressants at 1-844-405-6185.
- Emphasize the importance of follow-up exams to monitor progress.

Evaluation/Desired Outcomes

- Increased sense of well-being.
- Renewed interest in surroundings. Need for therapy should be periodically reassessed. Therapy is usually continued for several mo.

dexamethasone, See CORTICOSTEROIDS (SYSTEMIC).

BEERS

dexlansoprazole

(dex-lan-**soe**-pra-zole)

Dexilant

Classification

Therapeutic: antiulcer agents

Pharmacologic: proton-pump inhibitors

Indications

Healing of erosive esophagitis (EE). Maintenance of healed EE and relief of heartburn. Treatment of heartburn from nonerosive gastroesophageal reflux disease (GERD).

© F.A. Davis Publishing

Action

Binds to an enzyme in the presence of acidic gastric pH, preventing the final transport of hydrogen ions into the gastric lumen. **Therapeutic Effects:** Diminished accumulation of acid in the gastric lumen, with lessened acid reflux.

Pharmacokinetics

Absorption: Well absorbed following oral administration.

Distribution: Unknown.

Protein Binding: 96–99%.

Metabolism and Excretion: Extensively metabolized by the liver (CYP2C19 and CYP3A4 enzyme systems are involved); ✖ the CYP2C19 enzyme system exhibits genetic polymorphism (15–20% of Asian patients and 3–5% of Caucasian and Black patients may be poor metabolizers and may have significantly ↑ dexlansoprazole concentrations and an ↑ risk of adverse effects); no active metabolites. No renal elimination.

Half-life: 1–2 hr.

TIME/ACTION PROFILE (blood levels)

ROUTE	ONSET	PEAK*	DURATION
PO	unknown	1–2 hr (1st); 4–5 hr (2nd)	24 hr

*Reflects effects of delayed release capsule.

Contraindications/Precautions

Contraindicated in: Hypersensitivity to dexlansoprazole or related drugs (benzimidazoles); Severe hepatic impairment; Concurrent use of rilpivirine.

Use Cautiously in: Moderate hepatic impairment (daily dose should not exceed 30 mg); Patients using high doses for >1 yr (↑ risk of hip, wrist, or spine fractures and fundic gland polyps); Patients using therapy for >3 yr (↑ risk of vitamin B_{12} deficiency); OB: Safety not established in pregnancy; Lactation: Safety not established in breast feeding; Pedi: Children <12 yr (safety and effectiveness not established); ↑ risk of heart valve thickening in children <2 yr.

Adverse Reactions/Side Effects

Derm: cutaneous lupus erythematosus. **F and E:** hypomagnesemia (especially if treatment duration ≥3 mo). **GI:** CLOSTRIDIOIDES DIFFICILE-ASSOCIATED DIARRHEA (CDAD), abdominal pain, diarrhea, flatulence, fundic gland polyps, nausea, vomiting. **GU:** acute tubulointerstitial nephritis. **Hemat:** vitamin B_{12} deficiency. **MS:** bone fracture. **Misc:** HYPERSENSITIVITY REACTIONS (including anaphylaxis, angioedema, or acute tubulointerstitial nephritis), systemic lupus erythematosus.

Interactions

Drug-Drug: May ↓ absorption of drugs requiring acid pH, including **ketoconazole**, **itraconazole**, **atazanavir**, **nelfinavir**, **rilpivirine**, **ampicillin esters**, **iron salts**, **erlotinib**, and **mycophenolate mofetil**; concurrent use with **rilpivirine** contraindicated; avoid concurrent use with **atazanavir** and **nelfinavir**. May ↑ levels of **digoxin**, **methotrexate**, and **tacrolimus**. May ↑ effect of **warfarin**. Hypomagnesemia ↑ risk of **digoxin** toxicity.

Route/Dosage

PO (Adults and Children ≥12 yr): *Healing of EE*— 60 mg once daily for up to 8 wk; *Maintenance of healed EE*— 30 mg once daily for up to 6 mo (adults) and up to 16 wk (12–17 yr old); *GERD*— 30 mg once daily for 4 wk.

Hepatic Impairment

PO (Adults): *Moderate hepatic impairment*— daily dose should not exceed 30 mg.

Availability (generic available)

Delayed-release capsules: 30 mg, 60 mg.

NURSING IMPLICATIONS

Assessment

- Assess patient routinely for epigastric or abdominal pain and for frank or occult blood in stool, emesis, or gastric aspirate.
- Monitor bowel elimination. Diarrhea, abdominal cramping, fever, and bloody stools should be reported to health care professional promptly as a sign of *Clostridioides difficile*-associated diarrhea (CDAD).
- Monitor for signs and symptoms of decreased renal function (malaise, nausea, anorexia) periodically during therapy. If symptoms occur, discontinue dexlansoprazole and evaluate patient for acute tubulointerstitial nephritis.
- ***Lab Test Considerations:*** May cause abnormal liver function tests, including ↑ AST, ALT, and ↑ or ↓ serum bilirubin.
- May cause ↑ serum creatinine and BUN, ↑ blood glucose, and ↑ serum potassium, and ↓ serum magnesium levels.
- May cause ↓ platelet levels.
- May also cause ↑ gastrin and total protein levels.
- Monitor INR and prothrombin time in patients taking warfarin.

Implementation

- Do not confuse Dexilant (dexlansoprazole) with duloxetine.
- **PO:** May be administered without regard to food. ***DNC:*** Swallow capsules whole or may be opened and sprinkled on 1 tbsp of applesauce and swallowed immediately, without crushing or chewing, for patients with difficulty swallowing.
- Capsules may be opened and granules emptied into 20 mL water. Withdraw entire mixture into syringe; swirl gently to mix. Administer mixture into mouth or NG tube immediately; do not save for later. Rinse syringe with 10 mL of water twice to ensure all medication administered.

© F.A. Davis Publishing

- Administer for shortest time possible to minimize risk of osteoporosis-related fractures and cutaneous or systemic lupus erythematosus.

Patient/Family Teaching

- Instruct patient to take medication as directed for the full course of therapy, even if feeling better. Take missed doses as soon as remembered but not if just before next scheduled dose; do not double doses.
- Advise patient to avoid alcohol, products containing aspirin or NSAIDs, and foods that may cause an increase in GI irritation.
- Advise patient to report onset of black, tarry stools; diarrhea; or abdominal pain to health care professional promptly, especially if accompanied by fever or bloody stools. Do not treat with antidiarrheals without consulting health care professional.
- Advise patient to notify health care professional if signs and symptoms of hypomagnesemia (seizures, dizziness, abnormal or fast heartbeat, jitteriness, jerking movements or shaking [tremors], muscle weakness, spasms of the hands and feet, cramps or muscle aches, spasm of the voice box) occur.
- Instruct patient to notify health care professional of all Rx or OTC medications, vitamins, or herbal products being taken and to consult with health care professional before taking other medications.
- Advise females of reproductive potential to notify health care professional if pregnancy is planned or suspected or if breast feeding.

Evaluation/Desired Outcomes

- Decrease in abdominal pain, heartburn, gastric irritation, and bleeding in patients with GERD; may require up to 4 wk of therapy.
- Healing in patients with erosive esophagitis; may require up to 8 wk of therapy for healing and 6 mo of therapy for maintenance.

dexmedetomidine

(dex-me-de-**to**-mi-deen)

Precedex

Classification

Therapeutic: sedative/hypnotics

Indications

Sedation of initially intubated and mechanically ventilated patients during treatment in an intensive care setting; should not be used for >24 hr. Sedation of non-intubated patients before and/or during surgical and other procedures.

Action

Acts as a relatively selective alpha-adrenergic agonist with sedative properties. **Therapeutic Effects:** Sedation.

Pharmacokinetics

Absorption: IV administration results in complete bioavailability.
Distribution: Unknown.
Protein Binding: 94%.
Metabolism and Excretion: Mostly metabolized by the liver, some metabolism by P450 enzyme system. Metabolites are mostly excreted in urine.
Half-life: 2 hr.

TIME/ACTION PROFILE (sedation)

ROUTE	ONSET	PEAK	DURATION
IV	rapid	unknown	unknown

Contraindications/Precautions

Contraindicated in: Hypersensitivity.
Use Cautiously in: Hepatic impairment (lower doses may be required); Advanced heart block; Severe left ventricular dysfunction; OB, Lactation, Pedi: Safety not established; Geri: ↑ risk of bradycardia and hypotension (consider dose ↓).

Adverse Reactions/Side Effects

CV: BRADYCARDIA, SINUS ARREST, hypotension, transient hypertension. **GI:** dry mouth, nausea, vomiting. **Hemat:** anemia. **Resp:** hypoxia. **Misc:** fever.

Interactions

Drug-Drug: Sedation is enhanced by **anesthetics**, other **sedative/hypnotics**, and **opioid analgesics**.
Drug-Natural Products: Concomitant use of **kava-kava, valerian, skullcap, chamomile,** or **hops** can ↑ CNS depression.

Route/Dosage

ICU Sedation

IV (Adults): *Loading infusion*—1 mcg/kg over 10 min followed by *maintenance infusion* of 0.2–0.7 mcg/kg/hr for maximum of 24 hr; rate is adjusted to achieve desired level of sedation.
IV (Children): *Loading infusion*—0.5–1 mcg/kg followed by *maintenance infusion* of 0.2–1 mcg/kg/hr. Children <1 yr may require higher end of infusion rate.

Procedural Sedation

IV (Adults): *Loading infusion*—1 mcg/kg (0.5 mcg/kg for ophthalmic surgery or patients >65 yr) over 10 min followed by *maintenance infusion* of 0.6 mcg/kg/hr; rate is adjusted to achieve desired level of sedation (usual range 0.2–1 mcg/kg/hr) (maintenance infusion of 0.7 mcg/kg/hr recommended for fiberoptic intubation until endotracheal tube secured).

Availability (generic available)

Premixed infusion (in 0.9% NaCl): 80 mcg/20 mL, 200 mcg/50 mL, 400 mcg/100 mL, 1000 mcg/250 mL.

© F.A. Davis Publishing

Solution for injection (requires further dilution): 100 mcg/mL.

NURSING IMPLICATIONS

Assessment

- Assess level of sedation throughout therapy. Dose is adjusted based on level of sedation.
- Monitor ECG and BP continuously throughout therapy. May cause hypotension, bradycardia, and sinus arrest.
- ***Toxicity and Overdose:*** Atropine IV may be used to modify the vagal tone.

Implementation

- Do not confuse dexmedetomidine with dexamethasone.
- Dexmedetomidine should be administered only in intensive care settings with continuous monitoring.
- A loading dose may not be required when converting patient from another sedative.

IV Administration

- **Continuous Infusion:** ***Dilution:*** To prepare infusion, withdraw 2 mL of dexmedetomidine and add to 48 mL of 0.9% NaCl for a total of 50 mL. ***Concentration:*** 4 mcg/mL. Shake gently. Solution should be clear; do not administer solutions that are discolored or contain particulate matter. Ampules and vials are for single use only. ***Rate:*** Administer *loading infusion* over 10 min, followed by *maintenance infusion* of 0.2–0.7 mcg/kg/hr for ICU sedation and 0.2–1.0 mcg/kg/hr for procedural sedation. Adjust dose to achieve desired level of sedation. Administer via infusion pump to ensure accurate rate.
- **Y-Site Compatibility:** acetaminophen, acyclovir, alemtuzumab, alfentanil, allopurinol, amifostine, amikacin, aminophylline, amiodarone, amphotericin B liposome, ampicillin, ampicillin/sulbactam, anidulafungin, argatroban, arsenic trioxide, atropine, azithromycin, aztreonam, bivalirudin, bleomycin, bumetanide, buprenorphine, busulfan, butorphanol, calcium chloride, calcium gluconate, carboplatin, carmustine, caspofungin, cefazolin, cefepime, cefotaxime, cefotetan, cefoxitin, ceftazidime, ceftazidime/avibactam, ceftriaxone, cefuroxime, chlorpromazine, ciprofloxacin, cisatracurium, cisplatin, clindamycin, cyclophosphamide, cyclosporine, cytarabine, D5W, dacarbazine, dactinomycin, daptomycin, daunorubicin hydrochloride, dexamethasone, dexrazoxane, digoxin, diltiazem, diphenhydramine, dobutamine, docetaxel, dopamine, doxorubicin hydrochloride, doxorubicin liposome, doxycycline, droperidol, enalaprilat, ephedrine, epinephrine, ertapenem, erythromycin, esmolol, etomidate, etoposide, etoposide phosphate, famotidine, fenoldopam, fentanyl, fluconazole, fludarabine, fluorouracil, foscarnet, fosphenytoin, furosemide, ganciclovir, gemcitabine, gentamicin, glycopyrrolate, granisetron, haloperidol, heparin, hetastarch, hydrocortisone, hydromorphone, idarubicin, ifosfamide, imipenem/cilastatin, imipenem/cilastatin/relebactam, insulin, regular, isavuconazonium, isoproterenol, ketorolac, labetalol, lactated Ringer's solution, leucovorin calcium, levofloxacin, levorphanol, lidocaine, linezolid, lorazepam, magnesium sulfate, mannitol, meperidine, meropenem, meropenem/vaborbactam, mesna, methohexital, methotrexate, methylprednisolone, metoclopramide, metoprolol, metronidazole, midazolam, milrinone, mitomycin, mitoxantrone, morphine, moxifloxacin, mycophenolate, nalbuphine, naloxone, nicardipine, nitroglycerin, nitroprusside, norepinephrine, octreotide, ondansetron, oritavancin, oxaliplatin, oxytocin, paclitaxel, palonosetron, pamidronate, pancuronium, pemetrexed, pentamidine, pentobarbital, phenobarbital, phenylephrine, piperacillin/tazobactam, plazomicin, potassium acetate, potassium chloride, potassium phosphate, prochlorperazine, promethazine, propofol, propranolol, quinapristin/dalfopristin, remifentanil, rocuronium, sodium acetate, sodium bicarbonate, sodium phosphate, succinylcholine, sufentanil, tacrolimus, theophylline, thiopental, thiotepa, tigecycline, tirofiban, tobramycin, topotecan, trimethoprim/sulfamethoxazole, vancomycin, vasopressin, vecuronium, verapamil, vinblastine, vincristine, vinorelbine, voriconazole, zidovudine, zoledronic acid.
- **Y-Site Incompatibility:** amphotericin B deoxycholate, amphotericin B lipid complex, diazepam, gemtuzumab ozogamicin, irinotecan, pantoprazole, phenytoin.

Patient/Family Teaching

- Explain to patient and family the purpose of the medication.
- Advise patient to notify health care professional if pregnancy is suspected or if breast feeding.

Evaluation/Desired Outcomes

- Sedation for up to 24 hr.

dexrazoxane (dex-ra-**zox**-ane)

~~Totect~~, Canada Zinecard

Classification

Therapeutic: cardioprotective agents

Indications

Reducing incidence and severity of cardiomyopathy from doxorubicin in women with metastatic breast cancer who have already received a cumulative dose of doxorubicin >300 mg/m^2 and who will continue to receive doxorubicin therapy to maintain tumor control. Treatment of extravasation resulting from IV anthracycline chemotherapy.

Action

Acts as an intracellular chelating agent. **Therapeutic Effects:** Diminishes the cardiotoxic effects of doxoru-

© F.A. Davis Publishing

bicin. Decreased damage from extravasation of anthracyclines.

Pharmacokinetics

Absorption: IV administration results in complete bioavailability.
Distribution: Unknown.
Metabolism and Excretion: Some metabolism occurs; 42% eliminated in urine.
Half-life: 2.1–2.5 hr.

TIME/ACTION PROFILE (cardioprotective effect)

ROUTE	ONSET	PEAK	DURATION
IV	rapid	unknown	unknown

Contraindications/Precautions

Contraindicated in: Any other type of chemotherapy except other anthracyclines (doxorubicin-like agents); Hepatic impairment (for treatment of extravasation only); OB: Pregnancy (may cause fetal harm); Lactation: Lactation.
Use Cautiously in: Renal impairment (CCr <40 mL/min) (↓ dose); Rep: Women of reproductive potential and men with female partners of reproductive potential; Pedi: Safety and effectiveness not established in children.

Adverse Reactions/Side Effects

GU: ↓ fertility (males). **Hemat:** NEUTROPENIA, leukopenia, thrombocytopenia. **Local:** pain at injection site. **Misc:** HYPERSENSITIVITY REACTIONS (including anaphylaxis and angioedema), MALIGNANCY.

Interactions

Drug-Drug: Myelosuppression may be ↑ by **antineoplastics** or **radiation therapy**. Antitumor effects of concurrent combination chemotherapy with **fluorouracil** and **cyclophosphamide** may be ↓ by dexrazoxane.

Route/Dosage

Cardioprotective

IV (Adults): 10 mg of dexrazoxane/1 mg doxorubicin.

Renal Impairment

IV (Adults): *CCr <40 mL/min* — ↓ dose by 50%.

Extravasation Treatment

IV (Adults): 1000 mg/m^2 (maximum 2000 mg) given on days 1 and 2, and followed by a dose of 500 mg/m^2 (maximum 1000 mg) on day 3.

Renal Impairment

IV (Adults): *CCr <40 mL/min* — ↓ dose by 50%.

Availability (generic available)

Lyophilized powder for injection: 250 mg/vial, 500 mg/vial.

NURSING IMPLICATIONS

Assessment

- **Cardioprotective:** Assess extent of cardiomyopathy (cardiomegaly on x ray, basilar rales, S_3 gallop, dyspnea, decline in left ventricular ejection fraction) prior to and periodically during therapy.
- **Extravasation protection:** Assess site of extravasation for pain, burning, swelling, and redness. Assess site during and after therapy until resolution. Dexrazoxane is not effective against the effects of vesicants other than anthracyclines.
- ***Lab Test Considerations:*** Verify negative pregnancy test before starting therapy.
- Monitor CBC and platelet count before each course of therapy and frequently during therapy. Thrombocytopenia, leukopenia, neutropenia, and granulocytopenia from chemotherapy may be more severe at nadir with dexrazoxane therapy.
- Monitor liver function tests periodically during therapy. May cause reversible ↑ of liver enzymes.

Implementation

IV Administration

- Solution should be prepared in a biologic cabinet. Wear gloves, gown, and mask while handling IV medication. Discard IV equipment in specially designated containers.
- Solution is slightly yellow. Do not administer solutions that are discolored or contain particulate matter. Reconstituted solution and diluted solution are stable in an IV bag for 6 hr at room temperature or if refrigerated. Discard unused solutions.
- **Extravasation Protection:** Administer as soon as possible within 6 hr of extravasation in a large caliber vein in an extremity/area other than the one affected by the extravasation. Remove cooling procedures, such as ice packs, at least 15 min before administration to allow sufficient blood flow to area of extravasation. Start treatment on Day 2 and Day 3 at same hr (+/- 3 hr) as on first day.
- **Intermittent Infusion:** ***Reconstitution:*** Reconstitute with 50 mL sterile water for injection. ***Concentration:*** 10 mg/mL. ***Dilution:*** Withdraw dose volume within 30 min of reconstitution and inject into 1000 mL bag of LR. Solution is stable for 4 hr at room temperature or 12 hr if refrigerated. ***Rate:*** Infuse over 1–2 hr in a large caliber vein.
- **Cardioprotective:** Doxorubicin should be administered within 30 min following dexrazoxane administration.
- **Intermittent Infusion:** ***Reconstitution:*** Reconstitute with 25 mL sterile water for injection for 250-mg vial or 50 mL for 500-mg vial. ***Concentration:*** 10 mg/mL. ***Dilution:*** Dilute reconstituted solution further in LR. ***Concentration:*** 1.3–5 mg/mL. Solution is stable for 1 hr at room temperature or 4 hr

© F.A. Davis Publishing

if refrigerated. ***Rate:*** Infuse over 15 min. Administer doxorubicin within 30 min of completion of infusion. Do not administer via IV push.

- **Additive Incompatibility:** Do not mix with other medications.
- **Y-Site Compatibility:** alemtuzumab, alfentanil, amifostine, amikacin, amiodarone, ampicillin, ampicillin/sulbactam, anidulafungin, argatroban, arsenic trioxide, atracurium, azithromycin, aztreonam, bivalirudin, bleomycin, bumetanide, buprenorphine, busulfan, butorphanol, calcium chloride, calcium gluconate, carboplatin, carmustine, caspofungin, cefazolin, cefotaxime, cefotetan, cefoxitin, ceftazidime, ceftriaxone, cefuroxime, chloramphenicol, chlorpromazine, ciprofloxacin, cisatracurium, cisplatin, clindamycin, cyclophosphamide, cyclosporine, cytarabine, dactinomycin, daptomycin, daunorubicin hydrochloride, dexmedetomidine, digoxin, diltiazem, diphenhydramine, docetaxel, dopamine, doxorubicin, doxorubicin liposomal, doxycycline, droperidol, enalaprilat, ephedrine, epinephrine, epirubicin, eptifibatide, ertapenem, erythromycin, esmolol, etoposide, etoposide phosphate, famotidine, fenoldopam, fentanyl, fluconazole, fludarabine, fluorouracil, foscarnet, fosphenytoin, gemcitabine, gentamicin, glycopyrrolate, granisetron, haloperidol, heparin, hetastarch, hydralazine, hydrocortisone, hydromorphone, idarubicin, ifosfamide, imipenem/cilastatin, insulin, regular, irinotecan, isoproterenol, ketorolac, leucovorin calcium, levofloxacin, lidocaine, linezolid, lorazepam, magnesium sulfate, mannitol, melphalan, meperidine, meropenem, mesna, metoclopramide, metoprolol, midazolam, milrinone, mitoxantrone, morphine, moxifloxacin, mycophenolate, nalbuphine, naloxone, nicardipine, nitroglycerin, nitroprusside, norepinephrine, octreotide, ondansetron, oxaliplatin, paclitaxel, palonosetron, pamidronate, pancuronium, pemetrexed, pentamidine, phenobarbital, phentolamine, phenylephrine, piperacillin/tazobactam, polymyxin B, potassium acetate, potassium chloride, potassium phosphates, procainamide, prochlorperazine, promethazine, propranolol, quinupristin/dalfopristin, remifentanil, rituximab, rocuronium, sodium acetate, sodium bicarbonate, streptozocin, succinylcholine, sufentanil, tacrolimus, theophylline, thiotepa, tigecycline, tirofiban, tobramycin, topotecan, vancomycin, vasopressin, vecuronium, verapamil, vinblastine, vincristine, vinorelbine, voriconazole, zoledronic acid.
- **Y-Site Incompatibility:** acyclovir, allopurinol, aminophylline, amphotericin B lipid complex, amphotericin B liposome, cefepime, dantrolene, diazepam, dobutamine, furosemide, ganciclovir, gemtuzumab ozogamicin, methotrexate, methylprednisolone, mitomycin, nafcillin, pantoprazole, pentobarbital, phenytoin, sodium phosphates, thiopental, trimethoprim/sulfamethoxazole, zidovudine.

Patient/Family Teaching

- Explain the purpose of the medication to the patient.
- Emphasize the need for continued monitoring of cardiac function.
- Rep: Dexrazoxane may cause fetal harm. Advise females of reproductive potential to use highly effective contraception during and for 6 mo after last dose of dexrazoxane and to avoid breast feeding during and for 2 wk after last dose. Advise males with female partners of reproductive potential to use highly effective contraception during and for 3 mo after last dose. Advise patient to notify health care professional immediately if pregnancy is suspected. May impair fertility in males.

Evaluation/Desired Outcomes

- Reduction of incidence and severity of cardiomyopathy associated with doxorubicin administration in women with metastatic breast cancer.
- Decrease in late sequelae (site pain, fibrosis, atrophy, and local sensory disturbance) following extravasation of anthracycline chemotherapeutic agents.

Classification

Therapeutic: allergy, cold, and cough remedies, antitussives

© F.A. Davis Publishing

Indications
Symptomatic relief of coughs caused by minor viral upper respiratory tract infections or inhaled irritants. Most effective for chronic nonproductive cough. A common ingredient in nonprescription cough and cold preparations.

Action
Suppresses the cough reflex by a direct effect on the cough center in the medulla. Related to opioids structurally but has no analgesic properties. **Therapeutic Effects:** Relief of irritating nonproductive cough.

Pharmacokinetics
Absorption: Rapidly absorbed from the GI tract. Extended-release product is slowly absorbed.
Distribution: Unknown. Probably crosses the placenta and enters breast milk.
Metabolism and Excretion: Metabolized to dextrorphan, an active metabolite. Dextromethorphan and dextrorphan are renally excreted.
Half-life: Unknown.

TIME/ACTION PROFILE (cough suppression)

ROUTE	ONSET	PEAK	DURATION
PO	15–30 min	unknown	3–6 hr†
PO-ER	unknown	unknown	9–12 hr

†Up to 8 hr for gelcaps.

Contraindications/Precautions
Contraindicated in: Hypersensitivity; Patients taking MAO inhibitors or SSRIs; Should not be used for chronic productive coughs; Some products contain alcohol and should be avoided in patients with known intolerance.
Use Cautiously in: Cough that lasts more than 1 wk or is accompanied by fever, rash, or headache—health care professional should be consulted; History of drug abuse or drug-seeking behavior (capsules have been abused resulting in deaths); Diabetes (some products contain sucrose); OB: Pregnancy (has been used safely); Lactation: Lactation; Pedi: Children <4 yr (OTC cough and cold products containing this medication should be avoided).

Adverse Reactions/Side Effects
GI: nausea. **Neuro:** *high dose*—dizziness, sedation.

Interactions
Drug-Drug: Use with **MAO inhibitors** may result in serotonin syndrome (nausea, confusion, changes in BP); concurrent use should be avoided. ↑ CNS depression with **antihistamines**, **alcohol**, **antidepressants**, **sedative/hypnotics**, or **opioids**. **Amiodarone**, **fluoxetine**, or **quinidine** may ↑ blood levels and adverse reactions from dextromethorphan.

Route/Dosage
PO (Adults and Children >12 yr): 10–20 mg every 4 hr *or* 30 mg every 6–8 hr *or* 60 mg of extended-release preparation bid (not to exceed 120 mg/day).
PO (Children 6–12 yr): 5–10 mg every 4 hr *or* 15 mg every 6–8 hr *or* 30 mg of extended-release preparation every 12 hr (not to exceed 60 mg/day).
PO (Children 4–6 yr): 2.5–5 mg every 4 hr *or* 7.5 mg every 6–8 hr *or* 15 mg of extended-release preparation every 12 hr (not to exceed 30 mg/day).

Availability (generic available)
Gelcaps: 30 mg[OTC]. **Lozenges (cherry):** 2.5 mg[OTC], 5 mg[OTC]. **Liquid (cherry, grape):** 3.5 mg/5 mL[OTC], 5 mg/5 mL, 7.5 mg/5 mL[OTC], 15 mg/5 mL[OTC], 30 mg/5 mL[OTC]. **Syrup (cherry, cherry bubblegum):** 7.5 mg/5 mL[OTC], 15 mg/15 mL[OTC], 10 mg/5 mL[OTC]. **Extended-release suspension (orange):** 30 mg/5 mL[OTC]. **Drops (Grape):** 7.5 mg/0.8 mL[OTC], 7.5 mg/1 mL[OTC]. **Orally-disintegrating strips (cherry, grape):** 7.5 mg[OTC], 15 mg[OTC]. ***In combination with:*** antihistamines, decongestants, and expectorants in cough and cold preparations[OTC], quinidine sulfate (Nuedexta). See Appendix N.

NURSING IMPLICATIONS

Assessment
- Assess frequency and nature of cough, lung sounds, and amount and type of sputum produced. Unless contraindicated, maintain fluid intake of 1500–2000 mL to decrease viscosity of bronchial secretions.

Implementation
- Dextromethorphan 15–30 mg is equivalent in cough suppression to codeine 8–15 mg.
- **PO:** Do not give fluids immediately after administering to prevent dilution of vehicle. Shake oral suspension well before administration.

Patient/Family Teaching
- Instruct patient to cough effectively: Sit upright and take several deep breaths before attempting to cough.
- Advise patient to minimize cough by avoiding irritants, such as cigarette smoke, fumes, and dust. Humidification of environmental air, frequent sips of water, and sugarless hard candy may also decrease the frequency of dry, irritating cough.
- Caution patient to avoid taking more than the recommended dose or taking alcohol or other CNS depressants concurrently with this medication; fatalities have occurred. Caution parents to avoid OTC cough and cold products while breast feeding or to children <4 yrs.
- May occasionally cause dizziness. Caution patient to avoid driving or other activities requiring alertness until response to the medication is known.

© F.A. Davis Publishing

- Advise patient that any cough lasting over 1 wk or accompanied by fever, chest pain, persistent headache, or skin rash warrants medical attention.

Evaluation/Desired Outcomes

- Decrease in frequency and intensity of cough without eliminating patient's cough reflex.

BEERS

diazePAM (dye-az-e-pam)

Diastat, Valium, Valtoco

Classification

Therapeutic: antianxiety agents, anticonvulsants, sedative/hypnotics, skeletal muscle relaxants (centrally acting)
Pharmacologic: benzodiazepines

Schedule IV

Indications

Anxiety disorders. Preoperative sedation. Conscious sedation (provides light anesthesia and anterograde amnesia). Status epilepticus/uncontrolled seizures. Acute treatment of intermittent, stereotypic episodes of frequent seizure activity that are distinct from a patient's usual seizure pattern (not status epilepticus) (nasal spray). Skeletal muscle spasms. Alcohol withdrawal.

Action

Depresses the CNS, probably by potentiating GABA, an inhibitory neurotransmitter. Produces skeletal muscle relaxation by inhibiting spinal polysynaptic afferent pathways. Has anticonvulsant properties due to enhanced presynaptic inhibition. **Therapeutic Effects:** Relief of anxiety. Sedation. Amnesia. Skeletal muscle relaxation. Decreased seizure activity.

Pharmacokinetics

Absorption: Rapidly absorbed from the GI tract. Absorption from IM sites may be slow and unpredictable. Well absorbed from rectal mucosa (90%) and nasal mucosa (97%).
Distribution: Widely distributed. Crosses the blood-brain barrier. Crosses the placenta; enters breast milk.
Metabolism and Excretion: Highly metabolized by the hepatic P450 enzymes (CYP2C19 and CYP3A4); the CYP2C19 enzyme system exhibits genetic polymorphism; 15–20% of Asian patients and 3–5% of Caucasian and Black patients may be poor metabolizers and may have significantly ↑ diazepam concentrations and an ↑ risk of adverse effects. Some products of metabolism are active as CNS depressants.
Half-life: Neonates: 50–95 hr; Infants 1 mo–2 yr: 40–50 hr; Children 2–12 yr: 15–21 hr; Children 12–16 yr: 18–20 hr; Adults: 20–50 hr (up to 100 hr for metabolites).

TIME/ACTION PROFILE (sedation)

ROUTE	ONSET	PEAK	DURATION
PO	30–60 min	1–2 hr	up to 24 hr
IM	within 20 min	0.5–1.5 hr	unknown
IV	1–5 min	15–30 min	15–60 min†
Rectal	2–10 min	1–2 hr	4–12 hr

†In status epilepticus, anticonvulsant duration is 15–20 min.

Contraindications/Precautions

Contraindicated in: Hypersensitivity; Cross-sensitivity with other benzodiazepines may occur; Comatose patients; Myasthenia gravis; Severe pulmonary impairment; Sleep apnea; Severe hepatic impairment; Pre-existing CNS depression; Uncontrolled severe pain; Angle-closure glaucoma; Some products contain alcohol, propylene glycol, or tartrazine and should be avoided in patients with known hypersensitivity or intolerance; OB: Pregnancy (may cause fetal harm); Lactation: Recommend to discontinue drug or bottle-feed; Pedi: Children <6 mo (for oral; safety not established).
Use Cautiously in: Severe renal impairment; History of suicide attempt or drug dependence; Debilitated patients (dose ↓ required); Patients with low albumin; Pedi: Metabolites can accumulate in neonates. Injection contains benzyl alcohol, which can cause potentially fatal gasping syndrome in neonates; Geri: Long-acting benzodiazepines cause prolonged sedation in the elderly. Appears on *Beers list* and is associated with ↑ risk of falls (↓ dose required or consider short-acting benzodiazepine).

Adverse Reactions/Side Effects

CV: hypotension (IV only). **Derm:** rash. **EENT:** blurred vision, epistaxis (nasal spray only), ↑ intraocular pressure, nasal congestion (nasal spray only), nasal discomfort (nasal spray only). **GI:** constipation, diarrhea (may be caused by propylene glycol content in oral solution), nausea, vomiting, weight gain. **Local:** pain (IM), phlebitis (IV), venous thrombosis. **Neuro:** dizziness, drowsiness, lethargy, depression, hangover, ataxia, slurred speech, headache, paradoxical excitation. **Resp:** RESPIRATORY DEPRESSION. **Misc:** physical dependence, psychological dependence, tolerance.

Interactions

Drug-Drug: Use with **opioids** or other **CNS depressants**, including other **benzodiazepines**, **non-benzodiazepine sedative/hypnotics**, **anxiolytics**, **general anesthetics**, **muscle relaxants**, **antipsychotics**, and **alcohol** may cause profound sedation, respiratory depression, coma, and death; reserve concurrent use for when alternative treatment options are inadequate. **Cimetidine**, **hormonal contraceptives**, **disulfiram**, **fluoxetine**, **isoniazid**, **ketoconazole**, **metoprolol**, **propranolol**, or **valproic acid** may ↓ the metabolism of diazepam, enhancing its actions. May ↓ the efficacy of **levodopa**. **Rifampin** or **barbiturates** may ↑ the metabolism and ↓ effectiveness of diaz-

© F.A. Davis Publishing

epam. Sedative effects may be ↓ by **theophylline**. Concurrent use of **ritonavir** is not recommended.

Drug-Natural Products: Concomitant use of **kava-kava**, **valerian**, or **chamomile** can ↑ CNS depression.

Route/Dosage

Antianxiety

PO (Adults): 2–10 mg 2–4 times daily.

IM, IV (Adults): 2–10 mg, may repeat in 3–4 hr as needed.

PO (Children >6 mo): 1–2.5 mg 3–4 times daily.

IM, IV (Children >1 mo): 0.04–0.3 mg/kg/dose every 2–4 hr to a maximum of 0.6 mg/kg within an 8-hr period if necessary.

Pre-Endoscopy

IV (Adults): 2.5–20 mg.

IM (Adults): 5–10 mg 30 min pre-endoscopy.

Pediatric Conscious Sedation for Procedures

PO (Children >6 mo): 0.2–0.3 mg/kg (not to exceed 10 mg/dose) 45–60 min prior to procedure.

Status Epilepticus/Acute Seizure Activity

IV (Adults): 5–10 mg, may repeat every 10–15 min to a total of 30 mg, may repeat regimen again in 2–4 hr (IM route may be used if IV route unavailable); larger doses may be required.

IM, IV (Children ≥5 yr): 0.05–0.3 mg/kg/dose given over 3–5 min every 15–30 min to a total dose of 10 mg, repeat every 2–4 hr.

IM, IV (Children 1 mo–5 yr): 0.05–0.3 mg/kg/dose given over 3–5 min every 15–30 min to maximum dose of 5 mg, repeat in 2–4 hr if needed.

IV (Neonates): 0.1–0.3 mg/kg/dose given over 3–5 min every 15–30 min to maximum dose of 2 mg.

Intranasal (Adults and Children ≥12 yr and ≥76 kg): 0.2 mg/kg as single dose (total dose = 20 mg; administered using two 10–mg spray devices, with one spray (10 mg) from each device administered into each nostril). May administer another dose, if needed, ≥4 hr after initial dose (max = 2 doses/seizure episode).

Intranasal (Adults and Children ≥12 yr and 51–75 kg): 0.2 mg/kg as single dose (total dose = 15 mg; administered using two 7.5–mg spray devices, with one spray (7.5 mg) from each device administered into each nostril). May administer another dose, if needed, ≥4 hr after initial dose (max = 2 doses/seizure episode).

Intranasal (Adults and Children ≥12 yr and 28–50 kg): 0.2 mg/kg as single dose (total dose = 10 mg; administered using one 10-mg spray device, with one spray (10 mg) from device administered into one nostril). May administer another dose, if needed, ≥4 hr after initial dose (max = 2 doses/seizure episode).

Intranasal (Adults and Children ≥12 yr and 14–27 kg): 0.2 mg/kg as single dose (total dose = 5 mg; administered using one 5-mg spray device, with one spray (5 mg) from device administered into one nostril). May administer another dose, if needed, ≥4 hr after initial dose (max = 2 doses/seizure episode).

Intranasal (Children 6–11 yr and 56–74 kg): 0.3 mg/kg as single dose (total dose = 20 mg; administered using two 10-mg spray devices, with one spray (10 mg) from each device administered into each nostril). May administer another dose, if needed, ≥4 hr after initial dose (max = 2 doses/seizure episode).

Intranasal (Children 6–11 yr and 38–55 kg): 0.3 mg/kg as single dose (total dose = 15 mg; administered using two 7.5-mg spray devices, with one spray (7.5 mg) from each device administered into each nostril). May administer another dose, if needed, ≥4 hr after initial dose (max = 2 doses/seizure episode).

Intranasal (Children 6–11 yr and 19–37 kg): 0.3 mg/kg as single dose (total dose = 10 mg; administered using one 10-mg spray device, with one spray (10 mg) from device administered into one nostril). May administer another dose, if needed, ≥4 hr after initial dose (max = 2 doses/seizure episode).

Intranasal (Children 6–11 yr and 10–18 kg): 0.3 mg/kg as single dose (total dose = 5 mg; administered using one 5-mg spray device, with one spray (5 mg) from device administered into one nostril). May administer another dose, if needed, ≥4 hr after initial dose (max = 2 doses/seizure episode).

Rect (Adults and Children >12 yr): 0.2 mg/kg; may repeat 4–12 hr later.

Rect (Children 6–11 yr): 0.3 mg/kg; may repeat 4–12 hr later.

Rect (Children 2–5 yr): 0.5 mg/kg; may repeat 4–12 hr later.

Febrile Seizure Prophylaxis

PO (Children >1 mo): 1 mg/kg/day divided every 8 hr at first sign of fever and continue for 24 hr after fever is gone.

Skeletal Muscle Relaxation

PO (Adults): 2–10 mg 3–4 times daily.

PO (Geriatric Patients or Debilitated Patients): 2–2.5 mg 1–2 times daily initially.

PO (Children >6 mo): 1–2.5 mg 3–4 times daily.

IM, IV (Adults): 5–10 mg; may repeat in 2–4 hr (larger doses may be required for tetanus).

IM, IV (Geriatric Patients or Debilitated Patients): 2–5 mg; may repeat in 2–4 hr (larger doses may be required for tetanus).

IM, IV (Children ≥5 yr): *Tetanus*—5–10 mg every 3–4 hr.

IM, IV (Children >1 mo): *Tetanus*—1–2 mg every 3–4 hr.

© F.A. Davis Publishing

Alcohol Withdrawal

PO (Adults): 10 mg 3–4 times in first 24 hr, ↓ to 5 mg 3–4 times daily.
IM, IV (Adults): 10 mg initially, then 5–10 mg in 3–4 hr as needed; larger or more frequent doses have been used.

Availability (generic available)

Nasal spray: 5 mg/device, 7.5 mg/device, 10 mg/device. **Oral solution:** 1 mg/mL, 5 mg/mL (Intensol). **Cost:** *Generic*— 1 mg/mL $2.44/5 mL, 5 mg/mL $33.98/30 mL. **Rectal gel delivery system:** 2.5 mg, 10 mg, 20 mg. **Solution for injection:** 5 mg/mL (contains 10% alcohol and 40% propylene glycol). **Tablets:** 2 mg, 5 mg, 10 mg. **Cost:** *Generic*— 2 mg $7.51/100, 5 mg $10.74/100, 10 mg $10.84/100.

NURSING IMPLICATIONS

Assessment

- Monitor BP, pulse, and respiratory rate prior to and periodically throughout therapy and frequently during IV therapy.
- Assess IV site frequently during administration; diazepam may cause phlebitis and venous thrombosis.
- Prolonged high-dose therapy may lead to psychological or physical dependence. Restrict amount of drug available to patient. Observe depressed patients closely for suicidal tendencies.
- Assess risk for addiction, abuse, or misuse prior to administration.
- Conduct regular assessment of continued need for treatment.
- Geri: Assess risk of falls and institute fall prevention strategies.
- **Anxiety:** Assess mental status (orientation, mood, behavior) and degree of anxiety.
- Assess level of sedation (ataxia, dizziness, slurred speech) prior to and periodically throughout therapy.
- **Seizures:** Observe and record intensity, duration, and location of seizure activity. The initial dose of diazepam offers seizure control for 15–20 min after administration. Institute seizure precautions.
- **Muscle Spasms:** Assess muscle spasm, associated pain, and limitation of movement prior to and during therapy.
- **Alcohol Withdrawal:** Assess patient experiencing alcohol withdrawal for tremors, agitation, delirium, and hallucinations. Protect patient from injury.
- ***Lab Test Considerations:*** Evaluate hepatic and renal function and CBC periodically during prolonged therapy. May cause ↑ transaminases and alkaline phosphatase.
- ***Toxicity and Overdose:*** Flumazenil is an adjunct in the management of toxicity or overdose. (Flumazenil may induce seizures in patients with a history of seizures disorder or who are on tricyclic antidepressants.).

Implementation

- Do not confuse diazepam with diltiazem.
- Patient should be kept on bed rest and observed for at least 3 hr following parenteral administration.
- If opioid analgesics are used concurrently with parenteral diazepam, decrease opioid dose by ⅓ and titrate dose to effect.
- Use lowest effective dose. Taper by 2 mg every 3 days to decrease withdrawal symptoms. Some patients may require longer taper periods (mo).
- **PO:** Tablets may be crushed and taken with food or water if patient has difficulty swallowing.
- **IM:** IM injections are painful and erratically absorbed. If IM route is used, inject deeply into deltoid muscle for maximum absorption.

IV Administration

- **IV:** Resuscitation equipment should be available when diazepam is administered IV.
- **IV Push:** ***Dilution:*** For IV administration do not dilute or mix with any other drug. If IV push is not feasible, administer IV push into tubing as close to insertion site as possible. Continuous infusion is not recommended due to precipitation in IV fluids and absorption of diazepam into infusion bags and tubing. Injection may cause burning and venous irritation; avoid small veins. ***Concentration:*** 5 mg/mL. ***Rate:*** Administer slowly at a rate of 5 mg/min in adults. Infants and children should receive 1–2 mg/min. Rapid injection may cause apnea, hypotension, bradycardia, or cardiac arrest.
- **Y-Site Compatibility:** docetaxel, piperacillin/tazobactam.
- **Y-Site Incompatibility:** acetaminophen, acyclovir, alemtuzumab, alfentanil, amikacin, aminocaproic acid, aminophylline, amphotericin B deoxycholate, amphotericin B lipid complex, amphotericin B liposome, ampicillin, ampicillin/sulbactam, anidulafungin, arsenic trioxide, argatroban, ascorbic acid, atracurium, atropine, azathioprine, azithromycin, aztreonam, benztropine, bivalirudin, bleomycin, bumetanide, buprenorphine, butorphanol, calcium chloride, calcium gluconate, carboplatin, carmustine, caspofungin, cefazolin, cefepime, cefotaxime, cefotetan, cefoxitin, ceftaroline, ceftazidime, ceftriaxone, cefuroxime, chloramphenicol, chlorpromazine, cisplatin, clindamycin, cyanocobalamin, cyclophosphamide, cyclosporine, cytarabine, dactinomycin, dantrolene, daunorubicin hydrochloride, dexamethasone, dexmedetomidine, dexrazoxane, diazoxide, digoxin, diltiazem, diphenhydramine, dopamine, doxorubicin, doxorubicin liposomal, doxycycline, enalaprilat, ephedrine, epinephrine, epirubicin, epoetin alfa, eptifibatide, ertapenem, erythromycin, esmolol, etoposide, etoposide phosphate, famotidine, fenoldopam, fluconazole, fludarabine, fluorouracil, folic acid, foscarnet, furosemide, ganciclovir, gemcitabine, gemtuzumab ozogamicin, gentamicin, glycopyrrolate, granisetron,

© F.A. Davis Publishing

haloperidol, heparin, hetastarch, hydralazine, hydrocortisone, hydroxycobalamin, hydroxyzine, idarubicin, ifosfamide, imipenem/cilastatin, indomethacin, insulin, regular, irinotecan, isoproterenol, ketorolac, labetalol, leucovorin calcium, levofloxacin, lidocaine, linezolid, magnesium chloride, mannitol, meperidine, meropenem, methotrexate, methylprednisolone, metoclopramide, metoprolol, metronidazole, midazolam, milrinone, mitoxantrone, multivitamin, mycophenolate, nalbuphine, naloxone, nitroglycerin, nitroprusside, norepinephrine, octreotide, oxacillin, oxaliplatin, oxytocin, paclitaxel, palonosetron, pancuronium, pantoprazole, papaverine, pemetrexed, penicillin G, pentamidine, pentobarbital, phenobarbital, phentolamine, phenylephrine, phenytoin, phytonadione, potassium acetate, potassium chloride, procainamide, prochlorperazine, promethazine, propofol, propranolol, protamine, pyridoxine, quinupristin/dalfopristin, rocuronium, sodium acetate, sodium bicarbonate, succinylcholine, tacrolimus, theophylline, thiamine, thiotepa, tigecycline, tirofiban, tobramycin, trimethoprim/sulfamethoxazole, vancomycin, vasopressin, vecuronium, verapamil, vinblastine, vincristine, vinorelbine, vitamin B complex with C, voriconazole, zoledronic acid.

- **Intranasal:** Do not prime before use. Only used for seizure clusters. Ensure caregiver is able to distinguish cluster seizures from patient's usual seizure activity. A 2nd dose, when required, may be administered after at least 4 hrs after initial dose; use a new blister pack. Do not use more than 2 doses to treat a single episode and used to treat no more than one episode every 5 days and no more than 5 episodes per mo.
- **Rect:** Only used for seizure clusters. Ensure caregiver is able to distinguish cluster seizures from patient's usual seizure activity; have been instructed to administer rectal dose; understands explicitly which seizure manifestations may or may not be treated with diazepam rectal gel; and are able to monitor the clinical response and recognize when that response is such that immediate professional medical evaluation is required.

Patient/Family Teaching

- Instruct patient to take medication as directed and not to take more than prescribed or increase dose if less effective after a few wk without checking with health care professional. Review *Medication Guide* for *Valtoco* and *Diastat* rectal gel with patient/caregiver prior to administration. Abrupt withdrawal of diazepam may cause insomnia, unusual irritability or nervousness, and seizures. Advise patient that sharing of this medication may be dangerous.
- Advise patient that diazepam is a drug with known abuse potential. Protect it from theft, and never give to anyone other than the individual for whom it was prescribed. Store out of sight and reach of children, and in a location not accessible by others.
- Medication may cause drowsiness, clumsiness, or unsteadiness. Advise patient to avoid driving or other activities requiring alertness until response to medication is known. Geri: Advise geriatric patients of increased risk for CNS effects and potential for falls.
- Caution patient to avoid taking alcohol or other CNS depressants, including opioids, concurrently with this medication.
- Instruct patient to notify health care professional of all Rx or OTC medications, vitamins, or herbal products being taken and consult health care professional before taking any new medications.
- Rep: May cause fetal harm. Advise patient to notify health care professional if pregnancy is planned or suspected or if breast feeding. Encourage women who take diazepam during pregnancy to enroll in the North American Antiepileptic Drug (NAAED) Pregnancy Registry by calling 1-888-233-2334 or visiting http://www.aedpregnancyregistry.org to monitor pregnancy outcomes in women exposed to antiepileptic drugs (AEDs).
- Emphasize the importance of follow-up examinations to determine effectiveness of the medication.
- **Intranasal:** Instruct caregiver in correct technique for administration and how to monitor patient after dose.
- **Rect:** Instruct caregiver in correct technique for administration and monitoring. Turn patient on side and administer rectal gel. Stay with patient and monitor for changes in resting breathing rate, changes in color, and side effects. A second dose, if prescribed, may be given 4–12 hours after the first dose, when required.
- **Seizures:** Patients on anticonvulsant therapy should carry identification describing disease process and medication regimen at all times.

Evaluation/Desired Outcomes

- Decrease in anxiety level. Full therapeutic antianxiety effects occur after 1–2 wk of therapy.
- Decreased recall of surgical or diagnostic procedures.
- Control of seizures.
- Decrease in muscle spasms.
- Decreased tremulousness and more rational ideation when used for alcohol withdrawal.

Classification
Therapeutic: antirheumatics, nonopioid analgesics
Pharmacologic: nonsteroidal anti-inflammatory drugs (NSAIDs)

†For ophthalmic use see Appendix B

Indications

PO: Management of inflammatory disorders including: Rheumatoid arthritis, Osteoarthritis, Ankylosing spondylitis. Primary dysmenorrhea. Relief of mild to moderate pain. Acute treatment of migraines (powder for oral solution). **Topical:** Management of: Actinic keratoses (3% gel), Osteoarthritis (Voltaren Gel, Pennsaid [for knees]). **Transdermal:** Acute pain due to minor strains, sprains, and contusions.

Action

Inhibits prostaglandin synthesis. **Therapeutic Effects:** Suppression of pain and inflammation. Relief of acute migraine attacks. **Topical (3% gel):** Clearance of actinic keratosis lesions.

Pharmacokinetics

Absorption: Undergoes first-pass metabolism by liver which results in 50% bioavailability. Oral diclofenac sodium is a delayed-release dose form. Diclofenac potassium is an immediate-release dose form. 6–10% of topical gel is systemically absorbed.
Distribution: Crosses the placenta.
Protein Binding: >99%.
Metabolism and Excretion: Metabolized by the liver (primarily by CYP2C9) to several metabolites; 65% excreted in urine, 35% in bile.
Half-life: 2 hr.

TIME/ACTION PROFILE

ROUTE	ONSET	PEAK	DURATION
PO (inflammation)	few days–1 wk	≥2 wk	unknown
PO (pain)	30 min	unknown	up to 8 hr
Top (gel and patch)	unknown	10–20 hr	unknown
Top (solution)	unknown	unknown	unknown

Contraindications/Precautions

Contraindicated in: Hypersensitivity to diclofenac or other components of formulation; Cross-sensitivity may occur with other NSAIDs including aspirin; Active GI bleeding/ulcer disease; Coronary artery bypass graft (CABG) surgery; Exudative dermatitis, eczema, infectious lesions, burns, or wounds; OB: Avoid use after 30 wk gestation.
Use Cautiously in: Severe renal/hepatic impairment; Cardiovascular disease or risk factors for cardiovascular disease (may ↑ risk of serious cardiovascular thrombotic events, myocardial infarction, and stroke, especially with prolonged use or use of higher doses); avoid use in patients with recent MI or HF; HF or edema; History of porphyria; History of peptic ulcer disease and/or GI bleeding; Bleeding tendency or concurrent anticoagulant therapy; OB: Use at or after 20 wk gestation may cause fetal or neonatal renal impairment; if treatment is necessary between 20 wk and 30 wk gestation, limit use to the lowest effective dose and shortest duration possible; Pedi: Safety and effectiveness only established for transdermal patch in children ≥6 yr and diclofenac potassium (Zipsor) in children ≥12 yr; Geri: Dose ↓ recommended in older adults; more susceptible to adverse effects, including GI bleeding.

Adverse Reactions/Side Effects

CV: HF, MYOCARDIAL INFARCTION, STROKE, edema, hypertension. **Derm:** DRUG REACTION WITH EOSINOPHILIA AND SYSTEMIC SYMPTOMS (DRESS), EXFOLIATIVE DERMATITIS, STEVENS-JOHNSON SYNDROME (SJS), TOXIC EPIDERMAL NECROLYSIS (TEN), pruritus, rashes, eczema, photosensitivity. **EENT:** tinnitus. **F and E:** hyperkalemia. **GI:** GI BLEEDING, HEPATOTOXICITY, abdominal pain, constipation, diarrhea, dyspepsia, flatulence, heartburn, ↑ liver enzymes, nausea, vomiting. **GU:** acute renal failure, hematuria. **Hemat:** anemia, prolonged bleeding time. **Local:** *Topical only*—contact dermatitis, dry skin, exfoliation. **Neuro:** dizziness, headache. **Misc:** HYPERSENSITIVITY REACTIONS (including anaphylaxis).

Interactions

Primarily noted for oral administration.

Drug-Drug: ↑ adverse GI effects with **aspirin**, other **NSAIDs**, or **corticosteroids**. May ↓ effectiveness of **diuretics** or **antihypertensives**. May ↑ levels/risk of toxicity from **cyclosporine**, **lithium**, or **methotrexate**. ↑ risk of bleeding with **anticoagulants**, **aspirin**, **clopidogrel**, **ticagrelor**, **prasugrel**, **corticoste-**

© F.A. Davis Publishing

roids, **fibrinolytics**, **SNRIs**, or **SSRIs**. **CYP2C9 inhibitors**, including **voriconazole** may ↑ levels/risk of toxicity. **CYP2C9 inducers**, including **rifampin**, may ↓ levels/effectiveness. Concurrent use of oral **NSAIDs** during topical diclofenac therapy should be minimized. **Drug-Natural Products:** ↑ bleeding risk with **arnica**, **chamomile**, **clove**, **dong quai**, **feverfew**, **garlic**, **ginger**, **ginkgo**, ***Panax ginseng***, and others.

Route/Dosage

Different formulations of oral diclofenac (diclofenac capsules, diclofenac sodium enteric-coated tablets, diclofenac sodium extended-release tablets, and diclofenac potassium immediate-release tablets) are not bioequivalent and should not be substituted on a mg-to-mg basis.

Diclofenac

PO (Adults): *Acute pain*—18–35 mg 3 times daily; *Osteoarthritis*—35 mg 3 times daily.

Hepatic Impairment

PO (Adults): Do not exceed dose of 18 mg 3 times daily.

Diclofenac Potassium

PO (Adults): *Analgesic/antidysmenorrheal (Cataflam)*—100 mg initially, then 50 mg 3 times daily as needed; *Mild-to-moderate acute pain (Zipsor)*—25 mg 4 times daily; *Rheumatoid arthritis (Cataflam)*—50 mg 3–4 times daily; *Osteoarthritis (Cataflam)*—50 mg 2–3 times daily; *Osteoarthritis (Cambia)*—one packet (50 mg) given as a single dose.
PO (Children ≥12 yr): *Mild-to-moderate acute pain (Zipsor)*—25 mg 4 times daily;.

Diclofenac Sodium

PO (Adults): *Rheumatoid arthritis (delayed-release [enteric-coated] tablets)*—50 mg 3–4 times daily *or* 75 mg twice daily (usual maintenance dose 25 mg 3 times daily). *Rheumatoid arthritis (extended-release tablets)*—100 mg once daily; if unsatisfactory response, dose may be ↑ to 100 mg twice daily. *Osteoarthritis (delayed-release [enteric-coated] tablets)*—50 mg 2–3 times daily *or* 75 mg twice daily. *Osteoarthritis (extended-release tablets)*—100 mg once daily. *Ankylosing spondylitis (delayed-release [enteric-coated] tablets)*—25 mg 4 times daily, with an additional 25 mg given at bedtime, if necessary.
Topical (Adults): *Solaraze*—Apply to lesions twice daily for 60–90 days; *Voltaren gel*—Lower extremities (knees, ankles, feet): Apply 4 g to affected area 4 times daily (maximum of 16 g per joint/day); Upper extremities (elbows, wrists, hands): Apply 2 g to affected area 4 times daily (maximum of 8 g per joint/day). Maximum total body dose should not exceed 32 g/day; *Pennsaid*—Apply 40 drops to affected knee(s) 4 times daily.
Rect (Adults): Insert 50 mg or 100 mg as single dose to substitute for final oral daily dose (max combined dose [rectal and oral]: 100 mg/day).

Diclofenac Epolamine

Transdermal (Adults and Children ≥6 yr): *Flector*—Apply 1 patch to most painful area twice daily.

Availability (generic available)

Diclofenac potassium immediate-release tablets (Cataflam): 50 mg. **Cost:** *Generic*—$156.55/100. **Diclofenac potassium liquid-filled capsules (Zipsor):** 25 mg. **Cost:** $478.80/100. **Diclofenac potassium powder for oral solution (Cambia):** 50 mg/packet. **Cost:** $29.04/1 pkt. **Diclofenac capsules (Zorvolex):** 18 mg, 35 mg. **Diclofenac sodium delayed-release (enteric-coated) tablets:** 25 mg, 50 mg, 75 mg. **Cost:** *Generic*—25 mg $142.18/100, 50 mg $147.23/100, 75 mg $177.39/100. **Diclofenac sodium extended-release tablets:** 🍁75 mg, 100 mg. **Cost:** *Generic*—100 mg $281.42/100. **Diclofenac sodium topical gel:** 1% (Voltaren gel)[OTC], 3% (Solaraze). **Cost:** 1% $46.48/100 g, 3% $931.92/100 g. **Diclofenac sodium topical solution:** 1.5%. **Cost:** $289.67/150 mL. **Diclofenac epolamine transdermal patch (Flector):** 180 mg/patch. **Cost:** $239.70/30. **Diclofenac sodium rectal suppository:** 🍁50 mg, 🍁100 mg. ***In combination with:*** misoprostol (Arthrotec). See Appendix N.

NURSING IMPLICATIONS

Assessment

- Patients who have asthma, aspirin-induced allergy, and nasal polyps are at ↑ risk for developing hypersensitivity reactions.
- Monitor BP closely during initiation of treatment and periodically during therapy in patients with hypertension.
- Assess patient for skin rash frequently during therapy. Discontinue at first sign of rash; may be life-threatening. SJS may develop. Treat symptomatically; may recur once treatment is stopped.
- Monitor for signs and symptoms of DRESS (fever, rash, lymphadenopathy, facial swelling) periodically during therapy. Discontinue therapy if symptoms occur.
- **Pain:** Assess pain and limitation of movement; note type, location, and intensity before and 30–60 min after administration.
- **Migraine:** Assess pain location, character, intensity, and duration and associated symptoms (photophobia, phonophobia, nausea, vomiting) during migraine attack.
- **Arthritis:** Assess arthritic pain (note type, location, intensity) and limitation of movement before and periodically during therapy.

© F.A. Davis Publishing

- **Actinic Keratosis:** Assess lesions prior to and periodically during therapy.
- ***Lab Test Considerations:*** Diclofenac has minimal effect on bleeding time and platelet aggregation.
- May cause ↓ in hemoglobin and hematocrit.
- Monitor CBC and liver function tests within 4–8 wk of initiating diclofenac and periodically during therapy. May cause ↑ serum alkaline phosphatase, LDH, AST, and ALT concentrations.
- Monitor BUN and serum creatinine periodically during therapy. May cause ↑ BUN and serum creatinine.

Implementation

- Various brands and dose forms are not interchangeable.
- Administration in higher than recommended doses does not provide increased effectiveness but may cause increased side effects. Use lowest effective dose for shortest period of time.
- **PO:** Take with food or milk to minimize gastric irritation. May take first 1–2 doses on an empty stomach for more rapid onset. ***DNC:*** Do not crush or chew enteric-coated or extended-release tablets. Administer *Zorvolex* capsules on an empty stomach; food may reduce effectiveness.
- **Dysmenorrhea:** Administer as soon as possible after the onset of menses. Prophylactic treatment has not been shown to be effective.
- **Migraine:** Empty contents of one packet into a cup containing 1–2 oz or 2–4 tablespoons (30–60 mL) of water, mix well and drink immediately. Do not use liquids other than water. Take on empty stomach; food may reduce effectiveness. Use only for acute migraine pain; not indicated for prophylaxis.
- **Topical: Gel** should be applied to intact skin; do not use on open wounds. An adequate amount of gel should be applied to cover the entire lesion.
- **Topical:** Dispense **solution** 10 drops at a time either directly onto knee or first into the hand and then onto knee. Spread solution evenly around front, back, and sides of the knee. Repeat until 40 drops have been applied and knee is completely covered with solution.
- **Transdermal:** Apply patch to the most painful area twice a day. Do not apply to nonintact or damaged skin resulting from any etiology (exudative dermatitis, eczema, infected lesion, burns, wounds). Avoid contact with eyes; wash hands after applying, handling, or removing patch.

Patient/Family Teaching

- Instruct patient to take diclofenac as directed and not take more than recommended. Advise patient to read *Medication Guide* before starting diclofenac and with each Rx refill in case of changes.
- *Migraine:* Advise patient that overuse (use more than 10 days/mo) may lead to exacerbation of headache (migraine-like daily headaches, or as a marked increase in frequency of migraine attacks). May require gradual withdrawal of diclofenac and treatment of symptoms (transient worsening of headache).
- Caution patient to avoid concurrent use of alcohol, aspirin, acetaminophen, other NSAIDs, or other OTC medications without consulting health care professional.
- Instruct patient to notify health care professional of medication regimen before treatment or surgery.
- May cause serious side effects: CV (MI or stroke), GI (ulcers, bleeding), skin (exfoliative dermatitis, Stevens-Johnson Syndrome, toxic epidermal necrolysis), and hypersensitivity (anaphylaxis). May occur without warning symptoms. Advise patient to stop medication and notify health care professional immediately if symptoms of CV side effects (chest pain, shortness of breath, weakness, slurring of speech), GI side effects (epigastric pain, dyspepsia, melena, hematemesis), skin side effects (skin rash, blisters, fever, itching), or hypersensitivity reactions (difficulty breathing or swelling of face or throat) occur. Inform patient that risk for heart attack or stroke that can lead to death increases with longer use of NSAIDs and in people who have heart disease and that risk of ulcer increases with concurrent use of corticosteroids and anticoagulants, longer use, smoking, drinking alcohol, older age, and having poor health.
- Advise patient to notify health care professional promptly if unexplained weight gain, swelling of arms and legs or hands and feet, nausea, fatigue, lethargy, rash, pruritus, yellowing of skin or eyes, itching, stomach pain, vomiting blood, bloody or tarry stools, or flu-like symptoms occur.
- Instruct patient to notify health care professional of all Rx or OTC medications, vitamins, or herbal products being taken and to consult with health care professional before taking other medications, especially other NSAIDs or aspirin.
- Rep: May cause fetal harm. Advise females of reproductive potential to notify health care professional if pregnancy is planned or suspected or if breast feeding. Advise women to avoid diclofenac in the 3rd trimester of pregnancy (after 29 wk); may cause premature closure of the fetal ductus arteriosus. Use of diclofenac after 20 wk may cause fetal renal dysfunction leading to oligohydramnios. May cause reversible infertility in women attempting to conceive; may consider discontinuing diclofenac.
- **PO:** Instruct patient to take diclofenac with a full glass of water and to remain in an upright position for 15–30 min after administration. Take missed doses as soon as possible within 1–2 hr if taking once or twice a day or unless almost time for next dose if taking more than twice a day. Do not double doses.
- May cause drowsiness or dizziness. Caution patient to avoid driving or other activities requiring alertness until response to medication is known.

© F.A. Davis Publishing

- Caution patient to wear sunscreen and protective clothing to prevent photosensitivity reactions.
- **Topical:** Advise patient to minimize use of concurrent NSAIDs during topical therapy. Instruct patient to read *Medication Guide* before starting therapy and with each Rx refill in case changes have been made.
- *Pennsaid:* Instruct patient to avoid touching treated knee and allowing another person to touch knee until completely dry. Cover knee with clothing until completely dry. Avoid covering lesion with occlusive dressing or tight clothing, and avoid applying sunscreen, insect repellent, lotion, moisturizer, or cosmetics to the affected area. Do not use heating pads, sunlamps, and tanning beds. Protect treated knee from sunlight; wear protective clothes when in sunlight. Avoid showers or baths for at least 30 min after application.
- *Voltaren:* Measure dose using the dosing card supplied in the drug product carton. Dosing card is clear polypropylene; use for each application. Apply gel within the rectangular area of the dosing card up to the 2-g or 4-g line (2 g for each elbow, wrist, or hand, and 4 g for each knee, ankle, or foot). Apply gel using dosing card. Use hands to gently rub gel into skin. After using dosing card, hold with fingertips, rinse, and dry. If treatment site is the hands, patient should wait at least one hr to wash hands.
- *3% gel:* Advise patient that it may take 60–90 days for complete healing of the lesion to occur.
- **Transdermal:** Instruct patient on correct application procedure for patch. Apply patch to most painful area. Change patch every 12 hr. Remove patch if irritation occurs. Fold used patches so adhesive sticks to itself and discard where children and pets cannot get them. Encourage patient to read the *NSAID Medication Guide* that accompanies the prescription.
- Do not wear patch during bathing or showering. Bathing should take place between scheduled patch removal and application.
- Instruct patients if patch begins to peel off to tape the edges. Patient may overlay the topical system with a mesh netting sleeve to secure topical systems applied to ankles, knees, or elbows. Mesh netting sleeve (Curad® Hold Tite™, Surgilast® Tubular Elastic Dressing) must allow air to pass through and not be occlusive.
- Advise patient referred for MRI test to discuss patch with referring health care professional and MRI facility to determine if removal of patch is necessary prior to test and for directions for replacing patch.

Evaluation/Desired Outcomes

- Decrease in severity of mild-to-moderate pain.
- Increased ease of joint movement. Patients who do not respond to one NSAID may respond to another. May require 2 wk or more for maximum effects.
- Decrease in severity of acute migraine pain.
- Decrease in or healing of lesions in actinic keratosis. Lesions that do not heal should be re-evaluated.

D

dicloxacillin, See PENICILLINS, PENICILLINASE RESISTANT.

diflorasone, See CORTICOSTEROIDS (TOPICAL/LOCAL).

BEERS HIGH ALERT

digoxin (di-jox-in)

Lanoxin, Toloxin

Classification

Therapeutic: antiarrhythmics, inotropics
Pharmacologic: digitalis glycosides

Indications

Heart failure. Atrial fibrillation and atrial flutter (slows ventricular rate). Paroxysmal atrial tachycardia.

Action

Increases the force of myocardial contraction. Prolongs refractory period of the AV node. Decreases conduction through the SA and AV nodes. **Therapeutic Effects:** Increased cardiac output (positive inotropic effect) and slowing of the heart rate (negative chronotropic effect).

Pharmacokinetics

Absorption: 60–80% absorbed after oral administration of tablets; 70–85% absorbed after administration of elixir; 80% absorbed from IM sites (IM route not recommended due to pain/irritation).
Distribution: Widely distributed; crosses placenta and enters breast milk.
Metabolism and Excretion: Excreted almost entirely unchanged by the kidneys.
Half-life: 36–48 hr (↑ in renal impairment).

TIME/ACTION PROFILE (antiarrhythmic or inotropic effects, provided that a loading dose has been given)

ROUTE	ONSET	PEAK	DURATION
Digoxin–PO	30–120 min	2–8 hr	2–4 days†
Digoxin–IM	30 min	4–6 hr	2–4 days†
Digoxin–IV	5–30 min	1–4 hr	2–4 days†

†Duration listed is that for normal renal function; in impaired renal function, duration will be longer.

= Canadian drug name. = Genetic implication. ~~Strikethrough~~ = Discontinued.
*CAPITALS indicates life-threatening; underlines indicate most frequent.

© F.A. Davis Publishing

Contraindications/Precautions

Contraindicated in: Hypersensitivity; Uncontrolled ventricular arrhythmias; AV block (in absence of pacemaker); Idiopathic hypertrophic subaortic stenosis; Constrictive pericarditis; Known alcohol intolerance (elixir only).

Use Cautiously in: Hypokalemia (↑ risk of digoxin toxicity); Hypercalcemia (↑ risk of toxicity, especially with mild hypokalemia); Hypomagnesemia (↑ risk of digoxin toxicity); Diuretic use (may cause electrolyte abnormalities including hypokalemia and hypomagnesemia); Hypothyroidism; Myocardial infarction; Renal impairment (dose ↓ required); Obesity (base dose on ideal body weight); OB: Monitor neonates for signs/symptoms of digoxin toxicity; monitor levels in mother during pregnancy as levels may fluctuate during pregnancy and post-partum periods; may lead to ↑ risk of arrhythmias during labor and delivery; Lactation: Similar concentrations in serum and breast milk result in subtherapeutic levels in infant, use with caution; Geri: Very sensitive to toxic effects; dose adjustments required for age-related ↓ in renal function and body weight.

Adverse Reactions/Side Effects

CV: ARRHYTHMIAS, bradycardia, ECG changes, AV block, SA block. **EENT:** blurred vision, yellow or green vision. **GI:** anorexia, nausea, vomiting, diarrhea. **Hemat:** thrombocytopenia. **Metab:** electrolyte imbalances with acute digoxin toxicity. **Neuro:** fatigue, headache, weakness..

Interactions

Drug-Drug: Thiazide and **loop diuretics**, **piperacillin/tazobactam**, **amphotericin B**, **corticosteroids**, and excessive use of **laxatives** may cause hypokalemia which may ↑ risk of toxicity. **Quinidine** and **ritonavir** may ↑ levels and lead to toxicity; ↓ digoxin dose by 30–50%. **Amiodarone** may ↑ levels and lead to toxicity; ↓ digoxin dose by 50%. **Cyclosporine**, **itraconazole**, **mirabegron**, **propafenone**, **quinine**, **spironolactone**, and **verapamil** may ↑ levels and lead to toxicity; serum level monitoring/dose ↓ may be required. Levels may be ↓ by some **antineoplastics** (**bleomycin**, **carmustine**, **cyclophosphamide**, **cytarabine**, **doxorubicin**, **methotrexate**, **procarbazine**, **vincristine**), **activated charcoal**, **cholestyramine**, **colestipol**, **metoclopramide**, **penicillamine**, **rifampin**, or **sulfasalazine**. In a small percentage (10%) of patients gut bacteria metabolize digoxin to inactive compounds; **macrolide anti-infectives** (**erythromycin**, **azithromycin**, **clarithromycin**) and **tetracyclines**, by killing these bacteria, will cause ↑ levels and toxicity; dose may need to be ↓ for up to 9 wk. Additive bradycardia may occur with **beta blockers**, **diltiazem**, **verapamil**, **clonidine**, **ivabradine**, and other **antiarrhythmics** (**quinidine**, **disopyramide**). Concurrent use of **sympathomimetics** may ↑ risk of arrhythmias. **Thyroid hormones** may ↓ therapeutic effects.

Drug-Natural Products: Licorice and stimulant natural products (**aloe**) may ↑ risk of potassium depletion. **St. John's wort** may ↓ levels and effect.

Drug-Food: Concurrent ingestion of a **high-fiber meal** may ↓ absorption. Administer digoxin 1 hr before or 2 hrs after such a meal.

Route/Dosage

For rapid effect, a larger initial loading/digitalizing dose should be given in several divided doses over 12–24 hr. Maintenance doses are determined for digoxin by renal function. All dosing must be evaluated by individual response. In general, doses required for atrial arrhythmias are higher than those for inotropic effect.

IV, IM (Adults): *Digitalizing dose*—0.5–1 mg given as 50% of the dose initially and one quarter of the initial dose in each of 2 subsequent doses at 6–12 hr intervals.

IV, IM (Children >10 yr): *Digitalizing dose*—8–12 mcg/kg given as 50% of the dose initially and one quarter of the initial dose in each of 2 subsequent doses at 6–12 hr intervals.

IV, IM (Children 5–10 yr): *Digitalizing dose*—15–30 mcg/kg given as 50% of the dose initially and one quarter of the initial dose in each of 2 subsequent doses at 6–12 hr intervals.

IV, IM (Children 2–5 yr): *Digitalizing dose*—25–35 mcg/kg given as 50% of the dose initially and one quarter of the initial dose in each of 2 subsequent doses at 6–12 hr intervals.

IV, IM (Children 1–24 mo): *Digitalizing dose*—30–50 mcg/kg given as 50% of the dose initially and one quarter of the initial dose in each of 2 subsequent doses at 6–12 hr intervals.

IV, IM (Infants –full term): 20–30 mcg/kg given as 50% of the dose initially and one quarter of the initial dose in each of 2 subsequent doses at 6–12 hr intervals.

IV, IM (Infants –premature): *Digitalizing dose*—15–25 mcg/kg given as 50% of the dose initially and one quarter of the initial dose in each of 2 subsequent doses at 6–12 hr intervals.

PO (Adults): *Digitalizing dose*—0.75–1.5 mg given as 50% of the dose initially and one quarter of the initial dose in each of 2 subsequent doses at 6–12 hr intervals. *Maintenance dose*—0.125–0.5 mg/day depending on patient's lean body weight, renal function, and serum level.

PO (Geriatric Patients): Initial daily dose should not exceed 0.125 mg.

PO (Children >10 yr): *Digitalizing dose*—10–15 mcg/kg given as 50% of the dose initially and one quarter of the initial dose in each of 2 subsequent doses at 6–12 hr intervals. *Maintenance dose*—2.5–5 mcg/kg given daily as a single dose.

PO (Children 5–10 yr): *Digitalizing dose*—20–35 mcg/kg given as 50% of the dose initially and one quarter of the initial dose in each of 2 subsequent doses at

© F.A. Davis Publishing

6–12 hr intervals. *Maintenance dose*—5–10 mcg/kg given daily in 2 divided doses.
PO (Children 2–5 yr): *Digitalizing dose*—30–40 mcg/kg given as 50% of the dose initially and one quarter of the initial dose in each of 2 subsequent doses at 6–12 hr intervals. *Maintenance dose*—7.5–10 mcg/kg given daily in 2 divided doses.
PO (Children 1–24 mo): *Digitalizing dose*—35–60 mcg/kg given as 50% of the dose initially and one quarter of the initial dose in each of 2 subsequent doses at 6–12 hr intervals. *Maintenance dose*—10–15 mcg/kg given daily in 2 divided doses.
PO (Infants –full term): *Digitalizing dose*—25–35 mcg/kg given as 50% of the dose initially and one quarter of the initial dose in each of 2 subsequent doses at 6–12 hr intervals. *Maintenance dose*—6–10 mcg/kg given daily in 2 divided doses.
PO (Infants –premature): *Digitalizing dose*—20–30 mcg/kg given as 50% of the dose initially and one quarter of the initial dose in each of 2 subsequent doses at 6–12 hr intervals. *Maintenance dose*—5–7.5 mcg/kg given daily in 2 divided doses.

Availability (generic available)

Elixir (lime flavor): 0.05 mg/mL. **Cost:** *Generic*—$42.10/60 mL. **Solution for injection:** 0.25 mg/mL. **Solution for injection (pediatric):** 0.1 mg/mL. **Tablets:** 0.0625 mg, 0.125 mg, 0.25 mg. **Cost:** *Generic*—All strengths $27.75/10.

NURSING IMPLICATIONS

Assessment

- Monitor apical pulse for 1 full min before administering. Withhold dose and notify health care professional if pulse rate is <60 bpm in an adult, <70 bpm in a child, or <90 bpm in an infant. Notify health care professional promptly of any significant changes in rate, rhythm, or quality of pulse.
- Pedi: Heart rate varies in children depending on age, ask health care professional to specify at what heart rates digoxin should be withheld.
- Monitor BP periodically in patients receiving IV digoxin.
- Monitor ECG during IV administration and 6 hr after each dose. Notify health care professional if bradycardia or new arrhythmias occur.
- Observe IV site for redness or infiltration; extravasation can lead to tissue irritation and sloughing.
- Monitor intake and output ratios and daily weights. Assess for peripheral edema, and auscultate lungs for rales/crackles throughout therapy.
- Before administering initial loading dose, determine whether patient has taken any digoxin in the preceding 2–3 wk.
- ***Lab Test Considerations:*** Evaluate serum electrolyte levels (especially potassium, magnesium, and calcium) and renal and hepatic function periodically during therapy. Notify health care professional before giving dose if patient is hypokalemic. Hypokalemia, hypomagnesemia, or hypercalcemia may make the patient more susceptible to digitalis toxicity. Pedi: Neonates may have falsely elevated serum digoxin concentrations due to a naturally occurring substance chemically similar to digoxin.
- ***Toxicity and Overdose:*** Therapeutic serum digoxin levels range from 0.5–2 ng/mL. Serum levels may be drawn 6–8 hr after a dose is administered; usually drawn immediately before the next dose. Geri: Older adults are at increased risk for toxic effects of digoxin (on Beers list) due to age-related decreased renal clearance; may exist even when serum creatinine levels are normal. Digoxin requirements in older adult may change and a formerly therapeutic dose can become toxic.
- Observe for signs and symptoms of toxicity. *In adults and older children,* first symptoms of toxicity usually include abdominal pain, anorexia, nausea, vomiting, visual disturbances, bradycardia, and other arrhythmias. *In infants and small children,* first signs of overdose are usually cardiac arrhythmias. If these appear, withhold drug and notify health care professional immediately.
- If signs of toxicity occur and are not severe, discontinuation of digoxin may be all that is required.
- Correct electrolyte abnormalities, thyroid dysfunction, and concomitant medications. Administer potassium to maintain serum potassium between 4.0 and 5.5 mmol/L. Monitor ECG for evidence of potassium toxicity (peaked T waves).
- Treatment of life-threatening arrhythmias may include administration of digoxin immune Fab *(Digibind)*, which binds to the digitalis glycoside molecule in the blood and is excreted by the kidneys.

Implementation

- Do not confuse Lanoxin (digoxin) with levothyroxine or naloxone.
- ***High Alert:*** Digoxin has a narrow therapeutic range. Medication errors associated with digoxin include miscalculation of pediatric doses and insufficient monitoring of digoxin levels. Have second practitioner independently check original order and dose calculations.
- For rapid digitalization, initial dose is higher than maintenance dose; 50% of total digitalizing dose is given initially. Administer remainder of dose in 25% increments at 4–8 hr intervals.
- When changing from parenteral to oral dose forms, dose adjustments may be necessary because of pharmacokinetic variations in percentage of digoxin absorbed: 100 mcg (0.1 mg) digoxin injection = 125 mcg (0.125 mg) tablet or 125 mcg (0.125 mg) of elixir.

© F.A. Davis Publishing

- **PO:** Administer oral preparations consistently with regard to meals. Tablets can be crushed and administered with food or fluids if patient has difficulty swallowing. Use calibrated measuring device for elixir; calibrated dropper is not accurate for doses of less than 0.2 mL or 10 mcg.
- **IM:** Administer deep into gluteal muscle and massage well to reduce painful local reactions. Do not administer more than 2 mL of digoxin in each IM site. IM administration is not generally recommended.

IV Administration

- **IV Push:** ***Dilution:*** May be administered undiluted. May also dilute 1 mL of digoxin in 4 mL of sterile water for injection, D5W, or 0.9% NaCl. Less diluent will cause precipitation. Use diluted solution immediately. ***Rate:*** Administer over at least 5 min.
- **Y-Site Compatibility:** acyclovir, alemtuzumab, alfentanil, amikacin, aminocaproic acid, aminophylline, amphotericin B lipid complex, anidulafungin, argatroban, arsenic trioxide, ascorbic acid, atracurium, atropine, azathioprine, azithromycin, aztreonam, benztropine, bivalirudin, bleomycin, bumetanide, buprenorphine, butorphanol, calcium chloride, calcium gluconate, cangrelor, carboplatin, carmustine, cefazolin, cefotaxime, cefotetan, cefoxitin, ceftaroline, ceftazidime, ceftriaxone, cefuroxime, chloramphenicol, chlorpromazine, ciprofloxacin, cisatracurium, cisplatin, clindamycin, cyanocobalamin, cyclophosphamide, cyclosporine, cytarabine, dacarbazine, dactinomycin, daptomycin, daunorubicin, dexamethasone, dexmedetomidine, dexrazoxane, diltiazem, dimenhydrinate, diphenhydramine, dobutamine, docetaxel, dopamine, doxorubicin liposome, doxycycline, enalaprilat, ephedrine, epinephrine, epirubicin, epoetin alfa, eptifibatide, ertapenem, erythromycin, esmolol, etoposide, etoposide phosphate, famotidine, fenoldopam, fentanyl, fludarabine, fluorouracil, folic acid, fosfomycin, fosphenytoin, furosemide, ganciclovir, gemcitabine, gentamicin, glycopyrrolate, granisetron, heparin, hetastarch, hydrocortisone sodium succinate, hydromorphone, ifosfamide, imipenem/cilastatin, indomethacin, irinotecan, isoproterenol, ketamine, ketorolac, labetalol, leucovorin calcium, levofloxacin, lidocaine, linezolid, lorazepam, magnesium sulfate, mannitol, meperidine, meropenem, mesna, methohexital, methotrexate, methylprednisolone sodium succinate, metoclopramide, metoprolol, midazolam, milrinone, mitomycin, morphine, moxifloxacin, multivitamins, mycophenolate, nafcillin, nalbuphine, naloxone, nicardipine, nitroglycerin, nitroprusside, norepinephrine, octreotide, ondansetron, oxacillin, oxaliplatin, oxytocin, palonosetron, pamidronate, pancuronium, pantoprazole, papaverine, pemetrexed, penicillin G, pentobarbital, phenobarbital, phentolamine, phenylephrine, phytonadione, piperacillin/tazobactam, potassium acetate, potassium chloride, procainamide, prochlorperazine, promethazine, propranolol, protamine, pyridoxine, remifentanil, rituximab, rocuronium, sodium acetate, sodium bicarbonate, streptomycin, succinylcholine, sufentanil, tacrolimus, theophylline, thiamine, thiotepa, tigecycline, tirofiban, tobramycin, trastuzumab, vancomycin, vasopressin, vecuronium, verapamil, vinblastine, vincristine, vinorelbine, vitamin B complex with C, voriconazole, zoledronic acid.
- **Y-Site Incompatibility:** amiodarone, amphotericin B deoxycholate, amphotericin B liposome, caspofungin, dantrolene, diazepam, diazoxide, doxorubicin, foscarnet, idarubicin, minocycline, mitoxantrone, paclitaxel, pentamidine, phenytoin, propofol, quinupristin/dalfopristin, telavancin, topotecan, trimethoprim/sulfamethoxazole.

Patient/Family Teaching

- Instruct patient to take medication as directed, at same time each day. Teach parents or caregivers of infants and children how to accurately measure medication. Take missed doses within 12 hr of scheduled dose or omit. Do not double doses. Consult health care professional if doses for 2 or more days are missed. Do not discontinue medication without consulting health care professional.
- Teach patient to take pulse and to contact health care professional before taking medication if pulse rate is <60 or >100.
- Pedi: Teach parents or caregivers that changes in heart rate, especially bradycardia, are among the first signs of digoxin toxicity in infants and children. Instruct parents or caregivers in apical heart rate assessment and ask them to notify health care professional if heart rate is outside of range set by health care professional before administering the next scheduled dose.
- Review signs and symptoms of digitalis toxicity with patient and family. Advise patient to notify health care professional immediately if these or symptoms of HF occur. Inform patient that these symptoms may be mistaken for those of colds or flu.
- Instruct patient to keep digoxin tablets in their original container and not to mix in pill boxes with other medications; may look similar to and may be mistaken for other medications.
- Advise patient that sharing of this medication can be dangerous.
- Instruct patient to notify health care professional of all Rx or OTC medications, vitamins, or herbal products being taken and to consult health care professional before taking other Rx, OTC, or herbal products, especially St. John's wort. Advise patient to avoid taking antacids or antidiarrheals within 2 hr of digoxin.
- Advise patient to notify health care professional of this medication regimen before treatment.
- Patients taking digoxin should carry identification describing disease process and medication regimen at all times.

© F.A. Davis Publishing

- Geri: Review fall prevention strategies with older adults and their families.
- Advise female patient to notify health care professional if pregnancy is planned or suspected, may increase risk for low birth weight or preterm birth. Monitor neonates for signs and symptoms of digoxin toxicity (vomiting, cardiac arrhythmias).
- Emphasize the importance of routine follow-up exams to determine effectiveness and to monitor for toxicity.

Evaluation/Desired Outcomes

- Decrease in severity of HF.
- Increase in cardiac output.
- Decrease in ventricular response in atrial tachyarrhythmias.
- Termination of paroxysmal atrial tachycardia.

diltIAZem (dil-tye-a-zem)

Cardizem, Cardizem CD, Cardizem LA, Cartia XT, Taztia XT, Tiazac, ✱Tiazac XC

Classification

Therapeutic: antianginals, antiarrhythmics (class IV), antihypertensives
Pharmacologic: calcium channel blockers

Indications

Hypertension. Angina pectoris and vasospastic (Prinzmetal's) angina. Supraventricular tachyarrhythmias and rapid ventricular rates in atrial flutter or fibrillation.

Action

Inhibits transport of calcium into myocardial and vascular smooth muscle cells, resulting in inhibition of excitation-contraction coupling and subsequent contraction.
Therapeutic Effects: Systemic vasodilation resulting in decreased BP. Coronary vasodilation resulting in decreased frequency and severity of attacks of angina. Reduction of ventricular rate in atrial fibrillation or flutter.

Pharmacokinetics

Absorption: Well absorbed, but rapidly metabolized after oral administration.
Distribution: Unknown.
Protein Binding: 70–80%.
Metabolism and Excretion: Mostly metabolized by the liver (CYP3A4 enzyme system).
Half-life: 3.5–9 hr.

TIME/ACTION PROFILE

ROUTE	ONSET	PEAK	DURATION
PO	30 min	2–3 hr	6–8 hr
PO–CD, LA, XT	unknown	14 days†	up to 24 hr
IV	2–5 min	2–4 hr	unknown

†Maximum antihypertensive effect with chronic therapy.

Contraindications/Precautions

Contraindicated in: Hypersensitivity; Sick sinus syndrome; 2nd- or 3rd-degree AV block (unless an artificial pacemaker is in place); Systolic BP <90 mm Hg; Recent MI or pulmonary congestion; Concurrent use of rifampin.
Use Cautiously in: Severe hepatic impairment (↓ dose recommended); Geri: ↓ dose; slower IV infusion rate recommended; ↑ risk of hypotension; consider age-related decrease in body mass, ↓ hepatic/renal/cardiac function, concurrent drug therapy, and other disease states); Severe renal impairment; Serious ventricular arrhythmias or HF; OB, Lactation, Pedi: Safety not established.

Adverse Reactions/Side Effects

EENT: blurred vision, disturbed equilibrium, epistaxis, tinnitus. **Resp:** cough, dyspnea. **CV:** ARRHYTHMIAS, HF, peripheral edema, bradycardia, chest pain, hypotension, palpitations, syncope, tachycardia. **GI:** ↑ liver enzymes, anorexia, constipation, diarrhea, dry mouth, dysgeusia, dyspepsia, nausea, vomiting. **GU:** dysuria, nocturia, polyuria, sexual dysfunction, urinary frequency. **Derm:** STEVENS-JOHNSON SYNDROME, dermatitis, erythema multiforme, flushing, sweating, photosensitivity, pruritus/urticaria, rash. **Endo:** gynecomastia, hyperglycemia. **Hemat:** anemia, leukopenia, thrombocytopenia. **Metab:** weight gain. **MS:** joint stiffness, muscle cramps. **Neuro:** paresthesia, tremor, abnormal dreams, anxiety, confusion, dizziness, drowsiness, headache, nervousness, psychiatric disturbances, weakness. **Misc:** gingival hyperplasia.

Interactions

Drug-Drug: ↑ hypotension may occur when used with **fentanyl**, other **antihypertensives**, **nitrates**, acute ingestion of **alcohol**, or **quinidine**. Antihypertensive effects may be ↓ by **NSAIDs**. May ↑ **digoxin** levels. May ↑ levels of and risk of myopathy from **simvastatin** and **lovastatin**. Concurrent use with **beta blockers**, **clonidine**, **digoxin**, **disopyramide**, **ivabradine**, or **phenytoin** may result in bradycardia, conduction defects, or HF; avoid concurrent use with ivabradine. **Phenobarbital** and **phenytoin** may ↑ metabolism and ↓ effectiveness. May ↓ metabolism of and ↑ risk of toxicity from **cyclosporine**, **quinidine**, or **carbamazepine**. **Cimetidine** ↑ levels and effects. May ↑ or ↓ the effects of **lithium** or **theophylline**.
Drug-Food: Grapefruit juice ↑ levels and effect.

Route/Dosage

PO (Adults): 30–120 mg 3–4 times daily or 180–240 mg once daily as CD or XR capsules or LA tablets (up to 360 mg/day); *Concurrent simvastatin therapy*—Diltiazem dose should not exceed 240 mg/day and simvastatin dose should not exceed 10 mg/day.

✱ = Canadian drug name. = Genetic implication. ~~Strikethrough~~ = Discontinued.
*CAPITALS indicates life-threatening; underlines indicate most frequent.

© F.A. Davis Publishing

IV (Adults): 0.25 mg/kg; may repeat in 15 min with a dose of 0.35 mg/kg. May follow with continuous infusion at 10 mg/hr (range 5–15 mg/hr) for up to 24 hr.

Availability (generic available)

Tablets: 30 mg, 60 mg, 90 mg, 120 mg. **Cost:** *Generic*— 30 mg $10.44/100, 60 mg $22.25/100, 90 mg $26.89/100. **Extended-release capsules (Cardizem CD, Tiazac, Cartia XT, Taztia XT):** 120 mg, 180 mg, 240 mg, 300 mg, 360 mg, 420 mg. **Cost:** *Generic*— 180 mg $58.19/100, 240 mg $63.54/100, 420 mg $171.49/100. **Extended-release tablets (Cardizem LA):** 120 mg, 180 mg, 240 mg, 300 mg, 360 mg, 420 mg. **Solution for injection:** 5 mg/mL.

NURSING IMPLICATIONS

Assessment

- Monitor BP and pulse prior to therapy, during dose titration, and periodically during therapy. Monitor ECG periodically during prolonged therapy. May cause prolonged PR interval.
- Monitor intake and output ratios and daily weight. Assess for signs of HF (peripheral edema, rales/crackles, dyspnea, weight gain, jugular venous distention).
- Monitor frequency of prescription refills to determine adherence.
- Patients receiving digoxin concurrently with calcium channel blockers should have routine serum digoxin levels checked and be monitored for signs and symptoms of digoxin toxicity.
- Assess for rash periodically during therapy. May cause Stevens-Johnson syndrome. Discontinue therapy if severe or if accompanied with fever, general malaise, fatigue, muscle or joint aches, blisters, oral lesions, conjunctivitis, hepatitis and/or eosinophilia.
- **Angina:** Assess location, duration, intensity, and precipitating factors of patient's anginal pain.
- **Arrhythmias:** Monitor ECG continuously during administration. Report bradycardia or prolonged hypotension promptly. Emergency equipment and medication should be available. Monitor BP and pulse before and frequently during administration.
- ***Lab Test Considerations:*** Total serum calcium concentrations are not affected by calcium channel blockers.
- Monitor serum potassium periodically. Hypokalemia ↑ the risk of arrhythmias and should be corrected.
- Monitor renal and hepatic functions periodically during long-term therapy. May cause ↑ in hepatic enzymes after several days of therapy, which return to normal on discontinuation of therapy.

Implementation

- Do not confuse Cardizem (diltiazem) with Cardene (nicardipine). Do not confuse Tiazac (diltiazem) with Ziac (bisoprolol/hydrochlorothiazide). Do not confuse diltiazem with diazepam.
- **PO:** May be administered without regard to meals. May be administered with meals if GI irritation becomes a problem.
- Do not open, crush, break, or chew extended-release tablets. Empty tablets that appear in stool are not significant.

IV Administration

- **IV Push:** ***Dilution:*** Administer bolus dose undiluted. ***Concentration:*** 5 mg/mL. ***Rate:*** Administer over 2 min.
- **Continuous Infusion:** ***Dilution:*** Dilute 125 mg in 100 mL, 250 mg in 250 mL, or 250 mg in 500 mL of 0.9% NaCl, D5W, or D5/0.45% NaCl. Infusion is stable for 24 hr at room temperature or if refrigerated. ***Concentration:*** 125 mg/125 mL (1 mg/mL), 250 mg/300 mL (0.83 mg/mL), 250 mg/550 mL (0.45 mg/mL). ***Rate:*** See Route/Dosage section. Titrate to patient's heart rate and BP response.
- **Y-Site Compatibility:** albumin, alemtuzumab, alfentanil, amifostine, amikacin, aminocaproic acid, amiodarone, amphotericin B deoxycholate, anidulafungin, argatroban, atracurium, azithromycin, aztreonam, bivalirudin, bleomycin, bumetanide, buprenorphine, busulfan, butorphanol, calcium chloride, calcium gluconate, cangrelor, carboplatin, carmustine, caspofungin, cefazolin, cefotaxime, cefotetan, cefoxitin, ceftaroline, ceftazidime, ceftriaxone, cefuroxime, chlorpromazine, ciprofloxacin, cisatracurium, cisplatin, clindamycin, cyclophosphamide, cyclosporine, cytarabine, dacarbazine, dactinomycin, daptomycin, daunorubicin, dexamethasone, dexmedetomidine, dexrazoxane, digoxin, diphenhydramine, dobutamine, docetaxel, dopamine, doxorubicin, doxycycline, droperidol, enalaprilat, ephedrine, epinephrine, epirubicin, eptifibatide, ertapenem, erythromycin, esmolol, etoposide, etoposide phosphate, famotidine, fenoldopam, fentanyl, fluconazole, fludarabine, foscarnet, fosphenytoin, gemcitabine, gentamicin, glycopyrrolate, granisetron, haloperidol, hetastarch, hydralazine, hydromorphone, idarubicin, ifosfamide, imipenem/cilastatin, irinotecan, isoproterenol, labetalol, leucovorin calcium, levofloxacin, lidocaine, linezolid, lorazepam, magnesium sulfate, mannitol, melphalan, meperidine, meropenem, metoclopramide, metoprolol, metronidazole, midazolam, milrinone, mitoxantrone, morphine, moxifloxacin, multivitamins, mycophenolate, nalbuphine, naloxone, nicardipine, nitroglycerin, nitroprusside, norepinephrine, octreotide, ondansetron, oxacillin, oxaliplatin, oxytocin, paclitaxel, palonosetron, pamidronate, pancuronium, pemetrexed, penicillin G potassium, pentamidine, phentolamine, phenylephrine, potassium acetate, potassium chloride, potassium phosphates, prochlorperazine, promethazine, propranolol, quinupristin/dalfopristin, remifentanil, rocuronium, sodium acetate, streptozocin, succinylcholine, sufentanil, tacrolimus, telavancin, theophylline, thiotepa,
