- **Storage:** Store refrigerated; if refrigeration is unavailable, may store at 77° F or less for up to 7 days; after removing from refrigerator, do not store product above 25° C; if the product has been exposed to conditions other than recommended, discard the product; do not expose to high temperatures; do not freeze; protect from light

Administration of Avonex prefilled autoinjector

- Patients may self-inject only if their provider determines that it is appropriate, and with medical follow-up, and after proper training in IM technique
- The first injection should be performed under the supervision of provider
- Remove one Administration Dose Pack from the refrigerator to warm to room temperature (about 30 min before use); do not use external heat sources such as hot water to warm the syringe Dose Pack
- Wash hands before handling Dose Pack contents
- Ensure tamper-evident cap has not been removed or is loose; then grasp the cap and bend it at a 90-degree angle until it snaps off; pull off the sterile foil from the needle cover
- Hold the Avonex Pen with the glass syringe tip pointing up; press the needle onto the glass syringe tip; gently turn the needle clockwise until firmly attached; do not remove plastic cover from the needle
- Hold Pen with one hand and, using other hand, hold onto the injector shield

(grooved area) tightly and quickly pull up on the injector shield until the injector shield covers the needle all the way; the plastic needle cover will pop off after the injector shield has been fully extended

- When the injector shield is extended the right way, there will be a small blue rectangular area next to the oval medication display window; check the display window and make sure the Avonex is clear and colorless
- Do not use the injection if the liquid is colored, cloudy, or has lumps or particles; air bubbles will not affect the dose
- Do not push down on the injector shield and the blue activation button at the same time until you are ready to give injection
- Avonex Pen should be injected into the upper outer thigh
- Use the alcohol wipe to clean the skin at the injection site and allow it to dry before injection
- Hold Pen at 90-degree angle to the injection site; firmly push the body of the pen down against the thigh to release the safety lock; safety lock is released when blue rectangle area above the oval medication display window is gone, push down on blue activation button with thumb and count to 10, you will hear a click if the injection is given the right way
- After counting to 10, pull the Pen straight out of the skin, use gauze pad to apply pressure for a few seconds
- The circular display window on the Pen is yellow if the full dose is received
- Cover exposed needle with Pen cover; do not hold the Pen cover with your hands while inserting the needle
- Dispose of used needles and syringes in a puncture-resistant container and discard appropriately
- Instruct patients to contact the health care provider if a skin reaction occurs that does not resolve in a few days
- Refer to the Patient Medication Guide for detailed instructions for preparing and giving a dose
- **Storage:** Store at 36°–46° F (2°–8° C); if refrigeration is unavailable, may store at 77° F or less for up to 7 days; after removing from refrigerator, do not store product above 25° C; if the product has been exposed to conditions other than recommended, discard the product and do not use; do not expose to high temperatures; do not freeze; protect from light

Subcutaneous administration

- Give at the same time (preferably late in the afternoon or evening) on the same days of the week at least 48 hours apart
- Do not give on two consecutive days; if a dose is missed, administer the dose as soon as possible, then skip the following day; return to the regular schedule the following week
- Premedication with acetaminophen or ibuprofen can lessen the severity of flulike symptoms
- Interferon β 1a (Rebif) 44 mcg is equivalent to 12 million IU
- Rotate injection sites; appropriate injection sites include thigh, outer surface of upper arm, stomach, or buttocks; do not inject into an area where the skin is irritated, reddened, bruised, or infected
- A Starter Pack containing a lower dose of Rebif syringes is available for the initial titration period; patients and/or their caregivers should be trained and understand appropriate preparation and administration
- The manufacturer offers complimentary services including injection training and reimbursement support; contact MS LifeLines at 877-44-REBIF

Injection (Rebif)

- Interferon β 1a (Rebif) is available in a prefilled syringe with a 29-G needle
- Inject subcutaneously into the outer surface of the upper arm, abdomen, thigh, or buttock do not inject the area near the navel or waistline; take care not to inject intradermally
- Discard any unused solution; prefilled syringes do not contain preservatives and are single-use only

Interferon beta-1b

SUBCUT route

- The manufacturers of Betaseron and of Extavia offer materials to assist with training on subcut use, call 1-800-788-1467 (Betaseron), 1-888-669-6682 (Extavia)
- Premedication with acetaminophen or ibuprofen and use of product at bedtime can lessen the severity of flulike symptoms
- Visually inspect parenteral products for particulate matter and discoloration before use; do not use if particulate matter is present

Reconstitution

- Add 1.2 ml of 0.54% sodium chloride injection (supplied by the manufacturer) to the vial by using the vial adapter to attach the prefilled syringe that contains the diluent; keep the plunger depressed, and gently swirl, do not shake; if you take your thumb off the plunger, the solution can come back into the syringe before the product is fully reconstituted; if foaming occurs, allow the vial to sit until the foam settles; final concentration (250 mcg interferon β 1b/ml, which corresponds to 8 million IU/ml)
- If not used immediately, store in the refrigerator for up to 3 hr; do not freeze; discard any unused portion after 3 hr

Injection

- Withdraw the desired amount of the reconstituted solution into the syringe by turning the vial and syringe to get the vial on top; pull the plunger back to get the desired amount of product; turn the syringe to point the needle upward, and tap the syringe and release any air bubbles; twist the vial adapter to remove it and the vial
- Choose an injection site on the upper back arm; abdomen; buttock; or front thigh; do not inject within 2 in of the navel or in a site where the skin is red, bruised, infected, broken, painful, uneven, or scabbed; rotate injection sites to minimize injection site reactions such as necrosis or localized infection
- Inject subcutaneously; take care not to inject intradermally

SIDE EFFECTS

CNS: *Headache, fever, pain, chills, mental changes, depression, hypertonia, suicide attempts, seizures*

CV: *Migraine, palpitations, hypertension, tachycardia, peripheral vascular disorders*

EENT: *Conjunctivitis, blurred vision*

GI: *Diarrhea, constipation, vomiting, abdominal pain*

GU: *Dysmenorrhea, irregular menses, metrorrhagia, cystitis, breast pain*

HEMA: *Decreased lymphocytes, ANC, WBC; lymphadenopathy, anemia*

INTEG: *Sweating, inj site reaction*

MS: *Myalgia, myasthenia*

RESP: *Sinusitis, dyspnea*

PHARMACOKINETICS

β-1a: Onset ≤12 hr, peak 48 hr, duration 4 days, half-life 8.6 hr

β-1b: Onset rapid, peak 2-8 hr, duration unknown, half-life 8 min-4.3 hr

INTERACTIONS

Increase: hepatic damage—antiretrovirals (NNRTIs, NRTIs, protease inhibitors)

Increase: myelosuppression—antineoplastics

Decrease: clearance of zidovudine

Drug/Herb

- Change in immunomodulation: astragalus, echinacea, melatonin

Drug/Lab Test

Interference: vaccines, toxoids; avoid concurrent use

Increase: LFTs

NURSING CONSIDERATIONS

Assess:

- Blood, hepatic studies: CBC, differential, platelet counts, BUN, creatinine ALT, urinalysis; if absolute neutrophil count <750/mm³ or if AST/ALT is 10× normal, discontinue product
- CNS symptoms: headache, fatigue, depression
- GI status: diarrhea or constipation, vomiting, abdominal pain
- Cardiac status: increased B/P, tachycardia
- Mental status: depression, depersonalization, **suicidal thoughts**, insomnia
- Multiple sclerosis symptoms

Perform/provide:

- Storage in refrigerator; do not freeze

Evaluate:

- Therapeutic response: decreased symptoms of multiple sclerosis

Teach patient/family:

- With written, detailed information about product
- That blurred vision, sweating may occur
- That female patients may experience irregular menses, dysmenorrhea or metrorrhagia, breast pain
- To use sunscreen to prevent photosensitivity
- To notify prescriber if pregnancy is suspected
- About inj technique, care of equipment

- To notify prescriber of increased temp, chills, muscle soreness, fatigue, depression, symptoms of hepatotoxicity
-

🍁 Canada only Side effects: *italics* = common; **bold** = life-threatening ⚠️
Nurse Alert

interferon gamma-1b (Rx)

(in-ter-feer'on)

Actimmune

Func. class.: Biologic response modifier

Chem. class.: Lymphokine, interleukin type

ACTION:

Species-specific protein synthesized in response to viruses, effects; can mediate killing of *Staphylococcus aureus*, *Toxoplasma gondii*, *Leishmania donovani*, *Listeria monocytogenes*, *Mycobacterium avium intracellulare*; enhances oxidative metabolism of macrophages, enhances antibody-dependent cellular cytotoxicity

USES:

Serious infections associated with chronic granulomatous disease, osteopetrosis

Unlabeled uses: *Mycobacterium avium* complex (MAC), pulmonary fibrosis

CONTRAINDICATIONS:

Hypersensitivity to interferon- γ , *Escherichia coli*-derived products

Precautions: Pregnancy (C), breastfeeding, children <1 yr, cardiac disease, seizure disorders, CNS disorders, myelosuppression

DOSAGE AND ROUTES

Calculator

• **Adult: SUBCUT** 50 mcg/m² (1.5 million units/m²) for patients with surface area >0.5 m²; 1.5 mcg/kg/dose for patients with surface area <0.5 m²; give Monday, Wednesday, Friday for 3 $\times$ /wk dosing

Available forms: Inj 100 mcg (2 million units)/single-dose vial

Administer:

- At bedtime to minimize adverse reactions; give acetaminophen for fever, headache
- 50% of dose if severe reactions occur or discontinue treatment until reactions subside
- In right and left deltoid and anterior thigh
- Warm to room temp before use; do not leave at room temp >12 hr (unopened)

vial)

SIDE EFFECTS

CNS: *Headache, fatigue*, depression, fever, chills

GI: *Nausea, anorexia*, abdominal pain, weight loss, diarrhea, vomiting, colitis

HEMA: *Leukopenia, thrombocytopenia, neutropenia*

INTEG: Rash, pain at inj site, *Stevens-Johnson syndrome*

MS: Myalgia, arthralgia

PHARMACOKINETICS

SUBCUT: Dose absorbed 89%, elimination half-life 5.9 hr, peak 7 hr

INTERACTIONS

Increase: myelosuppression—other myelosuppressive agents

Increase: level of theophylline, aminophylline

Increase: liver toxicity—protease inhibitors, nucleoside reverse transcriptase inhibitors (NRTIs), nonnucleoside reverse transcriptase inhibitors (NNRTIs)

NURSING CONSIDERATIONS

Assess:

- Blood, renal, hepatic studies: CBC, differential, platelet counts, BUN, creatinine, ALT, urinalysis
- CNS symptoms: headache, fatigue, depression

Perform/provide:

- Storage in refrigerator upon receipt; do not freeze; do not shake

Evaluate:

- Therapeutic response: decreased serious infections; improvement in existing infections and inflammatory conditions

Teach patient/family:

- About the method of administration if family members will be giving medication
- With written, detailed information about product

☼ Canada only Side effects: *italics* = common; **bold** = life-threatening ⚠

Nurse Alert

ipilimumab

(ip-i-lim'ue-mab)

Yervoy

Func. class.: Antineoplastic; biologic response modifier

ACTION:

A recombinant, human monoclonal antibody that binds to the cytotoxic T-lymphocyte-associated antigen 4 (CTLA-4); action is indirect, possibly through T-cell-mediated anti-tumor immune responses

USES:

Treatment of unresectable or metastatic malignant melanoma

CONTRAINDICATIONS

Hypersensitivity

Precautions: Pregnancy, breastfeeding, Crohn's disease, hepatitis, immunosuppression, inflammatory bowel disease, iritis, ocular disease, organ transplant, pancreatitis, renal disease, rheumatoid arthritis, sarcoidosis, systemic lupus erythematosus, thyroid disease, ulcerative colitis, uveitis

Black Box Warning:

Adrenal insufficiency, diarrhea, Guillain-Barré syndrome, hepatic disease, myasthenia gravis, hypo/hyperthyroidism, hypopituitarism, peripheral neuropathy, serious rash

DOSAGE AND ROUTES

Calculator

- **Adult/geriatric:** IV 3 mg/kg over 90 min q3wk × 4 doses; permanently discontinue if the full treatment course is not completed within 16 wk from 1st dose or for severe or life-threatening adverse reactions; withhold a dose for any moderate endocrine or immune-mediated adverse reactions; if the moderate adverse reaction completely or partially resolves (Grade 0-1) and if the patient is receiving <7.5 mg predniSONE or equivalent/day, resume at a dose of 3 mg/kg IV q3wk until all 4 planned doses or 16 wk from 1st dose, whichever occurs earlier; if moderate adverse reactions are persistent or if the corticosteroid dose cannot be reduced to 7.5 mg predniSONE or equivalent/day, permanently discontinue

Available forms: Sol for inj 50 mg/10 ml, 200 mg/40 ml

Administer:

Intermittent IV INF route

- Visually inspect parenteral products for particulate matter and discoloration before using whenever sol and container permit; sol may have a pale yellow color and have translucent to white, amorphous particles; discard the vial if sol is cloudy, if there is pronounced discoloration, or if particulate matter is present
- Allow vials to stand at room temperature for 5 min before inf preparation; withdraw the required volume and transfer into an IV bag; discard partially used vials or empty vials; dilute with 0.9% sodium chloride injection or 5% dextrose injection to a final conc (1-2 mg/ml); mix diluted sol by gentle inversion; do not admix
- Give inf over 90 min through an IV line with a low-protein binding in-line filter, do not give with other products; after each inf, flush the line with 0.9% sodium chloride injection or 0.5% dextrose injection

SIDE EFFECTS

CNS: Severe and fatal immune-mediated neuropathies, fatigue, headache, fever

EENT: Uveitis, iritis, episcleritis

ENDO: Severe and fatal immune-mediated endocrinopathies

GI: Severe and fatal immune-mediated enterocolitis, hepatitis, pancreatitis, abdominal pain, nausea, diarrhea, appetite decreased, vomiting, constipation, colitis

INTEG: Severe and fatal immune-mediated dermatitis pruritus, rash, urticaria

MISC: Cough, dyspnea, anemia, eosinophilia, nephritis

SYST: Antibody formation, Stevens-Johnson syndrome, toxic epidermal necrolysis

PHARMACOKINETICS:

Steady state by 3rd dose; terminal half-life 14.7 days

NURSING CONSIDERATIONS

- **Serious skin disorders: Stevens-Johnson syndrome, toxic epidermal necrolysis:** permanently discontinue in these or rash complicated by full thickness dermal ulceration or necrotic, bullous, or hemorrhagic manifestations

like bullous rash; give systemic corticosteroids at a dose of 1-2 mg/kg/day of predniSONE or equivalent; when dermatitis is controlled, taper corticosteroids over a period of at least 1 mo, withhold in patients with moderate to severe reactions; for mild to moderate dermatitis (localized rash and pruritus), give topical or systemic corticosteroids

- **Hepatotoxicity:** monitor liver functions tests baseline and before each dose to rule out infectious or malignant causes, increase the frequency of liver function test monitoring until resolution, permanently discontinue in patients with Grade 3-5 toxicity, give systemic corticosteroids at a dose of 1-2 mg/kg/day of predniSONE or equivalent

- **Neuropathy:** monitor for motor or sensory neuropathy (unilateral or bilateral weakness, sensory alterations, or paresthesias) before each dose; permanently discontinue if severe neuropathy (interfering with daily activities), such as Guillain-Barré-like syndromes, occur

- **Endocrinopathy:** monitor thyroid function tests at baseline and before each dose; monitor hypophysitis, adrenal insufficiency, adrenal crisis, hypo/hyperthyroidism (fatigue, headache, mental status changes, abdominal pain, unusual bowel habits, hypotension, or nonspecific symptoms that may resemble other causes)

Perform/provide:

- Storage once diluted for no more than 24 hr refrigerated or at room temperature

Evaluate: Decreasing spread of malignant melanoma

Teach patient/family:

- To immediately report allergic reactions, skin rash, severe abdominal pain, yellowing of skin or eyes, tingling of extremities, change in bowel habits

- About the reason for treatment and expected results

✳ Canada only Side effects: *italics* = common; **bold** = life-threatening ⚠

Nurse Alert

ipratropium (Rx)

(i-pra-troe'pee-um)

Atrovent HFA

Func. class.: Anticholinergic, bronchodilator

Chem. class.: Synthetic quaternary ammonium compound

Do not confuse: Atrovent/Alupent

ACTION:

Inhibits interaction of acetylcholine at receptor sites on the bronchial smooth muscle, thereby resulting in decreased cGMP and bronchodilation

USES:

COPD; rhinorrhea (nasal spray)

CONTRAINDICATIONS:

Hypersensitivity to this product, atropine, bromide, soybean or peanut products

Precautions: Breastfeeding, children <12 yr, angioedema, heart failure, surgery, acute bronchospasm, bladder obstruction, closed-angle glaucoma, prostatic hypertrophy, urinary retention, pregnancy (B)

DOSAGE AND ROUTES

Calculator

Bronchospasm in chronic bronchitis/emphysema

- **Adult:** INH 2 sprays (17 mcg/spray) 3-4×/day, max 12 INH/24 hr; SOL 500 mcg (1 unit dose) given 3-4×/day by nebulizer; nasal spray: 2 sprays (42 mcg/spray) 3-4×/day

- **Child 5-11 yr:** INH 4-8 inhalations q20min as needed for ≤3 hr (asthma, unlabeled); NEB 250-500 mcg q20min as needed for ≤3 hr (asthma, unlabeled)

Rhinorrhea perennial rhinitis

- **Adult/child ≥6 yr:** INTRANASAL 2 sprays (43 mcg)/nostril bid or tid

- **Child 5-12 yr:** INTRANASAL 2 sprays (0.03%) in each nostril 3×/day

Available forms: Aerosol 17 mcg/actuation; nasal spray 0.03%, 0.06%; sol for inh 0.0125% ✱, 0.02%

Administer:

Nebulizer route

- Use sol in nebulizer with a mouthpiece rather than a face mask

Intranasal route

- Priming pump initially requires 7 actuations of pump; priming again is not necessary if used regularly, tilt head backward after dose

SIDE EFFECTS

CNS: *Anxiety, dizziness, headache, nervousness*

CV: Palpitation

EENT: Dry mouth, blurred vision, nasal congestion

GI: *Nausea, vomiting, cramps*

INTEG: Rash

RESP: *Cough, worsening of symptoms, bronchospasms*

PHARMACOKINETICS

Half-life 2 hr, does not cross blood-brain barrier

INTERACTIONS

Increase: toxicity—other bronchodilators (INH)

Increase: anticholinergic action—phenothiazines, antihistamines, disopyramide

Drug/Herb

Increase: anticholinergic effect—belladonna

Increase: bronchodilator effect—green tea (large amts), guarana

NURSING CONSIDERATIONS**Assess:**

- Palpitations; if severe, product may have to be changed
- Tolerance over long-term therapy; dose may have to be increased or changed
- Atropine sensitivity; patient may also be sensitive to this product
- Respiratory status: rate, rhythm, auscultate breath sounds prior to and after administration

Perform/provide:

- Storage at room temp
- Hard candy, frequent drinks, sugarless gum to relieve dry mouth

Evaluate:

- Therapeutic response: ability to breathe adequately

Teach patient/family:

- That compliance is necessary with number of inhalations/24 hr or overdose may occur; about spacer device for geriatric patients; that max therapeutic effects may take 2-3 mo
 - To shake before using
 - About the correct method of inhalation; how to clean equipment daily
 - Patients should prime the inhaler before using for the first time by releasing 2 test sprays into the air, away from the face
 - Each inhaler has 200 actuations or sprays
-

🍁 Canada only Side effects: *italics* = common; **bold** = life-threatening ⚠️
Nurse Alert

irbesartan (Rx)

(er-be-sar'tan)

Avapro

Func. class.: Antihypertensive

Chem. class.: Angiotensin II receptor blocker (Type AT₁)

Do not confuse: Avapro/Anaprox

ACTION:

Blocks the vasoconstrictor and aldosterone-secreting effects of angiotensin II; selectively blocks the binding of angiotensin II to the AT₁ receptor found in tissues

USES:

Hypertension, alone or in combination; nephropathy in type 2 diabetic patients; proteinuria

Unlabeled uses: Heart failure

CONTRAINDICATIONS:

Hypersensitivity

Black Box Warning:

Pregnancy (D) 2nd/3rd trimester

Precautions: Pregnancy (C) 1st trimester, breastfeeding, children <6 yr, geriatric patients, hypersensitivity to ACE inhibitors; hepatic/renal disease; renal artery stenosis

DOSAGES AND ROUTES

Calculator

Hypertension

- **Adult: PO** 150 mg/day; may be increased to 300 mg/day, volume-depleted patients: start with 75 mg/day

Nephropathy in type 2 diabetic patients

- **Adult: PO** maintenance dose 300 mg/day, start 75 mg/day

Available forms: Tabs 75, 150, 300 mg

Administer:

- Without regard to meals

- May be used with other antihypertensives, diuretic

SIDE EFFECTS

CNS: *Dizziness*, anxiety, headache, fatigue

CV: Hypotension

GI: Diarrhea, dyspepsia

HEMA: **Thrombocytopenia**

MISC: Edema, chest pain, rash, tachycardia, UTI, **angioedema**, hyperkalemia

RESP: *Cough, upper respiratory tract infection*, sinus disorder, pharyngitis, rhinitis

PHARMACOKINETICS

Peak 1.5-2 hr, extensively metabolized, half-life 11-15 hr, highly bound to plasma proteins, excreted in urine and feces, protein binding 90%

INTERACTIONS

Increase: hyperkalemia: potassium-sparing diuretics, potassium salt substitutes, ACE inhibitors

Increase: irbesartan level—CYP2C9 inhibitors (amiodarone, delavirdine, fluconazole, FLUoxetine, fluvastatin, fluvoxamine, imatinib, sulfonamides, sulfinpyrazone, voriconazole, zafirlukast)

Decrease: antihypertensive effect—NSAIDs

Drug/Herb

Increase: antihypertensive effect—black cohosh, goldenseal, hawthorn, kelp

Increase or decrease: antihypertensive effect—astragalus, cola tree

Decrease: antihypertensive effect—guarana, khat, licorice, yohimbe

NURSING CONSIDERATIONS

Assess:

- **Hypotension:** for severe hypotension, place in supine position and give IV infusion of NS, drug may be continued after B/P is restored
- B/P, pulse q4hr; note rate, rhythm, quality
- Baselines of renal/hepatic studies before therapy begins; periodically monitor LFTs, total/direct bilirubin
- Skin turgor, dryness of mucous membranes for hydration status; edema in feet, legs daily

Evaluate:

- Therapeutic response: decreased B/P

Teach patient/family:

- To comply with dosage schedule, even if feeling better; that max therapeutic effects may take 2-3 mo, to take without regard to food
- That product may cause dizziness, fainting, lightheadedness
- To rise slowly to sitting or standing position to minimize orthostatic hypotension

Black Box Warning:

To notify prescriber if pregnancy is suspected; discontinue if pregnant; pregnancy (D) 2nd/3rd trimester, (C) 1st trimester

☼ Canada only Side effects: *italics* = common; **bold** = life-threatening ⚠
Nurse Alert

HIGH ALERT

irinotecan (Rx)

(ear-een-oh-tee'kan)

Camptosar

Func. class.: Antineoplastic

Chem. class.: Camptothecin analog

ACTION:

Cytotoxic by producing damage to single-strand DNA during DNA synthesis; binds to topoisomerase I

USES:

Metastatic carcinoma of the colon or rectum or 1st-line treatment in combination with 5-FU and leucovorin for metastatic colon or rectal carcinomas

Unlabeled uses: Cervical, gastric, lung, ovarian, pancreatic cancer, malignant glioma, rhabdomyosarcoma

CONTRAINDICATIONS:

Pregnancy (D), hypersensitivity

Precautions: Breastfeeding, children, geriatric patients, irradiation, hepatic disease

Black Box Warning:

Myelosuppression, diarrhea

DOSAGE AND ROUTES

Calculator

First-line treatment of colorectal cancer in combination with 5-fluorouracil (5-FU):

Intravenous dosage (with bolus 5-FU/leucovorin)

- **Adult:** IV 125 mg/m² over 90 min followed by leucovorin 20 mg/m² IV bolus and then 5-FU 500 mg/m² IV bolus on days 1, 8, 15, and 22; the next course begins on day 43 or when toxicity has recovered to NCI grade 1 or less

Intravenous dosage (with infusional 5-FU/leucovorin)

- **Adult:** IV 180 mg/m² over 90 min followed by leucovorin 200 mg/m² IV over 2 hr then 5-FU bolus and continuous infusion 400 mg/m² IV bolus, then 600

mg/m² IV infusion over 22 hr on days 1, 15, and leucovorin and 5-FU are given on days 1, 2, 15, 16, 29, and 30; the next course begins on day 43 or when toxicity has recovered to NCI grade 1 or less

Single-agent treatment of metastatic colorectal cancer that has recurred or progressed after 5-FU–based therapy

Intravenous dosage (weekly dosage schedule)

- **Adult:** IV 125 mg/m² over 90 min weekly × 4 wk, every 6 wk

Intravenous dosage (once-every-3-weeks dosage schedule)

- **Adult:** IV 350 mg/m² over 90 min every 3 wk

Available forms: Inj 20 mg/ml

Administer:

- Use cytotoxic handling precautions

IV route

- Premedicate with antiemetic dexamethasone 10 mg plus another antiemetic agent, such as a 5-HT₃ blocker, given at least 30 min before use
- Before beginning a course of therapy, the granulocyte count should be ≥1500, the platelet count should be ≥100,000, and treatment-related diarrhea should be fully resolved

Dilution

- Dilute appropriate dose in D₅W (preferred) or NS injection to a final concentration of 0.12–2.8 mg/ml
- Store up to 24 hr at room temperature and room lighting; however, because of possible microbial contamination during preparation, an admixture prepared with D₅W or NS should be used within 6 hr, solutions prepared with D₅W, refrigerated, protected from light must be used within 48 hr; avoid refrigeration if prepared with NS

Intravenous infusion

- Infuse intravenously over 90 min

SIDE EFFECTS

CNS: Fever, headache, chills, dizziness

CV: Vasodilation, edema, thromboembolism

GI: Severe diarrhea, nausea, vomiting, anorexia, constipation, cramps, flatus, stomatitis, dyspepsia, hepatotoxicity

HEMA: Leukopenia, anemia, neutropenia

INTEG: Irritation at site, rash, sweating, alopecia

MISC: Edema, asthenia, weight loss, back pain

RESP: Dyspnea, increased cough, rhinitis

PHARMACOKINETICS

Rapidly and completely absorbed, excreted in urine and bile as metabolites, half-life 6-12 hr, bound to plasma proteins 30%-68%, increased risk for toxicity in patients homozygous for UGT1A1 28

INTERACTIONS

Increase: toxicity—fluorouracil

Increase: bleeding risk—NSAIDs, anticoagulants

Increase: irinotecan levels—some CYP3A4 inhibitors (ketoconazole)

Increase: myelosuppression, diarrhea—other antineoplastics, radiation

Increase: lymphocytopenia, hyperglycemia—dexamethasone

Increase: akathisia—prochlorperazine

Increase: dehydration—diuretics

Decrease: irinotecan levels—CYP3A4 inducers (phenytoin, carbamazepine, phenobarbital)

Drug/Herb

Decrease: product level—St. John's wort; avoid concurrent use

Drug/Lab Test

Increase: alk phos, LFTs, bilirubin

Decrease: platelets, WBC, neutrophils, Hgb/HcT

NURSING CONSIDERATIONS

Assess:

- CNS symptoms: fever, headache, chills, dizziness

Black Box Warning:

CBC, differential, platelet count weekly; use colony-stimulating factor if WBC $<2000/\text{mm}^3$ or platelet count $<100,000/\text{mm}^3$, Hgb ≤ 9 g/dl, neutrophil $\leq 1000/\text{mm}^3$; notify prescriber of results; product should be discontinued and colony-stimulating factor given

- Buccal cavity for dryness, sores or ulceration, white patches, oral pain, bleeding, dysphagia

Black Box Warning:

GI symptoms: frequency of stools; cramping; severe, life-threatening diarrhea may occur with fluid and electrolyte imbalances, treat diarrhea within 24 hr of use with 0.25-1 mg atropine IV; treat diarrhea >24 hr of use with loperamide, diarrhea >24 hr (late diarrhea) can be fatal

- Signs of dehydration: rapid respirations, poor skin turgor, decreased urine output, dry skin, restlessness, weakness
- Bone marrow depression: bruising, bleeding, blood in stools, urine, sputum, emesis

Perform/provide:

- Increased fluid intake to 2-3 L/day to prevent dehydration unless contraindicated
- Rinsing of mouth tid-qid with water, club soda; brushing of teeth bid-tid with soft brush or cotton-tipped applicator for stomatitis; use unwaxed dental floss

Evaluate:

- Therapeutic response: decrease in tumor size, spread of cancer

Teach patient/family:

- To avoid foods with citric acid or hot or rough texture if stomatitis is present; to drink adequate fluids
- To report stomatitis; any bleeding, white spots, ulcerations in mouth; to examine mouth daily, report symptoms
- To report signs of anemia: fatigue, headache, faintness, SOB, irritability, infection, rash
- To use contraception during therapy
- **To report if pregnancy is planned or suspected pregnancy (D)**
- To avoid salicylates, NSAIDs, alcohol because bleeding may occur; to avoid all products unless approved by prescriber
- About alopecia; that, when hair grows back, it will be different texture, thickness
- To avoid vaccinations while taking this product

⚠ To report diarrhea that occurs 24 hr after administration; severe dehydration can occur rapidly

☼ Canada only Side effects: *italics* = common; **bold** = life-threatening ⚠
Nurse Alert

iron dextran (Rx)

DexFerrum, INFeD

Func. class.: Hematinic

Chem. class.: Ferric hydroxide complex with dextran

ACTION:

Iron is carried by transferrin to the bone marrow, where it is incorporated into hemoglobin

USES:

Iron-deficiency anemia

CONTRAINDICATIONS:

Black Box Warning:

Hypersensitivity

Precautions: Pregnancy (C), breastfeeding, neonates, infants <4 mo, children, acute renal disease, asthma, rheumatoid arthritis (IV), ankylosing spondylitis, lupus, hypotension, all anemias excluding iron-deficiency anemia, hepatic/cardiac/renal disease

DOSAGE AND ROUTES

Calculator

- Total dose in ml = $[0.0442 \times (\text{desired Hb} - \text{observed Hb}) \times \text{LBW}] + (0.26 \times \text{LBW})$
- **Adult and child:** IM 0.5 ml as a test dose by Z-track then no more than the total dose including test dose following/day:
- **Adult/adolescent/child >15 kg:** IM 100 mg/day
- **Child (10-15 kg):** IM 100 mg/kg
- **Child/infant >4 mo (5-9.9 kg):** IM 50 mg/day
- **Infant >4 mo (<5 kg):** IM 25 mg/day

Available forms: Inj 50 mg/ml (2-ml, 10-ml vials)

Administer:

- D/C oral iron before parenteral; give only after test dose of 25 mg by preferred route; wait at least 1 hr before giving remaining portion

IM route

- IM deeply in large muscle mass; use **Z-track** method, 19-20G 2-3-in needle; ensure needle long enough to place product deep in muscle; change needles after withdrawing product and before injecting to prevent skin, tissue staining

 **Only with EPINEPHrine available in case of anaphylactic reaction during dose**

IV route

- IV after flushing with 10 ml 0.9% NaCl; give undiluted; may be diluted in 50-250 ml NS for inf; give ≤ 1 ml (50 mg) over ≥ 1 min; flush line after use with 10 ml 0.9% NaCl; patient should remain recumbent for 1/2-1 hr
- IV inj requires single-dose vial without preservative; verify on label that IV use approved

SIDE EFFECTS

CNS: Headache, paresthesia, dizziness, shivering, weakness, **seizures**

CV: Chest pain, **shock**, hypotension, tachycardia

GI: *Nausea*, vomiting, metallic taste, abdominal pain

HEMA: **Leukocytosis**

INTEG: Rash, pruritus, urticaria, fever, sweating, chills, brown skin discoloration, pain at inj site, necrosis, sterile abscesses, phlebitis

OTHER: **Anaphylaxis**

RESP: Dyspnea

PHARMACOKINETICS

IM: Excreted in feces, urine, bile, breast milk; crosses placenta; most absorbed through lymphatics; can be gradually absorbed over weeks/months from fixed locations

INTERACTIONS

Increase: toxicity—oral iron; do not use

Decrease: reticulocyte response—chloramphenicol

Drug/Lab Test

False increase: serum bilirubin

False decrease: serum calcium

False positive: ^{99m}Tc diphosphate bone scan, iron test (large doses >2 ml)

NURSING CONSIDERATIONS

Assess:

- Observe for 1 hr after test dose
- Blood studies: Hct, Hgb, reticulocytes, transferrin, plasma iron concentrations, ferritin, total iron binding, bilirubin before treatment, at least monthly

Black Box Warning:

Allergy: anaphylaxis, rash, pruritus, fever, chills, wheezing; notify prescriber immediately, keep emergency equipment available

- Cardiac status: anginal pain, hypotension, tachycardia
- Nutrition: amount of iron in diet (meat, dark green leafy vegetables, dried beans, dried fruits, eggs)
- Cause of iron loss or anemia, including use of salicylates, sulfonamides
- **Toxicity:** nausea, vomiting, diarrhea, fever, abdominal pain (early symptoms), cyanotic-looking lips, nailbeds, seizures, CV collapse (late symptoms)

Perform/provide:

- Storage at room temp in cool environment
- Recumbent position 30 min after IV inj to prevent orthostatic hypotension
- Therapeutic response: increased serum iron levels, Hct, Hgb

Teach patient/family:

- That iron poisoning may occur if increased beyond recommended level; not to take oral iron preparation or vitamins containing iron
- That delayed reaction may occur 1-2 days after administration and last 3-4 days (IV), 3-7 days (IM); to report fever, chills, malaise, muscle, joint aches, nausea, vomiting, backache
- To avoid breastfeeding
- That stools may become dark

TREATMENT OF OVERDOSE:

Discontinue product, treat allergic reaction, give diphenhydrAMINE or EPINEPHrine as needed, give iron-chelating product for acute poisoning

✳ Canada only Side effects: *italics* = common; **bold** = life-threatening 
Nurse Alert

iron sucrose (Rx)

Venofer

Func. class.: Hematinic

Chem. class.: Ferric hydroxide complex with dextran

ACTION:

Iron is carried by transferrin to the bone marrow, where it is incorporated into hemoglobin

USES:

Iron-deficiency anemia

Unlabeled uses: Dystrophic epidermolysis bullosa (DEB)

CONTRAINDICATIONS:

Hypersensitivity, all anemias excluding iron-deficiency anemia, iron overload

Precautions: Pregnancy (B), breastfeeding, children, geriatric patients, abdominal pain, anaphylactic shock, arthralgia, chest pain, cough, diarrhea, dizziness, dyspnea, edema, increased LFTs, fever, headache, heart failure, hypo/hypertension, infection, MS pain nausea/vomiting, seizures, weakness

DOSAGE AND ROUTES

Calculator

- **Adult:** IV 5 ml (100 mg of elemental iron) given during dialysis; most will need 1000 mg of elemental iron over 10 sequential dialysis sessions
- **Child ≥2 yr/adolescents:** IV 0.5 mg/kg by slow IV inj over 5 min (undiluted) or diluted in 25 ml of 0.9% NaCl, give over 5-60 min, max 100 mg every 2 wk × 12 wk

Available forms: Inj 20 mg/ml

Administer:

 Only with EPINEPHrine, Solu-medrol available in case of anaphylactic reaction during dose

IV route

- Do not use if particulate is present or if discolored
- Give directly in dialysis line by slow inj or inf; give by slow inj at 1 ml/min (5 min/vial); inf dilute each vial exclusively in ≤100 ml 0.9% NaCl, give at

100 mg of iron/15 min; discard unused portions

- Do not use with IV products

SIDE EFFECTS

CNS: Headache, dizziness

CV: Chest pain, hypo/hypertension, hypervolemia, heart failure

GI: Nausea, vomiting, abdominal pain

INTEG: Rash, pruritus, urticaria, fever, sweating, chills

OTHER: Anaphylaxis, hyperglycemia

RESP: Dyspnea, pneumonia, cough

PHARMACOKINETICS

Excreted in urine, half-life 6 hr

INTERACTIONS

Increase: toxicity—oral iron, dimercaprol, do not use

Decrease: iron sucrose effect—chloramphenicol

Drug/Lab Test

Increase: glucose

NURSING CONSIDERATIONS

Assess:

- Blood studies: Hct, Hgb, reticulocytes, transferrin, plasma iron concentrations, ferritin, total iron binding; bilirubin before treatment, at least monthly
- Allergy, anaphylaxis: rash, pruritus, fever, chills, wheezing; notify prescriber immediately, keep emergency equipment available
- Cardiac status: hypo/hypertension, hypervolemia
- **Toxicity:** nausea, vomiting, diarrhea, fever, abdominal pain (early symptoms), cyanotic-looking lips, nailbeds, seizures, CV collapse (late symptoms)

Perform/provide:

- Storage at room temp in cool environment, do not freeze

Evaluate:

- Therapeutic response: increased serum iron levels, Hct, Hgb

Teach patient/family:

- To report itching, rash, chest pain, headache, vertigo, nausea, vomiting, abdominal pain, joint/muscle pain, numbness, tingling

- That iron poisoning may occur if dosage increased beyond recommended level; not to take oral iron preparation

TREATMENT OF OVERDOSE:

Discontinue product, treat allergic reaction, give diphenhydrAMINE or EPINEPHrine as needed, give iron-chelating product for acute poisoning

✳ Canada only Side effects: *italics* = common; **bold** = life-threatening ⚠
Nurse Alert

isoflurophate ophthalmic

See [Appendix B](#)

isoniazid (Rx)

(eye-soe-nye'a-zid)

Isotamine 

Func. class.: Antitubercular

Chem. class.: Isonicotinic acid hydrazide

ACTION:

Bactericidal interference with lipid, nucleic acid biosynthesis

USES:

Treatment, prevention of TB

CONTRAINDICATIONS:

Hypersensitivity

Black Box Warning:

Acute hepatic disease

Precautions: Pregnancy (C), renal disease, diabetic retinopathy, cataracts, ocular defects, IV drug users, >35 yr, postpartum, HIV, neuropathy

Black Box Warning:

Alcoholism, females (African descent/Hispanic patients)

DOSAGE AND ROUTES

Calculator

• **Adult/adolescent with/without HIV: PO/IM** 5 mg/kg/day ≤300 mg/day or 15 mg/kg 2-3×/wk, max 900 mg 2-3×/wk

• **Child/infant with HIV: PO/IM** 10-15 mg/kg/day, max 300 mg/day

Available forms: Tabs 100, 300 mg; inj 100 mg/ml

Administer:

PO route

• PO with meals to decrease GI symptoms; better to take on empty stomach 1 hr before or 2 hr after meals

IM route

- IM deep in large muscle mass; massage; rotate inj site; warm inj to room temp to dissolve crystals

SIDE EFFECTS

CNS: *Peripheral neuropathy, dizziness, memory impairment, toxic encephalopathy, seizures, psychosis, slurred speech*

EENT: Blurred vision, optic neuritis

GI: *Nausea, vomiting, epigastric distress, jaundice, fatal hepatitis*

HEMA: *Agranulocytosis, hemolytic, aplastic anemia, thrombocytopenia, eosinophilia, methemoglobinemia*

Hypersensitivity: Fever, skin eruptions, lymphadenopathy, vasculitis

MISC: Dyspnea, B₆ deficiency, pellagra, hyperglycemia, metabolic acidosis, gynecomastia, rheumatic syndrome, SLE-like syndrome

PHARMACOKINETICS

Metabolized in liver, excreted in urine (metabolites), crosses placenta, excreted in breast milk, half life 1-4 hr

PO: Peak 1-2 hr

IM: Peak 45-60 min

INTERACTIONS

Increase: toxicity—tyramine foods, alcohol, cycloSERINE, ethionamide, rifampin, carBAMazepine, phenytoin, benzodiazepines, meperidine

Increase: serotonin syndrome—SSRIs, SNRIs

Decrease: absorption—aluminum antacids

Decrease: effectiveness of BCG vaccine, ketoconazole

Drug/Food

- Do not give with high-tyramine foods, alcohol

Drug/Lab Test

Increase: LFTs, bilirubin, glucose

Decrease: platelets granulocytes

NURSING CONSIDERATIONS

Assess:

Black Box Warning:

Hepatic studies weekly: baseline in all patients, those >35 yr and all women should be monitored

periodically; ALT, AST, bilirubin; increased test results may indicate hepatitis; hepatic status: decreased appetite, jaundice, dark urine, fatigue, those with fast acetylation (genetic) may metabolize product more than 5 times faster (black, Asian patients are at greater risk) some Caucasian patients; fatal hepatitis is at greater risk in black/Hispanic patients after birth

- Mental status often: affect, mood, behavioral changes; psychosis may occur
- Paresthesia in hands, feet

Evaluate:

- Therapeutic response: decreased symptoms of TB

Teach patient/family:

- That compliance with dosage schedule, duration is necessary; not to skip or double dose
- That scheduled appointments must be kept or relapse may occur

 **To avoid alcohol while taking product; may increase risk for hepatic injury**

- That, if diabetic, to use blood glucose monitor to obtain correct result

 **To report weakness, fatigue, loss of appetite, nausea, vomiting, jaundice of skin or eyes, tingling/numbness of hands/feet**

Black Box Warning:

Fatal hepatitis: to notify prescriber immediately of yellow skin/eyes, dark urine, loss of appetite

TREATMENT OF OVERDOSE:

Pyridoxine

🍁 Canada only Side effects: *italics* = common; **bold** = life-threatening 

Nurse Alert

isosorbide dinitrate (Rx)

(eye-soe-sor'bide)

Apo-ISDN , Dilatrate-SR, Isochron, IsoDitrate, Isordil

isosorbide mononitrate (Rx)

Apo-ISMN , Imdur

Func. class.: Antianginal, vasodilator

Chem. class.: Nitrate

Do not confuse: **Imdur**/Imuran/Inderal/K-Dur

ACTION:

Relaxation of vascular smooth muscle, which leads to decreased preload, afterload, which is responsible for decreasing left ventricular end-diastolic pressure, systemic vascular resistance, and reducing cardiac oxygen demand

USES:

Treatment, prevention of chronic stable angina pectoris

Unlabeled uses: Diffuse esophageal spasm, heart failure (dinitrate)

CONTRAINDICATIONS:

Hypersensitivity to this product or nitrates; severe anemia, increased intracranial pressure, cerebral hemorrhage, acute MI

Precautions: Pregnancy (C), breastfeeding, children, postural hypotension, MI, CHF, severe renal/hepatic disease

DOSAGE AND ROUTES

Calculator

Dinitrate

• **Adult: PO** 5-20 mg bid-tid initially, maintenance 10-40 mg bid-tid; **SL**, buccal 2.5-5 mg, may repeat q5-10min × 3 doses; **EXT REL** 40-80 mg q8-12hr, max 160 mg/day

Mononitrate

• **Adult: PO** (Monoket) 10-20 mg bid, 7 hr apart; (Imdur) initiate at 30-60 mg/day as a single dose, increase q3days as needed, may increase to 120 mg/day, max 240 mg/day

Available forms: *Dinitrate*: sus rel caps (SR) 40 mg, SR tabs 40 mg; tabs 5, 10, 20, 30, 40 mg; SL tabs 2.5, 5 mg; *mononitrate*: tabs (Monoket) 10, 20 mg; ext rel (Imdur) 30, 60, 120 mg

Administer:

- Do not break, crush, or chew sus rel caps, SL tabs
- After checking expiration date
- PO with 8 oz water on empty stomach
- SL tabs should be placed under the tongue until dissolved; avoid smoking, eating, drinking until dissolved

SIDE EFFECTS

CNS: *Vascular headache, flushing, dizziness*, weakness, faintness

CV: *Postural hypotension*, tachycardia, **collapse**, syncope, palpitations

GI: Nausea, vomiting, diarrhea

INTEG: Pallor, sweating, rash

MISC: Twitching, **hemolytic anemia, methemoglobinemia**, tolerance

PHARMACOKINETICS

Dinitrate

Metabolized by liver, excreted in urine as metabolites (80%-100%)

PO: Onset 15-30 min, duration 4-6 hr, half-life 5-6 hr

SUS REL: Onset ≤ 4 hr, duration 6-8 hr

SL: Onset 2-5 min, duration 1-4 hr, half-life 2 hr

Mononitrate

SUS REL: Onset 30-60 min, peak 1-4 hr, duration 6-8 hr, half-life 5 hr

INTERACTIONS

⚠ Fatal hypotension: sildenafil, tadalafil, vardenafil, **do not use together**

Increase: hypotension— β -blockers, diuretics, antihypertensives, alcohol, calcium channel blockers, phenothiazines

NURSING CONSIDERATIONS

Assess:

- **Anginal pain:** duration, time started, activity being performed, character
- **Methemoglobinemia (rare):** Cyanosis of lips, nausea/vomiting, coma, shock, usually caused by high dose of product but may occur with normal dosing

- B/P, pulse, respirations during beginning therapy and periodically thereafter
- Tolerance if taken over long period, to prevent, allow intervals of 12-14 hr/day without product
- Headache, lightheadedness, decreased B/P; may indicate a need for decreased dosage, treat headache with OTC analgesics

Evaluate:

- Therapeutic response: decrease or prevention of anginal pain

Teach patient/family:

- To leave tabs in original container
- To avoid alcohol, OTC products unless approved by prescriber
- That product may cause headache; that taking with meals may reduce or eliminate headache; to take no later than 7 PM (last dose)
- To avoid hazardous activities if dizziness occurs
- About the importance of complying with complete medical regimen
- To make position changes slowly to prevent orthostatic hypotension
- Not to use with sildenafil, tadalafil, vardenafil with nitrates, may cause serious drop in B/P
- Not to discontinue abruptly, may cause heart attack
- To use at beginning of angina symptoms, may repeat every 15 mins; if no relief, seek medical attention immediately

☼ Canada only Side effects: *italics* = common; **bold** = life-threatening ⚠
Nurse Alert

RARELY USED

isotretinoin (Rx)

(eye-soe-tret'i-noyn)

Amnesteem, Claravis, Sotret

Func. class.: Antiacne agent, retinoid

USES:

Severe recalcitrant nodulocystic acne

CONTRAINDICATIONS:

Hypersensitivity, inflamed skin

Black Box Warning:

Pregnancy (X)

DOSAGE AND ROUTES

Calculator

• **Adult: PO** 0.5-2 mg/kg/day in 2 divided doses $\times$ 15-20 wk; if relapse occurs, repeat after 2 mo off product

☼ Canada only Side effects: *italics* = common; **bold** = life-threatening ⚠
Nurse Alert

itraconazole (Rx)

(it-ra-con'a-zol)

Sporanox

Func. class.: Antifungal, systemic

Chem. class.: Triazole derivative

ACTION:

Alters cell membranes; inhibits several fungal enzymes

USES:

Histoplasmosis, blastomycosis (pulmonary and extrapulmonary), aspergillosis, onychomycosis of toenail/fingernail

Unlabeled uses: Dermatomycosis, histoplasmosis, chromoblastomycosis, coccidioidomycosis, pityriasis versicolor, sebopsoriasis, vaginal candidiasis, cryptococcus, subcutaneous mycoses, dimorphic infections, fungal keratitis, zygomycosis, superficial mycoses (dermatophytoses), chronic mucocutaneous candidiasis

CONTRAINDICATIONS:

Hypersensitivity, fungal meningitis; onychomycosis or dermatomycosis with cardiac dysfunction, in pregnant women

Black Box Warning:

Heart failure, ventricular dysfunction, coadministration with other products

Precautions: Pregnancy (C), breastfeeding, children, cardiac/renal/hepatic disease, achlorhydria or hypochlorhydria (product-induced), dialysis

DOSAGE AND ROUTES

Calculator

Dose varies with type of infection

- **Adult: PO** 200 mg/day with food; may increase to 400 mg/day if needed; life-threatening infections may require a loading dose of 200 mg tid × 3 days
- **Child: PO** 3-5 mg/kg/day

Available forms: Caps 100 mg; oral sol 10 mg/ml

Administer:

- In the presence of acid products only; do not use alkaline products, antacids

within 2 hr of product; may give coffee, tea, acidic fruit juices

PO route

- Swallow caps whole; do not break, crush, or chew caps
- Give caps after full meal to ensure absorption
- Oral sol: patient should swish in mouth vigorously, use on empty stomach
- Oral sol and caps are not interchangeable on mg/mg basis

SIDE EFFECTS

CNS: *Headache, dizziness, insomnia, somnolence, depression*

CV: Hypertension

GI: *Nausea, vomiting, anorexia, diarrhea, cramps, abdominal pain, flatulence, GI bleeding, hepatotoxicity*

GU: Gynecomastia, impotence, decreased libido

INTEG: *Pruritus, fever, rash, toxic epidermal necrolysis*

MISC: *Edema, fatigue, malaise, hypokalemia, tinnitus, rhabdomyolysis*

PHARMACOKINETICS

PO: Peak 3-5 hr; half-life 21 hr, IV 35.4 hr; metabolized in liver; excreted in bile, feces, urine 40%; requires acid pH for absorption; distributed poorly to CSF; 99.8% protein bound; inhibits CYP4503A4

INTERACTIONS

 **Life-threatening CV reactions:** pimozone, quinidine, dofetilide, levomefentanyl

Increase: tinnitus, hearing loss—quinidine

Increase: hepatotoxicity—other hepatotoxic products

Increase: edema—calcium channel blockers

Increase: severe hypoglycemia—oral hypoglycemics

Increase: sedation—ALPRAZolam, clorazepate, diazepam, estazolam, flurazepam, triazolam, oral midazolam

Increase: levels, toxicity—busPIRone, busulfan, clarithromycin, cycloSPORINE, diazepam, digoxin, felodipine, fentaNYL, atorvastatin, carBAMazepine, disopyramide, indinavir, isradipine, niCARDipine, niFEDipine, niMODipine, phenytoin, quinidine, QUETiapine, ritonavir, saquinavir, tacrolimus, warfarin

Decrease: itraconazole action—antacids, H₂-receptor antagonists, rifamycins, didanosine, carBAMazepine, isoniazid, proton pump inhibitors

Drug/Food

- Food increases absorption
- Grapefruit juice decreases itraconazole level

NURSING CONSIDERATIONS

Assess:

- **CHF:** if present, discontinue product
- Type of infection; may begin treatment prior to obtaining results
- **Infection:** temp, WBC, sputum at baseline and periodically
- I&O ratio, potassium levels
- Hepatic studies (ALT, AST, bilirubin) if patient receiving long-term therapy
- Allergic reaction: rash, photosensitivity, urticaria, dermatitis

 **Hepatotoxicity:** nausea, vomiting, jaundice, clay-colored stools, fatigue

Perform/provide:

- Storage in tight container at room temp, do not freeze

Evaluate:

- Therapeutic response: decreased fever, malaise, rash, negative C&S for infecting organism

Teach patient/family:

- That long-term therapy may be needed to clear infection (1 wk-6 mo, depending on infection)
- To avoid hazardous activities if dizziness occurs
- To take 2 hr before administration of other products that increase gastric pH (antacids, H₂-blockers, omeprazole, sucralfate, anticholinergics); to avoid grapefruit juice; to notify health care provider of all medications taken; to take after a full meal (caps) or on empty stomach (oral sol)
- About the importance of compliance with product regimen; to use alternative methods of contraception
- To notify prescriber of GI symptoms; signs of hepatic dysfunction (fatigue, jaundice, nausea, anorexia, vomiting, dark urine, pale stools); heart failure (trouble breathing, unusual weight gain, fatigue, swelling); hearing changes

✳ Canada only Side effects: *italics* = common; **bold** = life-threatening 
Nurse Alert

ixabepilone (Rx)

(ix-ab-ep'i-lone)

Ixempra

Func. class.: Antineoplastic—miscellaneous

Chem. class.: Epothilone

ACTION:

Microtubule stabilizing agent; microtubules are needed for cell division

USES:

Breast cancer

CONTRAINDICATIONS:

Pregnancy (D), breastfeeding, hypersensitivity to products with polyoxyethylated castor oil, neutropenia of $<1500/\text{mm}^3$, thrombocytopenia

Black Box Warning:

Hepatic disease

Precautions: Children, geriatric patients, alcoholism, bone marrow suppression, cardiac dysrhythmias, cardiac/renal disease, diabetes mellitus, peripheral neuropathy, ventricular dysfunction

DOSAGE AND ROUTES

Calculator

Breast cancer, metastatic or locally advanced given with capecitabine and resistant to anthracycline, taxane

- **Adult:** IV INF 40 mg/m^2 over 3 hr q3wk plus capecitabine PO 2000 $\text{mg}/\text{m}^2/\text{day}$ in 2 divided doses on days 1-14 q21days; in those with BSA $>2.2 \text{ m}^2$, dose should be calculated for a BSA of 2.2 m^2

Breast cancer, metastatic or locally advanced resistant/refractory to anthracycline, taxane, capecitabine

- **Adult:** IV INF 40 mg/m^2 over 3 hr q3wk; in those with BSA $>2.2 \text{ m}^2$, dose should be calculated for a BSA of 2.2 m^2

Dosage reduction in those taking a strong CYP3A4 inhibitor

- **Adult:** IV INF 20 mg/m^2 over 3 hr q3wk

Available forms: Powder for inj 15, 45 mg

Administer:

- Premedicate with histamine antagonists 1 hr before use, prevents hypersensitivity
- Antiemetic 30-60 min before product and prn

IV route

- Let kit stand at room temp for 30 min; to reconstitute, withdraw supplied diluent (8 ml for 15-mg vials, 23.5 ml for 45-mg vials); slowly inject sol into vial; gently swirl and invert to mix, final conc 2 mg/ml; further dilute in LR in DEHP-free bags, final conc should be between 0.2 and 0.6 mg/ml; after added, mix by manual rotation
- Diluted sol stable for 6 hr at room temp; inf must be completed within 6 hr
- Use in-line filter, 0.2-1.2 micron
- Give over 3 hr

SIDE EFFECTS

CNS: *Peripheral neuropathy*, impaired cognition, chills, fatigue, fever, flushing, headache, insomnia, *asthenia*

CV: Bradycardia, *hypotension*, **abnormal ECG**, angina, **atrial flutter**, **cardiomyopathy**, chest pain, edema, **MI**, vasculitis

GI: *Nausea, vomiting, diarrhea*, abdominal pain, anorexia, colitis, constipation, gastritis, jaundice, GERD, hepatic failure, trismus

GU: **Renal failure**

HEMA: **Neutropenia**, **thrombocytopenia**, **anemia**, infections, coagulopathy

INTEG: *Alopecia*, rash, hot flashes

META: Hypokalemia, metabolic acidosis

MS: *Arthralgia, myalgia*

RESP: **Bronchospasm**, cough, dyspnea

SYST: *Hypersensitivity reactions*, **anaphylaxis**, dehydration, **radiation recall reaction**

PHARMACOKINETICS

Metabolized in liver by P45CYP3A4; excreted in feces (65%) and urine (21%); terminal half-life 52 hr

INTERACTIONS

Increase: ixabepilone level—CYP3A4 inhibitors (amiodarone, amprenavir,

aprepitant, atazanavir, chloramphenicol, clarithromycin, conivaptan, cycloSPORINE, danazol, darunavir, dalforpistin, delavirdine, diltiazem, erythromycin, estradiol, fluconazole, fluvoxamine, fosamprenavir, imatinib, indinavir, isoniazid, itraconazole, ketoconazole, lopinavir, miconazole, nefazodone, nelfinavir, propoxyphene, ritonavir, RU-486, saquinavir, tamoxifen, telithromycin, troleandomycin, verapamil, voriconazole, zafirlukast)

Decrease: ixabepilone levels—CYP3A4 inducers (aminoglutethimide, barbiturates, bexarotene, bosentan, carbamazepine, dexamethasone, efavirenz, griseofulvin, modafinil, nafcillin, nevirapine, oxcarbazepine, phenytoin, rifamycin, topiramate)

Drug/Herb

- Avoid use with St. John's wort

Drug/Food

- Avoid use with grapefruit products

NURSING CONSIDERATIONS

Assess:

- CBC, differential, platelet count prior to treatment and weekly; withhold product if WBC is $<1500/\text{mm}^3$ or platelet count is $<100,000/\text{mm}^3$, notify prescriber
- Monitor temp q4hr (may indicate beginning infection)

Black Box Warning:

Liver function tests before, during therapy (bilirubin, AST, ALT, LDH) prn or monthly; check for jaundiced skin and sclera, dark urine, clay-colored stools, itchy skin, abdominal pain, fever, diarrhea

- VS during 1st hr of infusion; check IV site for signs of infiltration

⚠ Hypersensitivity reactions, anaphylaxis including hypotension, dyspnea, angioedema, generalized urticaria; discontinue inf immediately; keep emergency equipment available

- Effects of alopecia on body image; discuss feelings about body changes

Evaluate:

- Therapeutic response: decreased tumor size, spread of malignancy

Teach patient/family:

- To report signs of infection: fever, sore throat, flulike symptoms
- To report signs of anemia: fatigue, headache, faintness, SOB
- To report any complaints or side effects to nurse or prescriber

- That hair may be lost during treatment; that a wig or hairpiece may make patient feel better; that new hair may be different in color, texture
 - That pain in muscles and joints 2-5 days after inf is common
 - To use nonhormonal type of contraception
 - To avoid receiving vaccinations while receiving product
-

🍁 Canada only Side effects: *italics* = common; **bold** = life-threatening ⚠️
Nurse Alert

ketoconazole (Rx)

(kee-toe-koe'na-zole)

Func. class.: Antifungal

Chem. class.: Imidazole derivative

ACTION:

Alters cell membrane permeability and inhibits several fungal enzymes, thereby leading to cell death

USES:

Systemic candidiasis, chronic mucocandidiasis, oral thrush, candiduria, coccidioidomycosis, histoplasmosis, chromomycosis, paracoccidioidomycosis, blastomycosis; tinea cruris, tinea corporis, tinea versicolor, *Pityrosporum ovale*

Unlabeled uses: Cushing's syndrome, advanced prostatic cancer, candidiasis/fungal prophylaxis, fungal keratitis, leishmaniasis

CONTRAINDICATIONS:

Breastfeeding, hypersensitivity, fungal meningitis

Black Box Warning:

Coadministration with other products (ergot derivatives, cisapride, or triazolam) may cause fatal cardiac arrhythmias due to inhibition of CYP3A4 enzyme system

Precautions: Pregnancy (C), children <2 yr, renal disease, achlorhydria (product-induced).

Black Box Warning:

Hepatic disease

DOSAGE AND ROUTES

Calculator

- **Adult: PO** 200-400 mg/day for 1-2 wk (candidiasis), 6 wk (other infections)
- **Child ≥2 yr: PO:** 3.3-6.6 mg/kg/day as a single daily dose

Prostate cancer (unlabeled)

- **Adult: PO** 400 mg tid

Available forms: Tabs 200 mg; oral susp 100 mg/5 ml 🍁

Administer:

- In the presence of acid products only; do not use alkaline products, proton

pump inhibitors, H₂-antagonists, antacids within 2 hr of product; may give coffee, tea, acidic fruit juices, cola • With food to decrease GI symptoms
• With HCl if achlorhydria is present; dissolve tab/4 ml of aqueous sol 0.2 N hydrochloric acid; use straw to avoid contact; rinse with water afterward and swallow

SIDE EFFECTS

CNS: Headache, dizziness, somnolence

GI: Nausea, vomiting, anorexia, diarrhea, abdominal pain, **hepatotoxicity**

GU: Gynecomastia, impotence

HEMA: **Thrombocytopenia, leukopenia, hemolytic anemia**

INTEG: Pruritus, fever, chills, photophobia, rash, dermatitis, purpura, urticaria

SYST: **Anaphylaxis, angioedema**

PHARMACOKINETICS

PO: Peak 1-2 hr; half-life 2 hr, terminal 8 hr; metabolized in liver; excreted in bile, feces; requires acid pH for absorption; distributed poorly to CSF; highly protein bound

INTERACTIONS

Increase: effect of CNS depression—chlordiazepoxide, clonazepam, clorazepate, diazepam, estazolam, flurazepam, prazepam, quazepam, avoid concurrent use

Decrease: effect of—theophylline

Decrease: metabolism of PACLitaxel

Increase: hepatotoxicity—other hepatotoxic products, alcohol

Increase: anticoagulant effect—warfarin, anticoagulants

Increase: effect of toxicity: alfentanil, ALPRAZolam, amprenavir, ARIPiprazole, atorvastatin, calcium channel blockers, carbamazepine, clarithromycin, corticosteroids, cyclophosphamide, cycloSPORINE, donepezil, eletriptan, erythromycin, fentanyl, ifosfamide, indinavir, lovastatin, midazolam, nelfinavir, nisoldipine, quinidine, ritonavir, saquinavir, sildenafil, simvastatin, SUFentanil, tamoxifen, triazolam, vinBLASTine, vinca alkaloids, vinCRISTine, zolpidem

Decrease: action of ketoconazole—antacids, H₂-receptor antagonists, anticholinergics, phenytoin, isoniazid, rifampin, ddI, gastric acid pump inhibitors

Drug/Lab Test

Increase: alkaline phosphatase, LFTs, lipids

Decrease: Hgb, WBC, platelets

NURSING CONSIDERATIONS

Assess:

- Infection symptoms before and after treatment
- C&S before starting treatment
- Allergic reaction: rash, photosensitivity, urticaria, dermatitis

Black Box Warning:

Hepatotoxicity: nausea, vomiting, jaundice, clay-colored stools, fatigue; hepatic studies (ALT, AST, bilirubin) if patient receiving long-term therapy, use cautiously in those with hepatic disease

- **Using with CYP3A4 inhibitors can lead to increased product level, toxicity**

Perform/provide:

- Storage in tight container at room temp

Evaluate:

- Therapeutic response: decreased fever, malaise, rash, negative C&S for infectious organism, absence of scaling

Teach patient/family:

- That long-term therapy may be needed to clear infection (1 wk-6 mo, depending on infection)
- To avoid hazardous activities if dizziness occurs
- To take 2 hr before administration of other products that increase gastric pH (antacids, H₂-blockers, omeprazole, sucralfate, anticholinergics)
- About the importance of compliance with product regimen, that testing will be done periodically to indicate if infection has been eradicated
- To decrease nausea, divide dose with meals
- Not to use any products (OTC, herbal) unless approved by prescriber

Black Box Warning:

To notify prescriber of GI symptoms, signs of hepatic dysfunction (fatigue, nausea, anorexia, vomiting, dark urine, pale stools)

- To use sunglasses to prevent photophobia (rare)
- To notify prescriber if pregnancy is planned or suspected; do not breastfeed

☛ Canada only Side effects: *italics* = common; **bold** = life-threatening ⚠
Nurse Alert

ketoconazole (topical)

(kee-toe-koe'na-zole)

Extina, Ketoderm , Ketodan, Nizoral, Nizoral A-D, Xolegel *Func. class.:* Topical antifungal

Chem. class.: Imidazole derivative

ACTION:

Antifungal activity results from altering cell membrane permeability

USES:

Seborrheic dermatitis (immunocompromised), tinea corporis, cruris, pedis, versicolor, dandruff

CONTRAINDICATIONS:

Hypersensitivity, sulfite allergy

Precautions: Pregnancy (C), breastfeeding, children

DOSAGE AND ROUTES

Calculator

Seborrheic dermatitis:

- **Adult/child ≥12 yr: TOP FOAM** apply to affected areas bid × 4 wk
- **GEL** apply to affected areas daily × 2 wk

Tinea corporis, cruris, pedis, versicolor

- **Adult: TOP** cover areas daily × 2 wk

Dandruff:

- **Adult: SHAMPOO** wet hair, lather, massage for 1 min, rinse, repeat 2×/wk spaced by 3 days, for up to 8 wk, then as needed

Available forms: Topical gel, foam, cream 2%; shampoo 1%, 2%

Administer:

Topical route

- For external use only; do not use skin products near the eyes, nose, or mouth, wash hands before and after use • **Cream/lotion:** Apply to the cleansed affected area, massage gently into affected areas, do not use on skin that is broken or irritated

SIDE EFFECTS

INTEG: Irritation, stinging, pustules, pruritus

NURSING CONSIDERATIONS

Assess allergic reaction:

- Assess for hypersensitivity, product might need to be discontinued

 **Assess for sulfate allergy; may be life threatening**

Evaluate:

- Decreased itching scaling

Teach patient/family:

Topical route

• Topical skin products are not for intravaginal therapy and are for external use only; do not use skin products near the eyes, nose, or mouth, wash hands before and after use • **Cream/Ointment/Lotion:** Apply a thin film to the cleansed affected area, massage gently into affected areas • **Foam Formulations:** Do not dispense foam directly onto hands or face; the warmth of the skin will cause the foam to melt; instead, dispense desired amount directly into the cap or onto a cool surface; make sure enough foam is dispensed to cover the affected area(s); if the can feels warm or the foam seems runny, run the can under cold water; to apply, pick up small amounts of the foam with the fingertips and gently massage into the affected areas until the foam disappears • To continue for prescribed time, tinea corporis/cruris ≥ 2 wk

✳ Canada only Side effects: *italics* = common; **bold** = life-threatening 
Nurse Alert

ketoprofen (OTC, Rx)

(ke-toe-proe'fen)

Apo-Keto 

Func. class.: Nonsteroidal antiinflammatory product (NSAID), antirheumatic *Chem. class.:* Propionic acid derivative

ACTION:

Inhibits COX-1, COX-2; analgesic, antiinflammatory, antipyretic

USES:

Mild to moderate pain, osteoarthritis, rheumatoid arthritis, dysmenorrhea; OTC relief of minor aches, pains

Unlabeled uses: Ankylosing spondylitis, bone pain, gouty arthritis

CONTRAINDICATIONS:

Pregnancy (D) 2nd/3rd trimester, hypersensitivity to this product, NSAIDs, salicylates; asthma, severe renal/hepatic disease, ulcer disease

Black Box Warning:

Perioperative pain with CABG

Precautions: Pregnancy (B) 1st trimester, breastfeeding, children, geriatric patients, bleeding, GI/cardiac disorders, hypersensitivity to other antiinflammatory agents

Black Box Warning:

GI bleeding, MI, stroke

DOSAGE AND ROUTES

Calculator

Antiinflammatory

• **Adult: PO** 50 mg qid or 75 mg tid, max 300 mg/day or **EXT REL** 200 mg/day

Analgesic

• **Adult: PO** 25-50 mg q6-8hr, max 300 mg/day

Available forms: Caps 50, 75 mg; ext rel cap 200 mg

Administer:

- Do not break, crush, or chew ext rel caps
- Give 30 min before or 2 hr after meals, use full glass of water

SIDE EFFECTS

CNS: Dizziness, drowsiness, fatigue, tremors, confusion, insomnia, anxiety, depression, headache

CV: Tachycardia, peripheral edema, palpitations, dysrhythmias, hypertension, **CV thrombotic events, MI, stroke**

EENT: Tinnitus, hearing loss, blurred vision

GI: *Nausea, anorexia, vomiting, diarrhea*, jaundice, **hepatitis**, constipation, flatulence, cramps, dry mouth, peptic ulcer, **GI bleeding**

GU: **Nephrotoxicity: dysuria, hematuria, oliguria, azotemia**

HEMA: **Blood dyscrasias**

INTEG: Purpura, rash, pruritus, sweating

SYST: **Anaphylaxis**

PHARMACOKINETICS

PO: Peak 1.2 hr; ext rel 6.8 hr, half-life 2-4 hr; 5.4 hr ext rel, metabolized in liver, urine (metabolites), breast milk; 99% plasma protein binding

INTERACTIONS

Increase: serotonin syndrome—SSRIs, SNRIs

Increase: hypoglycemia—insulin, sulfonylureas

Increase: toxicity—cycloSPORINE, lithium, methotrexate, phenytoin, alcohol

Increase: bleeding risk—anticoagulants, clopidogrel, eptifibatide, plicamycin, thrombolytics, ticlopidine, tirofiban, valproic acid, SSRIs

Increase: ketoprofen levels—aspirin, probenecid

Increase: adverse GI reactions—aspirin, corticosteroids, NSAIDs, alcohol

Increase: hematologic toxicity—radiation, antineoplastics

Decrease: effect of diuretics, antihypertensives

Drug/Herb

Increase: bleeding risk—feverfew, garlic, ginger, ginkgo

Drug/Lab Test

Increase: BUN, alk phos, AST, ALT, LDH, creatinine, bleeding time

NURSING CONSIDERATIONS

Assess:

• **Pain:** type, location, intensity, ROM before and 1-2 hr after treatment • Renal,

hepatic, blood studies: BUN, creatinine, AST, ALT, Hgb before treatment, periodically thereafter ⚠ Aspirin sensitivity, asthma; these patients may be more likely to develop hypersensitivity to NSAIDs • Audiometric, ophthalmic exam before, during, after treatment

- For eye/ear problems: blurred vision, tinnitus; may indicate toxicity

Black Box Warning:

GI bleeding: blood in sputum, emesis, stools

Black Box Warning:

CV thrombotic events: MI, stroke

Perform/provide:

- Storage at room temp

Evaluate:

- Therapeutic response: decreased pain, stiffness, swelling in joints; ability to move more easily; decreased fever

Teach patient/family:

- To report blurred vision, ringing, roaring in ears; may indicate toxicity • To avoid driving, other hazardous activities if dizziness, drowsiness occurs, especially in geriatric patients • To report immediately change in urine pattern, increased weight, edema, increased pain in joints, fever, blood in urine (indicate nephrotoxicity); rash, itching, blurred vision, ringing in ears, flulike symptoms; blood in urine, vomit, or stools (bleeding) • That therapeutic effects may take up to 1 mo; to take with 8 oz water; to sit upright for 1/2 hr after administration to prevent GI irritation, not to crush, chew ext rel products • To avoid aspirin, alcohol, corticosteroids, acetaminophen, other medications, supplements unless approved by prescriber • To wear sunscreen, protective clothing to prevent photosensitivity
- To report product use to all health care providers
- To report planned or suspected pregnancy (D) (2nd/3rd trimester), (C) (1st trimester); avoid breastfeeding

✳ Canada only Side effects: *italics* = common; **bold** = life-threatening ⚠
Nurse Alert

ketorolac (ophthalmic)

(kee'toe-role-ak)

Acular, Acular PF, Acular LS, Acuvail

Func. class.: Antiinflammatory (ophthalmic) *Chem. class.:* Nonsteroidal antiinflammatory drug

ACTION:

Inhibits miosis by inhibiting the biosynthesis of ocular prostaglandins; prostaglandins play a role in the miotic response produced during ocular surgery by constricting the iris sphincter independently of cholinergic mechanisms

USES:

Pain and inflammation after cataract surgery, refractive surgery, seasonal allergic conjunctivitis

CONTRAINDICATIONS:

Hypersensitivity to this product, sulfites, NSAIDs, salicylates

Precautions: Bleeding disorders, complicated ocular surgery, corneal denervation, diabetes mellitus, rheumatoid arthritis, dry eye syndrome, pregnancy (C), breastfeeding, children, contact lens

DOSAGE AND ROUTES

Calculator

Seasonal Allergic Conjunctivitis (Acular)

- **Adult/child ≥ 3 yr:** Instill 1 drop into affected eye qid

Inflammation after cataract extraction (Acular)

- **Adult: OPHTH** 1 drop in affected eye qid beginning 24 hr after surgery $\times$ 2 wk

Corneal refracture surgery, pain, burning (Acular LS)

- **Adult: OPHTH** 1 drop in affected eye qid $\times$ ≤ 4 days
- Incision refraction surgery, pain, photophobia (Acular PF)
- **Adult: OPHTH** 1 drop qid in affected eye $\times$ 3 days

Cataract surgery, pain, inflammation (Acuvail)

- **Adult: OPHTH** 1 drop bid in affected eye, starting 1 day before surgery, on the day of surgery, $\times$ 2 wks after surgery

Available forms: Ophthalmic solution Acular (0.5%), Acular PF (0.5%), Acular LS (0.4%), Acuvail (0.45%)

Administer:

- Apply topically to the eye, separate by ≥ 5 min when using with other ophthalmics
- Remove contact lenses before instillation of solution
- Instruct patient on proper instillation of eye solution
- Do not touch the tip of the dropper to the eye, fingertips, or other surface
- Do not share bottle with other patients

SIDE EFFECTS

CNS: Headache

EENT: Abnormal sensation in eye, conjunctival hyperemia, ocular irritation, ocular pain, ocular pruritus, conjunctival hyperemia, iritis, keratitis

NURSING CONSIDERATIONS

Assess:

- Eyes: For pain, inflammation, burning, redness after cataract surgery

Evaluate:

- Decreased pain and inflammation after cataract surgery, refractive surgery, seasonal allergic conjunctivitis

Teach patient/family:

- To apply topically to the eye
- To remove contact lenses before instillation of solution
- Proper instillation of eye solution
- Not to touch the tip of the dropper to the eye, fingertips, or other surface
- Not to share bottle with other patients

🇨🇦 Canada only Side effects: *italics* = common; **bold** = life-threatening ⚠️
Nurse Alert

ketorolac (systemic, nasal) (Rx)

(kee-toe'role-ak)

Toradol , Sprix

Func. class.: Nonsteroidal antiinflammatory/nonopioid analgesic *Chem. class.:* Acetic acid

ACTION:

Inhibits prostaglandin synthesis by decreasing an enzyme needed for biosynthesis; analgesic, antiinflammatory, antipyretic effects

USES:

Mild to moderate pain (short term); seasonal allergic conjunctivitis (ophthalmic)

CONTRAINDICATIONS:

Pregnancy (D) 3rd trimester, hypersensitivity, asthma, hepatic disease, peptic ulcer disease, CV bleeding

Black Box Warning:

Breastfeeding, severe renal disease, L&D, perioperative pain in CABG, before major surgery, epidural/intrathecal administration, GI bleeding, hypovolemia

Precautions: Pregnancy (C), GI/cardiac disorders, hypersensitivity to other antiinflammatory agents, CCr <25 ml/min

Black Box Warning:

Children, geriatric patients, bleeding, MI, stroke

DOSAGE AND ROUTES

Calculator

- **Adult/adolescent >17 yr and ≥50 kg:** **PO** continuation from **IM/IV** only 20 mg then 10 mg q4-6hr prn, max 40 mg/day; **NASAL** 1 spray (15.75 mg spray) in each nostril (31.5 mg/spray) q6-8hr; max 4 doses/day × 5 days
- **Adult/adolescent >17 yr and <50 kg:** **IM** (single dose) 30-60 mg, **IV** 15-30 mg; **IM/IV** (multiple dosing) 15-30 mg q6hr, max 60 mg/day × 5 days combined either **PO/IM/IV**; **NASAL** 1 spray (15.75 mg/spray) in 1 nostril q6-8hr, max 4 doses/day × 5 days

Renal dose

- **Do not use in advanced renal disease**

Available forms: Inj 15, 30 mg/ml (prefilled syringes); tab 10 mg; nasal spray 15.75 mg/spray

Administer:

- Not to exceed 5 days

IM route

- IM inj deeply in large muscle mass

Nasal route

- Prime pump before using for the first time, point away from person/pets, pump activator 5 times, no need to reprime • For single use only, discard 24 hr after opening if not used
- Do not share with others
- Have patient blow nose, sit upright to spray

IV route

- Give undiluted over ≥ 15 sec

Solution compatibility: D₅W, 0.9% NaCl, LR, D₅, Plasma-Lyte A

Syringe compatibilities: SUFentanil

Y-site compatibilities: Cisatracurium, remifentanil, SUFentanil

SIDE EFFECTS

CNS: Dizziness, *drowsiness*, tremors, **seizures**

CV: Hypertension, flushing, syncope, pallor, edema, vasodilation, **CV thrombotic events, MI, stroke**

EENT: Tinnitus, hearing loss, blurred vision

GI: Nausea, anorexia, vomiting, diarrhea, constipation, flatulence, cramps, dry mouth, peptic ulcer, **GI bleeding, perforation**, taste change, **hepatitis, hepatic failure**

GU: **Nephrotoxicity: dysuria, hematuria, oliguria, azotemia**

HEMA: **Blood dyscrasias**, prolonged bleeding

INTEG: Purpura, rash, pruritus, sweating, **angioedema, Stevens-Johnson syndrome, toxic epidermal necrolysis**

PHARMACOKINETICS

Half-life 6 hr, enters breast milk, <50% metabolized by liver, excreted by kidneys

PO: Peak 2-3 hr, duration 4-6 hr

IM: Peak 50 min

Nasal: Peak 1/2-2 hr, duration 6-8 hr

INTERACTIONS

Increase: toxicity—methotrexate, lithium, cycloSPORINE, pentoxifylline, probenecid

Increase: bleeding risk—anticoagulants, cefamandole, cefoperazone, cefoTEtan, clopidogrel, eptifibatide, plicamycin, salicylates, ticlopidine, tirofiban, thrombolytics, valproic acid, SSRIs, SNRIs

Increase: renal impairment—ACE inhibitors

⚠ Increase: ketorolac levels—**aspirin, other NSAIDs; contraindicated**

Increase: GI effects—corticosteroids, alcohol, aspirin, NSAIDs

Decrease: effects—antihypertensives, diuretics

Drug/Lab Test

Increase: AST, ALT, LDH, bleeding time

NURSING CONSIDERATIONS

Assess:

• **Aspirin sensitivity, asthma:** patients may be more likely to develop hypersensitivity to NSAIDs; monitor for hypersensitivity • **Pain:** type, location, intensity, ROM before and 1 hr after treatment

Black Box Warning:

Renal, hepatic, blood studies: BUN, creatinine, AST, ALT, Hgb before treatment, periodically thereafter; check for dehydration

Black Box Warning:

Bleeding times; check for bruising, bleeding, occult blood in urine

Black Box Warning:

Do not use epidurally, intrathecally, alcohol is present in the solution

• Eye/ear problems: blurred vision, tinnitus (may indicate toxicity)

⚠ Hepatic dysfunction: jaundice, yellow sclera and skin, clay-colored stools

Black Box Warning:

CV thrombotic events: MI, stroke, do not use in perioperative pain in CABG

• Audiometric, ophthalmic exam before, during, after treatment

Perform/provide:

• Storage at room temp, protect from light

Evaluate:

• Therapeutic response: decreased pain, stiffness, swelling in joints, ability to

move more easily

Teach patient/family:

- To report blurred vision, ringing/roaring in ears (may indicate toxicity) • To avoid driving, other hazardous activities if dizziness or drowsiness occurs

Black Box Warning:

To report change in urine pattern, weight increase, edema; pain increase in joints, fever, blood in urine (indicates nephrotoxicity); bruising, black tarry stools (indicates bleeding); pruritus, jaundice, nausea, right upper quadrant pain, abdominal pain (hepatotoxicity); to notify prescriber immediately

- To avoid alcohol, salicylates, other NSAIDs, acetaminophen
- To report product use to all health care providers, not to use with other products unless approved by prescriber; use for ≤ 5 days

Black Box Warning:

Not to breastfeed

- **Nasal:** to discard within 24 hr of opening; may cause irritation, may drink water after dose • To report if pregnancy is planned or suspected pregnancy (C) systemic, do not breastfeed

☼ Canada only Side effects: *italics* = common; **bold** = life-threatening ⚠
Nurse Alert

Ketotifen (ophthalmic)

(kee-toe-tye'fen)

Alaway, Zaditor, Zyrtec Itchy Eye, Claritin Eye

Func. class.: Antihistamine (ophthalmic) *Chem. class.:* Histamine 1 receptor antagonist/mast cell stabilizer

ACTION:

A topically active, direct H₁- receptor antagonist and mast cell stabilizer; by reducing these inflammatory mediators, relieves the ocular pruritus associated with allergic conjunctivitis

USES:

For the temporary relief of ocular pruritus due to ragweed, pollen, grass, animal hair, animal dander

CONTRAINDICATIONS:

Hypersensitivity

Precautions: Pregnancy (C), breastfeeding, children, contact lenses

DOSAGE AND ROUTES

Calculator

- **Adult/child ≥3 yr:** OPTH instill 1 drop in affected eye(s) every 8-12 hr

Available forms: Ophthalmic solution 0.025%

Administer:

Ophthalmic route

- For topical ophthalmic use only
- Wash hands before and after use; tilt the head back slightly and pull the lower eyelid down with the index finger; squeeze the prescribed number of drops into the conjunctival sac and gently close eyes for 1–2 min, do not blink
- Do not touch the tip of the dropper to the eye, fingertips, or other surface
- Wait ≥10 min after instilling the ophthalmic solution before inserting contact lenses; contact lenses should not be worn if eye is red
- Do not share ophthalmic drops with others

SIDE EFFECTS

CNS: Headache

EENT: Conjunctival hyperemia, rhinitis, allergic reactions, ocular irritation consisting of burning or stinging, conjunctivitis, eyelid disorder, flu syndrome, keratitis, lacrimation disorder, mydriasis, ocular discharge, ocular pain, pharyngitis, photophobia, pruritus, rash, xerophthalmia (dry eyes)

NURSING CONSIDERATIONS

Assess:

- Eyes: for itching, redness, use of soft or hard contact lens

Evaluate:

- Absence of redness, itching in the eyes

Teach patient/family:

Ophthalmic route

- That product is for topical ophthalmic use only
- To wash hands before and after use; tilt the head back slightly and pull the lower eyelid down with the index finger; squeeze the prescribed number of drops into the conjunctival sac and gently close eyes for 1–2 min; not to blink • Not to touch the tip of the dropper to the eye, fingertips, or other surface • To wait ≥ 10 min after instilling the ophthalmic solution before inserting contact lenses; contact lenses should not be worn if eye is red • Not to share ophthalmic drops with others
- To remove contact lenses before use because the preservative benzalkonium chloride may be absorbed by soft contact lenses; that product should not be used to treat contact lens–related irritation

🍁 Canada only Side effects: *italics* = common; **bold** = life-threatening ⚠️
Nurse Alert

labetalol (Rx)

(la-bet'a-lole)

Trandate

Func. class.: Antihypertensive, antianginal

Chem. class.: α -1/ β -Blocker

Do not confuse: **Trandate**/Tridrate

ACTION:

Produces decreases in B/P without reflex tachycardia or significant reduction in heart rate through mixture of α -blocking, β -blocking effects; elevated plasma renins are reduced

USES:

Mild to moderate hypertension; treatment of severe hypertension (IV)

Unlabeled uses: Hypertension in patients with pheochromocytoma, hypertension during cloNIDine withdrawal, pediatric hypertension

CONTRAINDICATIONS:

Hypersensitivity to β -blockers, cardiogenic shock, heart block (2nd or 3rd degree), sinus bradycardia, CHF, bronchial asthma

Precautions: Pregnancy (C), breastfeeding, geriatric patients, major surgery, diabetes mellitus, thyroid/renal/hepatic disease, COPD, well-compensated heart failure, CAD, nonallergic bronchospasm, peripheral vascular disease

Black Box Warning:

Abrupt discontinuation

DOSAGE AND ROUTES

Calculator

Hypertension

- **Adult: PO** 100 mg bid; may be given with diuretic; may increase to 200 mg bid after 2 days; may continue to increase q1-3days; max 2400 mg/day in divided doses
- **Child/adolescent (unlabeled): PO** 1-3 mg/kg/day, titrate to max 10-20 mg/kg/day based on B/P; **IV** 0.2-1 mg/kg over 2 min, max 40 mg/dose; **IV INF** 0.25-3 mg/kg/hr

Hypertensive crisis

• **Adult: IV INF** 200 mg/160 ml D₅W, run at 2 mg/min or 1.6 ml/min; stop inf at desired response, repeat q6-8hr as needed; **IV BOL** 20-80 mg over 2 min, may repeat q10min, not to exceed 300 mg

Available forms: Tabs 100, 200, 300 mg; inj 5 mg/ml

Administer:

• PO before meals, at bedtime; tab may be crushed or swallowed whole; give with meals to increase absorption • Reduced dosage for renal dysfunction

• **Do not discontinue before surgery**

Direct IV route

• Give undiluted (5 mg/ml) over 2 min

Continuous IV INF route

• Diluted in LR, D₅W, D₅ in 0.2%, 0.9%, 0.33% NaCl, Ringer's inj; inf is titrated to patient response; 200 mg of product/160 ml sol = 1 mg/ml; 300 mg of product/240 ml sol = 1 mg/ml; 200 mg of product/250 ml sol = 2 mg/3 ml; use inf pump • Keep patient recumbent during and for 3 hr after administration; monitor VS q5-15min

Y-site compatibilities: Amikacin, aminophylline, amiodarone, ampicillin, butorphanol, calcium gluconate, cefTAZidime, ceftizoxime, cimetidine, diltiazem, DOBUTamine, DOPamine, enalaprilat, EPINEPHrine, erythromycin, esmolol, famotidine, fentaNYL, gentamicin, HYDROmorphine, lidocaine, LORazepam, magnesium sulfate, meperidine, metroNIDAZOLE, midazolam, milrinone, morphine, niCARdipine, nitroglycerin, norepinephrine, nitroprusside, oxacillin, potassium chloride, potassium phosphate, propofol, ranitidine, sodium acetate, tobramycin, vancomycin, vecuronium

SIDE EFFECTS

CNS: Dizziness, mental changes, drowsiness, fatigue, headache, catatonia, depression, anxiety, nightmares, paresthesias, lethargy

CV: Orthostatic hypotension, bradycardia, **CHF**, chest pain, **ventricular dysrhythmias**, AV block, scalp tingling

EENT: Tinnitus, visual changes; sore throat; double vision; dry, burning eyes, floppy iris syndrome

GI: Nausea, vomiting, diarrhea, dyspepsia, taste distortion

GU: Impotence, dysuria, ejaculatory failure

HEMA: Agranulocytosis, thrombocytopenia, purpura (rare)

INTEG: Rash, alopecia, urticaria, pruritus, fever, exfoliative dermatitis

RESP: Bronchospasm, dyspnea, wheezing

PHARMACOKINETICS

Half-life 2.5-8 hr, metabolized by liver (metabolites inactive), excreted in urine, crosses placenta, excreted in breast milk, protein binding 50%

PO: Onset 30 min, peak 2-4 hr, duration 8-12 hr

IV: Onset 5 min, peak 15 min, duration 2-4 hr

INTERACTIONS

- Do not use within 2 wk of MAOIs

Increase: myocardial depression—hydantoins, general anesthetics, verapamil, class I antidysrhythmics

Increase: tremor—tricyclic antidepressants

Increase: hypotension—diuretics, other antihypertensives, cimetidine, nitroglycerin, alcohol, nitrates

Decrease: effects of—sympathomimetics, lidocaine, theophylline, β -blockers, bronchodilators, xanthines

Decrease: antihypertensive effect—NSAIDs, salicylates

Increase or decrease: effects of—antidiabetics

Drug/Herb

Increase: antihypertensive effect—hawthorn

Decrease: antihypertensive effect—ephedra

Drug/Lab Test

Increase: ANA titer, blood glucose, alk phos, LDH, AST, ALT, BUN, potassium, triglyceride, uric acid, serum lipoprotein

False increase: urinary catecholamines

NURSING CONSIDERATIONS

Assess:

- **Hypertension:** B/P during beginning treatment, periodically thereafter; note pulse, rate, rhythm, quality; apical/radial pulse before administration; notify prescriber of any significant changes 🚨 CHF: I&O, weight daily; fluid overload:

weight gain, jugular venous distention, edema, crackles in lungs

Black Box Warning:

Abrupt discontinuation: product should be tapered to prevent adverse reactions

- Baselines of renal/hepatic studies before therapy begins

Perform/provide:

- Storage in dry area at room temp; do not freeze

Evaluate:

- Therapeutic response: decreased B/P after 1-2 wk

Teach patient/family:

Black Box Warning:

Not to discontinue product abruptly; to taper over 2 wk; may cause precipitate angina

- Not to use OTC products containing α -adrenergic stimulants (nasal decongestants, OTC cold preparations) unless directed by prescriber
- To report bradycardia, dizziness, confusion, depression, fever
- To take pulse at home; advise when to notify prescriber
- To avoid alcohol, smoking, increased sodium intake
- To comply with weight control, dietary adjustments, modified exercise program
- To carry emergency ID to identify product, allergies
- To avoid hazardous activities if dizziness is present
- **To report symptoms of CHF:** difficulty breathing, especially on exertion or when lying down; night cough; swelling of extremities
- To take medication at bedtime to prevent effect of orthostatic hypotension; to rise slowly
- To avoid driving or other hazardous activities until response is known; dizziness, drowsiness, may occur
- To wear support hose to minimize effects of orthostatic hypotension

TREATMENT OF OVERDOSE:

Lavage, IV glucagon or atropine for bradycardia, IV theophylline for bronchospasm; digoxin, O₂, diuretic for cardiac failure; hemodialysis useful for removal/hypotension; administer vasopressor

✳ Canada only Side effects: *italics* = common; **bold** = life-threatening ⚠
Nurse Alert

lacosamide (Rx)

(la-koe'sa-mide)

Vimpat

Func. class.: Anticonvulsant

Chem. class.: Functionalized amino acid

ACTION:

May act through action at sodium channels; exact action is unknown

USES:

Adjunctive therapy for partial seizures

CONTRAINDICATIONS:

Hypersensitivity

Precautions: Pregnancy (C), breastfeeding, children <17 yr, geriatric patients, allergies, cardiac/renal/hepatic disease, acute MI, atrial fibrillation/flutter, AV block, bradycardia, CHD, dehydration, depression, dialysis, hazardous activity, electrolyte imbalance, heart failure, labor, PR prolongation, sick sinus syndrome, substance abuse, suicidal ideation, syncope, torsades de pointes

DOSAGE AND ROUTES

Calculator

• **Adult and adolescent ≥17 yr:** **PO** 50 mg bid, may increase weekly by 100 mg bid to 200-400 mg/day; **IV** 50 mg bid, infuse over 30-60 min, may be increased by 100 mg/day weekly up to 200-400 mg/day maintenance

Renal/hepatic dose

• **Adult:** **PO/IV** max 300 mg/day for mild to moderate hepatic disease or CCr ≤30 ml/min

Available forms: Film-coated tabs 50, 100, 150, 200 mg; IV 20 ml single-use vials (200 mg/20 ml); oral sol 10 mg/ml

Administer:

PO route

- **Tablet:** give without regard to meals
- **Oral sol:** measure with calibrated measuring device

IV route

- May give undiluted or mixed in 0.9%NaCl, D₅, or LR
- Infuse over 30-60 min
- Do not use if discolored or if particulates are present; discard unused portions

SIDE EFFECTS

CNS: Dizziness, syncope, tremor, vertigo, ataxia, drowsiness, fever, hypoesthesia, paresthesias, depression, fatigue, headache, confusion, irritability, psychologic dependence, **suicidal ideation**

CV: **Atrial fibrillation/flutter, AV block, bradycardia, myocarditis, orthostatic hypotension, palpitations, PR prolongation**

EENT: Diplopia, blurred vision, nystagmus, tinnitus

GI: Nausea, constipation, vomiting, **hepatitis**, diarrhea, dyspepsia

HEMA: **Anemia, neutropenia**

INTEG: Rash, erythema, inj site reaction, pruritus, xerostomia

MS: Asthenia, dysarthria

SYST: **Drug reaction with eosinophilia, systemic symptoms (DRESS)**

PHARMACOKINETICS

Metabolized by liver; excreted by kidneys, 95%; protein binding <15%

PO: Peak 1-4 hr

IV: Peak 30-60 min; half-life 13 hr; elimination half-life 15-23 hr

INTERACTIONS

⚠ Increase: PR prolongation—beta-blockers, calcium channel blockers, atazanavir, dronedarone, digoxin, lopinavir, ritonavir **⚠ Increase:** lincosamide effect—CYP2C19 inhibitors (fluconazole, isoniazid, miconazole)

Drug/Lab Test

Increase: LFTs

NURSING CONSIDERATIONS

Assess:

- **Seizures:** duration, type, intensity precipitating factors
- Renal function: albumin concentration
- CV status: orthostatic hypotension, PR prolongation; monitor cardiac status

throughout treatment • Mental status: mood, sensorium, affect, memory (long, short term), depression, suicidal ideation, psychologic dependence • Rash, hypersensitivity reactions

• **Pregnancy:** Enroll in UCB Antiepileptic Drugs Registry 1-888-537-7734

Perform/provide:

• Storage of PO products/IV vials at room temp; sol is stable for 24 hr when mixed with compatible diluents in glass or PVC bags at room temp

Evaluate:

• Therapeutic response: decrease in severity of seizures

Teach patient/family:

• **Not to discontinue product abruptly; to taper over 1 week because seizures may occur**

• To avoid hazardous activities until stabilized on product

• To carry emergency ID stating product use

• **To notify prescriber of suicidal thoughts/behaviors, syncope, cardiac changes**

• To notify prescriber if pregnancy is planned or suspected

• That interactions with other medications may occur

• To consult MedGuide for proper use, risks

☼ Canada only Side effects: *italics* = common; **bold** = life-threatening ⚠

lactulose (Rx)

(lak'tyoo-lose)

Constulose, Enulose, Generlac, Kristalose

Func. class.: Laxative; ammonia detoxicant (hyperosmotic) *Chem. class.:* Lactose synthetic derivative

ACTION:

Prevents absorption of ammonia in colon by acidifying stool; increases water, softens stool

USES:

Chronic constipation, portal-systemic encephalopathy in patients with hepatic disease

CONTRAINDICATIONS:

Hypersensitivity, low-galactose diet

Precautions: Pregnancy (B), breastfeeding, geriatric patients, debilitated patients, diabetes mellitus

DOSAGE AND ROUTES

Calculator

Constipation

- **Adult: PO** 15-30 ml/day (10-20 g), may increase to 60 ml/day prn
- **Child: PO** 7.5 ml/day

Hepatic encephalopathy

- **Adult: PO** 30-45 ml (20-30 g) tid or qid until stools soft; **RETENTION ENEMA** 300 ml (200 g) diluted
- **Child: PO** 40-90 ml/day in 3-4 divided doses

- **Infant: PO** 2.5-10 ml/day in divided doses

Available forms: Oral sol (encephalopathy) 10 g/15 ml; oral sol (constipation) 10 g/15 ml

Administer:

PO route

- With 8 oz fruit juice, water, milk to increase palatability of oral form; for rapid effect, give on empty stomach
- Increased fluids to 2 L/day; do not give with

other laxatives; if diarrhea occurs, reduce dosage

- **Kristalose:** dissolve contents of packet/4 oz water

Rectal route

- **Retention enema** by diluting 300 ml lactose/700 ml of water; administer by rectal balloon catheter

SIDE EFFECTS

GI: *Nausea, vomiting, anorexia, abdominal cramps, diarrhea, flatulence, distention, belching*

META: Hyponatremia

PHARMACOKINETICS

Metabolized in colon, excreted by kidneys, onset 1-2 days, peak unknown, duration unknown

INTERACTIONS

- **Do not use with other laxatives (hepatic encephalopathy)**

Increase: GI obstruction—NIFEdipine ext-rel tabs

Decrease: lactulose effects—neomycin, other oral antiinfectives, antacids

Drug/Herb

Increase: laxative action—flax, senna

Drug/Lab Test

Increase: blood glucose (diabetic patients)

Decrease: blood ammonia

NURSING CONSIDERATIONS

Assess:

- **Stool:** amount, color, consistency
- **Cause of constipation;** determine whether fluids, bulk, or exercise is missing from lifestyle; use of constipating products
- **Hepatic encephalopathy:** blood ammonia level (30-70 mg/100 ml); may decrease ammonia level by 25%-50%; clearing of confusion, lethargy, restlessness, irritability if portal-systemic encephalopathy
- Blood, urine electrolytes if product used often; may cause diarrhea, hypokalemia, hyponatremia
- I&O ratio to identify fluid loss
- **Cramping, rectal bleeding, nausea, vomiting; if these symptoms occur, product should be discontinued**

Evaluate:

- Therapeutic response: decreased constipation, decreased blood ammonia level, clearing of mental state

Teach patient/family:

- Not to use laxatives long term
- To dilute with water or fruit juice to counteract sweet taste
- To store in cool environment; not to freeze
- To take on an empty stomach for rapid action
- To report diarrhea; may indicate overdose

☼ Canada only Side effects: *italics* = common; **bold** = life-threatening ⚠
Nurse Alert

lamiVUDine 3TC (Rx)

(lam-i-voo'deen)

Epivir, Epivir HBV

Func. class.: Antiretroviral

Chem. class.: Nucleoside reverse transcriptase inhibitor (NRTI)

Do not confuse: lamiVUDine/lamoTRIgene

ACTION:

Inhibits replication of HIV virus by incorporating into cellular DNA by viral reverse transcriptase, thereby terminating cellular DNA chain

USES:

HIV-1 infection in combination with at least 2 other antiretrovirals; chronic hepatitis B (Epivir-HBV)

Unlabeled uses: Prophylaxis of HIV: postexposure with indinavir and zidovudine

CONTRAINDICATIONS:

Hypersensitivity

Black Box Warning:

Lactic acidosis

Precautions: Pregnancy (C), breastfeeding, children, geriatric patients, granulocyte count $<1000/\text{mm}^3$ or Hgb <9.5 g/dl, renal disease, pancreatitis, peripheral neuropathy

Black Box Warning:

Severe hepatic dysfunction

DOSAGE AND ROUTES

Calculator

HIV

- **Adult and adolescent >16 yr:** PO 150 mg bid or 300 mg/day
- **Child 3 mo-16 yr:** PO 4 mg/kg bid, max 150 mg bid

Chronic hepatitis B

- **Adult:** PO 100 mg/day

- **Child and adolescent 2-17 yr: PO** 3 mg/kg/day, max 100 mg

Renal dose

- **Adult: PO** CCr 30-49 ml/min: Epivir 150 mg/day; Epivir HBV 100 mg 1st dose then 50 mg/day; CCr 15-29 ml/min: Epivir 150 mg 1st dose then 100 mg/day; Epivir HBV 100 mg 1st dose then 25 mg/day; CCr 5-14 ml/min: Epivir 150 mg 1st dose then 50 mg/day; Epivir HBV 35 mg 1st dose then 15 mg/day; CCr <5 ml/min: Epivir 50 mg 1st dose then 25 mg/day; Epivir HBV 35 mg 1st dose then 10 mg/day

Available forms: (Epivir) oral sol 10 mg/ml; tabs 150, 300 mg; **(Epivir HBV)** oral sol 5 mg/ml; tabs 100 mg

Administer:

- PO daily or bid, without regard to meals
- Epivir and Epivir HBV are not interchangeable
- With other antiretrovirals only

SIDE EFFECTS

CNS: *Fever, headache, malaise, dizziness, insomnia, depression, fatigue, chills, seizures*, peripheral neuropathy, paresthesias

EENT: Taste change, hearing loss, photophobia

GI: *Nausea, vomiting, diarrhea*, anorexia, cramps, dyspepsia, *hepatomegaly with steatosis, pancreatitis*

HEMA: *Neutropenia, anemia, thrombocytopenia*

INTEG: *Rash*

MS: *Myalgia, arthralgia, pain*

RESP: *Cough*

SYST: *Lactic acidosis, anaphylaxis, Stevens-Johnson syndrome*

PHARMACOKINETICS

Rapidly absorbed, distributed to extravascular space, excreted unchanged in urine, protein binding <36%, terminal half-life 5-7 hr

INTERACTIONS

Decrease: both products—zalcitabine; avoid concurrent use

Increase: lamiVUDine level—trimethoprim-sulfamethoxazole, amiloride, dofetilide, entecavir, metformin, memantine, procainamide, trospium

- Do not use with emtricitabine, duplication

Decrease: lamivudine effect—interferons

Drug/Lab Test

Increase: ALT, bilirubin

Decrease: Hgb, neutrophil, platelet count

NURSING CONSIDERATIONS

Assess:

- **HIV:** Test for HIV before starting treatment, blood counts q2wk; watch for neutropenia, thrombocytopenia, Hgb, CD4, viral load; if low, therapy may have to be discontinued and restarted after hematologic recovery; blood transfusions may be required; assess for lessening of symptoms; if HBV is present, a higher dose of Epivir-HBV is needed
- **Hepatitis B:** fatigue, anorexia, pruritus, jaundice during and for several months after discontinuation; AST, ALT, bilirubin; amylase, lipase, triglycerides, periodically during treatment
- **Children for pancreatitis:** abdominal pain, nausea, vomiting, neuropathy

Black Box Warning:

Lactic acidosis, severe hepatomegaly with steatosis: obtain baseline LFTs, if elevated, discontinue treatment; discontinue even if LFTs are normal if lactic acidosis, severe hepatomegaly develops, may be fatal

Perform/provide:

- Storage in cool environment; protect from light

Evaluate:

- Decreasing symptoms of HIV, CD4, viral load

Teach patient/family:

- That GI complaints, insomnia resolve after 3-4 wk of treatment
 - That product is not a cure for HIV but will control symptoms; that compliance is necessary; to take as directed; to complete full course of treatment even if feeling better
 - To notify prescriber of sore throat, swollen lymph nodes, malaise, fever, peripheral neuropathy; other infections may occur
 - That patient is still infective, may pass HIV virus on to others
 - That follow-up visits must be continued since serious toxicity may occur; that blood counts must be done
 - That other products may be necessary to prevent other infections
 - That product may cause fainting or dizziness
 - Not to breastfeed, excreted in breast milk
-

lamoTRIGine (Rx)

(la-moe'tri-geen)

LaMICtal, LaMICtal CD, LaMICtal ODT, LaMICtal XR

Func. class.: Anticonvulsant—miscellaneous

Chem. class.: Phenyltriazine

Do not confuse: lamoTRIGine/lamiVUDine

LaMICtal/Lomotil/LamISIL

ACTION:

Inhibits voltage-sensitive sodium channels, thus decreasing seizures

USES:

Adjunct for the treatment of partial, tonic-clonic seizures; children with Lennox-Gastaut syndrome, bipolar disorder

Unlabeled uses: Absence, seizures

CONTRAINDICATIONS:

Hypersensitivity

Precautions: Pregnancy (C) (cleft lip/palate during 1st trimester), breastfeeding, geriatric patients, cardiac/renal/hepatic disease, severe depression, suicidal, blood dyscrasias

Black Box Warning:

Children <16 yr

DOSAGE AND ROUTES

Calculator

Seizures: monotherapy

- **Adult and adolescent ≥16 yr:** PO 50 mg/day while receiving 1 enzyme-inducing AED (carBAMazepine, PHENobarbital, phenytoin, primidone but not valproic acid) wk 1-2, then increase to 100 mg divided bid wk 3-4; maintenance 300-500 mg/day; EXT REL 50 mg/day × 1-2 wk, then 100 mg/day wk 3-4, then 200 mg/day wk 5, then 300 mg/day wk 6, then 400 mg/day wk 7; after wk 7, range is 400-600 mg/day
- **Adolescent <16 yr and child:** PO 0.3 mg/kg/day wk 1-2, then 0.6 mg/kg/day wk 3-4; depends on use of AED; usual dose 4.5-7.5 mg/kg/day, max 300 mg/day

Monotherapy for patients taking valproate

- **Adult and adolescent ≥ 16 yr receiving lamotrigine and valproate without enzyme-inducing drug: PO** (immediate release) stabilize on valproate, target dose of 200 mg/day lamotrigine; if patient is not taking lamotrigine 200 mg/day, increase dose by 25-50 mg/day q1-2wk to reach 200 mg/day; while maintaining lamotrigine 200 mg/day, decrease valproate to 500 mg/day by ≤ 500 mg/day/wk, maintain valproate at 500 mg/day $\times 1$ wk, then increase lamotrigine to 300 mg/day while decreasing valproate 250 mg/day $\times 1$ wk, then discontinue valproate and increase lamotrigine by 100 mg/day/wk to maintenance of 500 mg/day

Seizures: Multiple therapy with valproate

- **Adult and adolescent ≥ 16 yr: PO** 25 mg every other day then 25 mg/day wk 3-4, increase by 25-50 mg q1-2wk, maintenance 100-400 mg/day
- **Adolescent < 16 yr and child: PO** 0.1-0.2 mg/kg/day initially then increase q2wk as needed to 1-5 mg/kg/day or 200 mg/day

Bipolar disorder (escalation regimen for those not taking carbamazepine, other enzyme-inducing drugs, or valproate)

- **Adult and adolescent ≥ 16 yr: PO** wk 1-2, 25 mg/day; wk 3-4, 50 mg/day; wk 5, 100 mg/day; wk 6-7, 200 mg/day; for patients taking valproic acid: wk 1-2, 25 mg every other day; wk 3-4, 25 mg/day; wk 5, 50 mg/day; wk 6, 100 mg/day; wk 7, 100 mg/day

Hepatic dose

- **Adult: PO** moderate hepatic impairment or severe without ascites: reduce by 25%; severe hepatic impairment with ascites: reduce by 50%

Absence seizures (unlabeled)

- **Adolescent and child 3-13 yr: PO** 0.5 mg/kg/day in 2 divided doses $\times 2$ wk then 1 mg/kg/day in 2 divided doses $\times 2$ wk, adjusted q5days

Available forms: Tabs 25, 100, 150, 200 mg; PO ext rel 25-50-100, 50-100-200 mg titration kit; PO 25-100 mg starter kit; ext rel 25, 50, 100, 250 mg; chew dispersible tabs 5, 25 mg; oral disintegrating tab 25, 50, 100, 200 mg; oral disintegrating tab 25-50, 50-100 mg, 25-50-100 mg titration kit

Administer:

- Correct starter kit; errors have occurred
- Discontinue all products gradually over ≥ 2 wk; abrupt discontinuation can increase seizures
- **Chewable dispersible tab:** may be swallowed whole,

chewed, mixed in water or fruit juice; to mix, add to small amount of liquid in glass or spoon; tabs will dissolve in 1 min, then mix in more liquid and swirl and swallow immediately • **Orally disintegrating tabs:** place on tongue, move around in mouth, when disintegrated, swallow; examine blister pack before use, do not use if blisters are torn or missing • **Extended-release tabs:** swallow whole, do not cut, break, chew; without regard to food

SIDE EFFECTS

CNS: *Dizziness*, ataxia, *headache*, fever, insomnia, tremor, depression, anxiety, *suicidal ideation*

EENT: Nystagmus, *diplopia*, *blurred vision*

GI: *Nausea*, *vomiting*, *anorexia*, *abdominal pain*, *hepatotoxicity*

GU: *Dysmenorrhea*

HEMA: Anemia, *DIC*, *leukopenia*, *thrombocytopenia*

INTEG: *Rash (potentially life-threatening)*, alopecia, photosensitivity

SYST: *Stevens-Johnson syndrome*, *angioedema*, *toxic epidermal necrolysis*

PHARMACOKINETICS

Half-life varies depending on dose; terminal half-life 24 hr, 15 hr with enzyme inducers; rapidly, completely absorbed; metabolized by glucuronic acid conjugation; protein binding 55%; peak 1.4-2.3 hr; crosses placenta; excreted in breast milk

INTERACTIONS

Decrease: metabolic clearance of lamotrigine—valproic acid, CYP3A4 inhibitors

Decrease: lamotrigine concentration—carbamazepine, rifamycins, oral contraceptives, acetaminophen, phenytoin, primidone, phenobarbital, oxcarbazepine, succinimides, estrogen

Drug/Herb

Increase: anticonvulsant effect—ginkgo

Decrease: anticonvulsant effect—ginseng

NURSING CONSIDERATIONS

Assess:

- **Seizure:** duration, type, intensity, halo before seizure

⚠️ Rash (Stevens-Johnson syndrome, toxic epidermal necrolysis) in pediatric patients; product should be discontinued at first sign of rash ⚠️ **Bipolar disorder:** suicidal thoughts/behaviors

Evaluate:

- Therapeutic response: decrease in severity of seizures or of bipolar symptoms

Teach patient/family:

- To take PO doses divided, with or after meals to decrease adverse effects; not to discontinue product abruptly because seizures may occur
- To avoid hazardous activities until stabilized on product
- To carry emergency ID; to notify prescriber of skin rash, increased seizure activity; to use sunscreen, protective clothing if photosensitivity occurs
- To notify prescriber if pregnant, intending to become pregnant
- To notify prescriber immediately of suicidal thoughts/behaviors
- To notify prescriber if pregnancy is planned or suspected, pregnancy (C), product decreases folate, avoid breastfeeding

🍁 Canada only Side effects: *italics* = common; **bold** = life-threatening ⚠️
Nurse Alert

lansoprazole (Rx, OTC)

(lan-so-prey'zole)

Prevacid, Prevacid SoluTab

Func. class.: Antiulcer, proton pump inhibitor

Chem. class.: Benzimidazole

Do not confuse: Prevacid/Pravachol/Prinivil

ACTION:

Suppresses gastric secretion by inhibiting hydrogen/potassium ATPase enzyme system in gastric parietal cell; characterized as gastric acid pump inhibitor because it blocks the final step of acid production

USES:

Gastroesophageal reflux disease (GERD), severe erosive esophagitis, poorly responsive systemic GERD, pathologic hypersecretory conditions (Zollinger-Ellison syndrome, systemic mastocytosis, multiple endocrine adenomas); possibly effective for treatment of duodenal, gastric ulcers, maintenance of healed duodenal ulcers

Unlabeled uses: GERD (infants/neonates)

CONTRAINDICATIONS:

Hypersensitivity

Precautions: Pregnancy (B), breastfeeding, children

DOSAGE AND ROUTES

Calculator

Frequent heartburn

- **Adult: PO (OTC)** 15 mg daily up to 14 days

Duodenal ulcer

- **Adult: PO** 15 mg/day before eating for 4 wk then 15 mg/day to maintain healing of ulcers; associated with *Helicobacter pylori*: 30 mg lansoprazole, 500 mg clarithromycin, 1 g amoxicillin bid × 14 days or 30 mg lansoprazole, 1 g amoxicillin tid × 14 days

Pathologic hypersecretory conditions

- **Adult: PO** 60 mg/day, may give up to 90 mg bid, administer doses of >120 mg/day in divided doses

GERD/esophagitis

- **Adult and adolescent: PO** 15-30 mg/day × 8 wk
- **Child 1-11 yr (>30 kg): PO** 30 mg/day ≤12 wk
- **Child 1-11 yr (≤30 kg): PO** 15 mg/day ≤12 wk
- **Infant (unlabeled): PO** 1-1.74 mg/kg/day; limited data available
- **Neonate (unlabeled): PO** 0.5-1 mg/kg/day

Stress gastric prophylaxis

- **Adult: NG** Use 30 mg oral cap or 30 mg disintegrating tab

Available forms: Del rel caps 15, 30 mg; orally disintegrating tabs 15, 30 mg

Administer:

PO route

- Swallow caps whole 30 min before eating; do not crush or chew caps; caps may be opened and contents sprinkled on food

NG route

- **Oral cap:** open cap and pour 1/4 of granules into NG feeding syringe with plunger removed, slowly add water and depress plunger, repeat until all granules used; flush tube with 15 ml water • Place on tongue, allow to dissolve, use without regard to water
- **Oral syringe:** dissolve 15 mg/4 ml or 30 mg/10 ml water, use extra water in syringe to remove all of the product

NG tube

- **Oral disintegrating tab:** mix 30 mg tab in 10 ml water, give via NG tube, flush tube with 10 ml sterile water, clamp for 60 min

SIDE EFFECTS

CNS: *Headache*

GI: Diarrhea, abdominal pain, vomiting, nausea, *constipation*, flatulence, acid regurgitation, anorexia, irritable colon, microscopic colitis

GU: *Hematuria*, glycosuria, impotence, kidney calculus, breast enlargement

PHARMACOKINETICS

Absorption after granules leave stomach 80%; plasma half-life 1½-2 hr; protein binding 97%; extensively metabolized in liver; excreted in urine, feces;

clearance decreased in geriatric patients, renal/hepatic impairment

INTERACTIONS

Decrease: antiplatelets, effect of—clopidogrel

Increase: lansoprazole, toxicity—fluvoxamine, voriconazole

Decrease: lansoprazole absorption—sucralfate

Decrease: absorption of ketoconazole, itraconazole, iron salts, calcium carbonate, atazanavir, ampicillin

Increase: hypomagnesemia—loop/thiazide diuretics

Decrease: lansoprazole effect—antimuscarinics, octreotide, H₂-blockers, misoprostol

Decrease: release of ext rel amphetamine/dextroamphetamine

- Avoid use with dasatinib, delavirdine

Drug/Herb

- Avoid use with red yeast rice, St. John's wort

NURSING CONSIDERATIONS

Assess:

- **GI system:** bowel sounds q8hr, abdomen for pain, swelling, anorexia, blood in stool, emesis
- **Hepatic studies:** AST, ALT, alk phos during treatment
- INR and prothrombin time when taking warfarin
- Magnesium: low magnesium may occur

Evaluate:

- Therapeutic response: absence of epigastric pain, swelling, fullness

Teach patient/family:

- **To report severe diarrhea; product may have to be discontinued**
- That hypoglycemia may occur if diabetic
- To avoid hazardous activities; that dizziness may occur
- To avoid alcohol, salicylates, ibuprofen; may cause GI irritation

✳ Canada only Side effects: *italics* = common; **bold** = life-threatening 

Nurse Alert

RARELY USED

lanthanum (Rx)

(lan'-tha-num)

Fosrenol

Func. class.: Phosphate binder

USES:

End-stage renal disease

CONTRAINDICATIONS:

Hypophosphatemia, hypersensitivity

DOSAGE AND ROUTES

Calculator

• **Adult: PO** 750-1500 mg/day in divided doses with meals; titrate dose q2-3wk until an acceptable phosphate level is reached; tabs should be chewed completely before swallowing; intact tabs should not be swallowed; maintenance dose 1500-3000 mg/day divided with meals

☼ Canada only Side effects: *italics* = common; **bold** = life-threatening ⚠
Nurse Alert

HIGH ALERT

lapatinib (Rx)

(la-pa'tin-ib)

Tykerb

Func. class.: Antineoplastic—miscellaneous

Chem. class.: Biologic response modifier, signal transduction inhibitor (STIs)

ACTION:

Reversibly binds tyrosine kinase of both the epidermal growth factor receptor (ERbB1) and the human epidermal receptor type 2 (HER2) (ERbB2), blocking downstream signaling for cell proliferation

USES:

Advanced metastatic breast cancer patients with tumor that overexpresses HER2 protein and who have received previous chemotherapy

CONTRAINDICATIONS:

Pregnancy (D), breastfeeding, hypersensitivity

Precautions: Geriatric patients, cardiac disease, bradycardia, hypertension, hypokalemia, hypomagnesemia, QT prolongation, pneumonitis, interstitial lung disease

Black Box Warning:

Hepatic disease

DOSAGE AND ROUTES

Calculator

Advanced/metastatic breast cancer with HER2 overexpression who have received previous therapy

- **Adult: PO** 1250 mg (5 tabs)/day 1 hr before or after food on days 1-21 plus capecitabine 2000 mg/m²/day in 2 divided doses on days 1-14 in a repeating 21-day cycle; continue until therapeutic response or toxicity occurs

Metastatic breast cancer with HER2 overexpression for whom hormonal therapy is indicated

- **Adult: PO** 1500 mg (6 tabs) 1 hr before food with letrozole 2.5 mg/day

Hepatic dose

- **Adult: PO** (Child-Pugh C) 750 mg/day (with capecitabine); 1000 mg/day (with letrozole)

Available forms: Tabs 250 mg

Administer:

- Once a day with water on an empty stomach, 1 hr before or after food
- Do not use with grapefruit products

SIDE EFFECTS

CNS: Fatigue, insomnia, palmar-plantar erythrodysesthesia (hand/foot syndrome)

CV: Heart failure, palpitations, QT prolongation

GI: Anorexia, diarrhea, dyspepsia, mouth ulcerations, nausea, vomiting, xerosis

HEMA: Anemia, neutropenia, thrombocytopenia

INTEG: Rash

RESP: Dyspnea, pneumonitis

PHARMACOKINETICS

Bioavailability incomplete; peak 4 hr; >99% protein bound; extensively metabolized in the liver by P450 enzymes CYP3A4, CYP3A5; elimination half-life 24 hr; steady state 6-7 days; increased half-life in hepatic disease

INTERACTIONS

⚠ Increase: effect of lapatinib—CYP3A4 inhibitors (amiodarone, amprenavir, aprepitant, atazanavir, chloramphenicol, clarithromycin, conivaptan, dalfopristin, danazol, darunavir, delavirdine, diltiazem, efavirenz, erythromycin, estradiol, fluconazole, fluvoxamine, imatinib, indinavir, isoniazid, itraconazole, ketoconazole, miconazole, mifepristone, nefazodone, nelfinavir, propoxyphene, quinupristin, ritonavir, RU-486, saquinavir, telithromycin, troleandomycin, verapamil, voriconazole, zafirlukast); avoid concurrent use

⚠ Increase: QT prolongation—CYP3A4 inhibitors (amiodarone, clarithromycin, erythromycin, telithromycin, troleandomycin); class IA/III antidysrhythmics, arsenic trioxide, chlorpromazine, chloroquine, haloperidol, levomethadyl, mesoridazine, pentamine, thioridazine, CYP3A4 substrates (methadone, pimozide, quetiapine, quinidine, risperidone, terfenadine, ziprasidone)

NURSING CONSIDERATIONS

Assess:

- **Cardiac status:** ECG for QT prolongation, ejection fraction; chest pain, palpitations, dyspnea
- **Hepatic status:** liver function tests; jaundice of sclera, skin; dose should be reduced in hepatic disease
- **Skin toxicities** NCI CTC grade ≥ 2 discontinue use in those with decreased left ventricular ejection fraction (LVEF) or for a LVEF that drops below institution's lower limit of normal; product may be restarted after 2 wk if LVEF recovers to normal at 1000 mg/day; restart at 1250 mg/day when toxicity improves to grade 1 or better

Perform/provide:

- Storage at room temp, away from heat

Evaluate:

- Therapeutic response: decrease in breast cancer progression

Teach patient/family:

- To take with a full glass of water, once a day, 1 hr before or after food; not to take with food or grapefruit products
- To take as directed only; if a dose is missed, to take as soon as remembered; if it is close to the next dose, to take only that dose; not to double
- To report chest pain, difficulty breathing, fever, chills, sore throat, bleeding, bruising, yellow skin or eyes, severe fatigue, dizziness, palpitations to prescriber
- That other side effects that may occur, but do not need to be reported: nausea, diarrhea, heartburn, mouth sores, rash, numbness/pain in hands/feet
- To use adequate contraception because the fetus could be damaged by this product (D)

☼ Canada only Side effects: *italics* = common; **bold** = life-threatening ⚠
Nurse Alert

latanoprost (ophthalmic)

(lah-tan'oh-prost)

Xalatan

Func. class.: Antiglaucoma agent

Chem. class.: Prostaglandin agonist

Do not confuse: **latanoprost**/bimatoprost

ACTION:

Increases aqueous humor outflow

USES:

Increased intraocular pressure in those who have open-angle glaucoma/ocular hypertension and who do not respond to other IOP-lowering products

CONTRAINDICATIONS:

Hypersensitivity to this product, benzalkonium chloride

Precautions: Eye infections, angle-closure glaucoma, renal/hepatic function impairment, children

DOSAGE AND ROUTES

Calculator

• **Adult: OPHTH** Instill 1 drop in each affected eye (conjunctival sac) every night

Available forms: Ophthalmic solution 0.005%

Administer:

Ophthalmic route

• Wash hands before and after use; contact lenses should be removed before using the product, reinsert 15 min after use; contains benzalkonium chloride, which may be absorbed by soft contact lenses • Tilt the head back slightly and pull the lower eyelid down with the index finger to form a pouch; squeeze the prescribed number of drops into the pouch and gently close the eyes for 1–2 min; do not blink; to avoid contamination, do not touch the tip of the dropper to the eye, fingertips, or other surface • The solution may be used concomitantly with

other topical ophthalmic drug products to lower IOP; if more than one topical ophthalmic drug is being used, the drugs should be administered at least 5 min apart • Store unopened bottle refrigerated; once opened, it may be stored at room temperature, protected from light, for up to 6 wk

SIDE EFFECTS

EENT: *Conjunctival hyperemia, iris color change, ocular pruritus, xerophthalmia, visual disturbance, ocular irritation burning, foreign body sensation, ocular pain, blepharitis, cataracts, and superficial punctate keratitis*

INTEG: Rash

MISC: Flulike symptoms

PHARMACOKINETICS

Ophthalmic: Onset 3-4 hr, peak 8-12 hr; half-life 3 hr

NURSING CONSIDERATIONS

Assess:

- **Intraocular pressure:** in those with ongoing increased IOP

Evaluate:

- Decreasing IOP

Teach patient/family:

Ophthalmic route

- To wash hands before and after use; that contact lenses should be removed before using product, reinsert 15 min after use; contains benzalkonium chloride, which may be absorbed by soft contact lenses • To tilt the head back slightly and pull the lower eyelid down with the index finger to form a pouch; squeeze the prescribed number of drops into the pouch and gently close the eyes for 1–2 min; not to blink; to avoid contamination, do not touch the tip of the dropper to the eye, fingertips, or other surface • That the solution may be used concomitantly with other topical ophthalmic drug products to lower IOP; if more than one topical ophthalmic drug is being used, the drugs should be administered at least 5 minutes apart • To store unopened bottle refrigerated; that once opened, it may be stored at room temperature, protected from light, for up to 6 wk

Nurse Alert

leflunomide (Rx)

(leh-floo'noh-mide)

Arava

Func. class.: Antirheumatic (DMARDs)

Chem. class.: Immune modulator, pyrimidine synthesis inhibitor

ACTION:

Inhibits an enzyme involved in pyrimidine synthesis; has antiproliferative, antiinflammatory effect

USES:

RA: to reduce disease process and symptoms

Unlabeled uses: Juvenile RA

CONTRAINDICATIONS:

Breastfeeding, hypersensitivity, jaundice, lactase deficiency, hepatic disease

Black Box Warning:

Pregnancy (X)

Precautions: Children, renal disorders, vaccinations, infection, alcoholism, immunosuppression

Black Box Warning:

Hepatic disease

DOSAGE AND ROUTES

Calculator

Rheumatoid arthritis

- **Adult: PO** Loading dose 100 mg/day × 3 days, maintenance 20 mg/day; may be decreased to 10 mg/day if not well tolerated

Juvenile rheumatoid arthritis (unlabeled)

- **Adolescent and child >40 kg: PO** 20 mg
- **Adolescent and child 20-40 kg: PO** 15 mg
- **Adolescent and child 10-19.9 kg: PO** 10 mg

Available forms: Tabs 10, 20 mg

Administer:

- Give loading dose of 100 mg/day × 3, then 20 mg/day; decrease to 10 mg/day

if poorly tolerated • With food for GI upset

• **Drug elimination:** give cholestyramine 8 g tid × 11 days, check levels

SIDE EFFECTS

CNS: *Headache*, dizziness, insomnia, depression, paresthesia, anxiety, migraine, neuralgia

CV: Palpitations, hypertension, chest pain, angina pectoris, peripheral edema

EENT: Pharyngitis, oral candidiasis, stomatitis, dry mouth, blurred vision

GI: *Nausea, anorexia, vomiting, constipation, flatulence, diarrhea, elevated LFTs, hepatotoxicity*

HEMA: Anemia, ecchymosis, hyperlipidemia

INTEG: Rash, pruritus, alopecia, acne, hematoma, herpes infections

RESP: Pharyngitis, rhinitis, bronchitis, cough, respiratory infection, pneumonia, sinusitis, *interstitial lung disease*

SYST: *Opportunistic/fatal infections*

PHARMACOKINETICS

Metabolized in liver to active metabolite, half-life of metabolite 2 wk, excreted in urine

INTERACTIONS

Increase: NSAID effect—NSAIDs

Increase: *hepatotoxicity—hepatotoxic agents, methotrexate*

Increase: rifampin levels—rifampin

Decrease: antibody response—live virus vaccines

Decrease: leflunomide effect—activated charcoal, cholestyramine, use for overdose

NURSING CONSIDERATIONS

Assess:

• Screen for latent TB before starting treatment; if TB is present, pretreat before using product • **Interstitial lung disease:** increased or worsening cough, SOB, fever; product may need to be discontinued • **Arthritic symptoms:** ROM, mobility, swelling of joints at baseline and during treatment

Black Box Warning:

Hepatic studies: if ALT elevations are > 2× ULN, reduce dose to 10 mg/day, monitor monthly or more

frequently

- CBC with differential monthly $\times$ 6 mo, then q 6-8 wk thereafter; pregnancy test; serum electrolytes  **Infections:** fatal infections can occur • B/P, weight; edema can occur

Black Box Warning:

Pregnancy (X): determine that patient is not pregnant before treatment; not to be given to women of child-bearing potential that are not using reliable contraception

Evaluate:

- Therapeutic response: decreased inflammation, pain in joints

Teach patient/family:

- That product must be continued for prescribed time to be effective, that up to a month may be required for improvement • To take with food, milk, or antacids to avoid GI upset; to take at same time of day
- To use caution when driving because drowsiness, dizziness may occur
- To take with a full glass of water to enhance absorption, may continue with correct prescribed treatment with other antiinflammatories

Black Box Warning:

Not to become pregnant (X) while taking this product; not to breastfeed while taking this product; men should also discontinue product and begin leflunomide removal protocol if pregnancy is planned

- That hair may be lost; review alternatives
- To avoid live virus vaccinations during treatment
- To notify prescriber of weight loss
- Overdose treatment: give cholestyramine tid $\times$ 24 hr or activated charcoal

🍁 Canada only Side effects: *italics* = common; **bold** = life-threatening 
Nurse Alert

letrozole (Rx)

(let'tro-zohl)

Femara

Func. class.: Antineoplastic, nonsteroidal aromatase inhibitor

ACTION:

Binds to the heme group of aromatase; inhibits conversion of androgens to estrogens to reduce plasma estrogen levels

USES:

Early, advanced, or metastatic breast cancer in postmenopausal women who are hormone receptor positive

Unlabeled uses: Infertility, idiopathic short stature, constitutional delayed puberty

CONTRAINDICATIONS:

Pregnancy (D), premenopausal females, hypersensitivity

Precautions: Respiratory/hepatic disease, osteoporosis

DOSAGE AND ROUTES

Calculator

• **Adult: PO** 2.5 mg/day

Infertility (unlabeled)

• **Adult: PO** 2.5, 5, 7.5 mg/day × 5 days, usually days 3-7 of menstrual cycle

Idiopathic short stature, constitutional delayed puberty (unlabeled)

• **Adolescent and child ≥9 (male): PO** 2.5 mg/day; use with testosterone for delayed puberty

Available forms: Tabs 2.5 mg

Administer:

- Without regard to meals; with small glass of water
- May administer biphosphates to increase bone density

SIDE EFFECTS

CNS: Headache, lethargy, somnolence, dizziness, depression, anxiety

CV: Angina, MI, CVA, thromboembolic events, hypertension, peripheral edema

GI: Nausea, vomiting, anorexia, constipation, heartburn, diarrhea

GU: Endometrial cancer, vaginal bleeding, endometrial proliferation disorders

INTEG: Rash, pruritus, alopecia, sweating

MISC: Hot flashes, night sweats, second malignancies, anaphylaxis, angioedema

MS: Arthralgia, arthritis, bone fracture, myalgia, osteoporosis

RESP: Dyspnea, cough

PHARMACOKINETICS

Metabolized in liver, excreted in urine, peak 2 days, terminal half-life 48 hr, steady state 2-6 wk

INTERACTIONS

Decrease: letrozole effect—estrogens, oral contraceptives

NURSING CONSIDERATIONS

Assess:

- Hepatic studies before, during therapy (bilirubin, AST, ALT, LDH) as needed or monthly

Evaluate:

- Therapeutic response: decrease in size of tumor

Teach patient/family:

- To report allergic reactions (rash; hives; difficulty breathing; tightness in chest; swelling of mouth, face, lips, tongue)
- To report vaginal bleeding, diarrhea, chest/bone pain
- To use adequate contraception in perimenopausal, recently postmenopausal women; pregnancy (D)

☼ Canada only Side effects: *italics* = common; **bold** = life-threatening ⚠

Nurse Alert

leucovorin (Rx)

(loo-koe-vor'in)

Func. class.: Vitamin, folic acid/methotrexate antagonist antidote *Chem. class.:* Tetrahydrofolic acid derivative

Do not confuse: **leucovorin**/Leukeran/leukine
folinic acid/folic acid

ACTION:

Needed for normal growth patterns; prevents toxicity during antineoplastic therapy by protecting normal cells

USES:

Megaloblastic or macrocytic anemia caused by folic acid deficiency, overdose of folic acid antagonist, methotrexate/pyrimethamine/ trimetrexate/trimethoprim toxicity, pneumocystosis, toxoplasmosis

CONTRAINDICATIONS:

Hypersensitivity to this product or folic acid, benzyl alcohol; anemias other than megaloblastic not associated with vit B₁₂ deficiency

Precautions: Pregnancy (C), neonates, breastfeeding, geriatric patients, seizures, stomatitis, vomiting

DOSAGE AND ROUTES

Calculator

Megaloblastic anemia caused by enzyme deficiency

- **Adult and child:** PO/IV/IM up to 6 mg/day

Megaloblastic anemia caused by deficiency of folate

- **Adult and child:** IM ≤ 1 mg/day until adequate response

Methotrexate toxicity/leucovorin rescue

- **Adult and child:** PO/IM/IV **Normal elimination** given 6 hr after dose of methotrexate (10 mg/m^2) until methotrexate $< 5 \times 10^{-8} \text{ m}$, CCr $> 50\%$ above prior level, or methotrexate level $5 \times 10^{-8} \text{ m}$ at 24 hr or $> 9 \times 10^{-8} \text{ m}$ at 48 hr; give leucovorin 100 mg/m^2 q3hr until level drops to $< 10^{-8} \text{ m}$

Pyrimethamine/trimethoprim toxicity

- **Adult and child: PO/IM** 5-15 mg/day

Advanced colorectal cancer

- **Adult: IV** 200 mg/m², then 5-FU 370 mg/m² or leucovorin 20 mg/m², then 5-FU 425 mg/m²; give daily × 5 days q4-5wk

Available forms: Tabs 5, 10, 15, 25 mg; inj 3, 5 mg/ml; powder for inj 10 mg/ml

Administer:

- Within 1 hr of folic acid antagonist
- Do not give concurrently with systemic methotrexate

IM route

- No reconstitution needed
- For treatment of megaloblastic anemia

IV route

- Reconstitute 50 mg/5 ml bacteriostatic or sterile water for inj (10 mg/ml) or (100 mg/10 ml); use immediately if sterile water used

Direct IV route

- Give over 160 mg/min or less (16 ml of 10 mg/ml sol/min)

Intermittent IV INF route

- Give after diluting in 100-500 ml of 0.9% NaCl, D₅W, D₁₀W, LR, Ringer's sol

Y-site compatibilities: Amifostine, aztreonam, bleomycin, cefepime, CISplatin, cladribine, cyclophosphamide, DOXOrubicin, DOXOrubicin liposome, filgrastim, fluconazole, fluorouracil, furosemide, granisetron, heparin, methotrexate, metoclopramide, mitoMYcin, piperacillin/tazobactam, tacrolimus, teniposide, thiotepa, vinBLAStine, vinCRISTine

SIDE EFFECTS

HEMA: Thrombocytosis (intraarterial)

INTEG: Rash, pruritus, erythema, urticaria

RESP: Wheezing

INTERACTIONS

Increase: metabolism of barbiturates, hydantoins, primidone

Decrease: effect of—sulfamethoxazole, trimethoprim

NURSING CONSIDERATIONS

Assess:

- CCr, creatinine before leucovorin rescue, daily to detect nephrotoxicity; methotrexate level • I&O; urine pH q6hr, maintain >7 to prevent neurotoxicity; watch for nausea and vomiting • **Other products taken:** alcohol, hydantoins, trimethoprim may cause increased folic acid use by body • Neurologic status (rescue): weakness, fatigue
- Monitor calcium levels
- **Megaloblastic anemia**, plasma lactic acid, reticulocyte count, Hct, Hgb
- **Hypersensitivity:** rash, urticaria, wheezing; notify prescriber

Perform/provide:

- Increased fluid intake if used to treat folic acid inhibitor overdose
- Protection from light and heat

Evaluate:

- Therapeutic response: increased weight; improved orientation, well-being; absence of fatigue; reversal of toxicity (methotrexate, folic acid antagonist overdose)

Teach patient/family:

- **For leucovorin rescue** to drink 3 L fluid/day of rescue
- **For folic acid deficiency**, to eat folic-acid-rich foods: bran; yeast; dried beans; nuts; fresh, green leafy vegetables • To take product exactly as prescribed
- To notify prescriber of side effects
- **To report signs of hypersensitivity reaction immediately**
- To avoid breastfeeding

🌿 Canada only Side effects: *italics* = common; **bold** = life-threatening ⚠️
Nurse Alert

HIGH ALERT

leuprolide (Rx)

(loo-proe'lide)

Eligard, Lupron Depot, Lupron Depot-Ped, Viadur

Func. class.: Antineoplastic hormone

Chem. class.: Gonadotropin-releasing hormone

Do not confuse: **Lupron**/Nuprin/Lopurin

ACTION:

Causes initial increase in circulating levels of LH, FSH; continuous administration results in decreased LH, FSH; in men, testosterone is reduced to castrate levels; in premenopausal women, estrogen is reduced to menopausal levels

USES:

Metastatic prostate cancer (inj implant), management of endometriosis, central precocious puberty, uterine leiomyomata (fibroids)

Unlabeled uses: Breast cancer, recurrent priapism, benign prostatic hyperplasia

CONTRAINDICATIONS:

Pregnancy (X), breastfeeding, hypersensitivity to GnRH or analogs, thromboembolic disorders, undiagnosed vaginal bleeding; Viadur implant or Eligard should not be used in women, children

Precautions: Edema, hepatic disease, CVA, MI, seizures, hypertension, diabetes mellitus, CHF, depression, osteoporosis, spinal cord compression, urinary tract obstruction

DOSAGE AND ROUTES

Calculator

Prostate cancer

• **Adult:** **SUBCUT** 1 mg/day; **IM** 7.5 mg/dose monthly; Viadur implant (72 mg) yearly; or **IM** 22.5 mg q3mo; or **IM** 30 mg q4mo; or **IM** 45 mg q6mo

Endometriosis/fibroids

• **Adult:** **IM** 3.75 mg monthly for 6 mo or 11.25 q3mo for 6 mo or 30 mg q4mo

Central precocious puberty

- **Child: SUBCUT** 50 mcg/kg/day; may increase by 10 mcg/kg/day as needed
- **Child >37.5 kg: IM** 15 mg q4wk
- **Child 25-37.5 kg: IM** 11.25 mg q4wk
- **Child ≤25 kg: 7.5 mg q4wk**

Benign prostatic hyperplasia (BPH) (unlabeled)

- **Adult: SUBCUT** (sol for inj) 1 mg/day, must be cont; IM (inj susp) 3.75 mg q28day × 24 wk

Available forms: Powder for inj depot 1 mo 3.75 mg, depot 3 mo/1.25 mg, 22.5 mg; depot 4 mo 30 mg; depot 6 mo 45 mg; depot-ped 7.5, 11.25, 15 mg; sol for inj 1 mg/0.2 ml; susp for inj 7.5, 22.5, 30, 45 mg; implant (Viadur) 65 mg

Administer:

- **SUBCUT:** No dilution needed if patient self-administering; make sure patient using syringes provided by manufacturer
- **Viadur DUROS Implant:** Insert in inner aspect of arm, remove after 12 mo
- **SUBCUT: Eligard:** bring to room temperature, once mixed, give within 30 min, prepare the 2 syringes for mixing, join the 2 syringes together by pushing in and twisting until secure; mix the product by pushing the contents of both syringes back and forth between syringes until uniform; should be light tan to tan, hold syringes vertically with syringe B on the bottom, draw entire mixed product into syringe B (short, wide syringe) by depressing the syringe A plunger and slightly withdrawing syringe B plunger, uncouple syringe A, while pushing down on syringe A plunger, small air bubbles will remain, hold syringe B upright, remove pink cap, attach needle cartridge to the end of syringe B, remove needle cover, give by subcut

IM route

- **Monthly:** reconstitute single-use vial with 1 ml of diluent; if multiple vials used, withdraw 0.5 ml, inject into each vial (1 ml); withdraw all, inject at 90-degree angle (3.75 mg)
- **3-month:** reconstitute microspheres using 1.5 ml of diluent, inject into vial; shake, withdraw, inject
- **12-month:** insert into upper arm; at the end of 12 months, implant must be removed

SIDE EFFECTS

CNS: Memory impairment, depression, **seizures**

CV: **MI, PE, dysrhythmias**, peripheral edema

GI: Nausea, vomiting, anorexia, diarrhea, **GI bleeding**

GU: Edema, hot flashes, impotence, decreased libido, amenorrhea, vaginal dryness, gynecomastia, **profuse vaginal bleeding**

INTEG: Alopecia

MS: Bone pain

RESP: Dyspnea, pulmonary fibrosis, interstitial lung disease

PHARMACOKINETICS

SUBCUT: Onset 1-2 wk; peak 2-4 wk; absorbed rapidly (SUBCUT), slowly (IM depot); half-life 3 hr

INTERACTIONS

Increase: antineoplastic action—flutamide, megestrol

Drug/Herb

- Do not use with black cohosh or chaste tree fruit, may interfere with treatment

NURSING CONSIDERATIONS

Assess:

- **Prostate cancer:** increased bone pain for first 4 wk of treatment; those with metastases in spinal column may exhibit severe back pain
- **Symptoms of endometriosis** (lower abdominal pain)/**fibroids** (pelvic pain, excessive vaginal bleeding, bloating) before, during, after treatment
- **Central precocious puberty (CPP)** diagnosis should have been confirmed by secondary S₄ characteristics in children <9 yr, estradiol/testosterone levels, GnRH test, tomography of head, adrenal steroids, chorionic gonadotropin, wrist x-ray, height, weight
- Hepatic studies before, during therapy (bilirubin, AST, ALT, LDH) monthly, as needed; PSA, calcium, testosterone with prostate cancer; bone mineral density; blood glucose, HbA1c
- Pituitary gonadotropic and gonadal function during therapy and 4-8 wk after therapy decreased
- **Tumor flare:** worsening of signs and symptoms; normal during beginning therapy
- Fatigue, increased pulse, pallor, lethargy; edema in feet, joints; stomach pain

⚠ Severe allergic reaction: rash, pruritus, urticaria, purpuric skin lesions, itching, flushing

Perform/provide:

- Storage in tight container at room temp

Evaluate:

- Therapeutic response: decreased tumor size and spread of malignancy; decrease in lesions, pain with endometriosis, fibroids, correction of CPP; increased follicle maturation

Teach patient/family:

- To notify prescriber if menstruation continues; menstruation should stop
- To notify prescriber if pregnancy is planned or suspected (X), avoid breastfeeding
- That bone pain will disappear after 1 wk
- To report any complaints, side effects to nurse, prescriber; hot flashes may occur; record weight, report gain of >2 lb/day • How to prepare, give; to rotate sites for SUBCUT inj
- To keep accurate records of dose
- **That tumor flare may occur:** increase in size of tumor, increased bone pain, will subside rapidly; may take analgesics for pain • That voiding problems may increase during beginning of therapy but will decrease in several weeks

☛ Canada only Side effects: *italics* = common; **bold** = life-threatening ⚠
Nurse Alert

levalbuterol (Rx)

(lev-al-byoo'ter-ole)

Xopenex, Xopenex HFA

Func. class.: Bronchodilator, adrenergic β_2 -agonist

ACTION:

Causes bronchodilation by action on β_2 (pulmonary) receptors by increasing levels of cAMP, which relaxes smooth muscle; produces bronchodilation, CNS, cardiac stimulation as well as increased diuresis and gastric acid secretion

USES:

Treatment or prevention of bronchospasm (reversible obstructive airway disease)

CONTRAINDICATIONS:

Hypersensitivity to sympathomimetics, this product, albuterol

Precautions: Pregnancy (C), breastfeeding, hyperthyroidism, diabetes mellitus, hypertension, prostatic hypertrophy, angle-closure glaucoma, seizures, renal disease, QT prolongation, tachydysrhythmias, severe cardiac disease, hypokalemia

DOSAGE AND ROUTES

Calculator

- **Adult/child ≥ 12 yr:** INH 0.63 mg tid q6-8hr by nebulization, may increase 1.25 mg q8hr
- **Adult/adolescent/child >4 yr:** (HFA, metered dose) 90 mcg (2 INH) q4-6hr
- **Child 6-11 yr:** INH 0.31 mg tid by nebulization, max 0.63 mg tid

Available forms: Sol, inh pediatric 0.31/3 ml; 0.63 mg, 1.25 mg/3 ml; 45 mcg per actuation (HFA)

Administer:

- Every 6-8hr; wait ≥ 1 min between inhalation of aerosols

Inhalation route

- Shake well before use, use a spacer device, prime with 4 test sprays in new canister or when not used for >3 days

SIDE EFFECTS

CNS: Tremors, anxiety, insomnia, headache, dizziness, stimulation, restlessness, irritability, weakness

CV: Palpitations, tachycardia, hypertension, angina, hypotension, dysrhythmias, QT prolongation

EENT: Dry nose, irritation of nose and throat, rhinitis

GI: Heartburn, nausea, vomiting, diarrhea

INTEG: Rash

META: Hypokalemia, hyperglycemia

MS: Muscle cramps

RESP: Cough

SYST: Anaphylaxis, angioedema

PHARMACOKINETICS

Metabolized in the liver and tissues; crosses placenta, breast milk, blood-brain barrier; half-life 3.3-4 hr

INH sol: Onset 10-17 min, peak 11/2 hr, duration 5-6 hr; **INH aerosol:** onset 4.5-10.2 min, peak 76-78 min, duration ≤6 hr

INTERACTIONS

Increase: QT prolongation—Class IA, III antidysrhythmics, usually at high doses or hypokalemia

Increase: action of aerosol bronchodilators

Increase: levalbuterol action—tricyclics, MAOIs, other adrenergics

Decrease: levalbuterol action—other β-blockers, severe bronchospasm may occur

Drug/Herb

Increase: stimulation—black/green tea, coffee, cola nut, guarana, yerba maté

NURSING CONSIDERATIONS

Assess:

- **Respiratory function:** vital capacity, forced expiratory volume, ABGs, lung sounds, heart rate and rhythm (baseline); character of sputum: color, consistency, amount
- **Cardiac status:** palpitations, increase/decrease in B/P, dysrhythmias

⚠ For evidence of allergic reactions, paradoxical bronchospasm, anaphylaxis,

angioedema

Evaluate:

- Therapeutic response: absence of dyspnea, wheezing after 1 hr; improved airway exchange, ABGs

Teach patient/family:

- Not to use OTC medications because excess stimulation may occur
- To avoid getting aerosol in eyes because blurring may result
- To avoid smoking, smoke-filled rooms, persons with respiratory infections

⚠ That paradoxical bronchospasm may occur; to stop product immediately, contact prescriber • To limit caffeine products such as chocolate, coffee, tea, colas, and herbs such as cola nut, guarana, yerba maté • To use this product first if using other inhalers; to wait 5 min or more between products; to rinse mouth with water after each dose to prevent dry mouth

TREATMENT OF OVERDOSE:

Administer a β_1 -adrenergic blocker

☼ Canada only Side effects: *italics* = common; **bold** = life-threatening ⚠
Nurse Alert

levETIRAcetam (Rx)

(lev-eh-teer-ass'eh-tam)

Keppra, Keppra XR

Func. class.: Anticonvulsant

Do not confuse: **Keppra**/Kaletra

ACTION:

Unknown; may inhibit nerve impulses by limiting influx of sodium ions across cell membrane in motor cortex

USES:

Adjunctive therapy for partial-onset seizures, primary generalized tonic-clonic seizures

Unlabeled use: Pediatrics

CONTRAINDICATIONS:

Hypersensitivity, breastfeeding

Precautions: Pregnancy (C), children, geriatric patients, renal/cardiac disease, psychosis

DOSAGE AND ROUTES

Calculator

Adjunctive treatment of partial seizures

- **Adult/adolescent ≥ 16 yr:** IV 500 mg bid, may be titrated by 1000 mg/day q2wk, max 3000 mg/day in divided doses; **EXT REL** 1000 mg/day, may increase q2wk, max 3000 mg/day
- **Adolescent < 16 yr/child/infant:** PO 10 mg/kg bid, increase daily dose q2wk by 20 mg/kg to dose of 30 mg/kg bid; if patient unable to tolerate, may reduce dose

Myoclonic seizures/tonic-clonic seizures/partial seizures

- **Adult/adolescent ≥ 16 yr:** PO/IV 500 mg bid, may increase by 1000 mg/day q2wk, max 3000 mg/day

Renal dose

- **Adult:** PO CCr 50-80 ml/min, 500-1000 mg q12hr or **EXT REL** 1000-2000

q24hr, max 2000 mg/day; CCr 30-49 ml/min, 250-750 mg q12hr or **EXT REL** 500-1500 mg q24hr, max 1500 mg/day; CCr <30 ml/min, 250-500 mg q12hr or **EXT REL** 500-1000 q24hr, max 1000 mg/day

Available forms: Tabs 250, 500, 750, 1000 mg; oral sol 100 mg/ml; sol for inj 100 mg/ml; ext rel tab 500, 750 mg

Administer:

PO route

- Swallow tab whole; do not break, crush, or chew
- With food, milk to decrease GI symptoms (rare)
- **Child:** <20 kg should be given oral solution; use calibrated device

Intermittent IV INF route

- Single-use vials: dilute in 100 ml of 0.9% NaCl, D₅, LR; give over 15 min, discard unused vial contents, do not use product with particulates or discoloration

Additive compatibilities: diazepam, LORazepam, valproate

SIDE EFFECTS

CNS: Dizziness, somnolence, asthenia, psychosis, **suicidal ideation**, nonpsychotic behavioral symptoms

HEMA: Lowered Hct, Hgb, RBC, infection

MISC: Infection, abdominal pain, pharyngitis

SYST: **Stevens-Johnson syndrome, toxic epidermal necrolysis**

PHARMACOKINETICS

Rapidly absorbed; not protein bound; excreted via kidneys 66% unchanged; half-life 6-8 hr, longer in geriatric patients or with renal disease

INTERACTIONS

- Avoid use with alcohol
- Possible increased carBAMazepine toxicity: carBAMazepine

Decrease: levETIRAcetam absorption—sevelamer; separate by 1 hr before, 3 hr after sevelamer

Drug/Lab Test

Increase: eosinophils

NURSING CONSIDERATIONS

Assess:

- **Seizures:** type, location, duration, character; provide seizure precautions
- Renal studies: urinalysis, BUN, urine creatinine q3mo
- Blood studies: RBC, Hct, Hgb

 **Mental status:** mood, sensorium, affect, behavioral changes, **suicidal thoughts/behaviors**; if mental status changes, notify prescriber

Perform/provide:

- Storage at room temp (PO)
- Diluted preparation stable for 24 hr at room temp in polyvinyl bags
- Assistance with ambulation during early part of treatment; dizziness occurs

Evaluate:

- Therapeutic response: decreased seizure activity; document on patient's chart

Teach patient/family:

- To carry emergency ID stating patient's name, products taken, condition, prescriber's name, phone number
- How to use oral sol; if trouble swallowing, measure oral sol in medicine cup or dropper, do not use teaspoon
- To notify prescriber if pregnant, intending to become pregnant
- To avoid driving, other activities that require alertness
- Not to discontinue medication quickly after long-term use because withdrawal seizure may occur
- Not to breastfeed, excreted in breast milk

🌿 Canada only Side effects: *italics* = common; **bold** = life-threatening 
Nurse Alert

levobetaxolol ophthalmic

See [Appendix B](#)

levobunolol (ophthalmic)

(lee'voe-byoo'no-lahl)

Betagan

Func. class.: Antiglaucoma

Chem. class.: β -Blocker

ACTION:

Can decrease aqueous humor and increase outflows

USES:

Treatment of chronic open-angle glaucoma and ocular hypertension

CONTRAINDICATIONS:

Hypersensitivity, AV block, heart failure, bradycardia, sick sinus syndrome, asthma

Precautions: Abrupt discontinuation, children, pregnancy, breastfeeding, COPD, depression, diabetes mellitus, myasthenia gravis, hyperthyroidism, pulmonary disease, sulfite sensitivity, angle-closure glaucoma

DOSAGE AND ROUTES

Calculator

• **Adult:** Instill 1-2 drops in the affected eyes once or twice a day (0.5% solution), bid (0.25% solution)

Available forms: Ophthalmic solution 0.25%, 0.5%

Administer:

- For ophthalmic use only
- Do not touch the tip of the dropper to the eye, fingertips, or other surface to prevent contamination • Wash hands before and after use; tilt head back slightly and pull the lower eyelid down with the index finger to form a pouch; squeeze

the prescribed number of drops into the pouch; close eyes to spread drops; to avoid excessive systemic absorption, apply finger pressure on the lacrimal sac for 1–2 min after use • If more than one topical ophthalmic drug product is being used, the drugs should be administered at least 5 min apart • To avoid contamination or the spread of infection, do not use dropper for more than one person • Decreased intraocular pressure can take several weeks, monitor IOP after a month

SIDE EFFECTS

CNS: Insomnia, headache, dizziness

CV: Palpitations

EENT: Eye stinging/burning, tearing, photophobia

PULM: Bronchospasm

PHARMACOKINETICS

Onset 60 min, peak 2-6 hr, duration 24 hr

INTERACTIONS

Increase: β -blocking effect—oral β -blockers

Increase: Intraocular pressure reduction—topical miotics, dipivefrin, EPINEPHrine, carbonic anhydrase inhibitors; this may be beneficial

Increase: B/P, severe—when abruptly stopping cloNIDine

Increase: Depression of AV nodal conduction, bradycardia, or hypotension—adenosine, cardiac glycosides, disopyramide, other antiarrhythmics, class 1C antiarrhythmic drugs (flecainide, propafenone, moricizine, encainide, quinIDine, or drugs that significantly depress AV nodal conduction

Increase: AV block nodal conduction, induce AV block—high doses of procainamide

Increase: Antihypertensive effect—other antihypertensives

NURSING CONSIDERATIONS

Assess:

 **Systemic absorption:** When used in the eye, systemic absorption is common with the same adverse reactions and interactions • **Glaucoma:** Monitor intraocular pressure

Evaluate:

- Decreasing intraocular pressure

Teach patient/family:

- That product is for ophthalmic use only
- Not to touch the tip of the dropper to the eye, fingertips, or other surface to prevent contamination
- To wash hands before and after use; tilt the head back slightly and pull the lower eyelid down with the index finger to form a pouch; squeeze the prescribed number of drops into the pouch; close eyes to spread drops; to avoid excessive systemic absorption by applying finger pressure on the lacrimal sac for 1–2 min following use
- That if more than one topical ophthalmic drug product is being used, the drugs should be administered at least 5 min apart
- To avoid contamination or the spread of infection by not using dropper for more than one person

🍁 Canada only Side effects: *italics* = common; **bold** = life-threatening ⚠️
Nurse Alert

levocabastine ophthalmic

See [Appendix B](#)

levocetirizine (Rx)

(lee-voh-she-teer'ah-zeen)

[Xyzal](#)

Func. class.: Antihistamine, low sedating

Chem. class.: H₁ histamine blocker, low sedating

ACTION:

Acts on blood vessels, GI, respiratory system by competing with histamine for H₁-receptor site; decreases allergic response by blocking pharmacologic effects of histamine; minimal anticholinergic action

USES:

Perennial or seasonal rhinitis, allergy symptoms, chronic idiopathic urticaria

CONTRAINDICATIONS:

Breastfeeding; children 6-11 yr with renal disease; end-stage renal disease; dialysis; hypersensitivity to this product, cetirizine, hydrOXYzine

Precautions: Pregnancy (B), driving, renal disease

DOSAGE AND ROUTES

Calculator

- **Adult and child ≥12 yr: PO** 2.5-5 mg/day in the evening
- **Child 6-11 yr: PO** (oral solution) 2.5 mg/day in the evening
- **Child 2-5 yr: PO** (oral solution) 1.25 mg/day in the evening
- **Geriatric: PO** 2.5-5 mg/day in the evening

Renal dose

- **Adult: PO** CCr 50-80 ml/min, 2.5 mg/day; CCr 30-50 ml/min, 2.5 mg every other day; CCr 10-30 ml/min, 2.5 mg 2×/wk; CCr <10 ml/min, do not use

Available forms: Tabs 5 mg; oral sol 2.5 mg/15 ml

Administer:

- Without regard to meals in the evening; tabs scored, may be broken in half

SIDE EFFECTS

CNS: *Drowsiness, fatigue*, asthenia, dizziness

GI: Dry mouth, increase LFTs, **hepatitis**

MISC: Urinary retention

PHARMACOKINETICS

Rapid absorption; peak 0.9 hr; protein binding 91%-92%; half-life 8 hr; excreted in urine 85.4%, feces 12.9%

INTERACTIONS

Increase: CNS depression—alcohol, other CNS depressants

Increase: anticholinergic/sedative effect—MAOIs, phenothiazines, tricyclics

Decrease: clearance of levocetirizine—ritonavir

Drug/Lab Test

False negative: Skin allergy tests

NURSING CONSIDERATIONS

Assess:

- **Allergy symptoms:** pruritus, urticaria, watering eyes at baseline, during treatment
- **Respiratory status:** rate, rhythm, increase in bronchial secretions, wheezing, chest tightness
- Liver function tests, serum creatinine, BUN

Perform/provide:

- Storage in tight, light-resistant container

Evaluate:

- Therapeutic response: absence of running or congested nose or rashes

Teach patient/family:

- About all aspects of product use; to notify prescriber if confusion, sedation, hypotension occur, not to exceed recommended dose
- To avoid driving, other hazardous activities if drowsiness occurs
- To avoid alcohol, other CNS depressants
- That product not recommended while breastfeeding

TREATMENT OF OVERDOSE:

Administer diazepam, vasopressors, IV phenytoin

🍁 Canada only Side effects: *italics* = common; **bold** = life-threatening ⚠️
Nurse Alert

levodopa-carbidopa (Rx)

(lee-voe-doe'pa)-(kar-bi-doe'pa)

Apo-Levocarb , Atamet, Parcopa, Sinemet, Sinemet CR

Func. class.: Antiparkinson agent

Chem. class.: Catecholamine

ACTION:

Decarboxylation of levodopa in periphery is inhibited by carbidopa; more levodopa is made available for transport to the brain and for conversion to dopamine in the brain

USES:

Parkinson's disease, parkinsonism resulting from carbon monoxide, chronic manganese intoxication, cerebral arteriosclerosis

Unlabeled uses: Restless leg syndrome

CONTRAINDICATIONS:

Hypersensitivity, malignant melanoma, history of malignant melanoma or undiagnosed skin lesions resembling melanoma

Precautions: Pregnancy (C), breastfeeding, diabetes, closed-angle glaucoma, respiratory/cardiac/renal/hepatic disease, MI with dysrhythmias, seizures, peptic ulcer, depression

DOSAGE AND ROUTES

Calculator

Beginning therapy for those not taking levodopa

- **Adult: PO** 25 mg carbidopa/100 mg levodopa tid, may increase daily or every other day by 1 tab to desired response (8 tabs/day); **EXT REL** tabs 50 mg carbidopa/200 mg levodopa bid

For those not taking levodopa ER

- 50 mg carbidopa/200 mg levodopa bid

For those taking levodopa ER

- Begin treatment with 10% more levodopa/day given q4-8hr, may increase or decrease dose q3days

For those taking levodopa <1.5 g/day

- **Adult: PO** 25 mg carbidopa/100 mg levodopa tid-qid, may increase daily to desired response

For those taking levodopa >1.5 g/day

- **Adult: PO** 25 mg carbidopa/250 mg levodopa tid-qid, may increase daily to desired response

Restless leg syndrome (RLS) (unlabeled)

- **Adult: PO** 25 mg carbidopa/100 mg levodopa, 1 tab at bedtime, may repeat if awakening within 2 hr or 50 mg carbidopa/200 mg levodopa sus rel tab 1-2 tabs 1 hr before bedtime

Available forms: Tabs 10 mg carbidopa/100 mg levodopa, 25 mg carbidopa/100 mg levodopa, 25 mg carbidopa/250 mg levodopa; ext rel tab 25 mg/100 mg, 50 mg carbidopa/200 mg levodopa (Sinemet CR); oral disintegrating tab (Parcopa) 10 mg carbidopa/100 mg levodopa, 25 mg carbidopa/100 mg levodopa; 25 mg carbidopa/250 mg levodopa

Administer:

- Pyridoxine (B₆) not effective for reversing Sinemet or Sinemet CR

PO route

- Do not crush or chew **ext rel tabs**; they may be broken in half; adjust dosage to response
- **Oral disintegrating tab** by gently removing from bottle, placing on tongue and swallowing with saliva; after tab dissolves, liquid is not necessary
- With meals if GI symptoms occur; limit protein taken with product
- Only after nonselective MAOIs have been discontinued for 2 wk; if patient has been previously treated with levodopa, discontinue for at least 12 hr before change to carbidopa-levodopa

SIDE EFFECTS

CNS: *Involuntary choreiform movements, hand tremors, fatigue, headache, anxiety, twitching, numbness, weakness, confusion, agitation, insomnia, nightmares, psychosis, hallucination, hypomania, severe depression, dizziness, impulsive behaviors, **neuroleptic malignant syndrome***

CV: *Orthostatic hypotension, tachycardia, hypertension, palpitation*

EENT: *Blurred vision, diplopia, dilated pupils*

GI: *Nausea, vomiting, anorexia, abdominal distress, dry mouth, flatulence, dysphagia, bitter taste, diarrhea, constipation*

HEMA: Hemolytic anemia, leukopenia, agranulocytosis

INTEG: Rash, sweating, alopecia

MISC: Urinary retention, incontinence, weight change, dark urine

PHARMACOKINETICS

PO: Onset 30 min, peak 1-3 hr, excreted in urine (metabolites)

EXT REL: Onset 4-6 hr

INTERACTIONS

- Hypertensive crisis: nonselective MAOIs

Increase: effects of levodopa—antacids, metoclopramide

Decrease: effects of levodopa—anticholinergics, hydantoins, papaverine, pyridoxine, benzodiazepines, antipsychotics

Drug/Lab Test

Increase: BUN, AST, ALT, bilirubin, alk phos, LDH, serum glucose

Decrease: BUN, creatinine, uric acid

False positive: urine ketones (dipstick), Coombs' test

False negative: urine glucose

False increase: urine protein

Drug/Food

Decrease: absorption of levodopa—protein

NURSING CONSIDERATIONS

Assess:

- **Parkinson's symptoms:** tremors, pill rolling, drooling, akinesia, rigidity, shuffling gait before, during treatment
- B/P, respiration; orthostatic B/P
- Mental status: affect, mood, behavioral changes, depression, complete suicide assessment
- **Toxicity:** muscle twitching, blepharospasm
- Renal, hepatic, hematopoietic tests; also for diabetes, acromegaly if on long-term therapy

Evaluate:

- Therapeutic response: decrease in akathisia/bradykinesia, tremor, rigidity, improved mood

Teach patient/family:

- To change positions slowly to prevent orthostatic hypotension
 - To report side effects: twitching, eye spasms because these indicate overdose
 - To use product as prescribed; if discontinued abruptly, parkinsonian crisis, neuroleptic malignant syndrome (NMS) may occur; to gradually taper • That urine, sweat may darken
 - To use physical activities to maintain mobility, lessen spasms
 - That improvement may not occur for 2-4 mo; about “on-off phenomenon”
-

🌿 Canada only Side effects: *italics* = common; **bold** = life-threatening ⚠️
Nurse Alert

levofloxacin (Rx)

(lee-voh-floks'a-sin)

Levaquin

Func. class.: Antiinfective

Chem. class.: Fluoroquinolone

ACTION:

Interferes with conversion of intermediate DNA fragments into high-molecular-weight DNA in bacteria; DNA gyrase inhibitor; inhibits topoisomerase IV

USES:

Acute sinusitis, acute chronic bronchitis, community-acquired pneumonia, uncomplicated skin infections, UTI, cellulitis, prostatitis, inhalational anthrax (postexposure); acute pyelonephritis caused by *Streptococcus pneumoniae*, *Haemophilus influenzae*, *Haemophilis parainfluenzae*, *Moraxella catarrhalis*, *Escherichia coli*, *Serratia marcescens*, *Klebsiella pneumoniae*, *Chlamydia pneumoniae*, *Legionella pneumophila*, *Mycoplasma pneumoniae*, *Enterococcus faecalis*, *Staphylococcus epidermidis*, *Staphylococcus pyogenes*; inhalation anthrax in children

Unlabeled uses: Adnexitis, Bartholin abscess, Bartholinitis, cervicitis, epididymis, gastroenteritis, *H. pylori* eradication, mastitis, MAC, nongonococcal urethritis, obstetric infections, PID, plague, SARS, shigellosis, TB, typhoid fever, gonococcal infections, disseminated; otitis media, otitis externa, tonsillitis, pharyngitis, sialadenitis

CONTRAINDICATIONS:

Hypersensitivity to quinolones

Precautions: Pregnancy (C), breastfeeding, children, photosensitivity, acute MI, atrial fibrillation, colitis, dehydration, diabetes, QT prolongation, myasthenia gravis, renal disease, seizure disorder, syphilis

Black Box Warning:

Tendon pain/rupture, tendinitis

DOSAGE AND ROUTES

Calculator

Acute bacterial exacerbation of chronic bronchitis

- **Adult: PO/IV** 500 mg q24hr × 7 days

Acute bacterial sinusitis

- **Adult: PO** 500 mg q24hr × 10-14 days or 750 mg q24hr × 5 days

Acute pyelonephritis

- **Adult: PO** 250 mg q24hr × 10 days or 750 mg q24hr × 5 days

Chronic bacterial prostatitis

- **Adult: PO** 500 mg q24hr × 28 days

Postexposure inhalational anthrax

- **Adult/adolescent/child >50 kg: PO/IV** 500 mg q24hr × 60 days
- **Infant >6 mo/child <50 kg: IV** 8 mg/kg q12hr × 60 days, max 250 mg/dose

Pneumonia, community acquired

- **Adult: PO/IV** 500 mg q24hr × 7-14 days or 750 mg q24hr × 5 days

Pneumonia, nosocomial

- **Adult: PO/IV** 750 mg q24hr × 7-14 days

Skin/skin-structure infections, complicated

- **Adult: PO/IV** 750 mg q24hr × 7-14 days

Skin/skin-structure infections, uncomplicated

- **Adult: PO** 500 mg q24hr × 7-10 days

UTI, complicated

- **Adult: PO/IV** 250 mg q24hr × 10 days

UTI, uncomplicated

- **Adult: PO** 250 mg q24hr × 3 days

Plague (*y. pestis*)

- **Adult: PO/IV** 500 mg q24hr × 10-14 days, with pneumonia 750 mg q24hr
- **Child/adolescent <50 kg: PO/IV** 8 mg/kg (max 250 mg/dose) q12hr × 10-14 days

Gonococcal infection, disseminated (unlabeled)

- **Adult: IV** 250 mg q24hr × 24-48 hr then **PO** 500 mg/day × 7 days

PID

- **Adult: IV** 500 mg q24hr × 14 days

Otitis media (unlabeled)

- **Adult: PO** 100-200 mg bid-tid × 3-14 days
- **Child 6 mo-14 yr: PO** 10 mg/kg bid × ≥10 days

Renal disease

- **Adult: PO/IV** CCr 20-49 ml/min, initial 500 mg then 250 mg q24hr; CCr 10-19 ml/min, 500-700 mg, depending on condition, then 250-500 mg q48hr

Available forms: Single-use vials 500, 750 mg; premixed flexible containers 250 mg/50 ml D₅W, 500 mg/100 ml D₅W, 750 mg/150 ml D₅W; tabs 250, 500, 750 mg; oral sol 25 mg/ml

Administer:

- Obtain C&S before treatment and periodically
- PO 4 hr before or 2 hr after antacids, iron, calcium, zinc, give fluids
- **Do not use theophylline with this product; toxicity may result**
- **Oral solution:** Give 1 hr before or 2 hr after food

Intermittent IV INF route

- Discard any unused sol in single-dose vial
- Dilute with 0.9% NaCl, D5W to 5 mg/ml; give over 60 min/250 mg or 90 min/750 mg or using premix; tear outer wrap at notch and remove sol container; check for leaks; close control clamps; remove cover from port at bottom of container; insert pin into port with a twist; suspend container from hanger; squeeze, release drip chamber to proper fluid level; open flow control to expel air, close clamp; regulate rate with flow control clamps

Y-site compatibilities: Alfentanil, amifostine, amikacin, aminocaproic acid, aminophylline, ampicillin, anidulafungin, atenolol, atracurium, aztreonam, bivalirudin, bleomycin, bumetanide, buprenorphine, busulfan, butorphanol, caffeine citrate, calcium gluconate, CARBOplatin, carmustine, caspofungin, cefepime, cefoTetan, ceftAZidime, ceftizoxime, cefTRIAxone, cefuroxime, chlorproMAZINE, cimetidine, cisatracurium, CISplatin, clindamycin, cyclophosphamide, cycloSPORINE, cytarabine, DACTINomycin, DAPTOmycin, dexamethasone, dexrazoxane, digoxin, diltiazem, diphenhydrAMINE, DOBUTamine, DOCEtaxel, dolasetron, DOPamine, doripenem, doxacurium, doxycycline, droperidol, enalaprilat, ePHEDrine, EPINEPHrine, epirubicin, ertapenem, erythromycin, esmolol, etoposide, famotidine, fenoldopam, fentaNYL, filgrastim, floxuridine, fluconazole, fludarabine, fosphenytoin, gemcitabine, gentamicin, granisetron, haloperidol, hydrocortisone, HYDROmorphone, IDArubicin, ifosfamide, imipenem-cilastatin, isoproterenol, labetalol, leucovorin, levorphanol, lidocaine, linezolid, magnesium sulfate, mannitol, mechlorethamine, meperidine, mesna,

methylPREDNISolone, metoclopramide, metroNIDAZOLE, midazolam, milrinone, mitoMYcin, mitoXANtrone, morphine, nalbuphine, naloxone, nesiritide, octreotide, ondansetron, oxacillin, oxaliplatin, oxytocin, PACLitaxel, palonosetron, pancuronium, PEMEtrexed, penicillin G sodium, pentamidine, phenylephrine, plicamycin, potassium chloride, promethazine, propranolol, ranitidine, remifentanyl, rocuronium, sargramostim, succinylcholine, SUFentanyl, tacrolimus, teniposide, theophylline, thiotepa, tirofiban, tobramycin, trimethoprim-sulfamethoxazole, vancomycin, vasopressin, vecuronium, verapamil, vinBLASTine, vinCRISTine, vinorelbine, voriconazole, zidovudine
Solution compatibilities: 0.9% NaCl, D₅W, D₅/0.9% NaCl, D₅LR, D₅/0.45% NaCl, sodium lactate, plasma-lyte 56/D₅W

SIDE EFFECTS

CNS: Headache, dizziness, insomnia, anxiety, seizures, encephalopathy, paresthesia, pseudotumor cerebri

CV: Chest pain, palpitations, vasodilation, QT prolongation

EENT: Dry mouth, visual impairment

GI: Nausea, flatulence, vomiting, diarrhea, abdominal pain, pseudomembranous colitis, hepatotoxicity

GU: Vaginitis, crystalluria

HEMA: Eosinophilia, hemolytic anemia, lymphopenia

INTEG: Rash, pruritus, photosensitivity, epidermal necrolysis

MISC: Hypoglycemia, hypersensitivity, tendinitis, tendon rupture

RESP: Pneumonitis

SYST: Anaphylaxis, multisystem organ failure, Stevens-Johnson syndrome

PHARMACOKINETICS

Metabolized in liver, excreted in urine unchanged, half-life 6-8 hr, peak 1-2 hr

INTERACTIONS

Black Box Warning:

Increase: tendon rupture—corticosteroids

• Do not use with magnesium in same IV line

Increase: levofloxacin levels—probenecid

Increase: CNS stimulation, seizures—NSAIDs, foscarnet

Increase: bleeding risk—warfarin

Decrease: levofloxacin absorption—antacids containing aluminum, magnesium; sucralfate, zinc, iron, calcium

Decrease: clearance of theophylline; toxicity may result

Drug/Lab Test

Decrease: glucose, lymphocytes

NURSING CONSIDERATIONS

Assess:

- Previous sensitivity reaction
- **Signs, symptoms of infection:** characteristics of sputum, WBC $>10,000/\text{mm}^3$, fever; obtain baseline information before, during treatment • C&S before beginning product therapy to identify if correct treatment initiated

⚠ **Allergic reactions, anaphylaxis:** rash, urticaria, pruritus, chills, fever, joint pain; may occur a few days after therapy begins; EPINEPHrine and resuscitation equipment should be available for anaphylactic reaction • **Pseudomembranous colitis:** bowel pattern daily; if severe diarrhea, fever occurs, product should be discontinued ⚠ **Overgrowth of infection:** perineal itching, fever, malaise, redness, pain, swelling, drainage, rash, diarrhea, change in cough, sputum

- Renal function (BUN/creatinine)

Black Box Warning:

Tendon rupture: discontinue product at first sign of tendon pain or inflammation, usually the Achilles tendon is affected; can occur up to few months after treatment and may require surgical repair; steroids may increase risk

Perform/provide:

- Increased fluid intake to 2 L/day to prevent crystalluria

Evaluate:

- Therapeutic response: absence of signs, symptoms of infection (WBC $<10,000/\text{mm}^3$, temp WNL)

Teach patient/family:

- To contact prescriber if vaginal itching; loose, foul-smelling stools; furry tongue occur (may indicate superinfection); to report itching, rash, pruritus, urticaria • To notify prescriber of diarrhea with blood or pus
- To take product 4 hr before or 2 hr after antacids, iron, calcium, zinc products
- To complete full course of therapy
- To avoid hazardous activities until response is known

- To use frequent rinsing of mouth, sugarless candy or gum for dry mouth
- To avoid other medication unless approved by prescriber
- To prevent sun exposure or to use sunscreen to prevent phototoxicity

Black Box Warning:

To notify prescriber of tendon pain, inflammation; avoid corticosteroids with this product

☼ Canada only Side effects: *italics* = common; **bold** = life-threatening ⚠
Nurse Alert

levofloxacin ophthalmic

See [Appendix B](#)

levothyroxine (T₄) (Rx)

(lee-voe-thye-rox'een)

Eltroxin , Levothroid, Levoxyl, Synthroid, Tirosint, Unithroid *Func. class.:* Thyroid hormone

Chem. class.: Levoisomer of thyroxine

Do not confuse: **Synthroid**/Symmetrel

ACTION:

Increases metabolic rate; controls protein synthesis; increases cardiac output, renal blood flow, O₂ consumption, body temp, blood volume, growth, development at cellular level via action on thyroid hormone receptors

USES:

Hypothyroidism, myxedema coma, thyroid hormone replacement, thyrotoxicosis, congenital hypothyroidism, some types of thyroid cancer, pituitary TSH suppression

CONTRAINDICATIONS:

Adrenal insufficiency, recent MI, thyrotoxicosis, hypersensitivity to beef, alcohol intolerance (inj only)

Black Box Warning:

Obesity treatment

Precautions: Pregnancy (A), breastfeeding, geriatric patients, angina pectoris, hypertension, ischemia, cardiac disease, diabetes

DOSAGE AND ROUTES

Calculator

Hypothyroidism

• **Adult ≤50 yr: PO** 1.7 mcg/kg/day, 6-8 wk, average dose 100-200 mcg/day; max 200 mcg/day **IM/IV** 50-100 mcg/day as single dose or 50% of usual oral dosage

- **Adult >50 yr without heart disease or <50 yr with heart disease: PO** 25-50 mcg/day, titrate q6-8wk
- **Adult >50 yr with heart disease: PO** 12.5-25 mcg/day, titrate by 12.5-25 mcg q6-8wk
- **Child >12 yr: PO** 2-3 mcg/kg/day as single dose in AM
- **Child 6-12 yr: PO** 4-5 mcg/kg/day as single dose in AM
- **Child 1-5 yr: PO** 5-6 mcg/kg/day as single dose in AM
- **Child 6-12 mo: PO** 6-8 mcg/kg/day as single dose in AM
- **Child to 6 mo: PO** 8-10 mcg/kg/day as single dose in AM

Myxedema coma

- **Adult: IV** 200-500 mcg, may increase by 100-300 mcg after 24 hr; give oral medication as soon as possible

Subclinical hypothyroidism

- **Adult: PO** 1 mcg/kg/day may be sufficient

Available forms: Powder for inj 200, 500 mcg/vial; tabs 25, 50, 88, 100, 112, 125, 137, 150, 175, 200, 300 mcg; cap (liquid filled) 13, 25, 50, 75, 88, 100, 112, 125, 137, 150 mcg

Administer:

PO route

- In AM if possible as single dose to decrease sleeplessness; at same time each day to maintain product level; take on empty stomach
- Only for hormone imbalances; not to be used for obesity, male infertility, menstrual conditions, lethargy
- Lowest dose that relieves symptoms; lower dose to geriatric patients and for those with cardiac diseases
- Crush and mix with water; nonsoy formula or breast milk for infants, children
- Separate antacids, iron, calcium products by 4 hr

Direct IV route

- IV after diluting with provided diluent 500 mcg/5 ml, 200 mcg/2 ml; shake; give through Y-tube or 3-way stopcock; give ≤100 mcg/1 min; do not add to IV inf
- Considered to be incompatible in syringe with all other products

SIDE EFFECTS

CNS: Anxiety, insomnia, tremors, headache, **thyroid storm**, excitability

CV: Tachycardia, palpitations, angina, dysrhythmias, hypertension, **cardiac**

arrest

GI: Nausea, diarrhea, increased or decreased appetite, cramps

MISC: Menstrual irregularities, weight loss, sweating, heat intolerance, fever, alopecia, decreased bone mineral density

PHARMACOKINETICS

Half-life euthyroid 6-7 days, hypothyroid 9-10 days, hyperthyroid 3-4 days, distributed throughout body tissues

PO: Onset 3-5 days, peak 6-8 wk, duration 1-3 wk

IV: Onset 6-8 hr, peak 24 hr, duration unknown

INTERACTIONS

Increase: cardiac insufficiency risk—EPINEPHrine products

Increase: effects of anticoagulants, sympathomimetics, tricyclics

Decrease: levothyroxine absorption—bile acid sequestrants, orlistat, ferrous sulfate

Decrease: levothyroxine effect—estrogens, antacids, sucralfate, aluminum, magnesium, calcium, iron, rifampin, rifabutin

Drug/Herb

Decrease: thyroid hormone effect—soy

Drug/Lab Test

Increase: CPK, LDH, AST, blood glucose

Decrease: thyroid function tests

NURSING CONSIDERATIONS

Assess:

- B/P, pulse periodically during treatment
- Weight daily in same clothing, using same scale, at same time of day
- Height, growth rate of child
- T_3 , T_4 , FTIs, which are decreased; radioimmunoassay of TSH, which is increased; radio uptake, which is increased if patient receiving too low a dose of medication
- Patient may require decreased anticoagulant; check for bleeding, bruising
- Increased nervousness, excitability, irritability, which may indicate too high a dose of medication, usually after 1-3 wk of treatment
- Cardiac status: angina,

palpitation, chest pain, change in VS

Perform/provide:

- Storage in tight, light-resistant container; sol should be discarded if not used immediately
- Withdrawal of medication 4 wk before RAIU test

Evaluate:

- Therapeutic response: absence of depression; increased weight loss, diuresis, pulse, appetite; absence of constipation, peripheral edema, cold intolerance; pale, cool, dry skin; brittle nails, alopecia, coarse hair, menorrhagia, night blindness, paresthesias, syncope, stupor, coma, rosy cheeks

Teach patient/family:

- That hair loss will occur in child, is temporary; that hypothyroid child will show almost immediate behavior/personality change
- To report excitability, irritability, anxiety, which indicate overdose
- Not to switch brands unless approved by prescriber
- That product may be discontinued after giving birth; that thyroid panel should be evaluated after 1-2 mo
- That product is not to be taken to reduce weight
- To avoid OTC preparations with iodine; to read labels; to separate antacids, iron, calcium products by 4 hr
- To avoid iodine-rich food, iodized salt, soybeans, tofu, turnips, high-iodine seafood, some bread
- That product is not a cure but controls symptoms; that treatment is lifelong, full effect may take up to 6 wk

🍁 Canada only Side effects: *italics* = common; **bold** = life-threatening ⚠️
Nurse Alert

HIGH ALERT

lidocaine (parenteral) (Rx)

(lye'doe-kane)

LidoPen Auto-Injector, Xylocaine, Xylocard 

Func. class.: Antidysrhythmic (Class Ib)

Chem. class.: Aminoacyl amide

ACTION:

Increases electrical stimulation threshold of ventricle, His-Purkinje system, which stabilizes cardiac membrane, decreases automaticity

USES:

Ventricular tachycardia, ventricular dysrhythmias during cardiac surgery, digoxin toxicity, cardiac catheterization

Unlabeled uses: Attenuation of intracranial pressure increased during intubation/endotracheal tube suctioning

CONTRAINDICATIONS:

Hypersensitivity to amides, severe heart block, supraventricular dysrhythmias, Adams-Stokes syndrome, Wolff-Parkinson-White syndrome

Precautions: Pregnancy (B), breastfeeding, children, geriatric patients, renal/hepatic disease, CHF, respiratory depression, malignant hyperthermia, myasthenia gravis, weight <50 kg

DOSAGE AND ROUTES

Calculator

• **Adult:** **IV BOL** 50-100 mg (1-1.5 mg/kg) 25-50 mg/min, repeat q3-5min, max 300 mg in 1 hr; begin **IV INF**; **IV INF** 1-4 mg/min (20-50 mcg/kg/min); **IM** 200-300 mg (4.3 mg/kg) in deltoid muscle, may repeat after 1-1 1/2 hr if needed

Available forms: **IV INF** 0.2% (2 mg/ml), 0.4% (4 mg/ml), 0.8% (8 mg/ml); **IV ad** 4% (40 mg/ml), 10% (100 mg/ml), 20% (200 mg/ml); **IV dir** 1% (10 mg/ml), 2% (20 mg/ml); **IM** 10% 300 mg/ml

Administer:

• IM inj in deltoid; aspirate to avoid intravascular administration; check IV site

daily for infiltration or extravasation

IV route

- Bolus undiluted (1%, 2% only), give ≤ 50 mg/1 min or dilute 1 g/250-500 ml D₅W; titrate to patient response; use inf pump; pediatric inf 120 mg lidocaine/100 ml D₅W; 1-2.5 ml/kg/hr = 20-50 mcg/kg/min; use only 1%, 2% sol for IV bol

Y-site compatibilities: Alemtuzumab, alteplase, amikacin, aminophylline, amiodarone, argatroban, atropine, aztreonam, bivalirudin, bumetanide, calcium chloride/gluconate, ceFAZolin, cefotaxime, cefOXitin, cefTAZidime, ceftizoxime, cefTRIAxone, cefuroxime, chloramphenicol, cimetidine, ciprofloxacin, cisatracurium, clindamycin, cycloSPORINE, DAPTOmycin, dexamethasone, dexmedetomidine, digoxin, diltiazem, diphenhydrAMINE, DOBUTamine, DOPamine, doxycycline, enalaprilat, EPINEPHrine, eptifibatide, ertapenem, erythromycin, esmolol, etomidate, famotidine, fenoldopam, fentaNYL, fluconazole, furosemide, gentamicin, granisetron, haloperidol, heparin, hydrocortisone, imipenem/cilastatin, inamrinone, insulin, isoproterenol, ketorolac, labetalol, levofloxacin, linezolid, LORazepam, magnesium sulfate, meperidine, methylPREDNISolone sodium succinate, metoclopramide, metoprolol, metroNIDAZOLE, micafungin, midazolam, morphine, nafcillin, niCARdipine, nitroglycerin, nitroprusside, norepinephrine, ondansetron, palonosetron, penicillin G potassium, phenylephrine, phytonadione, piperacillin/tazobactam, potassium chloride, procainamide, prochlorperazine, promethazine, propofol, propranolol, protamine, quinupristin/dalfopristin, ranitidine, remifentanyl, sodium bicarbonate, streptokinase, tacrolimus, theophylline, ticarcillin/clavulanate, tigecycline, tirofiban, tobramycin, vancomycin, vasopressin, verapamil, vitamin B complex with C, voriconazole, warfarin

SIDE EFFECTS

CNS: Headache, dizziness, involuntary movement, confusion, tremor, drowsiness, euphoria, **seizures**, shivering

CV: Hypotension, bradycardia, **heart block**, **CV collapse**, **arrest**

EENT: Tinnitus, blurred vision

GI: Nausea, vomiting, anorexia

HEMA: Methemoglobinemia

INTEG: Rash, urticaria, edema, swelling, petechiae, pruritus

MISC: Febrile response, phlebitis at inj site

RESP: Dyspnea, respiratory depression

PHARMACOKINETICS

Half-life 8 min, 1-2 hr (terminal); metabolized in liver; excreted in urine; crosses placenta

IM: Onset 5-15 min, duration 1½ hr

IV: Onset 2 min, duration 20 min

INTERACTIONS

Increase: cardiac depression, toxicity—amiodarone, phenytoin, procainamide, propranolol

Increase: hypotensive effects—MAOIs, antihypertensives

Increase: neuromuscular blockade—neuromuscular blockers, tubocurarine

Increase: lidocaine effects—cimetidine, beta blockers, protease inhibitors, ritonavir

Decrease: lidocaine effects—barbiturates, ciprofloxacin, voriconazole

Decrease: effect of—cycloSPORINE

Drug/Lab Test

Increase: CPK

NURSING CONSIDERATIONS

Assess:

⚠️ ECG continuously to determine increased PR or QRS segments; if these develop, discontinue or reduce rate; watch for increased ventricular ectopic beats, may have to rebolus; B/P

- **Blood levels:** therapeutic level, 1.5-5 mcg/ml

- I&O ratio, electrolytes (potassium, sodium, chlorine)

⚠️ **Malignant hyperthermia:** tachypnea, tachycardia, changes in B/P, increased temp • **Respiratory status:** rate, rhythm, lung fields for crackles, watch for respiratory depression; lung fields, bilateral crackles may occur with CHF; increased respiration, pulse; product should be discontinued • **CNS effects:** dizziness, confusion, psychosis, paresthesias, convulsions; product should be discontinued

Evaluate:

- Therapeutic response: decreased dysrhythmias

Teach patient/family:

- About the use of automatic lidocaine injection device if ordered for personal use
- To report signs of toxicity

TREATMENT OF OVERDOSE:

O₂, artificial ventilation, ECG; administer DOPamine for circulatory depression, diazepam or thiopental for seizures; decrease product if needed

🍁 Canada only Side effects: *italics* = common; **bold** = life-threatening ⚠️
Nurse Alert

lidocaine topical

See [Appendix B](#)

linagliptin

(lin'a-glip'tin)

Tradjenta

Func. class.: Antidiabetic

Chem. class.: Dipeptidyl peptidase-4 inhibitor

ACTION:

Slows the inactivation of incretin hormones. Concentrations of the active, intact hormones are increased, thereby increasing and prolonging the action of these hormones. Incretin hormones are released by the intestine throughout the day, and levels are increased in response to a meal

USES:

Type 2 diabetes mellitus

CONTRAINDICATIONS:

Hypersensitivity to linagliptin, type 1 diabetes mellitus, diabetic ketoacidosis (DKA)

Precautions: Pregnancy (category B), breastfeeding, adolescents or children <18 yr, debilitated physical condition, malnutrition, uncontrolled adrenal insufficiency, pituitary insufficiency, hypo/hyperthyroidism, diarrhea, gastroparesis, GI obstruction, ileus, female hormonal changes, high fever, severe psychological stress, uncontrolled hypercortisolism

DOSAGE AND ROUTES

Calculator

- **Adult: PO** 5 mg daily; when used with a sulfonylurea or insulin; a lower dose of the sulfonylurea may be necessary to minimize the risk of hypoglycemia

Available forms: Tab 5 mg

Administer:

- Once daily; may give without regard to food

SIDE EFFECTS

CNS: Headache

EENT: Nasopharyngitis

ENDO: Hypoglycemia, hyperuricemia

GI: Body weight loss, **pancreatitis**

INTEG: Hypersensitivity reactions, urticaria, **angioedema, exfoliative dermatitis**

MISC: Arthralgia, back pain

RESP: Bronchial hyperreactivity (with **bronchospasm**), nasopharyngitis, cough

PHARMACOKINETICS

Extensively distributed in the tissues, protein binding is concentration-dependent, a weak to moderate inhibitor of CYP3A4, plasma terminal half life of >100 hr; effective half-life 12 hr, 90% excreted unchanged, 85% excreted via the enterohepatic system (80%) or in urine (5%) within 4 days of dosing, rapidly absorbed, peak in 1.5 hr; bioavailability 30%

INTERACTIONS

- Increased hypoglycemia: sulfonylureas, beta blockers, ACE inhibitors, angiotensin II receptor antagonists, disopyramide, guanethidine, cloNIDine, octreotide, fenfluramine, dexfenfluramine, fibric acid derivatives, monoamine oxidase inhibitors (MAOIs), FLUoxetine, salicylates
- Increased masking of the signs and symptoms of hypoglycemia: reserpine

- Increased need for dosing change: cisapride, metoclopramide, tegaserod, androgens, alcohol, lithium, quinolones

Decrease: hypoglycemic effect—dextrothyroxine, bumetanide, furosemide, ethacrynic acid, torsemide, estrogens, progestins, oral contraceptives, thyroid hormones, glucocorticoids, glucagon, carbonic anhydrase inhibitors, phenytoin, fosphenytoin, or ethosuximide; atypical antipsychotics (ARIPiprazole, cloZAPine, OLANZapine, QUetiapine, risperiDONE, and ziprasidone), phenothiazine, niacin (nicotinic acid), triamterene, thiazide diuretics

Decrease: effect of linagliptin—CYP3A4 inducers (topiramate, rifabutin, pioglitazone, OXcarbazepine, carBAMazepine, nevirapine, modafinil, metyrapone, etravirine, efavirenz, bosentan, barbiturates, aprepitant, fosaprepitant)

Drug/Herb:

Decrease: linagliptin effect—St. John's wort

Drug/Lab Test:

Increase: uric acid

NURSING CONSIDERATIONS

Assess

- **Hypo/hyperglycemia:** reaction may occur after meals, for severe hypoglycemia use IV Dextrose • Monitor blood glucose, A1c, during treatment to determine diabetes control
- CBC baseline and periodically during treatment, report decreased blood counts

Perform/provide:

- Storage at room temperature

Evaluate:

- Improving blood glucose level, A1c; decreasing polydipsia, polyphagia, polyuria, clear sensorium, absence of dizziness

Teach patient/family:

- About the symptoms of hypo/hyperglycemia and what to do about each; to have glucagon emergency kit available, to carry sugar packets • That product must be continued on a daily basis, about the consequences of discontinuing product abruptly; to take only as directed • To avoid OTC products unless approved by prescriber
- That diabetes is a lifelong illness, that product will not cure diabetes
- That all food in diet plan must be eaten to prevent hypoglycemia
- To carry emergency ID with prescriber, condition and medications taken
- **To immediately report skin disorders, swelling, difficulty breathing, or severe abdominal pain**

✳ Canada only Side effects: *italics* = common; **bold** = life-threatening ⚠

Nurse Alert

lindane (Rx)

(lin'dane)

Hexit 

Func. class.: Scabicide, pediculicide

Chem. class.: Chlorinated hydrocarbon (synthetic)

ACTION:

Stimulates nervous system of arthropods, resulting in seizures, death

USES:

Scabies, lice (head/pubic/body), nits in those intolerant to or who do not respond to other agents

CONTRAINDICATIONS:

Hypersensitivity, patients with known seizure disorders, Norwegian (crusted) scabies

Black Box Warning:

Premature neonate; inflammation of skin, abrasions, skin breaks; seizure disorder

Precautions: Pregnancy (C), breastfeeding, infants, children <10 yr, avoid contact with eyes

DOSAGE AND ROUTES

Calculator

Lice

• **Adult and child: CREAM/LOTION** shampoo using 30 ml: work into lather, rub for 5 min, rinse, dry with towel; comb with fine-toothed comb to remove nits; most require 1 oz, max 2 oz

Scabies

• **Adult and child: TOP** apply 1% cream/lotion to skin, from neck to bottom of feet, toes; wash area with soap, water; remove visible crusts; apply to skin surfaces; remove with soap, water in 8-12 hr; repeat after 1 wk prn; most require 1 oz, max 2 oz

Available forms: Lotion, shampoo, cream (1%)

Administer:

- Caregivers should wear gloves less permeable to lindane, thoroughly clean hands after application; avoid natural latex gloves • **Cream/ointment/lotion:** use for scabies only; skin should be clean without other products on it, wait 1 hr after bathing or showering before application, shake well, apply under fingernails after trimming; toothbrush can be used to apply; after application wrap toothbrush in paper and throw away; use only a single application, apply as thin layer over all skin from neck down, close bottle containing leftover lotion, throw away • Do not cover, wash off after 8-12 hr
- Use warm, not hot, water; do not leave on >12hr
- **Shampoo:** for lice only; do not use other hair products before use; shake well; hair should be completely dry; use only enough shampoo to lightly coat hair and scalp, work into hair, do not use water; allow to remain only 4 min, rinse, lather away, towel briskly • To scalp only; do not apply to face, lips, mouth, eyes, any mucous membrane, anus, or meatus • Topical corticosteroids as ordered to decrease contact dermatitis; antihistamines
- Lotions of menthol or phenol to control itching
- Topical antibiotics for infection

SIDE EFFECTS

CNS: Seizures, CNS toxicity, stimulation, dizziness

INTEG: Pruritus, rash, irritation, contact dermatitis

PHARMACOKINETICS

Peak 6 hr, half-life 18-22 hr

INTERACTIONS

- Oils may increase absorption; if oil-based hair dressing used, shampoo, rinse, dry hair before applying lindane shampoo

NURSING CONSIDERATIONS

Assess:

Black Box Warning:

Skin for abrasions, breaks, inflammation; do not use on these areas

- **Infestation:** head, hair for lice, nits before and after treatment; if scabies present, check all skin surfaces; identify source of infection: school, family,

sexual contacts

Perform/provide:

- Isolation until areas on skin, scalp have cleared, treatment completed
- Removal of nits with fine-toothed comb rinsed in vinegar after treatment; use gloves

Evaluate:

- Therapeutic response: decreased crusts, nits, brownish trails on skin, itching papules in skin folds, decreased itching after several weeks

Teach patient/family:

- To wash all inhabitants' clothing using insecticide; that preventive treatment may be required of all persons living in same house using lotion or shampoo to decrease spread of infection; to use rubber gloves when applying product
- That itching may continue for 4-6 wk
- That product must be reapplied if accidentally washed off or treatment will be ineffective
- Not to apply to face; if accidental contact with eyes occurs, flush with water
- To remove product after specified time to prevent toxicity
- To treat sexual contacts simultaneously
- To check for CNS toxicity: dizziness, cramps, anxiety, nausea, vomiting, seizures

✳ Canada only Side effects: *italics* = common; **bold** = life-threatening ⚠
Nurse Alert

linezolid (Rx)

(line-zoe'lide)

Zyvox

Func. class.: Broad-spectrum antiinfective

Chem. class.: Oxazolidinone

Do not confuse: Zyvox/Ziox/Zosyn

ACTION:

Inhibits protein synthesis by interfering with translation; binds to bacterial 23S ribosomal RNA of the 50S subunit, thus preventing formation of the bacterial translation process in primarily gram-positive organisms

USES:

Vancomycin-resistant *Enterococcus faecium* infections, nosocomial pneumonia caused by *Staphylococcus aureus* or *Streptococcus pneumoniae*, uncomplicated or complicated skin and skin-structure infections, community-acquired pneumonia, *Pasteurella multocida*, viridans streptococci

CONTRAINDICATIONS:

Hypersensitivity

Precautions: Pregnancy (C), breastfeeding, children, thrombocytopenia, bone marrow suppression, hypertension, hyperthyroidism, pheochromocytoma, seizure disorder, ulcerative colitis, MI, PKU, renal/GI disease

DOSAGE AND ROUTES

Calculator

Vancomycin-resistant *enterococcus faecium* infections

- **Adult/adolescent/child ≥ 12 yr:** IV/PO 600 mg q12hr $\times$ 14-28 days; max 1200 mg/day

- **Child < 12 yr/infant/term neonate:** IV/PO 10 mg/kg q8hr $\times$ 14-28 days

Nosocomial pneumonia/complicated skin infections/community-acquired pneumonia/concurrent bacterial infection

- **Adult:** IV/PO 600 mg q12hr $\times$ 10-14 days; max 1200 mg/day

- **Child: Birth-11 yr:** PO 10 mg/kg q8hr $\times$ 10-14 days

Uncomplicated skin infections

- **Adult: PO** 400 mg q12hr × 10-14 days; max 1200 mg/day
- **Adolescent: PO** 600 mg q12hr × 10-14 days; max 1200 mg/day
- **Infant preterm <7 days old: PO** 10 mg/kg q12hr × 10-14 days

Available forms: Tabs 600 mg; oral sus 100 mg/5 ml; inj 2 mg/ml

Administer:

PO route

- With/without food
- Store reconstituted oral susp at room temp, use within 3 wk

Intermittent IV INF route

- Do not use if particulate is present, yellow color is normal
- Premixed sol ready to use (2 mg/ml), give over 30-120 min; do not use IV inf bag in series connections; do not use with additives in sol; do not use with another product, administer separately, flush line before and after use

Y-site compatibilities: Acyclovir, alfen-tanil, amikacin, aminophylline, ampicillin, aztreonam, buprenorphine, butorphanol, calcium gluconate, CARBOplatin, ceFAZolin, cefoperazone, cefoTEtan, cefOXitin, cefTAZidime, ceftizoxime, cefuroxime, cimetidine, ciprofloxacin, cisatracurium, CISplatin, clindamycin, cyclophosphamide, cycloSPORINE, cytarabine, digoxin, furosemide, ganciclovir, gemcitabine, gentamicin, heparin, HYDROmorphine, ifosfamide, labetalol, leucovorin, levofloxacin, lidocaine, LORazepam, magnesium sulfate, mannitol, meperidine, meropenem, mesna, methotrexate, methylPREDNISolone, metoclopramide, metroNIDAZOLE, midazolam, minocycline, mitoXANtrone, morphine, nalbuphine, naloxone, nitroglycerin, ofloxacin, ondansetron, PACLitaxel, PENTobarbital, PHENobarbital, piperacillin, potassium chloride, prochlorperazine, promethazine, propranolol, ranitidine, remifentanyl, SUFentanyl, theophylline, ticarcillin, tobramycin, vancomycin, vecuronium, verapamil, vinCRISTine, zidovudine

Solution compatibilities: D₅, 0.9% NaCl, LR

SIDE EFFECTS

CNS: Headache, dizziness, insomnia

GI: Nausea, diarrhea, pseudomembranous colitis, increased ALT/AST, vomiting, taste change, tongue-color change

HEMA: Myelosuppression

MISC: Vaginal moniliasis, fungal infection, oral moniliasis, lactic acidosis, anaphylaxis, angioedema, Stevens-Johnson syndrome

PHARMACOKINETICS

Peak 1-2 hr, terminal half-life 4-5 hr, rapidly and extensively absorbed, protein binding 31%, metabolized by oxidation of the morpholine ring

INTERACTIONS

⚠ Do not use with MAOIs (or within 2 wk) or with products that possess MAOI-like action (furazolidone, isoniazid, INH, procarbazine); hypertensive crisis may occur ⚠ **Increase:** hypertensive crisis, seizures, coma—amoxapine, maprotiline, mirtazapine, traZODone, cyclobenzaprine, tricyclics, methyl dopa

Increase: serotonin syndrome—SSRIs, SNRIs, serotonin receptor agonists

Increase: effects of adrenergic agents (DOPamine, EPINEPHrine, pseudoephedrine)

Drug/Herb

- Avoid use with green tea, valerian, ginseng, yohimbine, kava, guarana, St. John's wort

Drug/Food

- Tyramine foods: avoid; increased pressor response

NURSING CONSIDERATIONS

Assess:

- CBC with differential weekly, assess for myelosuppression (anemias, leukopenia, pancytopenia, thrombocytopenia) • **Serotonin syndrome:** at least 2 wk should elapse between discontinuing linezolid and starting serotonergic agents; assess for increased heart rate, shivering, sweating, dilated pupils, tremor, high B/P, hyperthermia, headache, confusion; if these occur, stop linezolid, administer a serotonin antagonist if needed • **Lactic acidosis:** repeated nausea/vomiting, unexplained acidosis, low bicarbonate level; notify prescriber immediately • **Anaphylaxis/angioedema/Stevens-Johnson syndrome:** rash, pruritus, difficulty breathing, fever; have emergency equipment nearby • CNS symptoms: headache, dizziness
- Hepatic studies: AST, ALT
- **Diabetes mellitus:** monitor those receiving insulin or oral antidiabetics for

increased hypoglycemia  **Pseudomembranous colitis:** diarrhea, abdominal pain, fever, fatigue, anorexia, possible anemia, elevated WBC, low serum albumin; stop product, usually either vancomycin or IV metroNIDAZOLE given

Evaluate:

- Therapeutic response: decreased symptoms of infection, blood cultures negative

Teach patient/family:

- If dizziness occurs, to ambulate, perform activities with assistance
- To complete full course of product therapy
- To contact prescriber if adverse reaction occurs
- To inform prescriber if SSRI or cold products, decongestants being used
- To inform prescriber of history of hypertension
- To avoid large amounts of high-tyramine foods, drinks; provide list

☼ Canada only Side effects: *italics* = common; **bold** = life-threatening 
Nurse Alert

liothyronine (T₃) (Rx)

(lye-oh-thye'roe-neen)

Cytomel, Triostat

Func. class.: Thyroid hormone

Chem. class.: Synthetic T₃

Do not confuse: Cytomel/Cytotec

ACTION:

Increases metabolic rates, cardiac output, O₂ consumption, body temp, blood volume, growth, development at cellular level; exact mechanism unknown

USES:

Hypothyroidism, myxedema coma, thyroid hormone replacement, congenital hypothyroidism, nontoxic goiter, T₃ suppression test

CONTRAINDICATIONS:

Adrenal insufficiency, MI, thyrotoxicosis, untreated hypertension

Black Box Warning:

Obesity treatment

Precautions: Pregnancy (A), breastfeeding, geriatric patients, angina pectoris, hypertension, ischemia, cardiac disease, diabetes

DOSAGE AND ROUTES

Calculator

- **Adult: PO** 25 mcg/day, increase by 12.5-25 mcg q1-2wk until desired response, maintenance dose 25-75 mcg/day, max 100 mcg/day
- **Geriatric: PO** 5 mcg/day, increase by 5 mcg/day q1-2wk, maintenance 25-75 mcg/day

Congenital hypothyroidism

- **Child >3 yr: PO** 50-100 mcg/day
- **Child <3 yr: PO** 5 mcg/day, increase by 5 mcg q3-4days titrated to response, infant maintenance 20 mcg/day; 1-3 yr 50 mcg/day

Myxedema, severe hypothyroidism

- **Adult: PO** 25-50 mcg then may increase by 5-10 mcg q1-2wk; maintenance

dose 50-100 mcg/day

Myxedema coma/precoma

- **Adult: IV** 25-50 mcg initially, 5 mcg in geriatric patients, 10-20 mcg with cardiac disease; give doses q4-12hr

Nontoxic goiter

- **Adult: PO** 5 mcg/day, increase by 12.5-25 mcg q1-2wk; maintenance dose 75 mcg/day

Suppression test

- **Adult: PO** 75-100 mcg/day × 1 wk; radioactive ^{131}I given before and after 1-wk dose

Available forms: Tabs 5, 25, 50 mcg; inj 10 mcg/ml

Administer:

- In AM if possible as a single dose to decrease sleeplessness • At same time each day to maintain product level
- Only for hormone imbalances; do not use for obesity, male infertility, menstrual conditions, lethargy • Lowest dose that relieves symptoms
- Liothyronine after discontinuing other thyroid preparations
- Do not give with calcium, iron, aluminum, magnesium, soy products

SIDE EFFECTS

CNS: *Insomnia, tremors, headache, thyroid storm*

CV: *Tachycardia, palpitations, angina, dysrhythmias, hypertension, cardiac arrest*

GI: Nausea, diarrhea, increased or decreased appetite, cramps

MISC: Menstrual irregularities, weight loss, sweating, heat intolerance, fever, alopecia

PHARMACOKINETICS

PO/IV: Peak 2-3 days, duration 72 hr, half-life 2.5 days

INTERACTIONS

Increase: effects of—anticoagulants, sympathomimetics, tricyclics, amphetamines, decongestants, vasopressors

Decrease: absorption of liothyronine—cholestyramine; colestipol; calcium, iron, aluminum, magnesium products

Decrease: effects of liothyronine—estrogens

Drug/Herb

Decrease: thyroid hormone effect—soy

Drug/Lab Test

Increase: CPK, LDH, AST, PBI, blood glucose

Decrease: thyroid function tests

NURSING CONSIDERATIONS

Assess:

- B/P, pulse periodically during treatment
- Weight daily in same clothing, using same scale, at same time of day
- Height, growth rate of child
- T₃, T₄, which are decreased; radioimmunoassay of TSH, which is increased; radio uptake, which is increased if patient receiving too low a dose of medication
- Patient may require decreased anticoagulant; check for bleeding, bruising
- Increased nervousness, excitability, irritability, which may indicate too high a dose of medication, usually after 1-3 wk of treatment • Cardiac status: angina, palpitation, chest pain, change in VS

Perform/provide:

- Removal of medication 4 wk before RAIU test

Evaluate:

- Therapeutic response: absence of depression; increased weight loss, diuresis, pulse, appetite; absence of constipation, peripheral edema, cold intolerance; pale, cool, dry skin; brittle nails; alopecia, coarse hair; menorrhagia; night blindness; paresthesia; syncope, stupor, coma

Teach patient/family:

- That hair loss will occur in child but is temporary
- To report excitability, irritability, anxiety, which indicate overdose
- Not to switch brands unless approved by prescriber
- That hypothyroid child will show almost immediate behavior/personality change
- That product is not to be taken to reduce weight
- To avoid OTC preparations with iodine; to read labels; not to take with calcium, iron, aluminum, magnesium products • To avoid iodine-rich food, iodized salt, soybeans, tofu, turnips, high iodine seafood, some bread • That

product controls symptoms but does not cure; that treatment is lifelong

🍁 Canada only Side effects: *italics* = common; **bold** = life-threatening ⚠️
Nurse Alert

liotrix (Rx)

(lye'oh-trix)

Thyrolar, T₃/T₄

Func. class.: Thyroid hormone

Chem. class.: Levothyroxine/liothyronine (synthetic T₄, T₃)

Do not confuse: **Thyrolar**/Thyrar

ACTION:

Increases metabolic rates, cardiac output, O₂ consumption, body temp, blood volume, growth, development at cellular level; exact mechanism unknown

USES:

Hypothyroidism, thyroid hormone replacement

CONTRAINDICATIONS:

Adrenal insufficiency, MI, thyrotoxicosis

Black Box Warning:

Obesity treatment

Precautions: Pregnancy (A), breastfeeding, geriatric patients, angina pectoris, hypertension, ischemia, cardiac disease, diabetes

DOSAGE AND ROUTES

Calculator

• **Adult: PO** single dose of Thyrolar, 1/4 or 1/2 of adult dose, adjust as needed at 2-wk intervals

• **Geriatric: PO** 1/4 tab initially, adjust q6-8wk

Available forms: Tabs: Levothyroxine 12.5 mcg/liothyronine 3.1 mcg; levothyroxine 25 mcg/liothyronine 6.25 mcg (Thyrolar-1/2); levothyroxine 50 mcg/liothyronine 12.5 mcg (Thyrolar-1); levothyroxine 100 mcg/liothyronine 25 mcg (Thyrolar-2); levothyroxine 150 mcg/liothyronine 37.5 mcg (Thyrolar-3)

Administer:

- Separate products containing calcium, iron by ≥ 4 hr
- In AM if possible as a single dose to decrease sleeplessness • At same time each day to maintain product level

- Only for hormone imbalances; do not use for obesity, male infertility, menstrual conditions, lethargy
- Lowest dose that relieves symptoms

SIDE EFFECTS

CNS: *Insomnia, tremors, headache, thyroid storm, nervousness*

CV: *Tachycardia, palpitations, angina, dysrhythmias, hypertension, cardiac arrest*

GI: *Nausea, vomiting, diarrhea, increased or decreased appetite, cramps*

MISC: *Menstrual irregularities, weight loss, sweating, heat intolerance, fever*

PHARMACOKINETICS

PO (T₄): Onset unknown, peak 1-3 wk, duration 1-3 wk, terminal half-life 6-7 days

PO (T₃): Onset unknown, peak 24-72 hr, duration 72 hr, terminal half-life 1-2 days

INTERACTIONS

Increase: effects of amphetamines, decongestants, vasopressors, anticoagulants, sympathomimetics, tricyclics, catecholamines

Decrease: absorption of liotrix—cholestyramine, colestipol

Decrease: effects of liotrix—estrogens, phenytoin, carbamazepine, rifampin

Drug/Herb

Decrease: thyroid hormone effect—soy

Drug/Lab Test

Increase: CPK, LDH, AST, PBI, blood glucose

Decrease: thyroid function tests

NURSING CONSIDERATIONS

Assess:

- B/P, pulse periodically during treatment
- Weight daily in same clothing, using same scale, at same time of day
- Height, growth rate of child
- T₃, T₄, FTIs, which are decreased; radioimmunoassay of TSH, which is increased; radio uptake, which is increased if patient is receiving too low a dose of medication
- May require decreased anticoagulant; check for bleeding,

bruising

- Increased nervousness, excitability, irritability, which may indicate too high a dose of medication, usually after 1-3 wk of treatment
- Cardiac status: angina, palpitation, chest pain, change in VS

Perform/provide:

- Withdrawal of medication 4 wk before RAIU test
- Storage in airtight, light-resistant container

Evaluate:

- Therapeutic response: absence of depression; increased weight loss, diuresis, pulse, appetite; absence of constipation, peripheral edema, cold intolerance; pale, cool, dry skin; brittle nails; coarse hair; menorrhagia; night blindness; paresthesias; syncope, stupor, coma; rosy cheeks

Teach patient/family:

- That hair loss will occur in child, is temporary
- To report excitability, irritability, chest pain, increased pulse rate, palpitations, excessive sweating, heat intolerance, nervousness, anxiety, which indicate overdose
- Not to switch brands unless approved by prescriber
- That hypothyroid child will show almost immediate behavior/personality change
- That product is not to be taken to reduce weight
- To avoid OTC preparations with iodine; read labels; separate products containing calcium, iron by ≥ 4 hr
- To avoid iodine food, iodized salt, soybeans, tofu, turnips, high iodine seafood, some bread
- That product does not cure but controls symptoms; treatment is lifelong

🇨🇦 Canada only Side effects: *italics* = common; **bold** = life-threatening ⚠️
Nurse Alert

liraglutide (Rx)

(lir'a-gloo'tide)

Victoza

Func. class.: Antidiabetic agent

Chem. class.: Incretin mimetics

ACTION:

Improved glycemic control and potential weight loss via activation of the glucagon-like peptide-1 (GLP-1) receptor

USES:

Type 2 diabetes mellitus in combination with diet/exercise

CONTRAINDICATIONS:

Hypersensitivity

Black Box Warning:

Medullary thyroid carcinoma (MTC), multiple endocrine neoplasia syndrome type 2 (MEN 2), thyroid cancer

Precautions: Breastfeeding, children, geriatric patients, alcoholism, burns, cholelithiasis, type 1 diabetes mellitus, ketoacidosis, diarrhea, fever, gastroparesis, hepatic/renal disease, hypoglycemia, infection, pancreatitis, surgery, thyroid disease, trauma, vomiting

DOSAGES AND ROUTES

Calculator

• **Adult:** SUBCUT 0.6 mg/day $\times$ 1 wk, then increase to 1.2 mg/day, max 1.8 mg/day

Available forms: Solution for injection 18 mg/3 ml pre-filled pen

Administer:

SUBCUT route

• Give subcut only, inspect for particulate matter, discoloration; do not use if unusually viscous, cloudy, discolored, or if particles present; give daily anytime, without regard to meals; pen needles must be purchased separately, use Novo Nordisk needle; prior to first use, prime, see manual for directions; give in thigh, abdomen, or upper arm; lightly pinch fold of skin, insert needle at 90-degree

angle (45-degree angle if thin), release skin; aspiration is not needed, give over 6 sec, rotate injection sites • If dose is missed, resume once-daily dosing at next scheduled dose

SIDE EFFECTS

CNS: Dizziness, headache

CV: Hypertension

ENDO: Hypoglycemia

EENT: Sinusitis

GI: Abdominal pain, anorexia, constipation, diarrhea, dyspepsia, nausea, vomiting, **pancreatitis**

INTEG: **Angioedema**, erythema, injection site reaction, urticaria

MS: Back pain

SYST: Antibody formation, infection, influenza, **secondary thyroid malignancy**, **anaphylaxis**

INTERACTIONS

Increase: hypoglycemic reactions—angiotensin II receptor antagonists, ACE inhibitors, other antidiabetics, β -blockers, dexfenfluramine, fenfluramine, disopyramide, FLUoxetine, fibric acid derivatives, mecamermin, MAOIs, octreotide, pegvisomant, salicylates

Increase: hyperglycemic reactions—protease inhibitors, phenothiazines, baclofen, atypical antipsychotics, corticosteroids, cycloSPORINE, tacrolimus, carbonic anhydrase inhibitors, dextrothyroxine, diazoxide, phenytoin, fosphenytoin, ethotoin, isoniazid, INH, niacin, nicotine, estrogens, progestins, oral contraceptives, growth hormones, sympathomimetics

Increase or decrease: hypoglycemic reactions—androgens, bortezomib, quinolones, cloNIDine, alcohol, lithium, pentamidine

Increase or decrease: effects of—torvastatin, acetaminophen, griseofulvin

PHARMACOKINETICS

Protein binding (98%); half-life 12-13 hr; binds to albumin, then released into circulation; peak 8-12 hr; body weight significantly affects pharmacokinetics

NURSING CONSIDERATIONS

Assess:

Black Box Warning:

Thyroid C-cell tumors; monitor during treatment

- **Hypoglycemic reactions** that may occur soon after meals: hunger, sweating, weakness, dizziness, tremors, restlessness, tachycardia
- Hypersensitivity to this product

- Serum glucose, A1c, CBC during treatment

- **Stress:** those diabetic patients exposed to stress, surgery, fever, infections may require insulin administration temporarily

- **Serious skin reactions:** angioedema, pancreatitis, secondary thyroid malignancy

Perform/provide:

- Storage: do not store pen with needle attached; avoid direct heat and sunlight; discard 30 days after first use; after first use may be stored at room temp or refrigerated, do not freeze

Evaluate:

- Therapeutic response: stable and improved serum glucose, A1C, weight loss

Teach patient/family:

- About symptoms of hypo/hyperglycemia, what to do for each; to have glucagon emergency kit available; to carry a carbohydrate source at all times

- About side effects associated with therapy, such as nausea and vomiting; that upward dose titration can be delayed or ignored, depending on tolerance
- That diabetes is a lifelong illness; that product does not cure disease and must be continued on a daily basis
- To carry emergency ID with prescriber's phone number and medications taken

- To continue with other recommendations: diet, exercise, hygiene

- To test blood glucose using a blood glucose meter

- To avoid other medications, herbs, supplements unless approved by prescriber

- **To report serious skin effects, abdominal pain with nausea/vomiting**
- **Provide patient with written instructions if self-administration is ordered**

✳ Canada only Side effects: *italics* = common; **bold** = life-threatening 

Nurse Alert

lisdexamfetamine (Rx)

(lis-dex'am-fet'a-meen)

Vyvanse

Func. class.: CNS stimulant

Chem. class.: Amphetamine

Controlled Substance Schedule II

ACTION:

Increases release of norepinephrine, dopamine in cerebral cortex to reticular activating system

USES:

Attention-deficit/hyperactivity disorder (ADHD)

CONTRAINDICATIONS:

Breastfeeding, hyperthyroidism, hypertension, glaucoma, severe arteriosclerosis, CV disease, hypersensitivity to sympathomimetic amines

Black Box Warning:

Substance abuse

Precautions: Pregnancy (C), children <6 yr, Gilles de la Tourette's disorder, depression, anorexia nervosa, psychosis, seizure disorder, suicidal ideation, MI, heart failure, alcoholism, aortic stenosis, bipolar disorder

DOSAGE AND ROUTES

Calculator

• **Child 6-12 yr: PO** 30 mg/day, may increase by 10-20 mg/day at weekly intervals, max 70 mg/day

Available forms: Caps 30, 50, 70 mg

Administer:

- Give daily in AM
- Without regard to meals
- Caps: may take whole or opened and contents dissolved in water

SIDE EFFECTS

CNS: Hyperactivity, insomnia, restlessness, talkativeness, dizziness, headache,

dysphoria, irritability, aggressiveness, CNS tumor, dependence, addiction, mild euphoria, somnolence, lability, psychosis, mania, hallucinations, aggression

CV: *Palpitations, tachycardia*, hypertension, decrease in heart rate, *dysrhythmias*, MI, *cardiomyopathy*

EENT: Blurred vision, mydriasis, diplopia

ENDO: Growth inhibition

GI: *Anorexia*, dry mouth, diarrhea, weight loss

GU: Impotence, change in libido

INTEG: Urticaria, *angioedema, Stevens-Johnson syndrome, toxic epidermal necrolysis*

PHARMACOKINETICS

Metabolized by liver; urine excretion pH dependent; crosses placenta, breast milk; half-life <1hr

INTERACTIONS

 **Hypertensive crisis:** MAOIs or within 14 days of MAOIs

Increase: serotonin syndrome, neuroleptic malignant syndrome—SSRIs, SNRIs, serotonin-receptor agonists

Increase: lisdexamfetamine effect—acetaZOLAMIDE, antacids, sodium bicarbonate, urinary alkalinizers

Increase: CNS effect—haloperidol, tricyclics, phenothiazines, modafinil, meperidine, PHENobarbital, phenytoin

Increase: CNS stimulation—melatonin

Decrease: absorption of phenytoin

Decrease: lisdexamfetamine effect—ascorbic acid, ammonium chloride, urinary acidifiers

Decrease: effect of—adrenergic blockers, antidiabetics

Drug/Herb

- Serotonin syndrome: St. John's wort

Increase: stimulant effect—khat, melatonin, green tea, guarana

Decrease: stimulant effect—eucalyptus

Drug/Food

Increase: amine effect—caffeine

NURSING CONSIDERATIONS

Assess:

- VS, B/P; product may reverse antihypertensives; check patients with cardiac disease often
- CBC, urinalysis; in diabetes: blood glucose; insulin changes may be required because eating may decrease
- Height, growth rate in children; growth rate may be decreased

- Mental status: mood, sensorium, affect, stimulation, insomnia, irritability

⚠ Serotonin syndrome, neuroleptic malignant syndrome: increased heart rate, shivering, sweating, dilated pupils, tremors, high B/P, hyperthermia, headache, confusion; if these occur, stop product, administer serotonin antagonist if needed; at least 2 wk should elapse between discontinuation of serotonergic agents and start of product

- **Tolerance or dependency:** increased amount of product may be used to get same effect; will develop after long-term use
- **Overdose:** pain, fever, dehydration, insomnia, hyperactivity

Black Box Warning:

Before giving this product, identify presence of substance abuse; high potential for abuse

Perform/provide:

- Gum, hard candy, frequent sips of water for dry mouth

Evaluate:

- Therapeutic response: increased CNS stimulation, decreased drowsiness

Teach patient/family:

- **Seizures:** product may decrease seizure threshold; those with a seizure disorder should notify prescriber if seizure occurs
- To decrease caffeine consumption (coffee, tea, cola, chocolate); may increase irritability, stimulation
- To avoid OTC preparations unless approved by prescriber

- To taper product over several weeks; depression, increased sleeping, lethargy may occur

- To avoid alcohol ingestion

- To avoid breastfeeding

- To avoid hazardous activities until stabilized on medication

- To get needed rest; patient will feel more tired at end of day

- To use as part of a comprehensive treatment program

Black Box Warning:

Serious CV effects may occur from increasing dose

TREATMENT OF OVERDOSE:

Administer fluids, antihypertensive for increased B/P, ammonium chloride for

increased excretion, chlorproMAZINE for antagonizing CNS effects

🍁 Canada only Side effects: *italics* = common; **bold** = life-threatening ⚠️
Nurse Alert

lisinopril (Rx)

(lyse-in'oh-pril)

Prinivil, Zestril

Func. class.: Antihypertensive, angiotensin-converting enzyme 1 (ACE) inhibitor *Chem. class.:* Enalaprilat lysine analog

Do not confuse: **lisinopril**/Risperdal

Prinivil/Plendil/Proventil/PriLOSEC

ACTION:

Selectively suppresses renin-angiotensin-aldosterone system; inhibits ACE, thereby preventing conversion of angiotensin I to angiotensin II

USES:

Mild to moderate hypertension, adjunctive therapy of systolic CHF, acute MI

CONTRAINDICATIONS:

Hypersensitivity, angioedema

Black Box Warning:

Pregnancy (D), 2nd/3rd trimesters

Precautions: Breastfeeding, renal disease, hyperkalemia, renal artery stenosis, CHF, pregnancy (C) 1st trimester

DOSAGE AND ROUTES

Calculator

Hypertension

- **Adult: PO** 10-40 mg/day; max 80 mg/day
- **Child ≥6 yr: PO** 0.07 mg/kg/day up to 5 mg/day; titrate q1-2wk up to 0.6 mg/kg/day or 40 mg/day
- **Geriatric: PO** 2.5-5 mg/day, increase q7days

CHF

- **Adult: PO** 5 mg initially with diuretics, range 5-40 mg
- **Acute myocardial infarction in adults who are hemodynamically stable:**
PO give 5 mg within 24 hr of onset of symptoms, then 5 mg after 24 hr, 10 mg after 48 hr, then 10 mg daily

Renal dose

- **Adult: PO** CCr <30 ml/min, reduce dose by 50%, initially 5 mg/day, max 40 mg/day; CCr <10 ml/min, 2.5 mg/day, max 40 mg/day

Available forms: Tabs 2.5, 5, 10, 20, 30, 40 mg

Administer:

- Severe hypotension may occur after 1st dose of product; may be prevented by reducing or discontinuing diuretic therapy 3 days before beginning lisinopril therapy

SIDE EFFECTS

CNS: *Vertigo*, depression, **stroke**, insomnia, paresthesias, headache, *fatigue*, asthenia, dizziness

CV: Chest pain, hypotension, sinus tachycardia

EENT: Blurred vision, nasal congestion

GI: Nausea, vomiting, anorexia, constipation, flatulence, GI irritation, diarrhea, **hepatic failure, hepatic necrosis**

GU: **Proteinuria, renal insufficiency**, sexual dysfunction, impotence

INTEG: Rash, pruritus

MISC: Muscle cramps, hyperkalemia

RESP: Dry cough, dyspnea

SYST: **Angioedema, anaphylaxis, toxic epidermal necrolysis**

PHARMACOKINETICS

Onset 1 hr, peak 6-8 hr, duration 24 hr, excreted unchanged in urine, half-life 12 hr

INTERACTIONS

Increase: hyperkalemia—potassium salt substitutes, potassium-sparing diuretics, potassium supplements, cycloSPORINE

Increase: possible toxicity—**lithium**

Increase: hypotensive effect—diuretics, other antihypertensives, probenecid, phenothiazines, nitrates, acute alcohol ingestion

Increase: hypersensitivity—allopurinol

Decrease: lisinopril effects—aspirin, indomethacin, NSAIDs

Drug/Food

- High-potassium diet (bananas, orange juice, avocados, nuts, spinach) should be avoided; hyperkalemia may occur

Drug/Lab Test

Interference: glucose/insulin tolerance tests, ANA titer

NURSING CONSIDERATIONS

Assess:

⚠️ Blood studies, platelets; WBC with differential at baseline, periodically q3mo; if neutrophils $<1000/\text{mm}^3$, discontinue treatment (recommended with collagen-vascular disease) • Baselines of renal, hepatic studies before therapy begins, periodically; LFTs, uric acid, glucose may be increased • **Angioedema: anaphylaxis, toxic epidermal necrolysis**, facial swelling, dyspnea, tongue swelling (rare)

Black Box Warning:

Pregnancy before starting treatment; pregnancy (D)

- **Hypertension:** B/P, pulse q4hr during beginning treatment and periodically thereafter; note rate, rhythm, quality; apical/pedal pulse before administration; notify prescriber of any significant changes • Electrolytes: potassium, sodium, chlorine
- **CHF:** edema in feet, legs daily; weight daily; dyspnea, wet crackles
- Skin turgor, dryness of mucous membranes for hydration status

Evaluate:

- Therapeutic response: decreased B/P, CHF symptoms

Teach patient/family:

- Not to discontinue product abruptly; to taper
- To rise slowly to sitting or standing position to minimize orthostatic hypotension
- To avoid increasing potassium in the diet
- To report dry cough

Black Box Warning:

To report if pregnancy is planned or suspected; pregnancy (D) 2nd/3rd trimesters

TREATMENT OF OVERDOSE:

Lavage, IV atropine for bradycardia, IV theophylline for bronchospasm, digoxin, O₂, diuretic for cardiac failure

🍁 Canada only Side effects: *italics* = common; **bold** = life-threatening ⚠️
Nurse Alert

lithium (Rx)

(li'thee-um)

Carbolith , Duralith , Lithobid *Func. class.: Antimanic, antipsychotic*

Chem. class.: Alkali metal ion salt

ACTION:

May alter sodium, potassium ion transport across cell membrane in nerve, muscle cells; may balance biogenic amines of norepinephrine, serotonin in CNS areas involved in emotional responses

USES:

Bipolar disorders (manic phase), prevention of bipolar manic-depressive psychosis

CONTRAINDICATIONS:

Pregnancy (D), breastfeeding, children <12 yr, hepatic disease, brain trauma, organic brain syndrome, schizophrenia, severe cardiac/renal disease, severe dehydration

Precautions: Geriatric patients, thyroid disease, seizure disorders, diabetes mellitus, systemic infection, urinary retention

Black Box Warning:

Lithium level >1.5 mmol/L

DOSAGE AND ROUTES

Calculator

- **Adult:** PO 300-600 mg tid, maintenance 300 mg tid or qid; **SLOW REL TABS** q300 mg bid; dose should be individualized to maintain blood levels at 1-1.5 mEq/L
 - **Geriatric:** PO 300 mg bid, increase q7days by 300 mg to desired dose
 - **Child:** PO 15-20 mg/kg/day in 3-4 divided doses; increase as needed; do not exceed adult doses; maintain blood levels at 0.4-0.5 mEq/L
- Available forms:** Caps 150, 300, 600 mg; tabs 300 mg; ext rel tabs 300, 450 mg; syr 300 mg/5 ml (8 mEq/5 ml); slow rel caps 150, 300 mg 

Administer:

- Do not break, crush, chew caps, ext rel tabs

- Reduced dose to geriatric patients
- With meals to avoid GI upset
- Adequate fluids (2-3 L/day) to prevent dehydration during initial treatment, 1-2 L/day during maintenance

SIDE EFFECTS

CNS: *Headache, drowsiness, dizziness, tremors, twitching, ataxia, seizure, slurred speech, restlessness, confusion, stupor, memory loss, clonic movements, fatigue*

CV: *Hypotension, ECG changes, dysrhythmias, circulatory collapse, edema, Brugada syndrome*

EENT: *Tinnitus, blurred vision*

ENDO: *Hyponatremia, goiter, hyperglycemia, hypo/hyperthyroidism*

GI: *Dry mouth, anorexia, nausea, vomiting, diarrhea, incontinence, abdominal pain, metallic taste*

GU: *Polyuria, glycosuria, proteinuria, albuminuria, urinary incontinence, polydipsia*

HEMA: *Leukocytosis*

INTEG: *Drying of hair, alopecia, rash, pruritus, hyperkeratosis, acneiform lesions, folliculitis*

MS: *Muscle weakness*

PHARMACOKINETICS

PO: *Onset rapid, peak 1/2-12 hr, half-life 18-36 hr depending on age, crosses blood-brain barrier, 80% of filtered lithium reabsorbed by renal tubules, excreted in urine, crosses placenta, enters breast milk, well absorbed by oral method*

INTERACTIONS

- **Neurotoxicity:** *haloperidol, thioridazine*

Increase: *hypothyroid effects—antithyroid agents, calcium iodide, potassium iodide, iodinated glycerol*

Increase: *effects of neuromuscular blocking agents, phenothiazines*

Increase: *renal clearance—sodium bicarbonate, acetazolamide, mannitol, aminophylline*

Increase: *masking of lithium toxicity—beta-blockers used for lithium tremor*

Increase: toxicity—indomethacin, diuretics, NSAIDs, losartan

Increase: lithium effect/toxicity—carbamazepine, fluoxetine, methyl dopa, thiazide diuretics, probenecid

Decrease: lithium effects—theophyllines, urea, urinary alkalinizers

Drug/Herb

- Avoid use with kava, St. John's wort, valerian

Decrease: lithium levels—black/green tea, guarana

Drug/Food

- Significant changes in sodium intake alter lithium excretion

Drug/Lab Test

Increase: potassium excretion, urine glucose, blood glucose, protein, BUN

Decrease: VMA, T₃, T₄, ¹³¹I

NURSING CONSIDERATIONS

Assess:

- **Mental status:** manic symptoms, mood, behavior before, during treatment

Black Box Warning:

Lithium toxicity: diarrhea, vomiting, tremor, twitching; serum lithium levels 2×/wk initially then q2mo (therapeutic level: 0.5-1.5 mEq/L); toxic level >1.5 mcg/L

- Weight daily; check for, report edema in legs, ankles, wrists
- **Sodium intake; decreased sodium intake with decreased fluid intake may lead to lithium retention; increased sodium, fluids may decrease lithium retention**
- **Skin turgor at least daily**
- Urine for albuminuria, glycosuria, uric acid during beginning treatment, q2mo thereafter
- Neurologic status: LOC, gait, motor reflexes, hand tremors
- ECG in those >50 yr with CV disease, cardiology consult is recommended in those with risk factor

Evaluate:

- Therapeutic response: decrease in excitement, manic phase

Teach patient/family:

- **About the symptoms of minor toxicity:** vomiting, diarrhea, poor coordination, fine motor tremors, weakness, lassitude; **major toxicity:** coarse tremors, severe thirst, tinnitus, diluted urine
- To monitor urine specific gravity, emphasize need for follow-up care to determine lithium levels; to monitor lithium levels to ensure effective levels and treatment
- That contraception is necessary because lithium may harm fetus (pregnancy [D]); not to breastfeed
- Not to operate

machinery until lithium levels stable

- That beneficial effects may take 1-3 wk
- About products that interact with lithium (provide list); about need for adequate, stable intake of salt and fluids; not to use OTC products unless approved by prescriber

TREATMENT OF OVERDOSE:

Induce emesis or lavage, maintain airway, respiratory function; dialysis for severe intoxication

🇨🇦 Canada only Side effects: *italics* = common; **bold** = life-threatening ⚠️
Nurse Alert

lodoxamide ophthalmic

See [Appendix B](#)

loperamide (OTC, Rx)

(loe-per'a-mide)

AntiDiarrheal, Equaline AntiDiarrheal, Good Sense AntiDiarrheal, Imodium , Imodium A-D, Select Brand AntiDiarrheal, Top Care AntiDiarrheal, Walgreens AntiDiarrheal *Func. class.: Antidiarrheal*

Chem. class.: Piperidine derivative

Do not confuse: **Imodium**/Indocin

Loperamide/furosemide

ACTION:

Direct action on intestinal muscles to decrease GI peristalsis; reduces volume, increases bulk; electrolytes not lost

USES:

Diarrhea (cause undetermined), travelers' diarrhea, chronic diarrhea, to decrease amount of ileostomy discharge

Unlabeled uses: Irinotecan-induced diarrhea, irritable bowel syndrome

CONTRAINDICATIONS:

Hypersensitivity, pseudomembranous colitis, constipation, dysentery, GI bleeding/obstruction/perforation, ileus, vomiting

Precautions: Pregnancy (C), breastfeeding, children <2 yr, hepatic disease, dehydration, gastroenteritis, toxic megacolon, geriatric patients, severe ulcerative colitis

DOSAGE AND ROUTES

Calculator

- **Adult:** PO 4 mg then 2 mg after each loose stool, max 16 mg/day
- **Child 9-11 yr:** PO 2 mg then 1 mg after each loose stool, max 6 mg/24 hr
- **Child 6-8 yr:** PO 2 mg then 0.1 mg/kg after each loose stool, max 4 mg/day
- **Child 2-5 yr:** PO 1 mg then 0.1 mg/kg after each loose stool, max 4 mg/24 hr

Irinotecan-induced diarrhea (unlabeled)

- **Adult: PO** 4 mg at first sign of late diarrhea (≥ 24 hr after irinotecan) then 2 mg q2hr $\times \geq 12$ hr; at night, 4 mg q4hr

Available forms: Caps 2 mg; liq 1 mg/5 ml; tabs 2 mg, chew tabs 2 mg

Administer:

- Do not break, crush, or chew caps
- For 48 hr only
- Do not mix oral sol with other sol

SIDE EFFECTS

CNS: Dizziness, drowsiness, fatigue

GI: Nausea, dry mouth, vomiting, constipation, abdominal pain, anorexia, **toxic megacolon**, bacterial enterocolitis, flatulence

INTEG: Rash

MISC: Hyperglycemia

SYST: **Anaphylaxis, angioedema, toxic epidermal necrolysis**

PHARMACOKINETICS

PO: Onset 1-3 hr, duration 4-5 hr, half-life 9-14 hr, metabolized in liver, excreted in feces as unchanged product, small amount in urine

INTERACTIONS

Increase: CNS depression—alcohol, antihistamines, analgesics, opioids, sedative/hypnotics

Drug/Herb

Increase: CNS depression—chamomile, hops, kava, valerian

NURSING CONSIDERATIONS

Assess:

- **Stools:** volume, color, characteristics, frequency; bowel pattern before product; rebound constipation
- Electrolytes (potassium, sodium, chlorine) if receiving long-term therapy
- Skin turgor q8hr if dehydration is suspected; fluid replacement
- Response after 48 hr; if no response, product should be discontinued
- **Dehydration, CNS problems in children, those with hepatic disease**
- **Abdominal distention, toxic megacolon; may occur with ulcerative colitis**

Perform/provide:

- Storage in tight container

Evaluate:

- Therapeutic response: decreased diarrhea (48 hr); decreased chronic diarrhea (10 days)

Teach patient/family:

- To avoid OTC products unless directed by prescriber
- That ileostomy patient may take product for extended time
- If drowsiness occurs, not to operate machinery
- To use hard candy, sips of water for dry mouth

☼ Canada only Side effects: *italics* = common; **bold** = life-threatening ⚠
Nurse Alert

lopinavir/ritonavir

(low-pin'ah-ver/ri-toe'na-veer)

Kaletra

Func. class.: Antiretroviral

Chem. class.: Protease inhibitor

ACTION:

Inhibits human immunodeficiency virus (HIV-1) protease and prevents maturation of the infectious virus

USES:

HIV-1 in combination with or without other antiretrovirals

CONTRAINDICATIONS:

Hypersensitivity to this product or polyoxyethylated castor oil (oral solution), CYP3A4 metabolized products

Precautions: Pregnancy (C), breastfeeding, hepatic disease, pancreatitis, diabetes, hemophilia, AV block, hypercholesterolemia, immune reconstitution syndrome, neonates, cardiomyopathy, congenital long-QT prolongation, hypokalemia, elderly patients, Grave's disease, polymyositis, Guillain-Barré syndrome, children, HBV/HCVCO-infection

DOSAGE AND ROUTES

Calculator

HIV infection in combination with other antiretroviral agents

- **Adult: PO** 400 mg lopinavir/100 mg ritonavir bid or 800 mg lopinavir/200 mg ritonavir per day may be administered to patients with <3 lopinavir resistance-associated substitutions (L10F/I/R/V, K20M/N/R, L24I, L33F, M36I, I47V, G48V, 154L/T/V, V82A/C/F/S/T, and I84V); do not give once-daily dosing with concomitant carbamazepine, phenobarbital, or phenytoin; do not give as once daily dosing with efavirenz, nevirapine, (fos)amprenavir, nelfinavir
- **Pregnant adults: PO** 400 mg lopinavir/100 mg ritonavir bid, may need 600 mg lopinavir/150 mg ritonavir bid in the 2nd/3rd trimesters; once-daily dosing is not recommended; a preferred PI-based regimen for pregnant patients combines

twice-daily lopinavir; ritonavir with zidovudine and either lamivudine or emtricitabine

- **Adult receiving concomitant efavirenz, nelfinavir, or nevirapine: PO TABS**, 500 mg lopinavir/125 mg ritonavir bid; **CAPS/SOL**, 533 mg lopinavir/133 mg ritonavir bid

- **Adolescent/child/infant >6 mo**: The once-daily regimen is not recommended in pediatric patients; capsules are not recommended for use in patients ≤ 40 kg; a preferred PI-based regimen for all children combines lopinavir/ritonavir with a dual NRTI; a lopinavir/ritonavir plus dual NRTI regimen is an alternative option in adolescents

Available forms: Oral solution 400 mg lopinavir/100 mg ritonavir/5 ml; tablets 100 mg lopinavir/25 mg ritonavir, 200 mg lopinavir/50 mg ritonavir, cup 133.3/33.3 mg

Administer:

PO route

- **TAB**: take without regard to food; swallow whole, do not crush, break, chew
- **CAP**: must take with food
- **ORAL SOL**: shake well, use calibrated measuring device
- Drug resistance testing should be done before beginning therapy in antiretroviral-naïve patients and before changing therapy for treatment failure
- For adults and adolescents, therapy is recommended in those with a CD4 $\leq 500/\text{mm}^3$, who is pregnant, who has HIV-associated nephropathy, or who is being treated for hepatitis B (HBV) infection; therapy should be offered to patients at risk of transmitting HIV to sexual partners; treatment in those with a CD4 count $>500/\text{mm}^3$ may be considered
- For children, use is recommended in any symptomatic patient; for asymptomatic or mildly symptomatic children ≥ 5 years, therapy is recommended for those with HIV RNA $\geq 100,000$ copies/ml or CD4 $<500/\text{mm}^3$; for asymptomatic or mildly symptomatic children 1–4 yr, therapy is recommended for patients with HIV RNA $\geq 100,000$ copies/ml or CD4 $<25\%$
- For infants <12 mo, therapy is recommended regardless of clinical status, CD4 percentage, or viral load

SIDE EFFECTS

CNS: Paresthesia, headache, **seizures**, fever, dizziness, insomnia, asthenia, **intracranial bleeding, encephalopathy**

CV: **QT, PR interval prolongation, deep vein thrombosis**

EENT: Blurred vision, otitis media, tinnitus

GI: Diarrhea, buccal mucosa ulceration, abdominal pain, nausea, taste perversion, dry mouth, vomiting, anorexia

INTEG: Rash

MISC: Asthenia, **angioedema, anaphylaxis, Stevens–Johnson syndrome**, increase lipids, lipodystrophy

MS: Pain, **rhabdomyolysis**, myalgias

PHARMACOKINETICS

Well absorbed, 98% protein binding, hepatic metabolism, peak 2-4 hr, terminal half-life 6 hr

INTERACTIONS

Increase: Toxicity—amiodarone, astemizole, azole antifungals, benzodiazepines, buPROPion, CISapride, cloZAPine, desipramine, dihydroergotamine, encainide, ergotamine, flecainide, HMG-CoA reductase inhibitors, interleukins, meperidine, midazolam, pimozide, piroxicam, propafenone, propoxyphene, quiNIDine, ranolazine, saquinavir, terfenadine, triazolam, zolpidem

Increase: QT prolongation—class 1A/III antidysrhythmics, some phenothiazines, β -agonists, local anesthetics, tricyclics, haloperidol, chloroquine, droperidol, pentamidine, CYP3A4 inhibitors (amiodarone, clarithromycin, erythromycin, telithromycin, troleandomycin), arsenic trioxide, levomethadyl, CYP3A4 substrates (methadone, pimozide, QUetiapine, quiNIDine, risperiDONE, ziprasidone)

Increase: Ritonavir levels—fluconazole

Increase: Level of both products—clarithromycin, ddI

Increase: Levels of bosentan

Decrease: Ritonavir levels—rifamycins, nevirapine, barbiturates, phenytoin

Decrease: Levels of anticoagulants, atovaquone, divalproex, ethinyl estradiol, lamoTRigine, phenytoin, sulfamethoxazole, theophylline, voriconazole, zidovudine

Drug/Lab Test

Increase: AST, ALT, CPK, cholesterol, GGT, triglycerides, uric acid

Decrease: Hct, Hgb, RBC, neutrophils, WBC

Drug/Herb

Decrease: Ritonavir levels—St. John's wort; avoid concurrent use

Avoid use with red yeast rice, evening primrose oil

NURSING CONSIDERATIONS

Assess:

- HIV: viral load, CD4 at baseline, throughout therapy; blood glucose, plasma HIV RNA, serum cholesterol/lipid profile; resistance testing before starting therapy and after treatment failure
- Signs of infection, anemia
- Hepatic studies: ALT, AST
- Bowel pattern before, during treatment; if severe abdominal pain with bleeding occurs, discontinue product; monitor hydration
- Skin eruptions; rash

 **Rhabdomyolysis:** Muscle pain, increased CPK, weakness, swelling of affected muscles; if these occur and if confirmed by CPK, product should be discontinued  **QT prolongation:** ECG for QT prolongation, ejection fraction; assess for chest pain, palpitations, dyspnea  **Serious skin disorders:** Stevens–Johnson syndrome, angioedema, anaphylaxis

Evaluate:

- Therapeutic response: improvement in HIV symptoms; improving viral load, CD4+ T cells

Teach patient/family:

- To take as prescribed; if dose is missed, to take as soon as remembered up to 1 hr before next dose; not to double dose
- That product is not a cure for HIV; that opportunistic infections can continue to be acquired
- That redistribution of body fat or accumulation of body fat may occur
- That others can continue to contract HIV from patient
- To avoid OTC, prescription medications, herbs, supplements unless approved by prescriber; not to use St. John's wort because it decreases product's effect
- That regular follow-up exams and blood work will be required

✳ Canada only Side effects: *italics* = common; **bold** = life-threatening 
Nurse Alert

loratadine (OTC, Rx)

(lor-a'ti-deen)

Alavert, Claritin, Claritin Children's, Claritin RediTabs, Clear-Atadine, Dimetapp, Equaline Non-Drowsy, Equate Allergy Relief, Good Sense Non-Drowsy, Leader Allergy Relief, Tavist ND, Wal-itin Aller-Melts, Wal-vert *Func. class.:* Antihistamine, 2nd generation

Chem. class.: Selective histamine (H₁)-receptor antagonist

Do not confuse: loratadine/lovastatin/LORazepam/losartan

ACTION:

Binds to peripheral histamine receptors, thereby providing antihistamine action without sedation

USES:

Seasonal rhinitis, chronic idiopathic urticaria for those ≥ 2 yr

CONTRAINDICATIONS:

Hypersensitivity, acute asthma attacks, lower respiratory tract disease

Precautions: Pregnancy (B), breastfeeding, increased intraocular pressure, bronchial asthma, hepatic/renal disease

DOSAGE AND ROUTES

Calculator

- **Adult and child ≥ 6 yr:** PO 10 mg/day
- **Child 2-5 yr:** PO 5 mg/day

Renal/hepatic dose

- **Adult:** PO CCr < 30 ml/min or hepatic disease, 10 mg every other day

Available forms: Tabs 10 mg; rapid-disintegrating tabs 10 mg; orally disintegrating tabs 10 mg; syr 1 mg/ml; susp 5 mg/ml, ext rel tab 10 mg

Administer:

- **Rapid-disintegrating tabs** by placing on tongue, to be swallowed after disintegrated with/without water
- Use within 6 mo of opening pouch and immediately after opening blister pack
- On empty stomach daily

Ext Rel Tab

- Do not break, crush, or chew

SIDE EFFECTS

CNS: Sedation (more common with increased doses), headache, fatigue, restlessness

EENT: Dry mouth

PHARMACOKINETICS

Onset 1-3 hr, peak 8-10 hr, duration 24 hr, metabolized in liver to active metabolites, excreted in urine, active metabolite desloratadine half-life 20 hr

INTERACTIONS

Increase: antihistamine effects—MAOIs

Increase: CNS depressant effects—alcohol, antidepressants, other antihistamines, sedative/hypnotics

Increase: loratadine level—cimetidine, ketoconazole, macrolides (clarithromycin, erythromycin)

Drug/Lab Test

False negative: skin allergy tests (discontinue antihistamine 3 days before testing)

NURSING CONSIDERATIONS

Assess:

- **Allergy:** hives, rash, rhinitis; monitor respiratory status

Perform/provide:

- Storage in tight container at room temp

Evaluate:

- Therapeutic response: absence of running or congested nose, other allergy symptoms

Teach patient/family:

- To avoid driving, other hazardous activities if drowsiness occurs
- To avoid use of other CNS depressants

☛ Canada only Side effects: *italics* = common; **bold** = life-threatening ⚠
Nurse Alert

LORazepam (Rx)

(lor-a'ze-pam)

Ativan

Func. class.: Sedative, hypnotic; antianxiety

Chem. class.: Benzodiazepine, short acting

Controlled Substance Schedule IV

Do not confuse: LORazepam/ALPRAZolam/clonazepam

ACTION:

Potentiates the actions of GABA, especially in the limbic system and the reticular formation

USES:

Anxiety, irritability with psychiatric or organic disorders, preoperatively; insomnia; adjunct for endoscopic procedures, status epilepticus

Unlabeled uses: Antiemetic before chemotherapy, rectal use, alcohol withdrawal, seizure prophylaxis, agitation, insomnia, sedation maintenance

CONTRAINDICATIONS:

Pregnancy (D), breastfeeding, hypersensitivity to benzodiazepines, benzyl alcohol; closed-angle glaucoma, psychosis, history of drug abuse, COPD, sleep apnea

Precautions: Children <12 yr, geriatric patients, debilitated, renal/hepatic disease, addiction, suicidal ideation, abrupt discontinuation

DOSAGE AND ROUTES

Calculator

Anxiety

- **Adult/adolescent:** PO 2-3 mg/day in divided doses, max 10 mg/day
- **Geriatric:** PO 1-2 mg/day in divided doses or 0.5-1 mg at bedtime

Preoperatively

- **Adult:** IM 50 mcg/kg 2 hr prior to surgery; IV 44 mcg/kg 15-20 min prior to surgery, max 2 mg 15-20 min prior to surgery

- **Child ≥ 12 yr:** IV 0.05 mg/kg

Status epilepticus

- **Neonate:** IV 0.05 mg/kg
- **Child:** IV 0.1 mg/kg up to 4 mg/dose; **RECT** (unlabeled) 0.05-0.1 mg $\times$ 2; wait 7 min before giving 2nd dose

Alcohol withdrawal (unlabeled)

- **Adult:** PO 2 mg q6hr $\times$ 4 doses then 1 mg q6hr for 8 doses

Insomnia (unlabeled)

- **Adult:** PO 2-4 mg at bedtime; only minimally effective after 2 wk continuous therapy
- **Geriatric:** PO 0.5-1 mg initially

Available forms: Tabs 0.5, 1, 2 mg; inj 2, 4 mg/ml; conc oral sol 2 mg/ml

Administer:

PO route

- With food or milk for GI symptoms; crushed if patient is unable to swallow medication whole
- Sugarless gum, hard candy, frequent sips of water for dry mouth
- Give largest dose before bedtime if giving in divided doses
- **Concentrate:** use calibrated dropper; add to food/drink; consume immediately

IM route

- Deep into large muscle mass
- Use this route when IV is not feasible

Direct IV route

- Prepare immediately before use; short stability time
- IV after diluting in equal vol sterile water, 5% dextrose, or 0.9% NaCl for inj; give through Y-tube or 3-way stopcock; give at ≤ 2 mg/1 min, do not give rapidly
- Do not use in neonates (benzyl alcohol)

Y-site compatibilities: Acyclovir, albumin, allopurinol, amifostine, amikacin, amoxicillin, amoxicillin/clavulanate, amphotericin B cholesteryl, amsacrine, atenolol, atracurium, bivalirudin, bleomycin, bumetanide, butorphanol, calcium chloride/gluconate, CARBOplatin, ceFAZolin, cefepime, cefotaxime, cefoTEtan, cefOXitin, cefTAZidime, ceftizoxime, ceftobiprole, cefTRIAxone, cefuroxime, chloramphenicol, chlorproMAZINE, cimetidine, ciprofloxacin, cisatracurium, CISplatin, cladribine, clindamycin, cloNIDine, cyclophosphamide,

cycloSPORINE, cytarabine, DACTINomycin, DAPTOmycin, dexamethasone, dexmedetomidine, diltiazem, DOBUTamine, DOCEtaxel, DOPamine, doripenem, DOXOrubicin, DOXOrubicin liposomal, droperidol, enalaprilat, ePHEDrine, EPINEPHrine, epirubicin, eptifibatide, erythromycin, esmolol, etomidate, famotidine, fenoldopam, fentaNYL, filgrastim, fluconazole, fludarabine, fosphenytoin, furosemide, ganciclovir, gatifloxacin, gemcitabine, gentamicin, glycopyrrolate, granisetron, haloperidol, heparin, hydrocortisone, HYDROmorphine, hydrOXYzine, ifosfamide, inamrinone, insulin (regular), irinotecan, isoproterenol, ketorolac, labetalol, lidocaine, linezolid, magnesium sulfate, mannitol, mechlorethamine, melphalan, meropenem, metaraminol, methadone, methotrexate, methyl dopate, methylPREDNISolone, metoclopramide, metoprolol, metroNIDAZOLE, micafungin, midazolam, milrinone, minocycline, mitoXANtrone, morphine, mycophenolate, nafcillin, nalbuphine, naloxone, nesiritide, niCARDipine, nitroglycerin, nitroprusside, norepinephrine, octreotide, oxaliplatin, oxytocin, PACLitaxel, palonosetron, pamidronate, pancuronium, PEMEtrexed, pentamidine, PENTobarbital, PHENobarbital, piperacillin, piperacillin-tazobactam, polymyxin B, potassium chloride, propofol, ranitidine, remifentanyl, tacrolimus, teniposide, theophylline, thiotepa, ticarcillin, ticarcillin-clavulanate, tigecycline, tirofiban, tobramycin, TPN, trastuzumab, trimethobenzamide, trimethoprim-sulfamethoxazole, vancomycin, vasopressin, vecuronium, verapamil, vinCRISTine, vinorelbine, voriconazole, zidovudine

SIDE EFFECTS

CNS: *Dizziness, drowsiness, confusion, headache, anxiety, tremors, stimulation, fatigue, depression, insomnia, hallucinations, weakness, unsteadiness*

CV: *Orthostatic hypotension, ECG changes, tachycardia, hypotension; apnea, cardiac arrest (IV, rapid)*

EENT: *Blurred vision, tinnitus, mydriasis*

GI: *Constipation, dry mouth, nausea, vomiting, anorexia, diarrhea*

INTEG: *Rash, dermatitis, itching*

MISC: *Acidosis*

PHARMACOKINETICS

Metabolized by liver; excreted by kidneys; crosses placenta, excreted in breast

milk; half-life 42 hr (neonates), 10.5 hr (older child), 12 hr (adult), 91% protein bound

PO: Onset 1/2 hr, peak 1-6 hr, duration 12-24 hr

IM: Onset 15-30 min, peak 1-1½ hr, duration 6-8 hr

IV: Onset 5-15 min, peak unknown, duration 6-8 hr

INTERACTIONS

Increase: LORazepam effects—CNS depressants, alcohol, disulfiram

Decrease: LORazepam effects—valproic acid, oral contraceptives

Drug/Herb

Increase: CNS depression—chamomile, kava, valerian

Drug/Lab Test

Increase: AST, ALT

NURSING CONSIDERATIONS

Assess:

⚠️ **Anxiety:** decrease in anxiety; mental status: mood, sensorium, affect, sleeping pattern, drowsiness, dizziness, suicidal tendencies • Renal/hepatic/blood status if receiving high-dose therapy

• **Physical dependency, withdrawal symptoms:** headache, nausea, vomiting, muscle pain, weakness, tremors, seizures, after long-term, excessive use

Perform/provide:

- Assistance with ambulation during beginning therapy, since drowsiness, dizziness occurs
- Check to confirm that PO medication has been swallowed
- Refrigerate parenteral form

Evaluate:

- Therapeutic response: decreased anxiety, restlessness, insomnia

Teach patient/family:

- That product may be taken with food
- Not to use product for everyday stress or for >4 mo unless directed by prescriber
- **Not to take more than prescribed amount; may be habit forming**
- To avoid OTC preparations (cough, cold, hay fever) unless approved by prescriber
- To avoid driving, activities that require alertness, since drowsiness may occur

- To avoid alcohol, other psychotropic medications unless directed by prescriber
- **Not to discontinue medication abruptly after long-term use**
- To rise slowly because fainting may occur, especially among geriatric patients
- That drowsiness may worsen at beginning of treatment
- **To notify prescriber if pregnancy is planned or suspected, pregnancy (D), do not breastfeed**

TREATMENT OF OVERDOSE:

Lavage, VS, supportive care, flumazenil

🍁 Canada only Side effects: *italics* = common; **bold** = life-threatening ⚠️
Nurse Alert

losartan

(lo-zar'tan)

Cozaar

Func. class.: Antihypertensive

Chem. class.: Angiotensin II receptor (type AT₁) antagonist

Do not confuse: losartan/valsartan

Cozaar/Zocor

ACTION:

Blocks the vasoconstrictor and aldosterone-secreting effects of angiotensin II; selectively blocks the binding of angiotensin II to the AT₁ receptor found in tissues

USES:

Hypertension, alone or in combination; nephropathy in type 2 diabetes; proteinuria; stroke prophylaxis for hypertensive patients with left ventricular hypertrophy

CONTRAINDICATIONS:

Hypersensitivity

Black Box Warning:

Pregnancy (D) 2nd/3rd trimesters

Precautions: Pregnancy (C) 1st trimester, breastfeeding, children, geriatric patients; hypersensitivity to ACE inhibitors; hepatic disease, angioedema, renal artery stenosis, those of African American descent

DOSAGE AND ROUTES

Calculator

Hypertension

- **Adult: PO** 50 mg/day alone or 25 mg/day in combination with diuretic; maintenance 25-100 mg/day
- **Child ≥6 yr: PO** 0.7 mg/kg/day, max 50 mg/day

Hypertension with left ventricular hypertrophy (benefit does not apply to those of African american descent)

- **Adult: PO** 50 mg/day; add hydrochlorothiazide 12.5 mg/day and/or increase losartan to 100 mg/day then increase hydrochlorothiazide to 25 mg/day

Nephropathy in type 2 diabetic patients/proteinuria

- **Adult: PO** 50 mg/day, may increase to 100 mg/day

Hepatic dose

- **Adult: PO** 25 mg/day as starting dose

Available forms: Tabs 25, 50, 100 mg

Administer:

- Without regard to meals

SIDE EFFECTS

CNS: *Dizziness, insomnia*, anxiety, confusion, abnormal dreams, migraine, tremor, vertigo, headache, malaise, depression

CV: Angina pectoris, 2nd-degree AV block, **cerebrovascular accident**, hypotension, **MI, dysrhythmias**

EENT: Blurred vision, burning eyes, conjunctivitis

GI: *Diarrhea, dyspepsia*, anorexia, constipation, dry mouth, flatulence, gastritis, vomiting

GU: Impotence, nocturia, urinary frequency, UTI, **renal failure**

HEMA: Anemia, **thrombocytopenia**

INTEG: Alopecia, dermatitis, dry skin, flushing, photosensitivity, rash, pruritus, sweating, **angioedema**

META: Gout

MS: Cramps, myalgia, pain, stiffness

RESP: *Cough, upper respiratory infection*, congestion, dyspnea, bronchitis

PHARMACOKINETICS

Peak 1-4 hr, extensively metabolized, half-life 2 hr, metabolite 6-9 hr, excreted in urine/feces, protein binding 98.7%

INTERACTIONS

Increase: lithium toxicity—lithium

Increase: antihypertensive effect—fluconazole

Increase: hyperkalemia—potassium-sparing diuretics, potassium supplements, ACE inhibitors

Decrease: antihypertensive effect—NSAIDs, PHENobarbital, rifamycin, salicylates

NURSING CONSIDERATIONS

Assess:

- B/P with position changes, pulse before and periodically during treatment; note rate, rhythm, quality • Baselines of renal, hepatic studies before therapy begins and periodically thereafter
- Skin turgor, dryness of mucous membranes for hydration status
- ⚠ **Angioedema:** facial swelling, dyspnea, wheezing; may occur rapidly; tongue swelling (rare) • **CHF:** jugular venous distention; edema in feet/legs, weight daily
- **Blood dyscrasias:** thrombocytopenia, anemia (rare)

Black Box Warning:

Pregnancy before starting treatment; pregnancy (D) 2nd/3rd trimester

Evaluate:

- Therapeutic response: decreased B/P, slowing diabetic neuropathy

Teach patient/family:

- To avoid sunlight or to wear sunscreen if in sunlight; that photosensitivity may occur
- To comply with dosage schedule, even if feeling better; not to discontinue abruptly
- To notify prescriber of mouth sores, fever, swelling of hands or feet, irregular heartbeat, chest pain • That excessive perspiration, dehydration, vomiting, diarrhea may lead to fall in B/P; to consult prescriber if these occur • That product may cause dizziness, fainting, lightheadedness
- To rise slowly to sitting or standing position to minimize orthostatic hypotension

Black Box Warning:

To use contraception while taking this product; pregnancy (D) 2nd/3rd trimesters

- To avoid salt substitutes, alcohol, grapefruit juice, OTC products unless approved by prescriber

☼ Canada only Side effects: *italics* = common; **bold** = life-threatening ⚠
Nurse Alert

loteprednol ophthalmic

See [Appendix B](#)

lovastatin (Rx)

(loh-vah-stat'in)

Altoprev, Mevacor

Func. class.: Antilipemic

Chem. class.: HMG-CoA reductase inhibitor

Do not confuse: **lovastatin**/Lotensin/Leustatin

Mevacor/mivacron

ACTION:

Inhibits HMG-CoA reductase enzyme, which reduces cholesterol synthesis

USES:

As an adjunct for primary hypercholesterolemia (types IIa, IIb), atherosclerosis; heterozygous familial hypercholesterolemia (adolescents)

CONTRAINDICATIONS:

Pregnancy (X), breastfeeding, hypersensitivity, active hepatic disease

Precautions: Children, past hepatic disease, alcoholism, severe acute infections, trauma, hypotension, uncontrolled seizure disorders, severe metabolic disorders, electrolyte imbalances, visual disorder

DOSAGE AND ROUTES

Calculator

- **Adult: PO** 20 mg/day with evening meal; may increase to 20-80 mg/day in single or divided doses, max 60 mg/day; **EXT REL** 20-60 mg/day at bedtime, max 80 mg/day

Heterozygous familial hypercholesterolemia

- **Adolescent 10-17 yr: PO** 10-40 mg with evening meal

Renal dose

- **Adult: PO** CCr <30 mg/min, max 20 mg/day unless titrated

Available forms: Tabs 10, 20, 40 mg; ext rel tab (Altacor) 10, 20, 40, 60 mg

Administer:

- In evening with meal; if dose is increased, take with breakfast and evening meal
- Altrovep not equivalent to Mevacor
- Do not crush, chew ext rel tab

SIDE EFFECTS

CNS: *Dizziness, headache, tremor, insomnia, paresthesia*

EENT: *Blurred vision, lens opacities*

GI: *Flatus, nausea, constipation, diarrhea, dyspepsia, abdominal pain, heartburn, hepatic dysfunction, vomiting, acid regurgitation, dry mouth, dysgeusia*

HEMA: *Thrombocytopenia, hemolytic anemia, leukopenia*

INTEG: *Rash, pruritus, photosensitivity*

MS: *Muscle cramps, myalgia, myositis, rhabdomyolysis; leg, shoulder, or localized pain*

PHARMACOKINETICS

PO: Peak 2 hr; peak response 4-6 wk, ext rel peak 14 hr; metabolized in liver (metabolites); highly protein bound; excreted in urine 10%, feces 83%; crosses blood-brain barrier, placenta; excreted in breast milk; half-life 1 hr

INTERACTIONS

Increase: myalgia, myositis, rhabdomyolysis—azole antifungals, clarithromycin, clofibrate, cycloSPORINE, dalfopristin, danazol, diltiazem, erythromycin, gemfibrozil, niacin, protease inhibitors, quinupristin, telithromycin, verapamil, avoid concurrent use

Increase: bleeding—warfarin

Increase: lovastatin effects—diltiazem

Decrease: effects of lovastatin—bile acid sequestrants, exenatide, bosentan

Drug/Herb

Decrease: effect—pectin, St. John's wort

Increase: adverse reactions—red yeast rice

Drug/Food

- Possible toxicity: grapefruit juice

Increase: levels of lovastatin with food; must be taken with food

Decrease: absorption—oat bran

Drug/Lab Test

Increase: CK, LFTs

NURSING CONSIDERATIONS

Assess:

- **Diet;** obtain diet history including fat, cholesterol in diet
- Fasting cholesterol, LDL, HDL, triglycerides periodically during treatment
- Hepatic studies at initiation, 6 wk, 12 wk after initiation or change in dose, periodically thereafter; AST, ALT, LFTs may increase
- Renal function in patients with compromised renal system: BUN, creatinine, I&O ratio

Perform/provide:

- Storage in cool environment in airtight, light-resistant container

Evaluate:

- Therapeutic response: decreased triglycerides, sLDL, total cholesterol; increased HDL; slowing CAD

Teach patient/family:

- **To report suspected pregnancy (pregnancy [X]); not to breastfeed**
- That blood work, ophthalmic exam will be necessary during treatment
- To report blurred vision, severe GI symptoms, dizziness, headache, muscle pain, weakness
- To use sunscreen or to stay out of the sun to prevent photosensitivity
- That previously prescribed regimen will continue: low-cholesterol diet, exercise program, smoking cessation
- That product should be taken with food, not to crush, chew ext rel product

☼ Canada only Side effects: *italics* = common; **bold** = life-threatening ⚠
Nurse Alert

loxapine (Rx)

(lox'a-peen)

Loxapac , Loxitane

Func. class.: Antipsychotic, neuroleptic

Chem. class.: Dibenzoxazepine

Do not confuse: Loxitane/Soriatane

ACTION:

Depresses cerebral cortex, hypothalamus, limbic system, which control activity and aggression; blocks neurotransmission produced by DOPamine at synapse; exhibits strong α -adrenergic, anticholinergic blocking action; mechanism for antipsychotic effects is unclear

USES:

Psychotic disorders, nonpsychotic symptoms associated with dementia

Unlabeled uses: Depression, anxiety

CONTRAINDICATIONS:

Hypersensitivity, blood dyscrasias, coma, brain damage, bone marrow depression, alcohol and barbiturate withdrawal states, severe CNS depression, closed-angle glaucoma

Precautions: Pregnancy (C), breastfeeding, children <16 yr, geriatric patients, seizure disorders, cardiac/renal/hepatic disease, prostatic hypertrophy, cardiac conditions

Black Box Warning:

Increased mortality in elderly patients with dementia-related psychosis

DOSAGE AND ROUTES

Calculator

• **Adult: PO** 10 mg bid-qid initially, may be rapidly increased depending on severity of condition, maintenance 60-100 mg/day

• **Geriatric: PO** 5-10 mg daily-bid, increase q4-7days by 5-10 mg, max 250 mg/day

Available forms: Caps 5, 10, 25, 50 mg; tabs 5, 10, 25, 50 mg; conc 25 mg/ml

Administer:

- Reduced dose to geriatric patients
- Anticholinergic agent if EPS symptoms occur

PO route

- Concentrate mixed in orange or grapefruit juice

SIDE EFFECTS

CNS: *EPS: pseudoparkinsonism, akathisia, dystonia, tardive dyskinesia, drowsiness, headache, seizures, confusion, neuroleptic malignant syndrome*

CV: *Orthostatic hypotension, cardiac arrest, ECG changes, tachycardia*

EENT: *Blurred vision, glaucoma*

GI: *Dry mouth, nausea, vomiting, anorexia, constipation, diarrhea, jaundice, weight gain*

GU: *Urinary retention, urinary frequency, enuresis, impotence, amenorrhea, gynecomastia*

HEMA: *Anemia, leukopenia, leukocytosis, agranulocytosis*

INTEG: *Rash, photosensitivity, dermatitis*

RESP: *Laryngospasm, dyspnea, respiratory depression*

PHARMACOKINETICS

Metabolized by liver, excreted in urine, crosses placenta, enters breast milk, initial half-life 5 hr, terminal half-life 19 hr

PO: Onset 20-30 min, peak 2-4 hr, duration 12 hr

INTERACTIONS

Increase: toxicity—**EPINEPHrine**

Increase: EPS—other antipsychotics

Increase: CNS depression—MAOIs, antidepressants, alcohol

Increase: anticholinergic effects—anticholinergics

Decrease: effects—guanadrel, guanethidine, levodopa

Drug/Herb

Increase: CNS depression—chamomile, cola tree, hops, kava, nettle, nutmeg, skullcap, valerian

Increase: EPS—betel palm, kava

NURSING CONSIDERATIONS

Assess:

- Mental status before initial administration
- Swallowing of PO product; check for hoarding, giving of product to other patients
- I&O ratio; palpate bladder if low urinary output occurs, urinary retention may be present • Bilirubin, CBC, LFTs q mo
- Urinalysis recommended before and during prolonged therapy
- Affect, orientation, LOC, reflexes, gait, coordination, sleep-pattern disturbances
- B/P standing and lying; pulse, respirations q4hr during initial treatment; establish baseline before starting treatment; report drops of 30 mm Hg
- Dizziness, faintness, palpitations, tachycardia on rising
- **EPS** including akathisia (inability to sit still, no pattern to movements), tardive dyskinesia (bizarre movements of jaw, mouth, tongue, extremities), pseudoparkinsonism (rigidity, tremors, pill rolling, shuffling gait)  **Neuroleptic malignant syndrome:** muscle rigidity, increased CPK, altered mental status, hyperthermia • Constipation, urinary retention daily; if these occur, increase bulk, water in diet

Perform/provide:

- Supervised ambulation until stabilized on medication; do not involve patient in strenuous exercise program because fainting is possible; patient should not stand still for long periods • Increased fluids to prevent constipation
- Sips of water, candy, gum for dry mouth
- Storage in airtight, light-resistant container

Evaluate:

- Therapeutic response: decrease in emotional excitement, hallucinations, delusions, paranoia; reorganization of patterns of thought, speech

Teach patient/family:

- That orthostatic hypotension may occur; to rise from sitting or lying position gradually • To avoid hot tubs, hot showers, tub baths because hypotension may occur; that, in hot weather, heat stroke may occur; to take extra precautions to stay cool • To avoid abrupt withdrawal of product because EPS may result; that product should be withdrawn slowly
- To avoid OTC preparations (cough, hay fever, cold) unless approved by prescriber; that serious product interactions may occur; to avoid use with alcohol, CNS depressants; that increased drowsiness may occur • To avoid

hazardous activities until stabilized on medication

- To use sunscreen during sun exposure to prevent burns
- About necessity for meticulous oral hygiene because oral candidiasis may occur
- To report impaired vision, jaundice, tremors, muscle twitching

TREATMENT OF OVERDOSE:

Lavage; provide an airway, do not use EPINEPHrine

☼ Canada only Side effects: *italics* = common; **bold** = life-threatening ⚠
Nurse Alert

lubiprostone (Rx)

(loo-bee-pros'tone)

Amitiza

Func. class.: Gastrointestinal agent —miscellaneous

ACTION:

Locally acting chloride channel activator; enhances a chloride-rich intestinal fluid secretion without altering other electrolytes; increases motility in the intestine, thereby increasing softening and passage of stool

USES:

Chronic idiopathic constipation, constipation-predominant irritable bowel syndrome in women >18 yr

CONTRAINDICATIONS:

Hypersensitivity, GI obstruction

Precautions: Pregnancy (C), breastfeeding, children, diarrhea, inflammatory bowel disease, abdominal pain, cholelithiasis, fecal impaction, GI/hepatic disease

DOSAGE AND ROUTES

Calculator

Chronic idiopathic constipation

- **Adult: PO** 24 mcg bid with food, water

IBS with constipation (females)

- **Adult and adolescent ≥18 yr: PO** 8 mcg bid with food, water

Hepatic dose

- **Adult: PO For chronic constipation:** 16 mcg bid (Child-Pugh B); 8 mcg bid (Child-Pugh C); **for irritable bowel:** 8 mcg daily (Child-Pugh C), may be increased if tolerated

Available forms: Caps 8, 24 mcg

Administer:

- With food bid

SIDE EFFECTS

CNS: *Headache*, dizziness, depression, fatigue, insomnia

CV: Hypertension, chest pain

GI: *Nausea, abdominal pain, eructation*, abdominal distention, constipation, diarrhea, dry mouth, dyspepsia, flatulence, gastroenteritis viral, gastroesophageal reflux disease, vomiting, fecal incontinence, fecal urgency

GU: UTI

MISC: Chest pain, peripheral edema, influenza, pyrexia, viral infection

MS: Back pain, arthralgia, muscle cramps, pain in extremities

RESP: Bronchitis, cough, dyspnea, nasopharyngitis, sinusitis, upper respiratory tract infection

PHARMACOKINETICS

Peak 1.14 hr; 94% protein binding; half-life 0.9-1.4 hr; metabolism rapid, extensively in stomach, jejunum

INTERACTIONS

Decrease: effect by antidiarrheals and anticholinergics

• Do not use with sodium phosphate monobasic monohydrate, sodium phosphate dibasic anhydrous or with other laxative, purgatives when evacuating bowel prior to radiologic exam or surgery • Possible GI obstruction: NIFEdipine ext rel tab

NURSING CONSIDERATIONS

Assess:

- **GI symptoms:** nausea, abdominal pain, diarrhea
- Need for continued treatment periodically

Perform/provide:

- Storage at room temp

Evaluate:

- Therapeutic response: decreased constipation

Teach patient/family:

- To notify prescriber of GI symptoms, diarrhea, hypersensitivity reactions

☼ Canada only Side effects: *italics* = common; **bold** = life-threatening ⚠

Nurse Alert

lurasidone (Rx)

(loo-ras'i-done)

Latuda

Func. class.: Atypical antipsychotic

Chem. class.: Benzoisothiazol derivative

ACTION:

May modulate central dopaminergic and serotonergic activity; high affinity for dopamine-D2 receptors, serotonin 5-HT_{2A} receptors; partial agonist at serotonin 5-HT_{1A} receptor

USES:

Schizophrenia

CONTRAINDICATIONS:

Hypersensitivity

Precautions: Pregnancy (B), breastfeeding, children, geriatric patients, abrupt discontinuation, ambient temperature increase, breast cancer, cardiac disease, dehydration, diabetes, ketoacidosis, driving, operating machinery, dysphagia, heart failure, hematologic/hepatic/renal disease, hypotension, hypovolemia, MI, infertility, obesity, Parkinson's disease, seizures, strenuous exercise, stroke, substance abuse, suicidal ideation, syncope, tardive dyskinesia

Black Box Warning:

Dementia: antipsychotics (e.g., as lurasidone) not approved for treatment of dementia-related psychosis in geriatric patients; may increase risk of death in this population

DOSAGE AND ROUTES

Calculator

• **Adult: PO** 40 mg/day, range 40-160 mg/day; for those receiving CYP3A4 inhibitors (max 80 mg/day), do not use with strong CYP3A4 inducers/inhibitors

Hepatic/renal dose

• **Adult: PO** Child-Pugh class B/C; CCr ≥ 10 ml/min, ≤ 50 ml/min, max 40 mg/day

Available forms: Tabs 40, 80 mg

Administer:

• Give with meal of ≥ 350 calories

SIDE EFFECTS

CNS: Agitation, akathisia, anxiety, dizziness, drowsiness, fatigue, hyperthermia, insomnia, dystonic reactions; **neuroleptic malignant syndrome (rare)**, pseudoparkinsonism, restlessness, **seizures, suicidal ideation**, syncope, tardive dyskinesia, vertigo

CV: Angina, **AV block, bradycardia**, hypertension, orthostatic hypotension, **sinus tachycardia, stroke**

EENT: Blurred vision

ENDO: Diabetes mellitus, ketoacidosis, hyperglycemia, hyperprolactinemia

GI: Abdominal pain, diarrhea, dyspepsia, nausea, vomiting, gastritis, weight gain/loss

GU: Amenorrhea, breast enlargement, dysmenorrhea, impotence, dysuria, renal failure

HEMA: **Agranulocytosis, anemia, leucopenia, neutropenia**

INTEG: Pruritus, rash

MS: Back pain, dysarthria; **rhabdomyolysis (rare)**

SYST: **Angioedema**

PHARMACOKINETICS

99% protein binding; excreted 80% in feces, 9% in urine; elimination half-life 18 hr; 9-19% absorbed; peak 1-3 hr, steady state 7 days

INTERACTIONS

Increase: lurasidone effect—strong CYP3A4 inhibitors; do not use concurrently

Increase: serotonin syndrome, neuroleptic malignant syndrome—SSRIs, SNRIs

Increase: sedation—other CNS depressants, alcohol

NURSING CONSIDERATIONS

Assess:

- **Schizophrenia:** hallucinations, delusions, agitation, social withdrawal; monitor orientation, behavior, mood prior to and periodically during therapy
- **Neuroleptic malignant syndrome (rare):** fever, dyspnea, tachycardia, seizures, sweating, hypo/hypertension, muscle stiffness, pallor; report immediately
- **Blood dyscrasias:** CBC periodically; blood dyscrasias may occur
- **Serious cardiac symptoms:** AV block, stroke, bradycardia may occur

- **EPS:** restlessness, difficulty speaking, loss of balance, pill rolling, masklike face, shuffling gait, rigidity, tremors, muscle spasms; monitor before and periodically during therapy; report tardive dyskinesia immediately

Black Box Warning:

Dementia: this product is not approved for geriatric patients with dementia-related psychosis

- Weight gain, hyperglycemia, metabolic changes in diabetes

Perform/provide:

- Storage at room temp, protection from moisture

Evaluate:

- Therapeutic response: decreasing hallucinations, delusions, agitation, social withdrawal

Teach patient/family:

- About reason for treatment, expected results
- That lab work will be needed regularly
- To avoid hazardous activities until response is known
- To avoid OTC products unless approved by prescriber
- To report fast heartbeat, extra beats
- To report EPS symptoms, blood dyscrasias: sore throat, fever, unusual bleeding/bruising

☼ Canada only Side effects: *italics* = common; **bold** = life-threatening ⚠
Nurse Alert

lymphocyte immune globulin (anti-thymocyte, equine) (Rx)

Atgam

Func. class.: Immune globulins—immunosuppressant

ACTION:

Produces immunosuppression by inhibiting the function of lymphocytes (T)

USES:

Renal organ transplants to prevent rejection, aplastic anemia

Unlabeled uses: Immunosuppressant in liver, bone marrow, heart, and other organ transplants; stem-cell transplant preparations

CONTRAINDICATIONS:

Hypersensitivity to this product or equine/leporine protein; acute viral illness

Precautions: Pregnancy (C), breastfeeding, children, severe renal/hepatic disease, leukopenia, thrombocytopenia

Black Box Warning:

Infection, neoplastic disease

DOSAGE AND ROUTES

Calculator

Renal allograft rejection

- **Adult/child:** IV 10-15 mg/kg/day × 14 days then every other day for 14 days if needed up to 21 total

Prevent renal allograft rejection

- **Adult:** IV 15 mg/kg/day × 7-14 days then every other day × 14 days for total of 21 doses in 28 days

Aplastic anemia

- **Adult:** IV 10-20 mg/kg/day × 8-14 days then every other day for ≤21 total doses

Available forms: Inj 50 mg equine gamma globulin/ml

Administer:

- Do not infuse <4 hr; usually given over 4-8 hr
- Use 0.2-1 micron in-line filter

- Skin testing must be completed before treatment; use intradermal inj of 0.1 ml of a 1:1000 dilution (5 mcg horse IgG) in 0.9% NaCl; if wheal or rash >10 mm or both, use caution during inf
- Dilute in saline sol before inf; invert IV bag so undiluted product does not contact air inside; conc should not be >1 mg/ml; do not shake
- Keep emergency equipment nearby for severe allergic reaction

SIDE EFFECTS

Renal transplant

CNS: Fever, chills, headache, dizziness, weakness, faintness, **seizures**

CV: Chest pain, hypo/hypertension, tachycardia

GI: Diarrhea, nausea, vomiting, epigastric pain, **GI bleeding**

INTEG: Rash, pruritus, urticaria, wheal

SYST: **Anaphylaxis**

Aplastic anemia

CNS: Fever, chills, headache, **seizures**, lightheadedness, encephalitis, postviral encephalopathy

CV: Bradycardia, myocarditis, irregularity

GI: Nausea, LFTs abnormality

HEMA: **Thrombocytopenia, leukopenia**

MS: **Backache**

RESP: **Dyspnea, pulmonary edema**

PHARMACOKINETICS

Onset rapid, half-life 5-7 days

NURSING CONSIDERATIONS

Assess:

- **Infection:** if infection occurs, evaluation will be needed to continue therapy
- Renal studies: BUN, creatinine at least monthly during treatment, for 3 mo after treatment
- Hepatic studies: alk phos, AST, ALT, bilirubin
- CBC with differential

Evaluate:

- Therapeutic response: absence of rejection; hematologic recovery (aplastic anemia)

Teach patient/family:

- To report fever, chills, sore throat, fatigue, since serious infections may occur
 - To use contraceptive measures during treatment, for 12 wk after therapy
-

✳ Canada only Side effects: *italics* = common; **bold** = life-threatening ⚠
Nurse Alert

mafenide topical

See [Appendix B](#)

MAGNESIUM SALTS

magnesium chloride (Rx)

Mag-64

magnesium citrate (OTC)

magnesium gluconate (OTC)

Mag-G, Magtrate

magnesium oxide (OTC)

Mag-Ox 400, Uro-Mag

magnesium hydroxide (OTC)

Freelax, MOM, Phillips' Milk of Magnesia

magnesium sulfate (OTC, Rx)

epsom salts; magnesium sulfate (IV)—HIGH ALERT

Func. class.: Electrolyte; anticonvulsant; saline laxative, antacid

ACTION:

Increases osmotic pressure, draws fluid into colon, neutralizes HCl

USES:

Constipation; bowel preparation before surgery or exam; anticonvulsant for preeclampsia, eclampsia (magnesium sulfate); electrolyte

Unlabeled uses: *Magnesium sulfate:* persistent pulmonary hypertension of the newborn (PPHN), cardiac arrest, CPR, digitoxin/digoxin toxicity, premature labor, seizure prophylaxis, status asthmaticus, torsades de pointes, ventricular fibrillation/tachycardia

CONTRAINDICATIONS:

Hypersensitivity, abdominal pain, nausea/vomiting, obstruction, acute surgical abdomen, rectal bleeding, heart block, myocardial damage

Precautions: Pregnancy (A); (B) (magnesium sulfate), renal/cardiac disease

DOSAGE AND ROUTES

Calculator

Laxative

- **Adult: PO** (Milk of Magnesia) 15-60 ml at bedtime
- **Adult and child >12 yr: PO** (magnesium sulfate) 15 g in 8 oz water; **PO** (Concentrated Milk of Magnesia) 5-30 ml; **PO** (magnesium citrate) 5-10 oz at bedtime
- **Child 2-6 yr: PO** (Milk of Magnesia) 5-15 ml/day

Prevention of magnesium deficiency

- **Adult and child ≥10 yr: PO** (male) 350-400 mg/day; (female) 280-300 mg/day; (breastfeeding) 335-350 mg/day; (pregnancy) 320 mg/day
- **Child 8-10 yr: PO** 170 mg/day
- **Child 4-7 yr: PO** 120 mg/day

Magnesium sulfate deficiency

- **Adult: PO** 200-400 mg in divided doses tid-qid; **IM** 1 g q6hr × 4 doses; **IV** 5 g (severe)
- **Child 6-12 yr: PO** 3-6 mg/kg/day in divided doses tid-qid

Preeclampsia/eclampsia (magnesium sulfate)

- **Adult: IM/IV** 4-5 g IV inf; with 5 g **IM** in each gluteus, then 5 g q4hr or 4 g **IV INF**, then 1-2 g/hr **CONT INF**, max 40 g/day or 20 g/48 hr in severe renal disease

Persistent pulmonary hypertension of the newborn (PPHN) in mechanically ventilated neonates (unlabeled)

- **Premature infants >33 wk and term neonates: IV** (magnesium sulfate) 200 mg/kg over 20-30 min then **CONT IV INF** 20-150 mg/kg/hr to maintain blood magnesium levels at 3.5-5.5 mmol/L

Status asthmaticus (unlabeled)

- **Adult: IV** (magnesium sulfate) 2 g
- **Child: IV INF** (PALS) (magnesium sulfate) 25-50 mg/kg diluted in D₅W, given over 10-20 min, max 2 g/dose

Premature labor (unlabeled)

- **Adult: IV INF** (magnesium sulfate) 4-6 g given as a loading dose over 20-30

min then 2-4 g/hr **CONT INF**; use infusion pump until contractions cease; continue inf at lowest dose over 12-24 hr; **PO** (magnesium chloride/gluconate/oxide) 648-1200 mg/day elemental magnesium in divided doses

Torsades de pointes/cardiac dysrhythmias with hypomagnesemia (unlabeled)

- **Adult: IV** (magnesium sulfate) use ACLS guidelines or 1-2 g in 50-100 ml D₅W given over 5-20 min in emergent cases or over 5-60 min

Available forms: Chloride: sus rel tabs 535 mg (64 mg Mg); enteric tabs 833 mg (100 mg Mg); **citrate:** oral sol 240-, 296-, 300-ml bottles (77 mEq/100 ml); **oxide:** tabs 400 mg; caps 140 mg; **hydroxide:** liq 400 mg/5 ml; conc liq 800 mg/5 ml; chew tabs 300, 600 mg; **sulfate:** powder for oral, bulk packages; epsom salts, bulk packages; inj 10%, 12.5%, 25%, 50%

Administer:

PO route

- With 8 oz water
- Refrigerate magnesium citrate before giving
- Shake susp before using as antacid at least 2 hr after meals
- Tablets should be chewed thoroughly before patient swallows; give 4 oz of water afterwards
- **Laxative:** give on empty stomach

IM route (magnesium sulfate)

- Give deeply in gluteal site

IV route (magnesium sulfate)

- Only when calcium gluconate available for magnesium toxicity

Direct IV route

- Dilute 50% sol to ≤20%, give at ≤150 mg/min

Continuous IV INF route

- May dilute to 20% sol, infuse over 3 hr
- IV at less than 125 mg/kg/hr; circulatory collapse may occur; use inf pump

Y-site compatibilities: Acyclovir, aldesleukin, amifostine, amikacin, ampicillin, aztreonam, ceFAZolin, cefoperazone, cefotaxime, cefOXitin, cephalothin, cephapirin, chloramphenicol, cisatracurium, DOBUTamine, doxycycline, DOXOrubicin liposome, enalaprilat, erythromycin, esmolol, famotidine, fludarabine, gallium, gentamicin, granisetron, heparin, HYDROmorphine,

IDArubicin, insulin, kanamycin, labetalol, meperidine, metroNIDAZOLE, minocycline, morphine, moxalactam, nafcillin, ondansetron, oxacillin, PACLitaxel, penicillin G potassium, piperacillin, piperacillin/tazobactam, potassium chloride, propofol, remifentanyl, sargramostim, thiotepa, ticarcillin, tobramycin, trimethoprim-sulfamethoxazole, vancomycin, vit B complex/C

SIDE EFFECTS

CNS: Muscle weakness, flushing, sweating, confusion, sedation, depressed reflexes, **flaccid paralysis**, hypothermia

CV: Hypotension, heart block, **circulatory collapse**, vasodilation

GI: *Nausea, vomiting, anorexia, cramps*, diarrhea

HEMA: Prolonged bleeding time

META: Electrolyte, fluid imbalances

RESP: Respiratory depression/paralysis

PHARMACOKINETICS

PO: Onset 1-2 hr

IM: Onset 1 hr, duration 4 hr

IV: Duration 1/2 hr

Excreted by kidney, effective anticonvulsant serum levels 2.5-7.5 mEq/L

INTERACTIONS

Increase: effect of neuromuscular blockers

Increase: hypotension—antihypertensives

Decrease: absorption of tetracyclines, fluoroquinolones, nitrofurantoin

Decrease: effect of digoxin

NURSING CONSIDERATIONS

Assess:

- **Laxative:** cause of constipation; lack of fluids, bulk, exercise; cramping, rectal bleeding, nausea, vomiting; product should be discontinued  **Eclampsia:**

seizure precautions, B/P, ECG (magnesium sulfate); **magnesium toxicity:** thirst, confusion, decrease in reflexes; I&O ratio; check for decrease in urinary output

Evaluate:

- Therapeutic response: decreased constipation; absence of seizures (eclampsia),

normal serum calcium levels

Teach patient/family:

- Not to use laxatives for long-term therapy because bowel tone will be lost
 - That chilling improves taste of magnesium citrate
 - To shake suspension well
 - Not to give at bedtime as a laxative; may interfere with sleep; MOM is usually given at bedtime
 - To give citrus fruit after administering to counteract unpleasant taste
 - About reason for product, expected results
-

🍁 Canada only Side effects: *italics* = common; **bold** = life-threatening ⚠️

Nurse Alert

mannitol (Rx)

(man'i-tole)

Osmitrol, Resectisol

Func. class.: Diuretic, osmotic

Chem. class.: Hexahydric alcohol

ACTION:

Acts by increasing osmolarity of glomerular filtrate, which inhibits reabsorption of water and electrolytes and increases urinary output

USES:

Edema; promotion of systemic diuresis in cerebral edema; decrease in intraocular/intracranial pressure; improved renal function in acute renal failure, chemical poisoning

CONTRAINDICATIONS:

Active intracranial bleeding, hypersensitivity, anuria, severe pulmonary congestion, edema, severe dehydration, progressive heart, renal failure

Precautions: Pregnancy (C), breastfeeding, geriatric patients, dehydration, severe renal disease, CHF, electrolyte imbalances

Black Box Warning:

Acute bronchospasm asthma

DOSAGE AND ROUTES

Calculator

Oliguria, prevention

- **Adult: IV** after initial test dose; if urine output is 30-50 ml/hr $\times$ 2 hr, give 20-100 g over a 24-hr period of 15% or 20% sol

Oliguria, treatment

- **Adult: IV** after initial test dose; give balance of 50 g of a 20% sol over 1 hr then 5% via **CONT IV INF** to maintain output at 50 ml/hr
- **Child (unlabeled): IV** 0.5-2 g/kg as 15%-20% sol, run over 30-60 min; maintenance 0.25-0.5 g/kg q4-6hr

Intraocular pressure

- **Adult: IV** 1.5-2 g/kg of 15%-25% sol over 30-60 min

ICP

- **Adult:** IV 1-2 g/kg then 0.25-1 g/kg q4hr

Diuresis with drug intoxication

- **Adult and child >12 yr:** 5%-10% sol continuously up to 200 g IV while maintaining 100-500 ml urine output/hr

Available forms: Inj 5%, 10%, 15%, 20%, 25%; GU irrigation: 5%

Administer:

Intermittent/Continuous IV route

- Change IV q24hr
- In 15%-25% sol with filter; rapid inf may worsen CHF; warm in hot water, shake to dissolve if crystals are present, use in-line filter, do not give as direct injection
- **Test dose** with severe oliguria, 0.2 g/kg over 3-5 min; if continued oliguria, give 2nd test dose; if no response, reassess patient

Y-site compatibilities: Acyclovir, aldesleukin, alemtuzumab, amifostine, amikacin, ampicillin, atropine, aztreonam, bivalirudin, bumetanide, calcium gluconate, caspofungin, ceFAZolin, cefotaxime, cefOXitin, cefTAZidime, ceftizoxime, chloramphenicol, cimetidine, cisatracurium, clindamycin, DAPTOmycin, dexmedetomidine, digoxin, diltiazem, diphenhydrAMINE, DOBUTamine, DOCEtaxel, DOPamine, DOXOrubicin liposome, doxycycline, enalaprilat, EPINEPHrine, ertapenem, esmolol, famotidine, fenoldopam, fentaNYL, fluconazole, fludarabine, gentamicin, granisetron, heparin, HYDROmorphine, hydrOXYzine, IDArubicin, imipenem/cilastatin, insulin, isoproterenol, ketorolac, labetalol, levofloxacin, lidocaine, linezolid, LORazepam, meperidine, metoclopramide, metoprolol, metroNIDAZOLE, micafungin, midazolam, milrinone, morphine, nafcillin, niCARdipine, nitroglycerin, nitroprusside, norepinephrine, ondansetron, oxaliplatin, PACLitaxel, palonosetron, pantoprazole, penicillin G potassium, phenylephrine, piperacillin/tazobactam, potassium chloride, procainamide, prochlorperazine, promethazine, propofol, propranolol, protamine, quinupristin/dalfopristin, ranitidine, remifentanyl, sargramostim, sodium bicarbonate, tacrolimus, thiotepa, ticarcillin/clavulanate, tirofiban, tobramycin, trimethoprim/sulfamethoxazole, vancomycin, vasopressin, verapamil, vit B complex with C, voriconazole

SIDE EFFECTS

CNS: Dizziness, headache, **seizures, rebound increased ICP**, confusion
CV: Edema, thrombophlebitis, hypo/hypertension, **tachycardia**, angina-like chest pains, fever, chills, **CHF, circulatory overload**
EENT: Loss of hearing, blurred vision, nasal congestion, decreased intraocular pressure
ELECT: Fluid, electrolyte imbalances, *acidosis*, electrolyte loss, dehydration, hypo/hyperkalemia
GI: *Nausea, vomiting*, dry mouth, diarrhea
GU: Marked diuresis, urinary retention, thirst
RESP: Pulmonary congestion

PHARMACOKINETICS

IV: Onset 1-3 hr for diuresis, 1/2-1 hr for intraocular pressure, 15 min for cerebrospinal fluid; duration 4-6 hr for intraocular pressure, 3-8 hr for cerebrospinal fluid; excreted in urine; half-life 100 min

INTERACTIONS

Increase: elimination of mannitol—lithium

Increase: excretion of salicylates, barbiturates, imipramine, bromides

Increase: hypokalemia—arsenic trioxide, cardiac glycosides, levomethadyl

Drug/Lab Test

Interference: inorganic phosphorus, ethylene glycol

NURSING CONSIDERATIONS

Assess:

- Weight, I&O daily to determine fluid loss; effect of product may be decreased if used daily; output every hr prn
- B/P lying, standing; postural hypotension may occur
- Electrolytes: potassium, sodium, chloride; include BUN, CBC, serum creatinine, blood pH, ABGs, CVP, PAP
- **Metabolic acidosis:** drowsiness, restlessness
- **Hypokalemia:** postural hypotension, malaise, fatigue, tachycardia, leg cramps, weakness, or hyperkalemia
- Rashes, temp daily
- Confusion, especially in geriatric patients; take safety precautions if needed
- Hydration including skin turgor, thirst, dry mucous membranes, provide

adequate fluids • Blurred vision, pain in eyes before, during treatment
(increased intraocular pressure); neurologic checks, intracranial pressure
during treatment **(increased intracranial pressure)**

Evaluate:

- Therapeutic response: improvement in edema of feet, legs, sacral area daily if medication being used with CHF; decreased intraocular pressure, prevention of hypokalemia, increased excretion of toxic substances; decreased ICP

Teach patient/family:

- To rise slowly from lying or sitting position
- About the reason for, method of treatment
- To report signs of electrolyte imbalance, confusion

TREATMENT OF OVERDOSE:

Discontinue inf; correct fluid, electrolyte imbalances; hemodialysis; monitor hydration, CV status, renal function

☼ Canada only Side effects: *italics* = common; **bold** = life-threatening ⚠
Nurse Alert

maraviroc (Rx)

(mah-rav'er-rock)

Selzentry

Func. class.: Antiretroviral

Chem. class.: Fusion inhibitor, CCR5-receptor antagonist

ACTION:

Interferes with entry into HIV-1 by inhibiting the fusion of the virus and the cell membrane

USES:

CCR5-tropic HIV in combination with other antiretroviral agents for treating experienced patients

CONTRAINDICATIONS:

Hypersensitivity, dialysis, renal impairment

Precautions: Pregnancy (B), Asian patients, breastfeeding, renal/hepatic/cardiac disease, electrolyte imbalance, dehydration, immune reconstitution syndrome, infection, MI, orthostatic hypotension, children, geriatric patients, Graves' disease, Guillain-Barré syndrome, polymyositis

Black Box Warning:

Hepatitis, fever, serious rash

DOSAGE AND ROUTES

Calculator

Those not taking any CYP3A inducers/inhibitors

- **Adult/adolescent ≥16 yr: PO 300 mg bid**

Those taking CYP3A4 inhibitors with/without a CYP3A inducer

- **Adult/adolescent ≥16 yr: PO 150 mg bid**

Those taking CYP3A4 inducers without a strong CYP3A inhibitor

- **Adult/adolescent ≥16 yr: PO 600 mg bid**

Renal dose

- **Adult: PO ≤30 ml/min, reduce dose to 150 mg bid**

Available forms: Tabs 150, 300 mg

Administer:

- May give without regard to meals, with 8 oz water; swallow whole, do not

crush, chew, break

SIDE EFFECTS

CV: MI, cardiac ischemia, orthostatic hypotension

CNS: Dizziness, depression, viral meningitis, disturbances in consciousness, peripheral neuropathy, paresthesia, dysesthesia, fever

EENT: Gingival hyperplasia

GI: Diarrhea, constipation, dyspepsia, pseudomembranous colitis, hepatotoxicity

INTEG: Rash, urticaria, pruritus, folliculitis

MS: Joint pain, leg pain, muscle cramps

RESP: Cough, upper respiratory tract infection, sinusitis, bronchitis, pneumonia, bronchospasm, obstruction

SYST: Herpes virus

PHARMACOKINETICS

Metabolized by P450 system; CYP3A metabolism; excreted 20% urine, 76% feces; protein binding 76%; terminal half-life 14-18 hr

INTERACTIONS

Increase: maraviroc levels—CYP3A inhibitors (amiodarone, aprepitant, chloramphenicol, clarithromycin, conivaptan, cycloSPORINE, dalfopristin, danazol, diltiazem, erythromycin, estradiol, fluconazole, fluvoxamine, imatinib, isoniazid, itraconazole, ketoconazole, miconazole, nefazodone, niCARDipine, propoxyphene, RU-486, tamoxifen, telithromycin, troleandomycin, verapamil, voriconazole, zafirlukast); reduce dose

Decrease: maraviroc levels—CYP3A4 inducers (efavirenz, aminoglutethimide, barbiturates, bexaroten, bosentan, carbamazepine, dexamethasone, griseofulvin, modafinil, nafcillin, OXcarbazepine, phenytoin, fosphenytoin, rifabutin, rifampin, rifapentine, topiramate, tipranavir); increase dose

Drug/Herb

- Decreased maraviroc effect: St. John's wort

Drug/Food

- High-fat meal decreases absorption 33%

NURSING CONSIDERATIONS

Assess:

- **HIV:** CD₄, T-cell count, plasma HIV RNA, CCR5-tropic HIV-1; assess for changes in symptoms, other infections during treatment
- Renal studies: serum creatinine
- Bowel pattern before, during treatment
- **Allergies:** skin eruptions: rash, urticaria, itching; discontinue product

Black Box Warning:

Hepatitis: dark urine; abdominal pain, vomiting; yellowing of skin, eyes; hepatomegaly; discontinue product; monitor liver function tests

Perform/provide:

- Storage at room temp

Evaluate:

- Therapeutic response: improvement in CD4, viral load, T-cell count

Teach patient/family:

- To take as prescribed; if dose is missed, to take as soon as remembered up to 1 hr before next dose; not to double dose; that product does not cure condition, should not be shared with others
- That product does not cure infection, just controls symptoms and does not prevent infecting others ⚠️ To report sore throat, fever, fatigue (**may indicate superinfection**); yellow skin/eyes, abdominal pain, vomiting (**hepatitis**); itching, SOB (**allergic reaction**)
- That product must be taken in equal intervals around the clock to maintain blood levels for duration of therapy
- To avoid all OTC products unless approved by prescriber
- To avoid driving, other hazardous activities until reaction is known; that dizziness may occur
- To make position changes slowly to prevent postural hypotension
- To notify prescriber if pregnancy is planned or suspected, **not to breastfeed**

✳ Canada only Side effects: *italics* = common; **bold** = life-threatening ⚠️
Nurse Alert

mebendazole (Rx)

(me-ben'da-zole)

Func. class.: Anthelmintic

Chem. Class.: Carbamate

ACTION:

Inhibits glucose uptake, degeneration of cytoplasmic microtubules in the cell; interferes with absorption, secretory function

USES:

Pinworms, roundworms, hookworms, whipworms, thread-worms, pork tapeworms, dwarf tapeworms, beef tapeworms, hydatid cyst

CONTRAINDICATIONS:

Hypersensitivity

Precautions: Pregnancy (C) (1st trimester), breastfeeding, children <2yr, Crohn's disease, hepatic disease, inflammatory bowel disease, ulcerative colitis

DOSAGE AND ROUTES

Calculator

• **Adult and child >2 yr:** PO 100 mg as a single dose (pinworms) or bid ×3 days (whipworms, roundworms, or hookworms); course may be repeated in 3 wk if needed, max 200 mg/day

Available forms: Chew tabs 100 mg

Administer:

- May be crushed, chewed, swallowed whole, mixed with food
- PO after meals to avoid GI symptoms
- Second course after 3 wk if needed; usually recommended

SIDE EFFECTS

CNS: Dizziness, fever, headache, **seizures (rare)**

GI: Transient diarrhea, abdominal pain, nausea, vomiting, constipation, hepatitis

INTEG: Rash

PHARMACOKINETICS

PO

Peak ½-7 hr; excreted in feces primarily (metabolites), small amount in urine (unchanged); highly bound to plasma proteins 95%

INTERACTIONS

Decrease: mebendazole effect—carbamazepine, hydantoins

Drug/Food

Increase: absorption—high-fat meal

NURSING CONSIDERATIONS

Assess:

- Stools during entire treatment; specimens must be sent to lab while still warm, also 1-3 wk after treatment is completed
- For allergic reaction: rash (rare)
- For diarrhea during expulsion of worms; avoid self-contamination with patient's feces
- For infection in other family members, since infection from person to person is common
- Blood studies: AST, ALT, alk phos, BUN, CBC during treatment

Perform/provide:

- Storage in tight container

Evaluate:

- Therapeutic response: expulsion of worms and 3 negative stool cultures after completion of treatment

Teach patient/family:

- Proper hygiene after BM, including hand-washing technique; tell patient to avoid putting fingers in mouth; clean fingernails
- That infected person should sleep alone; do not shake bed linen, change bed linen daily, wash in hot water, change and wash undergarments daily
- To clean toilet daily with disinfectant (green soap solution)
- The need for compliance with dosage schedule, duration of treatment
- To wear shoes, wash all fruits and vegetables well before eating; use commercial fruit/vegetable cleaner
- That all members of the family should be treated (pinworms)
- To report jaundice, liver pain

Nurse Alert

mecasermin (Rx)

(mec-a'sir-men)

Increlex

Func. class.: Biologic response modifier; insulin-like growth factor

ACTION:

Stimulates growth; IGF-1 is the principal hormonal mediator of statural growth; GH binds to its receptor in the liver and other tissues

USES:

Growth failure in children with severe primary insulin-like growth factor-1 (IGF-1) deficiency (primary IGFD) or with growth hormone (GH) gene deletion who have developed neutralizing antibodies to GH

Unlabeled uses: ALS

CONTRAINDICATIONS:

Hypersensitivity, benzyl alcohol, closed epiphyses, active/suspected neoplasia, IV use

Precautions: Pregnancy (C), breastfeeding, children <2 yr, diabetes mellitus, hypothyroidism, lymphoid tissue hypertrophy, increased intracranial pressure, malnutrition, scoliosis, sleep apnea

DOSAGE AND ROUTES

Calculator

• **Child ≥2 yr: SUBCUT** 0.04-0.08 mg/kg (40-80 mcg/kg) bid; if well tolerated for 1 wk, may increase by 0.04 mg/kg/dose, max 0.12 mg/kg bid

Available forms: Inj 10 mg/ml

Administer:

SUBCUT route

- Give within 20 min of meal or snack, do not give if unable to eat or if vomiting
- Rotate inj site; use sterile, disposable syringe/needles; use small-volume syringe for accurate measurement; if using syringe (units), convert to mg/kg (weight [kg] × dose [mg/kg] × 1 ml/mg × 100 units/1 ml = units/injection) • Do not double dose if a dose is missed

SIDE EFFECTS

CNS: Headache, **seizures**, dizziness, cardiac valvulopathy, **increased intracranial pressure**

CV: Cardiac murmur

EENT: Ear pain, otitis media, abnormal tympanometry, papilledema, visual impairment, tonsillar hypertrophy

ENDO: **Hypoglycemia, ketosis, hypothyroidism, hypercholesterolemia, hypertriglyceridemia**

INTEG: Pruritus, urticaria, **anaphylaxis, angioedema**

GI: Vomiting, nausea

HEMA: Thymus hypertrophy

MISC: Bruising, lipohypertrophy, inj site reaction

MS: Arthralgia, joint pain, slipped upper femoral epiphysis

RESP: Snoring, **apnea**

SYST: **Antibodies to growth hormone, secondary malignancy**

PHARMACOKINETICS

Bioavailability almost 100%, metabolized in liver/kidney, half-life 5.8 hr

INTERACTIONS

Increase: hypoglycemia—antidiabetics, corticosteroids

Decrease: growth suppression possible—psychostimulants

NURSING CONSIDERATIONS

Assess:

- Monitor preprandial glucose at beginning of treatment and until well tolerated
- By funduscopic exam at beginning and periodically during treatment
- **Allergic reactions;** if present, interrupt treatment and notify prescriber
- Growth rate of child at intervals during treatment
- **Serious skin disorders:** angioedema, anaphylaxis

Perform/provide:

- Storage in refrigerator before opening, avoid freezing; after opening, stable for 30 days after initial vial entry, store in refrigerator; do not use if particulate matter is present, avoid direct light, do not use after expiration date

Evaluate:

- Therapeutic response: growth in children

Teach patient/family:

- That treatment may continue for years; that regular assessments are required
 - To avoid hazardous activities, driving within 2-3 hr of dosing
 - About correct administration, needle disposal
-

🍁 Canada only Side effects: *italics* = common; **bold** = life-threatening ⚠️

Nurse Alert

meclizine (OTC, Rx)

(mek'li-zeen)

Antivert, Bonamine , Bonine, Dramamine Less Drowsy Formula, Medivert, Travel Sickness, Wal-Dram II *Func. class.:* Antiemetic, antihistamine, anticholinergic *Chem. class.:* H₁-receptor antagonist, piperazine derivative

ACTION:

Acts centrally by blocking chemoreceptor trigger zone, which in turn acts on vomiting center

USES:

Vertigo, motion sickness

CONTRAINDICATIONS:

Hypersensitivity to cyclizines

Precautions: Pregnancy (B), breastfeeding, children, geriatric patients, closed-angle glaucoma, prostatic hypertrophy, hepatic/renal disease

DOSAGE AND ROUTES

Calculator

Vertigo

- **Adult/adolescent: PO** 25-100 mg/day in divided doses

Motion sickness

- **Adult/adolescent: PO** 25-50 mg 1 hr before traveling, repeat dose q24hr prn

Available forms: Tabs 12.5, 25, 50 mg; chew tabs 25 mg; caps 25, 30 mg

Administer:

PO route

- May give without regard to food
- **Chew tab:** give without regard to water or may be swallowed whole with water
- Lowest possible dose for geriatric patients; anticholinergic effects

SIDE EFFECTS

CNS: Drowsiness, fatigue, restlessness, headache, insomnia

CV: Hypotension

EENT: Dry mouth, blurred vision

GI: Nausea, anorexia, constipation, increased appetite

GU: Urinary retention

SYST: Anaphylaxis

PHARMACOKINETICS

PO: Onset 1 hr, duration 8-24 hr, half-life 6 hr

INTERACTIONS

Increase: sedation—CYP2D6, inhibitors

Increase: anticholinergic effects—other antihistamines, atropine, antidepressants, phenothiazines

Increase: effect of alcohol, opioids, other CNS depressants

Drug/Lab Test

False negative: allergy skin testing (allergen extracts)

NURSING CONSIDERATIONS

Assess:

- **Vertigo/motion sickness:** nausea, vomiting after 1 hr; assess vertigo periodically ⚠️ Signs of toxicity of other products, masking of symptoms of disease: brain tumor, intestinal obstruction
- Observe for drowsiness, dizziness, level of consciousness

Evaluate:

- Therapeutic response: absence of dizziness, vomiting

Teach patient/family:

- That a false-negative result may occur with skin testing for allergies; that these procedures should not be scheduled for ≤ 4 days after discontinuing use
- To avoid hazardous activities, activities requiring alertness because dizziness may occur; to request assistance with ambulation
- To avoid alcohol, other depressants; not to breastfeed

✳️ Canada only Side effects: *italics* = common; **bold** = life-threatening ⚠️

medroxyPROGESTERone (Rx)

(me-drox'ee-proe-jess'te-rone)

Depo-Provera, Depo-sub Q Provera, Gen-Medroxy , Provera *Func. class.:* Antineoplastic, hormone, contraceptive *Chem. class.:* Progesterone derivative

Do not confuse: medroxyPROGESTERone/methylPREDNISolone
Provera/Premarin/Covera

ACTION:

Inhibits secretion of pituitary gonadotropins, which prevents follicular maturation and ovulation; antineoplastic action against endometrial cancer

USES:

Uterine bleeding (abnormal); secondary amenorrhea; prevention of endometrial changes associated with estrogen replacement therapy (ERT); contraceptive; inoperable, recurrent, metastatic endometrial/ renal cancer

Unlabeled uses: Hot flashes; symptoms of menopause; paraphilia (men); hot flashes (men) with prostate cancer

CONTRAINDICATIONS:

Pregnancy (X), hypersensitivity, reproductive cancer, genital bleeding (abnormal, undiagnosed), missed abortion, stroke, cerebrovascular disease, cervical cancer, hepatic disease, uterine/vaginal cancer

Black Box Warning:

Breast cancer, MI, stroke, thromboembolic disease, thrombophlebitis

Precautions: Breastfeeding, hypertension, asthma, blood dyscrasias, gallbladder disease, CHF, diabetes mellitus, bone disease, depression, migraine headache, seizure disorders, renal/hepatic disease, family history of cancer of breast or reproductive tract, bone mineral density loss, ocular disorders, AIDS/HIV, alcoholism, children, hyperlipidemia

Black Box Warning:

Cardiac disease, dementia, osteoporosis

DOSAGE AND ROUTES

Calculator

Secondary amenorrhea

- **Adult: PO** 5-10 mg/day × 5-10 days

Uterine bleeding

- **Adult: PO** 5-10 mg/day × 5-10 days starting on 16th or 21st day of menstrual cycle

With ERT

- **Adult: PO** 5-10 mg daily × 10-14 or more days/mo (sequential estrogen); 2.5-5 mg daily (continuous estrogen)

Contraceptive

- **Adult: IM** (contraceptive inj) 150 mg q12wk; **SUBCUT** (depot SUBCUT Provera 104 inj) 104 mg q3mo

Endometrial/renal cancer

- **Adult: IM** 400 mg-1 g (using 400 mg/ml depot inj susp) weekly

Hot flashes/symptoms of menopause (unlabeled)

- **Adult (female): PO** 20 mg/day; **IM** 150 mg monthly

Hot flashes (men) in prostate cancer (unlabeled)

- **Adult (male): IM** Depot 150 or 400 mg

Available forms: Tabs 2.5, 5, 10 mg; inj susp, 150, 400 mg/ml; depot-SUBCUT inj: 104 mg/0.65 ml

Administer:

PO route

- Give without regard to food

IM route

- Visually inspect particulate matter and discoloration before use

Depo-provera contraceptive injection suspension

- IM only, *never* IV
- Instruct patient on risks and warnings associated with hormonal contraceptives (see Patient Information) • The possibility of pregnancy should be excluded before giving the first dose of medroxyprogesterone or whenever more than 14 wk has passed since the last dose • Do not dilute
- Shake vigorously immediately before administration
- Inject deeply into the gluteal or deltoid muscle; Aspirate before injection to avoid injection into a blood vessel

Depo-provera sterile aqueous suspension, preserved

- IM only, *never* IV
- Instruct patient on risks and warnings associated with progestin use (see Patient

Information) • Shake vigorously immediately before use

- When multidose vials are used, take special care to prevent contamination
- Inject deeply into the gluteal or deltoid muscle; aspirate before injection

SUBCUT route

depo-subq provera 104 contraceptive injection suspension *only*

- For subcut only, *never* give IM or IV
- Instruct patient on risks and warnings associated with hormonal contraceptives (see Patient Information) • Shake vigorously for at least 1 min before use
- Inject the entire contents of the prefilled syringe subcut into the anterior thigh or abdomen, avoiding bony areas and the umbilicus; gently grasp and squeeze a large area of skin in the chosen injection area, ensuring that the skin is pulled away from the body; insert the needle at a 45-degree angle; inject until the syringe is empty; this usually requires 5-7 sec; following use, press lightly on the injection site with a clean cotton pad for a few seconds; do not rub the area

SIDE EFFECTS

CNS: Dizziness, headache, migraines, depression, fatigue, nervousness

CV: Hypotension, thrombophlebitis, edema, **thromboembolism, stroke, PE, MI**

EENT: Diplopia

GI: *Nausea*, vomiting, anorexia, cramps, increased weight, **cholestatic jaundice**, abdominal pain

GU: Amenorrhea, cervical erosion, breakthrough bleeding, dysmenorrhea, vaginal candidiasis, breast changes, *gynecomastia, testicular atrophy, impotence*, endometriosis, **spontaneous abortion**, vaginitis, libido increased/decreased

INTEG: Rash, urticaria, acne, hirsutism, alopecia, oily skin, seborrhea, purpura, melasma, photosensitivity, injection site reaction

META: Hyperglycemia

MS: Decreased bone density

SYST: **Angioedema, anaphylaxis**

PHARMACOKINETICS

PO: Duration 24 hr; excreted in urine and feces; metabolized in liver

INTERACTIONS

Decrease: medroxyPROGESTERone action—aminoglutethimide,

carbamazepine, phenytoins, phenobarbital, rifampin

Decrease: bone mineral density—anticoagulants, corticosteroids

Drug/Lab Test

Increase: LFTs, HDL, triglycerides

Decrease: GTT, HDL

NURSING CONSIDERATIONS

Assess:

- Pelvic exam, Pap smear before treatment, periodically

⚠ Severe allergic reaction, angioedema; have EPINEPHrine and resuscitative equipment available • Weight daily; notify prescriber of weekly weight gain >5 lb; bone mineral density • B/P at beginning of treatment and periodically

- I&O ratio; be alert for decreasing urinary output, increasing edema
- Hepatic studies: ALT, AST, bilirubin periodically during long-term therapy
- Edema, hypertension, cardiac symptoms, jaundice
- Mental status: affect, mood, behavioral changes, depression

Black Box Warning:

This product should not be given to those with breast cancer, MI, stroke, thromboembolic disorders

- **Bone mineral density loss:** in those taking anticoagulants, corticosteroids with Depo-Provera or Depo-sub Q Provera

Black Box Warning:

Use of product shown to increase dementia in women ≥65 yr old; use may increase osteoporosis in long-term treatment; those who smoke also at greater risk; adequate calcium and vit D should be taken

Perform/provide:

- Storage in dark area

Evaluate:

- Therapeutic response: decreased abnormal uterine bleeding, absence of amenorrhea

Teach patient/family:

- To avoid sunlight or to use sunscreen; photosensitivity can occur

⚠ To report breast lumps, vaginal bleeding, edema, jaundice, dark urine, clay-colored stools, dyspnea, headache, blurred vision, abdominal pain, sudden change in speech/coordination, numbness or stiffness in legs, chest pain; males to report impotence, gynecomastia • To report suspected pregnancy (X); fertility returns 6-12 mo after discontinuing

Black Box Warning:

Long-term use decreases bone density; exercise, calcium supplements can help lessen osteoporosis

🍁 Canada only Side effects: *italics* = common; **bold** = life-threatening ⚠️
Nurse Alert

medrysone ophthalmic

See [Appendix B](#)

megestrol (Rx)

(me-jess'trole)

Megace, Megace ES

Func. class.: Antineoplastic hormone

Chem. class.: Progestin

Do not confuse: **Megace**/Reglan

ACTION:

Affects endometrium with antiluteinizing effect; thought to bring about cell death

USES:

Breast, endometrial cancer; cachexia, anorexia, weight loss with AIDS

Unlabeled uses: Hot flashes in women (menopause) or men (prostate cancer), unexplained weight loss in geriatric patients, endometriosis, renal cell cancer (palliative), endometrial cancer, breast cancer (metastatic)

CONTRAINDICATIONS:

Pregnancy (D) tabs, (X) susp; hypersensitivity

Precautions: Diabetes, thrombosis, adrenal insufficiency

DOSAGE AND ROUTES

Calculator

Endometrial/ovarian carcinoma

- **Adult: PO** 40-320 mg/day in divided doses

Breast carcinoma

- **Adult: PO** 40 mg qid or 160 mg/day

Cachexia (AIDS)

- **Adult: PO** 800 mg/day (oral susp) or 625 mg/day (ES)

Hot flashes (unlabeled)

- **Adult: PO** 20 mg bid

Metastatic endometrial cancer

- **Adult: PO** 40-320 mg/day in divided doses $\times \geq 2$ mo

Available forms: Tabs 20, 40 mg; oral susp 40, 125 mg/ml

Administer:

- Oral susp for AIDS patients; shake well
- Tablets for carcinoma
- Without regard to food

SIDE EFFECTS

CNS: Mood swings, insomnia, fever, lethargy, depression

CV: Thrombophlebitis, thromboembolism, hypertension

ENDO: Adrenal insufficiency

GI: Nausea, vomiting, diarrhea, abdominal cramps, weight gain, flatus, indigestion

GU: Gynecomastia, fluid retention, hypercalcemia, vaginal bleeding, discharge, impotence, decreased libido, menstruation disorders

INTEG: Alopecia, rash, pruritus, purpura, itching, sweating

META: Hyperglycemia

MISC: Tumor flare

RESP: Dyspnea

PHARMACOKINETICS

PO: Half-life 13-105 hr; metabolized in liver; excreted in feces, urine, breast milk; food increases bioavailability of oral sol

INTERACTIONS

- Do not use with dofetilide

Decrease: megestrol effect—antidiabetics

Drug/Lab Test

Increase: glucose

NURSING CONSIDERATIONS

Assess:

- PSA levels in men (prostate cancer); blood glucose, LFTs, serum calcium, weight

- Effects of alopecia on body image; feelings about body changes
- Frequency of stools, characteristics: cramping, acidosis, signs of dehydration (rapid respirations, poor skin turgor, decreased urine output, dry skin, restlessness, weakness) • Anorexia, nausea, vomiting, constipation, weakness, loss of muscle tone

⚠ Thrombophlebitis: Homans' sign, edema; pain in calf, thigh; notify prescriber immediately

Perform/provide:

- Storage in tight container at room temp

Evaluate:

- Therapeutic response: decreased tumor size, spread of malignancy; weight gain in AIDS patients; resolved dysfunctional uterine bleeding

Teach patient/family:

- To report vaginal bleeding
- That nonhormonal contraception should be used during and for 4 mo after treatment; pregnancy (D) tabs, (X) susp • That gynecomastia, alopecia can occur; reversible after discontinuing treatment

⚠ To recognize signs of fluid retention, thromboemboli; to report these immediately • To monitor blood glucose if diabetic

🍁 Canada only Side effects: *italics* = common; **bold** = life-threatening ⚠
Nurse Alert

HIGH ALERT

melphalan (Rx)

(mel'fa-lan)

Alkeran

Func. class.: Antineoplastic, alkylating agent

Chem. class.: Nitrogen mustard

Do not confuse: melphalan/Myleran

ACTION:

Responsible for cross-linking DNA strands, thereby leading to cell death; activity is not cell-cycle–phase specific

USES:

Multiple myeloma, malignant melanoma, advanced ovarian cancer

Unlabeled uses: Breast, testicular, prostate carcinoma; osteogenic sarcoma, amyloidosis, chronic myelogenous leukemia, non-Hodgkin's lymphoma, pediatric rhabdomyosarcoma, stem cell transplant, bone marrow ablation, AML, myelodysplastic syndrome

CONTRAINDICATIONS:

Pregnancy (D), breastfeeding, other nitrogen mustards

Black Box Warning:

Hypersensitivity to this product

Precautions: Children, radiation therapy, infections, renal disease

Black Box Warning:

Bone marrow depression, secondary malignancy, radiation therapy; requires an experienced clinician

DOSAGE AND ROUTES

Calculator

Multiple myeloma

- **Adult: PO** 6 mg daily $\times$ 2-3 wk, adjust dose based on blood counts or 10 mg daily $\times$ 7-10 day
- **Adult: IV INF** 16 mg/m², reduce with renal insufficiency, give over 15-20 min, give at 2-wk intervals $\times$ 4 doses then at 4-wk intervals

Ovarian carcinoma

- **Adult: PO** 200 mcg/kg/day × 5 days q4-5wk

Testicular cancer/breast cancer/non-hodgkin's lymphoma/osteogenic sarcoma (unlabeled)

- **Adult: PO** 150 mcg/kg/day × 7 days q4wk; when leukocytes normal, give 50 mcg/kg/day maintenance

Pediatric rhabdomyosarcoma (unlabeled)

- **Child: IV** 10-35 mg/m² q21-28days

Available forms: Tabs 2 mg, powder for inj 50 mg

Administer:

- Antiemetic 30-60 min before product to prevent vomiting

PO route

- Give on empty stomach
- Protect from light, store refrigerated

Intermittent IV INF route

- Use gloves during administration; if skin exposure occurs, wash immediately with soap and water, use cytotoxic handling procedures • Give after reconstituting with 10 ml diluent provided (5 mg/ml); shake, dilute dose with 0.9% NaCl (≤ 0.45 mg/ml), give within 1 hr, run over ≥ 15 min; degrading of product occurs rapidly, make sure infusion is completed in time specified

Y-site compatibilities: Acyclovir, amikacin, aminophylline, ampicillin, aztreonam, bleomycin, bumetanide, buprenorphine, butorphanol, calcium gluconate, CARBOplatin, carmustine, ceFAZolin, cefepime, cefoperazone, cefotaxime, cefoTEtan, cefTAZidime, ceftizoxime, cefTRIAxone, cefuroxime, cimetidine, CISplatin, clindamycin, cyclophosphamide, cytarabine, dacarbazine, DACTINomycin, DAUNOrubicin, dexamethasone, diphenhydrAMINE, DOXOrubicin, doxycycline, droperidol, enalaprilat, etoposide, famotidine, floxuridine, fluconazole, fludarabine, fluorouracil, furosemide, gallium, ganciclovir, gentamicin, granisetron, haloperidol, heparin, hydrocortisone, hydrocortisone sodium phosphate, HYDROmorphone, hydrOXYzine, IDArubicin, ifosfamide, imipenem-cilastatin, LORazepam, mannitol, mechlorethamine, meperidine, mesna, methotrexate, methylPREDNISolone, metoclopramide, metroNIDAZOLE, miconazole, minocycline, mitoMYcin,

mitoXANtrone, morphine, nalbuphine, netilmicin, ondansetron, pentostatin, piperacillin, plicamycin, potassium chloride, prochlorperazine, promethazine, ranitidine, sodium bicarbonate, streptozocin, teniposide, thiotepa, ticarcillin, ticarcillin/clavulanate, tobramycin, trimethoprim-sulfamethoxazole, vancomycin, vinBLAStine, vinCRIStine, vinorelbine, zidovudine

SIDE EFFECTS

GI: *Nausea, vomiting*, stomatitis, diarrhea, **hepatitis**

GU: Amenorrhea, hyperuricemia, gonadal suppression, hyperuricemia

HEMA: **Thrombocytopenia, neutropenia, leukopenia**, anemia

INTEG: Rash, urticaria, alopecia, pruritus

RESP: **Fibrosis, dysplasia**, dyspnea, pneumonitis

SYST: **Anaphylaxis**, allergic reactions, **secondary malignancies**, edema

PHARMACOKINETICS

Metabolized in liver, excreted in urine, half-life 1½ hr, protein binding 80%-90%

INTERACTIONS

- Avoid administration of sargramostim, GM-CSF, filgrastim, G-CSF 14 hr before or 24 hr after product

Increase: toxicity—antineoplastics, radiation

Increase: pulmonary toxicity—carmustine

Increase: renal failure risk—cycloSPORINE

Increase: enterocolitis risk—nalidixic acid

Increase: bleeding risk—NSAIDs, anticoagulants, salicylates, thrombolytics, platelet inhibitors

Decrease: antibody response—live virus vaccines

NURSING CONSIDERATIONS

Assess:

Black Box Warning:

Bone marrow depression: CBC, differential, platelet count weekly; withhold product if WBC is $<3000/\text{mm}^3$ or platelet count is $<100,000/\text{mm}^3$; notify prescriber; recovery usually occurs in 6 wk

- Renal studies: BUN, serum uric acid before, during therapy
- I&O ratio; report fall in urine output to 30 ml/hr

• **Infection:** fever, cough, temp, chills, sore throat; notify prescriber • Hepatic studies before, during therapy (bilirubin, AST, ALT, LDH) as needed; jaundiced skin and sclera, dark urine, clay-colored stools, itchy skin, abdominal pain, fever, diarrhea • **Bleeding:** hematuria, guaiac, bruising or petechiae, mucosa or orifices q8hr • Buccal cavity q8hr for dryness, sores, ulceration, white patches, oral pain, bleeding, dysphagia • Local irritation, pain, burning, discoloration at inj site • **Hyperuricemia:** joint pain, edema, increased uric acid, increase fluids to >2 L unless contraindicated  **Severe allergic reaction:** rash, pruritus, urticaria, purpuric skin lesions, itching, flushing; assess allergy to chlorambucil; cross-sensitivity may occur

Perform/provide:

- Increase fluid intake to 2-3 L/day to prevent urate deposits, calculi formation
- Rinsing of mouth tid-qid with water, club soda; brushing of teeth bid-tid with soft brush or cotton-tipped applicators for stomatitis; use unwaxed dental floss

Evaluate:

- Therapeutic response: decreased tumor size, spread of malignancy

Teach patient/family:

- That usually sterility, amenorrhea occur; reversible after discontinuing treatment • To avoid foods with citric acid, hot or rough texture
- To report any bleeding, white spots, or ulcerations in mouth to prescriber; to examine mouth daily • To report signs of infection: fever, sore throat, flulike symptoms
- To report suspected pregnancy; to use contraception during treatment; pregnancy (D) • To report signs of anemia: fatigue, headache, faintness, SOB, irritability
- To avoid use of razors, commercial mouthwash
- To avoid use of aspirin products, NSAIDs, alcohol

☼ Canada only Side effects: *italics* = common; **bold** = life-threatening 
Nurse Alert

memantine (Rx)

(me-man'teen)

Ebixa , Namenda, Namenda XR

Func. class.: Anti-Alzheimer agent

Chem. class.: NMDA receptor antagonist

ACTION:

Antagonist action of CNS NMDA receptors that may contribute to the symptoms of Alzheimer's disease

USES:

Moderate to severe dementia in Alzheimer's disease

Unlabeled uses: Vascular dementia, acquired pendular nystagmus

CONTRAINDICATIONS:

Children, hypersensitivity

Precautions: Pregnancy (B), breastfeeding, renal disease, GU conditions that raise urine pH, seizures, severe hepatic disease, renal failure

DOSAGE AND ROUTES

Calculator

• **Adult: PO** 5 mg/day, may increase dose in 5-mg increments ≥ 1 wk intervals; recommended target dose of 20 mg/day as 10 mg bid; $\times$ R 7 mg q day increase in 7 mg increments $\geq$ q wk to 28 mg/day

Available forms: Tabs 5, 10 mg; tab titration pak 5, 10 mg; oral sol 2 mg/ml (10 mg/5 ml); cap ext rel 7, 14, 21, 28 mg

Administer:

- Can be taken without regard to meals
- Twice a day if dose > 5 mg
- Dosage adjusted to response no more than q1wk
- **Ext rel caps:** do not crush, chew, divide; swallow whole or open and sprinkle on applesauce • **Oral sol** using device provided; remove dosing syringe, green cap, plastic tube from plastic; attach tube to green cap; open cap by pushing down on cap, turning counterclockwise; remove unscrewed cap; carefully

remove seal from bottle, discard; insert plastic tube fully into bottle, screw green cap tightly onto bottle by turning cap clockwise; keeping bottle upright on table, remove lid; with plunger fully depressed, insert tip of syringe into cap; while holding syringe, gently pull up on plunger; remove syringe; invert syringe, slowly press plunger to level that removes large air bubbles; keep plunger in inverted position; few small air bubbles may be present

SIDE EFFECTS

CNS: *Dizziness, confusion*, somnolence, headache, hallucinations, **stroke**

CV: Hypertension, **heart failure, CHF**

GI: Vomiting, constipation

HEMA: Anemia

INTEG: Rash

MISC: Back pain, fatigue, pain

RESP: Coughing, dyspnea

PHARMACOKINETICS

Rapidly absorbed PO, 44% protein binding, very little metabolism, 57%-82% excreted unchanged in urine, terminal elimination half-life 60-80 hr

INTERACTIONS

- May alter levels of both products: hydrochlorothiazide, triamterene, cimetidine, quiniDine, ranitidine, nicotine

Increase: effect—levodopa, some ergots

Decrease: clearance of memantine—products that make urine alkaline (sodium bicarbonate, carbonic anhydrase inhibitors)

NURSING CONSIDERATIONS

Assess:

- **Alzheimer's dementia:** affect, mood, behavioral changes; hallucinations, confusion, attention, orientation, memory

Perform/provide:

- Assistance with ambulation during beginning therapy; dizziness may occur

Evaluate:

- Therapeutic response: decrease in confusion, improved mood, maintenance of

function, even with no improvement in symptoms

Teach patient/family:

- To report side effects: restlessness, psychosis, visual hallucinations, stupor, LOC; may indicate overdose
 - To use product exactly as prescribed; that product not a cure, to avoid alcohol, nicotine
 - To use oral sol dispenser
 - To avoid OTC, herbal products unless approved by prescriber
-

🍁 Canada only Side effects: *italics* = common; **bold** = life-threatening ⚠️

Nurse Alert

HIGH ALERT

meperidine (Rx)

(me-per'i-deen)

Demerol, Meperitab

Func. class.: Opioid analgesic

Chem. class.: Phenylpiperidine derivative

Controlled Substance Schedule II

Do not confuse: **meperidine**/HYDROmorphine/meprobamate/morphine
Demerol/Dilaudid/Desyrel/Demulen

ACTION:

Depresses pain impulse transmission at the spinal cord level by interacting with opioid receptors

USES:

Moderate to severe pain preoperatively, postoperatively

Unlabeled uses: Obstetric/regional analgesic, acute severe headache/migraine, shaking chills induced by IV amphotericin B or postoperative shivering

CONTRAINDICATIONS:

Hypersensitivity, severe respiratory insufficiency

Precautions: Pregnancy (C), breastfeeding, children <18 yr, geriatric patients, addictive personality, increased intracranial pressure, MI (acute), severe heart disease, respiratory depression, renal/hepatic disease, seizure disorder, abrupt discontinuation, chronic pain

DOSAGE AND ROUTES

Calculator

Moderate to severe pain

- **Adult:** PO/SUBCUT/IM 50-150 mg q3-4hr prn; **CONT INF** 15-35 mg/hr as PCA 10 mg then 1-to 5-mg incremental dose; lockout interval 6-10 min
- **Child:** PO/SUBCUT/IM 1-1.8 mg/kg q3-4hr prn, max 100 mg q4hr

Labor analgesia

- **Adult: SUBCUT/IM** 50-100 mg given when contractions regularly spaced, repeat q1-3hr prn

Preoperatively

- **Adult: IM/SUBCUT** 50-100 mg 30-90 min before surgery
- **Child: IM/SUBCUT** 1-2.2 mg/kg 30-90 min before surgery, max 100 mg

Renal dose

- **Avoid or modify dose**

Available forms: Inj 10, 25, 50, 75, 100 mg/ml; tabs 50, 100 mg; oral sol 50 mg/5 ml

Administer:

PO route

- May give with food or milk to decrease GI irritation
- **Oral liquid:** dilute in 4 oz water

IM/SUBCUT route

- Patient should remain recumbent for 1 hr after IM/SUBCUT route
- With antiemetic for nausea, vomiting
- When pain beginning to return; determine dosage interval by patient response
- In gradually decreasing dose after long-term use; withdrawal symptoms may occur
- Inject IM into large muscle mass; IM preferred route for multiple inj

Direct IV route

- Dilute to conc of 10 mg/ml with sterile water for inj or NS
- Inject slowly ≤ 25 mg/min
- Have emergency equipment and opiate antagonist on hand

Continuous IV INF route

- Dilute to conc of 1 mg/ml
- Infuse using inf pump

Syringe compatibilities: Butorphanol, chlorproMAZINE, cimetidine, dimenhyDRINATE, diphenhydrAMINE, droperidol, fentaNYL, glycopyrrolate, hydrOXYzine, ketamine, metoclopramide, midazolam, pentazocine, perphenazine, prochlorperazine, promazine, promethazine, ranitidine, scopolamine

Y-site compatibilities: Amifostine, amikacin, atenolol, aztreonam, bumetanide, ceFAZolin, cefotaxime, cefOXitin, cefTAZidime, ceftizoxime, cefTRIAxone,

cefuroxime, cephapirin, cisatracurium, cladribine, clindamycin, diltiazem, diphenhydrAMINE, DOBUTamine, DOPamine, DOXOrubicin HCL, doxycycline, droperidol, erythromycin, famotidine, filgrastim, fluconazole, fludarabine, gallium, gentamicin, granisetron, hydrocortisone, insulin (regular), kanamycin, labetalol, lidocaine, methyl dopate, melphalan, metoclopramide, metoprolol, metroNIDAZOLE, moxalactam, ondansetron, oxacillin, oxytocin, PACLitaxel, penicillin G potassium, piperacillin, potassium chloride, propofol, propranolol, ranitidine, remifentanyl, sargramostim, teniposide, thiotepa, ticarcillin, ticarcillin/clavulanate, tobramycin, vancomycin, verapamil, vinorelbine

Continuous intrathecal INF route

- Use controlled inf device; implantable controlled micro inf device used for highly concentrated inf, monitor for several days after implantation
- Filling of inf reservoir should only be done by those fully qualified
- To prevent pain, depletion of reservoir should be avoided

SIDE EFFECTS

CNS: *Drowsiness, dizziness, confusion, headache, sedation, euphoria, increased intracranial pressure, seizures*, serotonin syndrome

CV: Palpitations, bradycardia, hypotension, change in B/P, tachycardia (IV)

EENT: Tinnitus, blurred vision, miosis, diplopia, depressed corneal reflex

GI: Nausea, vomiting, anorexia, constipation, cramps, biliary spasm, paralytic ileus

GU: Urinary retention, dysuria

INTEG: Rash, urticaria, bruising, flushing, diaphoresis, pruritus

RESP: *Respiratory depression*

SYST: *Anaphylaxis*

PHARMACOKINETICS

Metabolized by liver (to active/inactive metabolites), excreted by kidneys; crosses placenta, excreted in breast milk; half-life 3-4 hr; toxic by-product accumulation can result from regular use or renal disease; protein binding 65%-75%

PO: Onset 15 min, peak 1/2-1 hr, duration 2-4 hr, absorption 50%

SUBCUT/IM: Onset 10 min, peak 1/2-1 hr, duration 2-4 hr, well absorbed

IV: Onset 5 min, duration 2 hr

INTERACTIONS

 **May cause fatal reaction:** MAOIs, procarbazine

Increase: serotonin syndrome, neuroleptic malignant syndrome, SSRIs, SNRIs, serotonin-receptor agonists

Increase: effects with other CNS depressants, alcohol, opioids, sedative/hypnotics, antipsychotics, skeletal muscle relaxants

Increase: adverse reactions—protease inhibitor antiretrovirals

Decrease: meperidine effect—phenytoin

Drug/Herb

Increase: CNS depression—St. John's wort

Drug/Lab Test

Increase: amylase, lipase

NURSING CONSIDERATIONS

Assess:

- **Pain:** location, type, character; give product before pain becomes extreme; reassess after 60 min (IM, SUBCUT, PO) and 5-10 min (IV)
- Renal function prior to initiating therapy; poor renal function can lead to accumulation of toxic metabolite and seizures
- I&O ratio; check for decreasing output; may indicate urinary retention
- For constipation; increase fluids, bulk in diet; give stimulant laxatives if needed
- CNS changes: dizziness, drowsiness, hallucinations, euphoria, LOC, pupil reactions with chronic or high-dose use
- Allergic reactions: rash, urticaria

 **Respiratory dysfunction:** depression, character, rate, rhythm; notify prescriber if respirations are <12/min

- CNS stimulation: with chronic or high doses

Perform/provide:

- Storage in light-resistant container at room temp

Evaluate:

- Therapeutic response: decrease in pain

Teach patient/family:

- To report any symptoms of CNS changes, allergic reactions
- That physical dependency may result from extended use, use should be short term only
- That drowsiness, dizziness may occur

- That withdrawal symptoms may occur: nausea, vomiting, cramps, fever, faintness, anorexia
- To make position changes slowly; orthostatic hypotension can occur
- To avoid OTC medications, alcohol unless directed by prescriber

TREATMENT OF OVERDOSE:

Naloxone (Narcan) 0.2-0.8 mg IV, caution in physically dependent patients, O₂, IV fluids, vasopressors

🍁 Canada only Side effects: *italics* = common; **bold** = life-threatening ⚠️
Nurse Alert

mercaptopurine (6-MP) (Rx)

(mer-kap-toe-pyoor'een)

Purinethol

Func. class.: Antineoplastic-antimetabolite

Chem. class.: Purine analog

ACTION:

Inhibits purine metabolism at multiple sites, which inhibits DNA and RNA synthesis; specific for S phase of cell cycle

USES:

Acute lymphocytic leukemia

Unlabeled uses: Ulcerative colitis, Crohn's disease

CONTRAINDICATIONS:

Pregnancy (D), breastfeeding, patients with prior product resistance, hypersensitivity, requires an experienced clinician, secondary malignancy, infection, hypocalcemia, hyperuricemia, hyperphosphatemia, hyperkalemia

Precautions: Renal/hepatic disease, tumor lysis syndrome, dental disease, herpes, radiation therapy, leukopenia, thrombocytopenia, anemia

DOSAGE AND ROUTES

Calculator

Acute lymphocytic leukemia

- **Adult: PO** 2.5-5 mg/kg/day or 80-100 mg/m²/day, maintenance 1.5-2.5 mg/kg/day
- **Child: PO** 2.5-5 mg/kg/day, maintenance 1.5-2.5 mg/kg/day or 70-100 mg/m²/day

Crohn's disease/ulcerative colitis (unlabeled)

- **Adult: PO** 1.5-2 mg/kg/day

Available forms: Tabs 50 mg

Administer:

- Give product after evening meal, before bedtime, on an empty stomach
- Sodium bicarbonate to maintain uric acid levels, alkalinization of urine

SIDE EFFECTS

CNS: Weakness

GI: *Nausea, vomiting, anorexia, diarrhea, stomatitis, hepatotoxicity* (high doses), jaundice, gastritis, *pancreatitis*

GU: *Renal failure*, hyperuricemia, *oliguria*, crystalluria, *hematuria*

HEMA: *Thrombocytopenia, leukopenia, myelosuppression, anemia*

INTEG: *Rash, dry skin, urticaria, alopecia*

PHARMACOKINETICS

Incompletely absorbed when taken orally, metabolized in liver, excreted in urine, peak 1-2 hr, terminal half-life 1-1.5 hr

INTERACTIONS

Increase: effects of mercaptopurine—allopurinol, avoid use of decrease dose

Increase: effects—radiation or other antineoplastics, immunosuppressants

Increase: bone marrow depression—azathioprine, sulfamethoxazole-trimethoprim, avoid concurrent use

Increase: anticoagulant action—anticoagulants, NSAIDs, thrombolytics, platelet inhibitors, salicylates

Decrease: antibodies—live virus vaccines

Decrease: TPMT, rapid bone marrow suppression—balsalazide, olsalazine, mesalamine, sulfasalazine, use cautiously

NURSING CONSIDERATIONS

Assess:

- **Bone marrow suppression:** CBC, differential, platelet count weekly; withhold product at first sign of abnormally large decrease in blood counts, unless bone marrow aplasia is the goal
- **Thiopurine methyltransferase (TPMT) deficiency:** individuals are prone to rapid bone marrow suppression, dosage reduction may be required in homozygous-TPMT-deficient persons
- **Tumor lysis syndrome:** monitor for increased potassium, uric acid, phosphate, decreased urine output, calcium
- **Renal studies:** BUN, serum uric acid, urine CCr, electrolytes before, during therapy
- **I&O ratio;** report fall in urine output to <30 ml/hr
- **Monitor temp;** fever may indicate beginning infection; no rectal temp
- **Hepatotoxicity:** Hepatic studies before, during therapy: bilirubin, alk phos,

AST, ALT, weekly during beginning therapy, hepatic encephalopathy, toxic hepatitis, ascites can be fatal • **Bleeding:** hematuria, guaiac, bruising, petechiae, mucosa or orifices, avoid IM inj if platelets are low; blood transfusions may be needed • **Stomatitis:** buccal cavity for dryness, sores, ulceration, white patches, oral pain, bleeding, dysphagia

Perform/provide:

- Increase fluid intake to 2-3 L/day to prevent urate deposits, calculi formation, unless contraindicated
- Rinsing of mouth tid-qid with water, club soda; brushing of teeth bid-tid with soft brush or cotton-tipped applicators for stomatitis; use unwaxed dental floss
- Storage in tightly closed container in cool environment

Evaluate:

- Therapeutic response: decreased size of tumor, spread of malignancy

Teach patient/family:

- To avoid foods with citric acid, hot or rough texture for stomatitis; to report stomatitis: any bleeding, white spots, ulcerations in mouth; to examine mouth daily, report symptoms
- **Pregnancy:** That contraceptive measures recommended during therapy (D); to avoid breastfeeding
- To drink 10-12 8-oz glasses of fluid/day
- To notify prescriber of fever, chills, sore throat, nausea, vomiting, anorexia, diarrhea, bleeding, bruising, which may indicate blood dyscrasias/infection
- To report signs of infection: fever, sore throat, flulike symptoms
- To report signs of anemia: fatigue, headache, faintness, SOB, irritability
- To report bleeding; to avoid use of razors, commercial mouthwash
- To avoid use of aspirin products, NSAIDs
- To take entire dose at one time

☼ Canada only Side effects: *italics* = common; **bold** = life-threatening ⚠
Nurse Alert

meropenem (Rx)

(mer-oh-pen'em)

Merrem

Func. class.: Antiinfective—miscellaneous

Chem. class.: Carbapenem

ACTION:

Bactericidal; interferes with cell-wall replication of susceptible organisms; osmotically unstable cell wall swells, bursts from osmotic pressure

USES:

Serious infections caused by gram-positive bacteria: *Streptococcus pneumoniae*, group A β -hemolytic streptococci, enterococcus; gram-negative: *Klebsiella*, *Proteus*, *Escherichia coli*, *Pseudomonas aeruginosa*; appendicitis, peritonitis caused by viridans group streptococci; *Bacteroides fragilis*, *Bacteroides thetaiotaomicron*, bacterial meningitis (≥ 3 mo)

Unlabeled uses: Febrile, neutropenic, community-acquired pneumonia

CONTRAINDICATIONS:

Hypersensitivity to this product, carbapenems, cephalosporins, penicillins

Precautions: Pregnancy (B), breastfeeding, geriatric patients, renal disease, seizure disorder

DOSAGE AND ROUTES

Calculator

Intraabdominal infections (complicated appendicitis, peritonitis)

- **Adult/child/adolescent >50 kg: IV 1 g q8hr**
- **Infant ≥ 3 mo/child/adolescent ≤ 50 kg: IV 20 mg/kg q8hr**

Complicated skin and skin structure infections

- **Adult/adolescents/child >50 kg: IV 500 mg q8hr**
- **Infants ≥ 3 mo/children/adolescents ≤ 50 kg: IV 10 mg/kg q8hr**

Bacterial meningitis

- **Adult: IV 2 g q8hr**
- **Infant/child/adolescent ≤ 50 kg: IV 40 mg/kg q8hr**

Renal disease

- **Adult:** IV CCr 26-50 ml/min, give dose q12hr; CCr 10-25 ml/min, give 1/2 dose q12hr; CCr <10 ml/min, give 1/2 dose q24hr

Febrile neutropenia (unlabeled)

- **Adult:** IV 1 g q8hr

Community-acquired pneumonia (CAP) (unlabeled)

- **Adult:** IV 1 g q8hr with ciprofloxacin or with aminoglycoside plus fluoroquinolone

Available forms: Powder for inj 500 mg, 1 g

Administer:

- After C&S is taken

Direct IV route

- Reconstitute 500-mg or 1-g vials with 10, 20 ml of sterile water for inj, respectively; shake to dissolve, let stand until clear (average conc 50 mg/ml); reconstituted sol may be stored for 2 hr at room temp or for 12 hr refrigerated; inject up to 1 g in 5-20 ml over 3-5 min

Intermittent IV INF route

- Vials may be directly reconstituted with compatible inf fluid (NS, D₅W) to 2.5-50 mg/ml; vials with NS can be stored 2 hr at room temp or for ≤18 hr refrigerated, (D₅W solutions) may be stored for up to 1 hr at room temp or ≤8 hr refrigerated; infuse over 15-30 min

Y-site compatibilities: Aminophylline, atenolol, atropine, cimetidine, dexamethasone, digoxin, diphenhydramine, enalaprilat, fluconazole, furosemide, gentamicin, heparin, insulin (regular), metoclopramide, morphine, norepinephrine, phenobarbital, vancomycin

SIDE EFFECTS

CNS: Seizures, dizziness, weakness, headache

CV: Hypotension, palpitations, tachycardia

GI: Diarrhea, nausea, vomiting, pseudomembranous colitis, hepatitis, glossitis

INTEG: Rash, urticaria, pruritus, pain at inj site, phlebitis, erythema at inj site

RESP: Dyspnea, hyperventilation

SYST: Anaphylaxis, Stevens-Johnson syndrome, angioedema

PHARMACOKINETICS

IV: Onset immediate, peak dose dependent, half-life 1 hr, excreted unchanged in

urine (70%)

INTERACTIONS

Increase: meropenem plasma levels—probenecid

Decrease: effect of valproic acid

Drug/Lab Test

Increase: AST, ALT, LDH, BUN, alk phos, bilirubin, creatinine

False positive: direct Coombs' test

NURSING CONSIDERATIONS

Assess:

- Sensitivity to carbapenem antibiotics, penicillins
- Renal disease: lower dose may be required; monitor serum creatinine/BUN before, during therapy
- **Pseudomembranous colitis:** bowel pattern daily; if severe diarrhea, fever, abdominal pain, fatigue occurs, product should be discontinued
- **Infection:** temp, sputum, characteristics of wound before, during, and after treatment
- **Allergic reactions, anaphylaxis:** rash, laryngeal edema, wheezing, urticaria, pruritus; may occur immediately or several days after therapy begins, identify if there has been hypersensitivity to penicillins, cephalosporins, beta-lactams, cross-sensitivity may occur
- **Seizures:** may occur in those with brain lesions, seizure disorder, bacterial meningitis, or renal disease; stop product, notify prescriber if seizures occur
- **Overgrowth of infection:** perineal itching, fever, malaise, redness, pain, swelling, drainage, rash, diarrhea, change in cough, sputum

Evaluate:

- Therapeutic response: negative C&S; absence of symptoms and signs of infection

Teach patient/family:

- **Pseudomembranous colitis:** to report severe diarrhea
- To report sore throat, bruising, bleeding, joint pain; may indicate blood dyscrasias (rare)
- To report overgrowth of infection: black, furry tongue; vaginal itching; foul-smelling stools
- To avoid breastfeeding; product is excreted in breast milk

TREATMENT OF ANAPHYLAXIS:

EPINEPHrine, antihistamines; resuscitate if necessary

🍁 Canada only Side effects: *italics* = common; **bold** = life-threatening ⚠️
Nurse Alert

mesalamine, 5-ASA (Rx)

(mez-al'a-meen)

Apriso, Asacol, Asacol HD, Canasa, Lialda, Pentasa, Rowasa Salofalk , sf Rowasa *Func. class.:* GI antiinflammatory

Chem. class.: 5-Aminosalicylic acid

Do not confuse: **Asacol**/Ansaid/Os-Cal

ACTION:

May diminish inflammation by blocking cyclooxygenase, inhibiting prostaglandin production in colon; local action only

USES:

Mild to moderate active distal ulcerative colitis, proctosigmoiditis, proctitis

Unlabeled uses: Crohn's disease

CONTRAINDICATIONS:

Hypersensitivity to this product or salicylates, 5-aminosalicylates

Precautions: Pregnancy (B), breastfeeding, children, geriatric patients, renal disease, sulfite sensitivity, pyloric stenosis

DOSAGE AND ROUTES

Calculator

Treatment of ulcerative colitis

• **Adult:** **RECT** 60 ml (4 g) at bedtime, retained for 8 hr $\times$ 3-6 wk; **DEL REL TAB (Lialda)** 2.4-4.8 g/day $\times$ 8 wk; **DEL REL TAB (Asacol)** 800 mg tid $\times$ 6 wk; **CONTROLLED REL CAP (Pentasa)** 1 g qid up to 8 wk; **EXT REL cap (Apriso)** 1500 mg (4 caps) qAM daily up to 6 mo, **RECT SUPP** 500 mg bid retained for 1-3 hr $\times$ 3-6 wk until remission, may increase tid if needed

Maintenance of remission

• **Adult:** **PO** (del rel tab: Asacol) 800 mg bid or 400 mg qid; **PO** (del rel cap: Apriso) 1500 mg (4 caps) each AM; **PO** (del rel tab: Lialda) 2.4 g (2 tabs) daily with meal

Available forms: Enema 4 g/60 ml (Rowasa, sf Rowasa); ext rel tab 500 mg; ext rel cap 250, 500 mg (Pentasa); 0.375 g (Apriso); del rel tab 400 mg (Asacol),

800 mg (Asacol HD); del rel tab (Lialda) 1.2 g; rectal supp 1000 mg (Canasa)

Administer:

PO route

- Swallow tabs whole; do not break, crush, or chew tabs
- **Lialda:** take with meal
- **Apriso caps:** take without regard to meals in AM

Rectal suspension

- Product should be given at bedtime, retained until morning (8 hr); empty bowel before insertion, shake well

Rectal suppository

- Moisten before insertion; suppository should be retained for 1-3 hr

SIDE EFFECTS

CNS: *Headache, fever, dizziness, insomnia, asthenia, weakness, fatigue*

CV: Pericarditis, myocarditis, chest pain, palpitations

EENT: Sore throat, cough, pharyngitis, rhinitis

GI: *Cramps, gas, nausea, diarrhea, rectal pain, constipation*

GU: *Nephrotoxicity, interstitial nephritis*

INTEG: *Rash, itching, acne*

SYST: *Flulike symptoms, malaise, back pain, peripheral edema, leg and joint pain, arthralgia, dysmenorrhea, anaphylaxis, acute intolerance syndrome*

PHARMACOKINETICS

RECT: Primarily excreted in feces but some in urine as metabolite; half-life 1 hr, metabolite half-life 5-10 hr

INTERACTIONS

- Do not give H₂ blockers with Apriso

Increase: nephrotoxicity—NSAIDs

Increase: action, adverse reactions of azaTHIOprine, mercaptopurine

Decrease: mesalamine absorption—lactulose, antacids

Decrease: effect of—warfarin

Drug/Lab Test

Increase: AST, ALT, alk phos, LDH, GGTP, amylase, lipase

NURSING CONSIDERATIONS

Assess:

- **Allergy to salicylates, sulfonamides;** if allergic reactions occur, discontinue product
- Renal studies: BUN, creatinine before, periodically during treatment; renal toxicity may occur
- **Bowel disorders:** cramps, gas, nausea, diarrhea, rectal pain; if severe, product should be discontinued

Evaluate:

- Therapeutic response: absence of pain, bleeding from GI tract, decrease in number of diarrhea stools

Teach patient/family:

- That usual course of therapy is 3-6 wk
- To shake bottle well (rectal susp)
- About method of rectal administration
- To inform prescriber of GI symptoms
- To report abdominal cramping, pain, diarrhea with blood, headache, fever, rash, chest pain; product should be discontinued

🍁 Canada only Side effects: *italics* = common; **bold** = life-threatening ⚠️
Nurse Alert

metformin (Rx)

(met-for'min)

Fortamet, Glucophage, Glucophage XR, Glumetza, Riomet

Func. class.: Antidiabetic, oral

Chem. class.: Biguanide

ACTION:

Inhibits hepatic glucose production and increases sensitivity of peripheral tissue to insulin

USES:

Type 2 diabetes mellitus

Unlabeled uses: Precocious puberty or early-normal onset of puberty to delay menarche; polycystic ovary syndrome, infertility

CONTRAINDICATIONS:

Hypersensitivity; hepatic disease; creatinine ≥ 1.5 mg/ml (males), ≥ 1.4 (females); alcoholism; cardiopulmonary disease; acidemia; acute MI; cardiogenic shock; diabetic ketoacidosis; metabolic acidosis

Black Box Warning:

History of lactic acidosis

Precautions: Pregnancy (B), breastfeeding, geriatric patients, previous hypersensitivity, thyroid disease, CHF, type 1 diabetes mellitus

DOSAGE AND ROUTES

Calculator

Type 2 diabetes mellitus

• **Adult: PO** 500 mg bid or 850 mg/day initially then 500 mg weekly or 850 mg q2wk up to 2000 mg/day in divided doses with morning meal, with dosage increased every other wk, max 2550 mg/day, **EXT REL** (Glucophage XR) 500 mg daily with evening meal, may increase by 500 mg per wk, max 2000 mg/day; (Glumetza) 1000 mg daily with food, preferably with PM meal, may increase by 500 mg per wk, max 2000 mg daily; (Fortamet) 500-1000 mg daily with PM meal, may increase by 500 mg per wk, max 2550 mg daily; regular rel or oral sol 2000-2500 mg/day for ext rel tab, depending on formulation

- **Geriatric: PO** Use lowest effective dose

To delay early menarche and to prolong pubertal growth with early onset of puberty (unlabeled)

- **Child 8-9 yr: PO** 825 mg/day with PM meal

To delay clinical puberty and early menarche in precocious puberty (unlabeled)

- **Child >6 yr: PO** 425 mg/day with PM meal

Polycystic ovary syndrome/infertility related to hyperinsulinemia secondary to polycystic ovary syndrome (unlabeled)

- **Adult (female): PO** 500 mg tid

Available forms: Tabs 500, 850, 1000 mg; ext rel tab 500, 850, 1000 mg; oral sol 500 mg/5 ml

Administer:

PO route

- **Immediate rel product:** twice a day given with meals to decrease GI upset, and provide the best absorption; immediate rel tabs crushed, mixed with meal, fluids for patients with difficulty swallowing • **Ext rel product** may also be taken as single dose; titrate slowly to therapeutic response, side effect tolerance
- Ext rel tabs: do not chew, break, crush

SIDE EFFECTS

CNS: *Headache, weakness, dizziness, drowsiness, tinnitus, fatigue, vertigo, agitation*

CV: *Heart failure*

ENDO: *Lactic acidosis*, hypoglycemia

GI: *Nausea, vomiting, diarrhea*, heartburn, anorexia, metallic taste

HEMA: *Thrombocytopenia*, decreased vit B₁₂ levels

INTEG: Rash

PHARMACOKINETICS

Excreted by kidneys unchanged 35%-50%, half-life 1½-5 hr, terminal 6-20 hr, peak 1-3 hr

INTERACTIONS

- Do not give with radiologic contrast media; may cause renal failure
- Do not use with dofetilide; may cause lactic acidosis

Increase: metformin level—cimetidine, digoxin, morphine, procainamide, quinidine, ranitidine, triamterene, vancomycin

Increase: hyperglycemia—calcium channel blockers, corticosteroids, estrogens, oral contraceptives, phenothiazines, sympathomimetics, diuretics, phenytoin, β -blockers

Drug/Herb

Increase: hyperglycemia—glucosamine

Increase: hypoglycemia—garlic, green tea, horse chestnut

Drug/Lab Test

Decrease: vit B12

NURSING CONSIDERATIONS

Assess:

- **Hypoglycemic reactions** (sweating, weakness, dizziness, anxiety, tremors, hunger); hyperglycemic reactions soon after meals; these occur rarely with product, may occur when product combined with sulfonylureas • CBC (baseline, q3mo) during treatment; check LFTs periodically, AST, LDH, renal studies: BUN, creatinine during treatment; glucose, A1c; folic acid, vit B₁₂ q1-2yr
- **Surgery:** product should be discontinued temporarily for surgical procedures when patient is NPO or if contrast media is used, resume when patient is eating

Black Box Warning:

Lactic acidosis: malaise, myalgia, abdominal distress; risk increases with age, poor renal function; monitor electrolytes, lactate, pyruvate, blood pH, ketones, glucose; suspect in any diabetic patient with metabolic acidosis, with ketoacidosis; immediately stop product if hypoxemia or significant renal dysfunction occurs

Perform/provide:

- Conversion from other oral hypoglycemic agents; change may be made without gradual dosage change; monitor serum glucose, urine ketones tid during conversion • Storage in tight container in cool environment

Evaluate:

- Therapeutic response: decrease in polyuria, polydipsia, polyphagia; clear sensorium; absence of dizziness; stable gait; blood glucose, A1c at normal level

Teach patient/family:

Black Box Warning:

Lactic acidosis: hyperventilation, fatigue, malaise, chills, myalgia, somnolence; to notify prescriber immediately; stop product

- To regularly self-monitor blood glucose with blood-glucose meter
 - About symptoms of hypo/hyperglycemia, what to do about each (rare)
 - That product must be continued on daily basis; about consequences of discontinuing product abruptly
 - To avoid OTC medications, alcohol unless approved by prescriber
 - That diabetes is a lifelong illness; that product is not a cure, only controls symptoms
 - To carry emergency ID and glucagon emergency kit
 - That Glucophage XR tab may appear in stool
 - To take with meals, not to break, crush, chew ext rel product
 - About signs, symptoms of hypo/hyperglycemic reactions
-

🍁 Canada only Side effects: *italics* = common; **bold** = life-threatening ⚠️
Nurse Alert

HIGH ALERT

methadone (Rx)

(meth'a-done)

Dolophine, Metadol , Methadose

Func. class.: Opioid analgesic

Chem. class.: Synthetic diphenylheptane derivative

Controlled Substance Schedule II

Do not confuse: **methadone**/methylphenidate

ACTION:

Depresses pain impulse transmission at the spinal cord level by interacting with opioid receptors; produces CNS depression

USES:

Severe pain, opioid withdrawal

CONTRAINDICATIONS:

Hypersensitivity to this product or chlorobutanol (inj); asthma, ileus

Black Box Warning:

Respiratory depression

Precautions: Pregnancy (C), breastfeeding, children <18 yr, geriatric patients, addictive personality, increased intracranial pressure, MI (acute), severe heart disease, respiratory depression, pulmonary/renal/hepatic disease, respiratory insufficiency, torsades de pointes, COPD

Black Box Warning:

QT prolongation, pain, substance abuse, potential for overdose, poisoning, accidental exposure

DOSAGE AND ROUTES

Calculator

Severe pain

- **Adult: PO/SUBCUT/IM/IV** 2.5-10 mg q8-12hr prn

Opioid withdrawal

- **Adult including pregnant woman:** 20-30 mg initially unless low opioid

tolerance expected; additional 5-10 mg q2-4hr as needed after initial dose; if symptoms continue, may give for ≤ 5 days

Renal disease

- **Adult:** may need to be modified

Available forms: Inj 10 mg/ml; tabs 5, 10 mg; oral sol 5, 10 mg/5 ml, 10 mg/ml

Administer:

IM route

- Rotating inj sites, give deep in large muscle mass (IM)

SUBCUT route

- Pain and induration may occur at site

SIDE EFFECTS

CNS: *Drowsiness, dizziness, confusion, headache, sedation, euphoria, seizures*

CV: *Palpitations, bradycardia, change in B/P, cardiac arrest, shock, hypotension, torsades de pointes, QT prolongation*

EENT: *Tinnitus, blurred vision, miosis, diplopia*

GI: *Nausea, vomiting, anorexia, constipation, cramps, biliary tract spasm*

GU: *Increased urinary output, dysuria, urinary retention, impotence*

INTEG: *Rash, urticaria, bruising, flushing, diaphoresis, pruritus*

RESP: *Respiratory depression, respiratory arrest*

PHARMACOKINETICS

Metabolized by liver; excreted by kidneys; crosses placenta; excreted in breast milk; half-life 8-59 hr, extended interval with continued dosing; 90% bound to plasma proteins

PO: Onset 30-60 min, peak 1-1.5 hr, duration 6-8 hr, cumulative 22-48 hr; PO half as active as INJ

SUBCUT/IM: Onset 10-20 min, peak 1½-2 hr, duration 4-6 hr, cumulative 22-48 hr

INTERACTIONS

 **Unpredictable reactions: MAOIs; do not use together • Do not use within 2 wk of selegiline**

Increase: effects with other CNS depressants—alcohol, opiates, sedative/hypnotics, antipsychotics, skeletal muscle relaxants

Increase: toxicity—CYP3A4 inhibitors (aprepitant, antiretroviral protease

inhibitors, clarithromycin, danazol, delavirdine, diltiazem, erythromycin, fluconazole, FLUoxetine, fluroxamine, imatinib, ketoconazole, mibefradil, nefazodone, telithromycin, voriconazole)

Increase: QT prolongation—class IA antiarrhythmics (disopyramide, procainamide, quinidine), class III antiarrhythmics (amiodarone, dofetilide, ibutilide, sotalol), astemizole, arsenic trioxide, cisapride, chloroquine, clarithromycin, levomefentanyl, pentamidine, some phenothiazines, pimozone, terfenadine

Decrease: analgesia—rifampin, phenytoin, nalbuphine, pentazone

Decrease: methadone effect—CYP3A4 inducers (barbiturates, bosentan, carbamazepine, efavirenz, phenytoins, nevirapine, rifabutin, rifampin), withdrawal symptoms may occur

Drug/Food

- Avoid use with grapefruit juice

Drug/Herb

- Avoid use with St. John's wort; withdrawal may result

Increase: CNS depression—chamomile, hops, kava, valerian

Drug/Lab Test

Increase: amylase, lipase

NURSING CONSIDERATIONS

Assess:

- **Pain:** type, location, intensity, grimacing before, 1½-2 hr after administration; use pain scoring
- I&O ratio; check for decreasing output; may indicate urinary retention
- CNS changes: dizziness, drowsiness, hallucinations, euphoria, LOC, pupil reaction
- Allergic reactions: rash, urticaria

Black Box Warning:

Respiratory dysfunction: respiratory depression, character, rate, rhythm; notify prescriber if respirations are <10/min

Black Box Warning:

QT prolongation: may be dose related or use with other products that increase QT

Black Box Warning:

Accidental exposure: make sure product is not accessible to children, pets

Black Box Warning:

Overdose, poisoning: advise persons involved in correct use

Black Box Warning:

Substance abuse: may occur but has less psychological dependence than other opiate agonists

- Opioid detoxification: no analgesia occurs, only prevention of withdrawal symptoms

Black Box Warning:

B/P, pulse, ECG; hypotension, palpitations may occur

- Bowel changes, bulk, fluids, laxatives should be used for constipation

Perform/provide:

- Storage in light-resistant container at room temp
- Assistance with ambulation

Evaluate:

- Therapeutic response: decrease in pain, successful opioid withdrawal

Teach patient/family:

- To report any symptoms of CNS changes, allergic reactions
- That physical dependency may result from extended use

 **That withdrawal symptoms may occur: nausea, vomiting, cramps, fever, faintness, anorexia • To maintain proper hydration; to avoid alcohol use**

TREATMENT OF OVERDOSE:

Naloxone (Narcan) 0.2-0.8 mg IV, O₂, IV fluids, vasopressors

🍁 Canada only Side effects: *italics* = common; **bold** = life-threatening 
Nurse Alert

methimazole (Rx)

(meth-im'a-zole)

Tapazole

Func. class.: Thyroid hormone antagonist (antithyroid)

Chem. class.: Thioamide

Do not confuse: **methimazole**/metoprolol/minoxidil

ACTION:

Inhibits synthesis of thyroid hormones by decreasing iodine use in manufacture of thyroglobin and iodothyronine; does not affect circulatory T₄, T₃

USES:

Hyperthyroidism, preparation for thyroidectomy, thyrotoxic crisis; thyroid storm when PTU is contraindicated

CONTRAINDICATIONS:

Pregnancy (D), breastfeeding, hypersensitivity

Precautions: Infection, bone marrow suppression, hepatic disease, bleeding disorders

DOSAGE AND ROUTES

Calculator

Hyperthyroidism

- **Adult: PO** 15 mg/day (mild hyperthyroidism); 30-40 mg/day (moderate to severe); 60 mg/day (severe); maintenance 5-15 mg/day; may be divided
- **Child: PO** 0.4 mg/kg/day in divided doses q8hr; continue until euthyroid; maintenance dose 0.2 mg/kg/day in divided doses q8hr, max 30 mg/24 hr; may be divided

Preparation for thyroidectomy

- **Adult and child: PO** same as above; iodine may be added × 10 days before surgery

Thyrotoxic crisis

- **Adult and child: PO** same as hyperthyroidism with iodine and propranolol

Available forms: Tabs 5, 10, 15, 20 mg

Administer:

- With meals to decrease GI upset
- At same time each day to maintain product level
- Lowest dose that relieves symptoms; discontinue before RAIU

SIDE EFFECTS

CNS: *Drowsiness, headache, vertigo, fever, paresthesias, neuritis*

ENDO: *Enlarged thyroid*

GI: *Nausea, diarrhea, vomiting, jaundice, hepatitis, loss of taste*

GU: *Nephritis*

HEMA: *Agranulocytosis, leukopenia, thrombocytopenia, hypothermia, lymphadenopathy, bleeding, vasculitis*

INTEG: *Rash, urticaria, pruritus, alopecia, hyperpigmentation, lupuslike syndrome*

MS: *Myalgia, arthralgia, nocturnal muscle cramps*

PHARMACOKINETICS

Onset 12-18 hr; duration 36-72 hr; half-life 4-12 hr; excreted in urine, breast milk; crosses placenta

INTERACTIONS

Increase: bone marrow depression—radiation, antineoplastic agents

Increase: response to digoxin

Decrease: effectiveness—amiodarone, potassium iodide

Decrease: Anticoagulant effect—warfarin

Drug/Lab Test

Increase: PT, AST, ALT, alk phos

NURSING CONSIDERATIONS**Assess:**

- **Hyperthyroidism:** palpitation, nervousness, loss of hair, insomnia, heat intolerance, weight loss, diarrhea
- **Hypothyroidism:** constipation, dry skin, weakness, fatigue, headache, intolerance to cold, weight gain; adjustment may be needed
- Pulse, B/P, temp
- I&O ratio; check for edema: puffy hands, feet, periorbits; these indicate

hypothyroidism • Weight daily; same clothing, scale, time of day

• T₃, T₄, which are increased; serum TSH, which is decreased; free thyroxine index, which is increased if dosage too low; discontinue product 3-4 wk before RAIU

⚠ **Blood dyscrasias:** CBC, leukopenia, thrombocytopenia, agranulocytosis; if these occur, product should be discontinued and other treatment initiated, may occur at higher doses • **Hypersensitivity:** rash, enlarged cervical lymph nodes; product may have to be discontinued • **Hypoprothrombinemia:** bleeding, petechiae, ecchymosis

• **Clinical response:** after 3 wk should include increased weight; decreased T₄, pulse ⚠ **Bone marrow suppression:** sore throat, fever, fatigue

Perform/provide:

- Storage in light-resistant container
- Increased fluids to 3-4 L/day unless contraindicated

Evaluate:

- Therapeutic response: weight gain, decreased pulse, decreased T₄, B/P

Teach patient/family:

- Not to breastfeed
- To take pulse daily
- To report redness, swelling, sore throat, mouth lesions, fever, which indicate blood dyscrasias • To keep graph of weight, pulse, mood
- To avoid OTC products, seafood that contains iodine, other iodine products
- Not to discontinue product abruptly because thyroid crisis may occur; stress patient response • That response may take several months if thyroid is large
- **Symptoms and signs of overdose:** periorbital edema, cold intolerance, mental depression • **Symptoms of inadequate dose:** tachycardia, diarrhea, fever, irritability
- To take medication as prescribed; not to skip or double dose

☼ Canada only Side effects: *italics* = common; **bold** = life-threatening ⚠
Nurse Alert

HIGH ALERT

methotrexate (Rx)

(meth-oh-trex'ate)

Rheumatrex, Trexall

Func. class.: Antineoplastic-antimetabolite (vesicant)

Chem. class.: Folic acid antagonist

Do not confuse: **methotrexate**/metolazone/mitoXANtrone

ACTION:

Inhibits an enzyme that reduces folic acid, which is needed for nucleic acid synthesis in all cells; specific to S phase of cell cycle; immunosuppressive

USES:

Acute lymphocytic leukemia; in combination for breast, lung, head, neck carcinoma; lymphosarcoma, gestational choriocarcinoma, hydatidiform mole, psoriasis, RA, mycosis fungoides, osteosarcoma

Unlabeled uses: Burkitt's lymphoma, bladder or ovarian cancer, carcinomatous meningitis, desmoid tumor, fibromatosis, asthma, active Crohn's disease, ulcerative colitis, GVHD prophylaxis, ectopic pregnancy, pregnancy termination, psoriatic arthritis, pruritus due to cholestasis or primary biliary cirrhosis, SLE, sarcoidosis

CONTRAINDICATIONS:

Hypersensitivity, leukopenia ($<3500/\text{mm}^3$), thrombocytopenia ($<100,000/\text{mm}^3$), anemia; psoriatic patients with severe renal disease, alcoholism, HIV

Black Box Warning:

Pregnancy (X), hepatic disease

Precautions: Breastfeeding, children

Black Box Warning:

Renal disease, ascites, diarrhea, exfoliative dermatitis, infection, intrathecal administration, lymphoma, pleural effusion, pulmonary disease, radiation therapy, stomatitis, tumor lysis syndrome, renal impairment

DOSAGE AND ROUTES

Calculator

Acute lymphocytic leukemia

- **Adult and child: PO/IM/IV** 3.3 mg/m²/day × 4-6 wk until remission then 20-30 mg/m² **PO/IM** weekly in 2 divided doses or 2.5 mg/kg **IV** × 2 wk

Choriocarcinoma

- **Adult and child: PO/IM** 15-30 mg/day × 5 days then off 1 wk; may repeat

Meningeal leukemia

- **Adult and child: 12 mg/m² INTRATHECALLY** q2-5days until CSF is normal then 1 additional dose, max 15 mg

Lymphosarcoma (stage III)

- **Adult: PO/IM/IV** 0.625-2.5 mg/kg/day

Osteosarcoma

- **Adult and child: IV** 12 g/m² given over 4 hr then leucovorin rescue

Mycosis fungoides

- **Adult: PO** 5-50 mg q wk or 15-37.5 mg twice weekly; **IV/IM** 50 mg q week or 15-37.5 mg twice weekly

Psoriasis

- **Adult: PO/IM/IV** 10-25 mg/wk or 2.5 mg **PO** q12hr × 3 doses/wk, may increase to 25 mg/wk

Breast cancer

- **Adult: IV** 40-60 mg/m² on day 1 of every 21-28 days with other antineoplastics

Epidermal head/neck cancer

- **Adult/child: IV** 40 mg/m² on days 1 and 15, q21days alone or in combination with bleomycin, CISplatin
- **Adult: PO** 25-50 mg/m² q7days
- **Child: PO** 7.5-30 mg/m² q7-14days

Rheumatoid arthritis

- **Adult: PO** 7.5 mg/wk or in divided doses of 2.5 mg q12hr × 3 given per wk; max 20 mg/wk

Polyarticular-course juvenile RA

- **Child: PO/IM** 10 mg/m²/wk

Burkitt's lymphoma (stages I, II, III)

- **Adult/adolescent/child: IV** 200 mg/m² days 8 and 15 q21days with bleomycin, cyclophosphamide, vinCRISTine, dexamethasone

Bladder cancer (unlabeled)

- **Adult: IV** 30 mg/m² on days 1, 15, 22 q28days in combination with vinBLAStine, DOXOrubicin, CISplatin (MVAC) regimen

Active crohn's disease/ulcerative colitis (unlabeled)

- **Adult: IM** 25 mg/wk; **SUBCUT** 15 mg/kg/wk × 16 wk

GVHD prophylaxis (unlabeled)

- **Adult and child: IV** 15 mg/m² on day 1 after transplant then 10 mg/m² on days 3, 6, 11

Ectopic pregnancy (unlabeled)

- **Adult: IM** 50 mg/m² may be used in combination with mifepristone

Pregnancy termination prior to 63rd day of pregnancy (unlabeled)

- **Adult: IM** 50 mg/m² then intravaginal misoprostol 5-7 days later

Psoriatic arthritis (unlabeled)

- **Adult: PO** 5-7.5 mg weekly

Available forms: Tabs 2.5, 5, 7.5, 10, 15 mg; inj 25 mg/ml; powder for inj 1 g

Administer:

- Using chemotherapeutic handling
- Antiemetic 30-60 min before product
- Allopurinol or sodium bicarbonate to maintain uric acid levels, alkalinization of urine (pH >7.5), adequate fluids

Direct IV route

- After diluting 5 mg/2 ml of sterile water for inj; give through **Y-tube** or 3-way stopcock

Intermittent/Continuous IV INF route

- Further dilute in D5W, D5NS, NS, prior to infusion check patency of vein, flush with 5-10 ml of D5W, NS, infuse at 4-20 mg/hr or prescribed rate ⚠

Leucovorin rescue: leucovorin calcium within 24 hr of product to prevent tissue damage; check agency policy, continue until methotrexate level <10⁻⁸ m

IV INF intermediate or high dose (500 mg/m² over <4 hr or >1 g/m² over >4 hr): confirm WBC >1500/mm³, neutrophils >200/mm³, platelets >75,000/mm³, serum bilirubin <1.2 mg/dl, serum creatinine WNL, SGPT <450 U, creatinine clearance >60 ml/min

⚠ Give sodium bicarbonate tabs or IV fluids to prevent precipitation of product

at high doses; urine pH should be >7; may need to reduce dosage if BUN 20-30 mg/dl or creatinine is 1.2-2 mg/dl; stop product if BUN >30 mg/dl or creatinine >2 mg/dl

Additive compatibilities: Cephalothin, cyclophosphamide, cytarabine, fluorouracil, hydrOXYzine, mercaptopurine, ondansetron, sodium bicarbonate, vinCRISTine

Solution compatibilities: Amino acids, 4.25%/D₂₅, D₅W, sodium bicarbonate 0.05 mol/L, sodium chloride 0.9%

Syringe compatibilities: Bleomycin, CISplatin, cyclophosphamide, doxapram, DOXOrubicin, fluorouracil, furosemide, heparin, leucovorin, mitoMYcin, vinBLASTine, vinCRISTine

Y-site compatibilities: Allopurinol, amifostine, amphotericin B cholesteryl, asparaginase, aztreonam, bleomycin, cefepime, cefTRIAXone, cimetidine, CISplatin, cyclophosphamide, cytarabine, DAUNOrubicin, dexchlorpheniramine, diphenhydrAMINE, DOXOrubicin, DOXOrubicin liposome, etoposide, famotidine, filgrastim, fludarabine, fluorouracil, furosemide, gallium, ganciclovir, granisetron, heparin, HYDROmorphine, imipenem-cilastatin, leucovorin, LORazepam, melphalan, mesna, methylPREDNISolone, metoclopramide, mitoMYcin, morphine, ondansetron, oxacillin, PACLitaxel, piperacillin/tazobactam, prochlorperazine, ranitidine, sargramostim, teniposide, thiotepa, vinBLASTine, vinCRISTine, vinorelbine

Intrathecal route

Black Box Warning:

Use preservative-free sol, reconstitute with NS; dose should be drawn into 5-to 10-ml syringe after LP, vol of CSF should be withdrawn equal to vol of methotrexate; allow CSF to flow into syringe and mix, inject over 15-30 sec with bevel of needle upward

SIDE EFFECTS

CNS: Dizziness, **seizures**, **leukoencephalopathy**, headache, confusion, **encephalopathy**, hemiparesis, malaise, fatigue, chills, fever; **arachnoiditis** (intrathecal)

EENT: Blurred vision, optic neuropathy

GI: *Nausea, vomiting, anorexia, diarrhea, ulcerative stomatitis*, **hepatotoxicity**, cramps, ulcer, gastritis, **GI hemorrhage**, abdominal pain, hematemesis, **hepatic fibrosis**, **acute toxicity**

GU: Urinary retention, renal failure, menstrual irregularities, defective spermatogenesis, hematuria, azotemia, uric acid nephropathy
HEMA: Leukopenia, thrombocytopenia, myelosuppression, anemia
INTEG: Rash, alopecia, dry skin, urticaria, photosensitivity, folliculitis, vasculitis, petechiae, ecchymosis, acne, alopecia, severe fatal skin reaction
RESP: Methotrexate-induced lung disease
SYST: Sudden death, *Pneumocystis jiroveci*, tumor lysis syndrome

PHARMACOKINETICS

Not metabolized; excreted in urine (unchanged); crosses placenta, blood-brain barrier; 50% plasma protein bound; terminal half-life 10-12 hr

PO: Readily absorbed

PO/IM/IV: Onset, duration unknown

IT: Onset, peak, duration unknown

INTERACTIONS

Do not use with proton pump inhibitors

Increase: toxicity—salicylates, sulfa products, other antineoplastics, radiation, alcohol, probenecid, NSAIDs, phenylbutazone, theophylline, penicillins

Increase: hypoprothrombinemia—oral anticoagulants

Increase: hepatitis—acitretin, avoid concurrent use

Decrease: effect of oral digoxin, vaccines, phenytoin, fosphenytoin

Decrease: effect of methotrexate—folic acid supplements

NURSING CONSIDERATIONS

Assess:

- Make sure product is taken weekly in RA, JRA

Black Box Warning:

Infection: those with active infections should be treated for infection before product use; monitor temperature, fever may indicate beginning of infection

- Make sure drug-drug interacting products are discontinued before therapy, and do not resume until methotrexate level is safe ⚠️ CBC, differential, platelet count weekly; avoid use until WBC is $>1500/\text{mm}^3$ or platelet count is $>75,000/\text{mm}^3$, neutrophils $>200/\text{mm}^3$; notify prescriber; WBC, platelet nadirs occur on day 7; monitor

Black Box Warning:

Renal disease: avoid use in renal failure, BUN, serum uric acid, urine CCr, electrolytes before, during therapy; I&O ratio; report fall in urine output to <30 ml/hr

- Bleeding time, coagulation time during treatment; bleeding: hematuria, guaiac, bruising, or petechiae in mucosa or orifices • Effects of alopecia on body image; discuss feelings about body changes

Black Box Warning:

Pulmonary toxicity: those with ascites or pleural effusion at greater risk for toxicity; fluid should be removed before treatment; monitor plasma methotrexate levels

Black Box Warning:

Tumor lysis syndrome: hyperkalemia, hyperphosphatemia, hyperuricemia, hypocalcemia, decreased urine output; use aggressive hydration, allopurinol to correct severe electrolyte imbalances, renal toxicity

Black Box Warning:

Hepatotoxicity: jaundiced skin and sclera, dark urine, clay-colored stools, pruritus, abdominal pain, fever, diarrhea, hepatic studies before and during therapy: bilirubin, alk phos, AST, ALT; liver biopsy should be done before start of therapy (psoriasis)

- Monitor methotrexate levels, adjust leucovorin dose based on level
- Buccal cavity for dryness, sores, ulceration, white patches, oral pain, bleeding, dysphagia

Black Box Warning:

Serious skin reaction: Stevens-Johnson syndrome, exfoliate dermatitis, skin necrosis, erythema multiform may occur within days of receiving product by any route, product should be discontinued

- **Strokelike encephalopathy:** common in high-dose therapy; assess for confusion, hemiparesis, seizures, coma; usually transient • **Rheumatoid arthritis:** ROM, pain, joint swelling before, during treatment
- **Psoriasis:** skin lesions before, during treatment

Perform/provide:

- Increased fluid intake to 2-3 L/day to prevent urate deposits, calculi formation unless contraindicated • Rinsing of mouth tid-qid with water, club soda; brushing of teeth bid-tid with soft brush or cotton-tipped applicators for stomatitis; use unwaxed dental floss • Storage in tightly closed container in cool environment; store injection, powder for inj in dark, dry area

Evaluate:

- Therapeutic response: decreased tumor size, spread of malignancy; decreased joint inflammation, pain in RA

Teach patient/family:

Black Box Warning:

To report any complaints, side effects to nurse or prescriber: black tarry stools, chills, fever, sore throat, bleeding, bruising, cough, SOB, dark or bloody urine, seizures

- That hair may be lost during treatment; that wig or hairpiece may make patient feel better; that new hair may be different in color, texture (alopecia rare)
- To avoid foods with citric acid, hot or rough texture if stomatitis is present
- To report stomatitis and any bleeding, white spots, ulcerations in mouth to prescriber; to examine mouth daily; to report symptoms to nurse; to use good oral hygiene

Black Box Warning:

That contraceptive measures are recommended during therapy and for at least 8 wk after cessation of therapy for women and men; to discontinue breastfeeding; that toxicity to infant may occur; pregnancy (X)

- To drink 10-12 glasses of fluid/day
- To avoid alcohol, salicylates, live vaccines
- To avoid use of razors, commercial mouthwash
- To use sunblock to prevent burns
- To use good dental care, to prevent overgrowth of infection in the mouth
- How to use this product with leucovorin rescue
- To continue leucovorin until told it is safe to stop
- To report CNS symptoms, vision changes
- To report fever, other symptoms of infection
- To report decreased urine output

☼ Canada only Side effects: *italics* = common; **bold** = life-threatening ⚠
Nurse Alert

methycellulose (OTC)

(meth-ill-sell'yoo-lose)

Citrucel, Equaline Fiber Therapy, Fiber Therapy, Leader Fiber Therapy, Walgreens Fiber Therapy

Func. class.: Laxative, bulk forming

Chem. class.: Hydrophilic semisynthetic cellulose derivative

Do not confuse: Citrucel/Citracal

ACTION:

Attracts water, expands in intestine to increase peristalsis; absorbs excess water in stool; decreases diarrhea

USES:

Chronic constipation

CONTRAINDICATIONS:

Hypersensitivity, GI obstruction, hepatitis

DOSAGE AND ROUTES

Calculator

- **Adult: PO** ≤ 6 g/day in divided doses
- **Child 6-12 yr: PO** 3 g/day in divided doses

Available forms: Powder 105 mg/g, 196 mg/g; tab 500 mg

Administer:

PO route

- Alone for better absorption; do not take within 1 hr of other products
- In AM or PM (oral dose)

SIDE EFFECTS

GI: Obstruction, abdominal distention

PHARMACOKINETICS

PO: Onset 12-24 hr, peak 1-3 days

INTERACTIONS

Decrease: absorption—digoxin, nitrofurantoin, salicylates, tetracyclines, oral

anticoagulants

Drug/Herb

Increase: laxative action—flax senna

NURSING CONSIDERATIONS

Assess:

- Blood, urine electrolytes if used often
- I&O ratio to identify fluid loss
- Cause of constipation; lack of fluids, bulk, exercise, constipating products
- **Cramping, rectal bleeding, nausea, vomiting; product should be discontinued**

Evaluate:

- Therapeutic response: decrease in constipation

Teach patient/family:

- To mix powder in water, take with full glass of water
- To increase fluid intake
- That normal bowel movements do not always occur daily
- **Not to use in presence of abdominal pain, nausea, vomiting**
- To notify prescriber if constipation unrelieved or if symptoms of electrolyte imbalance occur: muscle cramps, pain, weakness, dizziness, excessive thirst

☼ Canada only Side effects: *italics* = common; **bold** = life-threatening ⚠

Nurse Alert

methyldopa/ methyldopate (Rx)

(meth-ill-doe'pa)

Func. class.: Antihypertensive

Chem. class.: Centrally acting α -adrenergic inhibitor

Do not confuse: **methyldopa**/L-dopa/levodopa

ACTION:

Stimulates central inhibitory α -adrenergic receptors or acts as false transmitter, resulting in reduction of arterial pressure

USES:

Hypertension, hypertensive crisis

CONTRAINDICATIONS:

Active hepatic disease, hypersensitivity

Precautions: Pregnancy (B), geriatric patients, cardiac disease, autoimmune disease, depression, dialysis, hemolytic anemia, Parkinson's disease, pheochromocytoma, sulfite hypersensitivity

DOSAGE AND ROUTES

Calculator

- **Adult:** **PO** 250-500 mg bid or tid then adjusted q2days as needed, 0.5-2 g/day in 2-4 divided doses (maintenance), max 3 g/day; **IV** 250-500 mg in 100 ml D₅W q6hr, run over 30-60 min, max 1 g q6hr, switch to oral as soon as possible
- **Geriatric:** **PO** 125 mg bid-tid, increase q2days as needed, max 3 g/day
- **Child:** **PO** 10 mg/kg/day in 2-4 divided doses, max 65 mg/kg or 3 g/day, whichever is less; **IV** 20-40 mg/kg/day in 4 divided doses, max 65 mg/kg or 3 g, whichever is less

Available forms: *Methyldopa*: tabs 250, 500 mg; *methyldopate*: inj 50 mg/ml

Administer:

PO route

- Increase in dose should be done in the evening to minimize drowsiness

Intermittent IV INF route

- After diluting with 100 ml D₅W; run over 1/2-1 hr

Y-site compatibilities: Alfentanil, amikacin, aminophylline, anidulafungin, ascorbic acid, atenolol, atracurium, atropine, aztreonam, benztropine, bivalirudin, bleomycin, bumetanide, buprenorphine, butorphanol, calcium chloride/gluconate, caspofungin, cefamandole, ceFAZolin, cefmetazole, cefonicid, cefotaxime, cefoTEtan, cefOXitin, cefTAZidime, ceftizoxime, cefTRIAxone, cefuroxime, cephalothin, chlorproMAZINE, cimetidine, clindamycin, cyanocobalamin, cycloSPORINE, DACTINomycin, DAPTOmycin, dexamethasone, digoxin, diltiazem, diphenhydrAMINE, DOCEtaxel, DOPamine, doxycycline, enalaprilat, ePHEDrine, EPINEPHrine, epoetin alfa, ertapenem, erythromycin, esmolol, etoposide, etoposide phosphate, famotidine, fenoldopam, fentaNYL, fluconazole, fludarabine, gatifloxacin, gemcitabine, gentamicin, glycopyrrolate, granisetron, heparin, hydrocortisone, HYDROmorphine, hydrOXYzine, IDArubicin, insulin (regular), irinotecan, isoproterenol, labetalol, lidocaine, linezolid, LORazepam, magnesium sulfate, mannitol, mechlorethamine, meperidine, metaraminol, methicillin, methoxamine, methylPREDNISolone, metoclopramide, metoprolol, metroNIDAZOLE, mezlocillin, miconazole, midazolam, milrinone, minocycline, mitoXANtrone, morphine, moxalactam, multiple vitamins, mycophenolate mofetil, nafcillin, nalbuphine, naloxone, netilmicin, nitroglycerin, nitroprusside, norepinephrine, octreotide, ondansetron, oxacillin, oxaliplatin, oxytocin, PACLitaxel, palonosetron, pamidronate, pancuronium, pantoprazole, papaverine, PEMEtrexed, penicillin G potassium/sodium, pentazocine, phentolamine, phenylephrine, phytonadione, piperacillin, polymyxin B, potassium chloride, procainamide, prochlorperazine, promethazine, propranolol, protamine, pyridoxine, quiNIDine, ranitidine, ritodrine, sodium bicarbonate, succinylcholine, SUFentanil, tacrolimus, teniposide, theophylline, thiamine, thiotepa, ticarcillin, ticarcillin-clavulanate, tigecycline, tirofiban, tobramycin, tolazoline, trimetaphan, urokinase, vancomycin, vasopressin, vecuronium, verapamil, vinorelbine, voriconazole, zoledronic acid

SIDE EFFECTS

CNS: *Drowsiness, weakness, dizziness, sedation, headache, depression,*

psychosis paresthesias, parkinsonism, Bell's palsy, nightmares

CV: Bradycardia, **myocarditis**, orthostatic hypotension, angina, edema, weight gain, **CHF**, paradoxical pressor response (IV)

EENT: Nasal congestion

ENDO: Breast enlargement, gynecomastia, amenorrhea

GI: Nausea, vomiting, diarrhea, constipation, **hepatic dysfunction**, sore or "black" tongue, **pancreatitis**, colitis, flatulence

GU: Impotence, failure to ejaculate

HEMA: **Leukopenia**, **thrombocytopenia**, **hemolytic anemia**, **granulocytopenia**, positive Coombs' test

INTEG: Rash, **toxic epidermal necrolysis**, lupuslike syndrome

PHARMACOKINETICS

PO: Peak 2-4 hr, duration 12-24 hr

IV: Peak 2 hr, duration 10-16 hr

Metabolized by liver, excreted in urine, half-life 2 hr

INTERACTIONS

- **Lithium toxicity:** lithium

⚠ Increase: pressor effect—sympathomimetic amines, MAOIs; do not use concurrently with MAOIs

Increase: hypotension, CNS toxicity—levodopa

Increase: hypotension—diuretics, other antihypertensives

Increase: psychosis—haloperidol

Increase: CNS depression—alcohol, antihistamines, antidepressants, analgesics, sedative/hypnotics

Increase: B/P—phenothiazines, β -blockers, amphetamines, NSAIDs, tricyclics, barbiturates

Increase: hypoglycemia—TOLBUTamide

Decrease: methyl dopa absorption—iron

Drug/Lab Test

Increase: creatinine, LFTs

Decrease: platelets, WBC, Hgb/HcT

Interference: urinary uric acid, serum creatinine, AST

False increase: urinary catecholamines

NURSING CONSIDERATIONS

Assess:

- Blood studies: neutrophils, decreased platelets
- **Hemolytic anemia:** Direct Coombs' test before, after 6, 12 mo of therapy, a positive test may indicate hemolytic anemia; usually reverses within weeks to months after discontinuing treatment, monitor Hgb/HcT and RBC; do not start therapy in those with hemolytic anemia
- Baselines of renal, hepatic studies before therapy begins
- **Hypertension:** B/P when beginning treatment, periodically thereafter; report significant changes
- **Allergic reaction:** rash, fever, pruritus, urticaria; product should be discontinued if antihistamines fail to help
- CNS symptoms, especially in geriatric patients; depression, change in mental status
- **CHF:** edema, dyspnea, wet crackles, B/P
- Renal symptoms: polyuria, oliguria, urinary frequency; I&O ratio, weight; report weight gain >5 lb
- **Product tolerance:** may occur within 3 mo of starting treatment, a dosage change and other products may be needed

Evaluate:

- Therapeutic response: decrease in B/P with hypertension

Teach patient/family:

- To avoid hazardous activities
- Not to discontinue product abruptly because withdrawal symptoms may occur: anxiety, increased B/P, headache, insomnia, increased pulse, tremors, nausea, sweating
- Not to use OTC (cough, cold, allergy) products unless directed by prescriber
- To rise slowly to sitting or standing position to minimize orthostatic hypotension
- To notify prescriber of mouth sores, sore throat, fever, swelling of hands or feet, irregular heartbeat, chest pain, signs of angioedema
- That excessive perspiration, dehydration, vomiting, diarrhea may lead to fall in B/P; to consult prescriber
- That dizziness, fainting, lightheadedness may occur during first few days of therapy
- That compliance is necessary; not to skip or stop product unless directed by prescriber
- That product may cause skin rash or impaired perspiration

TREATMENT OF OVERDOSE:

Gastric evacuation, sympathomimetics may be indicated; if severe, hemodialysis

🍁 Canada only Side effects: *italics* = common; **bold** = life-threatening ⚠️
Nurse Alert

methylergonovine (Rx)

(meth-ill-er-goe-noe'veen)

Func. class.: Oxytocic

Chem. class.: Ergot alkaloid

ACTION:

Stimulates uterine, vascular, and smooth muscle, thereby causing contractions; decreases bleeding; arterial vasoconstriction

USES:

Treatment of hemorrhage postpartum or postabortion, uterine contractions

CONTRAINDICATIONS:

Pregnancy (other than obstetric delivery/abortion), hypertension, preeclampsia, eclampsia, elective induction of labor, hypersensitivity to ergot preparations

Precautions: Severe renal/hepatic disease, jaundice, diabetes mellitus, seizure disorders, sepsis, CAD, last stage of labor

DOSAGE AND ROUTES

Calculator

• **Adult:** **PO** 200 mcg tid-qid $\times \leq 7$ days; **IM/IV** 200 mcg q2-4hr $\times 1-5$ doses

Available forms: Inj 200 mcg/ml; tabs 200 mcg

Administer:

PO route

- Do not exceed dosage limits
- Store tabs at room temperature
- Give with water
- Only during 4th stage of labor; not to be used to augment labor

IM route

- Protect from light
- IM in deep muscle mass; rotate inj sites for additional doses, aspirate

Direct IV route

- Undiluted through Y-tube or 3-way stopcock; give ≤ 0.2 mg/min or diluted in 5 ml 0.9% NaCl given through Y-site • With crash cart available on unit;

IV route used only in emergencies

- Refrigerated storage of ampules; protect from light; give only if solution is clear; colorless

Y-site compatibilities: Heparin, hydrocortisone sodium succinate, potassium chloride, vit B/C

SIDE EFFECTS

CNS: Headache, dizziness, seizures, hallucinations; stroke (IV)

CV: Hypotension, chest pain, palpitation, hypertension, dysrhythmias, CVA (IV)

EENT: Tinnitus

GI: Nausea, vomiting

GU: Cramping

INTEG: Sweating, rash, allergic reactions

MS: Leg cramps

RESP: Dyspnea

PHARMACOKINETICS

Metabolized in liver, excreted in urine

PO: Onset 5-25 min, duration 3 hr

IM: Onset 2-5 min, duration 3 hr

IV: Onset immediate, duration 45 min

INTERACTIONS

Increase: vasoconstriction—DOPamine, ergots, anesthetics (regional), vasopressors, nicotine

Increase: ergot toxicity—CYP3A4 inhibitors, do not use together

NURSING CONSIDERATIONS

Assess:

- B/P, pulse, character and amount of vaginal bleeding; watch for indications of hemorrhage
- Uterine relaxation; observe for severe cramping

 **Ergot toxicity:** tinnitus, hypertension, palpitations, chest pain, nausea, vomiting, weakness; cold, numb extremities

Evaluate:

- Therapeutic response: absence of hemorrhage

Teach patient/family:

- To report increased blood loss, severe abdominal cramps, fever or foul-smelling lochia

🍁 Canada only Side effects: *italics* = common; **bold** = life-threatening ⚠️
Nurse Alert

methylnaltrexone (Rx)

(meth-il-naltrex'one)

Relistor

Func. class.: Opioid antagonist

ACTION:

Peripheral μ -opioid receptor antagonist that reduces constipation associated with opiate agonists

USES:

Treatment of opioid-induced constipation in patients with advanced illness who are receiving palliative care when response to laxative therapy has been insufficient

Unlabeled uses: Pruritus; nausea, vomiting related to morphine; urinary retention from opioids

CONTRAINDICATIONS:

Hypersensitivity, GI obstruction, IV route

Precautions: Pregnancy (B), breastfeeding, children, geriatric patients, renal disease, diarrhea, driving, operating machinery, neoplastic disease, Crohn's disease, peptic ulcer, ulcerative colitis

DOSAGE AND ROUTES

Calculator

Opiate-agonist–induced constipation

- **Adult >114 kg:** SUBCUT 0.15 mg/kg every other day prn
- **Adult 62-114 kg:** SUBCUT 12 mg every other day prn
- **Adult 38-<62 kg:** SUBCUT 8 mg every other day prn
- **Adult <38 kg:** SUBCUT 0.15 mg/kg every other day prn

Renal dose

- **Adult: SUBCUT** CCr <30 ml/min, reduce normal adult dose by 50%

Pruritus, nausea, and vomiting related to morphine (unlabeled) (oral dose investigational)

- **Adult: PO** 19.2 mg/kg 20 min prior to morphine

Available forms: Sol for inj 12 mg/0.6 ml

Administer:

- SUBCUT only; oral dose investigational, not currently available
- Do not give IV; IV dosing for urinary retention investigational

SUBCUT route

• Inspect sol before use; should be clear, colorless to pale yellow aqueous sol; do not use if particulate matter or discoloration are present • Withdraw needed amount of sol into sterile syringe; if immediate administration is impossible, syringe may be kept at room temp for ≤ 24 hr; syringe does not need to be kept away from light during the 24-hr period; immediately discard any unused portion in vial; no preservatives are present • Administer into upper arm, abdomen, or thigh $\leq 1 \times / 24$ hr; rotate inj sites; do not inject same spot each time; do not inject into areas where skin is tender, bruised, red, or hard; avoid areas with scars or stretch marks • If using with retractable needle, slowly push down on plunger past resistance point until the syringe is empty and click is heard

SIDE EFFECTS

CNS: Dizziness

GI: Nausea, vomiting, diarrhea, flatulence, abdominal pain

INTEG: Hyperhidrosis

PHARMACOKINETICS

Terminal half-life 8 hr, protein binding 11%-15.3%; renal impairment has marked effect on renal excretion of methylnaltrexone; dose adjustment is required for patients with $CCr < 30$ ml/min; renal clearance decreased and total systemic exposure increased in patients with severe renal impairment who receive single SUBCUT dose of 0.3 mg/kg

SUBCUT: Peak 30 min

NURSING CONSIDERATIONS

Assess:

- Serum creatinine
- **Opioid-induced constipation:** stool characteristics, bowel sounds during treatment

Perform/provide:

- Storage at 59° F-86° F (15° C-30° C); do not freeze
- Storage away from light

Evaluate:

- Therapeutic response: decreasing constipation

Teach patient/family:

- That, after 30 min, to remain near toilet facilities because bowel relaxation occurs, not to use more than 1 dose in 24 hr
- To notify prescriber of abdominal pain, continuous or severe diarrhea, nausea, vomiting
- Avoid use in pregnancy unless absolutely necessary; avoid in breastfeeding

☼ Canada only Side effects: *italics* = common; **bold** = life-threatening ⚠
Nurse Alert

methlyphenidate (Rx)

(meth-ill-fen'i-date)

Biphentin , Concerta, Daytrana, Metadate CD, Metadate ER, Methylin, Quillivant XR, Ritalin, Ritalin LA, Ritalin SR

Func. class.: Cerebral stimulant

Chem. class.: Piperidine derivative

Controlled Substance Schedule II

Do not confuse: **methlyphenidate**/methadone

ACTION:

Increases release of norepinephrine, dopamine in cerebral cortex to reticular activating system; exact action not known

USES:

Attention deficit disorder (ADD), attention-deficit/hyperactivity disorder (ADHD); narcolepsy (except Concerta, Metadate CD, Ritalin LA)

CONTRAINDICATIONS:

Children <6 yr, hypersensitivity, anxiety, history of Gilles de la Tourette's syndrome; glaucoma, anorexia nervosa, tartrazine dye hypersensitivity

Precautions: Pregnancy (C), breastfeeding, hypertension, depression, seizures

Black Box Warning:

Substance abuse

DOSAGE AND ROUTES

Calculator

Attention-deficit/hyperactivity disorder (ADHD) initial treatment, not currently on methlyphenidate

Regular release: Ritalin, methylin, methylin oral sol, methylin chew tabs

- **Adult: PO** 20-30 mg/day, range 10-60 mg/day in 2-3 divided doses, 30-45 min before meals

- **Child ≥6 yr: PO** 5 mg bid initially, increase 5-10 mg/day weekly, usual dose 0.3-2 mg/kg/day, max 60 mg/day

Extended release: Ritalin SR, metadate ER, methylin ER

- **Adult/adolescent/child ≥6 yr: PO** max 20-30 mg tid

Extended-release once-daily tabs: Concerta

- **Adult: PO** 18-36 mg/day initially then adjust by 18 mg/wk, max 72 mg/day
- **Adolescent: PO** 18 mg/day initially then adjust by 18 mg/wk, max 72 mg/day
- **Child ≥6 yr: PO** 18 mg/day initially then adjust by 18 mg/wk, max 54 mg/day

Extended-release once-daily capsules: Ritalin LA

- **Adult/adolescent/child ≥6 yr: PO** 20 mg daily in AM initially, adjust by 10 mg/wk, max 60 mg/day

Extended-release once-daily capsules: Metadate CD

- **Adult/adolescent/child ≥6 yr: PO** 20 mg/day in AM, adjust by 20 mg/wk, max 60 mg/day

Transdermal: Daytrana

- **Adolescent/child ≥6 yr: TD** wk 1: 10 mg/day (9-mg patch); wk 2: 15 mg/day (9-mg patch); wk 3: 20 mg/day (9-mg patch); wk 4: 30 mg/day (9-mg patch)

Conversion to once-daily treatment from other forms for ADHD

Extended-release once-daily capsules: Metadate CD

- **Adult/adolescent/child ≥6 yr: PO** give no more than total daily dose of other forms, may adjust by 20 mg/wk, max 60 mg/day

Extended-release once-daily capsules: Ritalin LA

- **Adult/adolescent/child ≥6 yr: PO** give no more than total daily dose of other forms, may adjust by 10 mg/wk, max 60 mg/day

Extended-release once-daily tablets: Concerta

- **Adult/adolescent/child ≥6 yr (currently on 10-15 mg/day): PO** 18 mg every AM initially, adjust by 18 mg/wk, max 72 mg/day (adult); max 72 mg/day, 2 mg/kg/day (adolescent); 54 mg/day (child) mg/day
- **Adult/adolescent/child ≥6 yr (currently receiving 20-30 mg/day): PO** 36 mg every AM, adjust by 18 mg/wk, max 72 mg/day (adult); 72 mg/day, 2 mg/kg/day (adolescent); 54 mg/day (child)
- **Adult/adolescent/child ≥6 yr (currently receiving 30-45 mg/day): PO** 54 mg every AM, adjust by 18 mg/wk, max 72 mg/day (adult); 72 mg/day, 2 mg/kg/day (adolescent); 54 mg/day (child)
- **Adult/adolescent/child ≥6 yr (currently receiving 40-60 mg/day): PO** 72 mg every AM, 72 mg/day

Extended-release once-daily suspension: Quillivant XR

- **Adolescents/child ≥ 6 yr: PO** give in AM, increase in 10-20 mg increments q week

Narcolepsy

Immediate release: Ritalin, methylin oral sol, methylin chew tabs

- **Adult: PO** 20-30 mg/day, range 10-60 mg/day in 2-3 divided doses
- **Child ≥ 6 yr: PO** 5 mg bid, may increase by 5-10 mg/wk, max 60 mg/day

Extended-release tabs: Ritalin SR, metadate ER

- **Adult/adolescent/child ≥ 6 yr: PO** max 20 mg tid

Poststroke depression; major depression (unlabeled)

- **Adult and geriatric: PO** (immediate rel tabs) 2.5 mg bid, may increase by 2.5-5 mg q2-3days

Available forms: Tabs 5, 10, 20 mg; ext rel tabs 10, 20, mg; ext rel tabs (Concerta) 18, 27, 36, 54 mg; ext rel caps 10, 20, 30, 40 mg; oral sol 5 mg, 10 mg/ml; chew tabs (Methylin) 2.5, 5, 10 mg; transdermal patch 12.5 cm² (10 mg), 18.75 cm² (15 mg), 25 cm² (20 mg), 37.5 cm² (30 mg); ext rel oral susp 300 mg/60 ml, 600 mg/120 ml, 750 mg/150 ml, 900 mg/180 ml

Administer:

PO route

- Do not crush, chew ext rel product; caps may be opened, beads sprinkled over spoonful of applesauce; give without regard to meals
- Gum, hard candy, frequent sips of water for dry mouth
- Give immediate rel dose 30-45 min before meals
- **Chew tab** with adequate water to prevent choking; contains phenylalanine
- Avoid metadate CD on day of surgery

Extended release oral suspension (quillivant XR)

- Shake bottle well, use calibrated dosing dispenser provided, give in AM without regard to meals, reconstitute as per manufacturer

Transdermal route

- Place on clean, dry area of hip; avoid waist; remove 9 hr after application; fold after removal, flush down toilet • If patch falls off, apply new patch to different site; total wear time should be 9 hr

SIDE EFFECTS

CNS: *Hyperactivity, insomnia, restlessness, talkativeness, dizziness, drowsiness,*

toxic psychosis, headache, akathisia, dyskinesia, masking or worsening of Tourette's syndrome, **seizures**, hallucinations, **malignant neuroleptic syndrome**, aggression; **cerebral vasculitis, hemorrhage, stroke (rare)**

CV: *Palpitations, tachycardia*, B/P changes, angina, **dysrhythmias**

ENDO: Growth retardation

GI: Nausea, anorexia, dry mouth, weight loss, abdominal pain

HEMA: **Leukopenia, anemia, thrombocytopenic purpura**

INTEG: **Exfoliative dermatitis**, urticaria, rash, erythema multiforme, **hypersensitivity reactions**

MISC: Fever, arthralgia, scalp hair loss

PHARMACOKINETICS

PO: Onset 1/2-1 hr, duration 4-6 hr, metabolized by liver, excreted by kidneys, half-life 3-4 hr

INTERACTIONS

- **Hypertensive crisis: MAOIs or within 14 days of MAOIs, vasopressors**

Increase: effects of tricyclics, SSRIs, anticonvulsants, SNRIs, CNS stimulants

Decrease: effect of antihypertensives

Drug/Herb

Increase: CNS stimulation—cola nut, guarana, horsetail, yerba maté, yohimbe

Drug/Food

Increase: stimulation—caffeine

NURSING CONSIDERATIONS

Assess:

- **ADHD:** attention span, decreased hyperactivity

Black Box Warning:

Substance abuse: There is a high potential for abuse, use caution in those with history of substance abuse

- VS, B/P; may reverse antihypertensives; check patients with cardiac disease more often for increased B/P

- CBC with differential, platelets, LFTs, urinalysis; in diabetes: blood glucose, urine glucose; insulin changes may have to be made because eating will decrease

- Height, growth rate q3mo in children; growth rate may be decreased, but normal growth will resume when product is discontinued
- Mental status: mood,

sensorium, affect, stimulation, insomnia, aggressiveness

 **Withdrawal symptoms:** headache, nausea, vomiting, muscle pain, weakness, usually not associated with drug holidays • Appetite, sleep, speech patterns

• **Narcolepsy:** identify frequency, length of narcoleptic episodes

Evaluate:

• Therapeutic response: decreased hyperactivity (ADHD); increased ability to stay awake (narcolepsy)

Teach patient/family:

• To decrease caffeine consumption (coffee, tea, cola, chocolate), may increase irritability, stimulation; not to use guarana, yerba maté, cola nut • To avoid OTC preparations unless approved by prescriber

• To taper off product over several weeks because depression, increased sleeping, lethargy will occur

• To avoid driving, hazardous activities if dizziness, blurred vision occur

• To avoid alcohol

• To avoid hazardous activities until stabilized on medication

• To get needed rest; patients will feel more tired at end of day

• That shell of Concerta tab may appear in stools

• To take regular tab at least 6 hr prior to sleep, 10 hr for ext rel, use dosing syringe to measure liquid; do not use household teaspoon • **Transdermal:** after tray is opened, use within 2 mo; do not store patches without protective patch, notify prescriber if skin irritation or rash occurs

TREATMENT OF OVERDOSE:

Administer fluids; hemodialysis or peritoneal dialysis; antihypertensive for increased B/P; administer short-acting barbiturate before lavage

☼ Canada only Side effects: *italics* = common; **bold** = life-threatening 
Nurse Alert

methyLPREDNISolone (Rx)

(meth-il-pred-niss'oh-lone)

A-Methapred, Depo-Medrol, Medrol, Solu-Medrol

Func. class.: Corticosteroid, synthetic

Chem. class.: Glucocorticoid, immediate acting

Do not confuse:

methyLPREDNISolone/predniSONE/medroxyPROGESTERone/methylTESTOS

ACTION:

Decreases inflammation by suppression of migration of polymorphonuclear leukocytes, fibroblasts; reversal of increased capillary permeability and lysosomal stabilization

USES:

Severe inflammation, shock, adrenal insufficiency, collagen disorders, management of acute spinal cord injury, multiple sclerosis

Unlabeled uses: Multiple myeloma, bronchospasm prophylaxis, airway-obstructing hemangioma, noncardiogenic pulmonary edema, idiopathic pulmonary fibrosis, carpal tunnel syndrome, temporal arteritis, Churg-Strauss syndrome, mixed connective-tissue disease, polyarteritis nodosa, relapsing polychondritis, polymyalgia rheumatica, vasculitis, Wegener's granulomatosis, *Pneumocystis jiroveci* pneumonia in AIDS patients, acute spinal cord injury, severe acute respiratory syndrome (SARS), acute interstitial nephritis

CONTRAINDICATIONS:

Hypersensitivity, intrathecal use, neonates

Precautions: Pregnancy (C), breastfeeding, diabetes mellitus, glaucoma, osteoporosis, seizure disorders, ulcerative colitis, CHF, myasthenia gravis, renal disease, esophagitis, peptic ulcer, tartrazine, benzyl alcohol, corticosteroid hypersensitivity, viral infection, TB, traumatic brain injury, Cushing's syndrome, measles, varicella, fungal infections

DOSAGE AND ROUTES

Calculator

Adrenal insufficiency/inflammation

- **Adult: PO** 4-48 mg in 4 divided doses; **IM** 10-80 mg (acetate); **IM/IV** 10-250 mg (succinate); **INTRAARTICULAR** 4-80 mg (acetate)
- **Child: IV** 0.5-1.7 mg/kg in 3-4 divided doses (succinate)

Multiple sclerosis

- **Adult: PO** 160 mg/day × 1 wk then 64 mg every other day × 30 days

Multiple myeloma/temporal arteritis/Churg-Strauss syndrome/mixed connective-tissue disease/polyarteritis nodosa/relapsing polychondritis/polymyalgia rheumatica/vasculitis/wegener's granulomatosis (unlabeled)

- **Adult: PO** 4-48 mg/day in 4 divided doses; **IM** 10-120 mg (acetate); **IV** 10-40 mg over several min (sodium succinate)
- **Child: PO/IM** 0.5-1.7 mg/kg or 5-25 mg/m²/day in divided doses q6-12hr

Bronchospasm prophylaxis (unlabeled)

- **Adult and adolescent: PO/IV** 40-80 mg/day in 1-2 divided doses
- **Child: PO/IV** 1 mg/kg in 2 divided doses (max 60 mg)

Airway-obstructing hemangioma (unlabeled)

- **Child: PO** 0.5-1.7 mg/kg or 5-25 mg/m²/day in divided doses q6-12hr

Idiopathic pulmonary fibrosis (unlabeled)

- **Adult: IV** 1-2 g/wk or every other week

Carpal tunnel syndrome (unlabeled)

- **Adult: INJ** (local) 40-80 mg as a single inj

Available forms: Tabs 2, 4, 8, 16, 24, 32 mg; inj 20, 40, 80 mg/ml acetate; inj 40, 125, 500, 1000, 2000 mg/vial succinate

Administer:

- Titrated dose; use lowest effective dose

PO route

- With food or milk to decrease GI symptoms (PO)
- Once-a-day dose should be given in AM to coincide with body's normal cortisol secretion

IM route

- IM inj deep in large muscle mass; rotate sites; avoid deltoid; use 21G needle; after shaking suspension (parenteral); inj site reaction may occur (induration, pain at site, atrophy)
- In one dose in AM to prevent adrenal suppression; avoid SUBCUT administration; may damage tissue ⚠️ Do not give Solu-Medrol

intrathecally

IV route

- Use only Solu-Medrol, never use acetate product

Direct IV route

- Use only methylPREDNISolone sodium succinate (Solu-Medrol) IV, never use methylPREDNISolone acetate suspension IV
- After diluting with diluent provided; agitate slowly; give ≤ 500 mg/ ≥ 1 min directly over 3-15 min; doses ≥ 2 mg/kg or 250 mg should be given by intermittent IV infusion unless potential benefits outweigh risks

Intermittent/continuous INF route

- Dilute further in D5W, NS, D5NS; haze may form, give over 15-60 min; large dose (≥ 500 mg) should be given over 30-60 min

Syringe compatibilities: Granisetron, metoclopramide

Y-site compatibilities: Acyclovir, amifostine, amphotericin B cholesteryl, amrinone, aztreonam, cefepime, CISplatin, cladribine, cyclophosphamide, cytarabine, DOPamine, DOXOrubicin, enalaprilat, famotidine, fludarabine, granisetron, heparin, melphalan, meperidine, methotrexate, metroNIDAZOLE, midazolam, morphine, piperacillin/tazobactam, remifentanyl, sodium bicarbonate, tacrolimus, teniposide, theophylline, thiotepa

SIDE EFFECTS

CNS: Depression, flushing, sweating, headache, mood changes

CV: Hypertension, **circulatory collapse, thrombophlebitis, embolism,** tachycardia

EENT: Fungal infections, increased intraocular pressure, blurred vision, cataracts

GI: Diarrhea, nausea, abdominal distention, **GI hemorrhage,** increased appetite, pancreatitis

HEMA: **Thrombocytopenia**

INTEG: Acne, poor wound healing, ecchymosis, petechiae

MS: Fractures, osteoporosis, weakness

PHARMACOKINETICS

Half-life $>3\frac{1}{2}$ hr (plasma), 18-36 hr (tissue); crosses placenta, enters breast milk in small amounts; metabolized in liver; excreted by kidneys (unchanged)

PO: Peak 1-2 hr, duration 1½ days, well absorbed

IM: Peak 4-8 days, duration 1-4 wk, well absorbed

Intraarticular: Peak 1 wk

INTERACTIONS

Increase: side effects—amphotericin B, diuretics

Increase: methylPREDNISolone action—oral contraceptives, estrogens

Increase: adrenal suppression—CYP3A4 inhibitors (aprepitant, antiretroviral protease inhibitors, clarithromycin, danazol, delavirdine, diltiazem, erythromycin, fluconazole, FLUoxetine, fluvoxamine, imatinib, ketoconazole, mibefradil, nefazodone, telithromycin, voriconazole)

Decrease: methylPREDNISolone effect—CYP3A4 inducers (barbiturates, bosentan, carbamazepine, efavirenz, phenytoins, nevirapine, rifabutin, rifampin)

Decrease: effects of antidiabetics, vaccines, somatrem

Drug/Herb

- Avoid use with St. John's wort

Drug/Food

- Do not use with grapefruit juice; level of methylPREDNISolone will be increased

Drug/Lab Test

Increase: cholesterol, blood glucose

Decrease: Calcium, potassium, T₄, T₃, thyroid ¹³¹I uptake test, urine 17-OHCS, 17-KS

False negative: skin allergy tests

NURSING CONSIDERATIONS

Assess:

- **Potassium depletion:** paresthesias, fatigue, nausea, vomiting, depression, polyuria, dysrhythmias, weakness
- Edema, hypertension, cardiac symptoms
- Mental status: affect, mood, behavioral changes, aggression
- Potassium, blood glucose, urine glucose while receiving long-term therapy; hypokalemia and hyperglycemia
- Joint mobility, pain, edema if product given intraarticularly
- B/P q4hr, pulse; notify prescriber of chest pain, crackles

- I&O ratio; be alert for decreasing urinary output, increasing edema; weight daily; notify prescriber of weekly gain >5 lb ⚠️ **Adrenal insufficiency:** weight loss, nausea, vomiting, confusion, anxiety, hypotension, weakness; plasma cortisol levels during long-term therapy (normal level: 138-635 nmol/L SI units when drawn at 8 AM) • Growth in children receiving long-term treatment
- **Infection:** increased temp, WBC, even after withdrawal of product; product masks infection

Evaluate:

- Therapeutic response: ease of respirations, decreased inflammation; decreased symptoms of adrenal insufficiency

Teach patient/family:

- To increase intake of potassium, calcium, protein
- To carry emergency ID as corticosteroid user
- To notify prescriber if therapeutic response decreases; that dosage adjustment may be needed ⚠️ Not to discontinue abruptly because adrenal crisis can result
- To take PO with food, milk to decrease GI symptoms
- To avoid OTC products: salicylates, alcohol in cough products, cold preparations unless directed by prescriber; to avoid vaccinations because immunosuppression occurs • **Adrenal insufficiency:** nausea, anorexia, fatigue, dizziness, dyspnea, weakness, joint pain • **Cushingoid symptoms:** buffalo hump, moon face, rapid weight gain, excess sweating • **Infection:** to avoid persons with known infections; corticosteroids can mask symptoms of infection

🌿 Canada only Side effects: *italics* = common; **bold** = life-threatening ⚠️
Nurse Alert

metipranolol ophthalmic

See [Appendix B](#)

metoclopramide (Rx)

(met-oh-kloe-pra'mide)

Apo-Metoclop , Metozolv ODT, Reglan

Func. class.: Cholinergic, antiemetic

Chem. class.: Central dopamine receptor antagonist

Do not confuse: **metoclopramide**/metolazone

Reglan/Megace/Renagel

ACTION:

Enhances response to acetylcholine of tissue in upper GI tract, which causes the contraction of gastric muscle; relaxes pyloric, duodenal segments; increases peristalsis without stimulating secretions; blocks dopamine in chemoreceptor trigger zone of CNS

USES:

Prevention of nausea, vomiting induced by chemotherapy, radiation, delayed gastric emptying, gastroesophageal reflux

Unlabeled uses: Hiccups, migraines, breastfeeding induction, lung cancer

CONTRAINDICATIONS:

Hypersensitivity to this product, procaine, or procainamide; seizure disorder, pheochromocytoma, breast cancer (prolactin dependent), GI obstruction

Precautions: Pregnancy (B), breastfeeding, GI hemorrhage, CHF, Parkinson's disease

Black Box Warning:

Tardive dyskinesia

DOSAGE AND ROUTES

Calculator

Nausea/vomiting (chemotherapy)

- **Adult:** IV 1-2 mg/kg 30 min before administration of chemotherapy, then q2hr × 2 doses, then q3hr × 3 doses

- **Child (unlabeled): IV** 1-2 mg/kg/dose

Facilitate small-bowel intubation for radiologic exams

- **Adult and child >14 yr: IV** 10 mg over 1-2 min
- **Child <6 yr: IV** 0.1 mg/kg
- **Child 6-14 yr: IV** 2.5-5 mg

Diabetic gastroparesis

- **Adult: PO** 10 mg 30 min before meals, at bedtime × 2-8 wk
- **Geriatric: PO** 5 mg 30 min before meals, at bedtime, increase to 10 mg if needed

Gastroesophageal reflux

- **Adult: PO** 10-15 mg qid 30 min before meals and at bedtime
- **Child: PO** 0.4-0.8 mg/kg/day in 4 divided doses

Renal dose

- **Adult:** CCr <40 ml/min 50% of dose

Lactation induction (unlabeled)

- **Adult: PO** 10 mg bid-tid, may increase to 20-45 mg/day in divided doses

Non-small-cell lung cancer (NSCLC) radiation sensitizer (unlabeled)

- **Adult: IV** (Sensamide IV) 2 mg/kg given 1 hr prior to radiation therapy 3×/wk

Hiccups (unlabeled)

- **Adult: PO/IM/IV** 10 mg q6hr

Available forms: Tabs 5, 10 mg; syr 5 mg/5 ml; inj 5 mg/ml; conc sol 10 mg/ml; orally disintegrating tab 5, 10 mg

Administer:

PO route

- 1/2-1 hr before meals for better absorption
- Gum, hard candy, frequent rinsing of mouth for dry oral cavity
- **Oral disintegrating:** place on tongue, allow to dissolve, swallow, remove from bottle immediately before use

IM route

- Give for post-operative nausea, vomiting prior to end of surgery

Direct IV route

- DiphenhydrAMINE IV or benztropine IM for EPS
- Undiluted if dose ≤10 mg; give over 2 min

Intermittent IV INF route

- >10 mg may be diluted in ≥ 50 ml D₅W, NaCl, Ringer's, LR, given over ≥ 15 min

Y-site compatibilities: Alfentanil, amifostine, amikacin, aminophylline, ascorbic acid, atracurium, atropine, azaTHIOprine, aztreonam, bivalirudin, bleomycin, bumetanide, buprenorphine, butorphanol, calcium chloride/gluconate, CARBOplatin, caspofungin, ceFAZolin, cefonicid, cefoperazone, cefotaxime, cefoTEtan, cefOXitin, cefTAZidime, ceftizoxime, cefTRIAxone, cefuroxime, chloramphenicol, chlorproMAZINE, cimetidine, ciprofloxacin, cisatracurium, CISplatin, cladribine, clindamycin, cyanocobalamin, cyclophosphamide, cycloSPORINE, cytarabine, DACTINomycin, DAPTOmycin, dexamethasone, dexmedetomidine, digoxin, diltiazem, diphenhydrAMINE, DOBUTamine, DOCEtaxel, DOPamine, doripenem, doxapram, DOXOrubicin hydrochloride, doxycycline, droperidol, enalaprilat, ePHEDrine, EPINEPHrine, epirubicin, epoetin alfa, ertapenem, erythromycin, esmolol, etoposide, etoposide phosphate, famotidine, fenoldopam, fentaNYL, filgrastim, fluconazole, fludarabine, folic acid, foscarnet, gallium nitrate, gemcitabine, gentamicin, glycopyrrolate, granisetron, heparin, hydrocortisone, HYDROmorphone, IDArubicin, ifosfamide, imipenem/cilastatin, indomethacin, insulin, isoproterenol, ketorolac, labetalol, leucovorin, levofloxacin, lidocaine, linezolid, LORazepam, magnesium sulfate, mannitol, mechlorethamine, melphalan, meperidine, meropenem, metaraminol, methadone, methotrexate, methoxamine, methyl dopate, methylPREDNISolone, metoprolol, metroNIDAZOLE, miconazole, midazolam, milrinone, minocycline, mitoMYcin, morphine, moxalactam, multiple vitamins, nafcillin, nalbuphine, naloxone, nesiritide, nitroglycerin, nitroprusside, norepinephrine, octreotide, ondansetron, oxaliplatin, oxytocin, PACLitaxel, palonosetron, pantoprazole, papaverine, PEMEtrexed, penicillin G, pentamidine, pentazocine, PENTobarbital, PHENobarbital, phentolamine, phenylephrine, phytonadione, piperacillin/tazobactam, potassium chloride, procainamide, prochlorperazine, promethazine, propranolol, protamine, pyridoxine, quinupristin/dalfopristin, ranitidine, remifentanil, riTUXimab, rocuronium, sargramostim, sodium acetate/bicarbonate, succinylcholine, SUFentanil, tacrolimus, teniposide, theophylline, thiamine, thiotepa, ticarcillin/clavulanate, tigecycline, tirofiban, tobramycin, tolazoline, topotecan, trastuzumab, trimethaphan, urokinase,

vancomycin, vasopressin, vecuronium, verapamil, vinBLAStine, vinCRIStine, vinorelbine, voriconazole, zidovudine

SIDE EFFECTS

CNS: Sedation, fatigue, restlessness, headache, sleeplessness, dystonia, dizziness, drowsiness, **suicidal ideation, seizures, EPS, neuroleptic malignant syndrome; tardive dyskinesia (>3 mo, high doses)**

CV: Hypotension, supraventricular tachycardia

GI: Dry mouth, constipation, nausea, anorexia, vomiting, diarrhea

GU: Decreased libido, prolactin secretion, amenorrhea, galactorrhea

HEMA: **Neutropenia, leukopenia, agranulocytosis**

INTEG: Urticaria, rash

PHARMACOKINETICS

Metabolized by liver, excreted in urine, half-life 4 hr

PO: Onset 1/2-1 hr, duration 1-2 hr

IM: Onset 10-15 min, duration 1-2 hr

IV: Onset 1-3 min, duration 1-2 hr

INTERACTIONS

- Avoid use with MAOIs

Increase: sedation—alcohol, other CNS depressants

Increase: risk for EPS—haloperidol, phenothiazines

Decrease: action of metoclopramide—anticholinergics, opiates

Drug/Lab Test

Increase: prolactin, aldosterone, thyrotropin

NURSING CONSIDERATIONS

Assess:

Black Box Warning:

EPS, tardive dyskinesia; more likely to occur in treatment >3 mo, geriatric patients and may be irreversible; assess for involuntary movements often

• **Neuroleptic malignant syndrome:** hyperthermia, change in B/P, pulse, tachycardia, sweating, rigidity, altered consciousness (rare) • **Mental status:** depression, anxiety, irritability

• **GI complaints:** nausea, vomiting, anorexia, constipation

Perform/provide:

- Protect from light with aluminum foil during inf
- Discard open ampules

Evaluate:

- Therapeutic response: absence of nausea, vomiting, anorexia, fullness

Teach patient/family:

- To avoid driving, other hazardous activities until stabilized on product
- To avoid alcohol, other CNS depressants that will enhance sedating properties of this product

🍁 Canada only Side effects: *italics* = common; **bold** = life-threatening ⚠️
Nurse Alert

metolazone (Rx)

(me-tole'a-zone)

Zaroxolyn

Func. class.: Diuretic, antihypertensive

Chem. class.: Thiazide-like quinazoline derivative

Do not confuse: metolazone/methotrexate/metoclopramide

ACTION:

Acts on distal tubule by increasing excretion of water, sodium, chloride, potassium, magnesium, bicarbonate

USES:

Edema, hypertension

Unlabeled uses: Heart failure, nephrotic syndrome

CONTRAINDICATIONS:

Hypersensitivity to thiazides, sulfonamides; anuria, coma

Black Box Warning:

Hepatic encephalopathy

Precautions: Pregnancy (B), breastfeeding, geriatric patients, hypokalemia, renal/hepatic disease, gout, COPD, lupus erythematosus, diabetes mellitus, hypotension, history of pancreatitis; hypersensitivity to sulfonamides, thiazides; electrolyte imbalance

DOSAGE AND ROUTES

Calculator

Edema

- **Adult: PO** 5-10 mg/day; max 20 mg/day

Hypertension

- **Adult: PO** 2.5-5 mg/day

Available forms: Tabs 2.5, 5, 10 mg

Administer:

- In AM to avoid interference with sleep if using product as diuretic • Potassium replacement if potassium <3 mg/dl

- With food if nausea occurs; absorption may be decreased slightly

SIDE EFFECTS

CNS: Anxiety, depression, *headache, dizziness, fatigue, weakness*

CV: Orthostatic hypotension, palpitations, volume depletion, hypotension, chest pain

EENT: Blurred vision

ELECT: *Hypokalemia*, hypercalcemia, hyponatremia

GI: *Nausea, vomiting, anorexia*, constipation, diarrhea, cramps, pancreatitis, GI irritation, dry mouth, jaundice

GU: *Urinary frequency*, polyuria, **uremia, glucosuria**, nocturia, impotence

HEMA: **Aplastic anemia, hemolytic anemia, leukopenia, agranulocytosis, neutropenia**

INTEG: *Rash*, urticaria, purpura, photosensitivity, fever, dry skin

META: *Hyperglycemia*, increased creatinine, BUN

MS: Muscle cramps, joint pain, swelling

PHARMACOKINETICS

Onset 1 hr, peak 2 hr, duration 12-24 hr, excreted unchanged by kidneys, crosses placenta, enters breast milk, half-life 14 hr

INTERACTIONS

Increase: hypokalemia—mezlocillin, piperacillin, amphotericin B, glucocorticoids, digoxin, stimulant laxatives

Increase: hypotension—alcohol (large amounts), nitrates, antihypertensives, barbiturates, opioids

Increase: toxicity—lithium

Increase: metolazone effects—loop diuretics

Decrease: action of metolazone—NSAIDs, salicylates

NURSING CONSIDERATIONS

Assess:

- Weight, I&O daily to determine fluid loss; effect of product may be decreased if used daily
- **CHF:** improvement in edema of feet, legs, sacral area daily if product being used
- **Hypertension:** B/P lying, standing; postural hypotension

may occur

- Electrolytes: potassium, magnesium, sodium, chloride; include BUN, blood glucose, CBC, serum creatinine, blood pH, ABGs, uric acid, calcium
- **Hypokalemia**: postural hypotension, malaise, fatigue, tachycardia, leg cramps, weakness
- Rashes, fever daily
- Confusion, especially among geriatric patients; take safety precautions if needed

Black Box Warning:

Hepatic encephalopathy: do not use in hepatic coma or precoma; fluctuations in electrolytes can occur rapidly and precipitate hepatic coma; use caution in patients with impaired hepatic function

Evaluate:

- Therapeutic response: decreased edema, B/P

Teach patient/family:

- To increase fluid intake to 2-3 L/day unless contraindicated; to rise slowly from lying or sitting position
- To notify prescriber of muscle weakness, cramps, nausea, dizziness
- That product may be taken with food or milk
- To use sunscreen for photosensitivity
- That blood glucose may be increased in diabetics
- To take early in day to avoid nocturia
- To avoid alcohol
- To avoid sodium foods, to increase potassium foods in diet

TREATMENT OF OVERDOSE:

Lavage if taken orally; monitor electrolytes; administer dextrose in saline; monitor hydration, CV, renal status

☼ Canada only Side effects: *italics* = common; **bold** = life-threatening ⚠
Nurse Alert

metoprolol (Rx)

(meh-toe'proe-lole)

Lopressor, Nu-Metop , Toprol-XL

Func. class.: Antihypertensive, antianginal

Chem. class.: β_1 -Blocker

Do not confuse: metoprolol/misoprostol

ACTION:

Lowers B/P by β -blocking effects; reduces elevated renin plasma levels; blocks β_2 -adrenergic receptors in bronchial, vascular smooth muscle only at high doses; negative chronotropic effect

USES:

Mild to moderate hypertension, acute MI to reduce cardiovascular mortality, angina pectoris, NYHA class II, III heart failure

Unlabeled uses: Migraine prevention, heart rate control for atrial fibrillation/flutter without accessory pathway, essential tremor, unstable angina

CONTRAINDICATIONS:

Hypersensitivity to β -blockers, cardiogenic shock, heart block (2nd, 3rd degree), sinus bradycardia, pheochromocytoma, sick sinus syndrome

Precautions: Pregnancy (C), breastfeeding, geriatric patients, major surgery, diabetes mellitus, thyroid/renal/hepatic disease, COPD, CAD, nonallergic bronchospasm, CHF, bronchial asthma, CVA, children, depression, vasospastic angina

Black Box Warning:

Abrupt discontinuation

DOSAGE AND ROUTES

Calculator

Hypertension

- **Adult: PO** 50 mg bid or 100 mg/day; may give up to 200-450 mg in divided doses; **EXT REL** 25-100 mg daily, titrate at weekly intervals; max 400 mg/day
- **Geriatric: PO** 25 mg/day initially, increase weekly as needed
- **Child and adolescent 6-16 yr: PO ER** 1 mg/kg up to 50 mg daily

Myocardial infarction

- **Adult: IV BOL** (early treatment) 5 mg q2min × 3 then 50 mg **PO** 15 min after last dose and q6hr × 48 hr; (late treatment) **PO** maintenance 50-100 mg bid for 1-3 yr

Heart failure (NYHA class II/III)

- **Adult: PO EXT REL** 25 mg daily × 2 wk (class II); 12.5 mg daily (class III); **PO** (unlabeled) 5 mg bid, titrate to 100-150 mg/day in 2-3 divided doses

Angina

- **Adult: PO** 100 mg/day as a single dose or in 2 divided doses, increase weekly prn or 100 mg **EXT REL** daily, max 400 mg/day ext rel

Migraine prevention (unlabeled)

- **Adult: PO** 25-100 mg bid-qid; 50-200 mg daily (XL)

Heart rate control for atrial fibrillation/flutter without accessory pathway (unlabeled)

- **Adult: IV BOL** (acute setting) 2.5-5 mg over 2 min, may repeat dose × 3; **PO** (nonacute setting) 25-100 mg bid

Essential tremor (unlabeled)

- **Adult: PO** 50 mg/day, may increase, max 300 mg/day in divided doses; **EXT REL** 100 mg/day, max 400 mg/day

Available forms: Tabs 50, 100 mg; inj 1 mg/ml; ext rel tab (succinate) (XL) 25, 50, 100, 200 mg; ext rel tabs, tartrate: 100 mg

Administer:

PO route

- Do not break, crush, or chew ext rel tabs
- Regular release tab after meals, at bedtime; tab may be crushed or swallowed whole; take at same time each day

Direct IV route

- IV, undiluted, give over 1 min × 3 doses at 2 to 5-min intervals; start **PO** 15 min after last IV dose

Y-site compatibilities: Abciximab, acyclovir, alemtuzumab, alfentanil, alteplase, amikacin, aminophylline, amiodarone, amphotericin B liposome, anidulafungin, argatroban, ascorbic acid, atracurium, atropine, azaTHIOprine, aztreonam, benztropine, bivalirudin, bleomycin, bumetanide, buprenorphine, butorphanol, calcium chloride/gluconate, CARBOplatin, caspofungin,

ceFAZolin, cefonicid, cefoperazone, cefotaxime, cefoTEtan, cefOXitin, cefTAZidime, ceftizoxime, cefTRIAxone, cefuroxime, chloramphenicol, chlorproMAZINE, cimetidine, CISplatin, clindamycin, cyanocobalamin, cyclophosphamide, cycloSPORINE, cytarabine, DACTINomycin, DAPTOmycin, dexamethasone, dexmedetomidine, digoxin, diltiazem, diphenhydrAMINE, DOBUTamine, DOCEtaxel, DOPamine, doxacurium, DOXOrubicin, doxycycline, enalaprilat, ePHEDrine, EPINEPHrine, epirubicin, epoetin alfa, eptifibatide, esmolol, etoposide, etoposide phosphate, famotidine, fenoldopam, fentaNYL, fluconazole, fludarabine, fluorouracil, folic acid, furosemide, ganciclovir, gemcitabine, gentamicin, glycopyrrolate, granisetron, heparin, hydrocortisone, HYDROmorphone, IDArubicin, ifosfamide, imipenem/cilastatin, indomethacin, insulin, isoproterenol, ketorolac, labetalol, linezolid, LORazepam, magnesium sulfate, mannitol, mechlorethamine, meperidine, metaraminol, methotrexate, methoxamine, methyl dopate, methylPREDNISolone, metoclopramide, metroNIDAZOLE, midazolam, milrinone, mitoXANtrone, morphine, multivitamins, nafcillin, nalbuphine, naloxone, nitroprusside, norepinephrine, octreotide, ondansetron, oxacillin, oxaliplatin, oxytocin, PACLitaxel, palonosetron, pancuronium, papaverine, PEMEtrexed, penicillin G, pentamidine, pentazocine, PENTobarbital, PHENobarbital, phentolamine, phenylephrine, phytonadione, piperacillin/tazobactam, potassium chloride, procainamide, prochlorperazine, promethazine, propranolol, protamine, pyridoxime, quinupristin/dalfopristin, ranitidine, rocuronium, sodium bicarbonate, succinylcholine, SUFentanil, tacrolimus, teniposide, theophylline, thiamine, thiotepa, ticarcillin/clavulanate, tigecycline, tirofiban, tobramycin, tolazoline, trimetaphan, urokinase, vancomycin, vasopressin, vecuronium, verapamil, vinCRISTine, vinorelbine, voriconazole

SIDE EFFECTS

CNS: *Insomnia, dizziness, mental changes, hallucinations, depression, anxiety, headaches, nightmares, confusion, fatigue*

CV: *Hypotension, bradycardia, CHF, palpitations, dysrhythmias, cardiac arrest, AV block, pulmonary/peripheral edema, chest pain*

EENT: Sore throat; dry, burning eyes

GI: *Nausea, vomiting, colitis, cramps, diarrhea, constipation, flatulence, dry mouth, hiccups*

GU: Impotence

HEMA: Agranulocytosis, eosinophilia, thrombocytopenia, purpura

INTEG: Rash, purpura, alopecia, dry skin, urticaria, pruritus

RESP: Bronchospasm, dyspnea, wheezing

PHARMACOKINETICS

Half-life 3-4 hr, metabolized in liver (metabolites), excreted in urine, crosses placenta, enters breast milk

PO: Peak 2-4 hr, duration 13-19 hr

PO-ER: Peak 6-12 hr, duration 24 hr

IV: Onset immediate, peak 20 min, duration 6-8 hr

INTERACTIONS

- Do not use with MAOIs

Increase: hypotension, bradycardia—reserpine, hydralazine, methyldopa, prazosin, amphetamines, epinephrine, H₂-antagonists, calcium channel blockers

Increase: hypoglycemic effects—insulin, oral antidiabetics

Increase: metoprolol level—cimetidine

Increase: effects of benzodiazepines

Decrease: antihypertensive effect—salicylates, NSAIDs

Decrease: metoprolol level—barbiturates

Decrease: effects of—xanthines

Drug/Food

Increase: absorption with food

Drug/Lab Test

Increase: BUN, potassium, ANA titer, serum lipoprotein, triglycerides, uric acid, alk phos, LDH, AST, ALT

NURSING CONSIDERATIONS

Assess:

Black Box Warning:

Abrupt withdrawal: may cause MI, ventricular dysrhythmias, myocardial ischemia; taper dose over 7-14 days

- **Hypertension/angina:** ECG directly when giving IV during initial treatment
- I&O, weight daily; check for CHF (weight gain, jugular venous distention, crackles, edema, dyspnea)
- Monitor B/P during initial treatment, periodically thereafter; pulse q4hr; note rate, rhythm, quality; apical/radial pulse before administration; notify prescriber of any significant changes or pulse <60 bpm
- Baselines of renal, hepatic studies before therapy begins

Perform/provide:

- Storage in dry area at room temp; do not freeze

Evaluate:

- Therapeutic response: decreased B/P after 1-2 wk, decreased anginal pain

Teach patient/family:

- To take immediately after meals; to take medication at bedtime to prevent effect of orthostatic hypotension

Black Box Warning:

Not to discontinue product abruptly; to taper over 2 wk; may cause angina

- Not to use OTC products containing α -adrenergic stimulants (nasal decongestants, OTC cold preparations) unless directed by prescriber; to avoid alcohol, smoking, sodium intake
- To report bradycardia, dizziness, confusion, depression, fever, sore throat, SOB, decreased vision to prescriber
- To take pulse, B/P at home; when to notify prescriber
- To comply with weight control, dietary adjustments, modified exercise program
- To carry emergency ID to identify product, allergies
- To monitor blood glucose closely if diabetic
- To avoid hazardous activities if dizziness is present
- To report symptoms of CHF: difficult breathing, especially on exertion or when lying down; night cough; swelling of extremities
- To wear support hose to minimize effects of orthostatic hypotension
- To report Raynaud's symptoms

TREATMENT OF OVERDOSE:

Lavage, IV atropine for bradycardia, IV theophylline for bronchospasm, digoxin, O₂, diuretic for cardiac failure, hemodialysis, administer vasopressor

🍁 Canada only Side effects: *italics* = common; **bold** = life-threatening ⚠️
Nurse Alert

metroNIDAZOLE (Rx)

(me-troe-ni'da-zole)

Flagyl, Flagyl ER, Flagyl IV, Flagyl IV RTU, Florazone ER , Novo-Nidazol 

Func. class.: Antiinfective—miscellaneous

Chem. class.: Nitroimidazole derivative

ACTION:

Direct-acting amebicide/trichomonacide binds and disrupts DNA structure, thereby inhibiting bacterial nucleic acid synthesis

USES:

Intestinal amebiasis, amebic abscess, trichomoniasis, refractory trichomoniasis, bacterial anaerobic infections, giardiasis, septicemia, endocarditis; bone, joint, lower respiratory tract infections; rosacea

Unlabeled uses: Crohn's disease, urethritis, amebiasis due to *Dientamoeba fragilis*, *Entamoeba polecki*, giardiasis, pruritus; gastric ulcer, dyspepsia (*H. pylori*), pseudomembranous colitis, guinea worm disease, periodontitis

CONTRAINDICATIONS:

Pregnancy 1st trimester, breastfeeding, hypersensitivity to this product

Precautions: Pregnancy (B) 2nd/3rd trimesters, geriatric patients, *Candida* infections, heart failure, fungal infection, dental disease, bone marrow suppression, hematologic disease, GI/renal/hepatic disease, contracted visual or color fields, blood dyscrasias, CNS disorders

Black Box Warning:

Secondary malignancy

DOSAGE AND ROUTES

Calculator

Trichomoniasis

- **Adult: PO** 500 mg bid × 7 days or 2 g as single dose; do not repeat treatment for 4-6 wk
- **Child (unlabeled): PO** 15 mg/kg/day in 3 divided doses × 7-10 days
- **Infant (unlabeled): PO** 10-30 mg/kg/day × 5-8 days

Refractory trichomoniasis

- **Adult: PO** 250 mg bid × 10 days

Amebic hepatic abscess

- **Adult: PO** 500-750 mg tid × 5-10 days
- **Child: PO** 35-50 mg/kg/day in 3 divided doses × 10 days

Intestinal amebiasis

- **Adult: PO** 750 mg tid × 5-10 days
- **Child: PO** 35-50 mg/kg/day in 3 divided doses × 10 days then oral iodoquinol

Anaerobic bacterial infections

- **Adult: IV INF** 15 mg/kg over 1 hr then 7.5 mg/kg **IV** or **PO** q6hr, not to exceed 4 g/day; 1st maintenance dose should be administered 6 hr after loading dose

Bacterial vaginosis

- **Adult: PO** regular rel 500 mg bid or 250 mg tid × 7 days; ext rel 750 mg/day × 7 days

Persistent urethritis (unlabeled)

- **Adult and adolescent: PO** 2 g as single dose with azithromycin

***Dientamoeba fragilis* (unlabeled)**

- **Child: PO** 250 mg tid × 7 days

***Entamoeba polecki* (unlabeled)**

- **Adult: PO** 750 mg tid × 10 days
- **Child: PO** 30-50 mg/kg/day in 3 divided doses × 5-10 days

Guinea worm disease (unlabeled)

- **Adult: PO** 250 mg tid × 10 days
- **Child: PO** 25 mg/kg/day in 3 divided doses × 10 days

Crohn's disease (unlabeled)

- **Adult: PO** 250 mg tid-qid

Giardiasis (unlabeled)

- **Adult: PO** 250 mg tid × 5-7 days
- **Child: PO** 15 mg/kg/day in 3 divided doses × 5 days

Antibiotic-associated pseudomembranous colitis (unlabeled)

- **Adult: PO** 500 mg 3-4×/day × 10-14 days; **IV** 500 mg q8hr
- **Child: PO/IV** 30 mg/kg/day (max 2 g) divided q6hr × 10 days

Available forms: Tabs 250, 500 mg; ext rel tab (ER) 750 mg; caps 375 mg; inj 500 mg/100 ml; powder for inj 500-mg single dose

Administer:

PO route

- Do not break, crush, or chew ext rel product
- PO with or after meals to avoid GI symptoms, metallic taste; crush tabs if needed

IV route

Intermittent INF ([Flagyl] IV RTU)

- Prediluted, ready to use; inf over 30-60 min
- Lyophilized vials: dilute with 4.4 ml sterile water, 0.9% NaCl; must be diluted further with ≥ 8 mg/ml 0.9% NaCl, D₅W, or LR; must neutralize with 5 mEq NaCO₃/500 mg; CO₂ gas will be generated and may require venting; run over ≥ 1 hr; primary IV must be discontinued; may be given as cont inf; do not use aluminum products; IV may require venting
- Do not use aluminum needles or other products to prepare product

Y-site compatibilities: Acyclovir, alemtuzumab, alfentanil, allopurinol, amifostine, amikacin, aminophylline, amiodarone, ampicillin, ampicillin/sulbactam, anidulafungin, atracurium, bivalirudin, bumetanide, buprenorphine, busulfan, butorphanol, calcium acetate/chloride/gluconate, CARBOplatin, ceFAZolin, cefepime, cefoperazone, cefotaxime, cefoTEtan, cefTRIAxone, cefuroxime, chloramphenicol, chlorproMAZINE, cimetidine, ciprofloxacin, cisatracurium, CISplatin, clindamycin, codeine, cyclophosphamide, cycloSPORINE, cytarabine, DACTINomycin, dexamethasone, dexmedetomidine, dexrazoxane, digoxin, diltiazem, dimenhyDRINATE, diphenhydrAMINE, DOBUTamine, DOCEtaxel, DOPamine, doripenem, doxacurium, doxapram, DOXOrubicin, DOXOrubicin liposome, doxycycline, droperidol, enalaprilat, ePHEDrine, EPINEPHrine, epirubicin, eptifibatide, ertapenem, erythromycin, esmolol, etoposide, etoposide phosphate, famotidine, fenoldopam, fentaNYL, fluconazole, fludarabine, fluorouracil, foscarnet, fosphenytoin, furosemide, gemcitabine, gentamicin, glycopyrrolate, granisetron, haloperidol, heparin, hydrALAZINE, hydrocortisone, HYDROmorphone, IDArubicin, ifosfamide, imipenem/cilastatin, inamrinone, insulin, isoproterenol, ketorolac, labetalol, leucovorin, levofloxacin, lidocaine, linezolid, LORazepam, magnesium sulfate, mannitol, mechlorethamine, melphalan, meperidine, meropenem, mesna, metaraminol, methotrexate, methyldopate, methylPREDNISolone,

metoclopramide, metoprolol, midazolam, milrinone, mitoxantrone, morphine, nafcillin, nalbuphine, naloxone, nesiritide, nicardipine, nitroglycerin, nitroprusside, norepinephrine, octreotide, ondansetron, oxaliplatin, oxytocin, PACLitaxel, palonosetron, pancuronium, pentamidine, pentazocine, PENTobarbital, perphenazine, PHENobarbital, phentolamine, phenylephrine, piperacillin/tazobactam, potassium chloride/phosphates, prochlorperazine, promethazine, propranolol, ranitidine, remifentanyl, rituximab, rocuronium, sargramostim, sodium acetate/bicarbonate/phosphates, streptozocin, succinylcholine, sufentanil, tacrolimus, teniposide, theophylline, thiopental, thiotepa, ticarcillin/clavulanate, tigecycline, tirofiban, tobramycin, trastuzumab, trimethobenzamide, trimethoprim/sulfamethoxazole, vancomycin, vasopressin, vecuronium, verapamil, vincristine, vinorelbine, voriconazole, zidovudine, zoledronic acid

SIDE EFFECTS

CNS: *Headache, dizziness, confusion, irritability, restlessness, ataxia, depression, fatigue, drowsiness, insomnia, paresthesia, peripheral neuropathy, seizures, incoordination, depression, encephalopathy, aseptic meningitis*

CV: Flattening of T waves

EENT: Blurred vision, sore throat, retinal edema, dry mouth, metallic taste, furry tongue, glossitis, stomatitis, photophobia, optic neuritis

GI: *Nausea, vomiting, diarrhea, epigastric distress, anorexia, constipation, abdominal cramps, pseudomembranous colitis*

GU: Darkened urine, vaginal dryness, polyuria, albuminuria, dysuria, cystitis, decreased libido, nephrotoxicity, incontinence, dyspareunia, candidiasis

HEMA: Leukopenia, bone marrow, depression, aplasia, thrombocytopenia

INTEG: Rash, pruritus, urticaria, flushing, Stevens-Johnson syndrome

PHARMACOKINETICS

Crosses placenta, enters breast milk, metabolized by liver 30%-60%, excreted in urine (60%-80%), half-life 6-8 hr

PO: Peak 1-2 hr, absorbed 80%-85%

IV: Onset immediate, peak end of inf

INTERACTIONS

- Avoid use with zalcitabine, bortezomib, norfloxacin

- **Do not use with amprenavir**

Decrease: metroNIDAZOLE half-life—barbiturates

Decrease: metroNIDAZOLE—cholestyramine

Increase: disulfiram reaction—alcohol

Increase: busulfan toxicity—busulfan; avoid concurrent use

Increase: metroNIDAZOLE level—cimetidine

Increase: lithium, CYP3A4 substrates

Increase: action of warfarin, phenytoin, lithium, fosphenytoin

Increase: leukopenia—azaTHIOprine, fluorouracil

Drug/Lab Test

Altered: AST, ALT, LDH

Decrease: WBC, neutrophils

False decrease: triglycerides

NURSING CONSIDERATIONS

Assess:

- **Infection:** WBC, wound symptoms, fever, skin or vaginal secretions; start treatment after C&S; for opportunistic fungal infections; superinfection: fever, monilial growth, fatigue, malaise
- Stools during entire treatment; should be clear at end of therapy; stools should be free of parasites for 1 yr before patient considered cured (amebiasis)
- Vision by ophthalmic exam during, after therapy; vision problems often occur

⚠ Neurotoxicity: peripheral neuropathy, seizures, dizziness, uncoordination, pruritus, joint pain; product may be discontinued • **Allergic reaction:** fever, rash, itching, chills; product should be discontinued if these occur • **Renal, reproductive dysfunction:** dysuria, polyuria, impotence, dyspareunia, decreased libido, I&O; weight daily

Black Box Warning:

Secondary malignancy: use only when indicated; avoid unnecessary use

Perform/provide:

- Storage in light-resistant container; do not refrigerate

Evaluate:

- Therapeutic response: decreased symptoms of infection

Teach patient/family:

- That urine may turn dark reddish brown; that product may cause metallic taste
- About proper hygiene after bowel movement; handwashing technique
- To notify physician about numbness or tingling of extremities
- To avoid hazardous activities because dizziness can occur
- About need for compliance with dosage schedule, duration of treatment
- To use condoms if treatment for trichomoniasis or cross-contamination may occur; to notify prescriber if pregnant or planning to become pregnant; that treatment of both partners is necessary for trichomoniasis
- To use frequent sips of water, sugarless gum, candy for dry mouth
- Not to drink alcohol or use preparations containing alcohol during use or for 48 hr after use of product; disulfiram-like reaction can occur
- To notify if pregnancy is planned or suspected, pregnancy (B) 2nd/3rd trimester in trichomoniasis

🍁 Canada only Side effects: *italics* = common; **bold** = life-threatening ⚠️
Nurse Alert

metroNIDAZOLE (topical, vaginal)

(met-roe-ni'da-zole)

MetroCream, MetroGel, MetroGel Vaginal, MetroLotion, Noritate, Rosasol , Rosadan, Vandazole

Func. class.: Antiprotozoal, antibacterial

Chem. class.: Nitroimidazole

ACTION:

Antibacterial and antiprotozoal activity may result from interacting with DNA

USES:

Acne rosacea, bacterial vaginosis

CONTRAINDICATIONS:

Hypersensitivity to this product or nitroimidazoles, parabens

Precautions: Hepatic disease, blood dyscrasias; CNS conditions (vaginal), children

DOSAGE AND ROUTES

Calculator

Acne rosacea

- **Adult: TOP** apply to affected areas bid (0.75%) daily (1%); adjust therapy based on response

Bacterial vaginosis

- **Adult: VAG** 1 applicatorful bid × 5 days

Available forms: Topical cream 0.75%, 1%; gel 0.75%, 1%; lotion 0.75%; vaginal gel 0.75%

Administer:

Topical route

- Topical skin products are not for intravaginal therapy and are for external use only; do not use skin products near the eyes, nose, or mouth • Wash hands before and after use; wash affected area and gently pat dry

- **Cream/Gel/Lotion:** Apply a thin film to the cleansed affected area; massage gently into affected areas

Intravaginal route

- Only use dosage formulations specified for intravaginal use; intravaginal dosage forms are not for topical therapy; do not ingest • Avoid vaginal intercourse during treatment
- **Cream:** Use applicator(s) supplied by the manufacturer

SIDE EFFECTS

GU: Vaginitis, cervicitis; nausea, vomiting, cramping

INTEG: Redness, burning, dermatitis, rash, pruritus

INTERACTIONS

- MetroNIDAZOLE may increase warfarin anticoagulant effect
- Caution with drinking alcohol or using disulfiram while using metroNIDAZOLE products(vaginal gel) • Possible lithium toxicity (vaginal gel)

NURSING CONSIDERATIONS

Assess:

- **Allergic reaction:** Assess for hypersensitivity, product may need to be discontinued • **Infection:** Assess for number of lesions and severity of acne rosacea, itching in vaginosis

Evaluate:

- Decreased severity of acne rosacea, infection in vaginosis

Teach patient/family:

- That topical skin products are not for intravaginal therapy and are for external use only; not to use skin products near the eyes, nose, or mouth • To wash hands before and after use; to wash affected area and gently pat dry
- **Cream/Gel/Lotion:** To apply a thin film to the cleansed affected area and massage gently into affected areas • **Intravaginal Route:** To use only dosage formulations specified for intravaginal use; not to ingest intravaginal dosage forms because these are not for topical therapy; to avoid vaginal intercourse during treatment • **Cream:** To use applicator(s) supplied by the manufacturer

☼ Canada only Side effects: *italics* = common; **bold** = life-threatening ⚠
Nurse Alert

micafungin (Rx)

(my-ca-fun'gin)

Mycamine

Func. class.: Antifungal, systemic

Chem. class.: Echinocandin

ACTION:

Inhibits an essential component of fungal cell walls; causes direct damage to fungal cell wall

USES:

Treatment of esophageal candidiasis; prophylaxis for *Candida* infections in patients undergoing hematopoietic stem-cell transplantation (HSCT); susceptible *Candida* sp.: *C. albicans*, *C. glabrata*, *C. krusei*, *C. parapsilosis*, *C. tropicalis*

Unlabeled uses: *Aspergillus* sp., pediatrics to prevent candidiasis, endocarditis, endophthalmitis, infectious arthritis, myocarditis, osteomyelitis, pericarditis, pneumonia, sinusitis, tracheobronchitis, prophylaxis of HIV-related esophageal candidiasis

CONTRAINDICATIONS:

Hypersensitivity to this product or other echinocandins

Precautions: Pregnancy (C), breastfeeding, children, geriatric patients, severe hepatic disease, renal impairment

DOSAGE AND ROUTES

Calculator

Esophageal candidiasis

- **Adult:** IV INF 150 mg/day given over 1 hr

Candidemia/acute disseminated candidiasis, abscess/peritonitis

- **Adult:** IV 100 mg/day over 1 hr

Prophylaxis for *candida* infections

- **Adult:** IV INF 50 mg/day given over 1 hr
- **Adolescent/child/infant ≥6 mo (unlabeled):** IV INF 1 mg/kg/day, max 50 mg/day

Aspergillus sp. (unlabeled)

- **Adult: IV INF** 25-150 mg/day × ≥30 days

Available forms: Powder for inj 50 mg, in single-dose vials 50-, 100-mg vial

Administer:

- Do not use if cloudy or precipitated; do not admix; by IV inf only

IV route

- Flush line before and after use with 0.9% NaCl
- **For *Candida* prevention**, reconstitute with provided diluent 0.9% NaCl without bacteriostatic product; 50-mg vial/5 ml (10 mg/ml), swirl to dissolve, do not shake; further dilute with 100 ml 0.9% NaCl only; run over 1 hr
- **For *Candida* infection**: reconstitute with provided diluent 50 mg/5 ml (10 mg/ml); further dilute 3 reconstituted vials in 100 ml 0.9% NaCl, run over 1 hr

Y-site compatibilities: Aminophylline, bumetanide, calcium chloride/gluconate, cycloSPORINE, DOPamine, eptifibatide, esmolol, fenoldopam, furosemide, heparin, HYDROmorphine, lidocaine, LORazepam, magnesium sulfate, milrinone, nitroglycerin, nitroprusside, norepinephrine, phenylephrine, potassium chloride, potassium phosphate, tacrolimus, vasopressin

SIDE EFFECTS

CNS: **Seizures**, dizziness, *headache, somnolence*, fever, anxiety

CV: Flushing, hypertension, phlebitis, tachycardia

GI: Abdominal pain, *nausea, anorexia, vomiting, diarrhea, increased AST, ALT, alk phos, blood dehydrogenase, hyperbilirubinemia*

HEMA: **Neutropenia, thrombocytopenia, leukopenia, coagulopathy, anemia, hemolytic anemia**

INTEG: *Rash, pruritus, inj site pain*

META: Hypokalemia, hypocalcemia, hypomagnesemia

MS: *Rigors*

PHARMACOKINETICS

Metabolized in liver; excreted in feces, urine; terminal half-life 14-17.2 hr; protein binding 99%

INTERACTIONS

Increase: plasma concentrations—itraconazole, sirolimus, NIFEdipine; may

need dosage reduction

NURSING CONSIDERATIONS

Assess:

- **Infection**, clearing of cultures during treatment; obtain culture at baseline and during treatment; product may be started as soon as culture is taken (esophageal candidiasis); monitor cultures during HSCT for prevention of *Candida* infections
- CBC (RBC, Hct, Hgb), differential, platelet count periodically; notify prescriber of results
- Renal studies: BUN, urine CCr, electrolytes before and during therapy
- Hepatic studies before and during treatment: bilirubin, AST, ALT, alk phos as needed
- **Bleeding**: hematuria, heme-positive stools, bruising, or petechiae, mucosa or orifices; blood dyscrasias can occur
- **For hypersensitivity**: rash, pruritus, facial swelling, phlebitis
- For hemolytic anemia
- **GI symptoms**: frequency of stools, cramping; if severe diarrhea occurs, electrolytes may need to be given

Perform/provide:

- Storage at room temp, away from light, do not freeze; discard unused sol

Evaluate:

- Therapeutic response: prevention of *Candida* infection with HSCT or decreased symptoms of *Candida* infection, negative culture

Teach patient/family:

- To notify prescriber if pregnancy is suspected or planned
- To avoid breastfeeding while taking this product
- To inform prescriber of kidney or liver disease
- To report bleeding, facial swelling, wheezing, difficulty breathing, itching, rash, hives, increasing warmth, flushing
- To report signs of infection: increased temp, sore throat, flulike symptoms
- To notify prescriber of nausea, vomiting, diarrhea, jaundice, anorexia, clay-colored stools, dark urine; hepatotoxicity may occur

☛ Canada only Side effects: *italics* = common; **bold** = life-threatening ⚠

Nurse Alert

miconazole

(mi-kon'a-zole)

Oravig

miconazole nitrate

Desenex, Femizol-M, Fungoid, Tincture, Lotrimin AF, Micatin, Micozole, Monistat-1, Monistat-3, Monistat-7, M-Zole 3, M-Zole 7, Tetterine, Ting, Vagistat-1, Zeasorb-AF

Func. class.: Antifungal

Chem. class.: Imidazole

Do not confuse: **miconazole**/clotrimazole/metroNIDAZOLE

ACTION:

Antifungal activity results from disruption of cell membrane permeability

USES:

Treatment of topical fungal infection, vulvovaginal candidiasis; athlete's foot (tinea pedis), jock itch (tinea cruris), and ringworm (tinea corporis)

CONTRAINDICATIONS:

Hypersensitivity to this product or imidazoles; pregnancy first trimester(vaginal)

Precautions: Breastfeeding, children

DOSAGE AND ROUTES

Calculator

Tinea corporis, cruris, pedis; cutaneous candidiasis

- **Adult/child >2 yr: TOP** apply bid $\times$ 2-4 wk

Tinea versicolor

- **Adult/child >2 yr: TOP** use $\times$ 2 wk, apply sparingly every day

Vulvovaginal candidiasis

- **Adult/child $\geq$ 12 yr: VAG** 1 applicatorful of Monistat-7 (100 mg) or 1 supp (100 mg) at bedtime $\times$ 7 days, repeat if needed, or Monistat-3 (200 mg) $\times$ 3 days or a 1200 mg supp $\times$ 1 day

Available forms: Topical cream, ointment, solution, lotion, powder, aerosol, powder 2%; aerosol spray 2%; vag cream 2, 4%; vag supp 100, 200, 1200 mg

Administer:

Topical route

- Topical skin products are not for intravaginal therapy and are for external use only; do not use skin products near the eyes, nose, or mouth • Wash hands before and after use; wash affected area and gently pat dry
- **Cream/Ointment/Lotion/Solution:** Apply a thin film to the cleansed affected area; massage gently into affected areas • **Solution Formulations:** Apply a thin film to the cleansed affected area; massage gently into affected areas; if using a solution-soaked pledget, patient may use more than 1 pledget per application as needed to treat affected areas, but each pledget should be used only once and then discarded • **Intravaginal Route:** Only use dosage formulations specified for intravaginal use; intravaginal dosage forms are not for topical therapy; do not ingest • **Suppository:** Unwrap vaginal ovule (suppository) before insertion; use applicator(s) supplied by the manufacturer • **Cream:** Use applicator(s) supplied by the manufacturer

SIDE EFFECTS

CNS: Headache

GU: Pruritus, irritation, vaginal burning

INTEG: Burning, dermatitis, rash

NURSING CONSIDERATIONS

Assess:

Allergic reaction:

- Assess for hypersensitivity, product may need to be discontinued

Infection:

- Assess for severity of infection

Evaluate:

- Decreasing severity of infection

Teach patient/family:

Topical route

- That topical skin products are not for intravaginal therapy and are for external use only; not to use skin products near the eyes, nose, or mouth • To wash hands before and after use; wash affected area and gently pat dry
- **Cream/Ointment/Lotion/Solution:** To apply a thin film to the cleansed affected area and massage gently into affected areas • **Solution Formulations:**

To shake well before use, apply a thin film to the cleansed affected area, and massage gently into affected areas

Intravaginal route

- To only use dosage formulations specified for intravaginal use; not to ingest intravaginal dosage forms
 - **Suppository:** To unwrap vaginal ovule (suppository) before inserting; to use applicator(s) supplied by the manufacturer
 - **Cream:** To use applicator(s) supplied by the manufacturer
-

🍁 Canada only Side effects: *italics* = common; **bold** = life-threatening ⚠️
Nurse Alert

midazolam (Rx)

(mid'ay-zoe-lam)

Func. class.: Sedative, hypnotic, antianxiety

Chem. class.: Benzodiazepine, short-acting

Controlled Substance Schedule IV

ACTION:

Depresses subcortical levels in CNS; may act on limbic system, reticular formation; may potentiate γ -aminobutyric acid (GABA) by binding to specific benzodiazepine receptors

USES:

Preoperative sedation, general anesthesia induction, sedation for diagnostic endoscopic procedures, intubation, anxiety

Unlabeled uses: Refractory status epilepticus, alcohol withdrawal

CONTRAINDICATIONS:

Pregnancy (D), hypersensitivity to benzodiazepines, acute closed-angle glaucoma, status asthmaticus

Precautions: Breastfeeding, children, geriatric patients, COPD, CHF, chronic renal failure, chills, debilitated, hepatic disease, shock, coma, alcohol intoxication

Black Box Warning:

Neonates (contains benzyl alcohol), IV administration, respiratory depression/insufficiency

DOSAGE AND ROUTES

Calculator

Preoperative sedation

- **Adult and child ≥ 12 yr:** IM 0.07-0.08 mg/kg 1/2-1 hr before general anesthesia
- **Child 6 yr-11 yr:** IV 0.025-0.05 mg/kg; total dose of 0.4 mg/kg may be necessary
- **Child 6 mo-5 yr:** IV 0.05-0.1 mg/kg; total dose of 0.6 mg/kg may be necessary

- **Child 1-6 mo:** IM 0.1-0.15 mg/kg; may give up to 0.5 mg/kg if needed, max 10 mg

Induction of general anesthesia

- **Adult >55 yr:** (ASA I/II) IV 150-300 mcg/kg over 30 sec; (ASA III/IV) limit dose to 250 mcg/kg (nonpremedicated) or 150 mcg/kg (premedicated)
- **Adult <55 yr:** IV 200-350 mcg/kg over 20-30 sec; if patient has not received premedication, may repeat by giving 20% of original dose; if patient has received premedication, reduce dose by 50 mcg/kg
- **Child:** No safe and effective dose established; however, doses of 50-200 mcg/kg IV have been used

Continuous infusion for intubation (critical care)

- **Adult:** IV 0.01-0.05 mg/kg over several min; repeat at 10-to 15-min intervals until adequate sedation then 0.02-0.10 mg/kg/hr maintenance; adjust as needed
- **Child:** IV 0.05-0.2 mg/kg over 2-3 min then 0.06-0.12 mg/kg/hr by cont inf; adjust as needed
- **Neonate:** IV 0.03-0.06 mg/kg/hr, titrate using lowest dose

Status epilepticus (unlabeled)

- **Child and infant >2 mo:** IV 0.15 mg/kg then CONT IV 1 mcg/kg/min, titrate upward q5min until seizures controlled

Alcohol withdrawal (unlabeled)

- **Adult:** IV 1-5 mg q1-2hr (mild-moderate symptoms); CONT IV INF 1-20 mg q1-2hr (delirium tremens)

Available forms: Inj 1, 5 mg/ml, syr 2 mg/ml

Administer:

PO route

- Remove cap of pressin bottle adaptor, push adaptor into neck of bottle; close with cap; remove cap, insert tip of dispenser, insert into adaptor; turn upside-down, withdraw correct dose; place in mouth

IM route

- IM deep into large muscle mass

IV route

- May be given diluted or undiluted
- After diluting with D₅W or 0.9% NaCl to 0.25 mg/ml; give over 2 min (conscious sedation) or over 30 sec (anesthesia induction)

Y-site compatibilities: Abciximab, alfentanil, amikacin, amiodarone, argatroban, atracurium, atropine, aztreonam, benzotropine, calcium gluconate, ceFAZolin, cefotaxime, cefOXitin, cefTRIAxone, cimetidine, ciprofloxacin, CISplatin, clindamycin, cloNIDine, cyanocobalamin, cycloSPORINE, DACTINomycin, digoxin, diltiazem, diphenhydrAMINE, DOCEtaxal, DOPamine, doxycyclin, enalaprilat, EPINEPHrine, erythromycin, esmolol, etomidate, etoposide, famotidine, fentaNYL, fluconazole, folic acid, gatifloxacin, gemcitabine, gentamicin, glycopyrrolate, granisetron, heparin, hetastarch, HYDROmorphine, hydrOXYzine, inamrinone, isoproterenol, labetalol, lactated Ringer's, levofloxacin, lidocaine, linezolid, LORazepam, magnesium, mannitol, meperidine, methadone, methyl dopa, methylPREDNISolone, metoclopramide, metoprolol, metroNIDAZOLE, milrinone, morphine, nalbuphine, naloxone, niCARdipine, nitroglycerin, nitroprusside, norepinephrine, ondansetron, oxacillin, oxytocin, PACLitaxel, palonosetron, pancuronium, papaverin, phytonadione, piperacillin, potassium chloride, propranolol, protamine, pyridoxine, ranitidine, remifentanyl, sodium nitroprusside, succinylcholine, SUFentanyl, teniposide, theophylline, thiotepa, ticarcillin, tobramycin, vancomycin, vasopressin, vecuronium, verapamil, voriconazole

SIDE EFFECTS

CNS: Retrograde amnesia, euphoria, confusion, headache, anxiety, insomnia, slurred speech, paresthesia, tremors, weakness, chills, agitation, paradoxical reactions

CV: Hypotension, PVCs, tachycardia, bigeminy, nodal rhythm, **cardiac arrest**

EENT: Blurred vision, nystagmus, diplopia, loss of balance

GI: *Nausea, vomiting*, increased salivation, hiccups

INTEG: Urticaria; pain, swelling, pruritus at inj site; rash

RESP: Coughing, **apnea, bronchospasm, laryngospasm**, dyspnea, **respiratory depression**

PHARMACOKINETICS

Protein binding 97%; half-life 1.8-6.4 hr, metabolized in liver; metabolites excreted in urine; crosses placenta, blood-brain barrier

PO: Onset 20-30 min

IM: Onset 15 min, peak 1/2-1 hr, duration 2-3 hr

IV: Onset 3-5 min, onset of anesthesia 1½-2½ min, duration 2 hr

INTERACTIONS

Increase: hypotension—antihypertensives, opiates, alcohol, nitrates

Increase: extended half-life—CYP3A4 inhibitors (cimetidine, erythromycin, ranitidine)

Increase: respiratory depression—other CNS depressants, alcohol, barbiturates, opiate analgesics, verapamil, ritonavir, indinavir, fluvoxamine

Decrease: midazolam metabolism—CYP3A4 inducers (azole antifungals, theophylline)

Drug/Herb

Increase: sedation—kava, valerian

Decrease: midazolam effect—St. John's wort

Drug/Food

Increase: (PO) midazolam effect—grapefruit juice

NURSING CONSIDERATIONS

Assess:

- B/P, pulse, respirations during IV; emergency equipment should be nearby
- Inj site for redness, pain, swelling
- Degree of amnesia in geriatric patients; may be increased
- Anterograde amnesia
- Vital signs for recovery period in obese patients; half-life may be extended

Black Box Warning:

Respiratory depression insufficiency: apnea, respiratory depression that may be increased in geriatric patients

Perform/provide:

- Assistance with ambulation until drowsy period ends
- Storage at room temp; protect from light
- Immediate availability of resuscitation equipment, O₂ to support airway; do not give by rapid bolus

Evaluate:

- Therapeutic response: induction of sedation, general anesthesia

Teach patient/family:

- That amnesia occurs; that events may not be remembered

TREATMENT OF OVERDOSE:

Flumazenil, O₂

☼ Canada only Side effects: *italics* = common; **bold** = life-threatening ⚠

Nurse Alert

miglitol (Rx)

(mig'lih-tol)

Glyset

Func. class.: Oral hypoglycemic

Chem. class.: α -Glucosidase inhibitor

ACTION:

Delays digestion and absorption of ingested carbohydrates, which results in a smaller rise in blood glucose after meals; does not increase insulin production

USES:

Type 2 diabetes mellitus

CONTRAINDICATIONS:

Hypersensitivity, diabetic ketoacidosis, cirrhosis, inflammatory bowel disease, colonic ulceration, partial intestinal obstruction, chronic intestinal disease, ileus

Precautions: Pregnancy (B), breastfeeding, children, renal/hepatic disease

DOSAGE AND ROUTES

Calculator

- **Adult: PO** 25 mg tid initially, with 1st bite of meal; maintenance dose may be increased to 50 mg tid; may be increased to 100 mg tid if needed with dosage adjustment at 4-to 8-wk intervals

Available forms: Tabs 25, 50, 100 mg

Administer:

- Tid with first bite of each meal

SIDE EFFECTS

GI: Abdominal pain, diarrhea, flatulence, hepatotoxicity

HEMA: Low iron

INTEG: Rash

RESP: Pneumatosis cystoides, intestinalis

PHARMACOKINETICS

Peak 2-3 hr, not metabolized, excreted in urine as unchanged product, half-life 2

hr

INTERACTIONS

Decrease: levels of digoxin, propranolol, ranitidine

Decrease: miglitol levels—digestive enzymes, intestinal adsorbents; do not use together

Drug/Food

Increase: diarrhea—carbohydrates

NURSING CONSIDERATIONS

Assess:

- **Hypo/hyperglycemia;** even though product does not cause hypoglycemia, if patient receiving sulfonylureas or insulin, hypoglycemia may be additive (rare)
- Blood glucose levels, hemoglobin, A1c LFTs; if hypoglycemia occurs with monotherapy, treat with glucose

Perform/provide:

- Storage in tight container at room temp

Evaluate:

- Therapeutic response: decreased signs, symptoms of diabetes mellitus (polyuria, polydipsia, polyphagia; clear sensorium, absence of dizziness; stable gait); improved blood glucose, A1c

Teach patient/family:

- About the symptoms of hypo/hyperglycemia, what to do about each; that, during periods of stress, infection, or surgery, insulin may be required
- That medication must be taken as prescribed; about consequences of discontinuing medication abruptly
- To avoid OTC medications unless approved by health care provider
- That diabetes is lifelong; that product is not a cure
- To carry ID for emergency purposes
- That diet and exercise regimen must be followed
- About GI side effects

☼ Canada only Side effects: *italics* = common; **bold** = life-threatening ⚠

Nurse Alert

HIGH ALERT

milrinone (Rx)

(mill'rih-nohn)

Func. class.: Inotropic/vasodilator agent with phosphodiesterase activity *Chem. class.:* Bipyridine derivative

ACTION:

Positive inotropic agent; increases contractility of cardiac muscle with vasodilator properties; reduces preload and afterload by direct relaxation on vascular smooth muscle

USES:

Short-term management of advanced heart failure that has not responded to other medication

Unlabeled uses: Adolescents, children, infants

CONTRAINDICATIONS:

Hypersensitivity to this product, severe aortic disease, severe pulmonic valvular disease, acute MI

Precautions: Pregnancy (C), breastfeeding, children, geriatric patients, renal/hepatic disease, atrial flutter/fibrillation

DOSAGE AND ROUTES

Calculator

- **Adult: IV BOL** 50 mcg/kg given over 10 min; start inf of 0.375-0.75 mcg/kg/min
- **Adolescent/child/infant (unlabeled): IV** 50-75 mcg/kg over 10-60 min then 0.5-0.75 mcg/kg/min

Renal dose

- **Adult: IV** CCr 41-50 ml/min, 0.43 mcg/kg/min, titrate up; CCr 31-40 ml/min, 0.38 mcg/kg/min, titrate up; CCr 21-30 ml/min, 0.33 mcg/kg/min, titrate up; CCr 11-20 ml/min, 0.08 mcg/kg/min; CCr 6-10 ml/min, 0.23 mcg/kg/min; CCr ≤5 ml/min, 0.20 mcg/kg/min; max for all doses 0.75 mcg/kg/min

Available forms: Inj 1 mg/ml; premixed inj 200 mcg/ml in D₅W

Administer:

- Potassium supplements if ordered for potassium levels <3 mg/dl

Direct IV route

- Give IV loading dose undiluted over 10 min, use inf device

Continuous IV route

- Dilute 20-mg vial with 80, 113, 180 ml of 0.45% NaCl, 0.9% NaCl, or D₅W to a conc of 200, 150, 100 mcg/ml respectively • Titrate rate based on hemodynamic and clinical response, use inf device
- Precipitation will form when furosemide is injected into line with milrinone

Y-site compatibilities: Acyclovir, alfentanil, allopurinol, amifostine, amikacin, aminocaproic acid, aminophylline, amiodarone, amphotericin B liposome, ampicillin, ampicillin-sulbactam, anidulafungin, argatroban, atenolol, atracurium, aztreonam, bivalirudin, bleomycin, bumetanide, buprenorphine, busulfan, butorphanol, calcium chloride/gluconate, CARBOplatin, caspofungin, ceFAZolin, cefepime, cefotaxime, cefoTEtan, cefOXitin, cefTAZidime, ceftizoxime, cefTRIAxone, cefuroxime, chloramphenicol, chlorproMAZINE, cimetidine, ciprofloxacin, cisatracurium, CISplatin, clindamycin, cyclophosphamide, cycloSPORINE, cytarabine, DACTINomycin, DAPTOmycin, dexamethasone, digoxin, diltiazem, DOBUTamine, DOCEtaxel, DOPamine, doripenem, doxacurium, DOXOrubicin, doxycycline, droperidol, enalaprilat, ePHEDrine, EPINEPHrine, epirubicin, eptifibatide, ertapenem, erythromycin, etoposide, famotidine, fenoldopam, fentaNYL, fluconazole, fludarabine, fluorouracil, gallium, ganciclovir, gatifloxacin, gemcitabine, gentamicin, glycopyrrolate, granisetron, haloperidol, heparin, hydrALAZINE, hydrocortisone, HYDROmorphone, IDArubicin, ifosfamide, insulin (regular), irinotecan, isoproterenol, ketorolac, labetalol, levofloxacin, linezolid, LORazepam, magnesium sulfate, mannitol, mechlorethamine, melphalan, meperidine, meropenem, methohexital, methotrexate, methyl dopate, methylPREDNISolone, metoclopramide, metoprolol, metroNIDAZOLE, micafungin, midazolam, mitoXANtrone, morphine, mycophenolate, nafcillin, nalbuphine, naloxone, nesiritide, niCARdipine, nitroglycerin, nitroprusside, norepinephrine, octreotide, oxacillin, oxaliplatin, oxytocin, PACLitaxel, palonosetron, pamidronate, pancuronium, PEMEtrexed, pentamidine, pentazocine, PENTobarbital, PHENobarbital, phenylephrine, piperacillin,

piperacillin-tazobactam, polymyxin B, potassium chloride/phosphates, prochlorperazine, promethazine, propofol, propranolol, quiniDine, quinupristin-dalfopristin, ranitidine, remifentanyl, rocuronium, sodium acetate/bicarbonate/phosphates, streptozocin, succinylcholine, Sufentanyl, sulfamethoxazole-trimethoprim, tacrolimus, teniposide, theophylline, thiopental, thiotepa, ticarcillin, ticarcillin-clavulanate, tigecycline, tirofiban, tobramycin, torsemide, vancomycin, vasopressin, vecuronium, verapamil, vincristine, vinorelbine, voriconazole, zidovudine, zoledronic acid

SIDE EFFECTS

CV: Dysrhythmias, hypotension, chest pain, PVCs

GI: Nausea, vomiting, anorexia, abdominal pain, hepatotoxicity, jaundice

HEMA: Thrombocytopenia

MISC: Headache, hypokalemia, tremor, inj site reactions

PHARMACOKINETICS

IV: Onset 2-5 min, peak 10 min, duration variable; terminal half-life 2.3 hr; metabolized in liver; excreted in urine as product (83%), metabolites (12%)

INTERACTIONS

Increase: effects of antihypertensives, diuretics

NURSING CONSIDERATIONS

Assess:

 ECG continuously during IV; ventricular dysrhythmia can occur

- B/P, pulse q5min during inf; if B/P drops 30 mm Hg, stop inf, call prescriber
- Electrolytes: potassium, sodium, chloride, calcium; renal studies: BUN, creatinine; blood studies: platelet count • ALT, AST, bilirubin daily
- I&O ratio, weight daily; diuresis should increase with continuing therapy
- If platelets are $<150,000/\text{mm}^3$, product is usually discontinued and another product started

Evaluate:

- Therapeutic response: increased cardiac output, decreased PCWP, adequate CVP; decreased dyspnea, fatigue, edema, ECG

Teach patient/family:

- To report angina immediately during inf
- To report headache, which can be treated with analgesics

TREATMENT OF OVERDOSE:

Discontinue product, support circulation

☼ Canada only Side effects: *italics* = common; **bold** = life-threatening ⚠

Nurse Alert

minocycline (Rx)

(min-oh-sye'kleen)

Arestin, Dynacin, Minocin, Solodyn

Func. class.: Broad-spectrum antiinfective

Chem. class.: Tetracycline

ACTION:

Inhibits protein synthesis, phosphorylation in microorganisms by binding to ribosomal subunits, reversibly binding to ribosomal subunits; bacteriostatic

USES:

Syphilis, *Chlamydia trachomatis*, gonorrhea, lymphogranuloma venereum, rickettsial infections, inflammatory acne, *Neisseria meningitidis*, *Neisseria gonorrhoeae*, *Treponema pallidum*, *Chlamydia trachomatis*, *Ureaplasma urealyticum*, *Mycoplasma pneumoniae*, *Nocardia*, periodontitis, methicillin-resistant *S. aureus* (MRSA) infection, nonnodular moderate to severe acne vulgaris, *Rickettsia* sp.

Unlabeled uses: Rheumatoid arthritis, bullous pemphigoid, dental infection, prostatitis, pleural effusion

CONTRAINDICATIONS:

Pregnancy (D), children <8 yr, hypersensitivity to tetracyclines

Precautions: Hepatic disease, breastfeeding

DOSAGE AND ROUTES

Calculator

- **Adult: PO/IV** 200 mg then 100 mg q12hr, max 400 mg/24 hr **IV**;

SUBGINGIVAL inserted into periodontal pocket

- **Child >8 yr: PO/IV** 4 mg/kg then 4 mg/kg/day **PO** in divided doses q12hr

Rickettsial infections

- **Adult: PO/IV** 200 mg, then 100 mg q12hr

- **Child ≥8 yr/adolescent: PO/IV** 4 mg/kg, then 2 mg/kg q12hr, max adult dose

Gonorrhea

- **Adult: PO** 200 mg then 100 mg q12hr × ≥4 days

Chlamydia trachomatis

- **Adult: PO** 100 mg bid × 7 days

Syphilis

- **Adult: PO** 200 mg then 100 mg q12hr × 10-15 days

Uncomplicated gonococcal urethritis in men

- **Adult: PO** 100 mg q12hr × 5 days

Acne vulgaris (solodyn only)

- **Adult/adolescent/child ≥12 yr:** ext rel 1 mg/kg/day × 12 wk or those weighing 126-136 kg—135 mg/day; 111-125 kg—115 mg/day; 97-110 kg—105 mg/day; 85-96 kg—90 mg/day; 72-84 kg—80 mg/day; 60-71 kg—65 mg/day; 50-59 kg—55 mg/day; 45-49 kg—45 mg/day

Acne vulgaris (all except solodyn)

- **Adult/adolescent/child ≥12 yr:** ext rel 1 mg/kg × 12 wk or 91-136 kg, 135 mg/day; 60-90 kg, 90 mg/day; 45-59 kg, 45 mg/day

Rheumatoid arthritis (unlabeled)

- **Adult: PO** 100 mg bid for ≤48 wk

Bullous pemphigus (unlabeled)

- **Adult: PO** 50 mg/day; may increase to 100 mg/day after 1-2 wk

Available forms: Caps 50, 75, 100 mg; powder for inj 100 mg; caps, pellet filled 50, 100 mg; tabs 50, 75, 100 mg; ext rel tabs 45, 55, 65, 80, 90, 105, 115, 135 mg

Administer:

- After C&S obtained

PO route

- With full glass of water; with food for GI symptoms
- 2 hr before or after laxative or ferrous products; 3 hr after antacid

IV route

- After diluting 100 mg/5 ml sterile water for inj; further dilute in 500-1000 ml of NaCl, dextrose sol, LR, Ringer's sol; run 100 mg/6 hr

Y-site compatibilities: Alfentanil, amikacin, atracurium, benztropine, buprenorphine, butorphanol, calcium chloride, CARBOplatin, caspofungin, cefonicid, chlorpromazine, cimetidine, cisatracurium, codeine, cyclophosphamide, cycloSPORINE, cytarabine, DACTINomycin, dexmedetomidine, diltiazem, diphenhydrAMINE, DOBUTamine, DOCETaxel, doxacurium, doxycycline, enalaprilat, ePHEDrine, EPINEPHrine, eptifibatide,

etoposide, fenoldopam, fentaNYL, filgrastim, fludarabine, gatafloxacin, gemcitabine, gentamicin, glycopyrrolate, granisetron, heparin, hetastarch, IDArubicin, ifosfamide, inamrinone, isoproterenol, labetalol, levofloxacin, lidocaine, linezolid, LORazepam, magnesium sulfate, mannitol, melphalan, metaraminol, methotrexate, methyl dopa, metoclopramide, metoprolol, midazolam, mitoXANtrone, nalbuphine, naloxone, perphenazine, potassium chloride, remifentanyl, sargramostim, teniposide, vinorelbine, vit B/C

SIDE EFFECTS

CNS: *Dizziness*, fever, lightheadedness, vertigo, **seizures, increased intracranial pressure**

CV: Pericarditis

EENT: Dysphagia, glossitis, decreased calcification of deciduous teeth, permanent discoloration of teeth, oral candidiasis

GI: *Nausea*, abdominal pain, *vomiting, diarrhea*, anorexia, enterocolitis, **hepatotoxicity**, flatulence, abdominal cramps, epigastric burning, stomatitis, **pseudomembranous colitis**

GU: *Increased BUN*, polyuria, polydipsia, **renal failure, nephrotoxicity**

HEMA: **Eosinophilia, neutropenia, thrombocytopenia, hemolytic anemia, pancytopenia**

INTEG: *Rash, urticaria, photosensitivity, increased pigmentation*, **exfoliative dermatitis**, pruritus, blue-gray color of skin, mucous membranes

MS: Myalgia, arthritis, bone discoloration, joint stiffness

SYST: **Angioedema, Stevens-Johnson syndrome**

PHARMACOKINETICS

PO: Peak 1-4 hr, half-life 11-22 hr; excreted in urine, feces, breast milk; crosses placenta; 70%-75% protein bound

INTERACTIONS

Increase: effect of warfarin, digoxin, insulin, oral anticoagulants, theophylline, neuromuscular blockers

Increase: **chance of pseudomotor cerebri—retinoids; do not use concurrently**

Decrease: effect of minocycline—antacids, sodium bicarbonate, alkali products, iron, kaolin/pectin, cimetidine, quinapril, sucralfate

Decrease: effect of barbiturates, carbamazepine, phenytoin, penicillins, oral contraceptives, calcium

Drug/Lab Test

False negative: urine glucose with Clinistix or Tes-Tape

NURSING CONSIDERATIONS

Assess:

⚠ **Pseudomembranous colitis:** diarrhea, abdominal cramps, fever; may start up to 2 mo after treatment ends • I&O ratio

- Age and tooth development
- Blood tests: PT, CBC, AST, ALT, BUN, creatinine
- Signs of anemia: Hct, Hgb, fatigue

⚠ **Allergic reactions:** rash, itching, pruritus, angioedema • Nausea, vomiting, diarrhea; administer antiemetic, antacids as ordered

⚠ **Overgrowth of infection:** fever, malaise, redness, pain, swelling, drainage, perineal itching, diarrhea; changes in cough or sputum; black, furry tongue

Perform/provide:

- Storage in airtight, light-resistant container at room temp

Evaluate:

- Therapeutic response: decreased temp, absence of lesions, negative C&S

Teach patient/family:

- To avoid sunlight, wear protective clothing; sunscreen does not seem to decrease photosensitivity • That all prescribed medication must be taken to prevent superinfection; not to use outdated product because Fanconi's syndrome may occur • To avoid taking antacids, iron, cimetidine; use 2 hr before, 6 hr after this product; absorption may be decreased • That teeth discoloration, joint or muscle pain may occur

✳ Canada only Side effects: *italics* = common; **bold** = life-threatening ⚠

Nurse Alert

minoxidil (Rx, OTC)

(mi-nox'i-dill)

Loniten, Rogaine (topical)

Func. class.: Antihypertensive

Chem. class.: Vasodilator, peripheral

Do not confuse: minoxidil/Monopril

Loniten/Lipitor

ACTION:

Directly relaxes arteriolar smooth muscle, causing vasodilation; reduces peripheral vascular resistance, decreases B/P

USES:

Severe hypertension unresponsive to other therapy (use with diuretic and β -blocker); topically to treat alopecia

Unlabeled uses: Scleroderma renal crisis (SRC) to control hypertension

CONTRAINDICATIONS:

Dissecting aortic aneurysm, hypersensitivity, pheochromocytoma

Black Box Warning:

Acute MI

Precautions: Pregnancy (C), breastfeeding, children, geriatric patients, renal disease, CVD

Black Box Warning:

CAD, CHF, cardiac disease, cardiac tamponade, edema, hypotension, orthostatic hypotension, pericardial effusion

DOSAGE AND ROUTES

Calculator

Severe hypertension

- **Adult: PO** 2.5-5 mg/day in 1-2 divided doses; max 100 mg/day; usual range 10-40 mg/day in single dose
- **Geriatric: PO** 2.5 mg/day, may be increased gradually
- **Child <12 yr: PO** (initial) 0.1-0.2 mg/kg/day; (effective range) 0.25-1 mg/kg/day; (max) 50 mg/day

Alopecia

- **Adult: TOP** 1 ml bid, rub into scalp daily, max 2 ml/day

Scleroderma renal crisis (unlabeled)

- **Adult: PO** 5 mg/day in 1-2 divided doses, increase after 3 days by 10-20 mg/day to reach desired B/P, max 100 mg/day

Available forms: Tabs 2.5, 10 mg; topical 2%, 5% sol; topical foam 5%

Administer:

PO route

- With meals for better absorption, to decrease GI symptoms
- With β -blocker and/or diuretic for hypertension

Topical route

- 1 ml no matter how much balding has occurred; increasing dosage does not speed growth

SIDE EFFECTS

Systemic

CNS: Headache, fatigue

CV: *Severe rebound hypertension on withdrawal in children*, tachycardia, angina, increased T wave, **CHF, pulmonary edema, pericardial effusion**, edema, sodium, water retention, hypotension

GI: Nausea, vomiting

GU: Breast tenderness

HEMA: Hct, Hgb; erythrocyte count may decrease initially

INTEG: Pruritus, **Stevens-Johnson syndrome**, rash, hirsutism

PHARMACOKINETICS

PO: Onset 30 min, peak 2-3 hr, duration 48-120 hr; half-life 4.2 hr; metabolized in liver; metabolites excreted in urine, feces; protein binding minimal

INTERACTIONS

Increase: hypotension—antihypertensives, MAOIs

Decrease: antihypertensive effect—NSAIDs, salicylates, estrogens

Drug/Herb

Increase: antihypertensive effect—hawthorn

Drug/Lab Test

Increase: renal studies

Decrease: Hgb/Hct/RBC

NURSING CONSIDERATIONS

Assess:

 Monitor closely; usually given with β -blocker to prevent tachycardia and increased myocardial workload; usually given with diuretic to prevent serious fluid accumulation; patient should be hospitalized during beginning treatment

- Nausea, edema in feet, legs daily
- Skin turgor, dryness of mucous membranes for hydration status
- Crackles, dyspnea, orthopnea
- Electrolytes: potassium, sodium, chloride, CO_2
- Renal studies: catecholamines, BUN, creatinine
- Hepatic studies: AST, ALT, alk phos
- B/P, pulse
- Weight daily, I&O

Perform/provide:

- Storage protected from light and heat

Evaluate:

- Therapeutic response: decreased B/P, increased hair growth

Teach patient/family:

- That body hair will increase but is reversible after discontinuing treatment
- Not to discontinue product abruptly
- To report pitting edema, dizziness, weight gain >5 lb, SOB, bruising or bleeding, heart rate >20 beats/min over normal, severe indigestion, dizziness, lightheadedness, panting, new or aggravated symptoms of angina
- To take product exactly as prescribed because serious side effects may occur

Topical

- That for topical use, treatment must continue for the long term, or new hair will be lost
- Not to use except on scalp

TREATMENT OF OVERDOSE:

Administer normal saline IV, vasopressors

Nurse Alert

mirtazapine (Rx)

(mer-ta'za-peen)

Remeron, Remeron Soltab

Func. class.: Antidepressant

Chem. class.: Tetracyclic

ACTION:

Blocks reuptake of norepinephrine and serotonin into nerve endings, thereby increasing action of norepinephrine and serotonin in nerve cells; antagonist of central α_2 -receptors; blocks histamine receptors

USES:

Depression; dysthymic disorder; bipolar disorder: depressed, agitated depression

Unlabeled uses: Resting tremor, benign familial tremor, levodopa-induced dyskinesias, pruritus

CONTRAINDICATIONS:

Hypersensitivity to tricyclics, recovery phase of MI, agranulocytosis, jaundice

Precautions: Pregnancy (C), geriatric patients, suicidal patients, severe depression, increased intraocular pressure, closed-angle glaucoma, urinary retention, cardiac/renal/hepatic disease, hypo/hyperthyroidism, electroshock therapy, elective surgery, seizure disorder, bone marrow suppression, thrombocytopenia.

Black Box Warning:

Suicidal ideation, children

DOSAGE AND ROUTES

Calculator

- **Adult: PO** 15 mg/day at bedtime, maintenance to continue for 6 mo, titrate up to 45 mg/day; **ORALLY DISINTEGRATING** tabs: open blister pack, place tab on tongue, allow to disintegrate, swallow
- **Geriatric: PO** 7.5 mg at bedtime, increase by 7.5 mg q1-2wk to desired dose, max 45 mg/day

Resting tremor/benign familial tremor/levodopa-induced dyskinesias (unlabeled)

- **Adult: PO** titrate up to 30 mg at bedtime

Pruritus (unlabeled)

- **Adult: PO** 15-30 mg/day

Available forms: Tabs 7.5, 15, 30, 45 mg; orally disintegrating tab (Soltab) 15, 30, 45 mg

Administer:

- Increased fluids, bulk in diet for constipation, especially for geriatric patients
- With food, milk for GI symptoms
- Dosage at bedtime if oversedation occurs during day; may take entire dose at bedtime; geriatric patients may not tolerate once daily dosing • Gum, hard candy, or frequent sips of water for dry mouth
- **Orally disintegrating tab:** no water needed; allow to dissolve on tongue, do not split

SIDE EFFECTS

CNS: *Dizziness, drowsiness, confusion, headache, anxiety, tremors, stimulation, weakness, nightmares, EPS (geriatric patients), increased psychiatric symptoms, seizures*

CV: *Orthostatic hypotension, ECG changes, tachycardia, hypertension, palpitations*

EENT: *Blurred vision, tinnitus, mydriasis*

GI: *Diarrhea, dry mouth, nausea, vomiting, paralytic ileus, increased appetite, cramps, epigastric distress, constipation, jaundice, hepatitis, stomatitis, weight gain*

GU: *Urinary retention, acute renal failure*

HEMA: *Agranulocytosis, thrombocytopenia, eosinophilia, leukopenia*

INTEG: *Rash, urticaria, sweating, pruritus, photosensitivity*

SYST: *Flulike symptoms, increased cholesterol levels*

PHARMACOKINETICS

PO: Peak 2 hr, metabolized by CYP1A2, 2D6, 3A4 in liver; excreted in urine, feces; crosses placenta; half-life 20-40 hr, protein binding 85%

INTERACTIONS

 **Increase:** hyperpyretic crisis, seizures, hypertensive episode—MAOIs

Increase: CNS depression—alcohol, barbiturates, benzodiazepines, other CNS depressants

Increase: serotonin syndrome—SSRIs, SNRIs, serotonin-receptor agonists, fenfluramine, dexfenfluramine, sibutramine, nefazodone

Decrease: effects of cloNIDine, indirect-acting sympathomimetics (ePHEDrine)

Drug/Herb

• **Serotonin syndrome: St. John's wort**

Increase: CNS depression—kava

Drug/Lab Test

Increase: serum bilirubin, blood glucose, alk phos

Decrease: VMA, 5-HIAA

False increase: urinary catecholamines

NURSING CONSIDERATIONS

Assess:

- B/P (lying, standing), pulse q4hr; if systolic B/P drops 20 mm Hg, hold product, notify prescriber; vital signs q4hr in patients with CV disease • Blood studies: CBC, leukocytes, differential, cardiac enzymes, lipid profile, blood glucose if patient is receiving long-term therapy • Hepatic studies: AST, ALT, bilirubin, creatinine
- Weight weekly; appetite may increase with product
- **ECG for flattening of T wave, bundle branch block, AV block, dysrhythmias in cardiac patients**

Black Box Warning:

Mental status: mood, sensorium, affect, suicidal tendencies (especially among adolescents, young adults), increase in psychiatric symptoms: depression, panic; EPS primarily in geriatric patients: rigidity, dystonia, akathisia

⚠ Serotonin syndrome: hyperthermia, hypertension, myoclonus, rigidity, delirium, coma; if using other serotonergic products • **Alcohol consumption;** if alcohol consumed, hold dose until morning

Perform/provide:

- Storage in tight container at room temp; do not freeze
- Assistance with ambulation during beginning therapy, since drowsiness, dizziness occurs

Evaluate:

- Therapeutic response: decreased depression

Teach patient/family:

- That therapeutic effects may take 2-3 wk; to take at bedtime; that there is decreased sedation with increased doses
- To use caution when driving, performing other activities requiring alertness because of drowsiness, dizziness, blurred vision
- To avoid alcohol, other CNS depressants
- About how to take orally disintegrating tabs; dissolve on tongue, swallow
- Not to use within 14 days of MAOIs

Black Box Warning:

To notify prescriber of suicidal thoughts, behavior

TREATMENT OF OVERDOSE:

ECG monitoring, lavage, activated charcoal; administer anticonvulsant, IV fluids

☼ Canada only Side effects: *italics* = common; **bold** = life-threatening ⚠

Nurse Alert

misoprostol (Rx)

(mye-soe-prost'ole)

Cytotec

Func. class.: Gastric mucosa protectant, antiulcer

Chem. class.: Prostaglandin E₁ analog

Do not confuse: **misoprostol**/metoprolol

Cytotec/Cytosan

ACTION:

Inhibits gastric acid secretion; may protect gastric mucosa; can increase bicarbonate, mucus production

USES:

Prevention of NSAID-induced gastric ulcers

Unlabeled uses: Pregnancy termination, postpartum hemorrhage, cervical ripening/labor induction (vaginal), active duodenal/gastric ulcer, kidney transplant rejection prophylaxis

CONTRAINDICATIONS:

Hypersensitivity to this product or prostaglandins

Black Box Warning:

Pregnancy (X), females

Precautions: Breastfeeding, children, geriatric patients, renal/CV disease, abnormal fetal position, cardiac/renal/inflammatory bowel disease, C-section, dehydration, diarrhea, fever, ectopic pregnancy, fetal distress, sepsis, vaginal bleeding

DOSAGE AND ROUTES

Calculator

- **Adult: PO** 200 mcg qid with food for duration of NSAID therapy, with last dose given at bedtime; if 200 mcg is not tolerated, 100 mcg may be given

Active duodenal/gastric ulcer (unlabeled)

- **Adult: PO** 100-200 mcg qid with meals at bedtime × 4-8 wk

Pregnancy termination prior to 63rd day (unlabeled)

- **Adult: INTRAVAGINALLY** 800 mcg 5-7 days after methotrexate IM
Cervical ripening induction for term pregnancy (unlabeled)

- **Adult: INTRAVAGINALLY** 25 mcg q3-6hr

Available forms: Tabs 100, 200 mcg

Administer:

- PO with meals for prolonged product effect; avoid use of magnesium antacids

SIDE EFFECTS

GI: *Diarrhea*, nausea, vomiting, flatulence, constipation, dyspepsia, abdominal pain

GU: Spotting, cramps, hypermenorrhea, menstrual disorders

PHARMACOKINETICS

PO: Peak 12 min, plasma steady state achieved within 2 days, excreted in urine

INTERACTIONS

Drug/Food

Decrease: maximum concentrations when taken with food

NURSING CONSIDERATIONS

Assess:

- **NSAID-induced ulcer prophylaxis:** monitor GI symptoms (hematemesis, occult or frank blood in stools, gastric aspirate, cramping, severe diarrhea)

Black Box Warning:

Pregnancy (X): Obtain a negative pregnancy test; miscarriages are common

Perform/provide:

- Storage at room temp

Evaluate:

- Therapeutic response: absence of pain or GI complaints; prevention of ulcers

Teach patient/family:

- To take only as directed; to read patient information leaflet

Black Box Warning:

Not to take if pregnant (can cause miscarriage) (X); not to become pregnant while taking product; if pregnancy occurs during therapy, discontinue product, notify prescriber; not to breastfeed

- Not to give product to anyone else or to take for more than 4 wk unless directed by prescriber • To avoid OTC preparations: aspirin, cough, cold

products; condition may worsen

🍁 Canada only Side effects: *italics* = common; **bold** = life-threatening ⚠️
Nurse Alert

HIGH ALERT

mitoMYcin (Rx)

(mye-toe-mye'sin)

Mitosol

Func. class.: Antineoplastic, antibiotic

Do not confuse: mitoMYcin/mithramycin/mitotane/mitoXANtrone

ACTION:

Inhibits DNA synthesis, primarily; derived from *Streptomyces caespitosus*; appears to cause cross-linking of DNA; vesicant

USES:

Pancreatic, stomach, colorectal, bladder cancer

Unlabeled uses: Palliative treatment of anal, bladder, head, neck, colon, breast, biliary, cervical, lung malignancies; bone marrow ablation, desmoid tumor, mesothelioma, stem cell transplant preparation

CONTRAINDICATIONS:

Pregnancy (D) 1st trimester, breastfeeding, hypersensitivity, as single agent, coagulation disorders

Black Box Warning:

Thrombocytopenia

Precautions: Accidental exposure, acute bronchospasm, anemia, children, dental disease/work, extravasation, females, infection, radiation therapy, surgery, vaccines, renal/respiratory disease

Black Box Warning:

Bone marrow suppression, hemolytic-uremic syndrome

DOSAGE AND ROUTES

Calculator

• **Adult:** IV 20 mg/m² q6-8wk

Available forms: Inj 5, 20, 40 mg/vial

Administer:

Direct IV route

- Use port, or central line if possible
- Antiemetic 30-60 min before product to prevent vomiting
- IV after diluting 5 mg/10 ml, 20 mg/ 40 ml, 40 mg/80 ml (0.5 mg/ml) sterile water for inj; shake, allow to stand, give through Y-tube or 3-way stopcock; give slow IV push or infuse over 15-30 min; color of reconstituted sol is gray
- Avoid excessive heat, store reconstituted product in refrigerator, discard after 2 wk, store unreconstituted product at room temp

Y-site compatibilities: Amifostine, amphotericin B lipid complex, amphotericin B liposome, anidulafungin, argatroban, atenolol, bivalirudin, bleomycin, caspofungin, CISplatin, cyclophosphamide, DACTINomycin, dolasteron, DOXOrubicin, droperidol, epirubicin, ertapenem, fluorouracil, furosemide, granisetron, heparin, leucovorin, melphalan, methotrexate, metoclopramide, nesiritide, octreotide, ondansetron, oxaliplatin, PACLitaxel, palonosetron, PEMEtrexed, riTUXimab, teniposide, thiotepe, tigecycline, tirofiban, trastuzumab, vinBLAStine, vinCRISStine, voriconazole, zoledronic acid

SIDE EFFECTS

CNS: Fever, headache, confusion, drowsiness, syncope, fatigue

EENT: Blurred vision

GI: Nausea, vomiting, anorexia, stomatitis, **hepatotoxicity**, diarrhea

GU: Urinary retention, **renal failure**, edema

HEMA: **Thrombocytopenia, leukopenia, anemia**

INTEG: Rash, alopecia, **extravasation**, nail discoloration

MISC: **Hemolytic uremic syndrome, CHF**

RESP: **Fibrosis, pulmonary infiltrate**, dyspnea

PHARMACOKINETICS

Half-life 1 hr, metabolized in liver, 10% excreted in urine (unchanged)

INTERACTIONS

Increase: toxicity—other antineoplastics, radiation

Increase: bleeding risk—NSAIDs, anticoagulants

- Avoid use with vaccines

Drug/Herb

- Avoid use with black cohosh

NURSING CONSIDERATIONS

Assess:

Black Box Warning:

Bone marrow suppression: CBC, differential, platelet count weekly; withhold product if WBC is $<4000/\text{mm}^3$, serum creatinine $>1.7 \text{ mg/dl}$, or platelet count is $<100,000/\text{mm}^3$; notify prescriber; bleeding: hematuria, guaiac, bruising, petechiae, mucosa or orifices

Black Box Warning:

Fatal hemolytic-uremic syndrome: hypertension, thrombocytopenia, microangiopathic hemolytic anemia; occurs in those receiving long-term therapy

- Renal studies: BUN, serum uric acid, urine CCr, electrolytes before, during therapy, adjust dose based on renal function • I&O ratio; report fall in urine output to $<30 \text{ ml/hr}$
- Monitor temp q4hr; fever may indicate beginning infection
- Hepatic studies before, during therapy: bilirubin, AST, ALT, alk phos as needed or monthly; check for jaundiced skin and sclera, dark urine, clay-colored stools, itchy skin, abdominal pain, fever, diarrhea
- **Pulmonary fibrosis:** bronchospasm, dyspnea, crackles, unproductive cough; chest pain, tachypnea, fatigue, increased pulse, pallor, lethargy; pulmonary function tests; chest x-ray before, during therapy; chest x-ray should be obtained q2wk during treatment
- Effects of alopecia on body image; discuss feelings about body changes
- Buccal cavity q8hr for dryness, sores, ulceration, white patches, oral pain, bleeding, dysphagia • Local irritation, pain, burning at inj site
- GI symptoms: frequency of stools, cramping

Perform/provide:

- Adequate fluids 2-3 L/day unless contraindicated
- Rinsing of mouth tid-qid with water; brushing of teeth with baking soda bid-tid with soft brush or cotton-tipped applicators for stomatitis; use unwaxed dental floss

Evaluate:

- Therapeutic response: decreased tumor size, spread of malignancy

Teach patient/family:

- That hair may be lost during treatment; that wig or hairpiece may make patient feel better; that new hair may be different in color, texture • To avoid foods with citric acid, hot or rough texture

- To report any bleeding, white spots, ulcerations in mouth; to examine mouth daily
 - To report sign of IV site reaction, redness, inflammation, burning, pain
 - To avoid crowds, persons with infections if granulocyte count is low
 - **Infection:** report fever, flulike symptoms, sore throat
 - To immediately report urine retention, absence of urine, dyspnea, bleeding, jaundice, signs of pulmonary toxicity • To report if pregnancy is planned or suspected; pregnancy (D) 1st trimester, do not breastfeed
-

🍁 Canada only Side effects: *italics* = common; **bold** = life-threatening ⚠️
Nurse Alert

HIGH ALERT

mitoXANtrone (Rx)

(mye-toe-zan'trone)

Func. class.: Antineoplastic, antiinfective, immunomodulator *Chem. class.:* Synthetic anthraquinone

Do not confuse: mitoXANtrone/mitoMYcin/mithramycin/mitotane

ACTION:

DNA reactive agent; cytocidal effect on both proliferating and nonproliferating cells; topoisomerase II inhibitor (vesicant)

USES:

Acute myelogenous leukemia (adult), relapsed leukemia; used with steroids to treat bone pain (advanced prostate cancer), multiple sclerosis (MS)

Unlabeled uses: Liver malignancies, non-Hodgkin's lymphoma, breast cancer, ALL, bone marrow ablation, CLL, hepatocellular cancer, ovarian cancer, pleural effusion, stem cell transplant preparation

CONTRAINDICATIONS:

Pregnancy (D), hypersensitivity

Precautions: Breastfeeding, children; myelosuppression, renal/cardiac/hepatic disease; gout

Black Box Warning:

Secondary malignancy, neutropenia, intrathecal administration, extravasation, heart failure

DOSAGE AND ROUTES

Calculator

Acute myelogenous leukemia/induction

- **Adult:** IV INF 12 mg/m²/day on days 1-3 and 100 mg/m² cytarabine × 7 days as continuous 24-hr inf

Consolidation

- **Adult:** IV 12 mg/m² given as short 5-to 15-min inf for 2 days with cytarabine × 5 days

Advanced prostate cancer

- **Adult:** IV 12-14 mg/m² as single dose or short inf q21days

Multiple sclerosis, relapsing

- **Adult: IV INF** 12 mg/m² as 5-to 15-min inf q3mo, cumulative lifetime dose 140 mg/m²

Available forms: Inj 2, 10, 12.5, 15 mg/ml

Administer:

- Other medications by oral route if possible; avoid IM, SUBCUT, IV routes
- Antiemetic 30-60 min before product to prevent vomiting

Direct IV route

- IV after diluting with ≥50 ml NS or D₅W; give over 3-5 min into running IV of D₅W or NS; check for extravasation; do not give IM, SUBCUT, or intraarterially

Intermittent IV INF route

- May be diluted further in D₅W, NS, run over 15-30 min

Continuous IV INF route

- Give over 24 hr

Y-site compatibilities: Acyclovir, alemtuzumab, alfentanil, allopurinol, amikacin, aminocaproic acid, aminophylline, amiodarone, anidulafungin, argatroban, atracurium, bivalirudin, bleomycin, bretylium, bumetanide, buprenorphine, butorphanol, calcium chloride, calcium gluconate, CARBOplatin, carmustine, caspofungin, cefoTETan, ceftizoxime, chloramphenicol, chlorproMAZINE, cimetidine, ciprofloxacin, cisatracurium, CISplatin, cladribine, codeine, cyclophosphamide, cycloSPORINE, cytarabine, DACTINomycin, DAPTOmycin, DAUNOrubicin citrate liposome, dexmedetomidine, dexrazoxane, diltiazem, diphenhydrAMINE, DOBUTamine, DOCEtaxel, dolasetron, DOPamine, doxacurium, doxycycline, droperidol, enalaprilat, ePHEDrine, EPINEPHrine, erythromycin, esmolol, etoposide, etoposide phosphate, famotidine, fenoldopam, fentaNYL, filgrastim, fluconazole, fludarabine, fluorouracil, ganciclovir, gatifloxacin, gemcitabine, gentamicin, glycopyrrolate, granisetron, haloperidol, hydrALAZINE, hydrocortisone sodium succinate, HYDROmorphine, hydrOXYzine, ifosfamide, imipenem-cilastatin, inamrinone, insulin regular, irinotecan, isoproterenol, ketorolac, labetalol, leucovorin, levofloxacin, levorphanol, lidocaine, linezolid, LORazepam, magnesium sulfate, mannitol, melphalan, meperidine, meropenem, mesna, metaraminol, methohexital, methotrexate, methyl dopate,

metoclopramide, metoprolol, metroNIDAZOLE, midazolam, milrinone, minocycline, mivacurium, morphine sulfate, nalbuphine, naloxone, nesiritide, niCARdipine, nitroglycerin, norepinephrine, octreotide, ondansetron, oxaliplatin, palonosetron, pamidronate, pancuronium, pentamidine, pentazocine, PENTObarbital, PHENObarbital, phentolamine, phenylephrine, polymyxin b, potassium acetate, potassium chloride, procainamide, prochlorperazine, promethazine hydrochloride, propranolol, quiNIDine gluconate, quinupristin-dalfopristin, ranitidine, remifentanyl, riTUXimab, rocuronium, sargramostim, sodium acetate, sodium bicarbonate, succinylcholine, SUFentanyl, sulfamethoxazole-trimethoprim, tacrolimus, teniposide, theophylline, thiopental, thiotepa, tigecycline, tirofiban, tobramycin, tolazoline, trastuzumab, trimethobenzamide, vancomycin, vasopressin, vecuronium, verapamil, vinCRIStine, vinorelbine, zidovudine, zoledronic acid

SIDE EFFECTS

CNS: Headache, **seizures**, fatigue

CV: **CHF**, **cardiopathy**, **dysrhythmias**

EENT: Conjunctivitis, blue/green sclera, blurred vision

GI: *Nausea, vomiting, diarrhea, anorexia, mucositis*, **hepatotoxicity**, abdominal pain, constipation, jaundice

GU: Amenorrhea, menstrual disorders

HEMA: **Thrombocytopenia**, **leukopenia**, **myelosuppression**, **anemia**, **secondary leukemia**

INTEG: *Rash, necrosis at inj site*, dermatitis, thrombophlebitis at inj site, alopecia

MISC: Fever, hyperuricemia, infections

RESP: Cough, dyspnea

SYST: **Tumor lysis syndrome**, **sepsis**

PHARMACOKINETICS

Protein binding 78%; metabolized in liver; excreted via renal, hepatobiliary systems; half-life 23-215 hr

INTERACTIONS

Increase: bone marrow depression toxicity—radiation, other antineoplastics

Increase: adverse reactions—live virus vaccines, trastuzumab

Increase: bleeding risk—NSAIDs, anticoagulants

Increase: mitoXANtrone effects of—digoxin, phenytoin

Drug/Lab Test

Increase: LFTs, uric acid

Decrease: HcT/Hgb, platelets, WBC

NURSING CONSIDERATIONS

Assess:

- CBC, differential, platelet count weekly; withhold product if WBC is $<1500/\text{mm}^3$; leukopenia, neutropenia, thrombocytopenia are expected, leukocyte nadir 10-14 days, recovers in 2-3 wk
- **Hepatotoxicity:** hepatic studies before, during therapy: bilirubin, AST, ALT, alk phos prn or monthly; dose reduction needed with hepatic disease; jaundiced skin and sclera, dark urine, clay-colored stools, itchy skin, abdominal pain, fever, diarrhea
- Renal studies: BUN, serum uric acid, urine CCr, electrolytes before, during therapy
- Bleeding, hematuria, guaiac, bruising or petechiae, mucosa or orifices q8hr

Black Box Warning:

ECG, ECHO, chest x-ray, MUGA, RAI angiography; assess ejection fraction before and during treatment; cardiotoxic may develop during treatment or months to years after treatment; use vigilant cardiac monitoring in MS

Black Box Warning:

Secondary acute myelogenous leukemia (AML) that can develop after taking this product

Black Box Warning:

Multiple sclerosis: obtain MUGA, LVEF baselines; repeat LVEF if symptoms of CHF occur or if cumulative dose is $>100 \text{ mg}/\text{m}^2$; do not administer to patients who have received lifetime dose of $\geq 140 \text{ mg}/\text{m}^2$ or if LVEF $<50\%$ or significant LVEF

- Obtain pregnancy test for all women of childbearing age, even if birth control is used

Perform/provide:

- Rinsing of mouth tid-qid with water, club soda; brushing of teeth bid-qid with soft brush or cotton-tipped applicators for stomatitis; use unwaxed dental floss
- Increased fluids to 2-3 L/day unless contraindicated

Evaluate:

- Therapeutic response: decreased tumor size, spread of malignancy

Teach patient/family:

- To immediately report bleeding, dyspnea, possible infections, seizure, jaundice, fever, cough, or dyspnea
- To avoid hot foods or those with citric acid, rough texture
- To report any bleeding, white spots, ulcerations in mouth; to examine mouth daily
- To avoid crowds, persons with infections
- That sclera, urine may turn blue or green; that hair loss may occur

Black Box Warning:

To notify prescriber if pregnancy is suspected or planned; to use effective contraception

🍁 Canada only Side effects: *italics* = common; **bold** = life-threatening ⚠️
Nurse Alert

modafinil (Rx)

(mo-daf'i-nil)

Alertec , Provigil

Func. class.: CNS stimulant

Chem. class.: Racemic compound

Controlled Substance IV

ACTION:

Similar action as that of sympathomimetics; does not alter release of dopamine, norepinephrine

USES:

Narcolepsy, shift-work sleep disturbance, obstructive sleep apnea

Unlabeled uses: Fatigue in MS, ADHD

CONTRAINDICATIONS:

Hypersensitivity, ischemic heart disease, left ventricular hypertrophy, chest pain, dysrhythmias

Precautions: Pregnancy (C), breastfeeding, child <16 yr, geriatric patients, unstable angina, history of MI, severe hepatic disease

DOSAGE AND ROUTES

Calculator

To improve wakefulness with daytime sleepiness

- **Adult and adolescent ≥16 yr: PO** 200 mg daily

Hepatic dose (severe hepatic disease)

- **Adult: PO** 100 mg daily

Multiple sclerosis (unlabeled)

- **Adult/geriatric/adolescents ≥6 yr: PO** 200-400 mg daily in the AM

Available forms: Tabs 100, 200 mg

Administer:

- Give 1 hr before start of shift work or in AM for those with narcolepsy or sleep apnea

SIDE EFFECTS

CNS: *Headache*, anxiety, cataplexy, depression, dizziness, insomnia, amnesia, confusion, ataxia, tremors, paresthesia, dyskinesia, **suicidal ideation**

CV: Dysrhythmias, hypo/hypertension, chest pain, vasodilation

EENT: Change in vision, *rhinitis*, pharyngitis, epistaxis

GI: Nausea, vomiting, changes in LFTs, anorexia, diarrhea, thirst, mouth ulcers

GU: Ejaculation disorder, urinary retention, albuminuria

HEMA: Eosinophilia

INTEG: Rash, dry skin, herpes simplex, **Stevens-Johnson syndrome**

MISC: Infection, hyperglycemia, neck pain

RESP: *Dyspnea*, lung changes

PHARMACOKINETICS

Absorbed rapidly, 60% protein binding, metabolized by the liver (90%), half-life 15 hr, peak 2-4 hr

INTERACTIONS

Increase: Altered levels of CYP3A4 inhibitors (azole antibiotics some SSRIs), reaction difficult to predict

Increase: levels of CYP2C19 substrates (diazepam, phenytoin some tricyclics)

Decrease: effects of—cycloSPORINE, hormonal contraceptives, theophylline, estrogens

Delayed effect modafinil by 1 hr: methylphenidate

Altered: Levels of CYP3A4 inducers (carBAMazepine, phenytoin, rifampin, cycloSPORINE, theophylline)

Drug/Herb

Increase: stimulation—cola nut, guarana, yerba maté, coffee, tea

Drug/Lab Test

Increase: LFTs, glucose, eosinophils

NURSING CONSIDERATIONS

Assess:

- Narcolepsy, shift work, history of sleep apnea
- Depression, suicidal ideation
- Monitor B/P in those with hypertension

Perform/provide:

- Storage at room temp

Evaluate:

- Ability to stay awake

Teach patient/family:

- To take only as directed; that product may be taken with/without food
 - To use other form of contraception during and for ≥ 30 days after discontinuing medication if using hormonal birth control; to notify prescriber if pregnancy is planned or suspected or if breastfeeding
 - To notify prescriber of allergic reaction, tremors, confusion
 - To avoid all OTC medications unless approved by prescriber
 - To avoid hazardous activities until drug effect is known
-

🍁 Canada only Side effects: *italics* = common; **bold** = life-threatening ⚠️

Nurse Alert

montelukast (Rx)

(mon-teh-loo'kast)

Singulair

Func. class.: Bronchodilator

Chem. class.: Leukotriene receptor antagonist, cysteinyl

ACTION:

Inhibits leukotriene (LTD₄) formation; leukotrienes exert their effects by increasing neutrophil, eosinophil migration; aggregation of neutrophils, monocytes; smooth muscle contraction, capillary permeability; these actions further lead to bronchoconstriction, inflammation, edema

USES:

Chronic asthma in adults and children, seasonal allergic rhinitis, bronchospasm prophylaxis

CONTRAINDICATIONS:

Hypersensitivity

Precautions: Pregnancy (B), breastfeeding, children <6 yr, acute attacks of asthma, alcohol consumption, severe hepatic disease, corticosteroid withdrawal, phenylketonuria

DOSAGE AND ROUTES

Calculator

- **Adult and child ≥15 yr: PO** 10 mg/day in PM
- **Child 6-14 yr: PO** 5-mg chew tab/day in PM
- **Child 2-5 yr: PO** (chew tab/granules) 4 mg/day

Asthma

- **Child 12-23 mo: PO** 1 packet (4 mg) granules taken in PM

Exercise-induced bronchoconstriction

- **Adult/child ≥6 yr: PO** 10 mg 2 hr before exercise; do not take another dose within 24 hr

Available forms: Tabs 10 mg; chew tabs 4, 5 mg; oral granules 4 mg/packet

Administer:

PO route

- In PM daily for all uses except exercise-induced bronchoconstriction; then take 2 hr before exercise
- Granules directly in mouth or mixed with spoonful of soft food (carrots, applesauce, ice cream, rice)
- Do not open granules packet until ready to use; mix whole dose; give within 15 min

SIDE EFFECTS

CNS: *Dizziness, fatigue, headache*, behavior changes, hallucinations, **seizures**, agitation, anxiety, depression, fever, drowsiness

GI: *Abdominal pain*, dyspepsia, nausea, vomiting, diarrhea, **pancreatitis**

HEMA: **Thrombocytopenia**

INTEG: Rash, pruritus, erythema

MS: Asthenia, myalgia, muscle cramps

RESP: *Influenza, cough*, nasal congestion

SYST: **Anaphylaxis, angioedema, Churg-Strauss syndrome, Stevens-Johnson syndrome, toxic epidermal necrolysis**

PHARMACOKINETICS

Rapidly absorbed; peak 3-4 hr, chew tab (5 mg) 2-2.5 hr; half-life 2.7-5.5 hr, extended in hepatic disease; protein binding 99%; metabolized by liver; excreted via bile

INTERACTIONS

Increase: adverse reactions of CYP2C8 substrates

Decrease: montelukast levels—barbiturates, rifabutin, rifapentine, carbamazepine, fosphenytoin, phenytoin, rifampin

Drug/Herb

Increase: stimulation—black, green tea, guarana

Drug/Lab Test

Increase: ALT, AST

NURSING CONSIDERATIONS

Assess:

⚠ Churg-Strauss syndrome: rare adult patients carefully for symptoms: eosinophilia, vasculitic rash, worsening pulmonary symptoms, cardiac complications, neuropathy • Allergic reactions: rash, urticaria; product should be

discontinued

⚠️ For behavior changes and suicidal ideation, other neuropsychiatric reactions

• **Severe hepatic disease:** use cautiously

Evaluate:

• Therapeutic response: ability to breathe more easily

Teach patient/family:

• To check OTC medications, current prescription medications for ePHEDrine, which will increase stimulation; to avoid alcohol • To avoid hazardous activities; dizziness may occur

• That product is not to be used for acute asthma attacks

• If aspirin sensitivity is known, not to take NSAIDs while taking this product

• To continue to use inhaled β -agonists if exercise-induced asthma occurs

• **Granules:** to give directly in mouth or mixed in a spoonful of room temperature soft food (use only applesauce, carrots, rice, or ice cream) use within 15 min of opening packets, discard used portions

🍁 Canada only Side effects: *italics* = common; **bold** = life-threatening ⚠️

Nurse Alert

HIGH ALERT

morphine (Rx)

(mor'feen)

Astramorph PF, Avinza, Depo Dur, Infumorph PF, Kadian, M.O.S. , MS Contin, MSIR , Oramorph SR

Func. class.: Opioid analgesic

Chem. class.: Alkaloid

Controlled Substance Schedule II

Do not confuse: **morphine**/HYDROmorphine
MS Contin/oxyCONTIN

ACTION:

Depresses pain impulse transmission at the spinal cord level by interacting with opioid receptors

USES:

Moderate to severe pain

CONTRAINDICATIONS:

Hypersensitivity, addiction (opioid), hemorrhage, bronchial asthma, increased intracranial pressure, paralytic ileus, hypovolemia, shock

Black Box Warning:

Respiratory depression

Precautions: Pregnancy (C), breastfeeding, children <18 yr, geriatric patients, addictive personality, acute MI, severe heart disease, renal/hepatic disease, bowel impaction, abrupt discontinuation

Black Box Warning:

Accidental exposure, epidural/intrathecal administration, opioid-naïve patients, substance abuse

DOSAGE AND ROUTES

Calculator

Acute moderate to severe pain

PO regular-release route

- **Adult ≥50 kg:** Initially, 10–30 mg every 3–4 hr as needed

- **Adult <50 kg/geriatric patients:** Might require lower doses and/or extended dosing intervals; doses should be titrated carefully

- **Child/infant ≥6 mo:** 0.2–0.5 mg/kg every 4–6 hr as needed

- **Infants <6 mo/neonate: PO** 0.1 mg/kg every 3–4 hr

IV/IM/SUBCUT route

- **Adult ≥50 kg:** 2.5–15 mg every 2–6 hr as needed, titrate; or a loading dose of 0.05–0.1 mg/kg IV, followed by 0.8–10 mg/hr IV, titrate

- **Adult <50 kg/geriatric patients:** Might require lower doses and/or extended dosing intervals 0.1 mg/kg every 3–4 hr, titrate

- **Child/infant ≥6 mo:** 0.05–0.2 mg/kg every 2–4 hr, titrate to relief; max initial dose 15 mg/dose

- **Infants <6 mo/neonate:** 0.03–0.05 mg/kg every 3–8 hr, titrate to relief

Epidural (morphine sulfate injection, but not DepoDur)

- **Adult:** Initially, 5 mg in the lumbar region; if pain relief does not occur in 1 hr, give 1–2 mg epidurally; max 10 mg/24 hr; **continuous epidural infusion** 2–4 mg/24 hr; may give another 1–2 mg

Intrathecal route (morphine sulfate injection, but not DepoDur)

- Do not inject >2 ml of the 0.5 mg/ml or 1 ml of the 1 mg/ml ampule

- **Adult:** 0.2–1 mg in the lumbar area as a single dose or to establish dosage for continuous intrathecal infusion; repeated injections are not recommended

Rectal route

- **Adult: PR** 10–20 mg every 4 hr, as needed

- **Child:** Individualize

Chronic moderate and severe pain:

⚠ Do not use extended-release cap or tab as prn analgesics, for acute pain, or if the pain is mild or not expected to persist for an extended period of time; use for postoperative pain only if the patient is receiving chronic opioid therapy before surgery or if the postoperative pain is expected to be moderate to severe and expected to persist for an extended period of time; do not use controlled-release tablets (MS Contin) immediately after surgery (for the first 24 hr) in patients not previously taking the drug ⚠ Do not use in opioid-naïve patients: 90 mg, 120 mg morphine biphasic-release capsules (AVINza); 100 mg, 130 mg, 150 mg, 200 mg morphine extended-release capsules (Kadian), 100 mg, 200 mg morphine control-release tablets (MS Contin); patients considered opioid tolerant are those who are taking at least 60 mg/day oral morphine, 30 mg/day oral OxyCODONE, 8 mg/day oral HYDROMorphone, or an equal dose of another opioid, for 1 wk

or longer

PO (extended-release tab [MS contin, oramorph SR] or caps [kadian, avinza]) (opiate)

- **Adult:** 15–30 mg every 12 hr (tabs); 10 mg bid or 20 mg every day (Kadian); or 30 mg every day (AVINza), titrate; AVINza should be adjusted in increments ≤ 30 mg every 4 days; Kadian should be increased ≤ 20 mg every 1–2 days, taper gradually; to discontinue, gradually decrease AVINza and Kadian every 2–4 days

- **Child (unlabeled):** 0.3–0.6 mg/kg every 12 hr (tabs)

IV/SUBCUT route (opiate)

- **Adult: IV** 2–10 mg loading dose, then 0.8–10 mg/hour IV, titrate; maintenance 0.8–80 mg/hour IV

- **Children/infants ≥ 6 mo: IV** Initially, 0.04–0.07 mg/kg/hr (range: 0.025–2.6 mg/kg/hr)

- **Subcut infusion** 0.025–1.79 mg/kg/hour

- **Infants < 6 mo/neonate: IV** 0.01 mg/kg/hour initially; infusion rates max 0.015–0.02 mg/kg/hour IV

Breakthrough pain in patients receiving long-acting or continuous-infusion morphine

PO (regular-release) route

- **Adult/child:** The dose is usually 1/4 to 1/3 the 8-to 12-hour extended-release dose every 4–6 hr as needed

- **Adult/child:** For PCA, intermittent dosage is usually 25%–30% of the hourly rate IV/SC every 6–15 min as needed; intermittent IV injection dosage is 25%–30% of the hourly rate given IV/SC every 1–2 hr as needed

Available forms: Inj 0.5, 1, 2, 4, 5, 8, 10, 15, 25, 50 mg/ml; oral sol 10, 20 mg/5 ml, 10 mg/0.5 ml, 100 mg/5 ml; oral tabs 15, 30 mg; rect supp 5, 10, 20, 30 mg; ext rel tabs 15, 30, 60, 100, 200 mg; cont rel cap pellets (Kadian) 10, 20, 30, 50, 60, 80, 100, 200 mg; ext rel caps (AVINza) 30, 45, 60, 75, 90, 120 mg

Administer:

PO route

- Give with food or milk to minimize GI effects

- Begin with immediate-release products and titrate to correct dose and convert to a sustained-release product • **Immediate-release cap:** May swallow whole, or cap may be opened and contents sprinkled on cool food (pudding or applesauce)

or added to juice; give immediately or delivered via gastric or NG tube by either adding to or following with liquid

- **Extended-release and controlled-release tabs:** Swallow whole; do not crush, break, dissolve, or chew • The use of MS Contin 100 mg or 200 mg tabs should be limited to opioid-tolerant patients requiring oral doses equivalent to ≥ 200 mg/day; use of the 100 mg or 200 mg tablet is only recommended for patients who have already been titrated to a stable analgesic regimen using lower strengths of MS Contin or other opioids • **Sustained-release caps:** Swallow; do not chew, crush, or dissolve; caps may be opened and contents sprinkled on applesauce (at room temperature or cooler) immediately before ingestion; do not chew, crush, or dissolve the pellets/beads inside the cap; the applesauce should be swallowed without chewing; if the pellets/beads are chewed, an immediate release of a potentially fatal morphine dose may be delivered; rinse mouth to ensure all the pellets/beads have been swallowed; do not separate applesauce into separate doses; the entire portion should be taken; discard unused portion
- **Kadian caps:** may be given through a 16-F gastrostomy tube; flush with water, and sprinkle the cap contents into 10 ml of water; using a funnel and a swirling motion, pour the pellets and water into the tube; rinse the beaker with 10 ml of water, and pour the water into the funnel; repeat until no pellets remain in the beaker. **Do not administer AVINza tabs through a gastrostomy tube; do not administer Kadian or AVINza through a nasogastric tube** • Avoid concurrent administration of AVINza with prescription or nonprescription medications that contain alcohol; Consumption of alcohol while taking the extended-release capsules can result in the rapid release and absorption of a potentially fatal dose of morphine • AVINza ≥ 90 mg or Kadian 100 mg, 130 mg, 150 mg, or 200 mg caps are given only to opioid-tolerant patients

Oral liquid

- Check dose before use because many concentrations of oral solution are available; may be diluted in fruit juice, protect from light

Injectable administration

- Visually inspect for particulate matter, discoloration before use, do not use if a precipitate is present after shaking, do not use the Duramorph solution if a precipitate is present or if the color is darker than pale yellow

SUBCUT route

- Inject, taking care not to inject intradermally
- **Continuous SC infusion** Morphine is not approved by the FDA for subcut use; dilute to an appropriate concentration in D₅W, give using a portable, controlled, subcut device; adjust rate based on patient response and tolerance; max subcut rate is 2 ml/hour/site

Intrathecal/epidural route

⚠ Morphine sulfate injection is not interchangeable with morphine sulfate extended-release liposome injection (DepoDur); DepoDur is only for epidural administration ⚠ Do not use Infumorph (10 mg/ml or 25 mg/ml) for single-dose neuraxial injection because lower doses can be more reliably administered with Duramorph (0.5 mg/ml or 1 mg/ml)

Rectal route

- Moisten the suppository with water before insertion; if suppository is too soft, chill in the refrigerator for 30 min or run cold water over it before removing the wrapper

IV route

- Before use, an opiate antagonist and emergency facilities should be available
- ⚠ Do not use the highly concentrated morphine injections (i.e., 10–25 mg/ml) for IV, IM, or SC administration of single doses; these injection solutions are intended for use via continuous, controlled microinfusion devices
- **Direct IV route** Dilute dose with ≥5 ml of sterile water for injection or NS injection; inject 2.5–15 mg directly into a vein or into the tubing of a freely flowing IV solution over 4–5 min, do not give rapidly
- **Continuous IV infusion** Dilute in 5% dextrose, use a controlled-infusion device; adjust dosage and rate based on patient response
- **Patient-controlled analgesia (PCA)** A compatible patient-controlled infusion device must be used; dilute solutions to obtain a concentration of 1 or 10 mg/ml for ease in calculations and programming of PCA pumps; adjust dosage and rate based on patient response; consult the patient-controlled infusion device manual for directions on rate of infusion

Syringe compatibilities: Atropine, bupivacaine, butorphanol, cimetidine, dimenhydrinate, diphenhydramine, droperidol, fentanyl, glycopyrrolate, hydroxyzine, ketamine, metoclopramide, midazolam, milrinone, pentazocine, perphenazine, promazine, ranitidine, scopolamine

Y-site compatibilities: Allopurinol, amifostine, amikacin, aminophylline, amiodarone, ampicillin, ampicillin/sulbactam, amsacrine, atenolol, atracurium, aztreonam, bumetanide, calcium chloride, cefamandole, ceFAZolin, cefmetazole, cefotaxime, cefoTEtan, cefOXitin, cefTAZidime, ceftizoxime, cefTRIAxone, cefuroxime, cephalothin, chloramphenicol, cisatracurium, cladribine, clindamycin, cyclophosphamide, cytarabine, dexamethasone, digoxin, diltiazem, DOBUTamine, DOPamine, doxycycline, enalaprilat, EPINEPHrine, erythromycin, esmolol, etomidate, famotidine, fentaNYL, filgrastim, fluconazole, fludarabine, foscarnet, gentamicin, granisetron, heparin, hydrocortisone, HYDROmorphone, kanamycin, labetalol, lidocaine, LORazepam, magnesium sulfate, melphalan, meropenem, methotrexate, methyldopate, methylPREDNISolone, metoclopramide, metoprolol, metroNIDAZOLE, mezlocillin, midazolam, milrinone, moxalactam, nafcillin, niCARdipine, nitroglycerin, norepinephrine, ondansetron, oxacillin, oxytocin, PACLitaxel, pancuronium, penicillin G potassium, piperacillin, piperacillin/tazobactam, potassium chloride, propranolol, ranitidine, remifentanyl, sodium bicarbonate, teniposide, thiotepa, ticarcillin, ticarcillin/clavulanate, tobramycin, vancomycin, vecuronium, vinorelbine, vit B/C, warfarin, zidovudine

SIDE EFFECTS

CNS: Drowsiness, dizziness, confusion, headache, sedation, euphoria, insomnia, seizures

CV: Palpitations, bradycardia, change in B/P, shock, cardiac arrest, chest pain, hypo/hypertension, edema, tachycardia

EENT: Tinnitus, blurred vision, miosis, diplopia

GI: Nausea, vomiting, anorexia, constipation, cramps, biliary tract pressure

GU: Urinary retention

HEMA: Thrombocytopenia

INTEG: Rash, urticaria, bruising, flushing, diaphoresis, pruritus

RESP: Respiratory depression, respiratory arrest, apnea

PHARMACOKINETICS

PO: Onset variable, peak variable, duration variable

IM: Onset 1/2 hr, peak 50-90 min, duration 3-7 hr

SUBCUT: Onset 15-20 min, peak 50-90 min, duration 3-5 hr

IV: Peak 20 min

RECT: Peak 1/2-1 hr, duration 4-5 hr

Intrathecal: Onset rapid, duration ≤ 24 hr

Metabolized by liver, crosses placenta; excreted in urine, breast milk; half-life 1½-2 hr

INTERACTIONS

• **Unpredictable reaction, avoid use: MAOIs**

Increase: effects with other CNS depressants—alcohol, opiates, sedative/hypnotics, antipsychotics, skeletal muscle relaxants

Decrease: morphine action—rifampin

Drug/Herb

Increase: anticholinergic effect—corkwood

Increase: CNS depression—chamomile, hops, kava, St. John's wort, valerian

Drug/Food

Decrease: morphine effect—cranberry juice (excessive amounts), oats

Drug/Lab Test

Increase: amylase

NURSING CONSIDERATIONS

Assess:

- **Pain:** location, type, character; give dose before pain becomes severe • Bowel status; constipation common, use stimulant laxative if needed
- I&O ratio; check for decreasing output; may indicate urinary retention
- B/P, pulse, respirations (character, depth, rate)
- CNS changes: dizziness, drowsiness, hallucinations, euphoria, LOC, pupil reaction

• **Abrupt discontinuation:** gradually taper to prevent withdrawal symptoms; decrease by 50% q1-2days; avoid use of narcotic antagonists • **Allergic reactions:** rash, urticaria

Black Box Warning:

Accidental exposure: if Duramorph or Infumorph gets on skin, remove contaminated clothing, rinse affected area with water

• **Respiratory dysfunction:** depression, character, rate, rhythm; notify prescriber if respirations are < 12 /min; accidental overdose has occurred with high-potency

oral sols

Perform/provide:

- Storage in light-resistant container at room temp
- Assistance with ambulation
- Safety measures: side rails, night-light, call bell within easy reach
- Gradual withdrawal after long-term use

Evaluate:

- Therapeutic response; decrease in pain intensity

Teach patient/family:

- To change position slowly; orthostatic hypotension may occur
- To report any symptoms of CNS changes, allergic reactions
- That physical dependency may result from long-term use
- To avoid use of alcohol, CNS depressants
- That withdrawal symptoms may occur: nausea, vomiting, cramps, fever, faintness, anorexia

TREATMENT OF OVERDOSE:

Naloxone (Narcan) 0.2-0.8 mg IV, (caution with opioid-tolerant individuals) O₂, IV fluids, vasopressors

☼ Canada only Side effects: *italics* = common; **bold** = life-threatening ⚠
Nurse Alert

moxifloxacin (Rx)

Avelox, Avelox IV

Func. class.: Antiinfective

Chem. class.: Fluoroquinolone

ACTION:

Interferes with conversion of intermediate DNA fragments into high-molecular-weight DNA in bacteria; DNA gyrase inhibitor

USES:

Acute bacterial sinusitis: *Streptococcus pneumoniae*, *Haemophilus influenzae*, *Moraxella catarrhalis*; acute bacterial exacerbation of chronic bronchitis: *S. pneumoniae*, *H. influenzae*, *Haemophilus parainfluenzae*, *Klebsiella pneumoniae*, *Staphylococcus aureus*, *M. catarrhalis*; community-acquired pneumonia: *S. pneumoniae*, *H. influenzae*, *Mycoplasma pneumoniae*, *Chlamydia pneumoniae*, *M. catarrhalis*; uncomplicated skin/skin-structure infections: *S. aureus*, *Streptococcus pyogenes*; complicated intraabdominal infections including polymicrobial infections: *E. coli*, *Bacterioides fragilis*, *S. anginosus*, *S. constellatus*, *Enterococcus faecalis*, *Proteus mirabilis*, *Clostridium perfringens*, *Bacteroides thetaiotaomicron*, *Peptostreptococcus* sp; complicated skin, skin-structure infections caused by methicillin-susceptible: *S. aureus*, *E. coli*, *K. pneumoniae*, *Enterobacter cloacae*

CONTRAINDICATIONS:

Hypersensitivity to quinolones

Precautions: Pregnancy (C), breastfeeding, children, hepatic/cardiac/renal/GI disease, epilepsy, uncorrected hypokalemia, prolonged QT interval; patients receiving class IA, III antidysrhythmics; seizure disorder

Black Box Warning:

Tendon pain, rupture; tendinitis

DOSAGE AND ROUTES

Calculator

Acute bacterial sinusitis

- **Adult:** PO/IV 400 mg q24hr × 10 days

Acute bacterial exacerbation of chronic bronchitis

- **Adult: PO/IV** 400 mg q24hr × 5 days

Community-acquired pneumonia

- **Adult: PO/IV** 400 mg q24hr × 7-14 days

Uncomplicated skin/skin-structure infections

- **Adult: PO/IV** 400 mg q24hr × 7 days

Complicated intraabdominal infections

- **Adult: IV** 400 mg/day × 5-14 days

Complicated skin, skin-structure infections

- **Adult: PO/IV** 400 mg/day × 7-21 days

Available forms: Tabs 400 mg; inj premix 400 mg/250 ml

Administer:**PO route**

- 4 hr before or 8 hr after antacids, zinc, iron, calcium
- Without regard to food
- Store at room temperature

IV route

- Discontinue primary IV while administering moxifloxacin, give over 60 min
- Do not give SUBCUT, IM
- Available as premixed sol; may be diluted at ratios from 1:10 to 10:1; do not refrigerate; give by direct inf or through Y-type inf set; do not add other medications to sol or inf through same IV line at same time • Do not refrigerate
- Flush line with compatible sol before and after use
- Do not admix

Solution compatibilities: 0.9% NaCl, D₅, D₁₀, LR, sterile water for inj

SIDE EFFECTS

CNS: *Headache*, dizziness, fatigue, insomnia, depression, *restlessness*, **seizures**, confusion, **increased intracranial pressure**, peripheral neuropathy, **pseudotumor cerebri**

CV: **Prolonged QT interval**, **dysrhythmias**, **torsades de pointes**, tachycardia

EENT: Blurred vision, tinnitus, taste changes

GI: *Nausea*, *diarrhea*, increased ALT, AST, flatulence, heartburn, *vomiting*, oral

candidiasis, dysphagia, **pseudomembranous colitis**

INTEG: Rash, pruritus, urticaria, photosensitivity, flushing, fever, chills

MS: Tremor, arthralgia, tendinitis, **tendon rupture**, myalgia

SYST: **Anaphylaxis**, **Stevens-Johnson syndrome**

PHARMACOKINETICS

Excreted in urine as active product, metabolites; parent product excreted in urine (20%), feces (25%); terminal half-life PO 12-16 hr, IV 8-15 hr

INTERACTIONS

Increase: moxifloxacin serum levels—probenecid

Increase: warfarin, cycloSPORINE effect

Increase: seizure risk—NSAIDs

Black Box Warning:

Increase: tendon rupture—corticosteroids

Decrease: moxifloxacin absorption—magnesium antacids, aluminum hydroxide, zinc, iron, sucralfate, calcium, enteral feeding, didanosine

NURSING CONSIDERATIONS

Assess:

- CNS symptoms: headache, dizziness, fatigue, insomnia, depression, seizures
- Renal, hepatic studies: BUN, creatinine, AST, ALT
- I&O ratio, urine pH <5.5 is ideal

⚠ Allergic reactions, Stevens-Johnson syndrome, toxic epidermal necrolysis, anaphylaxis: fever, flushing, rash, urticaria, pruritus, sore throat, fatigue, ulcers, other lesions; keep EPINEPHrine, emergency equipment nearby for anaphylaxis

Black Box Warning:

Tendon pain, rupture, tendinitis; if tendon becomes inflamed, product should be discontinued, more common in Achilles tendon

⚠ Cardiac status: prolonged QT or use of products that increase QT prolongation **⚠Pseudomembranous colitis:** assess for diarrhea, abdominal pain, fever, fatigue, anorexia; possible anemia, elevated WBC, low serum albumin; stop product; usually either vancomycin or IV metroNIDAZOLE given

Perform/provide:

- Increased fluids to 3 L/day to avoid crystallization in kidneys

Evaluate:

- Therapeutic response: decreased pain, C&S; absence of infection

Teach patient/family:**Black Box Warning:**

To notify prescriber of tendon pain, inflammation; stop drug

- Not to take any products containing magnesium or calcium (such as antacids), iron, or aluminum with this product or 4 hr before or 8 hr after
- That photosensitivity may occur; to avoid sunlight or use sunscreen to prevent burns
- To use frequent rinsing of mouth, sugarless candy or gum for dry mouth
- To take as prescribed; not to double or miss doses
- If dizziness occurs, to ambulate, perform activities with assistance
- To complete full course of product therapy
- **To contact prescriber if abnormal heart rhythm or seizures occur**

☼ Canada only Side effects: *italics* = common; **bold** = life-threatening ⚠
Nurse Alert

moxifloxacin (ophthalmic)

(mocks-ih-floks'a-sin)

Vigamox, Moxeza

Func. class.: Ophthalmic antiinfective

Chem. class.: Fluoroquinolone

Do not confuse: ciprofloxacin/gatifloxacin/levofloxacin

ACTION:

Inhibits DNA gyrase, thereby decreasing bacterial replication

USES:

Bacterial conjunctivitis (aerobic gram-positive/negative organisms), *Chlamydia trachomatis*

CONTRAINDICATIONS:

Hypersensitivity to this product or fluoroquinolones

Precautions: Pregnancy (C), breastfeeding

DOSAGE AND ROUTES

Calculator

Bacterial conjunctivitis

• **Adult/adolescent/child ≥ 1 yr: Ophthalmic SOL** 1 drop in affected eye(s) bid (Moxeza) or tid (Vigamox) $\times 7$ days

Available forms: Ophthalmic solution 0.5%

Administer:

Ophthalmic route

- Commercially available ophthalmic solutions are not for injection subconjunctivally or into the anterior chamber of the eye • Apply topically to the eye, taking care to avoid contamination
- Do not touch the tip of the dropper to the eye, fingertips, or other surface
- Apply pressure to lacrimal sac for 1 min after instillation
- Avoid wearing contact lenses during treatment

SIDE EFFECTS

EENT: Hypersensitivity, pruritus, blurred vision, tearing

PHARMACOKINETICS

Half-life 13 hr

NURSING CONSIDERATIONS

Assess:

- **Allergic reaction:** Assess for hypersensitivity, discontinue product

Evaluate:

- Decreased ophthalmic infection

Teach patient/family:

Ophthalmic route

- To apply topically to the eye, taking care to avoid contamination
- That product is for ophthalmic use only
- Not to touch the tip of the dropper to the eye, fingertips, or other surface
- To apply pressure to lacrimal sac for 1 min after installation
- To avoid wearing contact lenses during treatment

🍁 Canada only Side effects: *italics* = common; **bold** = life-threatening ⚠️

Nurse Alert

mupirocin (topical, nasal)

(myoo-pihr'oh-sin)

Bactroban, Centany

Func. class.: Topical antiinfective

ACTION:

Antibacterial activity results from inhibition of protein synthesis; bacteriostatic

USES:

Impetigo, skin lesions (*Staphylococcus aureus*/*Streptococcus pyogenes*); nasal: methicillin-resistant *S. aureus*

CONTRAINDICATIONS:

Hypersensitivity to this product

Precautions: Open wounds, burns, severe kidney disease, children

DOSAGE AND ROUTES

Calculator

Impetigo

- **Adult/child: TOP** apply to affected area tid $\times$ 1-2 wk

Skin lesions

- **Adult/child: TOP** apply to affected area tid $\times$ 10 days

Methicillin-resistant *s. aureus* in the nose

- **Adult/child ≥ 12 yr: NASAL** divide ointment in single use tube in half; use in each nostril bid $\times$ 5 days

Available forms: Topical cream, ointment 2%; intranasal ointment 2%

Administer:

Topical route

- Do not use skin products near the eyes, nose, or mouth
- Wash hands before and after use; wash affected area and gently pat dry
- May cover treated areas with gauze dressing

Cream/ointment

- Apply a thin film to the cleansed affected area; massage gently into affected areas

- **Nasal:** Close nostrils by squeezing and releasing and gently massaging over 1 min

SIDE EFFECTS

CNS: Headache

EENT: Burning, rhinitis (nasal)

GI: Taste change

INTEG: Burning, rash, pruritus

INTERACTIONS

Decrease: Effect of other nasal products

NURSING CONSIDERATIONS

Assess:

- **Allergic reaction:** Assess for hypersensitivity, product may need to be discontinued
- **Infection:** Assess for number of lesions, severity in impetigo, other skin disorders

Evaluate:

- Decreased lesions in impetigo, other skin disorders

Teach patient/family:

Topical route

- Not to use skin products near the eyes, nose, or mouth
- To wash hands before and after use and to wash affected area and gently pat dry

• **Cream/Ointment:** To apply a thin film to the cleansed affected area; to cover treated areas with gauze dressing if desired

• **Nasal:** To close nostrils by squeezing and releasing and gently massaging over 1 min

🍁 Canada only Side effects: *italics* = common; **bold** = life-threatening ⚠️
Nurse Alert

mycophenolate mofetil (Rx)

(mye-koe-phen'oh-late)

CellCept, Myfortic

Func. class.: Immunosuppressant

ACTION:

Inhibits inflammatory responses that are mediated by the immune system

USES:

Prophylaxis for organ rejection in allogenic cardiac, hepatic, renal transplants

Unlabeled uses: Refractory uveitis, second-line therapy for Churg-Strauss syndrome, diffuse proliferative lupus nephritis (in combination), rheumatoid arthritis, psoriasis, GVHD, kidney disease, myasthenia gravis, atopic dermatitis

CONTRAINDICATIONS:

Hypersensitivity to this product or mycophenolic acid

Black Box Warning:

Pregnancy (D)

Precautions: Breastfeeding, lymphomas, neutropenia, renal disease, accidental exposure, anemia

Black Box Warning:

Infection, neoplastic disease

DOSAGE AND ROUTES

Calculator

Renal transplant to prevent organ rejection

- **Adult: PO** mycophenolate mofetil 1 g or 720 mg mycophenolate sodium; 1 g or 720 mg bid given to renal transplant patients in combination with corticosteroids, cycloSPORINE

- **Child: PO-ER** 400 mg/m² bid, max 720 mg bid

Renal dose

- **Adult: PO/IV** GFR <25 ml/min, max 2 g/day

Cardiac transplant to prevent organ rejection

- **Adult: PO/IV** 1.5 g bid, **IV** can be started ≤24 hr after transplant, switch to **PO** when able

Hepatic transplant to prevent organ rejection

- **Adult: PO** 1.5 g bid; **IV** 1 g over ≥ 2 hr

Refractory acute kidney transplant rejection (unlabeled)

- **Adult: PO** 1.5 g (Mofetil) bid

Rheumatoid arthritis (unlabeled)

- **Adult: PO** 250 mg-2 g/day (Mofetil)

GVHD (unlabeled)

- **Adult: PO** 2 g/day (Mofetil) with cycloSPORINE and prednisoLONE

Diffuse proliferative lupus nephritis (unlabeled)

- **Adult: PO** 1 g/day (Mofetil)

Uveitis (unlabeled)

- **Adult: PO** 1 g (Mofetil) bid $\times$ 6-41 mo

Atopic dermatitis (unlabeled)

- **Adult: PO** 1 g (Mofetil) bid $\times$ 4 wk, then 500 mg bid $\times$ 4 wk
- **Adolescent/child ≥ 2 yr: PO** 30-50 mg/kg/day (Mofetil) in 2 divided doses

Available forms: Caps 250 mg; tabs 500 mg; inj (powder) 500 mg/20-ml vial; powder for oral susp 200 mg/ml; ext rel tab (Myfortic) 180, 360 mg

Administer:

- May be given in combination with corticosteroids, cycloSPORINE
- Del rel tab, cap, oral susp, tab are not interchangeable

PO route

- Do not break, crush, or chew tabs; do not open caps
- Give at same time each day
- **Avoid inhalation or direct contact with skin, mucous membranes; teratogenic in animals** • **Oral susp:** tap closed bottle several times to loosen powder, use 94 ml of water in graduated cylinder, add 1/2 total amount of water for constitution and shake the closed bottle, add remaining water and shake; again, remove child-resistant cap, push adapter into neck of bottle, close tightly • Give alone for better absorption

Intermittent IV INF route

- Reconstitute each vial with 14 ml D₅W, shake gently, further dilute to 6 mg/ml, dilute 1 g/140 ml D₅W, 1.5 g/210 ml D₅W; give by slow IV inf ≥ 2 hr, never give by bolus or rapid IV inj • Do not give with other medications or sol

Y-site compatibilities: Alemtuzumab, alfentanil, amikacin, anidulafungin,

argatroban, bivalirudin, caspofungin, cefepime, DAPTOmycin, DOPamine, norepinephrine, octreotide, oxytocin, tacrolimus, tigecycline, tirofiban, vancomycin

SIDE EFFECTS

CNS: Tremor, dizziness, insomnia, headache, fever, anxiety, pain, **progressive multifocal leukoencephalopathy**, asthenia, paresthesia

CV: Hypertension, chest pain, hypotension, edema

GI: Diarrhea, constipation, nausea, vomiting, stomatitis, **GI bleeding**, abdominal pain, anorexia, dyspepsia

GU: UTI, hematuria, **renal tubular necrosis**, **polyomavirus-associated nephropathy**

HEMA: Leukopenia, thrombocytopenia, anemia, pancytopenia, pure red cell aplasia, neutropenia

INTEG: Rash

META: Peripheral edema, hypercholesterolemia, hypophosphatemia, edema, hyperkalemia, hypokalemia, hyperglycemia, hypocalcemia, hypomagnesemia

MS: Arthralgia, muscle wasting, back pain, weakness

RESP: Dyspnea, respiratory infection, increased cough, pharyngitis, bronchitis, pneumonia, **plural effusion**, **pulmonary fibrosis**

SYST: **Lymphoma**, nonmelanoma skin carcinoma, **sepsis**

PHARMACOKINETICS

Rapidly and completely absorbed; metabolized to active metabolite (MPA); excreted in urine, feces; protein binding (MPA) 97%; half-life (MPA) 17.9 hr

INTERACTIONS

Increase: bone marrow suppression—azaTHIOprine

• Increased bleeding risk: anticoagulants, NSAIDs, thrombolytics, salicylates

Increase: toxicity—**acyclovir**, **ganciclovir**, **valacyclovir**

Increase: effects of phenytoin, theophylline

Increase: mycophenolate levels—probenecid, immunosuppressives, salicylates

Decrease: mycophenolate levels—antacids (magnesium, aluminum), cholestyramine, cycloSPORINE, rifamycin

Decrease: protein binding of phenytoin, theophylline

Decrease: effect of live attenuated vaccines, oral contraceptives

Drug/Herb

Interference with immunosuppression: astragalus, echinacea, melatonin

Drug/Food

Decrease: absorption if taken with food

Drug/Lab Test

Increase: serum creatinine, BUN

- Abnormal LFTs

NURSING CONSIDERATIONS

Assess:

 **Progressive multifocal leukoencephalopathy**, may be fatal; ataxia, confusion, apathy, hemiparesis, visual problems, weakness; side effects should be reported to FDA • Blood studies: CBC during treatment monthly

- Hepatic studies: alk phos, AST, ALT, bilirubin
- Renal studies: BUN, CCr, electrolytes

Black Box Warning:

Pregnancy test within 1 wk before initiation of treatment; confirm negative pregnancy test

Evaluate:

- Therapeutic response: absence of graft rejection

Teach patient/family:

- To report fever, rash, severe diarrhea, chills, sore throat, fatigue because serious infections may occur
- To reduce risk of infection by avoiding crowds
- About the need for repeated lab tests

Black Box Warning:

To use 2 forms of contraception before, during, and for 6 wk after therapy

- To take at same time each day

☼ Canada only Side effects: *italics* = common; **bold** = life-threatening 

Nurse Alert

nabumetone (Rx)

(na-byoo'me-tone)

Func. class.: Nonsteroidal antiinflammatory

Chem. class.: Acetic acid derivative

ACTION:

Metabolite inhibits COX-1, COX-2 by blocking arachidonate; analgesic, antiinflammatory, antipyretic

USES:

Osteoarthritis, rheumatoid arthritis, acute or chronic treatment

CONTRAINDICATIONS:

Pregnancy (D) 3rd trimester; hypersensitivity to this product or aspirin, iodides, NSAIDs

Black Box Warning:

Perioperative pain with CABG surgery

Precautions: Pregnancy (C), breastfeeding, children, geriatric patients, bleeding/GI/cardiac/renal disorders, hepatic dysfunction, asthma, bone marrow suppression, lupus (SLE), ulcerative colitis, blood dyscrasias

Black Box Warning:

MI, stroke, GI bleeding

DOSAGE AND ROUTES

Calculator

- **Adult: PO** 1 g as single dose or divided bid; max 2 g/day if needed

Renal dose

- **Adult: PO** CCr 31-49 ml/min, 750 mg daily, max 1 g/day; CCr <30 ml/min 500 mg daily

Available forms: Tabs 500, 750 mg

Administer:

- With food or antacids

SIDE EFFECTS

CNS: Dizziness, headache, drowsiness, fatigue, tremors, confusion, insomnia,

anxiety, depression, nervousness

EENT: Tinnitus

CV: Tachycardia, peripheral edema, palpitations, dysrhythmias, CHF, MI, stroke

GI: Nausea, anorexia, vomiting, diarrhea, jaundice, cholestatic hepatitis, constipation, flatulence, cramps, dry mouth, peptic ulcer, gastritis, ulceration, perforation, bleeding

GU: Nephrotoxicity, dysuria, hematuria, oliguria, azotemia, cystitis

HEMA: Blood dyscrasias

INTEG: Purpura, rash, pruritus, sweating, photosensitivity

RESP: Dyspnea, pharyngitis, bronchospasm

SYST: Anaphylaxis, angioneurotic edema

PHARMACOKINETICS

PO: Peak 2½-4 hr; protein binding >99%; half-life 24 hr; metabolized in liver to active metabolite; excreted in urine (metabolites), breast milk

INTERACTIONS

Increase: bleeding risk—anticoagulants, thrombolytics, valproic acid, cefamandole, cefotetan, cefoperazone, plicamycin, clopidogrel, eptifibatide, ticlopidine, SSRIs, SNRIs

Increase: hematologic toxicity—antineoplastics, radiation

Increase: GI reactions—salicylates, NSAIDs, alcohol, potassium, corticosteroids

Increase: toxicity, effect of—lithium, methotrexate

Decrease: effect of diuretics, antihypertensives

Drug/Lab Test

Increase: bleeding time, potassium, BUN, AST, ALT, LDH, alk phos, creatinine

Decrease: CCr, blood glucose, Hct, Hgb

NURSING CONSIDERATIONS

Assess:

Black Box Warning:

Cardiac status: CV thrombotic events, MI, stroke; may be fatal, not to be used in perioperative pain after CABG

Black Box Warning:

GI status: ulceration, bleeding, perforation; may be fatal

- **Pain:** frequency, intensity, characteristics; relief of pain after taking product
- Asthma, aspirin sensitivity, or nasal polyps; increased hypersensitivity reactions
- Renal, hepatic studies: BUN, creatinine, AST, ALT, Hgb, LDH, blood glucose, WBC, platelets; CCr before treatment, periodically thereafter • Audiometric, ophthalmic exam before, during, after treatment
- For eye, ear problems: blurred vision, tinnitus; may indicate toxicity

Perform/provide:

- Storage at room temp

Evaluate:

- Therapeutic response: decreased pain and stiffness in joints

Teach patient/family:

- To avoid alcoholic beverages and aspirin
- ⚠ To report blurred vision, ringing, roaring in ears; may indicate toxicity
- To avoid driving, other hazardous activities if dizziness, drowsiness occur
- ⚠ To report change in urine pattern, increased weight, edema, increased pain in joints, fever, blood in urine; indicates nephrotoxicity
- That therapeutic effects may take up to 1 mo
- To take with a full glass of water and food or antacids to enhance absorption; to sit upright for 30 min • To report dark stools; may indicate GI bleeding
- To use sunscreen, wear protective clothing if in the sun
- To report use to all health care providers, to avoid all other products unless approved by prescriber

☼ Canada only Side effects: *italics* = common; **bold** = life-threatening ⚠
Nurse Alert

nadolol (Rx)

(nay-doe'lole)

Corgard

Func. class.: Antihypertensive, antianginal

Chem. class.: β -Adrenergic receptor blocker

Do not confuse: Corgard/Cognex/Coreg
Nadolol/Mandol

ACTION:

Long-acting, nonselective β -adrenergic receptor blocking agent, blocks β_1 in the heart and β_2 in the lungs, uterus, and circulatory system; mechanism is similar to that of propranolol

USES:

Chronic stable angina pectoris, mild to moderate hypertension

Unlabeled uses: Tachydysrhythmias, anxiety, tremors, esophageal varices (rebleeding only), prophylaxis of migraine headaches, portal hypertension

CONTRAINDICATIONS:

Hypersensitivity to this product, cardiac failure, cardiogenic shock, 2nd/3rd degree heart block, bronchospastic disease, sinus bradycardia, CHF, COPD

Precautions: Pregnancy (C), breastfeeding, diabetes mellitus, renal disease, hyperthyroidism, peripheral vascular disease, myasthenia gravis, major surgery, nonallergic bronchospasm

Black Box Warning:

Abrupt discontinuation

DOSAGE AND ROUTES

Calculator

- **Adult: PO** 40 mg/day, increase by 40-80 mg q3-7days; maintenance 40-240 mg/day for angina, 40-320 mg/day for hypertension
- **Geriatric: PO** 20 mg/day, may increase by 20 mg until desired dose

Renal dose

- **Adult: PO** CCr 31-50 ml/min, give q24-36hr; CCr 10-30 ml/min, give q24-48hr; CCr <10 ml/min, give q40-60hr

Migraine prevention (unlabeled)

- **Adult: PO** 80-240 mg/day × 2-18 mo

Available forms: Tabs 20, 40, 80 mg

Administer:

- With 8 oz water, check apical pulse prior to use, if <60 bpm, withhold; call prescriber
- Give without regard to food

SIDE EFFECTS

CNS: Depression, dizziness, *fatigue*, lethargy, paresthesias, headache, *weakness*, insomnia, memory loss, nightmares

CV: **Bradycardia**, *hypotension*, **CHF**, palpitations, **AV block**, chest pain, peripheral ischemia, flushing, edema, vasodilation, conduction disturbances

EENT: Blurred vision, dry eyes, nasal congestion

ENDO: Hyperglycemia, hypoglycemia

GI: Nausea, vomiting, diarrhea, colitis, constipation, cramps, dry mouth, flatulence, hepatomegaly, **pancreatitis**, taste distortion

GU: *Impotence*, decreased libido

HEMA: **Agranulocytosis**, **thrombocytopenia**

INTEG: Rash, pruritus, fever, alopecia

RESP: Dyspnea, respiratory dysfunction, **bronchospasm**, cough, wheezing, **pulmonary edema**, pharyngitis, **laryngospasm**

PHARMACOKINETICS

PO: Onset variable, peak 3-4 hr, duration 17-24 hr; half-life 20-24 hr; not metabolized; excreted in urine (unchanged), bile, breast milk; protein binding 30%

INTERACTIONS

- **Do not use with MAOIs; bradycardia may occur**
- Peripheral ischemia: ergots

Increase: bradycardia—digoxin

Increase: hypotension, bradycardia—cloNIDine, EPINEPHrine

Increase: hypotensive effects—other hypotensive agents, phenothiazines

Decrease: β-blocking effect—thyroid hormones

Decrease: antihypertensive effect—NSAIDs

Drug/Lab Test

Increase: serum potassium, serum uric acid, ALT, AST, alk phos, LDH, blood glucose, cholesterol, ANA, triglycerides

NURSING CONSIDERATIONS

Assess:

- B/P, pulse, respirations during beginning therapy; orthostatic hypotension may occur
- Weight daily; report gain of 5 lb
- I&O ratio, CCr if kidney damage diagnosed; crackles, jugular venous distention, fatigue, dyspnea
- **Pain:** duration, time started, activity being performed, character
- Headache, lightheadedness, decreased B/P; may indicate a need for decreased dosage

Black Box Warning:

Abrupt discontinuation: can result in MI, myocardial ischemia, ventricular dysrhythmias, severe hypertension; withdraw slowly by tapering

Evaluate:

- Therapeutic response: decreased B/P, heart rate, symptoms of angina

Teach patient/family:

- That product may mask signs of hypoglycemia or alter blood glucose in diabetics
- To avoid OTC products unless prescriber approves
- To avoid hazardous activities if dizziness occurs
- **Hypertension:** to comply with complete medical regimen; to report weight gain of >5 lb, swelling, unusual bruising, bleeding
- To rise slowly to prevent orthostatic hypotension
- About how and when to check B/P, pulse; to hold dose, contact prescriber if pulse ≤ 60 bpm, systolic B/P < 90 mm Hg

Black Box Warning:

Not to discontinue abruptly, may cause life-threatening cardiac changes

☛ Canada only Side effects: *italics* = common; **bold** = life-threatening ⚠
Nurse Alert

nafcillin (Rx)

(naf-sill'in)

Func. class.: Antiinfective, broad-spectrum

Chem. class.: Penicillinase-resistant penicillin

ACTION:

Bacteriocidal, interferes with cell wall replication of susceptible organisms; cell lysis mediated by cell wall autolytic enzymes

USES:

Effective for gram-positive cocci (*Staphylococcus aureus*, *Streptococcus viridans*, *Streptococcus pneumoniae*), infections caused by penicillinase-producing *Staphylococcus*

CONTRAINDICATIONS:

Hypersensitivity to penicillins or corn

Precautions: Pregnancy (B), breastfeeding, neonates; hypersensitivity to cephalosporins or carbapenems; GI disease, asthma

DOSAGE AND ROUTES

Calculator

- **Adult:** IV 500-2000 mg q4hr
- **Child and infant >1 mo:** IV 50-200 mg/kg/day in divided doses q4-6hr
- **Neonates >7 days (weight >2000 g):** IV 25 mg/kg q6hr
- **Neonates ≤7 days (weight <2000 g):** IV 25 mg/kg q8hr

Meningitis

- **Adult:** IV 100-200 mg/kg/day in divided doses q4-6hr, max 12 g/day
- **Neonates >7 days (weight >2000 g):** IV 50 mg/kg q6hr
- **Neonates ≤7 days (weight <2000 g):** IV 50 mg/kg q12hr

Available forms: Powder for inj 1, 2 g, premixed or Add-Vantage vials

Administer:

- Product after C&S has been drawn, begin therapy while waiting for results

IM route

- Reconstitute vials: add 1.7 (1.8 nafcil), 3, 4, or 6.4 ml (6.6 ml NaCl) (sterile

water for inj, 0.9% NaCl, bacteriostatic water for inj with benzyl alcohol or parabens) to vials with 1 g, 2 g of nafcillin, respectively (250 mg/ml) • No further dilution needed; after reconstitution, inject in deep muscle mass

IV route

- Reconstitute vials: add 1.7 (1.8 nafcil), 3, 4, or 6.4 ml (6.6 ml NaCl) sterile water for inj, 0.9% NaCl, bacteriostatic water for inj with benzyl alcohol or parabens) to vials with 1 g, 2 g of nafcillin, respectively (250 mg/ml)
- **Nallpen piggyback units:** reconstitute 1 or 2 g with 50-100 ml or 99 ml, respectively, of sterile water for inj, 0.45% NaCl, 0.9% NaCl • **Unipen piggyback units:** reconstitute according to manufacturer

Direct intermittent IV INJ route

- Further dilute reconstituted sol in 15-30 ml sterile water inj, 0.45% NaCl, 0.9% NaCl; inj slowly over 5-10 min into tubing of free-flowing compatible IV solution

Intermittent IV INF route

- Vials, further dilute reconstituted sol to 2-40 mg/ml for peripheral vein inf ≤20 mg/ml (preferred); piggyback unit, no further dilution needed; infuse ≥30-60 min, make sure entire dose is given before ≥10% of sol is inactivated

Y-site compatibilities: Acyclovir, atropine, cyclophosphamide, diazepam, enalaprilat, esmolol, famotidine, fentaNYL, fluconazole, foscarnet, heparin, HYDROmorphone, magnesium sulfate, morphine, perphenazine, propofol, theophylline, zidovudine

SIDE EFFECTS

CNS: Lethargy, hallucinations, anxiety, depression, twitching, **coma, seizures**

GI: *Nausea, vomiting, diarrhea*, increased AST, ALT, abdominal pain, glossitis, **pseudomembranous colitis**

GU: Oliguria, **proteinuria, hematuria**, vaginitis, moniliasis, **glomerulonephritis, interstitial nephritis**

HEMA: Anemia, increased bleeding time, **bone marrow depression, neutropenia**

INTEG: Tissue necrosis, extravasation injury at inj site

SYST: **Anaphylaxis, serum sickness, Stevens-Johnson syndrome**

PHARMACOKINETICS

Half-life 1 hr; metabolized by liver; excreted in bile, urine 90% protein bound

INTERACTIONS

- Avoid use with tetracyclines

Increase: nafcillin concentrations—probenecid

Decrease: effect of cycloSPORINE—warfarin

Decrease: nafcillin effect—chloramphenicol, macrolides, sulfonamides, tetracyclines, aminoglycosides

Drug/Food

Decrease: absorption—food, carbonated drinks, citrus fruit juices

Decrease: Hgb/HcT, neutrophils

Drug/Lab Test

False positive: urine glucose, urine protein

NURSING CONSIDERATIONS

Assess:

- I&O ratio; report hematuria, oliguria, high doses are nephrotoxic
- **Pseudomembranous colitis:** assess for diarrhea, abdominal pain, fever, fatigue, anorexia; possible anemia, elevated WBC, low serum albumin; stop product; usually either vancomycin or IV metroNIDAZOLE given
- **Hepatic studies:** AST, ALT
- Blood studies: CBC with differential bleeding time
- **Renal studies:** urinalysis, BUN, creatinine; abnormal urinalysis may indicate nephrotoxicity
- C&S before product therapy; product may be given as soon as culture is taken
- Respiratory status: rate, character, wheezing, tightness in chest
- **Allergies before initiation of treatment; monitor for anaphylaxis, dyspnea, rash, laryngeal edema; stop product; keep emergency equipment nearby; skin eruptions after administration of penicillin to 1 wk after discontinuing product; cross-sensitivity with cephalosporins may occur**
- Differential WBC $2 \times$ per wk in patients receiving long-term therapy
- IV site: for redness, swelling, pain at site

Perform/provide:

- Extravasation management with cold packs, hyaluronidase

Evaluate:

- Therapeutic response: absence of fever, draining wounds

Teach patient/family:

⚠ To report sore throat, fever, fatigue (may indicate superinfection); CNS reactions; pseudomembranous colitis (diarrhea, fever, abdominal pain, fatigue)

- To wear or carry emergency ID if allergic to penicillins

TREATMENT OF ANAPHYLAXIS:

Withdraw product; maintain airway; administer EPINEPHrine, aminophylline, O₂, IV corticosteroids

🇨🇦 Canada only Side effects: *italics* = common; **bold** = life-threatening ⚠
Nurse Alert

HIGH ALERT

nalbuphine (Rx)

(nal'byoo-feen)

Func. class.: Opioid analgesic

Chem. class.: Synthetic opioid agonist, antagonist

ACTION:

Depresses pain impulse transmission at the spinal cord level by interacting with opioid receptors

USES:

Moderate to severe pain, supplement to anesthesia

CONTRAINDICATIONS:

Hypersensitivity, addiction (opiate)

Precautions: Pregnancy (C), breastfeeding, addictive personality, increased intracranial pressure, MI (acute), severe heart disease, respiratory depression, renal/hepatic disease, bowel impaction

DOSAGE AND ROUTES

Calculator

Analgesic

- **Adult:** SUBCUT/IM/IV 10 mg q3-6hr prn (based on 70-kg body weight), max 160 mg/day (IV/IM/SUBCUT); 20 mg/dose if opiate naïve (IV/IM/SUBCUT)

Balanced anesthesia adjunct

- **Adult:** IV 0.3-3 mg/kg given over 10-15 min, may give 0.25-0.5 mg/kg as needed for maintenance

Available forms: Inj 10, 20 mg/ml

Administer:

- With antiemetic if nausea, vomiting occur
- When pain beginning to return; determine dosage interval by response

IM route

- IM deep in large muscle mass, rotate inj sites, protect from light

Direct IV route

- Undiluted ≤ 10 mg over 3-5 min into free-flowing IV line of D₅W, NS, or LR

Syringe compatibilities: Atropine, cimetidine, diphenhydrAMINE, droperidol, glycopyrrolate, hydrOXYzine, lidocaine, midazolam, prochlorperazine, ranitidine, scopolamine, trimethobenzamide

Y-site compatibilities: Amifostine, aztreonam, cefmetazole, cisatracurium, cladribine, filgrastim, fludarabine, granisetron, melphalan, PACLitaxel, propofol, remifentanyl, teniposide, thiotepa, vinorelbine

SIDE EFFECTS

CNS: *Drowsiness, dizziness, confusion, headache, sedation, euphoria, dysphoria* (high doses), hallucinations, dreaming, tolerance, physical, psychologic dependency

CV: Palpitations, bradycardia, change in B/P, orthostatic hypotension, **cardiac arrest**

EENT: Tinnitus, blurred vision, miosis, diplopia

GI: *Nausea, vomiting, anorexia, constipation, cramps*, abdominal pain, dyspepsia, xerostomia, bitter taste

GU: Increased urinary output, dysuria, urinary retention, urgency

INTEG: *Rash*, urticaria, bruising, flushing, diaphoresis, pruritus

RESP: **Respiratory depression**, pulmonary edema

PHARMACOKINETICS

SUBCUT/IM/IV: Peak 30 min, onset 2-15 min, IV 2-3 min, duration 3-6 hr, metabolized by liver, excreted by kidneys, half-life 3-6 hr

INTERACTIONS

 **Avoid use with MAOIs; unpredictable reactions may occur**

Increase: effects with other CNS depressants—alcohol, opiates, sedative/hypnotics, antipsychotics, skeletal muscle relaxants

NURSING CONSIDERATIONS

Assess:

- **Pain:** type, location, intensity before and 30-60 min after administration; titrate upward with 25%-50% until 50% of pain reduced; need for pain medication by

pain sedation scoring, physical dependency • Bowel status; constipation is common, may need laxative or stool softener

 **Withdrawal reactions** in opiate-dependent individuals: PE, vascular occlusion; abscesses, ulcerations, nausea, vomiting, seizures; low potential for dependence

- **CNS changes:** dizziness, drowsiness, hallucinations, euphoria, LOC, pupil reaction • Allergic reactions: rash, urticaria

- **Respiratory dysfunction: respiratory depression**, character, rate, rhythm; notify prescriber if respirations are <10/min

Perform/provide:

- Storage in light-resistant area at room temp

Evaluate:

- Therapeutic response: decrease in pain without respiratory depression

Teach patient/family:

- To report any symptoms of CNS changes, allergic reactions
- That physical dependency may result from long-term use; low potential for dependency • **That withdrawal symptoms may occur: nausea, vomiting, cramps, fever, faintness, anorexia, profuse sweating, twitching; without treatment symptoms resolve in 5-14 days, chronic abstinence syndrome may last 2-6 mo**
- To avoid CNS depressants, alcohol
- To avoid driving, operating machinery if drowsiness occurs

TREATMENT OF OVERDOSE:

Naloxone (Narcan) 0.2-0.8 mg IV, O₂, IV fluids, vasopressors

☼ Canada only Side effects: *italics* = common; **bold** = life-threatening 
Nurse Alert

naloxone (Rx)

(nal-oks'one)

Func. class.: Opioid antagonist, antidote

Chem. class.: Thebaine derivative

Do not confuse: **naloxone**/naltrexone

ACTION:

Competes with opioids at opiate receptor sites

USES:

Respiratory depression induced by opioids, pentazocine, propoxyphene

Unlabeled uses: IBS, opiate agonist dependence, opiate agonist-induced constipation, pruritus, urinary retention, coma, nausea, vomiting

CONTRAINDICATIONS:

Hypersensitivity

Precautions: Pregnancy (C), breastfeeding, children, neonates, CV disease, opioid dependency, seizure disorder, drug dependency

DOSAGE AND ROUTES

Calculator

Opioid-induced respiratory depression

- **Adult:** IV/SUBCUT/IM 0.4-2 mg, repeat q2-3min if needed, max 10 mg
- **Child <5 yr or ≤20 kg:** IV/SUBCUT/IM 0.01 mg/kg slowly followed by 0.1 mg/kg if needed or as **INF** titrated to response

Postoperative opioid-induced respiratory depression

- **Adult:** IV 0.1-0.2 mg q2-3min prn
- **Child:** IV/SUBCUT/IM 0.005-0.01 mg/kg q2-3min prn

Opioid overdose

- **Adult:** IV/SUBCUT/IM 0.4-2 mg (10 mcg/kg) (not opioid dependent), may repeat q2-3min; 0.1-0.2 mg q2-3min (opioid dependent)

Diagnosis of opiate-agonist dependence (unlabeled)

- **Adult:** IM 0.16 mg; if no withdrawal symptoms after 20-30 min, give 0.24 mg IV

Available forms: Inj 0.02, 0.4 mg/ml

Administer:

- Only with resuscitative equipment, O₂ nearby
- Only sol prepared within 24 hr

Direct IV route

- Undiluted with sterile water for inj; give ≤0.4 mg over 15 sec

Continuous IV INF route

- Dilute 2 mg/500 ml 0.9% NaCl or D₅W (4 mcg/ml), titrate to response

Y-site compatibilities: Acyclovir, alfentanil, amikacin, aminocaproic acid, aminophylline, anidulafungin, ascorbic acid, atenolol, atracurium, atropine, azaTHIOprine, aztreonam, benztropine, bivalirudin, bleomycin, bumetanide, buprenorphine, butorphanol, calcium chloride/gluconate, CARBOplatin, caspofungin, cefamandole, ceFAZolin, cefmetazole, cefonicid, cefoperazone, cefotaxime, cefoTEtan, cefOXitin, cefTAZidime, ceftizoxime, cefTRIAxone, cefuroxime, cephalothin, cephapirin, chloramphenicol, chlorproMAZINE, cimetidine, CISplatin, clindamycin, cyanocobalamin, cyclophosphamide, cycloSPORINE, cytarabine, DACTINomycin, DAPTOmycin, dexamethasone, digoxin, diltiazem, diphenhydrAMINE, DOBUTamine, DOCEtaxel, DOPamine, doxacurium, DOXOrubicin, doxycycline, enalaprilat, ePHEDrine, EPINEPHrine, epirubicin, epoetin alfa, eptifibatide, ertapenem, erythromycin, esmolol, etoposide, etoposide phosphate, famotidine, fenoldopam, fentaNYL, fluconazole, fludarabine, fluorouracil, folic acid, furosemide, ganciclovir, gatifloxacin, gemcitabine, gentamicin, glycopyrrolate, granisetron, heparin, hydrocortisone, hydrOXYzine, IDArubicin, ifosfamide, imipenem-cilastatin, inamrinone, indomethacin, insulin (regular), irinotecan, isoproterenol, ketorolac, labetalol, levofloxacin, lidocaine, linezolid, LORazepam, mannitol, mechlorethamine, meperidine, metaraminol, methicillin, methotrexate, methoxamine, methyl dopate, methylPREDNISolone, metoclopramide, metoprolol, metroNIDAZOLE, mezlocillin, miconazole, midazolam, milrinone, minocycline, mitoXANtrone, morphine, moxalactam, multiple vitamins, mycophenolate, nafcillin, nalbuphine, nesiritide, netilmicin, nitroglycerin, nitroprusside, norepinephrine, octreotide, ondansetron, oxacillin, oxaliplatin, oxytocin, PACLitaxel, palonosetron, pamidronate, pancuronium, papaverine, PEMEtrexed, penicillin G potassium/sodium, pentamidine, pentazocine,

PENTobarbital, PHENobarbital, phentolamine, phenylephrine, phytonadione, piperacillin, piperacillin-tazobactam, polymyxin B, potassium chloride, procainamide, prochlorperazine, promethazine, propofol, propranolol, protamine, pyridoxine, quiniDine, quinupristin-dalfopristin, ranitidine, ritodrine, rocuronium, sodium acetate/bicarbonate, succinylcholine, SUFentanil, tacrolimus, teniposide, theophylline, thiamine, ticarcillin, ticarcillin-clavulanate, tigecycline, tirofiban, tobramycin, tolazoline, trimetaphan, urokinase, vancomycin, vasopressin, vecuronium, verapamil, vinCRIStine, vinorelbine, voriconazole, zoledronic acid

SIDE EFFECTS

CNS: Drowsiness, nervousness, **seizures**, tremor

CV: Rapid pulse, increased systolic B/P (high doses), **ventricular tachycardia, fibrillation, hypo/hypertension, cardiac arrest, sinus tachycardia**

GI: Nausea, vomiting, **hepatotoxicity**

RESP: Hyperpnea, **pulmonary edema**

PHARMACOKINETICS

Well absorbed IM, SUBCUT; metabolized by liver, crosses placenta; excreted in urine, breast milk; half-life 30-81 min

IM/SUBCUT: Onset 2-5 min, duration 45-60 min

IV: Onset 1 min, duration 45 min

INTERACTIONS

Increase: seizures—traMADol overdose

Decrease: effect of opioid analgesics

NURSING CONSIDERATIONS

Assess:

- **Withdrawal:** cramping, hypertension, anxiety, vomiting, signs of withdrawal in drug-dependent individuals may occur ≤2 hr after administration • VS q3-5min
- ABGs including PO₂, PCO₂
- Cardiac status: tachycardia, hypertension; monitor ECG
- **Respiratory dysfunction:** respiratory depression, character, rate, rhythm; if respirations are <10/min, administer naloxone; probably due to opioid overdose;

monitor LOC

- **Pain:** duration, intensity, location before and after administration; may be used for respiratory depression

Perform/provide:

- Dark storage at room temp

Evaluate:

- Therapeutic response: reversal of respiratory depression; LOC—alert

Teach patient/family:

- When patient is lucid, about reasons for, expected results of product

🍁 Canada only Side effects: *italics* = common; **bold** = life-threatening ⚠️
Nurse Alert

naltrexone (Rx)

(naltrex'one)

ReVia, Vivitrol

Func. class.: Opioid antagonist

Chem. class.: Thebaine derivative

Do not confuse: **naloxone**/naltrexone

ACTION:

Competes with opioids at opioid-receptor sites

USES:

Blockage of opioid analgesics; used for treatment of opiate addiction, alcoholism

Unlabeled uses: Nicotine withdrawal, opiate-agonist withdrawal, pruritus

CONTRAINDICATIONS:

Hypersensitivity, opioid dependence

Black Box Warning:

Hepatic failure, hepatitis

Precautions: Pregnancy (C), breastfeeding, children, renal disease, depression, suicidal ideation

Black Box Warning:

Hepatic disease

DOSAGE AND ROUTES

Calculator

Adjunct in opiate-agonist dependence

- **Adult: PO** 25 mg; if no withdrawal symptoms in 1 hr, then 25 mg additionally; if no withdrawal symptoms, then 50-150 mg/day or in divided doses

Adjunct in alcoholism treatment

- **Adult: PO** 50 mg/day with food × 12 wk; **IM** (Vivitrol) 380 mg q4wk

Pruritus (unlabeled)

- **Adult: PO** 50 mg/day × 7 days to 4 wk

Nicotine withdrawal (unlabeled)

- **Adult: PO** 50 mg/day

Ultrarapid opiate detoxification (unlabeled)

- **Adult: PO** 50 mg prior to sedation with midazolam

Available forms: Tabs 50 mg; powder for inj 380 mg

Administer:

PO route

- Give with food, antacid to prevent nausea, vomiting

IM route

- Do not give until opioid-free for 7-10 days to prevent opioid withdrawal
- IM deep in gluteal, alternate inj sites; use supplied needle to prevent inj site reaction; aspirate before inj • Only if resuscitative equipment is nearby
- **Not to use IV or SUBCUT**

SIDE EFFECTS

CNS: *Stimulation, drowsiness, dizziness, confusion, seizures, headache, flushing, hallucinations, nervousness, irritability, suicidal ideation, syncope, anxiety*

CV: Rapid pulse, **pulmonary edema**, hypertension, **DVT**

EENT: Tinnitus, hearing loss, blurred vision

GI: *Nausea, vomiting, diarrhea, heartburn, anorexia, hepatitis, constipation, abdominal pain*

GU: Delayed ejaculation, decreased potency

INTEG: *Rash, urticaria, bruising, oily skin, acne, pruritus, inj site reactions*

MISC: Increased thirst, chills, fever

MS: Joint and muscle pain

RESP: Wheezing, hyperpnea, nasal congestion, rhinorrhea, sneezing, sore throat, pneumonia

PHARMACOKINETICS

Metabolized by liver, excreted by kidneys; crosses placenta, excreted in breast milk; half-life 4 hr; extensive first-pass metabolism; protein binding 21%-28%

PO: Onset 15-30 min, peak 1-2 hr, duration is dose dependent

IM: Peak 2 hr

INTERACTIONS

Increase: lethargy—phenothiazines

Increase: hepatotoxicity—disulfiram

Increase: bleeding risk—anticoagulants

Decrease: effect of analgesics, antidiarrheals, cough preparations

NURSING CONSIDERATIONS

Assess:

Black Box Warning:

Hepatic status: LFTs, jaundice, hepatitis, hepatic failure

- ABGs including PO₂, PCO₂, LFTs, VS q3-5min • Signs of withdrawal in drug-dependent individuals, use naltrexone challenge to test opioid dependence; must be free of opioids for 7-10 days before using this product, or withdrawal symptoms can occur • Cardiac status: tachycardia, hypertension
- **Respiratory dysfunction: respiratory depression**, character, rate, rhythm; if respirations <10/min, respiratory stimulant should be administered • Mental status: depression, **suicidal ideation**

Perform/provide:

- Storage in tight container

Evaluate:

- Therapeutic response: blocking opiate ingestion; successful nicotine, alcohol withdrawal

Teach patient/family:

- That patient must be drug-free to start treatment
- ⚠️ That using opioid while taking this product could prove fatal because high dose is needed to overcome this antagonist; not to self-dose with OTC products unless approved by prescriber
- To carry emergency ID stating product used
- That, if surgery is needed, all involved should be aware of this product
- To use caution while driving or performing other hazardous tasks until effect is known ⚠️ That suicidal thoughts/behaviors may occur; to report these immediately

✳ Canada only Side effects: *italics* = common; **bold** = life-threatening ⚠️
Nurse Alert

naphazoline nasal agent

See [Appendix B](#)

naphazoline (ophthalmic)

(na-faz'oh-leen)

Advanced Eye Relief, Redness Maximum Relief, Ak-Con, All Clear, Clear Eyes, Naphcon Forte ,
Vasoclear *Func. class.:* Ophthalmic vasoconstrictor

Chem. class.: Sympathomimetic

ACTION:

Acts on the blood vessels in the eye to produce vasoconstriction

USES:

Ocular congestion, irritation, itching of the eye

CONTRAINDICATIONS:

Hypersensitivity, acute angle-closure glaucoma, 0.1% solution in children/infants

Precautions: Hyperthyroidism, diabetes mellitus, hypertension, cardiac conditions

DOSAGE AND ROUTES

Calculator

• **Adult: OPHTH** Instill 1-2 drops in affected eye in the conjunctival sac every 3-4 hr, up to qid

Available forms: Ophthalmic solution 0.012%, 0.1%, 0.02%

Administer:

• Store at room temperature, keep tightly closed

SIDE EFFECTS

CNS: Headache

EENT: Blurred vision, irritation, photophobia, dilation, stinging, elevated IOP, keratitis

PHARMACOKINETICS

Onset 10 min, duration up to 6 hr

INTERACTIONS

Increase: Systemic effects— β -blockers

- Do not use within 14 days of MAOIs

NURSING CONSIDERATIONS

Assess:

- Ocular itching, congestion, irritation: should show improvement quickly, avoid using more than 3 days, long-term use or exceeding dosage can lead to rebound congestion; report eye pain, blurred vision

Evaluate:

- Decreasing ocular itching, congestion, irritation

Teach patient/family:

- Method for instilling drops
- **To notify prescriber of eye pain, blurred vision**
- That ocular itching, congestion, irritation should show improvement quickly
- To avoid using longer than 3 days; that long-term use or exceeding dosage can lead to rebound congestion
- To wait for at least 15 min before wearing contact lenses

☼ Canada only Side effects: *italics* = common; **bold** = life-threatening ⚠
Nurse Alert

naproxen (Rx, OTC)

Aleve, Anaprox, Anaprox DS, Apo-Napro-Na 🌿, EC-Naprosyn, Equaline All Day Relief, Good Sense All Day Pain Relief, Midol Extended Relief, Naprelan, Novo-Naprox 🌿, Novo-Naprox Sodium 🌿, Nu-Naprox 🌿, Top Care All Day Pain Relief, Wal-Proxen *Func. class.:* Nonsteroidal antiinflammatory, nonopioid analgesic *Chem. class.:* Propionic acid derivative

Do not confuse: Naprosyn/Natacyn/Naprelan

ACTION:

Inhibits COX-1, COX-2 by blocking arachidonate; analgesic, antiinflammatory, antipyretic

USES:

Osteoarthritis; rheumatoid, gouty arthritis; primary dysmenorrhea; ankylosing spondylitis, bursitis, tendinitis, myalgia, dental pain

Unlabeled uses: Juvenile rheumatoid arthritis, bone pain, migraine/migraine prophylaxis, heterotopic ossification

CONTRAINDICATIONS:

Pregnancy (D) 3rd trimester, hypersensitivity to NSAIDs, salicylates; asthma, severe renal/hepatic disease, ulcer disease

Black Box Warning:

Perioperative pain in CABG surgery

Precautions: Pregnancy (C) breastfeeding, children <2 yr, geriatric patients, bleeding disorders, GI disorders, cardiac disorders, hypersensitivity to other antiinflammatory agents, CCr <30 ml/min

Black Box Warning:

MI, GI bleeding, stroke

DOSAGE AND ROUTES

Calculator

200 mg base = 220 mg naproxen sodium

Antiinflammatory/analgesic/antidysmenorrheal

- **Adult:** PO 250-500 mg bid, max 1500 mg/day; **DEL REL** 375-500 mg bid
- **Child ≥2 yr:** PO 5-7 mg/kg q8-12hr

Antigout

- **Adult: PO** 750 mg, then 250 mg q8hr

OTC use

- **Adult: PO** 220 mg q8-12hr or 440 mg then 220 mg q12hr; max 660 mg/24hr taken ≤10 days

- **Geriatric >65 yr: PO** Max 220 mg q12hr

Available forms: Naproxen: tabs 250, 375, 500 mg; del rel tabs (EC-Naprosyn, Naprosyn-E) 250 , 375, 500 mg; oral susp 125 mg/5 ml; ext rel tabs (CR) 375, 500, 750 mg; **naproxen sodium:** tabs 220, 275, 550 mg tab, ext rel 220 mg

Administer:

- With food to decrease GI symptoms; take on empty stomach to facilitate absorption, give with full glass of liquid • Do not crush, break, or chew ext rel tabs
- OTC for ≤10 days unless approved by prescriber
- **Oral susp:** shake well, use measuring cup provided or other calibrated device

SIDE EFFECTS

CNS: Dizziness, drowsiness, fatigue, tremors, confusion, insomnia, anxiety, depression

CV: Tachycardia, peripheral edema, palpitations, dysrhythmias, **MI, stroke**

EENT: Tinnitus, hearing loss, blurred vision

GI: Nausea, anorexia, vomiting, diarrhea, jaundice, **hepatitis**, constipation, flatulence, cramps, peptic ulcer, **GI ulceration, bleeding, perforation**

GU: **Nephrotoxicity: dysuria, hematuria, oliguria, azotemia**

HEMA: **Blood dyscrasias**

INTEG: Purpura, rash, pruritus, sweating

SYST: **Anaphylaxis**

PHARMACOKINETICS

PO: Peak 2-4 hr, half-life 12-17 hr; metabolized in liver; excreted in urine (metabolites), breast milk; 99% protein binding

INTERACTIONS

Increase: renal impairment—ACE inhibitors

 **Increase:** toxicity risk—methotrexate, lithium, antineoplastics, probenecid, radiation treatment

Increase: bleeding risk—oral anticoagulants, thrombolytic agents, eptifibatide, tirofiban, cefamandole, cefotetan, cefoperazone, clopidogrel, ticlopidine, plicamycin, SSRIs, SNRIs, tricyclics, valproic acid

Increase: GI side effects risk—aspirin, corticosteroids, alcohol, NSAIDs

Decrease: effect of antihypertensives, diuretics

Decreased: absorption of naproxen—antacids, sucralfate, cholestyramine

Drug/Herb

- Bleeding risk: feverfew, garlic, ginger, ginkgo, ginseng (*Panax*)

Drug/Lab Test

Increase: BUN, alk phos, LFTs, potassium, glucose, cholesterol

Decrease: potassium, sodium

False increase: 5-HIAA, 17KS

NURSING CONSIDERATIONS

Assess:

Black Box Warning:

Cardiac status: CV thrombotic events, MI, stroke; may be fatal; not to be used with CABG

Black Box Warning:

GI status: ulceration, bleeding, perforation; may be fatal; obtain stool guaiac

- **Pain:** frequency, characteristics, intensity; relief before and 1-2 hr after product
- **Arthritis:** range of motion, pain, swelling before and 1-2 hr after use
- **Fever:** before, 1 hr after use

 **Asthma, aspirin hypersensitivity or nasal polyps, increased risk of hypersensitivity**

- **Renal, hepatic, blood studies:** BUN, creatinine, AST, ALT, Hgb, LDH, blood glucose, Hct, WBC, platelets, CCr before treatment, periodically thereafter during long-term therapy
- **Audiometric, ophthalmic exam** before, during, after treatment; if taking long term, eye, ear problems: blurred vision, tinnitus (may indicate toxicity)

Perform/provide:

- Storage at room temp

Evaluate:

- Therapeutic response: decreased pain, stiffness, swelling in joints; ability to move more easily

Teach patient/family:

- To report blurred vision, ringing, roaring in ears (may indicate toxicity)
- To avoid driving, other hazardous activities if dizziness or drowsiness occurs
- ⚠ To report change in urine pattern, weight increase, edema (face, lower extremities), pain increase in joints, fever, blood in urine (indicates nephrotoxicity); black stools, flulike symptoms
- That therapeutic effects may take up to 1 mo in arthritis
- To avoid ASA, alcohol, steroids or other OTC medications without prescriber approval • To report use to all health care providers
- To notify prescriber if pregnancy is planned or suspected, pregnancy (C), avoid breastfeeding

🇨🇦 Canada only Side effects: *italics* = common; **bold** = life-threatening ⚠
Nurse Alert

naratriptan (Rx)

(nair'ah-trip-tan)

Amerge

Func. class.: Antimigraine agent

Chem. class.: 5-HT₁ receptor agonist

Do not confuse: Amerge/Altace/Amaryl

ACTION:

Binds selectively to the vascular 5-HT₁ B/D receptor subtype, exerts antimigraine effect; causes vasoconstriction in cranial arteries

USES:

Acute treatment of migraine with/without aura

CONTRAINDICATIONS:

Hypersensitivity, angina pectoris, history of MI, documented silent ischemia, ischemic heart disease, concurrent ergotamine-containing preparations, uncontrolled hypertension, CV syndromes, hemiplegic or basilar migraines, severe renal disease (CCr <15 ml/min); severe hepatic disease (Child-Pugh grade C)

Precautions: Pregnancy (C), breastfeeding, children, geriatric patients, postmenopausal women, men >40 yr, CAD risk, hypercholesterolemia, obesity, diabetes, impaired renal/hepatic function, peripheral vascular disease overuse

DOSAGE AND ROUTES

Calculator

- **Adult: PO** 1 or 2.5 mg with fluids; if headache returns, repeat 1× after 4 hr; max 5 mg/24 hr

Hepatic/renal dose

- **Adult: PO** CCr 15-39 ml/min, or mild-moderate hepatic disease max 2.5 mg/24 hr

Available forms: Tabs 1, 2.5 mg

Administer:

- With fluids as soon as symptoms appear; may take another dose after 4 hr; do

not take >5 mg during any 24-hr period

SIDE EFFECTS

CNS: Dizziness, sedation, fatigue

CV: Increased B/P, palpitations, tachydysrhythmias, PR, QTc prolongation, ST/T wave changes, PVCs, atrial flutter/fibrillation, coronary vasospasm

EENT: EENT infections, photophobia

GI: Nausea, vomiting

MISC: Temperature change sensations; tightness, pressure sensations

MS: Weakness, neck stiffness, myalgia

PHARMACOKINETICS

Onset 2-3 hr; peak 2-3 hr; 28%-31% protein binding; half-life 6 hr; metabolized in liver (metabolite); excreted in urine, feces; may be excreted in breast milk

INTERACTIONS

Increase: serotonin syndrome, neuroleptic malignant syndrome—SSRIs (FLUoxetine, fluvoxamine, PARoxetine, sertraline), SNRIs, serotonin receptor agonists, sibutramine

Increase: vasospastic effects—ergot, ergot derivatives, other 5-HT₁ agonists

Increase: adverse reactions risk—MAOIs; do not use together

Drug/Herb

- Serotonin syndrome: SAM-e, St. John's wort

NURSING CONSIDERATIONS

Assess:

- **Migraine symptoms:** aura, duration, effect on lifestyle, aggravating/alleviating factors
- ⚠ **Serotonin syndrome, neuroleptic malignant syndrome:** increased heart rate, shivering sweating, dilated pupils, tremors, high B/P, hyperthermia, headache, confusion; if these occur, stop product, administer serotonin antagonist if needed; at least 2 wk should elapse between discontinuation of serotonergic agents and start of product
- ⚠ **Cardiac status:** ECG, increased B/P, dysrhythmias, monitor for PR, QT prolongation, ST-T wave changes, PVCs in those with cardiac disease
- Stress level, activity, recreation, coping mechanisms
- Neurologic status: LOC blurred vision, nausea, vomiting, tingling in

extremities preceding headache

Perform/provide:

- Quiet, calm environment with decreased stimulation (noise, bright light, excessive talking)

Evaluate:

- Therapeutic response: decrease in frequency, severity of headache

Teach patient/family:

⚠ To report pain, tightness in chest, neck, throat, or jaw; to notify prescriber immediately if sudden, severe abdominal pain occurs

- Not to use if another 5-HT₁ agonist or ergot preparation has been used during past 24 hr; to avoid using >2 days/wk because rebound headache may occur • To notify prescriber if pregnancy is planned or suspected; to avoid breastfeeding

🇨🇦 Canada only Side effects: *italics* = common; **bold** = life-threatening ⚠
Nurse Alert

natalizumab (Rx)

(na-ta-liz'u-mab)

Tysabri

Func. class.: Biologic response modifier, immunoglobulins, monoclonal antibody

ACTION:

Biologic-response-modifying properties mediated through specific receptors on cells, may be secondary to blockade of the interaction of inflammatory cells with vascular endothelial cells

USES:

Ambulatory patients with relapsing/remitting MS who have not responded to other treatment; those with moderate to severe Crohn's disease

CONTRAINDICATIONS:

Hypersensitivity, immunocompromised individuals (HIV, AIDS, leukemia, lymphoma, transplants), PML, murine (mouse) protein allergy

Black Box Warning:

Progressive multifocal leukoencephalopathy

Precautions: Pregnancy (C), breastfeeding, geriatric patients, chronic progressive MS, depression, mental disorders, diabetes, TB, active infections, hepatotoxicity

DOSAGE AND ROUTES

Calculator

- **Adult:** IV INF 300 mg q4wk; give over 1 hr; observe during and for 1 hr after inf
- **Adolescent and child ≥ 11 yr (unlabeled):** IV INF pediatric Crohn's disease activity index (PCDAI) >30 , 3 mg/kg q4wk

Available forms: Single-use vial, 300 mg/100 ml 0.9% NaCl

Administer:

- Acetaminophen for fever, headache
- Only after being enrolled in the TOUCH Prescribing Program

Intermittent IV INF route

- Use only clear, colorless solution, without particulates

- Withdraw 15 ml from the vial using aseptic technique: inj conc into 100 ml 0.9% NaCl; do not use other diluents; mix completely; do not shake; inf immediately or refrigerate for ≤ 8 hr; warm to room temp before using; flush with 0.9% NaCl before, after inf; do not admix or use in same line with other agents
- Withhold product at first sign of PML
- Prescribers must be registered in the TOUCH prescribing program (1-800-456-2255)

SIDE EFFECTS

CNS: *Headache, fatigue, rigors, syncope, tremors, depression, progressive multifocal leukoencephalopathy (PML), suicidal ideation, anxiety*

CV: Chest discomfort, hypo/hypertension, tachycardia

GI: *Abdominal discomfort, abnormal LFT, gastroenteritis, severe hepatic injury*

GU: Amenorrhea, *UTI, irregular menses*, vaginitis, urinary frequency

INTEG: *Rash, dermatitis, pruritus, skin melanoma*, infusion-related reactions

MS: *Arthralgia, myalgia*

RESP: *Lower respiratory tract infection, dyspnea*

SYST: *Anaphylaxis, angioedema*

PHARMACOKINETICS

Half-life approximately 11 days

INTERACTIONS

- Do not use with vaccines

Increase: infection—immunosuppressants, antineoplastics, immunomodulators, tumor necrosis factors

NURSING CONSIDERATIONS

Assess:

Black Box Warning:

Progressive multifocal leukoencephalopathy (weakness, paralysis, vision loss, impaired speech, cognitive deterioration; obtain gadolinium-enhanced MRI scan of the brain, possibly cerebrospinal fluid for JC viral DNA; signs, symptoms of PML (decreased cognition, vision; ataxia, dysphagia), incidences increase with number of doses, over 2 yr immunosuppressants and anti-JC virus antibody; consider testing for the anti-JC virus and periodically retest

- **Infection:** report serious opportunistic infections to the manufacturer; those

with Crohn's disease and chronic oral corticosteroids may be at greater risk of infection • Blood, renal, hepatic studies: CBC, differential, platelet counts, BUN, creatinine, ALT, urinalysis, antibody testing • CNS symptoms: headache, fatigue, depression, rigors, tremors

• GI status: abdominal discomfort, gastroenteritis, severe hepatic injury, abnormal LFTs • Mental status: depression, depersonalization, suicidal thoughts, insomnia

• **MS symptoms**; product should only be used by patients who have not responded to other treatments  **Anaphylaxis**: SOB, hives; swelling, tightness in throat, chest pain; usually within 2 hr of inf

Perform/provide:

• Storage of sol in refrigerator; do not freeze or shake; protect from light; use within 8 hr of preparation

Evaluate:

• Therapeutic response: decreased symptoms of MS, Crohn's disease

Teach patient/family:

• Provide patient or family member with written, detailed information about product (med guide) • That female patients may experience irregular menses, amenorrhea, may worsen over several days; to notify prescriber if pregnancy is suspected; to avoid breastfeeding while taking this product, if pregnant, call the Tysabri Pregnancy Exposure Registry (1-800-456-2255)  **To notify prescriber of possible infection: sore throat, cough, increased temp, inf site reactions** • That continuing follow-up will be needed at 3, 6 months after first dose, then every 6 months • To inform all prescribers of product use

☼ Canada only Side effects: *italics* = common; **bold** = life-threatening 
Nurse Alert

natamycin ophthalmic

See [Appendix B](#)

nebivolol (Rx)

(ne-biv'oh-lol)

[Bystolic](#)

Func. class.: Antihypertensive

Chem. class.: β_1 -blocker

ACTION:

Competitively blocks stimulation of β -adrenergic receptors within vascular smooth muscle; decreases rate of SA node discharge, increases recovery time, slows conduction of AV node, thereby resulting in decreased heart rate (negative chronotropic effect), which decreases O_2 consumption in myocardium due to β_1 -receptor antagonism; decreases renin-aldosterone-angiotensin system at high doses, inhibits β_2 -receptors in bronchial system at high doses

USES:

Hypertension alone or in combination

Unlabeled uses: Heart failure

CONTRAINDICATIONS:

Cardiogenic shock, heart failure, severe hepatic disease, severe bradycardia, sick sinus syndrome, AV heart block; hypersensitivity to product, β -blockers

Precautions: Pregnancy (C), breastfeeding, children, major surgery, peripheral vascular disease, diabetes mellitus, thyrotoxicosis disease, COPD, asthma, well-compensated heart failure, renal/hepatic disease, abrupt discontinuation, acute bronchospasm

DOSAGE AND ROUTES

Calculator

Hypertension

- **Adult:** PO 5 mg/day, may be increased to desired response q2wk; max 40 mg/day

- **Geriatric:** PO max 40 mg/day

Renal/hepatic dose

- **Adult:** PO CCr <30 ml/min, 2.5 mg/day; may increase cautiously; (Child-Pugh class B) 2.5 mg daily, use dose escalation cautiously

Heart failure (unlabeled)

- **Adult:** PO 1.25 mg titrated to max 10 mg/day

Available forms: Tabs 2.5, 5, 10, 20 mg

Administer:

PO route

- Without regard to meals; tab may be crushed or swallowed whole; give with food to prevent GI upset

SIDE EFFECTS

CNS: *Insomnia, fatigue, dizziness, mental changes, drowsiness, headache*

CV: **Bradycardia, MI**, AV heart block, edema

GI: *Nausea, diarrhea, vomiting, abdominal pain*

GU: *Impotence*

HEMA: **Thrombocytopenia**

INTEG: Rash, pruritus, vasculitis, urticaria, psoriasis, **angioedema**

MISC: **Renal failure, pulmonary edema**, hyperuricemia, hypercholesterolemia

RESP: **Bronchospasm**, dyspnea

PHARMACOKINETICS

Peak 1.5-4 hr; half-life 12 hr; metabolized in liver by CYP2D6; 38% excreted in urine, 44% in feces

INTERACTIONS

 **Do not give with other β -blockers, mefloquine**

Increase: nebivolol action—CYP2D6 inhibitors (amiodarone, buPROPion, chloroquine, chlorpheniramine, chlorproMAZINE, cinacalcet, diphenhydrAMINE, DULoxetine, FLUoxetine, haloperidol, imatinib, PARoxetine, promethazine, propoxyphene, quiNIDine, quiNINE, ritonavir, terbinafine, thioridazine), cimetidine, calcium channel blockers (nondihydropyridine)

Decrease: nebivolol action—CYP2D6 inducers (rifampin), sildenafil

Drug/Herb

- May increase nebivolol effect—hawthorn
- May decrease nebivolol effect—ephedra

Drug/Lab Test

Increase: serum lipoprotein levels, BUN, potassium, triglycerides, uric acid, LDH, AST, ALT, alk phos

Decrease: platelets

NURSING CONSIDERATIONS

Assess:

- **Hypertension:** B/P during beginning treatment, periodically thereafter; apical/radial pulse before administration; notify prescriber of any significant changes (pulse <50 bpm); **signs of CHF** (dyspnea, crackles, weight gain, jugular venous distention) • Baselines of renal, hepatic function tests before therapy begins and periodically, **do not use in Child-Pugh class >B**
- Edema in feet, legs daily: monitor I&O

Perform/provide:

- Storage protected from light, moisture; place in cool environment

Evaluate:

- Therapeutic response: decreased B/P after 1-2 wk; decreased dysrhythmias

Teach patient/family:

⚠ Not to discontinue product abruptly because severe cardiac reactions may occur, to taper over 2 wk; not to double dose; if dose is missed, to take as soon as remembered up to 4 hr before next dose

- That product may mask signs of hypoglycemia or alter blood glucose levels
- Not to use OTC products containing α -adrenergic stimulants (nasal decongestants, OTC cold preparations) unless directed by prescriber • To report low pulse, dizziness, confusion, depression, fever
- To take pulse, B/P at home; advise patient when to notify prescriber
- To comply with weight control, dietary adjustments, modified exercise program
- To carry emergency ID to identify product, allergies
- To avoid hazardous activities if dizziness, drowsiness present
- **To report symptoms of CHF:** difficulty breathing, especially on exertion or when lying down, night cough, swelling of extremities • To continue with

required lifestyle changes (exercise, diet, weight loss, stress reduction)

TREATMENT OF OVERDOSE:

Lavage, IV atropine for bradycardia, IV theophylline for bronchospasm, digoxin, O₂, diuretic for cardiac failure, IV glucose for hypoglycemia, IV diazepam (or phenytoin) for seizures, IV fluids, IV pressors

☼ Canada only Side effects: *italics* = common; **bold** = life-threatening ⚠
Nurse Alert

nelfinavir (Rx)

(nell-fin'a-ver)

Viracept

Func. class.: Antiretroviral

Chem. class.: Protease inhibitor

ACTION:

Inhibits human immunodeficiency virus (HIV-1) protease, which prevents maturation of the infectious virus

Uses: HIV-1 in combination with other antiretrovirals

CONTRAINDICATIONS:

Hypersensitivity to protease inhibitors

Precautions: Pregnancy (B), breastfeeding, renal/hepatic disease, hemophilia, PKU, pancreatitis, diabetes, infection, immune reconstitution syndrome

DOSAGE AND ROUTES

Calculator

HIV infection

- **Adult and child >13 yr: PO** 750 mg tid or 1250 mg bid
- **Child 2-13 yr: PO** 25-35 mg/kg tid, max 2500 mg/day

Prevention of HIV infection after exposure (unlabeled)

- **Adult: PO** 1250 mg bid with 2 other antiretroviral agents × 4 wk

Available forms: Tabs 250, 625 mg; powder, oral 50 mg/g/scoop

Administer:

PO route

- Do not mix with juice or acidic fluids
- **Oral powder:** mixed with fluids if desired; stable mixed for 6 hr, may use in child unable to take tabs, do not mix with water in original bottle • **Tabs** may be crushed and dispersed in water or mixed with food; consume immediately

SIDE EFFECTS

CNS: Headache, asthenia, poor concentration, **seizures, suicidal ideation**

CV: Bleeding

ENDO: Hyperglycemia, hyperlipidemia

GI: *Diarrhea*, anorexia, dyspepsia, *nausea*, *flatulence*, *hepatitis*, *pancreatitis*

HEMA: *Anemia*, *leukopenia*, *thrombocytopenia*, Hgb abnormalities

INTEG: *Rash*, dermatitis, *anaphylaxis*

MS: Pain, arthralgia, myalgia, myopathy

OTHER: *Hypoglycemia*, redistribution/accumulation of body fat, *immune reconstitution syndrome*

PHARMACOKINETICS

Half-life 3½-5 hr, excreted in feces (87%), peak 2-4 hr, 98% protein binding; metabolized by CYP3A4 enzyme system; potent inhibitor of CYP3A4

INTERACTIONS

Drug/Herb

 **Increase:** serious dysrhythmias: amiodarone, ergots, lovastatin, midazolam, pimozide, quiniDine, simvastatin, triazolam, salmeterol

Increase: effect of—atorvastatin, azithromycin, rifabutin, indinavir, saquinavir, cycloSPORINE, tacrolimus, sirolimus, sildenafil, alfentanil, alosetron, buprenorphine, busPIRone, bortezomib, calcium channel blockers, cilostazol, disopyramide, dofetilide, DOCEtaxel, donepezil, ethosuximide, fentaNYL, galantamine, gefitinib, levomethadyl, systemic lidocaine, PACLitaxel, sibutramine, SUFentanil, vinca alkaloids, ziprasidone, zonisamide, traZODone, tricyclic antidepressants, sildenafil

Increase: nelfinavir levels—ketoconazole, indinavir, ritonavir; delavirdine, other HIV protease inhibitors

Decrease: nelfinavir levels—rifamycins, nevirapine, PHENobarbital, phenytoin, carBAMazepine

Decrease: effect of—didanosine, methadone, oral contraceptives, phenytoin

Drug/Herb

 **Decrease:** antiretroviral effect—St. John's wort; do not use concurrently

Drug/Food

Increase: absorption with food

Drug/Lab Test

Increase: AST, ALT, alk phos, total bilirubin, CPK, LDH, lipids, uric acid

Decrease: WBC, platelets

NURSING CONSIDERATIONS

Assess:

- Resistance testing at initiation, with failure of treatment
- Signs of infection, anemia
- Hepatic studies: ALT, AST
- Bowel pattern before, during treatment; if severe abdominal pain with bleeding occurs, product should be discontinued; monitor hydration ⚠️

Immune reconstitution syndrome: occurs with combination therapy, including MAC, CMV, PCP TB requiring treatment

⚠️ **Anaphylaxis, hypersensitivity reaction:** wheezing, flushing; swelling of lips, tongue, throat, skin eruptions, rash, urticaria, itching

- **HIV:** serum lipid profile, plasma HIV RNA, blood glucose, viral load, CD4 cell counts at baseline and throughout treatment

Teach patient/family:

- To avoid taking with other medications unless directed by prescriber
- **Diarrhea** is most common side effect, may use loperamide to control
- That product does not cure but does manage symptoms; that product does not prevent transmission of HIV to others • To use a nonhormonal form of birth control while taking this product if using contraceptives • If dose is missed, to take as soon as remembered up to 1 hr before next dose; not to double dose • To take with food
- To report symptoms of hyperglycemia, bleeding, abdominal pain; yellowing of skin, eyes • **Phenylketonuria:** powder contains phenylalanine

🇨🇦 Canada only Side effects: *italics* = common; **bold** = life-threatening ⚠️
Nurse Alert

RARELY USED

neomycin (Rx)

(nee-oh-mye'sin)

Func. class.: Antiinfective

USES:

Severe systemic infections of CNS, respiratory, GI, urinary tract, eye, bone, skin, soft tissues caused by *Pseudomonas aeruginosa*, *Escherichia coli*, *Enterobacter*, *Klebsiella pneumoniae*, *Proteus vulgaris*; hepatic coma, preoperatively to sterilize bowel, infectious diarrhea caused by enteropathogenic *E. coli*

CONTRAINDICATIONS:

Infants, children, bowel obstruction (oral use), severe renal disease, hypersensitivity, GI disease

Precautions:

Black Box Warning:

Dehydration, geriatric patients, hearing impairment, neuromuscular disease, renal disease, respiratory insufficiency

DOSAGE AND ROUTES

Calculator

Hepatic encephalopathy

- **Adult: PO** 4-12 g/day in divided doses q6hr × 5-6 days
- **Child: PO** 50-100 mg/kg/day in divided doses q6hr × 5-6 days

Preoperative intestinal antisepsis

- **Adult: PO** 1 g/hr × 4 hr then 1 g q4hr for remaining 24 hr

☼ Canada only Side effects: *italics* = common; **bold** = life-threatening ⚠
Nurse Alert

neomycin topical

See [Appendix B](#)

nepafenac ophthalmic

See [Appendix B](#)

HIGH ALERT

nesiritide (Rx)

(neh-seer'ih-tide)

[Natrecor](#)

Func. class.: Vasodilator

Chem. class.: Human B-type natriuretic peptide

ACTION:

Uses DNA technology; human B-type natriuretic peptide binds to the receptor in vascular smooth muscle and endothelial cells, thereby leading to smooth muscle relaxation

USES:

Acutely decompensated CHF

CONTRAINDICATIONS:

Hypersensitivity to this product or *Escherichia coli* protein; cardiogenic shock or B/P <90 mm Hg as primary therapy

Precautions: Pregnancy (C); breastfeeding; children; mitral stenosis; significant valvular stenosis, restriction, or obstructive cardiomyopathy, or any condition dependent on venous return; renal disease; constrictive pericarditis

DOSAGE AND ROUTES

Calculator

• **Adult: IV BOL** 2 mcg/kg then **CONT IV INF** 0.01 mcg/kg/min

Available forms: Powder for inj, 1.5-mg single-use vial

Administer:

IV route

- Do not give through a central catheter containing other products; administer other products through separate catheter or central line heparin-coated catheter because nesiritide binds to heparin • Reconstitute one 1.5-mg vial/5 ml of diluent from prefilled 250-ml plastic IV bag with diluent of choice (preservative free D₅, 0.9% NaCl, D₅/1/2 NaCl, D₅/0.2% NaCl); do not shake vial, roll gently; use only clear sol • Withdraw all contents of reconstituted vial and add to 250-ml plastic IV bag (6 mcg/ml), invert bag several times
- Use within 24 hr of reconstituting
- Prime IV fluid with inf of 5 ml before connecting to patient's vascular access port and before bolus dose or IV inf

Direct IV route

- Prime tubing with 5 ml inf sol; calculate dose based on patient's weight, $0.33 \times \text{patient weight (kg)} = \text{bolus vol (ml)}$ (6 mcg/ml); withdraw prescribed bolus dose (volume) from prepared inf bag; give over 1 min through IV port

Intermittent IV INF route

- After bolus dose, use inf, give at 0.1 ml/kg/hr (0.01 mcg/kg/min)

Y-site compatibilities: Acyclovir, alfentanil, allopurinol, amifostine, aminocaproic acid, aminophylline, amiodarone, amphotericin B colloidal, amphotericin B lipid complex, amphotericin B liposome, anidulafungin, argatroban, atenolol, atracurium, azithromycin, aztreonam, bivalirudin, bleomycin, buprenorphine, busulfan, butorphanol, calcium acetate/chloride/gluconate, CARBOplatin, carmustine, ceFAZolin, cefotaxime, cefoTEtan, cefOXitin, cefTAZidime, ceftizoxime, cefTRIAxone, cefuroxime, chloramphenicol, cimetidine, ciprofloxacin, cisatracurium, CISplatin, clindamycin, cyclophosphamide, cycloSPORINE, cytarabine, dacarbazine, DACTINomycin, DAUNOrubicin, digoxin, diltiazem, diphenhydrAMINE, DOCEtaxel, dolasetron, doxacurium, DOXOrubicin, doxycycline, droperidol, ePHEDrine, epirubicin, ertapenem, erythromycin, esmolol, etoposide, etoposide phosphate, famotidine, fenoldopam, fentaNYL, filgrastim, fluconazole, fludarabine, fluorouracil, foscarnet, fosphenytoin, ganciclovir, gatifloxacin, gemcitabine, gemtuzumab, glycopyrrolate, granisetron, haloperidol, hydrocortisone, HYDROmorphone, hydrOXYzine, IDArubicin, ifosfamide, imipenem-cilastatin, irinotecan, ketorolac, leucovorin, levofloxacin, lidocaine, linezolid, LORazepam, magnesium sulfate, mannitol, mechlorethamine, melphalan, meropenem, mesna, metaraminol, methohexital, methotrexate,

methylPREDNISolone, metoclopramide, metroNIDAZOLE, midazolam, milrinone, minocycline, mitoMYcin, mitoXANtrone, mivacurium, moxifloxacin, mycophenolate, nalbuphine, naloxone, niCARdipine, nitroglycerin, nitroprusside, octreotide, ondansetron, oxaliplatin, oxytocin, PACLitaxel, palonosetron, pamidronate, pancuronium, PEMEtrexed, pentamidine, PENTobarbital, PHENobarbital, phentolamine, phenylephrine, polymyxin B sulfate, potassium chloride/phosphates, prochlorperazine, propranolol, quiNIDine, quinupristin-dalfopristin, ranitidine, remifentanyl, rocuronium, sodium acetate/bicarbonate/phosphates, streptozocin, succinylcholine, SUFentanyl, tacrolimus, teniposide, theophylline, thiotepa, ticarcillin, tigecycline, tirofiban, tolazoline, topotecan, torsemide, trimethobenzamide, vancomycin, vasopressin, vecuronium, verapamil, vinBLAStine, vinCRISStine, vinorelbine, zidovudine, zoledronic acid

SIDE EFFECTS

CNS: Headache, insomnia, dizziness, anxiety, confusion, paresthesia, tremor

CV: *Hypotension*, **tachycardia**, dysrhythmias, bradycardia, **ventricular tachycardia, ventricular extrasystoles, atrial fibrillation**

GI: Vomiting, nausea

INTEG: Rash, sweating, pruritus, inj site reaction

MISC: Abdominal pain, back pain

RESP: Increased cough, hemoptysis, **apnea**

PHARMACOKINETICS

Half-life 18 min

INTERACTIONS

Increase: hypotension—ACE inhibitors, antihypertensives, inotropes, IV nitrates

NURSING CONSIDERATIONS

Assess:

- PCWP, RAP, cardiac index, MPAP, B/P, pulse during treatment until stable
- Daily serum creatinine, BUN
- **CHF:** weight gain, dyspnea, crackles, I&O ratios, peripheral edema

Evaluate:

- Therapeutic response: improvement in CHF with improved PCWP, RAP, MPAP

Teach patient/family:

- About purpose of medication, expected results, to report pain at IV site
- To report dizziness, blurred vision, lightheadedness, sweating

🍁 Canada only Side effects: *italics* = common; **bold** = life-threatening ⚠️
Nurse Alert

nevirapine (Rx)

(ne-veer'a-peen)

Viramune, Viramune XR

Func. class.: Antiretroviral

Chem. class.: Nonnucleoside reverse transcriptase inhibitor (NNRTI)

Do not confuse: nevirapine/nelfinavir Viramune/Viracept

ACTION:

Binds directly to reverse transcriptase and blocks RNA, DNA, thus causing a disruption of the enzyme's site

USES:

HIV-1 in combination with other highly active antiretroviral therapy (HAART)

CONTRAINDICATIONS:

Black Box Warning:

Hypersensitivity, hepatic disease

Precautions: Pregnancy (B), breastfeeding, children, renal disease, Hispanic patients

Black Box Warning:

Females, hepatitis

DOSAGE AND ROUTES

Calculator

Treatment of HIV infection in combination with other antiretrovirals

- **Adult and adolescent: PO** 200 mg/day $\times$ 2 wk then 200 mg bid in combination; **EXT REL** tab (adults not currently taking immediate rel nevirapine) 200 mg/day (immediate rel tab) $\times$ 14 days with other antiretrovirals; if rash develops during lead-in periods and persists beyond 14 days, do not use ext rel tab; if no consistent rash present, then give 400 mg/day ext rel tab with other antiretrovirals; if interrupted >7 days, restart 14 day lead-in dosing; for adults switched from immediate rel tab, give 400 mg/day ext rel tab
- **Child/adolescent ≥ 6 yr: PO EXT REL** not currently taking immediate release 150 mg/m² (immediate release) daily (max 200 mg/day) $\times$ 14 days then BSA 0.58-0.83 m² 200 mg/day; BSA 0.84-1.16 m² 300 mg/day

- **Child/infant/neonate ≥ 15 days old:** PO 150 mg/m²/day $\times$ 14 days then 150 mg/m² bid, max 400 mg/day

Perinatal transmission prophylaxis (unlabeled)

- **Females with no previous antiretroviral therapy:** PO 200 mg as a single dose at onset of labor with zidovudine 2 mg/kg over 1 hr followed by zidovudine 1 mg/kg/hr until delivery
- **Neonate ≥ 34 wk gestation:** PO Nevirapine 12 mg (>2 kg) or 8 mg (1.5-2 kg) $\times$ 3 doses; 1st dose 48 hr after birth, 2nd dose 48 hr after 1st dose, 3rd dose 96 hr after 2nd dose and **PO** zidovudine

Hepatic dose

- **Adult:** **PO** Do not use with Child-Pugh grade B or C

Available forms: Tabs 200 mg; oral susp 50 mg/5 ml; ext rel 400 mg

Administer:

- Do not initiate treatment in females when CD4 counts >250 cells/mm³ or in males when >400 cells/mm³ unless benefits outweigh risks
- Without regard to meals
- Use in combination with at least 1 other antiretroviral
- **Oral susp** should be shaken before giving

SIDE EFFECTS

CNS: Paresthesia, headache, fever, peripheral neuropathy

GI: Diarrhea, abdominal pain, nausea, stomatitis, hepatotoxicity, hepatic failure

HEMA: Neutropenia, anemia, thrombocytopenia

INTEG: Rash, toxic epidermal necrolysis

MISC: Stevens-Johnson syndrome, anaphylaxis

MS: Pain, myalgia, rhabdomyolysis

PHARMACOKINETICS

Rapidly absorbed, peak 4 hr, 60% bound to plasma proteins, metabolized by liver; metabolized by hepatic P450 enzyme system, excreted 91% in urine, terminal half-life 25-30 hr, 50% removed by peritoneal dialysis; with hepatic disease and in Hispanic patients, African American patients, slower rate of clearance

INTERACTIONS

Increase: nevirapine levels—cimetidine, macrolide antiinfectives

Decrease: effects of protease inhibitors, oral contraceptives, ketoconazole, methadone, itraconazole

Decrease: nevirapine levels—rifamycins, anticonvulsants, clonazepam, diazepam, warfarin

Drug/Herb

Decrease: action of antiretroviral—St. John's wort; do not use concurrently

Drug/Lab Test

Increase: ALT, AST, GGT, bilirubin, Hgb

Decrease: neutrophil count

NURSING CONSIDERATIONS

Assess:

- Resistance testing before therapy and when therapy fails

⚠ **Signs of infection, anemia, hepatotoxicity, immune reconstitution syndrome; hepatitis B or C, liver toxicity may occur**

- **HIV:** blood studies during treatment: ALT, AST, viral load, CD4, plasma HIV RNA, renal studies; if LFTs elevated significantly, product should be withheld; glucose levels in diabetic patients, if treatment is interrupted by >1 wk, restart at initial dose ⚠ **Rhabdomyolysis:** pain, tenderness, weakness, edema; product should be discontinued

- Bowel pattern before, during treatment; if severe abdominal pain with bleeding occurs, product should be discontinued; monitor hydration ⚠ **Stevens-Johnson syndrome, toxic epidermal necrolysis**, allergies before treatment, reaction to each medication; skin eruptions; rash, urticaria, itching; if rash is severe or systemic symptoms occur, discontinue immediately

Evaluate:

- Therapeutic response: absence of AIDS-defining symptoms, improvement in quality of life; decreased viral load, increase in CD4 count

Teach patient/family:

⚠ **To report any right quadrant pain, yellowing of eyes or skin, dark urine, nausea, anorexia, muscle pain or tenderness, rash immediately**

- That product may be taken with food, antacids
- To take as prescribed; if dose is missed, to take as soon as remembered up to 1 hr before next dose; not to double dose
- That product is not a cure, does not

prevent transmission; controls symptoms of HIV

- To avoid OTC agents unless approved by prescriber
- To use a nonhormonal form of contraception during treatment in those using contraceptives

🍁 Canada only Side effects: *italics* = common; **bold** = life-threatening ⚠️

niacin (OTC, Rx)

(nye'a-sin)

Equaline Niacin, Niaspan, Ni-Odan , Slo-Niacin

niacinamide (OTC, Rx)

Func. class.: Vit B₃, antihyperlipidemic *Chem. class.:* Water-soluble vitamin

ACTION:

Needed for conversion of fats, protein, carbohydrates by oxidation reduction; acts directly on vascular smooth muscle, thus causing vasodilation; reduces total cholesterol, LDL, VLDL, triglycerides; increases HDL

USES:

Pellagra, hyperlipidemias (types 4, 5), peripheral vascular disease that presents a risk for pancreatitis

CONTRAINDICATIONS:

Breastfeeding, hypersensitivity, peptic ulcer, hepatic disease, hemorrhage, severe hypotension

Precautions: Pregnancy (C), breastfeeding, glaucoma, cardiovascular disease, CAD, diabetes mellitus, gout, schizophrenia

DOSAGE AND ROUTES

Calculator

Niacin deficiency

- **Adult:** **PO** 100-500 mg/day in divided doses; **IM/SUBCUT** 5-100 mg $\geq 5\times/\text{day}$; **IV** 25-100 mg bid or tid
- **Child:** **PO** ≤ 300 mg/day in divided doses

Adjunct in hyperlipidemia

- **Adult:** **PO** 250 mg after evening meal; may increase dose at 1-4 wk intervals to 1-2 g tid, max 6 g/day; **EXT REL** 500 mg at bedtime $\times 4$ wk then 1000 mg at bedtime for wk 5-8; do not increase by >500 mg q4wk, max 2000 mg/day

Pellagra

- **Adult:** **PO** 300-500 mg/day in divided doses; **IM** 50-100 mg $5\times/\text{day}$ or **IV** 25-

100 mg bid by slow **IV INF**

- **Child: PO** 100-300 mg/day in divided doses; **IV** ≤ 300 mg/day by slow **IV/INF**

Peripheral vascular disease

- **Adult: PO** 250-800 mg/day in 3-5 divided doses

Available forms: *Niacin*: tabs 50, 100, 250, 500, mg; ext rel caps 250, 500 mg; ext rel tab 250, 500, 750, 1000 mg; *niacinamide*: tab 100, 500 mg

Administer:

- Do not break, crush, or chew ext rel tabs, caps
- With meals for GI symptoms; with 81-325 mg aspirin or NSAIDs 30 min before dose to decrease flushing

SIDE EFFECTS

CNS: Paresthesias, headache, dizziness, anxiety

CV: Postural hypotension, vasovagal attacks, dysrhythmias, vasodilation

EENT: Blurred vision, ptosis

GI: Nausea, vomiting, anorexia, **jaundice, hepatotoxicity**, diarrhea, peptic ulcer, dyspepsia, **hepatitis**

GU: Hyperuricemia, **glycosuria, hypoalbuminemia**

INTEG: Flushing, dry skin, rash, pruritus, itching, tingling

PHARMACOKINETICS

PO: Peak 30-70 min (depends on formulation), half-life 45 min; metabolized in liver; 30% excreted unchanged in urine

INTERACTIONS

Increase: postural hypotension—ganglionic blockers

⚠ Increase: myopathy, rhabdomyolysis—HMG-CoA reductase inhibitors

Increase: flushing, pruritus—alcohol, avoid use

Drug/Herb

⚠ Increase: myopathy, rhabdomyolysis—red yeast rice

Drug/Lab Test

Increase: bilirubin, alk phos, hepatic enzymes, LDH, uric acid, glucose

Decrease: cholesterol

False increase: urinary catecholamines

False positive: urine glucose

NURSING CONSIDERATIONS

Assess:

- Cardiac status: rate, rhythm, quality; postural hypotension, dysrhythmias
- Nutritional status: liver, yeast, legumes, organ meat, lean poultry; fat in diet
- ⚠ **Hepatotoxicity:** clay-colored stools, itching, dark urine, jaundice; hepatic studies: AST, ALT, bilirubin, uric acid, alk phos; blood glucose before and during treatment
- CNS symptoms: headache, paresthesias, blurred vision
- **Niacin deficiency:** nausea, vomiting, anemia, poor memory, confusion, dermatitis
- **Hyperlipidemia:** for lipid, triglyceride, cholesterol level; obtain diet history

Evaluate:

- Therapeutic response: decreased lipids, warm extremities, absence of numbness in extremities

Teach patient/family:

- That flushing and increase in feelings of warmth will occur several hr after taking product (PO); after 2 wk of therapy, these side effects diminish
- To remain recumbent if postural hypotension occurs; to rise slowly to prevent orthostatic hypotension
- To abstain from alcohol if product is prescribed for hyperlipidemia
- To avoid sunlight if skin lesions are present

⚠ **Hepatotoxicity:** to report clay-colored stools, anorexia, yellow eyes or skin, dark urine

☼ Canada only Side effects: *italics* = common; **bold** = life-threatening ⚠
Nurse Alert

niCARDipine (Rx)

(nye-card'i-peen)

Cardene IV, Cardene SR

Func. class.: Calcium channel blocker, antianginal, antihypertensive *Chem. class.:* Dihydropyridine

Do not confuse: niCARDipine/NIFEdipine

Cardene/Cardizem

Cardene SR/Cardizem SR

ACTION:

Inhibits calcium ion influx across cell membrane during cardiac depolarization; produces relaxation of coronary vascular smooth muscle, peripheral vascular smooth muscle; dilates coronary vascular arteries; increases myocardial oxygen delivery in patients with vasospastic angina

USES:

Chronic stable angina pectoris, hypertension

CONTRAINDICATIONS:

Sick sinus syndrome, 2nd-/3rd-degree heart block; hypersensitivity to this product or dihydropyridine; advanced aortic stenosis

Precautions: Pregnancy (C), breastfeeding, children, geriatric patients, CHF, hypotension, hepatic injury, renal disease

DOSAGE AND ROUTES

Calculator

Hypertension

- **Adult: PO** 20 mg tid initially; may increase after 3 days (range 20-40 mg tid) or 30 mg bid **SUS REL**; may increase to 60 mg bid or **IV** 5 mg/hr; may increase by 2.5 mg/hr q15min; max 15 mg/hr

Angina

- **Adult: PO** 20 mg tid; may be adjusted q3days; may use 20-40 mg tid

Renal dose

- **Adult: PO** adjust based on response

Hepatic dose

- **Adult: PO 20 mg bid**

Available forms: Caps 20, 30 mg; sus rel caps 30, 45, 60 mg; inj 2.5 mg/ml, premixed 20 mg/200 ml, 40 mg/200 ml

Administer:

PO route

- Do not break, crush, chew, or open sus rel cap
- Without regard to meals

IV route

- Dilute each 25 mg/240 ml of compatible sol (0.1 mg/ml), give slowly, titrate to patient response, change IV site q12hr • Stable at room temp for 24 hr

Solution compatibilities: D₅W, D₅/0.45% NaCl, D₅/0.9% NaCl

Y-site compatibilities: Alemtuzumab, amikacin, aminophylline, aztreonam, bivalirudin, butorphanol, calcium gluconate, CARBOplatin, caspofungin, ceFAZolin, ceftizoxime, chloramphenicol, cimetidine, CISplatin, clindamycin, cytarabine, DAPTOmycin, dexmedetomidine, diltiazem, DOBUTamine, DOCEtaxel, DOPamine, DOXOrubicin hydrochloride, enalaprilat, EPINEPHrine, epirubicin, erythromycin, esmolol, famotidine, fenoldopam, fentaNYL, gentamicin, hydrocortisone, HYDROmorphine, labetalol, lidocaine, linezolid, LORazepam, magnesium sulfate, mechlorethamine, methylPREDNISolone, metroNIDAZOLE, midazolam, milrinone, morphine, nafcillin, nesiritide, nitroglycerin, nitroprusside, norepinephrine, octreotide, oxaliplatin, oxytocin, palonosetron, penicillin G potassium, potassium chloride/phosphate, quinupristin/dalfopristin, ranitidine, rocuronium, tacrolimus, tirofiban, tobramycin, trimethoprim/sulfamethoxazole, vancomycin, vasopressin, vecuronium, vinCRIStine, voriconazole, zoledronic acid

SIDE EFFECTS

CNS: *Headache, dizziness, anxiety, depression, confusion, paresthesia, somnolence, flushing*

CV: Edema, bradycardia, hypotension, palpitations, **pulmonary edema**, chest pain, tachycardia, increased angina, **arrhythmias, CHF**

GI: Nausea, vomiting, gastric upset, constipation, **hepatitis**, abdominal cramps, dry mouth, sore throat

GU: Nocturia, polyuria

INTEG: Rash, inf site discomfort, **Stevens-Johnson syndrome**

OTHER: Blurred vision, flushing, sweating, SOB, impotence

PHARMACOKINETICS

Metabolized by liver, excreted in urine 60%, feces 35%

PO: Onset 30 min, peak 1-2 hr, duration 8 hr

PO-SR: Onset unknown, peak 2-6 hr, duration 10-12 hr, half-life 2-5 hr

INTERACTIONS

Increase: effects of digoxin, neuromuscular blocking agents, theophylline, other antihypertensives, nitrates, alcohol, quinine

Increase: nifedipine effects—cimetidine

Increase: toxicity risk—cyclosporine, prazosin, carbamazepine, quinine, propranolol

Decrease: antihypertensive effect—NSAIDs, rifampin

Drug/Herb

Increase: effect—ginkgo, ginseng, hawthorn

Decrease: effect—ephedra, melatonin, St. John's wort, yohimbe

Drug/Food

Increase: hypotensive effect—grapefruit juice

Increase: LFTs

Drug/Lab Test

Decrease: potassium (IV), phosphate, platelets

NURSING CONSIDERATIONS

Assess:

Cardiac status: B/P often, pulse, respiration, ECG during long-term treatment

- **Anginal pain:** intensity, location, duration; alleviating, precipitating factors
- Potassium, renal, hepatic studies periodically

CHF: weight gain, crackles, jugular venous distention, dyspnea, I&O

- **Hypertension:** decreasing B/P; assess salt in diet, smoking, exercise, weight, monitor B/P often

Evaluate:

- Therapeutic response: decreased anginal pain, decreased B/P

Teach patient/family:

- To avoid hazardous activities until stabilized on product, dizziness is no longer a problem
- To limit caffeine consumption; to avoid alcohol products, to take without regard to food, avoid high-fat foods, to swallow sus rel product whole
- To avoid OTC products, grapefruit juice unless directed by prescriber
- **Hypertension:** comply in all areas of medical regimen: diet, exercise, stress reduction, product therapy  **To notify prescriber of irregular heartbeat, SOB, swelling of feet and hands, pronounced dizziness, constipation, nausea, hypotension, change in severity/pattern/incidence of angina**

TREATMENT OF OVERDOSE:

Defibrillation, β -agonists, IV calcium, diuretics, atropine for AV block, vasopressor for hypotension

🍁 Canada only Side effects: *italics* = common; **bold** = life-threatening 
Nurse Alert

nicotine

(nik'o-teen)

nicotine chewing gum

CVS Nicotine Polacrilex, Equate Nicotine, GNP Nicotine, Good Sense Nicotine, Leader Nicotine Gum, NICORELIEF, Nicorette, Publix Stop Smoking Aid, TopCare Nicotine, Walgreens Nicotine

nicotine inhaler (OTC, Rx)

Nicotrol

nicotine lozenge (OTC)

CVS Nicotine Polacrilex, GNP Nicotine Polacrilex, Good Sense Nicotine, Polacrilex, TopCare Nicotine Polacrilex, Walgreens Nicotine Polacrilex

nicotine nasal spray (Rx)

Nicotrol NS

nicotine transdermal (OTC, Rx)

CVS Nicotine Transdermal System, Equate Nicotine Transdermal System, Habitrol , Leader Nicotine Transdermal Patch, Nicoderm CQ, Sunmark Nicotine Transdermal System, Walgreens Nicotine

Transdermal Patch *Func. class.:* Smoking deterrent

Chem. class.: Ganglionic cholinergic agonist

ACTION:

Agonist at nicotinic receptors in peripheral, central nervous systems; acts at sympathetic ganglia, on chemoreceptors of aorta, carotid bodies; also affects adrenalin-releasing catecholamines

USES:

Deter cigarette smoking

Unlabeled uses: Gilles de la Tourette's syndrome, ulcerative colitis

CONTRAINDICATIONS:

Pregnancy (D) (transdermal, inhaler); hypersensitivity, immediate post-MI recovery period, severe angina pectoris

Precautions: Pregnancy (C) (gum); breastfeeding, vasospastic disease, dysrhythmias, diabetes mellitus, hyperthyroidism, pheochromocytoma, esophagitis, peptic ulcer, coronary/renal/hepatic disease; MRI (patch)

DOSAGE AND ROUTES

Calculator

Nicotine chewing gum

- **Adult:** Chew 1 piece of gum (2 mg nicotine) whenever urge to smoke occurs; dose varies; usually 20 mg/day during first mo, max 24 pieces/day, max 3 mo

Nicotine inhaler

- **Adult:INH** 6 cartridges/day for first 3-6 wk, max 16 cartridges/day $\times$ 12 wk

Nicotine lozenge

- **Adult:** If cigarette is desired >30 min after awakening, start with 2-mg lozenge; if <30 min after awakening, start with 4-mg lozenge then again q1-2hr, max 20 lozenges/day or 5 lozenges/6 hr $\times$ 6 wk, then 1 lozenge q2-4hr $\times$ 2 wk, then 1 lozenge q4-8hr $\times$ 2 wk, then discontinue

Nicotine nasal spray

- **Adult:** 1 spray in each nostril 1-2 $\times$ /hr, max 5 $\times$ /hr or 40 $\times$ /day, max 3 mo

Nicotine transdermal/inhaler system

- **Habitrol** , **nicoderm:** 21 mg/day $\times$ 4-8 wk; 14 mg/day $\times$ 2-4 wk; 7 mg/day $\times$ 2-4 wk
- **Nicotrol:** 15 mg/day $\times$ 12 wk; 10 mg/day $\times$ 2 wk; 5 mg/day $\times$ 2 wk
- **Nicotrol inhaler:** delivers 30% of nicotine that smoker receives from an actual cigarette

Gilles de la Tourette's syndrome (unlabeled)

- **Adult and child: Chewing gum** 2 mg chewed $\times$ 30 min bid for 1-6 mo;

TRANSDERMAL 7-or 10-mg patch daily $\times$ 2 days

Available forms: Transdermal patch (Habitrol , Nicoderm, nicotine transdermal system) delivering 7, 14, 21 mg/day; (Nicoderm) 5, 10, 15 mg/day; **nicotine inhaler** 4 mg delivered; **nasal spray** 0.5 mg nicotine/actuation; **gum** 2, 4 mg/piece; **lozenge** 2 mg, 4 mg

Administer:

- **Gum:** chew gum slowly for 30 min to promote buccal absorption of product; do not chew >45 min • Begin product withdrawal after 3 mo of use; do not exceed 6 mo
- **Transdermal patch:** 1 $\times$ /day to nonhairy, clean, dry area of skin on upper body or upper outer arm; rotate sites to prevent skin irritation • **Inhaler:** puffing on

mouthpiece delivers nicotine through mouth

SIDE EFFECTS

CNS: Dizziness, vertigo, insomnia, headache, confusion, seizures, depression, euphoria, numbness, tinnitus, strange dreams

CV: **Dysrhythmias**, tachycardia, palpitations, edema, flushing, hypertension

EENT: Jaw ache, irritation in buccal cavity

GI: *Nausea, vomiting, anorexia, indigestion*, diarrhea, abdominal pain, constipation, eructation, irritation

RESP: Breathing difficulty, cough, hoarseness, sneezing, wheezing, bronchial spasm

PHARMACOKINETICS

Onset 15-30 min, metabolized in liver, excreted in urine, half-life 2-3 hr, 30-120 hr (terminal)

INTERACTIONS

Increase: vasoconstriction—ergots, bromocriptine, cabergoline

Increase: effect of—adenosine

Increase: B/P—buPROPion

Decrease: effect of— α -blockers, insulin

Decrease: nicotine clearance—cimetidine

Drug/Food

- Avoid use of gum with acidic foods (colas, coffee) and for 15 min after

NURSING CONSIDERATIONS

Assess:

- **Smoking:** number of cigarettes smoked, years used; **withdrawal:** headache, cravings, restlessness, irritation, drowsiness, insomnia, sore throat, increased appetite
- **Adverse reaction:** irritation of buccal cavity, dislike of taste, jaw ache

Evaluate:

- Therapeutic response: decrease in urge to smoke, decreased need for gum after 3-6 mo

Teach patient/family:

- **Gum:** about all aspects of product use; give package insert to patient and

explain • That gum will not stick to dentures, dental appliances
• That gum is as toxic as cigarettes; that it is to be used only to deter smoking, call prescriber immediately, stop use if difficulty breathing or rash occur • To avoid use during pregnancy
• **Transdermal patch:** that patch is as toxic as cigarettes; to be used only to deter smoking • Not to use during pregnancy because birth defects may occur; not to breastfeed
• To keep used and unused system out of reach of children and pets
• To stop smoking immediately when beginning patch treatment
• To apply promptly after removing from protective patch because system may lose strength • **Nasal spray:** to tilt head back; not to swallow or inhale during administration; after smoking is stopped, to use spray up to 8 wk then discontinue over 6 wk by tapering • **Lozenges:** to allow to dissolve; to avoid swallowing
• **Inhalation:** to use by inhaler for 20 min

☼ Canada only Side effects: *italics* = common; **bold** = life-threatening ⚠
Nurse Alert

NIFEdipine (Rx)

(nye-fed'i-peen)

Adalat CC, Afeditab CR, Apo-Nifed , Apo-Nifed PA , Nifediac CC, Nifedical XL, Procardia, Procardia XL

Func. class.: Calcium channel blocker, antianginal, antihypertensive *Chem. class.:* Dihydropyridine

Do not confuse: NIFEdipine/niCARDipine/niMODipine

ACTION:

Inhibits calcium ion influx across cell membrane during cardiac depolarization; relaxes coronary vascular smooth muscle; dilates coronary arteries; increases myocardial oxygen delivery in patients with vasospastic angina; dilates peripheral arteries

USES:

Chronic stable angina pectoris, vasospastic angina, hypertension

Unlabeled uses: Migraines, preterm labor, chronic/acute hypertension (pediatrics), diabetic nephropathy, proteinuria, hiccups

CONTRAINDICATIONS:

Hypersensitivity to this product or dihydropyridine; cardiogenic shock

Precautions: Pregnancy (C), breastfeeding, children, CHF, hypotension, sick sinus syndrome, 2nd-/3rd-degree heart block, hypotension <90 mm Hg systolic, hepatic injury, renal disease, acute MI, aortic stenosis, GERD, heart failure

DOSAGE AND ROUTES

Calculator

• **Adult: PO** Immediate release 10 mg tid, increase in 10-mg increments q7-14days, max 180 mg/24 hr or single dose of 30 mg; **SUS REL** 30-60 mg/day, may increase q7-14days, max 90 mg/day

Hypertension

• **Adult: PO EXT REL** 30-60 mg daily, titrate upward as needed, max 90 mg/day (Adalat CC), 120 mg/day (Procardia XL)

• **Child/adolescent (unlabeled): PO EXT REL** 0.25-0.5 mg/kg/day, max 3 mg/kg/day

Acute hypertensive episodes in pediatric patients (unlabeled)

- **Adolescent/child/infant: PO** 0.2-0.5 mg/kg/dose up to 10 mg (total dose)

Migraine prophylaxis (unlabeled)

- **Adult: PO** 30-180 mg/day

Preterm labor (unlabeled)

- **Pregnant female: PO** Immediate release (Procardia, Adalat) 30-mg loading dose then 10-20 mg q4-6hr; use in monitored settings

Available forms: Caps 5 , 10, 20 mg; ext rel tabs (CC, XL) 10 , 20 , 30, 60, 90 mg; tabs 10 mg 

Administer:

- Do not break, crush, or chew ext rel tabs, do not use immediate release caps within 7 days of MI, coronary syndrome • Without regard to meals; avoid grapefruit juice
- Protect caps from direct light, keep in dry area, do not freeze

SIDE EFFECTS

CNS: *Headache*, fatigue, drowsiness, *dizziness*, anxiety, depression, weakness, insomnia, lightheadedness, paresthesia, tinnitus, blurred vision, nervousness, tremor, *flushing*

CV: *Dysrhythmias*, edema, hypotension, palpitations, tachycardia

GI: Nausea, vomiting, diarrhea, gastric upset, constipation, increased LFTs, dry mouth, flatulence, gingival hyperplasia

GU: *Nocturia*, *polyuria*

HEMA: Bruising, bleeding, petechiae

INTEG: Rash, pruritus, flushing, hair loss, *Stevens-Johnson syndrome*, *toxic epidermal necrolysis*, *exfoliative dermatitis*

MISC: Sexual difficulties, cough, fever, chills

PHARMACOKINETICS

Metabolized by liver; excreted in urine 60%-80% (metabolites), feces 15%; protein binding 90%-98%

PO: Onset 20 min, peak 0.5-6 hr, duration 6-8 hr, half-life 2-5 hr, well absorbed

PO-ER: Duration 24 hr

INTERACTIONS

 **Contraindicated with strong CYP3A4 inducers**

Increase: level of digoxin, phenytoin, cycloSPORINE, prazosin, carBAMazepine

 **Increase: NIFEdipine, toxicity—cimetidine, ranitidine**

Increase: effects of β -blockers, antihypertensives

Decrease: antihypertensive effect—NSAIDs

Decrease: effects of quiNIDine

Decrease: NIFEdipine level—smoking

Drug/Herb

Increase: effect—ginkgo biloba, ginseng, hawthorn

Decrease: effect—ephedra, melatonin, St. John's wort, yohimbe

Drug/Food

Increase: NIFEdipine level—grapefruit juice

Drug/Lab Test

Increase: CPK, LDH, AST

Positive: ANA, direct Coombs' test

NURSING CONSIDERATIONS

Assess:

- **Anginal pain:** location, intensity, duration, character, alleviating, aggravating factors • Cardiac status: B/P, pulse, respiration, ECG at baseline and periodically, in those taking antihypertensives, β -blockers, monitor B/P often • Potassium, renal, hepatic studies periodically during treatment
- For bruising, petechiae, bleeding
- **GI obstruction:** Ext rel products have been associated with rare reports of obstruction in those with strictures and no known GI disease • **Serious skin disorders:** rash that starts suddenly, fever, cutaneous lesions that may have pustules present; discontinue product

Evaluate:

- Therapeutic response: decreased anginal pain, B/P, activity tolerance

Teach patient/family:

- To avoid hazardous activities until stabilized on product, dizziness is no longer a problem • To limit caffeine consumption; to avoid alcohol products
- To avoid OTC products unless directed by prescriber without regard to meals, Adalat CC should be taken on empty stomach • That empty tab shells may

appear in stools and is not significant

- **Hypertension:** to comply with all areas of medical regimen: diet, exercise, stress reduction, product therapy
- To change position slowly because orthostatic hypotension is common

⚠ To notify prescriber of dyspnea, edema of extremities, nausea, vomiting, severe ataxia, severe rash; changes in pattern, frequency, severity of angina

- To increase fluid intake to prevent constipation
- To check for gingival hyperplasia and report promptly
- Not to discontinue abruptly; to gradually taper

TREATMENT OF OVERDOSE:

Defibrillation, atropine for AV block, vasopressor for hypotension

🍁 Canada only Side effects: *italics* = common; **bold** = life-threatening ⚠

Nurse Alert

nilotinib (Rx)

(nye-loe'ti-nib)

Tasigna

Func. class.: Antineoplastic—miscellaneous

Chem. class.: Protein-tyrosine kinase inhibitor

ACTION:

Inhibits BCR-ABL tyrosine kinase created in patients with chronic myeloid leukemia (CML)

USES:

Chronic phase/accelerated phase Philadelphia-chromosome–positive CML that is resistant or intolerant to imatinib

CONTRAINDICATIONS:

Pregnancy (D), breastfeeding, hypersensitivity

Black Box Warning:

Hypokalemia, hypomagnesemia, QT prolongation

Precautions: Children, females, geriatric patients, active infections, anemia, cardiac disease, bone marrow suppression, cholestasis, diabetes, gelatin hypersensitivity, infertility, galactose-free diet, lactase deficiency, neutropenia, pancreatitis, thrombocytopenia

Black Box Warning:

Hepatic disease

DOSAGE AND ROUTES

Calculator

- **Adult: PO** 400 mg q12hr, continue until disease progression or unacceptable toxicity

Adjustment after discontinuation of a strong CYP3A4 inducer

- **Adult: PO** Reduce to 400 mg/bid

For those taking a strong CYP3A4 inhibitor

- **Adult: PO** Reduce dose to 300 mg/day

QT prolongation

- **QTcF >480 msec:** Withhold dose

Myelosuppression

- **Anc $1 \times 10^9/l$ or platelets $<50 \times 10^9/l$:** Withhold dose

Hepatic dose

- **Adult: PO** (Child-Pugh A/B/C) newly diagnosed CML 200 mg bid, then escalation to 300 mg bid initially

Available forms: Caps 150, 200 mg

Administer:

- Do not break, crush, or chew caps; if whole capsule cannot be swallowed, disperse capsule contents in 1 tsp. applesauce • Without regard to meals; separate doses by 12 hr; make-up dose should not be taken if dose is missed

SIDE EFFECTS

CNS: Headache, dizziness, fatigue, fever, flushing, paresthesia

CV: **QT prolongation**, palpitations, **torsades de pointes**, AV block

GI: Nausea, **hepatotoxicity**, **vomiting**, **dyspepsia**, *anorexia*, *abdominal pain*, constipation, **pancreatitis**, diarrhea, xerostomia

HEMA: **Neutropenia**, **thrombocytopenia**, **anemia**, **pancytopenia**

INTEG: *Rash*, alopecia, erythema

META: Hyperamylasemia, hyperbilirubinemia, hyperglycemia, hyperkalemia, hypocalcemia, hyponatremia, hypomagnesemia

MISC: Diaphoresis, anxiety

MS: Arthralgia, myalgia, back or bone pain, muscle cramps

RESP: Cough, dyspnea

SYST: **Bleeding**, **tumor lysis syndrome**

PHARMACOKINETICS

Protein binding 98%, metabolized by CYP3A4, plasma levels 3 hr, elimination half-life 17 hr

INTERACTIONS

- Product interactions are numerous

- Do not use with phenothiazines, pimozide, ziprasidone

⚠ Increase: QT prolongation—class IA/III antidysrhythmics, some phenothiazines, β agonists, local anesthetics, tricyclics, haloperidol, chloroquine, droperidol, pentamidine; CYP3A4 inhibitors (amiodarone, clarithromycin, erythromycin, telithromycin, troleandomycin), arsenic trioxide, levomethadyl;

CYP3A4 substrates (methadone, pimozide, quetiapine, quinidine, risperidone, ziprasidone)

 **Increase:** hepatotoxicity—acetaminophen

Increase: concentrations—ketoconazole, itraconazole, erythromycin, clarithromycin

Increase: plasma concentrations of simvastatin, calcium channel blockers

Increase: plasma concentration of warfarin; avoid use with warfarin, use low-molecular-weight anticoagulants instead

Decrease: concentrations—dexamethasone, phenytoin, carbamazepine, rifampin, phenobarbital

Drug/Herb

Decrease: concentration—St. John's wort

Drug/Food

Increase: plasma concentrations—grapefruit juice

NURSING CONSIDERATIONS

Assess:

- **Tumor lysis syndrome:** maintain hydration, correct uric acid before use with this product

Black Box Warning:

QT prolongation can occur; monitor ECG, left ventricular ejection fraction (LVEF) at baseline periodically; hypertension, assess for chest pain, palpitations, dyspnea

Black Box Warning:

Hepatotoxicity: monitor LFTs before treatment and monthly; if liver transaminases $>5 \times \text{IULN}$, withhold until transaminase levels return to $<2.5 \times \text{IULN}$

- **Myelosuppression:** CBC, differential, platelet count; for bleeding: epistaxis, rectal, gingival, upper GI, genital and wound bleeding; **tumor-related**

hemorrhage may occur rapidly • ANC and platelets; if ANC $<1 \times 10^9/\text{L}$ and/or platelets $<50 \times 10^9/\text{L}$, stop until ANC $>1.5 \times 10^9/\text{L}$ and platelets $>75 \times 10^9/\text{L}$

- **Electrolytes:** calcium, potassium, magnesium, sodium; lipase, phosphate; hypokalemia, hypomagnesemia should be corrected before use

Perform/provide:

- Storage at 59° F-86° F (15° C-30° C)

Evaluate:

- Therapeutic response: decrease in progression of disease

Teach patient/family:

- To report adverse reactions immediately: SOB, bleeding
 - About reason for treatment, expected results
 - That many adverse reactions may occur
 - To avoid persons with known upper respiratory tract infections; immunosuppression is common • To watch for signs, symptoms of low potassium or magnesium
-

🍁 Canada only Side effects: *italics* = common; **bold** = life-threatening ⚠️
Nurse Alert

nisoldipine (Rx)

(nye-sole'dih-peen)

Sular

Func. class.: Calcium channel blocker, antihypertensive *Chem. class.:* Dihydropyridine

Do not confuse: nisoldipine/NIFEdipine/niMODipine

ACTION:

Inhibits calcium ion influx across the cell membrane, thereby resulting in the dilation of peripheral arteries

USES:

Essential hypertension, alone or in combination with other antihypertensives

Unlabeled uses: Variant (Prinzmetal's) angina, stable angina pectoris

CONTRAINDICATIONS:

Hypersensitivity to this product or dihydropyridines; sick sinus syndrome; 2nd-/3rd-degree heart block; aortic stenosis

Precautions: Pregnancy (C), breastfeeding, children, geriatric patients, CHF, hypotension <90 mm Hg systolic, hepatic injury, renal disease, acute MI, unstable angina, CAD, cardiogenic shock

DOSAGE AND ROUTES

Calculator

Hypertension

- **Adult: PO** 17 mg/day initially, may increase by 8.5 mg/wk, usual dose 17-34 mg/day, max 34 mg/day

- **Geriatric/hepatic dose: PO** 8.5 mg/day, increase based on patient response

Variant (Prinzmetal's) angina/stable angina pectoris (unlabeled)

- **Adult: PO** 17-34 mg/day, max 34 mg/day

Hepatic dose

- **Adult: PO** 8.5 mg/day

Available forms: Ext rel tabs 8.5, 17, 20, 25.5, 30, 34, 40 mg

Administer:

PO route

- Swallow whole; do not break, crush, or chew
- Once daily as whole tablet; avoid high-fat foods, grapefruit juice

SIDE EFFECTS

CNS: Headache, fatigue, drowsiness, dizziness, anxiety, depression, nervousness, insomnia, lightheadedness, paresthesia, tinnitus, psychosis, somnolence, ataxia, confusion, malaise, migraine, flushing

CV: Dysrhythmia, edema, **CHF**, hypotension, palpitations, **MI**, **pulmonary edema**, tachycardia, syncope, AV block, angina, chest pain, ECG abnormalities

GI: Nausea, vomiting, diarrhea, gastric upset, constipation, increased LFTs, dry mouth, dyspepsia, dysphagia, flatulence

GU: Nocturia, hematuria, dysuria

HEMA: **Anemia**, **leukopenia**, petechiae

INTEG: Rash, pruritus

MISC: Sexual difficulties, cough, nasal congestion, SOB, wheezing, epistaxis, dyspnea, gingival hyperplasia, chills, fever, gout, sweating

PHARMACOKINETICS

Metabolized by liver, excreted in urine, peak 6-12 hr, protein binding 99%, half-life 7-12 hr

INTERACTIONS

Increase: effects of β -blockers, antihypertensives, digoxin

Increase: nisoldipine level—CYP3A4 inhibitors, cimetidine, ranitidine, azole antifungals

Decrease: nisoldipine effect—CYP3A4 inducers, hydantoins

Drug/Herb

Increase: B/P—ephedra, melatonin

Decrease: B/P—hawthorn

Decrease: nisoldipine effect—St. John's wort, ginseng, ginkgo biloba

Drug/Food

Increase: nisoldipine level—high-fat foods

Increase: hypotensive effect—grapefruit juice

NURSING CONSIDERATIONS

Assess:

- Cardiac status: B/P, pulse, respiration, ECG before treatment and periodically
- **CHF**: weight gain, jugular venous distention, edema, crackles, I&O ratios
- **Angina**: frequency, severity of attacks, if angina worsens, report immediately

Evaluate:

- Therapeutic response: decreased B/P

Teach patient/family:

- To avoid hazardous activities until stabilized on product, dizziness is no longer a problem
- To report nausea, dizziness, swelling, SOB, palpitations, severe headache
- To avoid OTC products unless directed by prescriber; to avoid grapefruit juice
- About the importance of complying with all areas of the medical regimen: diet, exercise, stress reduction, product therapy
- To rise slowly to prevent orthostatic hypotension
- If dose is missed, to take as soon as remembered; not to double dose
- How to perform B/P monitoring at home

TREATMENT OF OVERDOSE:

Defibrillation, atropine for AV block, vasopressor for hypotension

☼ Canada only Side effects: *italics* = common; **bold** = life-threatening ⚠
Nurse Alert

nitazoxanide (Rx)

(nye-taz-ox'a-nide)

Alinia

Func. class.: Antiprotozoal

ACTION:

Interferes with DNA/RNA synthesis in protozoa

USES:

Diarrhea caused by *Cryptosporidium parvum* or *Giardia lamblia*

CONTRAINDICATIONS:

Hypersensitivity

Precautions: Pregnancy (B), breastfeeding, children <1 yr or >11 yr, renal/hepatic disease, diabetes mellitus (contains sucrose), HIV, immunocompromised patients

DOSAGE AND ROUTES

Calculator

- **Adult: PO** 500 mg q12hr × 3 days
- **Child 4-11 yr: PO** 10 ml (200 mg) q12hr × 3 days
- **Child 12-47 mo: PO** 5 ml (100 mg) q12hr × 3 days

Available forms: Powder for oral susp 100 mg/5 ml; tab 500 mg

Administer:

PO route

- With food
- Shake oral suspension before giving, discard after 1 wk

SIDE EFFECTS

CNS: Dizziness, fever, headache

CV: Hypotension

GI: Nausea, anorexia, flatulence, increased appetite, enlarged salivary glands, abdominal pain, diarrhea, vomiting

HEMA: Anemia, leukopenia, neutropenia

INTEG: Pruritus, sweating

MISC: Increased creatinine, pale yellow eye discoloration, rhinitis, discolored urine, infection, malaise

PHARMACOKINETICS

Peak 1-4 hr; excreted in urine, bile, feces; hydrolyzed to active metabolite, which undergoes conjugation; metabolite protein binding >99%

INTERACTIONS

- Competes for binding sites: other highly protein-bound products; phenytoin, salicylates

Drug/Lab Test

Increase: creatinine, GPT

NURSING CONSIDERATIONS

Assess:

- Signs of infection
- Bowel pattern before, during treatment

Evaluate:

- Therapeutic response: C&S negative for organism, decreased diarrhea

Teach patient/family:

- To take with food; shake susp well before each dose, discard susp after 7 days

☼ Canada only Side effects: *italics* = common; **bold** = life-threatening ⚠
Nurse Alert

nitrofurantoin (Rx)

(nye-troe-fyoor'an-toyn)

Furadantin, Macrobid, Macrochantin, Novo-Furantoin 

Func. class.: Urinary tract antiinfective

Chem. class.: Synthetic nitrofuran derivative

ACTION:

Inhibits bacterial acetyl-CoA interference with carbohydrate metabolism

USES:

Urinary tract infections caused by *Escherichia coli*, *Klebsiella*, *Pseudomonas*, *Proteus vulgaris*, *Proteus morganii*, *Serratia*, *Citrobacter*, *Staphylococcus aureus*, *Staphylococcus epidermidis*, *Enterococcus*, *Salmonella*, *Shigella*

CONTRAINDICATIONS:

Infants <1 mo, hypersensitivity, anuria, severe renal disease CCr <60 ml/min, at term pregnancy (38-42 wk), labor, delivery, cholestatic jaundice due to nitrofurantoin therapy

Precautions: Pregnancy (B), breastfeeding, geriatric patients, G6PD deficiency, GI disease, diabetes

DOSAGE AND ROUTES

Calculator

Active infections

- **Adult: PO** 50-100 mg qid after meals
- **Child: PO** 5-7 mg/kg/day in 4 divided doses

Chronic suppression

- **Adult: PO** 50-100 mg q PM
- **Child: PO** 1-2 mg/kg/day in PM or 0.5-1 mg/kg q12hr if dose not well tolerated

Available forms: Caps 25, 50, 100 mg; susp 25 mg/5 ml; macrocrystal caps (Macrochantin) 25, 50, 100 mg; Macrobid cap 100 mg (25 macrocrystals, 75 monohydrate)

Administer:

PO route

- Give with meals
- Do not break, crush, chew, or open tabs, caps, store in original container
- Two daily doses if urine output is high or if patient diabetic
- Use calibrated device to measure liquid product; may mix water, fruit juice; rinse mouth after liquid product; staining of teeth may occur

SIDE EFFECTS

CNS: *Dizziness, headache, drowsiness, peripheral neuropathy, chills, confusion, vertigo*

CV: *Bundle branch block, chest pain*

GI: *Nausea, vomiting, abdominal pain, diarrhea, cholestatic jaundice, loss of appetite, pseudomembranous colitis, hepatitis, pancreatitis*

HEMA: *Anemia, agranulocytosis, hemolytic anemia, leukopenia, thrombocytopenia*

INTEG: *Pruritus, rash, urticaria, angioedema, alopecia, tooth staining, exfoliative dermatitis, Stevens-Johnson syndrome*

MS: *Arthralgia, myalgia, numbness, peripheral neuropathy*

RESP: *Cough, dyspnea, pneumonitis, pulmonary fibrosis or infiltrate*

SYST: *Superinfection, SLE-like syndrome*

PHARMACOKINETICS

PO: Half-life 20-60 min; crosses blood-brain barrier, placenta; enters breast milk; excreted as inactive metabolites in liver, unchanged in urine; protein binding 60%-90%

INTERACTIONS

Increase: antagonistic effect—norfloxacin

Increase: levels of nitrofurantoin—probenecid

Decrease: absorption of magnesium trisilicate antacid

Drug/Lab Test

Increase: BUN, alk phos, bilirubin, creatinine, blood glucose

NURSING CONSIDERATIONS

Assess:

- Blood count during chronic therapy, LFTs, pulmonary function tests

- **Urinary tract infection:** burning, pain on urination; fever; cloudy, foul-smelling urine; I&O ratio: C&S before treatment, after completion; serum creatinine, BUN
- **Pseudomembraneous colitis:** diarrhea with mucus, abdominal pain, fever, fatigue, anorexia; may be treated with vancomycin or metroNIDAZOLE
- CNS symptoms: insomnia, vertigo, headache, drowsiness, seizures
- ⚠ **Hepatotoxicity:** yellowing of skin or eyes, dark urine, clay-colored stools; monitor AST, ALT
- ⚠ **Pulmonary fibrosis, pneumonitis:** dyspnea, tachypnea, persistent cough
- ⚠ **Serious skin disorders:** fever, flushing, rash, urticaria, pruritus
- **Peripheral neuropathy:** paresthesias (more common in diabetes mellitus, electrolyte imbalances, vit B deficiency, debilitated patients)

Evaluate:

- Therapeutic response: decreased dysuria, fever; negative C&S

Teach patient/family:

- To notify prescriber of continued symptoms of UTI, fever, myalgias, arthralgias, numbness or tingling of extremities
- To take with food or milk; to avoid alcohol
- To protect susp from freezing; shake well before taking
- That product may cause drowsiness; to seek aid with walking, other activities; not to drive or operate machinery while taking medication
- That diabetics should monitor blood glucose levels
- That product may turn urine rust-yellow to brown

⚠ **Pseudomembraneous colitis:** fever; diarrhea with mucus, pus, or blood; report immediately

🍁 Canada only Side effects: *italics* = common; **bold** = life-threatening ⚠
Nurse Alert

nitrofurazone topical

See [Appendix B](#)

nitroglycerin (Rx)

(nye-troe-gli'ser-in)

extended release caps (Rx)

Nitro-Time

topical ointment (Rx)

Nitro-Bid

rectal ointment

Rectiv

SL (Rx)

Nitrostat

translingual spray (Rx)

Nitrolingual

transdermal (Rx)

Minitran, Nitro-Dur

Func. class.: Coronary vasodilator, antianginal

Chem. class.: Nitrate

Do not confuse: **Nitro-Bid**/Nicobid

ACTION:

Decreases preload and afterload, which are responsible for decreasing left ventricular end-diastolic pressure, systemic vascular resistance; dilates coronary arteries, improves blood flow through coronary vasculature, dilates arterial and venous beds systemically

USES:

Chronic stable angina pectoris, prophylaxis of angina pain, CHF, acute MI, controlled hypotension for surgical procedures, anal fissures

Unlabeled uses: Pulmonary hypertension, hemorrhoids, retained placenta

CONTRAINDICATIONS:

Hypersensitivity to this product or nitrites; severe anemia, increased intracranial pressure, cerebral hemorrhage, closed-angle glaucoma, cardiac tamponade, cardiomyopathy, constrictive pericarditis

Precautions: Pregnancy (C), breastfeeding, children, postural hypotension, severe renal/hepatic disease, acute MI, abrupt discontinuation, hyperthyroidism

DOSAGE AND ROUTES

Calculator

- **Adult: SL** Dissolve tab under tongue when pain begins; may repeat q5min until relief occurs; take ≤ 3 tabs/15 min; use 1 tab prophylactically 5-10 min before activities; **SUS CAP** q6-12hr on empty stomach; **TOP** 1-2 in q8hr, increase to 4 in q4hr as needed; **IV** 5 mcg/min then increase by 5 mcg/min q3-5min; if no response after 20 mcg/min, increase by 10-20 mcg/min until desired response; **TRANS PATCH** apply a pad daily to a site free of hair; remove patch at bedtime to provide 10-12 hr nitrate-free interval to avoid tolerance

- **Child: IV** Initially 0.25-0.5 mcg/kg/min, titrate to patient response, usual dose 1-3 mcg/kg/min transmucosal

Anal fissures (Rectiv)

- **Adult: Rectal** Apply 1 inch of 0.4% ointment q12hr $\times$ 3 wk

Available forms: Translingual aero 0.4 mg/metered spray; sus rel tabs 2.6, 6.5, 9 mg; SL tabs 0.3, 0.4, 0.6 mg; topical oint 2%; trans syst 0.1, 0.2, 0.3, 0.4, 0.6, 0.8 mg/hr; inj sol 25 mg/250 ml, 50 mg/250 ml, 50 mg/500 ml, 100 mg/250 ml, 200 mg/500 ml; rectal ointment 0.4% (Rectiv)

Administer:

- **Topical ointment** should be measured on papers supplied, use paper to spread on nonhairy area of chest, abdomen, thigh skin; thin layer spread over 2-3 inches, do not rub

PO route

- Swallow sus rel products whole; do not break, crush, or chew
- With 8 oz water on empty stomach (oral tablet) 1 hr before or 2 hr after meals
- **SL:** should be dissolved under tongue, not swallowed
- **Aerosol** sprayed under tongue (**nitrolingual**), not inhaled; prime before 1st-time use or if product has not been used in >6 wk; press valve head with forefinger

Transdermal route

- Apply new TD patch daily, remove after 12-14 hr to prevent tolerance

Rectal route

- Cover finger with plastic wrap, disposable glove, or finger cot; lay finger alongside 1-inch dosing line on carton, squeeze tube until equal to 1-inch dosing line; insert covered finger gently into anal canal no further than 1st finger joint and apply to sides; wash hands thoroughly; if too painful, apply directly to outside of anus

Continuous IV INF route

- Diluted in D₅, D₅W, 0.9% NaCl for inf to 200-400 mcg/ml, depending on patient's fluid status; common dilution 50 mg/250 ml, use controlled inf device; use glass inf bottles, non-polyvinyl-chloride inf tubing; titrate to patient response; do not use filters

Y-site compatibilities: Acyclovir, alfen-tanil, amikacin, aminocaproic acid, aminophylline, amiodarone, amphotericin B cholesteryl, amphotericin B lipid complex, amphotericin B liposome, anidulafungin, argatroban, ascorbic acid, atenolol, atracurium, atropine, azaTHIOprine, aztreonam, benztropine, bivalirudin, bleomycin, bumetanide, buprenorphine, butorphanol, calcium chloride/gluconate, CARBOplatin, caspofungin, cefamandole, ceFAZolin, cefmetazole, cefonicid, cefoperazone, cefotaxime, cefoTEtan, cefOXitin, cefTAZidime, ceftizoxime, cefTRIAxone, cefuroxime, cephalothin, cephapirin, chloramphenicol, chlorproMAZINE, cimetidine, cisatracurium, CISplatin, clindamycin, cloNIDine, cyanocobalamin, cyclophosphamide, cycloSPORINE, cytarabine, DACTINomycin, dexamethasone, digoxin, diltiazem, diphenhydrAMINE, DOBUTamine, DOCEtaxel, DOPamine, doxacurium, DOXOrubicin, doxycycline, drotrecogin alfa, enalaprilat, ePHEDrine, EPINEPHrine, epirubicin, epoetin alfa, eptifibatide, ertapenem, erythromycin, esmolol, etoposide, famotidine, fenoldopam, fentaNYL, fluconazole, fludarabine, fluorouracil, folic acid, ganciclovir, gatifloxacin, gemcitabine, gemtuzumab, gentamicin, glycopyrrolate, granisetron, heparin, hydrocortisone, HYDROmorphine, hydrOXYzine, IDArubicin, ifosfamide, imipenem-cilastatin, indomethacin, insulin (regular), irinotecan, isoproterenol, ketorolac, labetalol, lidocaine, linezolid, LORazepam, magnesium sulfate, mannitol, mechlorethamine, meperidine, metaraminol, methicillin, methotrexate,

methoxamine, methyldopate, methylPREDNISolone, metoclopramide, metroNIDAZOLE, mezlocillin, micafungin, miconazole, midazolam, milrinone, minocycline, mitoXANtrone, morphine, moxalactam, mycophenolate, nafcillin, nalbuphine, naloxone, nesiritide, netilmicin, niCARdipine, nitroprusside, norepinephrine, octreotide, ondansetron, oxacillin, oxaliplatin, oxytocin, PACLitaxel, palonosetron, pamidronate, pancuronium, pantoprazole, papaverine, PEMEtrexed, penicillin G potassium/sodium, pentamidine, pentazocine, PENTobarbital, PHENobarbital, phentolamine, phenylephrine, phytonadione, piperacillin, piperacillin-tazobactam, polymyxin B, potassium chloride, procainamide, prochlorperazine, promethazine, propofol, propranolol, protamine, pyridoxine, quiNIDine, quinupristin-dalfopristin, ranitidine, remifentanyl, ritodrine, rocuronium, sodium bicarbonate, succinylcholine, SUFentanyl, tacrolimus, teniposide, theophylline, thiamine, thiopental, thiotepa, ticarcillin, ticarcillin-clavulanate, tigecycline, tirofiban, tobramycin, tolazoline, trimetaphan, urokinase, vancomycin, vasopressin, vecuronium, verapamil, vinCRIStine, vinorelbine, voriconazole, warfarin, zoledronic acid

SIDE EFFECTS

CNS: *Headache, flushing, dizziness*

CV: *Postural hypotension, tachycardia, collapse, syncope, palpitations*

GI: *Nausea, vomiting*

INTEG: *Pallor, sweating, rash*

PHARMACOKINETICS

Metabolized by liver, excreted in urine, half-life 1-4 min

SUS REL: Onset 20-45 min, duration 3-8 hr

SL: Onset 1-3 min, duration 30 min

TRANSDERMAL: Onset 30 min-1 hr, duration 12-24 hr

AEROSOL: Onset 2 min, duration 30-60 min

TOPICAL OINT: Onset 30-60 min, duration 2-12 hr

IV: Onset 1-2 min, duration 3-5 min

INTERACTIONS

- Severe hypotension, CV collapse: alcohol

Increase: effects of β -blockers, diuretics, antihypertensives, calcium channel

blockers

Increase: fatal hypotension—sildenafil, tadalafil, vardenafil; do not use together

Increase: nitrate level—aspirin

Decrease: heparin—IV nitroglycerin

Drug/Lab Test

Increase: urine catecholamine, urine VMA

False increase: cholesterol

NURSING CONSIDERATIONS

Assess:

- **Pain:** duration, time started, activity being performed, character
- Orthostatic B/P, pulse prior to and after administration
- Tolerance if taken over long period
- Headache, lightheadedness, decreased B/P; may indicate a need for decreased dosage

Evaluate:

- Therapeutic response: decrease, prevention of anginal pain

Teach patient/family:

- To place buccal tab between lip and gum above incisors or between cheek and gum
- To keep tabs in original container; to replace q6mo because effectiveness is lost; to keep away from heat, moisture, light
- That if 3 SL tabs in 15 min do not relieve pain, to seek immediate medical attention
- To avoid alcohol
- That product may cause headache; that tolerance usually develops; to use nonopioid analgesic
- That product may be taken before stressful activity: exercise, sexual activity
- That SL may sting when product comes in contact with mucous membranes
- To avoid hazardous activities if dizziness occurs
- To comply with complete medical regimen
- To make position changes slowly to prevent fainting

 **Never to use erectile dysfunction products (sildenafil, tadalafil, vardenafil); may cause severe hypotension, death**

☼ Canada only Side effects: *italics* = common; **bold** = life-threatening 

Nurse Alert

HIGH ALERT

nitroprusside (Rx)

(nye-troe-pruss'ide)

Nitropress

Func. class.: Antihypertensive, vasodilator

ACTION:

Directly relaxes arteriolar, venous smooth muscle, thereby resulting in reduction in cardiac preload and afterload

USES:

Hypertensive crisis; to decrease bleeding by creating hypotension during surgery; acute CHF

Unlabeled uses: Postoperative hypertension, mitral regurgitation

CONTRAINDICATIONS:

Hypersensitivity, hypertension (compensatory) due to aortic coarctation or AV shunting, acute CHF associated with reduced peripheral vascular resistance, AV shunt, Leber's disease, toxic amblyopia

Black Box Warning:

Cyanide toxicity

Precautions: Pregnancy (C), breastfeeding, children, geriatric patients, fluid, electrolyte imbalances, renal/hepatic disease, hypothyroidism

Black Box Warning:

Hypotension

DOSAGE AND ROUTES

Calculator

- **Adult and child:** IV INF 0.25-10 mcg/kg/min; max 10 mcg/kg/min

Renal dose

- **Adult:** IV INF CCr <60 ml/min, maintain doses <3 mcg/kg/min to reduce thiocyanate accumulation

Available forms: Inj 50 mg/2 ml

Administer:

- Antidote is sodium thiosulfate

Continuous IV INF route

- Depending on B/P reading q15min
- Reconstitute 50 mg/2-3 ml of D₅W, further dilute in 250, 500, or 1000 ml of D₅W to 200, 100, 50 mcg/ml, respectively; use inf pump only; wrap bottle with aluminum foil to protect from light; observe for color change in inf; discard if highly discolored (blue, green, dark red); titrate to patient response

Y-site compatibilities: Alfentanil, alprostadil, amikacin, aminocaproic acid, aminophylline, amphotericin B lipid compex, amphotericin B liposome, anidulafungin, argatroban, atenolol, atropine, aztreonam, benztropine, bivalirudin, bleomycin, bumetanide, buprenorphine, butorphanol, calcium chloride/gluconate, CARBOplatin, cefamandole, ceFAZolin, cefmetazole, cefonicid, cefoperazone, cefotaxime, cefoTEtan, cefOXitin, cefTAZidime, ceftizoxime, cefTRIAxone, cefuroxime, cephalothin, chloramphenicol, cimetidine, CISplatin, clindamycin, cyanocobalamin, cyclophosphamide, cycloSPORINE, cytarabine, DACTINomycin, DAPTOmycin, dexamethasone, digoxin, diltiazem, DOCEtaxel, DOPamine, doxacurium, DOXOrubicin, doxycycline, enalaprilat, ePHEDrine, EPINEPHrine, epirubicin, epoetin alfa, eptifibatide, ertapenem, esmolol, etoposide, famotidine, fenoldopam, fentaNYL, fluconazole, fludarabine, fluorouracil, folic acid, furosemide, ganciclovir, gatifloxacin, gemcitabine, gemtuzumab, gentamicin, glycopyrrolate, granisetron, heparin, hydrocortisone, HYDROmorphine, IDArubicin, ifosfamide, inamrinone, indomethacin, insulin (regular), isoproterenol, ketorolac, labetalol, lidocaine, linezolid, LORazepam, magnesium sulfate, mannitol, mechlorethamine, meperidine, metaraminol, methicillin, methoxamine, methyldopate, methylPREDNISolone, metoclopramide, metoprolol, metroNIDAZOLE, mezlocillin, micafungin, miconazole, midazolam, milrinone, minocycline, morphine, moxalactam, multiple vitamins injection, nafcillin, nalbuphine, naloxone, nesiritide, netilmicin, niCARdipine, nitroglycerin, norepinephrine, octreotide, ondansetron, oxacillin, oxaliplatin, oxytocin, PACLitaxel, palonosetron, pamidronate, pancuronium, pantoprazole, penicillin G potassium/sodium, pentamidine, PENTobarbital, PHENobarbital, phentolamine, phenylephrine, phytonadione, piperacillin, piperacillin-tazobactam, polymyxin B, potassium chloride/phosphates, procainamide, propofol, propranolol, protamine, pyridoxine, ranitidine, ritodrine, rocuronium,

sodium acetate/bicarbonate, succinylcholine, SUFentanil, tacrolimus, teniposide, theophylline, thiamine, ticarcillin, ticarcillin-clavulanate, tigecycline, tirofiban, tobramycin, tolazoline, trimetaphan, urokinase, vancomycin, vasopressin, vecuronium, verapamil, vinCRISTine, zoledronic acid

SIDE EFFECTS

CNS: *Dizziness, headache*, agitation, twitching, decreased reflexes, restlessness

CV: Bradycardia, ECG changes, tachycardia, hypotension

GI: Nausea, vomiting, abdominal pain

INTEG: Pain, irritation at inj site, sweating

MISC: *Cyanide, thiocyanate toxicity*, flushing, hypothyroidism

PHARMACOKINETICS

IV: Onset 1-2 min, duration 1-10 min, half-life 3 days in patients with abnormal renal function, circulating half-life 2 min; metabolized in liver, excreted in urine

INTERACTIONS

Increase: severe hypotension—ganglionic blockers, volatile liquid anesthetics, halothane, enflurane, circulatory depressants

Drug/Herb

Increase: antihypertensive effect—hawthorn

NURSING CONSIDERATIONS

Assess:

- Electrolytes: potassium, sodium, chloride, CO₂, CBC, serum glucose, serum methemoglobin if pulmonary O₂ levels are decreased; use IV 1-2 mg/kg methylene blue given over several min for methemoglobinemia
- Renal studies: catecholamines, BUN, creatinine
- Hepatic studies: AST, ALT, alk phos

Black Box Warning:

Hypotension: B/P by direct means if possible; check ECG continuously; pulse, jugular venous distention; PCWP; rebound hypertension may occur after nitroprusside is discontinued, give only with emergency equipment nearby, rapid decrease in B/P may occur

- Weight daily, I&O

⚠️ Thiocyanate, lactate, cyanide toxicity: obtain levels daily if inf >3 mcg/kg/min; thiocyanate level should be ≤1 mmol/L; thiocyanate toxicity

includes confusion, weakness, seizures, hyperreflexia, psychosis, tinnitus, coma

- Nausea, vomiting, diarrhea
- Edema in feet, legs daily; skin turgor, dryness of mucous membranes for hydration status • Crackles, dyspnea, orthopnea q30min
- For decrease in bicarbonate, PCO_2 blood pH, acidosis

Evaluate:

- Therapeutic response: decreased B/P, decreasing symptoms of cardiogenic shock or cardiac pump failure

Teach patient/family:

- To report headache, dizziness, loss of hearing, blurred vision, dyspnea, faintness, pain at IV site • About the reason for giving product and expected results

🍁 Canada only Side effects: *italics* = common; **bold** = life-threatening ⚠️
Nurse Alert

nizatidine (OTC, Rx)

(ni-za'ti-deen)

Axid, Axid AR

Func. class.: H₂-receptor antagonist Chem. class.: Substituted thiazole

ACTION:

Blocks H₂-receptors, thereby reducing gastric acid output

USES:

Benign gastric and duodenal ulceration, prevention of duodenal ulcer recurrence, symptomatic relief of gastroesophageal reflux, heartburn prevention

CONTRAINDICATIONS:

Hypersensitivity

Precautions: Pregnancy (B), breastfeeding, renal/hepatic impairment (reduce dose in renal impairment)

DOSAGE AND ROUTES

Calculator

Gastric and duodenal ulcer

- **Adult: PO** 300 mg at night or 150 mg bid for 4-8 wk; maintenance 150 mg at night

Prophylaxis of duodenal ulcer

- **Adult: PO** 150 mg/day at bedtime

Gastroesophageal reflux

- **Adult and child ≥12 yr: PO** 150 mg bid × ≤12 wk, max 300 mg/day

Heartburn prevention

- **Adult: PO** 75 mg before eating bid

Renal dose

- **Adult: PO** CCr 20-50 ml/min, give 150 mg every other day; CCr <20 ml/min, give 150 mg q72hr

Available forms: Caps 150, 300 mg; tabs 75 mg

Administer:

- With meals for prolonged product effect; antacids 1 hr before or 1 hr after

product; at bedtime if taken daily

SIDE EFFECTS

CNS: Headache, somnolence, confusion, abnormal dreams, dizziness

CV: Cardiac dysrhythmias, cardiac arrest

ENDO: Gynecomastia

GI: Elevated hepatic enzymes, hepatitis, jaundice, nausea

HEMA: Thrombocytopenia, agranulocytosis, aplastic anemia

INTEG: Pruritus, sweating, urticaria, exfoliative dermatitis

METAB: Hyperuricemia

MS: Myalgia

RESP: Bronchospasm, laryngeal edema, pneumonia

PHARMACOKINETICS

Partially metabolized by liver, excreted by kidneys, plasma half-life 1-2.8 hr, 70% absorbed orally, small amount (0.1% of plasma concentration) enters breast milk, 35% bound to plasma proteins

INTERACTIONS

Increase: GI obstruction risk—NIFEdipine (ext rel tabs)

Increase: effect of—mefloquine

Decrease: effect of—ketoconazole, itraconazole, atazanavir, cefditoren, cefpodoxime, delavirdine, gefitinib, raltegravir

Drug/Lab Test

Increase: ALT, AST, serum creatinine

False negative: allergy skin tests

NURSING CONSIDERATIONS

Assess:

- **GI pain:** epigastric, abdominal, character, alleviating factors, hematemesis, occult blood in stool, heartburn, GERD

⚠️ Agranulocytosis: CBC with differential if patient receiving long-term therapy

Evaluate:

- Decreased GI pain, heartburn, GERD; resolution of gastric, duodenal ulcers

Teach patient/family:

- That gynecomastia, impotence may occur, are reversible
- To avoid driving or other hazardous activities until stabilized on product; that dizziness may occur
- To avoid black pepper, caffeine, alcohol, harsh spices, extremes in temp of food
- To avoid OTC preparations: aspirin, cough, cold preparations

TREATMENT OF OVERDOSE:

Symptomatic and supportive therapy is recommended; activated charcoal, emesis, or lavage may reduce absorption

🍁 Canada only Side effects: *italics* = common; **bold** = life-threatening ⚠️
Nurse Alert

HIGH ALERT

norepinephrine (Rx)

(nor-ep-i-nef'rin)

Levophed

Func. class.: Adrenergic

Chem. class.: Catecholamine

Do not confuse: norepinephrine/EPINEPHrine

ACTION:

Causes increased contractility and heart rate by acting on β -receptors in heart; also acts on α -receptors, thereby causing vasoconstriction in blood vessels; B/P is elevated, coronary blood flow improves, and cardiac output increases

USES:

Acute hypotension, shock

CONTRAINDICATIONS:

Hypersensitivity to this product or cyclopropane/halothane anesthesia, sulfites; ventricular fibrillation, tachydysrhythmias, pheochromocytoma, hypotension, hypovolemia

Precautions: Pregnancy (C), breastfeeding, geriatric patients, arterial embolism, peripheral vascular disease, hypertension, hyperthyroidism, cardiac disease

Black Box Warning:

Extravasation

DOSAGE AND ROUTES

Calculator

- **Adult:** IV INF 0.5-1 mcg/min titrated to B/P; maintenance 2-4 mcg/min; max 30 mcg/min
- **Child:** IV INF 0.1-0.2 mcg/kg/min titrated to B/P; max 2 mcg/kg/min

Available forms: Inj 1 mg/ml

Administer:

- Plasma expanders for hypovolemia

Continuous IV INF route

- Dilute with 500-1000 ml D₅W or D₅/0.9% NaCl; average dilution 4 mg/1000 ml diluent (4 mcg base/ml); give as inf 2-3 ml/min; titrate to response

Y-site compatibilities: Alfentanil, amikacin, amiodarone, anidulafungin, argatroban, ascorbic acid, atenolol, atracurium, atropine, aztreonam, benztropine, bivalirudin, bleomycin, bumetanide, buprenorphine, butorphanol, calcium chloride/gluconate, CARBOplatin, caspofungin, cefamandole, ceFAZolin, cefmetazole, cefonicid, cefoperazone, cefotaxime, cefoTETan, cefOXitin, cefTAZidime, ceftizoxime, ceftobiprole, cefTRIAxone, cefuroxime, cephalothin, chloramphenicol, chlorproMAZINE, cimetidine, cisatracurium, CISplatin, clindamycin, cloNIDine, cyanocobalamin, cyclophosphamide, cycloSPORINE, cytarabine, DAPTOmycin, dexamethasone, digoxin, diltiazem, diphenhydrAMINE, DOBUTamine, DOCEtaxel, DOPamine, doripenem, doxycycline, enalaprilat, ePHEDrine, EPINEPHrine, epirubicin, epoetin alfa, ertapenem, erythromycin, esmolol, etoposide, famotidine, fenoldopam, fentaNYL, fluconazole, fludarabine, gatifloxacin, gemcitabine, gentamicin, glycopyrrolate, granisetron, heparin, hydrocortisone, HYDROmorphone, hydrOXYzine, IDArubicin, ifosfamide, imipenem-cilastatin, irinotecan, isoproterenol, ketorolac, labetalol, lidocaine, linezolid, LORazepam, magnesium sulfate, mannitol, mechlorethamine, meperidine, meropenem, metaraminol, methicillin, methotrexate, methoxamine, methylDopate, methylPREDNISolone, metoclopramide, metoprolol, metroNIDAZOLE, mezlocillin, micafungin, miconazole, midazolam, milrinone, minocycline, mitoXANtrone, morphine, moxalactam, multiple vitamins injection, mycophenolate, nafcillin, nalbuphine, naloxone, netilmicin, niCARdipine, nitroglycerin, nitroprusside, octreotide, ondansetron, oxacillin, oxaliplatin, oxytocin, PACLitaxel, palonosetron, pamidronate, pancuronium, papaverine, PEMEtrexed, penicillin G potassium/sodium, pentamidine, pentazocine, phenylephrine, phytonadione, piperacillin, piperacillin-tazobactam, polymyxin B, potassium chloride, procainamide, prochlorperazine, promethazine, propofol, propranolol, protamine, pyridoxine, quiNIDine, ranitidine, remifentanil, ritodrine, succinylcholine, SUFentanil, tacrolimus, teniposide, theophylline, thiamine, thiotepa, ticarcillin, ticarcillin-clavulanate, tigecycline, tirofiban, tobramycin, tolazoline, trimetaphan, urokinase, vancomycin, vasopressin, vecuronium,

verapamil, vincristine, vinorelbine, vitamin B complex with C, voriconazole, zoledronic acid

SIDE EFFECTS

CNS: *Headache*, anxiety, dizziness, insomnia, restlessness, tremor, **cerebral hemorrhage**

CV: *Palpitations, tachycardia, hypertension, ectopic beats, angina*

GI: *Nausea, vomiting*

GU: Decreased urine output

INTEG: **Necrosis, tissue sloughing with extravasation, gangrene**

RESP: Dyspnea

SYST: **Anaphylaxis**

PHARMACOKINETICS

IV: Onset 1-2 min; metabolized in liver; excreted in urine (inactive metabolites); crosses placenta

INTERACTIONS

Increase: dysrhythmias—general anesthetics

- **Incompatible with alkaline solutions: sodium, bicarbonate**
- **Severe hypertension: guanethidine**

⚠ Do not use within 2 wk of MAOIs, antihistamines, ergots, methyldopa, oxytocics, tricyclics, guanethidine because hypertensive crisis may result

Increase: B/P—oxytocics

Increase: pressor effect—tricyclics, MAOIs

Decrease: norepinephrine action— α -blockers

NURSING CONSIDERATIONS

Assess:

- I&O ratio; notify prescriber if output <30 ml/hr
- B/P, pulse q2-3min after parenteral route, ECG during administration continuously; if B/P increases, product is decreased, CVP or PWP during inf if possible
- Paresthesias and coldness of extremities; peripheral blood flow may decrease

Black Box Warning:

Extravasation: inj site: tissue sloughing

- Sulfite sensitivity, which may be life-threatening

Perform/provide:

- Storage of reconstituted sol in refrigerator ≤ 24 hr, protect from light, store unopened product at room temp, do not use discolored sol

Evaluate:

- Therapeutic response: increased B/P with stabilization, adequate tissue perfusion

Teach patient/family:

- About the reason for product administration; to report dyspnea, dizziness, chest pain

TREATMENT OF OVERDOSE:

Administer fluids, electrolyte replacement

☼ Canada only Side effects: *italics* = common; **bold** = life-threatening ⚠
Nurse Alert

norethindrone (Rx)

(nor-eth-in'drone)

Aygestin, Camila, Errin , Heather, Jolivette, Micronor, Nora-BE, Nor-QD, Ortho Micronor *Func. class.: Progestogen*

ACTION:

Inhibits the secretion of pituitary gonadotropins, which prevents follicular maturation and ovulation; stimulates growth of mammary tissue; antineoplastic action against endometrial cancer

USES:

Uterine bleeding (abnormal), amenorrhea, endometriosis, contraception

CONTRAINDICATIONS:

Pregnancy (X), breast cancer, hypersensitivity, thromboembolic disorders, reproductive cancer, genital bleeding (abnormal, undiagnosed), liver tumors, hepatic disease

Precautions: Breastfeeding, hypertension, asthma, blood dyscrasias, CHF, diabetes mellitus, depression, migraine headache, seizure disorders, bone/gallbladder/renal/hepatic disease, family history of breast or reproductive tract cancer, smoking, HIV

DOSAGE AND ROUTES

Calculator

Amenorrhea, abnormal uterine bleeding (Aygestin)

- **Adult: PO** 2.5-10 mg/day on days 5-25 of menstrual cycle

Endometriosis (Aygestin)

- **Adult: PO** 5 mg/day $\times$ 2 wk then increased by 2.5 mg/day $\times$ 2 wk up to 15 mg/day, may continue for 6-9 mo

Contraception

- **Adult: PO** 0.35 mg on 1st day of menses then 0.35 mg/day

Available forms: Tabs (Aygestin) 5 mg; tabs 0.35 mg

Administer:

- Titrated dose; use lowest effective dose

- One dose in AM; do not interrupt between pill packs, give at roughly same time of day
- Without regard to meals

SIDE EFFECTS

CNS: *Dizziness, headache, migraines, depression, fatigue*

CV: Hypotension, *thrombophlebitis, edema, thromboembolism, CVA, stroke, PE, MI*

EENT: Diplopia

GI: *Nausea, vomiting, anorexia, cramps, increased weight, cholestatic jaundice*

GU: Amenorrhea, cervical erosion, breakthrough bleeding, dysmenorrhea, vaginal candidiasis, breast changes, (gynecomastia, testicular atrophy, impotence), endometriosis, *spontaneous abortion, breast tenderness*

INTEG: Rash, urticaria, acne, hirsutism, alopecia, oily skin, seborrhea, purpura, melasma

META: Hyperglycemia

PHARMACOKINETICS

Duration 24 hr, excreted in urine, feces; metabolized in liver

INTERACTIONS

Decrease: progestin effect—barbiturates, carbamazepine, fosphenytoin, phenytoin, rifampin

Drug/Herb

Decrease: contraception—St. John's wort

Drug/Food

Increase: caffeine level—caffeine

Drug/Lab Test

Increase: LDL

Decrease: GTT, HDL, alk phos

NURSING CONSIDERATIONS

Assess:

- Weight daily: notify prescriber of weekly weight gain >5 lb
- B/P at beginning of treatment and periodically
- I&O ratio; be alert for decreasing urinary output, increasing edema

- Hepatic studies: ALT, AST, bilirubin periodically during long-term therapy
- Edema, hypertension, cardiac symptoms, jaundice, thromboembolism
- Mental status: affect, mood, behavioral changes, depression
- Hypercalcemia
- Breast exam, pap smear

Perform/provide:

- Storage in dark area

Evaluate:

- Therapeutic response: decreased abnormal uterine bleeding, absence of amenorrhea

Teach patient/family:

- About cushingoid symptoms

 To report breast lumps, vaginal bleeding, amenorrhea, edema, jaundice, dark urine, clay-colored stools, dyspnea, headache, blurred vision, abdominal pain, numbness or stiffness in legs, chest pain; impotence or gynecomastia (men)

- To take at same time of day; not to interrupt between pill packs
- To report suspected pregnancy immediately, to wait ≥ 3 mo after stopping product to become pregnant, (X), use backup contraception methods for 48 hr, if treatment is not begun on the first day of menstruation • To avoid smoking; CV reactions may occur
- That product does not protect against HIV, STDs
- That product may mask onset of menopause

☼ Canada only Side effects: *italics* = common; **bold** = life-threatening 
Nurse Alert

norfloxacin ophthalmic

See [Appendix B](#)

nortriptyline (Rx)

(nortrip'ti-leen)

Arentyl , Pamelor

Func. class.: Antidepressant, tricyclic

Chem. class.: Dibenzocycloheptene—secondary amine

Do not confuse: **nortriptyline**/amitriptyline

ACTION:

Blocks reuptake of norepinephrine and serotonin into nerve endings, thereby increasing action of norepinephrine and serotonin in nerve cells

USES:

Major depression

Unlabeled uses: Chronic pain management, PMDD, social phobia, neuropathy, panic disorder, enuresis, migraine prophylaxis

CONTRAINDICATIONS:

Pregnancy (D), hypersensitivity to tricyclics, recovery phase of MI, seizure disorders, prostatic hypertrophy

Precautions: Breastfeeding, suicidal patients, severe depression, increased intraocular pressure, closed-angle glaucoma, urinary retention, cardiac/hepatic disease, hyperthyroidism, electroshock therapy, elective surgery

Black Box Warning:

Children, suicidal ideation

DOSAGE AND ROUTES

Calculator

- **Adult: PO** 25 mg tid or qid; may increase to 150 mg/day; may give daily dose at bedtime
- **Adolescent: PO** 1-3 mg/kg/day in 3-4 divided doses or daily at bedtime, max 150 mg/day
- **Child 6-12 yr (unlabeled): PO** 1-3 mg/kg/day in 3-4 divided doses, max 150

mg/day

- **Geriatric: PO** 10-25 mg at bedtime, increase by 10-25 mg at weekly intervals to desired dose; usual maintenance 75 mg/day, max 150 mg/day

Available forms: Caps 10, 25, 50, 75 mg; sol 10 mg/5 ml

Administer:

- Increased fluids, bulk in diet if constipation occurs
- Without regard to meals
- Dosage at bedtime for oversedation during day; may take entire dose at bedtime; geriatric patients may not tolerate once daily dosing
- Gum, hard candy, frequent sips of water for dry mouth
- **Oral solution:** with fruit juice, water, or milk to disguise taste

SIDE EFFECTS

CNS: *Dizziness, drowsiness, confusion, headache, anxiety, tremors, stimulation, weakness, insomnia, nightmares, EPS (geriatric patients), increased psychiatric symptoms, seizures*

CV: *Orthostatic hypotension, ECG changes, tachycardia, hypertension, palpitations, dysrhythmias*

EENT: *Blurred vision, tinnitus, mydriasis*

GI: *Constipation, dry mouth, nausea, vomiting, paralytic ileus, increased appetite, cramps, epigastric distress, jaundice, hepatitis, stomatitis*

GU: *Urinary retention, acute renal failure*

HEMA: *Agranulocytosis, thrombocytopenia, eosinophilia, leukopenia*

INTEG: *Rash, urticaria, sweating, pruritus, photosensitivity*

PHARMACOKINETICS

PO: Steady state 4-19 days; metabolized by liver; excreted by kidneys; crosses placenta; excreted in breast milk; half-life 18-28 hr, protein binding 93%-95%

INTERACTIONS

 **Increase:** QT prolongation—class IA/III antidysrhythmics, some phenothiazines, β agonists, local anesthetics, tricyclics, haloperidol, chloroquine, droperidol, pentamidine; CYP3A4 inhibitors (amiodarone, clarithromycin, erythromycin, telithromycin, troleandomycin), arsenic trioxide, levomethadyl; CYP3A4 substrates (methadone, pimozide, QUEtiapine, quiNIDine, risperiDONE, ziprasidone)

- Heavy smoking: decreased product effect

⚠️ Hyperpyretic crisis, seizures, hypertensive episode: MAOI

Increase: effects of direct-acting sympathomimetics (EPINEPHrine), alcohol, barbiturates, benzodiazepines, CNS depressants, products increasing QT interval, other anticholinergics

⚠️ Increase: serotonin syndrome, neuroleptic malignant syndrome—SSRIs, SNRIs, serotonin receptor agonists, linezolid; methylene blue (IV)

Decrease: effects of guanethidine, cloNIDine, indirect-acting sympathomimetics (ePHEDrine)

Drug/Herb

Increase: CNS effect—kava, valerian

Decrease: nortriptyline level—St. John's wort

Drug/Lab Test

Increase: serum bilirubin, blood glucose, alk phos

Decrease: VMA, 5-HIAA

False increase: urinary catecholamines

NURSING CONSIDERATIONS

Assess:

Black Box Warning:

Suicidal thoughts/behaviors in children/young adults: not approved for children, monitor for suicidal ideation in depression, adolescents, young adults

• B/P (lying, standing), pulse q4hr; if systolic B/P drops 20 mm Hg, hold product, notify prescriber; VS q4hr in patients with CV disease • Blood studies: CBC, leukocytes, differential, cardiac enzymes if patient is receiving long-term therapy • Hepatic studies: AST, ALT, bilirubin

• Weight weekly; appetite may increase with product

⚠️ PR, QT prolongation: ECG for flattening of T wave, bundle branch block, AV block, QT prolongation, dysrhythmias in cardiac patients; assess for chest pain, palpitations, dyspnea • EPS primarily in geriatric patients: rigidity, dystonia, akathisia, preferred tricyclic in geriatric patients • Mental status changes: mood, sensorium, affect, suicidal tendencies, increase in psychiatric symptoms, depression, panic • Urinary retention, constipation; constipation is more likely to occur in children

⚠️ Withdrawal symptoms: headache, nausea, vomiting, muscle pain, weakness;

do not usually occur unless product was discontinued abruptly • Alcohol intake; if alcohol is consumed, hold dose until AM

• **Serotonin syndrome, neuroleptic malignant syndrome:** assess for increased heart rate, shivering, sweating, dilated pupils, tremors, high B/P, hyperthermia, headache, confusion; if these occur, stop product, administer serotonin antagonist if needed (**rare**)

Perform/provide:

- Storage in tight, light-resistant container at room temp
- Assistance with ambulation during beginning therapy because drowsiness/dizziness occurs; safety measures including side rails, primarily for geriatric patients

Evaluate:

- Therapeutic response: decreased depression

Teach patient/family:

- That therapeutic effects may take 2-3 wk, only small quantities may be dispersed
- To use caution when driving, during other activities requiring alertness because of drowsiness, dizziness, blurred vision • To avoid alcohol ingestion, other CNS depressants; to avoid MAOIs within 14 days
- Not to discontinue medication quickly after long-term use; may cause nausea, headache, malaise • To wear sunscreen or large hat because photosensitivity occurs

 To immediately report urinary retention, worsening depression, suicidal thoughts/behaviors

TREATMENT OF OVERDOSE:

ECG monitoring; lavage, activated charcoal; administer anticonvulsant

☼ Canada only Side effects: *italics* = common; **bold** = life-threatening 
Nurse Alert

nystatin (Rx)

(nye-stat'in)

Bio-Statin, Pediaderm AF, Nyamyc

Func. class.: Antifungal

Chem. class.: Amphoteric polyene

ACTION:

Interferes with fungal DNA replication; binds sterols in fungal cell membrane, which increases permeability, leaking of cell nutrients

USES:

Candida species causing oral, intestinal infections

CONTRAINDICATIONS:

Hypersensitivity

Precautions: Pregnancy (C)

DOSAGE AND ROUTES

Calculator

Oral infection

- **Adult/adolescent/child: SUSP** 400,000-600,000 units qid, use 1/2 dose in each side of mouth, swish and swallow, use for at least 48 hr after symptoms resolved
- **Infant: SUSP** 200,000 units qid (100,000 units in each side of mouth)
- **Newborn and premature infant: SUSP** 100,000 units qid
- **Adult/child: TROCHES** 200,000-400,000 units qid $\times \leq 2$ wk

GI infection

- **Adult: PO** 500,000-1,000,000 units tid

Cutaneous candidiasis

- **Adult/child: Top cream/ointment** apply to affected area bid; **powder** apply to affected area bid-tid

Vaginal candidiasis

- **Adult vag tab:** 100,000 units daily at bedtime $\times 14$ days

Available forms: Tabs 500,000 units; powder for oral susp 50 million, 150 million, 500 million; susp 100,000 units per ml; oral caps 500,000, 1,000,000

units, bulk powder

Administer:

PO route

- Oral susp dose by placing 1/2 in each cheek, then swallow; do not mix with food
- Topical dose after cleansing area; mouth may be swabbed; very moist lesions best treated with topical powder

SIDE EFFECTS

GI: Nausea, vomiting, anorexia, diarrhea, cramps

INTEG: Rash, urticaria (rare)

PHARMACOKINETICS

PO: Little absorption, excreted in feces

NURSING CONSIDERATIONS

Assess:

- **Allergic reaction:** rash, urticaria, irritated oral mucous membranes; product may have to be discontinued
- Obtain culture, histologic tests to confirm organism
- Predisposing factors: antibiotic therapy, pregnancy, diabetes mellitus, sexual partner infection (vaginal infections)

Perform/provide:

- Storage at room temp for oral susp; tabs in tight, light-resistant containers at room temp

Evaluate:

- Therapeutic response: culture negative for *Candida*

Teach patient/family:

- That long-term therapy may be needed to clear infection; to complete entire course of medication
- To avoid commercial mouthwashes for mouth infection
- To shake susp before measuring each dose
- To notify prescriber of irritation; product may have to be discontinued

octreotide (Rx)

(ok-tree'oh-tide)

SandoSTATIN, SandoSTATIN LAR Depot

Func. class.: Growth hormone, antidiarrheal

Chem. class.: Synthetic octapeptide

ACTION:

A potent growth hormone similar to somatostatin

USES:

SandoSTATIN: acromegaly, improves symptoms of carcinoid tumors, vasoactive intestinal peptide tumors (VIPomas); **LAR Depot:** long-term maintenance of acromegaly, carcinoid tumors, VIPomas

Unlabeled uses: GI fistula, variceal bleeding, diarrheal conditions, pancreatic fistula, irritable bowel syndrome, dumping syndrome, short bowel syndrome, insulinoma, hepatorenal syndrome

CONTRAINDICATIONS:

Hypersensitivity

Precautions: Pregnancy (B), breastfeeding, children, geriatric patients, diabetes mellitus, hypothyroidism, renal disease

DOSAGE AND ROUTES

Calculator

Acromegaly

- **Adult: SUBCUT/IV** (SandoSTATIN) 50-100 mcg bid-tid, adjust q2wk based on growth hormone levels or **IM** (SandoSTATIN LAR) 20 mg q4wk × 3 mo, adjust based on growth hormone levels

VIPomas

- **Adult: SUBCUT/IV** (SandoSTATIN) 200-300 mcg/day in 2-4 doses for 2 wk, or **IM** (SandoSTATIN LAR) 20 mg q4wk × 2 mo, adjust dose

Flushing/diarrhea in carcinoid tumors

- **Adult: SUBCUT/IV** (SandoSTATIN) 100-600 mcg/day in 2-4 doses for 2 wk, titrated to patient response or **IM** (SandoSTATIN LAR) 20 mg q4wk × 2 mo,

adjust dose

GI fistula

- **Adult: SUBCUT** (SandoSTATIN) 50-200 mcg q8hr

Antidiarrheal in AIDS patients (unlabeled)

- **Adult: SUBCUT** (SandoSTATIN) 50 mcg q8hr prn, increase to 500 mcg q8hr

Irritable bowel syndrome (unlabeled)

- **Adult: SUBCUT** (SandoSTATIN) 100 mcg in single dose, up to 125 mcg bid

Dumping syndrome (unlabeled)

- **Adult: SUBCUT** (SandoSTATIN) 50-150 mcg/day

Variceal bleeding (unlabeled)

- **Adult: IV** (SandoSTATIN) 25-50 mcg/hr **CONT IV INF** for 18 hr-5 days

Available forms: Inj (SandoSTATIN) 0.05, 0.1, 0.2, 0.5, 1 mg/ml; inj powder for susp (LAR depot) 10, 20, 30 mg/5 ml

Administer:

IM route

- Reconstitute with diluent provided; give in gluteal region

SUBCUT route

- Rotate inj site; use hip, thigh, abdomen
- Avoid using medication that is cold; allow to reach room temp; do not use LAR depot

IV route

- **IV direct:** give over 3 min; during an emergency carcinoid crisis, give rapid bolus
- **Intermittent IV inf:** dilute in 50-200 ml D₅W, 0.9% NaCl; give over 15-30 min

Y-site compatibilities: Acyclovir, alfentanil, allopurinol, amifostine, amikacin, aminocaproic acid, aminophylline, amiodarone, amphotericin B colloidal, amphotericin B lipid complex, amphotericin B liposome, ampicillin, ampicillin-sulbactam, anidulafungin, argatroban, arsenic trioxide, atenolol, atracurium, azithromycin, aztreonam, bivalirudin, bleomycin, bumetanide, buprenorphine, busulfan, butorphanol, calcium chloride/gluconate, capreomycin, CARBOplatin, carmustine, caspofungin, ceFAZolin, cefepime, cefotaxime, cefoTEtan, cefOXitin, cefTAZidime, ceftizoxime, cefTRIAxone, cefuroxime, chloramphenicol, chlorproMAZINE, cimetidine, ciprofloxacin, cisatracurium, CISplatin, clindamycin, cyclophosphamide, cycloSPORINE, cytarabine,

dacarbazine, DACTINomycin, DAPTOmycin, DAUNOrubicin, DAUNOrubicin liposome, dexamethasone, digoxin, diltiazem, diphenhydrAMINE, DOBUTamine, DOCEtaxel, dolasetron, DOPamine, DOXOrubicin, DOXOrubicin liposomal, doxycycline, droperidol, enalaprilat, ePHEDrine, EPINEPHrine, epirubicin, eptifibatide, ertapenem, erythromycin, esmolol, etoposide, famotidine, fenoldopam, fentaNYL, fluconazole, fludarabine, fluorouracil, foscarnet, fosphenytoin, furosemide, gallium nitrate, ganciclovir, gatifloxacin, gemcitabine, gentamicin, glycopyrrolate, granisetron, haloperidol, heparin, hydrALAZINE, hydrocortisone, HYDROmorphine, hydrOXYzine, IDArubicin, ifosfamide, imipenem-cilastatin, insulin (regular), irinotecan, isoproterenol, ketorolac, labetalol, lansoprazole, leucovorin, levofloxacin, lidocaine, linezolid, LORazepam, magnesium sulfate, mannitol, mechlorethamine, melphalan, meperidine, meropenem, mesna, methohexital, methotrexate, methyl dopate, methylPREDNISolone, metoclopramide, metoprolol, metroNIDAZOLE, midazolam, milrinone, minocycline, mitoMYcin, mitoXANtrone, mivacurium, morphine, moxifloxacin, mycophenolate, nafcillin, nalbuphine, naloxone, nesiritide, niCARDipine, nitroglycerin, nitroprusside, norepinephrine, ondansetron, oxaliplatin, PACLitaxel, palonosetron, pamidronate, pancuronium, PEMEtrexed, pentamidine, pentazocine, PENTobarbital, PHENobarbital, phenylephrine, piperacillin, piperacillin-tazobactam, polymyxin B, potassium acetate/chloride/phosphates, procainamide, prochlorperazine, promethazine, propranolol, quiNIDine, quinupristin-dalfopristin, ranitidine, remifentanyl, rocuronium, sodium acetate/bicarbonate/phosphates, streptozocin, succinylcholine, SUFentanyl, sulfamethoxazole-trimethoprim, tacrolimus, teniposide, thiopental, thiotepa, ticarcillin, ticarcillin-clavulanate, tigecycline, tirofiban, tobramycin, topotecan, vancomycin, vasopressin, vecuronium, verapamil, vinBLASTine, vinCRISTine, vinorelbine, voriconazole, zidovudine, zoledronic acid

SIDE EFFECTS

CNS: *Headache, dizziness, fatigue, weakness, depression, anxiety, tremors, seizure, paranoia*

CV: *Sinus bradycardia, conduction abnormalities, dysrhythmias, chest pain, SOB, thrombophlebitis, ischemia, CHF, hypertension, palpitations, QT*

prolongation, ST-or T-wave changes

ENDO: *Hypo/hyperglycemia, ketosis, hypothyroidism, galactorrhea, diabetes insipidus*

GI: *Diarrhea, nausea, abdominal pain, vomiting, flatulence, distention, constipation, hepatitis, increased LFTs, GI bleeding, pancreatitis, cholelithiasis, ileus*

GU: UTI

HEMA: Hematoma of inj site, bruise

INTEG: Rash, urticaria, pain; inflammation at inj site

MS: *Joint and muscle pain*

PHARMACOKINETICS

Absorbed rapidly, completely; peak 1/2 hr (subcut/IV), 2-3 wk (IM); half-life 1.7 hr, duration 12 hr, excreted unchanged in urine

INTERACTIONS

Increase: QT prolongation—class IA/III antidysrhythmics, some phenothiazines, β agonists, local anesthetics, tricyclics, haloperidol, chloroquine, droperidol, pentamidine; CYP3A4 inhibitors (amiodarone, clarithromycin, erythromycin, telithromycin, troleandomycin), arsenic trioxide, levomethadyl; CYP3A4 substrates (methadone, pimozide, QUetiapine, quinIDine, risperiDONE, ziprasidone)

Decrease: effect of—cycloSPORINE

Drug/Food

Decrease: absorption of dietary fat, vit B₁₂ levels

Drug/Lab Test

Increase: glucose

Decrease: T₄, thyroid function tests, vit B12, glucose

NURSING CONSIDERATIONS

Assess:

- Growth hormone antibodies, IGF-1 at 1-to 4-hr intervals for 8-12 hr after dose (**acromegaly**); 5-HIAA, plasma serotonin; blood glucose, serotonin levels (**carcinoid tumors**), plasma substance P, plasma vasoactive intestinal peptide (**VIP**) (**VIPoma**)
- Thyroid function tests: T₃, T₄, T₇, TSH to identify hypothyroidism • Fecal fat,

serum carotene, somatomedin-C q 14 days, glucose; plasma serotonin levels (carcinoid tumors); plasma vasoactive intestinal peptide levels (VIPoma); serum growth hormone, serum IGF-1 baseline and periodically, diabetes to monitor blood glucose • **Allergic reaction:** rash, itching, fever, nausea, wheezing

 **Cardiac status:** bradycardia, conduction abnormalities, dysrhythmias; monitor ECG for QT prolongation, low voltage, axis shifts, early repolarization, R/S transition, early wave progression • Gall bladder disease, pancreatitis: monitor closely

Perform/provide:

- Storage in refrigerator for unopened amps, vials or at room temp for 2 wk; protect from light; do not use discolored or cloudy sol

Evaluate:

- Therapeutic response: relief of diarrhea in patients with AIDS, improves symptoms of carcinoid or VIP tumors; data is insufficient regarding whether products decrease size/rate of tumor growth; decreasing symptoms of acromegaly

Teach patient/family:

- That regular assessments are required, diabetics to monitor blood glucose
- About SUBCUT inj if patient or other persons will be giving inj
-  That product may cause dizziness, drowsiness, weakness; to avoid hazardous activities if these occur; to report abdominal pain immediately • That pregnancy may occur in acromegaly because fertility may be restored
- That in diabetes, to monitor glucose regularly

✳ Canada only Side effects: *italics* = common; **bold** = life-threatening 
Nurse Alert

ofloxacin (Rx)

(o-flox'a-sin)

Func. class.: Antiinfective

Chem. class.: Fluoroquinolone

ACTION:

Interferes with conversion of intermediate DNA fragments into high-molecular-weight DNA in bacteria; inhibits DNA gyrase

USES:

Treatment of lower respiratory tract infections (pneumonia, bronchitis), genitourinary infections (prostatitis, UTIs) caused by *Escherichia coli*, *Klebsiella pneumoniae*, *Chlamydia trachomatis*, skin and skin-structure infections; otitis media, PID

Unlabeled uses: Leprosy, anthrax, epididymitis, meningococcal infection, prophylaxis, mycobacterium avium complex (MAC), plague, proctitis, traveler's diarrhea, typhoid fever

CONTRAINDICATIONS:

QT prolongation, hypersensitivity to quinolones

Precautions: Pregnancy (C), breastfeeding, children, geriatric patients, renal disease, seizure disorders, excessive sunlight, hypokalemia

Black Box Warning:

Tendon pain/rupture, tendinitis, myasthenia gravis

DOSAGE AND ROUTES

Calculator

Lower respiratory tract infections/skin and skin-structure infections

- **Adult: PO** 400 mg q12hr × 10 days

Cervicitis, urethritis

- **Adult: PO** 300 mg q12hr × 7 days (non-gonococcal); 400 mg as a single dose (Gonococcal)

Prostatitis from *E. coli*

- **Adult: PO** 300 mg q12hr × 6 wk

Urinary tract infection

- **Adult: PO** 200 mg q12hr × 3-7 days depending on organism 10 days (complicated)

Pelvic inflammatory disease

- **Adult: PO** 400 mg q12hr × 10-14 days

Renal dose

- **Adult: PO** CCr 10-50 ml/min, give q24hr; CCr <10 ml/min, give 50% of dose q24hr

Hepatic dose

- **Adult (child-pugh class c): PO** max 400 mg/day

Available forms: Tabs 200, 300, 400 mg

Administer:

PO route

- 2 hr before or 2 hr after antacids, calcium, iron, zinc products, without regard to food, maintain hydration

SIDE EFFECTS

CNS: *Dizziness, headache, fatigue, somnolence, depression, insomnia, lethargy, malaise, seizures, vertigo*

CV: *QT prolongation, dysrhythmias, chest pain*

EENT: Visual disturbances

GI: *Diarrhea, nausea, vomiting, anorexia, flatulence, heartburn, dry mouth, increased AST, ALT, abdominal pain, constipation, pseudomembranous colitis, abnormal taste, xerostomia*

HEMA: *Blood dyscrasias*

INTEG: Rash, pruritus, photosensitivity

MS: Tendinitis, *tendon rupture, rhabdomyolysis*

SYST: *Anaphylaxis, Stevens-Johnson syndrome, toxic epidermal necrolysis*

PHARMACOKINETICS

PO: Peak 1-2 hr; half-life 4-8 hr; steady state 2 days; excreted in urine as active product, metabolites; 90%-95% bioavailability

INTERACTIONS

Black Box Warning:

Increase: tendon rupture/tendinitis—corticosteroids

- May alter blood glucose levels: antidiabetics
- Possible theophylline toxicity: theophylline
- ⚠ **Increase:** QT prolongation—class IA/III antidysrhythmics, some phenothiazines, β -agonists, local anesthetics, tricyclics, haloperidol, methadone, chloroquine, clarithromycin, droperidol, erythromycin, pentamidine
- Increase:** CNS stimulation, seizures—NSAIDs
- Increase:** anticoagulation—warfarin
- Decrease:** absorption—antacids with aluminum, magnesium, iron products, sucralfate, zinc products; separate by 2 hr

NURSING CONSIDERATIONS

Assess:

Black Box Warning:

Tendon rupture/tendinitis: more common in lung, heart, kidney transplants or geriatric patients; assess for pain or inflammation

- Blood studies: BUN, creatinine, AST, ALT, CBC, blood glucose
- **CNS symptoms:** insomnia, vertigo, headache, agitation, confusion

Black Box Warning:

Myasthenia gravis: product may increase weakness, avoid use

- For overgrowth of infection in long-term treatment
- **Allergic reactions:** rash, flushing, urticaria, pruritus

Black Box Warning:

Stop product if these occur

Perform/provide:

- Storage at room temp, protect from light

Evaluate:

- Therapeutic response: urine culture, absence of symptoms of infection

Teach patient/family:

- That if dizziness or lightheadedness occurs, to ambulate, perform activities with assistance
 - To complete full course of therapy, take with plenty of fluids
 - To avoid iron-or mineral-containing supplements within 2 hr before or after dose, take without regard to meals
 - That allergic reactions usually occur after first dose but may occur later, stop product
 - To avoid sun exposure, photosensitivity can occur
-

🍁 Canada only Side effects: *italics* = common; **bold** = life-threatening ⚠️
Nurse Alert

ofloxacin ophthalmic

See [Appendix B](#)

OLANZapine (Rx)

(oh-lanz'a-peen)

Zyprexa, Zyprexa IntraMuscular, Zyprexa Relprevv, Zyprexa Zydis

Func. class.: Antipsychotic, neuroleptic

Chem. class.: Thienobenzodiazepine

Do not confuse: **OLANZapine**/osalazine

Zyprexa/Celexa/Zyrtec

ACTION:

May mediate antipsychotic activity by both dopamine and serotonin type 2 (5-HT₂) antagonists; may antagonize muscarinic receptors, histaminic (H₁)- and α -adrenergic receptors

USES:

Schizophrenia, acute manic episodes with bipolar disorder, acute agitation

Unlabeled uses: Acute psychosis

CONTRAINDICATIONS:

Hypersensitivity

Precautions: Pregnancy (C), breastfeeding, geriatric patients, hypertension, cardiac/renal/hepatic disease, diabetes, agranulocytosis, abrupt discontinuation, Asian patients, closed-angle glaucoma, coma, leukopenia, QT prolongation, tardive dyskinesia, torsades de pointes

Black Box Warning:

Increased mortality in elderly patients with dementia-related psychosis, postinjection delirium/sedation syndrome

DOSAGE AND ROUTES

Calculator

Schizophrenia

• **Adult: PO** 5-10 mg/day initially, may increase dosage by 5 mg at ≥ 1 wk intervals; **ORALLY DISINTEGRATING** tabs: open blister pack, place tab on

tongue, let disintegrate, swallow, max 20 mg/day

- **Geriatric: PO** 5 mg, may increase cautiously at 1-wk intervals, max 20 mg/day
- **Adolescent: PO** 2.5 or 5 mg/day, target 10 mg/day
- **Child 6-12 yr (unlabeled): PO** 2.5 mg daily, may increase to 5 mg/day after 4-7 days

Bipolar mania

- **Adult: PO** 10-15 mg/day, may increase dose after >24 hr by 5 mg, max 20 mg/day
- **Adolescent: PO** 2.5 or 5 mg/day, target 10 mg/day, max 20 mg/day

Agitation associated with schizophrenia, bipolar I mania

- **Adult: IM** 10 mg

Severe behavioral disturbances in geriatric patients (unlabeled)

- **Adult: PO** 2.5-5 mg/day; **acute psychosis PO** 5-10 mg every night

Available forms: **Tab** 2.5, 5, 7.5, 10, 15, 20 mg; **orally disintegrating tabs** 5, 10, 15, 20 mg (Zyprexa Zydis); **powder for inj** 10 mg; **ext rel powder for susp for inj** 210, 300, 405 mg (Zyprexa Relprevv)

Administer:

- Decreased dose in geriatric patients

PO route

- With full glass of water, milk, food to decrease GI upset
- **Orally disintegrating tabs:** open blister pack; place tab on tongue until dissolved; swallow; no water needed, do not break, crush, chew

IM route (Zyprexa Intramuscular)

- Dissolve contents of vials with 2.1 ml sterile water for inj (5 mg/ml), use immediately
- Do not use IV or SUBCUT
- Inject slowly, deep into muscle mass

IM route (Zyprexa Relprevv)

Black Box Warning:

Available only through restricted distribution program due to postinjection delirium/sedation syndrome, given at a facility with emergency services, continuous observation

- Use deep IM gluteal inj only
- Use only diluent provided in kit; give q2-4wk using 19G, 1.5-inch needle in kit, for obese patients, use 19G, 2-inch or larger needle

SIDE EFFECTS

CNS: EPS: (pseudoparkinsonism, akathisia, dystonia, tardive dyskinesia), **seizures**, headache, **neuroleptic malignant syndrome (rare)**, agitation, nervousness, hostility, *dizziness*, hypertonia, *tremor*, euphoria, confusion, *drowsiness*, fatigue, *abnormal gait*, *insomnia*, *fever*

CV: Hypotension, tachycardia, chest pain, **heart failure, sudden death (geriatric patients, IM)**, orthostatic hypotension, peripheral edema

ENDO: Increased prolactin levels, hypo/hyperglycemia

GI: *Dry mouth, nausea, vomiting, appetite, dyspepsia*, anorexia, *constipation*, abdominal pain, *weight gain*, jaundice, **hepatitis**

GU: Urinary retention, urinary frequency, enuresis, impotence, amenorrhea, gynecomastia, breast engorgement, premenstrual syndrome

HEMA: **Neutropenia**

INTEG: Rash

MISC: Peripheral edema, accidental injury, hypertonia, hyperlipidemia

MS: *Joint pain*, twitching

RESP: *Cough, pharyngitis*; **fatal pneumonia (geriatric patients, IM)**

PHARMACOKINETICS

Well absorbed (60%), metabolized by liver, glucuronidation/oxidation by CYP1A2 and CYP2D6; excreted in urine (57%), feces (30%); 93% bound to plasma proteins; half-life 21-54 hr, extended in geriatric patients; clearance decreased in women, increased in smokers, peak PO 6 hr, IM 15-45 min

INTERACTIONS

⚠ Increase: serotonin syndrome, neuroleptic malignant syndrome—SSRIs, SNRIs

Increase: sedation—other CNS depressants, alcohol, barbiturate anesthetics, antihistamines, sedatives/hypnotics, antidepressants

Increase: OLANzapine levels—CYP1A2 inhibitors (fluvoxamine)

Increase: hypotension—antihypertensives, alcohol, diazepam

Increase: anticholinergic effects—anticholinergics

Decrease: OLANzapine levels—CYP1A2 inducers: carbamazepine, omeprazole, rifampin

Decrease: antiparkinson activity—levodopa, bromocriptine, other DOPamine

agonists

Drug/Lab Test

Increase: LFTs, prolactin, CPK

NURSING CONSIDERATIONS

Assess:

Black Box Warning:

Postinjection delirium/sedation syndrome (Zyprexa Relprevv); monitor continuously for ≥ 3 hr after injection; patient must be accompanied when leaving: sedation, coma, delirium, EPS, slurred speech, altered gait aggression, dizziness, weakness, hypertension, seizures; before leaving, confirm that patient is alert, oriented, and free of any other symptoms

- Mental status: orientation, mood, behavior, presence of hallucinations and type before initial administration, monthly; EPS, including akathisia (inability to sit still, no pattern to movements), tardive dyskinesia (bizarre movements of jaw, mouth, tongue, extremities), pseudoparkinsonism (rigidity, tremors, pill rolling, shuffling gait) • I&O ratio; palpate bladder if low urinary output occurs, urinary retention may be cause, especially in geriatric patients • Bilirubin, CBC
- Urinalysis recommended before, during prolonged therapy
- Affect, orientation, LOC, reflexes, gait, coordination, sleep pattern disturbances
- B/P sitting, standing, lying: take pulse, respirations q4hr during initial treatment; establish baseline before starting treatment; report drops of 30 mm Hg; obtain baseline ECG
- Dizziness, faintness, palpitations, tachycardia on rising
- ⚠ **Geriatric patients for serious reactions:** fatal pneumonia, heart failure, stroke leading to death (IM) ⚠ **Neuroleptic malignant syndrome:** hyperpyrexia, muscle rigidity, increased CPK, altered mental status, for acute dystonia (check chewing, swallowing, eyes, pill rolling) • Constipation, urinary retention daily; increase bulk, water in diet
- Weight gain, hyperglycemia, metabolic changes in diabetic patients

Perform/provide:

- Supervised ambulation until patient stabilized on medication; do not involve patient in strenuous exercise program because fainting is possible; patient should not stand still for long periods • Storage in tight, light-resistant container

Evaluate:

- Therapeutic response: decrease in emotional excitement, hallucinations,

delusion, paranoia, reorganization of patterns of thought, speech

Teach patient/family:

Black Box Warning:

About postinjection delirium/sedation syndrome: teach about all symptoms

- To use good oral hygiene; frequent rinsing of mouth, sugarless gum, candy, ice chips for dry mouth • To avoid hazardous activities until product response is determined
- That orthostatic hypotension occurs often; to rise from sitting or lying position gradually • To avoid hot tubs, hot showers, tub baths because hypotension may occur
- To avoid abrupt withdrawal of this product because EPS may result; product should be withdrawn slowly • To avoid OTC preparations (cough, hay fever, cold) unless approved by prescriber because serious product interactions may occur; to avoid use with alcohol, CNS depressants because increased drowsiness may occur • That in hot weather, heat stroke may occur; to take extra precautions to stay cool

TREATMENT OF OVERDOSE:

Lavage if orally ingested; provide airway; do not induce vomiting or use EPINEPHrine

☼ Canada only Side effects: *italics* = common; **bold** = life-threatening ⚠
Nurse Alert

olmesartan (Rx)

(ol-meh-sar'tan)

Benicar

Func. class.: Antihypertensive

Chem. class.: Angiotensin II receptor (type AT₁) antagonist

ACTION:

Blocks the vasoconstrictor and aldosterone-secreting effects of angiotensin II; selectively blocks the binding of angiotensin II to the AT₁ receptor found in tissues

USES:

Hypertension, alone or in combination with other antihypertensives

CONTRAINDICATIONS:

Hypersensitivity, pregnancy 2nd/3rd trimesters (D)

Precautions: Pregnancy (C) 1st trimester, breastfeeding, children, geriatric patients, hepatic disease, CHF

DOSAGE AND ROUTES

Calculator

- **Adult: PO** Single agent 20 mg/day initially in patients who are not volume depleted, may be increased to 40 mg/day if needed after 2 wk
- **Child ≥6 yr/adolescents ≤16 yr weighing ≥35 kg: PO** 20 mg/day, may increase to max 40 mg/day after 2 wk
- **Child ≥6 yr/adolescents ≤16 yr weighing 20-<35 kg: PO** 10 mg daily, may increase to max 20 mg/day after 2 wk

Available forms: Tabs 5, 20, 40 mg

Administer:

- Without regard to meals, refrigerate susp and store up to 1 mo, shake susp before use

SIDE EFFECTS

CNS: Dizziness, fatigue, headache, insomnia

CV: Chest pain, peripheral edema, tachycardia

EENT: Sinusitis, rhinitis, pharyngitis

GI: *Diarrhea*, abdominal pain

MS: Arthralgia, pain

RESP: *Upper respiratory infection*, bronchitis

SYST: **Angioedema**

PHARMACOKINETICS

Peak 1-2 hr; excreted in urine, feces; half-life 13 hr; protein binding 99%

INTERACTIONS

Increase: antihypertensive effects—other antihypertensives, diuretics

Increase: hyperkalemia—potassium supplements, potassium-sparing diuretics

Increase: effect of lithium, antioxidants

Decrease: antihypertensive effect—NSAIDs, colessevelan

Drug/Herb

Increase: antihypertensive effect—hawthorn

Decrease: antihypertensive effect—ephedra

NURSING CONSIDERATIONS

Assess:

Black Box Warning:

Pregnancy; product can cause fetal death when given during pregnancy (D) 2nd/3rd trimesters

- Response, adverse reactions, especially in renal disease
- **Hypertension:** B/P, pulse q4hr; note rate, rhythm, quality; electrolytes: sodium, potassium, chloride; baselines for renal, hepatic studies before therapy begins
- **Hypotension:** place supine, may occur with hyponatremia or those with volume depletion, more common in those taking a diuretic also

Evaluate:

- Therapeutic response: decreased B/P

Teach patient/family:

- To comply with dosage schedule, even if feeling better
- To notify prescriber of mouth sores, fever, swelling of hands or feet, irregular heartbeat, chest pain
- That excessive perspiration, dehydration, vomiting, diarrhea may lead to fall in B/P; to consult prescriber if these occur
- That

product may cause dizziness, fainting, lightheadedness

- To rise slowly to sitting or standing position to minimize orthostatic hypotension

Black Box Warning:

To notify prescriber immediately if pregnant; not to use during breastfeeding

- To avoid all OTC medications unless approved by prescriber
- That blood glucose may increase and antidiabetic product may need dosage change
- To inform all health care providers of medication use
- To use proper technique for obtaining B/P, acceptable parameters

🍁 Canada only Side effects: *italics* = common; **bold** = life-threatening ⚠️
Nurse Alert

olopatadine nasal agent

See [Appendix B](#)

olopatadine ophthalmic

See [Appendix B](#)

olsalazine (Rx)

(ohl-sal'ah-zeen)

[Dipentum](#)

Func. class.: Antiinflammatory

Chem. class.: Salicylate derivative

Do not confuse: [olsalazine](#)/OLANZapine

ACTION:

Bioconverted to 5-aminosalicylic acid, which decreases inflammation

USES:

Maintenance of remission of ulcerative colitis in patients intolerant to sulfasalazine

CONTRAINDICATIONS:

Hypersensitivity to this product or salicylates

Precautions: Pregnancy (C), breastfeeding, children <14 yr; impaired renal/hepatic function; severe allergy; bronchial asthma

DOSAGE AND ROUTES

Calculator

• **Adult: PO** 500 mg bid, max 3 g/day

Available forms: Caps 250 mg

Administer:

• Total daily dose evenly spaced to minimize GI intolerance, give with food

SIDE EFFECTS

CNS: Headache, hallucinations, depression, vertigo, fatigue, dizziness

GI: Nausea, vomiting, abdominal pain, **hepatitis**, diarrhea, bloating, pancreatitis

HEMA: **Leukopenia**, **neutropenia**, **thrombocytopenia**, **agranulocytosis**, **anemia**

INTEG: Rash, dermatitis, urticaria

PHARMACOKINETICS

Partially absorbed, peak 1½ hr, half-life 30-90 min (rectal), 2-15 hr (PO), excreted in urine as 5-aminosalicylic acid and metabolites, crosses placenta

INTERACTIONS

Increase: azaTHIOprine toxicity—azaTHIOprine

Increase: myelosuppression—mercaptopurine, thioguanine

Increase: PT, INR—warfarin

Drug/Lab Test

Increase: AST, ALT

NURSING CONSIDERATIONS

Assess:

- **Colitis:** bowel pattern, number of stools, consistency, frequency, pain, mucus before treatment and periodically ⚠️
- **Blood dyscrasias:** skin rash, fever, sore throat, bruising, bleeding, fatigue, joint pain (rare); CBC before treatment and periodically
- **Allergic reaction:** rash, dermatitis, urticaria, pruritus, dyspnea, bronchospasm; allergy to salicylates

Perform/provide:

- Storage in tight, light-resistant container at room temp

Evaluate:

- Therapeutic response: absence of fever, mucus in stools, decreased diarrhea, abdominal pain

Teach patient/family:

- To report diarrhea, rash, bleeding, bruising, fever, hallucinations
- That product may cause dizziness; to avoid hazardous activities until reaction is known
- To take even if feeling better; to take as directed; to take missed dose when remembered; but not to double

✳ Canada only Side effects: *italics* = common; **bold** = life-threatening ⚠️

Nurse Alert

omalizumab (Rx)

(oh-mah-lye-zoo'mab)

Xolair

Func. class.: Antiasthmatic

Chem. class.: Monoclonal antibody

ACTION:

Recombinant DNA-derived humanized IgG murine monoclonal antibody that selectively binds to IgE to limit the release of mediators in the allergic response

USES:

Moderate to severe persistent asthma

Unlabeled uses: Seasonal allergic rhinitis, food allergy

CONTRAINDICATIONS:

Hypersensitivity to hamster protein

Black Box Warning:

Hypersensitivity to this product

Precautions: Pregnancy (B), breastfeeding, children <12 yr, acute attacks of asthma, lymphoma, nephrotic disease, bronchospasm, neoplastic disease, status asthmatics

DOSAGE AND ROUTES

Calculator

• **Adult/adolescent/child ≥12 yr: SUBCUT** 150-375 mg × 2-4 wk, divide inj into 2 sites if dose >150 mg; dose is adjusted based on IgE levels, significant changes in body weight

Available forms: Powder for inj, lyophilized 202.5 mg (150 mg/1.2 ml after reconstitution)

Administer:

SUBCUT route

• Reconstitute using 1.4 ml sterile water for inj (150 mg/1.2 ml or 125 mg/ml); gently swirl to dissolve; allow vial to stand and q5min gently swirl for 5-10 sec to dissolve, some vials may take ≥20 min, do not use if contents do not dissolve

within 40 min, should be clear or slightly opalescent; use large-bore needle to withdraw medication; replace needle with small-bore needle • Given q2-4wk; product is viscous; if >150 mg is given, divide into 2 sites; inj may take 5-10 sec to administer

SIDE EFFECTS

CV: Heart failure, cardiomyopathy, hypotension

HEMA: Serious systemic eosinophilia

INTEG: Pruritus, dermatitis, inj site reactions, rash

MISC: Earache, dizziness, fatigue, pain, malignancies, viral infections, anaphylaxis, thrombocytopenia, headache

MS: Arthralgia, fracture, leg, arm pain

RESP: Sinusitis, upper respiratory infections, pharyngitis, pulmonary hypertension, bronchospasm

PHARMACOKINETICS

Slowly absorbed, peak 7-8 days, half-life 26 days, degradation by liver, excretion in bile

INTERACTIONS

• Use cautiously with live virus vaccines

Drug/Lab Test

Increase: IgE

NURSING CONSIDERATIONS

Assess:

• **Asthma:** respiratory rate, rhythm, depth; auscultate lung fields bilaterally; notify prescriber of abnormalities; monitor pulmonary function tests; serum IgE (may increase and continue for 1 year) • **Inj site reactions:** inflammation, edema, redness, warmth at site; may occur within 60 min of inj, may decrease with repeated dosing

Black Box Warning:

Anaphylaxis, allergic reactions: rash, urticaria, inability to breathe, edema of throat; product should be discontinued; have emergency equipment available, observe for 2 hr, reaction can occur ≤24 hr

Evaluate:

- Therapeutic response: ability to breathe more easily

Teach patient/family:

- That improvement will not be immediate
- Not to stop taking or decrease current asthma medications unless instructed by prescriber
- To avoid live virus vaccines while taking this product

Black Box Warning:

To report signs of allergic reaction

☼ Canada only Side effects: *italics* = common; **bold** = life-threatening ⚠

Nurse Alert

omeprazole (OTC, Rx)

(oh-mep'ray-zole)

Good Sense Omeprazole, Losec , PriLOSEC, PriLOSEC OTC

Func. class.: Antiulcer, proton pump inhibitor

Chem. class.: Benzimidazole

Do not confuse: **PriLOSEC**/Prinivil/PROzac/predniSONE

ACTION:

Suppresses gastric secretion by inhibiting hydrogen/potassium ATPase enzyme system in gastric parietal cells; characterized as gastric acid pump inhibitor because it blocks the final step of acid production

USES:

Gastroesophageal reflux disease (GERD), severe erosive esophagitis, poorly responsive systemic GERD, pathologic hypersecretory conditions (Zollinger-Ellison syndrome, systemic mastocytosis, multiple endocrine adenomas); treatment of active duodenal ulcers with/without antiinfectives for *Helicobacter pylori*

Unlabeled uses: NSAID-induced ulcer prophylaxis, stress gastritis prophylaxis

CONTRAINDICATIONS:

Hypersensitivity

Precautions: Pregnancy (C), breastfeeding, children

DOSAGE AND ROUTES

Calculator

Active duodenal ulcers

- **Adult: PO** 20 mg/day $\times$ 4-8 wk; associated with *H. pylori* 40 mg q AM and clarithromycin 500 mg tid on days 1-14 then 20 mg/day on days 15-28

Severe erosive esophagitis/poorly responsive GERD

- **Adult: PO** (del rel cap/del rel susp) 20 mg/day $\times$ 4-8 wk

Pathologic hypersecretory conditions

- **Adult: PO** 60 mg/day; may increase to 120 mg tid; daily doses >80 mg should be divided

Gastric ulcer

- **Adult: PO** 40 mg/day 4-8 wk
- **Geriatric: PO** ≤ 20 mg/day

Heartburn (OTC)

- **Adult: PO** 1 del rel tab (20 mg)/day before AM meal with glass of water

Available forms: Del rel caps 10, 20, 40 mg; del rel tabs 20 mg; granules for oral susp 2.5, 10 mg (del rel)

Administer:

- Swallow caps whole; do not crush or chew; caps may be opened and sprinkled over applesauce • Before eating, usually in the AM, separate with other medications • **Oral susp powder:** give on empty stomach ≥ 1 hr before food; if there is NG or enteral feeding tube, do not feed 3 hr before or 1 hr after giving product: contents of packet should be mixed with 1-2 tbls water, add 20 ml water for NG tube; for oral, stir well, drink, add more water, and drink

SIDE EFFECTS

CNS: Headache, dizziness, asthenia

CV: Chest pain, angina, tachycardia, bradycardia, palpitations, peripheral edema, heart failure

EENT: Tinnitus, taste perversion

GI: Diarrhea, abdominal pain, vomiting, nausea, constipation, flatulence, acid regurgitation, abdominal swelling, anorexia, irritable colon, esophageal candidiasis, dry mouth, hepatic failure

GU: UTI, urinary frequency, increased creatinine, proteinuria, hematuria, testicular pain, glycosuria

HEMA: Pancytopenia, thrombocytopenia, neutropenia, leukocytosis, anemia

INTEG: Rash, dry skin, urticaria, pruritus, alopecia

META: Hypoglycemia, increased hepatic enzymes, weight gain, hypomagnesemia, hyponatremia, vit B12 deficiency

MISC: Back pain, fever, fatigue, malaise

RESP: Upper respiratory infections, cough, epistaxis, pneumonia

SYST: Angioedema, exfoliative dermatitis, Stevens-Johnson syndrome, toxic epidermal necrolysis

PHARMACOKINETICS

Bioavailability 30%-40%; peak 1/2-3½ hr; half-life 1/2-1 hr; protein binding 95%; eliminated in urine as metabolites and in feces; in geriatric patients, elimination rate decreased, bioavailability increased; metabolized by CYP2C19 enzyme system

INTERACTIONS

Increase: bleeding—warfarin

Increase: serum levels of diazepam, phenytoin, flurazepam, triazolam, cycloSPORINE, disulfiram, digoxin

Decrease: effect of iron salts, ketoconazole, cyanocobalamin, calcium carbonate, ampicillin, indinavir, gefitinib

Drug/Lab Test

Increase: alk phos, AST, ALT, bilirubin, gastrin

NURSING CONSIDERATIONS

Assess:

• **GI system:** bowel sounds q8hr, abdomen for pain, swelling, anorexia, blood in stools • **Electrolyte imbalances:** hyponatremia; hypomagnesemia in patients using product (3 mo-1 yr); if hypomagnesemia occurs, use of magnesium supplements may be sufficient, if severe, discontinue product • **Hepatic enzymes:** AST, ALT, alk phos during treatment; **blood studies:** CBC, differential during treatment, blood dyscrasias may occur; vit B12 in long-term treatment  **Serious skin reactions:** toxic epidermal necrolysis, Stevens-Johnson syndrome, angioedema, exfoliative dermatitis; fever, sore throat, fatigue, thin ulcers, lesions in mouth, lips; discontinue product, some serious skin disorders may be fatal

Evaluate:

• Therapeutic response: absence of epigastric pain, swelling, fullness, bleeding; decreased GERD, esophagitis symptoms

Teach patient/family:

- To report severe diarrhea; black, tarry stools; abdominal cramps/pain; or continuing headache; product may have to be discontinued • That, if diabetic, hypoglycemia may occur
- To avoid hazardous activities because dizziness may occur
- To avoid alcohol, salicylates, NSAIDs; may cause GI irritation

- To take as directed, even if feeling better; to take missed dose as soon as remembered; not to double; PriLOSEC OTC takes up to 4 days for full effect
-

🍁 Canada only Side effects: *italics* = common; **bold** = life-threatening ⚠️
Nurse Alert

ondansetron (Rx)

(on-dan-seh'tron)

Zofran, Zofran ODT, Zuplenz

Func. class.: Antiemetic

Chem. class.: 5-HT₃ receptor antagonist

Do not confuse: Zofran/Zantac

ACTION:

Prevents nausea, vomiting by blocking serotonin peripherally, centrally, and in the small intestine

USES:

Prevention of nausea, vomiting associated with cancer chemotherapy, radiotherapy; prevention of postoperative nausea, vomiting

Unlabeled uses: Pruritus (rectal use), alcoholism, hyperemesis gravidarum

CONTRAINDICATIONS:

Hypersensitivity; phenylketonuric hypersensitivity (oral disintegrating tab), torsades de pointes

Precautions: Pregnancy (B), breastfeeding, children, geriatric patients, granisetron hypersensitivity, QT prolongation, torsades de pointes

DOSAGE AND ROUTES

Calculator

Prevention of nausea/vomiting (cancer chemotherapy)

- **Adult and child 4-18 yr:** IV 0.15 mg/kg infused over 15 min given 30 min before start of cancer chemotherapy, max 16 mg/dose; 0.15 mg/kg given 4 hr and 8 hr after 1st dose or 16 mg as single dose; dilute in 50 ml of D₅ or 0.9% NaCl before giving; **RECT** (unlabeled) 16 mg/day 2 hr prior to chemotherapy; **PO** 8 mg 1/2 hr prior to chemotherapy, repeat 4, 8 hr after 1st dose
- **Child ≥4 yr:** **PO** 4 mg TID, first dose 1/2 hr prior to chemotherapy

Prevention of nausea/vomiting (radiotherapy)

- **Adult:** **PO** 8 mg tid, may repeat q8hr

Prevention of postoperative nausea/vomiting

- **Adult: IV/IM** 4 mg undiluted over >30 sec prior to induction of anesthesia
- **Child 2-12 yr: IV** 0.1 mg/kg (≤ 40 kg); **IV** 4 mg (≥ 40 kg), give over ≥ 30 sec

Hepatic dose

- **Adult: PO/IM/IV** Max dose 8 mg/day

Hyperemesis gravidarum (unlabeled)

- **Adult: PO/IV** 4-8 mg bid-tid

Pruritus (unlabeled)

- **Adult: PO** 8 mg bid

Alcoholism (unlabeled)

- **Adult: PO** 4 mcg/kg bid

Available forms: Inj 2 mg/ml, 32 mg/50 ml (premixed); tabs 4, 8 mg; oral sol 4 mg/5 ml; oral disintegrating tabs 4, 8 mg; oral dissolving film 4, 8 mg

Administer:

PO route

- **Oral disintegrating tab:** do not push through foil; gently remove, immediately place on tongue to dissolve; swallow with saliva
- **Oral dissolving film:** fold pouch along dotted line to expose tear notch; while folded, tear and remove film, place film on tongue until dissolved, swallow after dissolved; to reach desired dose, administer successive films, allowing each to dissolve before using another

IM route

- Visually inspect for particulate or discoloration
- May give 4 mg undiluted IM, inject deeply in large muscle mass, aspirate

Direct IV route

- Check for discoloration or particulate, if particulate is present, shake to dissolve
- After diluting single dose in 50 ml NS or D₅W, 0.45% NaCl or NS; give over 15 min
- Do not use IV 32 mg/dose in chemotherapy nausea/vomiting due to QT prolongation, max 16 mg/dose (adult)

Y-site compatibilities: Aldesleukin, amifostine, amikacin, aztreonam, bleomycin, CARBOplatin, carmustine, ceFAZolin, cefmetazole, cefotaxime, cefOXitin, ceftAZidime, ceftizoxime, cefuroxime, chlorproMAZINE, cimetidine, cisatracurium, CISplatin, cladribine, clindamycin, cyclophosphamide, cytarabine, dacarbazine, DACTINomycin, DAUNOrubicin, dexamethasone, diphenhydrAMINE, DOPamine, DOXOrubicin, DOXOrubicin

liposome, doxycycline, droperidol, etoposide, famotidine, filgrastim, floxuridine, fluconazole, fludarabine, gallium, gentamicin, haloperidol, heparin, hydrocortisone, HYDROmorphone, hydrOXYzine, ifosfamide, imipenem-cilastatin, magnesium sulfate, mannitol, mechlorethamine, melphalan, meperidine, mesna, methotrexate, metoclopramide, miconazole, mitoMYcin, mitoXANtrone, morphine, PACLitaxel, pentostatin, piperacillin/tazobactam, potassium chloride, prochlorperazine, promethazine, ranitidine, remifentanyl, streptozocin, teniposide, thiotepa, ticarcillin, ticarcillin-clavulanate, vancomycin, vinBLAStine, vinCRIStine, vinorelbine, zidovudine

SIDE EFFECTS

CNS: *Headache, dizziness, drowsiness, fatigue, EPS*

GI: *Diarrhea, constipation, abdominal pain, dry mouth*

MISC: *Rash, bronchospasm (rare), musculoskeletal pain, wound problems, shivering, fever, hypoxia, urinary retention*

PHARMACOKINETICS

IV: Mean elimination half-life 3.5-4.7 hr, plasma protein binding 70%-76%, extensively metabolized in the liver, excreted 45%-60% in urine

INTERACTIONS

Increase: unconsciousness, hypotension—apomorphine, do not use together

Increase: QT prolongation—other products that prolong QT

Decrease: ondansetron effect—rifampin, carbamazepine, phenytoin

Drug/Lab Test

Increase: LFTs

NURSING CONSIDERATIONS

Assess:

- Absence of nausea, vomiting during chemotherapy
- Hypersensitivity reaction: rash, bronchospasm (rare)
- **EPS:** shuffling gait, tremors, grimacing, rigidity periodically
- **QT prolongation:** monitoring ECG in those with cardiac disease or receiving other products that increase QT

Perform/provide:

- Storage at room temp for 48 hr after dilution

Evaluate:

- Therapeutic response: absence of nausea, vomiting during cancer chemotherapy

Teach patient/family:

- To report diarrhea, constipation, rash, changes in respirations, or discomfort at insertion site
 - Headache requiring analgesic is common
-

🍁 Canada only Side effects: *italics* = common; **bold** = life-threatening ⚠️
Nurse Alert

orlistat (Rx, OTC)

(or'lih-stat)

Alli, Xenical

Func. class.: Weight-control agent

Chem. class.: Lipase inhibitor

ACTION:

Inhibits the absorption of dietary fats

USES:

Obesity management

CONTRAINDICATIONS:

Hypersensitivity, chronic malabsorption syndrome, cholestasis

Precautions: Pregnancy (X), children, hypothyroidism, other organic causes of obesity, anorexia nervosa, bulimia, nephrolithiasis, GI disease, diabetes, fat-soluble vitamin deficiency, breastfeeding

DOSAGE AND ROUTES

Calculator

• **Adult: PO** (Alli) 60 mg, (Xenical) 120 mg tid with each main meal containing fat, max 360 mg/day

Available forms: Caps (Alli) 60 mg, (Xenical) 120 mg

Administer:

• For obesity only if patient on weight-reduction program that includes dietary changes, exercise; patient should be on a diet with 30% of calories from fat; omit dose of orlistat if meal contains no fat

SIDE EFFECTS

CNS: *Insomnia*, depression, anxiety, dizziness, headache, fatigue

GI: *Oily spotting, flatus with discharge, fecal urgency, fatty/oily stool, oily evacuation, fecal incontinence, frequent defecation*, nausea, vomiting, abdominal pain, infectious diarrhea, rectal pain, tooth disorder, hypovitaminosis, **hepatic failure, hepatitis, pancreatitis**

GU: UTI, vaginitis, menstrual irregularity

INTEG: Dry skin, rash

MS: Back pain, arthritis, myalgia, tendinitis

RESP: Influenza, URI, LRI, EENT symptoms

PHARMACOKINETICS

Minimal absorption, peak 8 hr, 99% protein binding, excretion in feces, half-life 1-2 hr

INTERACTIONS

Increase: lipid-lowering effect—pravastatin

Increase: effects of warfarin

Decrease: absorption—fat-soluble vitamins (A, D, E, K), cycloSPORINE

NURSING CONSIDERATIONS

Assess:

- **Weight status:** before starting therapy, obtain testing to rule out physiologic reactions for weight, obtain thyroid testing, BMI, glucose; weight weekly; diabetic patients may need reduction in oral hypoglycemics
- For misuse in certain populations (anorexia nervosa, bulimia)

⚠ Hepatotoxicity/pancreatitis: jaundice, weakness, abdominal pain (rare)

Evaluate:

- Therapeutic response: decrease in weight

Teach patient/family:

- That 60-mg cap can be obtained OTC; 60 mg tid is highest OTC dose
- That safety and effectiveness beyond 2 yr have not been determined
- To read patient information sheet; to discuss unpleasant GI side effects
- To take multivitamin containing fat-soluble vitamins 2 hr before or after orlistat; that psyllium taken with each dose or at bedtime may decrease GI symptoms
- To avoid hazardous activities until stabilized on medication; to discuss unpleasant side effects
- To notify prescriber if pregnancy is planned or suspected pregnancy (X), if breastfeeding take proper fat-soluble vitamins ⚠

Hepatotoxicity/pancreatitis: yellowing of skin, eyes; dark urine; weakness; abdominal pain

Nurse Alert

oseltamivir (Rx)

(oss-el-tam'ih-veer)

Tamiflu

Func. class.: Antiviral

Chem. class.: Neuramidase inhibitor

ACTION:

Inhibits influenza virus neuraminidase with possible alteration of virus particle aggregation and release

USES:

Prevention and treatment of influenza type A or B

Unlabeled uses: Avian flu (H5N1), avian influenzae A (H5N1), swine flu (H1N1), encephalitis

CONTRAINDICATIONS:

Hypersensitivity

Precautions: Pregnancy (C), neonates, breastfeeding, infants, children, geriatric patients, renal/hepatic/pulmonary/cardiac disease, psychosis, viral infection

DOSAGE AND ROUTES

Calculator

Treatment of influenza

- **Adult/child >40 kg: PO** 75 mg bid × 5 days, begin treatment within 2 days of onset of symptoms
- **Child 23-40 kg and ≥1 yr: PO** 60 mg bid
- **Child 15-23 kg and ≥1 yr: PO** 45 mg bid
- **Child ≤15 kg and ≥1 yr: PO** 30 mg bid
- **Neonates ≥14 days, infants: PO** 3 mg/kg/dose BID × 5 days

Prevention of influenza

- **Adult/child ≥13 yr: PO** 75 mg/day × ≥10 days; begin treatment within 2 days of contact, max use 6 wk

Renal dose

- **Adult: PO** CCr 10-30 ml/min, 75 mg/day × 5 days (treatment); 75 mg every other day or 30 mg/day (prophylaxis)

H1N1 influenzae a virus (swine flu) (unlabeled)

- **Adult/adolescent/child >40 kg: PO** 75 mg bid × 5 days
- **Adolescent/child 24-40 kg: PO** 60 mg bid × 5 days
- **Child >1 yr and 15-23 kg: PO** 45 mg bid × 5 days
- **Child >1 yr and ≤15 kg: PO** 30 mg bid × 5 days

Available forms: Caps 30, 45, 75 mg; powder for oral susp 6 mg/ml

Administer:

- Within 2 days of symptoms of influenza; continue for 5 days
- At least 4 hr before bedtime to prevent insomnia
- Without regard to food; give with food for GI upset
- Take with full glass of water
- **Oral susp:** 6 mg/ml conc, take care to administer correct dose; loosen powder from side of bottle, add 55 ml, shake well (6 mg/ml), remove child-resistant cap, push bottle adapter into neck of bottle, close tightly with child-resistant cap to ensure sealing, use within 17 days of preparation when refrigerated or within 10 days at room temp, write expiration date on bottle, shake well prior to use, use oral syringe provided but only with markings for 30, 45, 60 mg, confirm that dosing instructions are in same units as syringe provided

SIDE EFFECTS

CNS: *Headache, dizziness, fatigue, insomnia, seizures, delirium, self-injury (children)*

ENDO: Hyperglycemia

GI: *Nausea, vomiting, diarrhea, abdominal pain*

INTEG: *Toxic epidermal necrolysis, Stevens-Johnson syndrome, erythema multiforme*

RESP: Cough

PHARMACOKINETICS

Rapidly absorbed, protein binding 40%-45%, converted to oseltamivir carboxylate (active form), active forms half-life 1-3 hr, metabolite 6-10 hr, excreted in urine (99%), protein binding 3%

INTERACTIONS

- Avoid use with H1N1 virus vaccine, intranasal influenzae vaccine

NURSING CONSIDERATIONS

Assess:

- Bowel pattern before, during treatment
- **Influenza:** fever, fatigue, sore throat, headache, muscle soreness, aches

Perform/provide:

- Storage in tight, dry container

Evaluate:

- Therapeutic response: absence of fever, malaise, cough, dyspnea in infection

Teach patient/family:

- About aspects of product therapy
- To avoid hazardous activities if dizziness occurs
- To take as soon as symptoms appear; to take full course even if feeling better
- To take missed dose as soon as remembered if within 2 hr of next dose
-  **To stop immediately; to report to prescriber skin rash, delirium, psychosis, hallucinations (child) • That this product should not be substituted for flu shot**
- Will not treat the common cold
- To avoid other products unless approved by prescriber

☼ Canada only Side effects: *italics* = common; **bold** = life-threatening 
Nurse Alert

HIGH ALERT

oxaliplatin (Rx)

(ox-al-i'plat-in)

Eloxatin

Func. class.: Antineoplastic

Chem. class.: 3rd-generation platinum analog

ACTION:

Forms crosslinks, thereby inhibiting DNA replication and transcription; not specific to cell cycle

USES:

Metastatic carcinoma of the colon or rectum in combination with 5-FU/leucovorin

Unlabeled uses: Relapsed or refractory non-Hodgkin's lymphoma; advanced ovarian cancer; breast, head/neck, testicular, pancreatic, gastric cancer; mesothelioma

CONTRAINDICATIONS:

Pregnancy (D), breastfeeding, radiation therapy or chemotherapy within 1 mo, thrombocytopenia, smallpox vaccination

Black Box Warning:

Hypersensitivity to this product or other platinum products

Precautions: Children, geriatric patients, pneumococcus vaccination, renal disease

DOSAGE AND ROUTES

Calculator

Dosage protocols may vary

Colorectal cancer

• **Adult: IV INF** *Day 1:* oxaliplatin 85 mg/m² in 250-500 ml D₅W and leucovorin 200 mg/m² in D₅W, give both over 2 hr at the same time in separate bags using a Y-line, followed by 5-FU 400 mg/m² **IV BOL** over 2-4 min then 5-FU 600 mg/m² **IV INF** in 500 ml D₅W as a 22-hr **CONT INF**; *day 2:*

leucovorin 200 mg/m² **IV INF** over 2 hr, then 5-FU 400 mg/m² **IV BOL** over 2-4 min, then 5-FU 600 mg/m² **IV INF** in 500 ml D₅W as a 22-hr **CONT INF**; repeat cycle q2wk

Renal dose

- **Adult: IV** CCr <30 ml/min, reduce starting dose to 65 mg/m²

Advanced ovarian cancer (unlabeled)

- **Adult: IV** 130 mg/m² q3wk as a single agent in those previously treated

Advanced breast cancer (unlabeled)

- **Adult: IV** 130 mg/m² on day 1 plus 5-fluorouracil (1000 mg/m² **CONT IV** INF days 1-4) q3wk

Pancreatic cancer (unlabeled)

- **Adult: IV** 100 mg/m² on day 2, with gemcitabine 1000 mg/m² on day 1, repeat q2wk; 625 mg/m² bid throughout treatment or fluorouracil 200 mg/m²/day throughout treatment

Gastric cancer (unlabeled)

- **Adult: IV** 130 mg/m² over 2 hr on day 1 with epirubic 50 mg/m² and capecitabine

Available forms: Powder for inj 50, 100-mg single-use vials (5 mg/ml); solution for inj 50 mg/10 ml, 100 mg/20 ml, 200 mg/40 ml

Administer:

Intermittent IV INF route

- Premedicate with antiemetics including 5HT₃ blockers, with or without dexamethasone; prehydration not needed
- Do not reconstitute or dilute with sodium chloride or any chloride-containing sol, do not use aluminum equipment during any preparation or administration, will degrade platinum; do not refrigerate unopened powder or sol; do not freeze; protect from light
- Use cytotoxic handling procedures; prepare in biologic cabinet using gown, gloves, mask; do not allow product to come in contact with skin; use soap and water if contact occurs
- EPINEPHrine, antihistamines, corticosteroids for hypersensitivity reaction
- **Lyophilized powder:** reconstitute vial 50 mg/10 ml or 100 mg/20 ml sterile water for inj or D₅W; after reconstitution, sol may be stored for ≤24 hr in refrigerator; after dilution in 250-500 ml D₅W, may store ≤24 hr in

refrigerator or 6 hr at room temp, infuse over 2 hr • **Aqueous solution:** dilute in 250-500 ml of D₅W; after dilution, may store ≤24 hr refrigerator, 6 hr at room temp, infuse over 2 hr

Y-site compatibilities: Alfentanil, amifostine, amikacin, aminocaproic acid, amiodarone, amphotericin B colloidal, amphotericin B lipid complex, amphotericin B liposome, ampicillin, ampicillin-sulbactam, anidulafungin, atenolol, atracurium, azithromycin, aztreonam, bivalirudin, bleomycin, bumetanide, buprenorphine, butorphanol, calcium chloride/gluconate, CARBOplatin, caspofungin, ceFAZolin, cefotaxime, cefoTETan, cefOXitin, cefTAZidime, ceftizoxime, cefTRIAxone, cefuroxime, chloramphenicol, chlorproMAZINE, cimetidine, ciprofloxacin, cisatracurium, CISplatin, clindamycin, cyclophosphamide, cycloSPORINE, cytarabine, dacarbazine, DACTINomycin, DAPTOmycin, DAUNOrubicin, dexamethasone, digoxin, diltiazem, diphenhydrAMINE, DOBUTamine, DOCEtaxel, dolasetron, DOPamine, doxacurium, DOXOrubicin, doxycycline, droperidol, enalaprilat, ePHEDrine, EPINEPHrine, epirubicin, ertapenem, erythromycin, esmolol, etoposide, famotidine, fenoldopam, fentaNYL, fluconazole, fludarabine, foscarnet, fosphenytoin, furosemide, gatifloxacin, gemcitabine, gemtuzumab, gentamicin, glycopyrrolate, granisetron, haloperidol, heparin, hydrALAZINE, hydrocortisone, HYDROmorphone, hydrOXYzine, IDArubicin, ifosfamide, imipenem-cilastatin, inamrinone, insulin (regular), irinotecan, isoproterenol, ketorolac, labetalol, leucovorin, levofloxacin, levorphanol, lidocaine, linezolid, LORazepam, magnesium sulfate, mannitol, meperidine, meropenem, mesna, metaraminol, methyl dopate, methylPREDNISolone, metoclopramide, metoprolol, metroNIDAZOLE, midazolam, milrinone, minocycline, mitoMYcin, mitoXANtrone, mivacurium, morphine, nafcillin, nalbuphine, naloxone, nesiritide, niCARDipine, nitroglycerin, nitroprusside, norepinephrine, octreotide, ondansetron, PACLitaxel, palonosetron, pancuronium, PEMEtrexed, pentamidine, pentazocine, phenylephrine, piperacillin, polymyxin B, potassium chloride/phosphates, procainamide, prochlorperazine, promethazine, propranolol, quiNIDine, quinupristin-dalfopristin, ranitidine, rocuronium, sodium acetate/phosphates, succinylcholine, SUFentanil, sulfamethoxazole-trimethoprim, tacrolimus, teniposide, theophylline, thiotepa, ticarcillin, ticarcillin-clavulanate, tigecycline, tirofiban, tobramycin, tolazoline, topotecan,

trimethobenzamide, vancomycin, vasopressin, vecuronium, verapamil, vinBLAStine, vinCRIStine, vinorelbine, voriconazole, zidovudine, zoledronic acid

SIDE EFFECTS

CNS: Peripheral neuropathy, fatigue, headache, dizziness, insomnia

CV: Cardiac abnormalities, **thromboembolism**

EENT: *Decreased visual acuity, tinnitus, hearing loss*

GI: *Severe nausea, vomiting, diarrhea, weight loss, stomatitis, anorexia, gastroesophageal reflux, constipation, dyspepsia, mucositis, flatulence*

GU: Hematuria, dysuria, creatinine

HEMA: **Thrombocytopenia, leukopenia, pancytopenia, neutropenia, anemia, hemolytic uremic syndrome**

INTEG: *Alopecia, rash, flushing, extravasation, redness, swelling, pain at inj site*

META: Hypokalemia

RESP: **Fibrosis**, dyspnea, cough, rhinitis, URI, pharyngitis

SYST: **Anaphylaxis, angioedema**

PHARMACOKINETICS

Metabolized in liver, excreted in urine; after administration, 15% of platinum in systemic circulation, 85% either in tissues or being eliminated in urine; half-life 390 hr; protein binding >90%

INTERACTIONS

Increase: bleeding risk—NSAIDs, alcohol, anticoagulants, platelet inhibitors, thrombolytics, salicylates

Increase: **oxaliplatin toxicity—tannins**

Increase: myelosuppression—myelosuppressive agents, radiation

Increase: nephrotoxicity—aminoglycosides, loop diuretics

Decrease: antibody response—live virus vaccines

Drug/Lab Test

Increase: ALT, AST, bilirubin, creatinine

Decrease: potassium, neutrophils, WBC, platelets

NURSING CONSIDERATIONS

Assess:

⚠️ **Bone marrow depression:** CBC, differential, platelet count each cycle; withhold product if WBC is <4000 or platelet count is <100,000; notify prescriber of results • Renal/hepatic studies: BUN, creatinine, serum uric acid, urine CCr before, electrolytes during therapy; dose should not be given if BUN >19 mg/dl; creatinine <1.5 mg/dl; I&O ratio; report fall in urine output of <30 ml/hr; LFTs

Black Box Warning:

Anaphylaxis: wheezing, tachycardia, facial swelling, fainting; discontinue product, report to prescriber; resuscitation equipment should be nearby

⚠️ **Pulmonary fibrosis:** cough, crackles, dyspnea, pulmonary infiltrate; discontinue immediately, death may occur • Monitor temp; may indicate beginning infection

- Hepatic studies before each cycle (bilirubin, AST, ALT, LDH) as needed or monthly
- **Bleeding:** hematuria, guaiac, bruising or petechiae, mucosa or orifices; obtain prescription for viscous lidocaine (Xylocaine) • Effects of alopecia on body image; discuss feelings about body changes
- Edema in feet, joint pain, stomach pain, shaking

Perform/provide:

- Comprehensive oral hygiene
- All medications PO if possible; avoid IM inj when platelets <100,000/mm³
- Increase fluid intake to 2-3 L/day to prevent urate deposits, calculi formation; elimination of product • Blankets, hat, gloves for cold prevention

Evaluate:

- Therapeutic response: decreased tumor size, spread of malignancy

Teach patient/family:

- ⚠️ To report signs of **infection:** increased temp, sore throat, flulike symptoms
- To report signs of **anemia:** fatigue, headache, faintness, SOB, irritability • To report **bleeding;** to avoid use of razors, commercial mouthwash
- To avoid aspirin, ibuprofen, NSAIDs, alcohol; may cause GI bleeding
- ⚠️ To report any changes in breathing, coughing • That hair may be lost during treatment; that a wig or hairpiece may make patient feel better; that new hair may be different in color, texture • To report numbness, tingling in face or extremities, poor hearing or joint pain or swelling • Not to receive vaccines during treatment

⚠ To use contraception during treatment and for 4 mo after; that product may cause infertility, pregnancy (D) • **Dysesthesias:** to avoid contact with cold (air, ice, liquid)

🍁 Canada only Side effects: *italics* = common; **bold** = life-threatening ⚠
Nurse Alert

oxazepam (Rx)

(ox-ay'ze-pam)

Func. class.: Sedative/hypnotic; antianxiety

Chem. class.: Benzodiazepine, short acting

Controlled Substance Schedule IV

ACTION:

Potentiates the actions of GABA, especially in the limbic system and the reticular formation

USES:

Anxiety, alcohol withdrawal, insomnia

CONTRAINDICATIONS:

Pregnancy (D), breastfeeding, children <6 yr, hypersensitivity to benzodiazepines, closed-angle glaucoma, psychosis

Precautions: Geriatric patients, debilitated, renal/hepatic disease, depression, suicidal ideation, dementia, sleep apnea, seizure disorder

DOSAGE AND ROUTES

Calculator

Anxiety

- **Adult: PO** 10-30 mg tid-qid, max 120 mg/day
- **Geriatric: PO** 5 mg daily-bid initially, may increase, max 15 mg qid

Alcohol withdrawal

- **Adult: PO** 15-30 mg tid-qid

Available forms: Caps 10, 15, 30 mg

Administer:

- Without regard to food

SIDE EFFECTS

CNS: *Dizziness, drowsiness, confusion, headache, anxiety, tremors, fatigue, depression, insomnia, hallucinations, paradoxical excitement, transient amnesia*

CV: *Orthostatic hypotension, ECG changes, tachycardia, hypotension*

EENT: *Blurred vision*, tinnitus, mydriasis

GI: Nausea, vomiting, anorexia

HEMA: Leukopenia

INTEG: Rash, dermatitis, itching

SYST: Dependence

PHARMACOKINETICS

Peak 2-4 hr; metabolized by liver; excreted by kidneys; half-life 5-15 hr; crosses placenta, breast milk; protein binding 97%

INTERACTIONS

Increase: oxazepam effects—CNS depressants, alcohol, disulfiram, oral contraceptives

Decrease: oxazepam effects—oral contraceptives, phenytoin, theophylline, valproic acid

Decrease: effects of levodopa

Drug/Herb

Increase: CNS depression—kava, melatonin, valerian

Drug/Lab Test

Increase: AST, ALT, serum bilirubin

Decrease: WBC

NURSING CONSIDERATIONS

Assess:

- B/P (lying, standing), pulse; if systolic B/P drops 20 mm Hg, hold product, notify prescriber 🚨 Mental status: mood, sensorium, affect, sleeping pattern, drowsiness, dizziness, **suicidal thoughts/behaviors**

🚨 **Physical dependency, withdrawal symptoms:** headache, nausea, vomiting, muscle pain, weakness, tremors, seizures (long-term use)

Perform/provide:

- Assistance with ambulation during beginning therapy because drowsiness, dizziness occurs
- Safety measures, including side rails

Evaluate:

- Therapeutic response: decreased anxiety, restlessness, insomnia

Teach patient/family:

- That product may be taken without regard to food
 - That medication not to be used for everyday stress or used >4 mo unless directed by prescriber; not to take more than prescribed dose because product may be habit forming
 - To avoid OTC preparations (cough, cold, hay fever) unless approved by prescriber
 - To avoid driving, activities that require alertness because drowsiness may occur
 - To avoid alcohol, other psychotropic products unless directed by prescriber
 - Not to discontinue product abruptly after long-term use
 - To rise slowly because fainting may occur, especially among geriatric patients
 - That drowsiness may worsen at beginning of treatment
 - To notify prescriber if pregnancy is planned or suspected pregnancy (D)
-

🌿 Canada only Side effects: *italics* = common; **bold** = life-threatening ⚠️
Nurse Alert

OXcarbazepine (Rx)

(ox'kar-baz'uh-peen)

Trileptal

Func. class.: Anticonvulsant

Chem. class.: CarBAMazepine analog

ACTION:

May inhibit nerve impulses by limiting influx of sodium ions across cell membrane in motor cortex

USES:

Partial seizures

Unlabeled uses: Trigeminal neuralgia, atypical panic disorder, bipolar disorder

CONTRAINDICATIONS:

Hypersensitivity

Precautions: Pregnancy (C), breastfeeding, children <4 yr, hypersensitivity to carBAMazepine, renal disease, fluid restriction, hyponatremia, abrupt discontinuation, suicidal ideation

DOSAGE AND ROUTES

Calculator

Seizures, adjunctive therapy

- **Adult: PO** 300 mg bid, may be increased by 600 mg/day in divided doses bid at weekly intervals; maintenance 1200 mg/day
- **Child 4-16 yr: PO** 8-10 mg/kg/day divided bid; dose determined by weight, increase by 5 mg/kg/day q3days, max doses weight dependent

Conversion to monotherapy for partial seizures

- **Adult: PO** 300 mg bid with reduction in other anticonvulsants; increase OXcarbazepine by 600 mg/day each week over 2-4 wk; withdraw other anticonvulsants over 3-6 wk; max 2400 mg/day

Initiation of monotherapy for partial seizures

- **Adult: PO** 300 mg bid, increase by 300 mg/day q3days to 1200 mg in divided doses bid

Renal dose

- **Adult: PO** CCr <30 ml/min, 150 mg bid, increase slowly

Bipolar disorder/trigeminal neuralgia (unlabeled)

- **Adult: PO** 300 mg bid, may increase by ≤600 mg/day

Available forms: Film-coated tabs 150, 300, 600 mg; oral susp 300 mg/5 ml

Administer:

PO route

- Without regard to meals
- **Oral susp:** shake well, use calibrated oral syringe provided, use or discard within 7 days of opening

SIDE EFFECTS

CNS: Headache, dizziness, confusion, fatigue, feeling abnormal, ataxia, abnormal gait, tremors, anxiety, agitation, **worsening of seizures, suicidal thoughts/behaviors**

CV: Hypotension, chest pain, edema

EENT: Blurred vision, diplopia, nystagmus, rhinitis, sinusitis

GI: Nausea, constipation, diarrhea, anorexia, vomiting, abdominal pain, gastritis

INTEG: Purpura, rash, acne

SYST: **Angioedema, anaphylaxis, Stevens-Johnson syndrome, toxic epidermal necrolysis, drug reaction with eosinophilia and systemic symptoms (DRESS)**

PHARMACOKINETICS

PO: Onset unknown; peak 4-6 hr; metabolized by liver to active metabolite; terminal half-life 7-9 hr metabolite; inhibits P450 CYP2C19, induces CYP3A4/5

INTERACTIONS

 **Contraindicated:** MAOIs, ranolazine, nisoldipine

Increase: CNS depression—alcohol

Decrease: effects—felodipine, oral contraceptive, carbamazepine

Decrease: OXcarbazepine levels—carbamazepine, phenobarbital, phenytoin, valproic acid, verapamil

Drug/Herb

Increase: anticonvulsant effect—ginkgo

Decrease: anticonvulsant effect—ginseng, saffron

Drug/Lab Test

Decrease: sodium

NURSING CONSIDERATIONS

Assess:

- Description of seizures: frequency, duration, aura
- Hyponatremia: headache, nausea, confusion, usually within the first 3 mo of treatment, but may occur ≤ 1 yr, if this product is being used with other products that decrease sodium, monitor sodium levels
- Electrolyte: sodium; T_4 ; phenytoin (when given together)

 **Serious reactions:** angioedema, anaphylaxis, Stevens-Johnson syndrome

- CNS/mental status: mood, sensorium, affect, behavioral changes, confusion, suicidal thoughts/behaviors; if mental status changes, notify prescriber
- Eye problems: need for ophthalmic exams before, during, after treatment (slit lamp, funduscopy, tonometry)
- **Pregnancy:** lack of seizure control due to MHD, a metabolite of OXcarbazepine, monitor seizure control

Perform/provide:

- Storage at room temp

Evaluate:

- Therapeutic response: decreased seizure activity

Teach patient/family:

- To avoid driving, other activities that require alertness
- To take twice a day at same intervals
- Not to discontinue medication quickly after long-term use, seizures may increase
- To inform prescriber if hypersensitive to carBAMazepine; multisystem hypersensitivity may occur, to report fever, other allergic symptoms
- To avoid use of alcohol while taking product
- To use alternative contraception if using hormonal method, to report if pregnancy is planned or suspected pregnancy (C)
- To report skin rashes immediately, serious skin reactions can occur

TREATMENT OF OVERDOSE:

Activated charcoal; give 0.9% NaCl (hypotensive state), atropine (bradycardia); use benzodiazepines, barbiturates for seizures

🍁 Canada only Side effects: *italics* = common; **bold** = life-threatening ⚠️
Nurse Alert

oxybutynin (Rx)

(ox-i-byoo'ti-nin)

Ditropan , Ditropan XL, Gelnique, Oxytrol , Oxytrol Transdermal, Uromax 

Func. class.: Anticholinergic

Chem. class.: Synthetic tertiary amine

Do not confuse: **Ditropan**/diazepam

ACTION:

Relaxes smooth muscles in urinary tract by inhibiting acetylcholine at postganglionic sites

USES:

Antispasmodic for neurogenic bladder, overactive bladder

CONTRAINDICATIONS:

Hypersensitivity, GI obstruction, urinary retention, glaucoma, severe colitis, myasthenia gravis, unstable CV disease

Precautions: Pregnancy (B), breastfeeding, children <12 yr, geriatric patients, suspected glaucoma, cardiac disease, dementia

DOSAGE AND ROUTES

Calculator

- **Adult:** **PO** 5 mg bid-tid, max 5 mg qid; **EXT REL** 5-10 mg/day, may increase by 5 mg, max 30 mg/day; **TD** apply 1 patch to abdomen, hip, buttock 2×/wk (q3-4 days); **GEL** apply contents of 1 packet to abdomen, upper arms, shoulders, thighs daily
- **Geriatric:** **PO** 2.5-5 mg bid-tid, increase by 2.5 mg q several days
- **Child >6 yr:** **PO** 5 mg bid, max 5 mg tid; **EXT REL** 5 mg/day, max 20 mg/day
- **Child 1-5 yr:** **PO** 0.2 mg/kg/dose bid-tid

Available forms: Syr 5 mg/5 ml; tabs 5 mg; ext rel tabs 5, 10, 15 mg; TD 3.9 mg/day; top gel 10% (Gelnique)

Administer:

PO route

- Do not crush, break, or chew ext rel tabs
- Without regard to meals

Topical route

- Wash hands; apply to clean, dry, intact skin on abdomen, upper arms/shoulders, thighs; avoid navel, rotate sites • Squeeze contents into palm of hand or directly on site, rub gently
- Do not bathe, exercise, swim for 1 hr after application
- Allow to dry before putting on clothing
- Do not be near flame, fire, or smoke until gel has dried
- Delivers 100 mg

Transdermal route

- Apply to clean, dry, intact skin on abdomen, hip, buttock; use firm pressure; not affected by showering/bathing; rotate sites • Delivers 3.9 mg/day

SIDE EFFECTS

CNS: *Anxiety, restlessness, dizziness, somnolence, insomnia, nervousness, seizures*, headache, drowsiness, confusion

CV: *Palpitations, sinus tachycardia*, hypertension, peripheral edema, **QT prolongation**

EENT: *Blurred vision, dry eyes*, increased intraocular tension, *dry mouth*, throat

GI: *Nausea, vomiting, anorexia*, abdominal pain, *constipation, dyspepsia*, diarrhea, taste perversion, GERD

GU: Dysuria, impotence, *urinary retention, hesitancy*

MISC: **Hyperthermia, anaphylaxis, angioedema**

PHARMACOKINETICS

Onset 1/2-1 hr, peak 3-6 hr, duration 6-10 hr; metabolized by liver, excreted in urine; terminal half-life 2-3 hr

INTERACTIONS

- Altered pharmacokinetic parameters: CYP3A4 inhibitors

Increase: CNS depression—benzodiazepines, sedatives, hypnotics, opioids

Increase: levels of atenolol, digoxin, nitrofurantoin

Increase: anticholinergic effects—antihistamines, amantidine, other anticholinergics

Increase or decrease: levels of phenothiazines

Decrease: levels of acetaminophen, haloperidol, levodopa

Decrease: effects of oxybutynin—CYP3A4 inducers

NURSING CONSIDERATIONS

Assess:

• **Urinary patterns:** distention, nocturia, frequency, urgency, incontinence, I&O ratios; cystometry to diagnose dysfunction, urinary tract infections should be treated

⚠ **Allergic reactions:** rash, urticaria; if these occur, product should be discontinued; angioedema ⚠ **QT prolongation:** ECG for QT prolongation, ejection fraction; assess for chest pain, palpitations, dyspnea • **CNS effects:** confusion, anxiety; anticholinergic effects in geriatric patients

Evaluate:

• Urinary status: dysuria, frequency, nocturia, incontinence

Teach patient/family:

- To avoid hazardous activities because dizziness, blurred vision may occur
- To avoid OTC medications with alcohol, other CNS depressants
- To avoid hot weather, strenuous activity because product decreases perspiration
- About the correct application of each product form
- **Transdermal:** Change patch 2×/wk, do not use same site within 7 days, dispose of and use container not accessible to pets/children • To open patch immediately before using
- Do not use during MRI, remove
- **Topical gel:** Rotate sites
- Apply to clean, dry skin on abdomen, upper arm/shoulders/thighs
- Gel is flammable

🍁 Canada only Side effects: *italics* = common; **bold** = life-threatening ⚠

Do not confuse: **Percodan**/Decadron

Roxicet/Roxanol

Tylox/Xanax/Trimox/Wymox

OxyCODONE/HYDROcodone

OxyCODONE/OxyCONTIN

Roxicodone/roxanol

ACTION:

Inhibits ascending pain pathways in CNS, increases pain threshold, alters pain perception

USES:

Moderate to severe pain

Unlabeled uses: Postherpetic neuralgia (cont rel)

CONTRAINDICATIONS:

Hypersensitivity, addiction (opiate), asthma, ileus

Black Box Warning:

Respiratory depression

Precautions: Pregnancy (B), breastfeeding, child <18 yr, addictive personality,

increased intracranial pressure, MI (acute), severe heart disease, renal/hepatic disease, bowel impaction

Black Box Warning:

Opioid-naïve patients, substance abuse, accidental exposure, potential for overdose/poisoning, status asthmaticus

DOSAGE AND ROUTES

Calculator

- **Adult: PO** 10-30 mg q4hr (5-15 mg q4-6hr for opiate-naïve patients) **Conc sol is extremely concentrated; do not use interchangeably; CONT REL** 10 mg q12hr for opiate-naïve patients

Available forms: OxyCODONE: cont rel tabs (OxyCONTIN) 10, 15, 20, 30, 40, 80, 160 mg; immediate rel tabs 5, 7.5, 10, 15, 20, 30 mg; immediate rel caps 5 mg; oral sol 5 mg/5 ml, 20 mg/ml; **oxyCODONE with acetaminophen:** tabs 2.5 mg/300 mg, 2.5 mg/325 mg, 5 mg/300 mg, 5 mg/325 mg, 7.5 mg/325 mg, 7.5 mg/500 mg, 10 mg/325 mg, 10 mg/400 mg, 10 mg/650 mg; caps 5 mg/500 mg; oral sol 5 mg/325 mg/5 ml; **oxyCODONE with aspirin:** 4.88/325 mg; **oxyCODONE with ibuprofen:** 5 mg/400 mg

Administer:

- OxyCODONE should be titrated from the initial recommended dosage to the dosage required to relieve pain
- There is no maximum dosage of oxyCODONE; however, careful titration is required until tolerance develops to some of the side effects (drowsiness, respiratory depression)

Oral solid formulations

Immediate-release tablets route

- May be administered with food or milk to minimize GI irritation
- **Oxecta brand tablets:** Swallow whole; do not crush or dissolve; owing to nature of this formulation, do not presoak, lick, or otherwise wet tablet before administering dose; administer 1 tablet at a time; allow patient to swallow each tablet separately with sufficient liquid to ensure prompt and complete transit through the esophagus; do not use this brand for administration via nasogastric, gastric, or other feeding tubes because it can obstruct feeding tubes

Oral solid formulations

Controlled-release tablets route (oxycontin):

- Administer whole; do not crush, chew, or break in half; taking chewed, broken,

or crushed controlled-release tablets could lead to the rapid release and absorption of a potentially toxic dose of oxyCODONE

- **OxyCONTIN brand tablets:** Owing to hydro-gelling nature of the 2010 reformulation do not presoak, lick, or otherwise wet tablet before administering dose; administer 1 tablet at a time; allow patient to swallow each tablet separately with sufficient liquid to ensure prompt and complete transit through the esophagus
- **OxyCODONE controlled-release (OxyCONTIN) 60 mg and 80 mg tablets** are for use only in opioid-tolerant patients
- May be administered without food

Oral liquid formulations

Oral concentrate solution route

- **OxyFAST** is a highly concentrated solution (20 mg oxyCODONE/ml), and care should be taken in dispensing and administering this medication; for ease of administration, the solution may be added to 30 ml of a liquid or semisolid food; if the medication is placed in liquid or food, the patient needs to consume it immediately; do not store diluted oxyCODONE for future use

SIDE EFFECTS

CNS: *Drowsiness, dizziness, confusion, headache, sedation, euphoria, fatigue, abnormal dreams/thoughts, hallucinations*

CV: Palpitations, bradycardia, change in B/P

EENT: Tinnitus, blurred vision, miosis, diplopia

GI: *Nausea, vomiting, anorexia, constipation, cramps, gastritis, dyspepsia, biliary spasms*

GU: Increased urinary output, dysuria, urinary retention

INTEG: *Rash, urticaria, bruising, flushing, diaphoresis, pruritus*

RESP: *Respiratory depression*

PHARMACOKINETICS

PO: Onset 15-30 min, peak 1 hr, duration reg rel 2-6 hr, cont rel 12 hr, metabolized by liver, excreted in urine, crosses placenta, excreted in breast milk, half-life 3-5 hr, protein binding 45%

INTERACTIONS

Increase: effects with other CNS depressants—alcohol, opioids,

sedative/hypnotics, antipsychotics, skeletal muscle relaxants

Increase: oxyCODONE level: CYP3A4 inhibitors

Increase: toxicity—cimetidine, MAOIs

Drug/Herb

Increase: sedative effect—kava, St. John's wort, valerian

Drug/Lab Test

Increase: amylase, lipase

NURSING CONSIDERATIONS

Assess:

- **Pain:** intensity, location, type, characteristics; need for pain medication by pain/sedation scoring; physical dependence
- I&O ratio; check for decreasing output; may indicate urinary retention
- **CNS changes:** dizziness, drowsiness, hallucinations, euphoria, LOC, pupil reaction
- **Allergic reactions:** rash, urticaria

Black Box Warning:

Respiratory dysfunction: respiratory depression, character, rate, rhythm; notify prescriber if respirations are <10/min; B/P, pulse

- **Bowel status:** constipation; stimulant laxative may be needed with fluids, fiber

Black Box Warning:

Substance abuse: assess for substance abuse in patient/family/friends before prescribing; monitor for abuse

Black Box Warning:

Accidental exposure: dispose of properly away from pets, children

Perform/provide:

- Storage in light-resistant area at room temp
- Assistance with ambulation
- Safety measures: nightlight, call bell within easy reach

Evaluate:

- Therapeutic response: decrease in pain without dependence

Teach patient/family:

- To report any symptoms of CNS changes, allergic reactions
- That physical dependency may result from extended use
- That withdrawal symptoms may occur after long-term use: nausea, vomiting, cramps, fever, faintness, anorexia
- To avoid CNS depressants, alcohol

- To avoid driving, operating machinery if drowsiness occurs

TREATMENT OF OVERDOSE:

Naloxone (Narcan) 0.2-0.8 mg IV, O₂, IV fluids, vasopressors, caution with patients physically dependent on opioids

✳ Canada only Side effects: *italics* = common; **bold** = life-threatening ⚠
Nurse Alert

oxymetazoline nasal agent

See [Appendix B](#)

oxymetazoline ophthalmic

See [Appendix B](#)

HIGH ALERT

oxymorphone (Rx)

(ox-i-mor'fone)

[Opana](#), [Opana ER](#)

Func. class.: Opiate analgesic

Chem. class.: Semisynthetic phenanthrene derivative

Controlled Substance Schedule II

Do not confuse: [oxymorphones](#)/oxyCODONE

ACTION:

Inhibits ascending pain pathways in CNS, increases pain threshold, alters pain perception

USES:

Moderate to severe pain

CONTRAINDICATIONS:

Hypersensitivity, addiction (opiate), asthma, hepatic disease, ileus, intrathecal use, surgery

Black Box Warning:

Respiratory depression

Precautions: Pregnancy (B) (short-term), breastfeeding, children <18 yr, addictive personality, increased intracranial pressure, MI (acute), severe heart disease, respiratory depression, renal/hepatic disease, bowel impaction

Black Box Warning:

Alcoholism, opioid-naive patients, substance abuse

DOSAGE AND ROUTES

Calculator

- **Adult: IM/SUBCUT** 1-1.5 mg q4-6hr prn; **IV** 0.5 mg q4-6hr prn; *opiate naive* **PO** (immediate release only) 5-20 mg q4-6hr prn; *opiate naive* **PO-ER** 5 mg q12hr in those requiring around-the-clock dosing

Labor analgesia

- **Adult: IM** 0.5-1 mg

Available forms: Inj 1, 1.5 mg/ml; ER tab 5, 10, 20, 40 mg; ER tab, crush resistant 5, 10, 20, 30, 40 mg; tabs 5, 10 mg

Administer:

- 1 hr before or 2 hr after food (PO)
- With antiemetic for nausea, vomiting
- Do not break, crush, chew ER product
- When pain is beginning to return; determine interval by response

CONTROLLED REL

- **Opiate naive:** start with lowest dose, titrate upward 5-10 mg q12hr q3-7days to therapeutic response
- When converting from immediate rel to ext rel, give 1/2 daily dose of ext rel product q12hr

SUBCUT route

- Rotate inj sites
- Do not use if respirations are <12/min

IV route

- Give undiluted over 2-3 min

Syringe compatibilities: Glycopyrrolate, hydrOXYzine, ranitidine

SIDE EFFECTS

CNS: Drowsiness, dizziness, confusion, headache, hallucinations, **increased intracranial pressure**, sedation, **seizures**, euphoria (geriatric patients)

CV: Palpitations, **bradycardia**, change in B/P, hypotension

EENT: Tinnitus, blurred vision, miosis, diplopia

GI: Nausea, vomiting, anorexia, constipation, cramps

GU: Dysuria, urinary retention

INTEG: *Rash*, urticaria, bruising, flushing, diaphoresis, pruritus

RESP: Respiratory depression

PHARMACOKINETICS

Metabolized by liver, excreted in urine, crosses placenta, half life: PO: 7-9 hr, ext rel: 9-11 hr

PO: Peak 1 hr (fasting)

SUBCUT/IM: Onset 10-15 min, peak 1½ hr, duration 3-6 hr

IV: Onset 5-10 min, peak 15-30 min, duration 3-6 hr

INTERACTIONS

⚠ **Increase:** effects with other CNS depressants—alcohol, opiates, sedative/hypnotics, antipsychotics, skeletal muscle relaxants ⚠ **Increase:** unpredictable effects/reactions—MAOIs

Drug/Herb

Increase: sedative effect—kava, St. John's wort, valerian

Drug/Lab Test

Increase: amylase

NURSING CONSIDERATIONS

Assess:

- **Pain:** location, intensity, type, other characteristics before and 1 hr after (IM) IV 30 min; need for pain medication, physical dependence, give 25%-50% until pain reduction of 50% on pain rating scale, repeat dose may be given at time of peak if previous dose does not control pain and respiratory depression has not occurred; give short-acting opioids for breakthrough pain if patient receiving controlled rel product • I&O ratio for decreasing output; may indicate urinary retention
- **Bowel status:** constipation; may need stimulative laxative, increased fluids, fiber
- **CNS changes:** dizziness, drowsiness, hallucinations, euphoria, LOC, pupil reaction
- **Allergic reactions:** rash, urticaria

Black Box Warning:

Respiratory dysfunction: respiratory depression, character, rate, rhythm; notify prescriber if respirations are <10/min

Black Box Warning:

Accidental exposure: dispose of properly, away from children/pets

Black Box Warning:

Overdose/poisoning: avoid alcohol ingestion, do not crush, chew, snort, or inject tabs, high abuse potential

Black Box Warning:

Opioid-naïve patients: ext rel tabs are not to be used immediately postop (12-24 hr after surgery) in these patients

Perform/provide:

- Storage in light-resistant area at room temp

Evaluate:

- Therapeutic response: decrease in pain

Teach patient/family:

- To report any symptoms of CNS changes, allergic reactions
- That physical dependency may result from extended use
- That withdrawal symptoms may occur: nausea, vomiting, cramps, fever, faintness, anorexia
- Not to drive or operate machinery if drowsiness occurs

 **Not to use other CNS depressants, alcohol • To make position changes slowly to prevent orthostatic hypotension**

TREATMENT OF OVERDOSE:

Naloxone (Narcan) 0.2-0.8 mg IV, (caution with patients physically dependent on opioids) O₂, IV fluids, vasopressors

 Canada only Side effects: *italics* = common; **bold** = life-threatening 
Nurse Alert

HIGH ALERT

oxytocin (Rx)

(ox-i-toe'sin)

Pitocin

Func. class.: Hormone

Chem. class.: Oxytocic, uterine-active agent

ACTION:

Acts directly on myofibrils, thereby producing uterine contraction; stimulates milk ejection by the breast; vasoactive antidiuretic effect

USES:

Stimulation, induction of labor; missed or incomplete abortion; postpartum bleeding

CONTRAINDICATIONS:

Hypersensitivity, serum toxemia, cephalopelvic disproportion, fetal distress, hypertonic uterus, prolapsed umbilical cord, active genital herpes

Precautions: Cervical/uterine surgery, uterine sepsis, primipara >35 yr, 1st/2nd stage of labor

Black Box Warning:

Elective induction of labor

DOSAGE AND ROUTES

Calculator

Postpartum hemorrhage

- **Adult: IV** 10-40 units in 1000 ml nonhydrating diluent infused at 20-40 mU/min

- **Adult: IM** 3-10 units after delivery of placenta

Contraction stress test (CST)

- **Adult: IV** 0.5 mU/min, increase q20min until 3 contractions within 10 min

Stimulation of labor

- **Adult: IV** 1-2 mU/min, increase by 1-2 mU q15-60min until contractions occur then decrease dose

Incomplete abortion

• **Adult: IV INF** 10 units/500 ml D₅W or 0.9% NaCl at 10-20 mU/min, max 30 units/12 hr

Available forms: Inj 10 units/ml

Administer:

IV route

- Use infusion pump

Labor induction

• After diluting 10 units/1000 ml of 0.9% NS or D₅ NS run at 1-2 mU/min at 15- to 30-min intervals to begin normal labor; dilute 10-40 mU/min; titrate to control postpartum bleeding; dilute 10 units/500 ml sol; run 10 units-20 mU/ml; administer by only 1 route at a time; use inf pump; rotate inf to provide mixing; do not shake

Control of postpartum bleeding

- Dilute 10-40 units/1000 ml of sol; run at 10-20 mU/min; adjust rate as needed
- With crash cart available on unit (magnesium sulfate at bedside)

Incomplete, inevitable, elective abortion

- Dilute 10 units/500 ml compatible IV sol

Y-site compatibilities: Heparin, hydrocortisone, insulin (regular), meperidine, morphine, potassium chloride, vit B/C, warfarin

SIDE EFFECTS

CNS: Seizures, tetanic contractions

CV: Hypo/hypertension, dysrhythmias, increased pulse, bradycardia, tachycardia, PVC

FETUS: Dysrhythmias, jaundice, hypoxia, intracranial hemorrhage

GI: Anorexia, nausea, vomiting, constipation

GU: Abruptio placentae, decreased uterine blood flow

HEMA: Increased hyperbilirubinemia

INTEG: Rash

RESP: Asphyxia

SYST: Water intoxication of mother

PHARMACOKINETICS

IM: Onset 3-7 min, duration 1 hr, half-life 12-17 min

IV: Onset 1 min, duration 30 min, half-life 12-17 min

INTERACTIONS

- Hypertension: vasopressors

Drug/Herb

- Hypertension: ephedra

NURSING CONSIDERATIONS

Assess:

- I&O ratio
- B/P, pulse; watch for changes that may indicate hemorrhage
- Respiratory rate, rhythm, depth; notify prescriber of abnormalities
- Length, intensity, duration of contraction; notify prescriber of contractions lasting >1 min or absence of contractions; turn patient on her side; discontinue oxytocin
- FHTs, fetal distress; watch for acceleration, deceleration; notify prescriber if problems occur; fetal presentation, pelvic dimensions; turn patient on left side if FHT change in rate, give O₂

 **Water intoxication;** confusion, anuria, drowsiness, headache

Evaluate:

- Therapeutic response: stimulation of labor, control of postpartum bleeding

Teach patient/family:

- To report increased blood loss, abdominal cramps, fever, foul-smelling lochia
- That contractions will be similar to menstrual cramps, gradually increasing in intensity

Black Box Warning:

Elective induction of labor: use only for induction when medically necessary

☼ Canada only Side effects: *italics* = common; **bold** = life-threatening 
Nurse Alert

PACLitaxel (Rx)

(pa-kli-tax'el)

PACLitaxel nanoparticle albumin-bound (Rx)

Abraxane

Func. class.: Antineoplastic—miscellaneous

Chem. class.: Taxane

Do not confuse: PACLitaxel/PARoxetine/Paxil

ACTION:

Inhibits reorganization of microtubule network needed for interphase and mitotic cellular functions; causes abnormal bundles of microtubules during cell cycle and multiple esters of microtubules during mitosis

USES:

Taxol: metastatic carcinoma of the ovary, breast; AIDS-related Kaposi's sarcoma (2nd-line), non-small-cell lung cancer (1st-line), adjuvant treatment for node-positive breast cancer

Unlabeled uses: Advanced head, neck, small-cell lung cancer; non-Hodgkin's lymphoma, adenocarcinoma of the upper GI tract, hormone-refractory prostate cancer, bladder cancer

CONTRAINDICATIONS:

Pregnancy (D); hypersensitivity to paclitaxel or other products with polyoxyethylated castor oil, albumin

Black Box Warning:

Neutropenia of $<1500/\text{mm}^3$

Precautions: Breastfeeding, children, females, geriatric patients, cardiovascular/hepatic/renal disease, CNS disorder, bone marrow suppression, dental disease/work, extravasation, herpes, infection, infertility, jaundice, ocular exposure, radiation therapy, thrombocytopenia, vaccination

Black Box Warning:

Taxane hypersensitivity, requires a specialized care setting, requires an experienced clinician

DOSAGE AND ROUTES

Calculator

PACLitaxel

Ovarian carcinoma

- **Adult:** IV INF 135 mg/m² given over 24 hr q3wk then CISplatin 75 mg/m²; or 175 mg/m² over 3 hr q3wk; or 175 mg/m² over 3 hr

Advanced ovarian carcinoma

- **Adult:** IV/INF 175 mg/m² with CISplatin 75 mg/m² using a 3-hr regimen q3wk

Breast carcinoma

- **Adult:** IV INF 175 mg/m² over 3 hr q3wk × 4 courses

AIDS-related Kaposi's sarcoma

- **Adult:** IV INF 135 mg/m² over 3 hr q3wk or 100 mg/m² over 3 hr q2wk

1st-line non-small-cell lung cancer

- **Adult:** IV INF 135 mg/m²/24 hr inf with CISplatin 75 mg/m² × 3 wk

Hepatic dose

- **Adult:** for 135 mg/m² 24-hr IV INF AST/ALT 2-10 × ULN, total bilirubin ≤1.5 mg/dl: 100 mg/m²; AST/ALT <10 × ULN, total bilirubin 1.6-7.5 mg/dl: 50 mg/m²; AST/ALT ≥10 × ULN or total bilirubin >7.5 mg/dl; avoid use; for 175/m² 3-hr IV INF AST/ALT <10 × ULN, total bilirubin 1.26-2 × ULN: 135 mg/m²; AST/ALT <10 × ULN, total bilirubin 2.01-5 × ULN: 90 mg/m²; AST/ALT ≥10 × ULN or total bilirubin >5 × ULN: avoid use

Bladder cancer (unlabeled)

- **Adult:** IV 175 mg/m² over 3 hr with CARBOplatin

Head/neck cancer (unlabeled)

- **Adult:** IV 250 mg/m² over 24 hr or 175-300 mg/m² over 3 hr

Stem cell transplant/bone marrow ablation (unlabeled)

- **Adult:** IV 250-775 mg/m² over 24 hr in combination with other chemotherapy

PACLitaxel protein-bound particles

- **Adult:** IV 260 mg/m² q3wk

Available forms: Inj 6 mg/ml, 30 mg/5-ml vial, 100 mg/16.7-ml vial, 150 mg/25-ml vial, 300 mg/50-ml vial; powder for inj, lyophilized 100 mg in single-use vials (Abraxane)

Administer:

- CBC, differential, platelet count before treatment and weekly; withhold product if WBC is $<1500/\text{mm}^3$ or platelet count is $<100,000/\text{mm}^3$; notify prescriber • If CISplatin is given, use after taxane
- Confirmation that dexamethasone was given 12 hr and 6 hr before inf begins
- Storage of prepared sol up to 27 hr in refrigerator

Continuous IV INF route

- After premedicating with dexamethasone 20 mg PO 12 hr and 6 hr before PACLitaxel, diphenhydrAMINE 50 mg IV 1/2-1 hr before PACLitaxel and cimetidine 300 mg or ranitidine 50 mg IV 1/2-1 hr before PACLitaxel • For extravasation if given by regular IV, not port

PACLitaxel

- After diluting in 0.9% NaCl, D₅, D₅ and 0.9% NaCl, D₅LR (0.3-1.2 mg/ml), chemo dispensing pin or similiar devices with spikes should not be used in vials of Taxol; use in-line filter ≤ 0.22 micron; may be given as 3-hr or 24-hr inf • Using only glass bottles, polypropylene, polyolefin bags and administration sets; do not use PVC inf bags or sets

Y-site compatibilities: Acyclovir, amikacin, aminophylline, ampicillin/sulbactam, bleomycin, butorphanol, calcium chloride, CARBOplatin, cefepime, cefoTEtan, cefTAZidime, cefTRIAxone, cimetidine, CISplatin, cladribine, cyclophosphamide, cytarabine, dacarbazine, dexamethasone, diphenhydrAMINE, DOXOrubicin, droperidol, etoposide, famotidine, floxuridine, fluconazole, fluorouracil, furosemide, ganciclovir, gentamicin, granisetron, haloperidol, heparin, hydrocortisone, HYDROmorphone, ifosfamide, LORazepam, magnesium sulfate, mannitol, meperidine, mesna, methotrexate, metoclopramide, morphine, nalbuphine, ondansetron, pentostatin, potassium chloride, prochlorperazine, propofol, ranitidine, sodium bicarbonate, thiotepa, vancomycin, vinBLASStine, vinCRISStine, zidovudine

Abraxane

Intermittent IV INF route

- Reconstitute vial by injecting 20 ml of 0.9% NaCl; slowly inject 20 ml of 0.9% NaCl over at least 1 min to direct sol flow on wall of vial; do not inject 0.9% NaCl directly onto lyophilized cake (foaming will occur); allow vial to sit for at least 5 min to ensure proper wetting of lyophilized cake; gently swirl or invert vial slowly for ≥ 2 min until completely dissolved • Calculate dose

by dosing vol/ml = total dose (mg) ÷ 5 (mg/ml)

SIDE EFFECTS

CNS: *Peripheral neuropathy*

CV: Bradycardia, *hypotension*, abnormal ECG, **supraventricular tachycardia (SVT)**

GI: *Nausea, vomiting, diarrhea, mucositis, stomatitis, increased bilirubin, alk phos, AST*

HEMA: **Neutropenia, leukopenia, thrombocytopenia, anemia**, bleeding, infections

INTEG: *Alopecia, tissue necrosis*, generalized urticaria, *flushing*

MS: *Arthralgia, myalgia*

RESP: **Pulmonary embolism**, dyspnea

SYST: *Hypersensitivity reactions, anaphylaxis, Stevens-Johnson syndrome, toxic epidermal necrolysis, angioedema*

PHARMACOKINETICS

89%-98% of product serum protein bound, metabolized in liver, excreted in bile and urine; terminal half-life 5.3-17.4 hr

INTERACTIONS

Increase: myelosuppression—other antineoplastics, radiation

Increase: DOXOrubicin levels—DOXOrubicin

⚠ Increase: **toxicity, decrease metabolism—ketoconazole; avoid concurrent use**

Increase: bleeding risk—NSAIDs, anticoagulants

Decrease: paclitaxel metabolism—verapamil, diazepam, cycloSPORINE, teniposide, etoposide, quiniDine, dexamethasone, vinCRIStine, testosterone

Decrease: paclitaxel levels—CYP2C8, CYP2C9 inducers

Decrease: immune response—live virus vaccines

Drug/Lab Test

Increase: AST/ALT

Decrease: neutrophils, platelets, WBC, Hgb

NURSING CONSIDERATIONS

Assess:

Black Box Warning:

Requires a specialized care setting such as a hospital or facility with management of complications; should be used by a clinician experienced in cytotoxic agents

- **Cardiovascular status:** ECG continuously in CV conditions; monitor for hypotension, sinus bradycardia/tachycardia
- **Peripheral neuropathy:** paresthesias, numbness; during inf, use ice packs on extremities to lessen continued neuropathy; may use acupuncture for some relief, use of ice on extremities when infusing
- **Arthralgia, myalgia:** may begin 2-3 days after inf and continue for 4-5 days; may use analgesics
- **Nausea, vomiting:** premedicate with antiemetics; nausea and vomiting occur often
- Hepatic studies before, during therapy (bilirubin, AST, ALT, LDH) prn or monthly, check for jaundiced skin and sclera, dark urine, clay-colored stool, itchy skin, abdominal pain, fever, diarrhea
- VS during 1st hr of inf, check IV site for signs of infiltration

⚠ Hypersensitivity reactions, anaphylaxis: hypotension, dyspnea, angioedema, generalized urticaria; discontinue inf immediately; keep emergency equipment available, monitor continuously during first 30-60 min then periodically

- **Flush:** for mild to moderate flush, may continue diphenhydramine for ≤ 48 hr

- Effects of alopecia on body image; discuss feelings about body changes

Evaluate:

- Therapeutic response: decreased tumor size, spread of malignancy

Teach patient/family:

- To report signs of infection: fever, sore throat, flulike symptoms
 - To report signs of anemia: fatigue, headache, faintness, SOB, irritability
 - To report bleeding; to avoid use of razors, commercial mouthwash; to use soft-bristle toothbrush; to use viscous xylocaine or compounded formula for stomatitis
 - To avoid use of aspirin, ibuprofen
 - To avoid crowds, persons with known infections
 - That hair may be lost during treatment; that a wig or hairpiece may make patient feel better; that new hair may be different in color, texture
 - That pain in muscles and joints 2-5 days after inf is common
 - To notify prescriber if pregnancy is planned or suspected, pregnancy (D), do not breastfeed
 - To avoid receiving vaccinations while taking product
-

🍁 Canada only Side effects: *italics* = common; **bold** = life-threatening ⚠️
Nurse Alert

paliperidone (Rx)

(pal-ee-per'i-done)

Invega, Invega Sustenna

Func. class.: Antipsychotic

Chem. class.: Benzisoxazole derivative

Do not confuse: Invega/Iveegam
paliperidone/risperiDONE

ACTION:

Mediated through both DOPamine type 2 (D₂) and serotonin type 2 (5-HT₂) antagonism

USES:

Schizophrenia

CONTRAINDICATIONS:

Breastfeeding, geriatric patients, seizure disorders, AV block, QT prolongation, torsades de pointes; hypersensitivity to this product, risperidone

Precautions: Pregnancy (C), children, renal/hepatic disease, obesity, Parkinson's disease

Black Box Warning:

Dementia-related psychosis (mortality)

DOSAGE AND ROUTES

Calculator

- **Adult: PO** 6 mg/day, max 12 mg/day; **IM** 234 mg on day 1 then 156 mg 1 wk later; after 2nd dose, give 117 mg each mo; range 39-234 mg, dosage change may be needed when used with CYP3A4 inducers
- **Child/adolescent ≥12 yr and ≥51 kg: PO** 3 mg daily, may increase if needed by 3 mg/day in intervals of >5 days, up to max 12 mg/day; <51 kg max 6 mg/day

Renal dose

- **Adult: PO** CCr 50-79 ml/min, 3 mg/day, max 6 mg/day; **EXT REL IM** 156 mg on day 1, 117 mg 1 wk later, then 78 mg each mo; CCr 10-49 ml/min, 1.5 mg/day, max 3 mg/day

Available forms: Ext rel tabs 1.5, 3, 6, 9 mg; ext rel susp for inj 39 mg/0.25 ml, 78 mg/0.5 ml, 117 mg/0.75 ml, 156 mg/ml, 234 mg/1.5 ml

Administer:

- Avoid use with CNS depressants

PO route

- Do not break, crush, or chew ext rel tabs
- Without regard for food
- Reduced dose for geriatric patients

IM route

- Use for IM only, do not use IV or subcut; inj kits contain prefilled syringe and 2 safety needles, for single use only, shake for 10 sec; **deltoid inj:** ≥ 90 kg, use 1.5-inch, 22G needle, < 90 kg, use 1-inch, 23G needle, alternate injections between deltoid muscles; **gluteal inj:** use 1.5-inch, 22G needle; while holding syringe upright, twist rubber tip clockwise to remove, peel safety needle pouch halfway open, grasp needle sheath using plastic peel pouch, attach needle to Luer connection in clockwise motion, pull needle sheath away using straight pull, bring syringe with attached needle upright to de-aerate, de-aerate, inject; after inj, use finger, thumb, or flat surface to activate needle protection system until click heard, use deltoid $\times 2$ doses

SIDE EFFECTS

CNS: *EPS, pseudoparkinsonism, akathisia, dystonia, tardive dyskinesia; drowsiness, insomnia, agitation, anxiety, headache, seizures, neuroleptic malignant syndrome, dizziness*

CV: Orthostatic hypotension, *tachycardia; heart failure, QT prolongation, heart block, dysrhythmias*

EENT: Blurred vision

ENDO: Hyperinsulinemia, weight gain, hyperglycemia, dyslipidemia

GI: *Nausea, vomiting, anorexia, constipation, weight gain in adolescents, xerostomia*

GU: Priapism

HEMA: *Agranulocytosis*

PHARMACOKINETICS

Peak 24 hr; elimination half-life 23 hr; excreted 80% urine, 11% feces, protein

binding >47%

INTERACTIONS

Increase: sedation—other CNS depressants, alcohol, sedative/hypnotics, opiates

Increase: EPS—other antipsychotics

⚠ Increase: QT prolongation—class IA, III antidysrhythmics, azole antifungals, tricyclics (high doses), some phenothiazines, β -blockers, chloroquine, pimozide, droperidol, some antipsychotics, abarelix, alfuzosin, amoxapine, apomorphine, dasatinib, dolasetron, flecainide, halogenated anesthetics

Increase: neurotoxicity—lithium

Increase: serotonin syndrome, neuroleptic malignant syndrome—SSRIs, SNRIs

Decrease: effect of paliperidone—carbamazepine, other CYP3A4 inducers

Decrease: levodopa effect—levodopa

Drug/Lab Test

Increase: prolactin levels

NURSING CONSIDERATIONS

Assess:

Black Box Warning:

Mental status: mood, behavior, confusion, orientation, suicidal thoughts/behaviors; dementia, especially in geriatric patients before initial administration

⚠ QT prolongation: ECG for QT prolongation, ejection fraction; chest pain, palpitations, dyspnea • Swallowing of PO medication; check for hoarding, giving of medication to others

- Affect, orientation, LOC, reflexes, gait, coordination, sleep pattern disturbances

- B/P (standing, lying), pulse, respirations; q4hr during initial treatment; establish baseline before starting treatment; report drops of 30 mm Hg; watch for ECG changes • **Hyperprolactinemia:** sexual dysfunction, decreased menstruation, breast pain

- Dizziness, faintness, palpitations, tachycardia on rising

- **EPS:** akathisia, tardive dyskinesia (bizarre movements of jaw, mouth, tongue, extremities), pseudoparkinsonism (rigidity, tremors, pill rolling, shuffling gait) **⚠**

Serotonin syndrome, neuroleptic malignant syndrome: hyperthermia, increased CPK, altered mental status, muscle rigidity, fever, seizures, discontinue

- Constipation, urinary retention daily; if these occur, increase bulk and water in

diet; monitor for weight gain, especially among adolescents

Perform/provide:

- Supervised ambulation until patient is stabilized on medication; do not involve patient in strenuous exercise program because fainting is possible; patient should not stand still for a long time
- Increased fluids to prevent constipation
- Sips of water, candy, gum for dry mouth
- Storage in tight, light-resistant container

Evaluate:

- Therapeutic response: decrease in emotional excitement, hallucinations, delusions, paranoia; reorganization of patterns of thought, speech

Teach patient/family:

- That orthostatic hypotension may occur; to rise gradually from sitting or lying position
- To avoid hot tubs, hot showers, tub baths because hypotension may occur
- To avoid abrupt withdrawal of this product because EPS may result; that product should be withdrawn slowly
- To avoid OTC preparations (cough, hay fever, cold) unless approved by prescriber because serious product interactions may occur; to avoid alcohol because increased drowsiness may occur
- To avoid hazardous activities if drowsy or dizzy
- About compliance with product regimen; that nonabsorbable tab shell is expelled in stool
- To report impaired vision, tremors, muscle twitching
- That heat stroke may occur in hot weather; to take extra precautions to stay cool
- To use contraception; to inform prescriber if pregnancy is planned or suspected, **do not breastfeed**

Black Box Warning:

To notify prescriber of suicidal thoughts/behaviors, other changes in behavior

TREATMENT OF OVERDOSE:

Lavage if orally ingested; provide airway; *do not induce vomiting*

☼ Canada only Side effects: *italics* = common; **bold** = life-threatening ⚠
Nurse Alert

palonosetron (Rx)

(pa-lone-o'se-tron)

Aloxi

Func. class.: Antiemetic

Chem. class.: 5-HT₃ receptor antagonist

ACTION:

Prevents nausea, vomiting by blocking serotonin peripherally, centrally, and in the small intestine at the 5-HT₃ receptor

USES:

Prevention of nausea, vomiting associated with cancer chemotherapy, postoperative nausea/vomiting

CONTRAINDICATIONS:

Hypersensitivity

Precautions: Pregnancy (B), breastfeeding, children, geriatric patients, hypokalemia, hypomagnesium, patients taking diuretics

DOSAGE AND ROUTES

Calculator

• **Adult: PO** 0.5 mg as single dose 1 hr prior to chemotherapy; **IV** 0.25 mg as single dose over 30 sec 1/2 hr prior to chemotherapy, max 25 mg **IV** over q7days
Postoperative nausea/vomiting prophylaxis for ≤24 hr after surgery

• **Adult: IV** 0.075 mg given over 10 sec immediately before induction

Available forms: Inj 0.25/5 ml; caps 0.5 mg

Administer:

PO route

- Give 1 hr prior to chemotherapy
- May be taken without regard to food
- Storage at room temp
- Do not mix with other products; flush IV line before and after administration with 0.9% NaCl

Direct IV route

- **Chemotherapy nausea/vomiting:** give as single dose over 30 sec
- **Postoperative nausea/vomiting:** give over 10 sec immediately prior to anesthesia induction

Syringe compatibilities: Dexamethasone

Y-site compatibilities: Alemtuzumab, alfentanil, amifostine, amikacin, aminocaproic acid, aminophylline, amiodarone, amphotericin B liposome, ampicillin, ampicillin/sulbactam, atracurium, atropine, azithromycin, aztreonam, bivalirudin, bleomycin, bumetanide, buprenorphine, busulfan, butorphanol, calcium acetate/chloride/gluconate, CARBOplatin, carmustine, caspofungin, ceFAZolin, cefepime, cefotaxime, cefoTEtan, cefOXitin, cefTAZidime, ceftizoxime, cefTRIAxone, cefuroxime, chloramphenicol, chlorproMAZINE, cimetidine, ciprofloxacin, cisatracurium, CISplatin, clindamycin, cyclophosphamide, cycloSPORINE, cytarabine, dacarbazine, DACTINomycin, dantrolene, DAPTOmycin, DAUNOrubicin, dexamethasone, dexmedetomidine, dexrazoxane, digoxin, diltiazem, diphenhydrAMINE, DOBUTamine, DOCEtaxel, DOPamine, doxacurium, DOXOrubicin hydrochloride, droperidol, enalaprilat, ePHEDrine, EPINEPHrine, epirubicin, eptifibatide, erythromycin, esmolol, etoposide, etoposide phosphate, famotidine, fenoldopam, fentaNYL, fluconazole, fludarabine, fluorouracil, foscarnet, fosphenytoin, furosemide, gemcitabine, gentamicin, glycopyrrolate, haloperidol, heparin, hydrALAZINE, hydrocortisone, HYDROmorphone, IDArubicin, ifosfamide, inamrinone, insulin, irinotecan, isoproterenol, ketorolac, labetalol, leucovorin, levofloxacin, lidocaine, linezolid, LORazepam, magnesium sulfate, mannitol, mechlorethamine, melphalan, meperidine, meropenem, mesna, metaraminol, methotrexate, methyl dopate, metoclopramide, metoprolol, metroNIDAZOLE, midazolam, milrinone, mitoMYcin, mitoXANtrone, mivacurium, morphine, nalbuphine, naloxone, neostigmine, nesiritide, niCARdipine, nitroglycerin, nitroprusside, norepinephrine, octreotide, oxaliplatin, oxytocin, PACLitaxel, pamidronate, pancuronium, pentazocine, PHENobarbital, phentolamine, phenylephrine, piperacillin/tazobactam, potassium acetate/chloride/phosphates, procainamide, prochlorperazine, promethazine, propranolol, quinupristin/dalfopristin, ranitidine, remifentanil, rocuronium, sodium acetate/bicarbonate/phosphates, streptozocin, succinylcholine, SUFentanil, tacrolimus, teniposide, theophylline, thiotepa, ticarcillin/clavulanate, tigecycline,

tirofiban, tobramycin, topotecan, trimethobenzamide, trimethoprim/sulfamethoxazole, vancomycin, vasopressin, vecuronium, verapamil, vinBLAStine, vinCRISStine, vinorelbine, zidovudine

SIDE EFFECTS

CNS: *Headache, dizziness, drowsiness, fatigue, insomnia*

GI: *Diarrhea, constipation, abdominal pain*

MISC: Weakness, hyperkalemia, anxiety, rash, **bronchospasm** (rare), arthralgia, *fever, urinary retention*

PHARMACOKINETICS

62% protein bound; metabolized by liver; unchanged product and metabolites excreted by kidney; terminal elimination half-life 40 hr

INTERACTIONS

- Possible QT prolongation: class 1A antidysrhythmics (disopyramide, procainamide, quinidine), class III antidysrhythmics (amiodarone, dofetilide, ibutilide, sotalol), chloroquine, clarithromycin, droperidol, erythromycin, haloperidol, levomethadyl, methadone, pentamidine, some phenothiazines, diuretics (except potassium sparing)

NURSING CONSIDERATIONS

Assess:

- For agents that cause QT prolongation, even if manufacturer has removed QT prolongation from warnings
- Absence of nausea, vomiting during chemotherapy
- **Hypersensitivity reaction:** rash, bronchospasm (rare)
- Cardiac disease: check ECG before use
- Hyperkalemia: monitor potassium

Evaluate:

- Therapeutic response: absence of nausea, vomiting during cancer chemotherapy, postoperatively

Teach patient/family:

- To report diarrhea, constipation, rash, changes in respirations, or discomfort at insertion site
- To avoid alcohol, barbiturates
- Use other antiemetics if nausea occurs

Nurse Alert

pamidronate (Rx)

(pam-i-drone'ate)

Aredia

Func. class.: Bone-resorption inhibitor, electrolyte modifier *Chem. class.:* Bisphosphonate

Do not confuse: Aredia/Adriamycin

ACTION:

Inhibits bone resorption, apparently without inhibiting bone formation and mineralization; adsorbs calcium phosphate crystals in bone and may directly block the dissolution of hydroxyapatite crystals of bone

USES:

Moderate to severe Paget's disease, hypercalcemia, osteolytic bone metastases in breast cancer, patients with multiple myeloma

Unlabeled uses: Postmenopausal osteoporosis and prevention, osteoporosis prophylaxis, ankylosing spondylitis, osteogenesis imperfecta, hyperparathyroidism

CONTRAINDICATIONS:

Pregnancy (D), hypersensitivity to bisphosphonates

Precautions: Children, nursing mothers, renal dysfunction, poor dentition

DOSAGE AND ROUTES

Calculator

Hypercalcemia of malignancy

- **Adult:** IV INF 60-90 mg as single dose for moderate hypercalcemia, 90 mg for severe hypercalcemia over 2-24 hr; dose should be diluted in 1000 ml 0.45% NaCl, 0.9% NaCl, or D₅W; wait 7 days before 2nd course

Osteolytic lesions

- **Adult:** IV 90 mg/500 ml of D₅W, 0.45% NaCl, or 0.9% NaCl given over 4 hr each mo (multiple myeloma) or over 2 hr q3-4wk (breast carcinoma)

Paget's disease

- **Adult:** IV INF 30 mg/day given over 4 hr × 3 days

Severe osteogenesis imperfecta (unlabeled)

- **Child: IV** 1.5-3 mg/kg/cycle, cycle dose is divided in 3, administered via slow IV over 4 hr/day × 3 days

Hypercalcemia (hyperparathyroidism) (unlabeled)

- **Adult: IV** 15-60 mg as a single dose

Corticosteroid-induced osteoporosis (unlabeled)

- **Adult: IV** 30 mg q3mo × 1 yr

Ankylosing spondylitis (unlabeled)

- **Adult: IV INF** 60 mg over 4 hr; 6-hr inf for 1st dose

Osteoporosis prophylaxis in crohn's disease (unlabeled)

- **Adult: IV INF** 30 mg over 1 hr q3mo × 1 yr

Available forms: Powder for inj 30, 90 mg/vial; inj 3, 6, 9 mg/ml

Administer:

IV route

- After reconstituting by adding 10 ml sterile water for inj to each vial (30 mg/10 ml or 90 mg/10 ml, depending on vial used); add to 1000 ml of sterile 0.45%, 0.9% NaCl, D₅W, run over 2-24 hr (**hypercalcemia**); dilute reconstituted sol in 500 ml of 0.9% NaCl, 0.45% NaCl, or D₅W, give over 4 hr (**multiple myeloma, Paget's disease**); dilute reconstituted sol in 250 ml of 0.9% NaCl, 0.45% NaCl, or D₅W, give over 2 hr (**osteolytic bone metastases of breast cancer**)
- Do not mix with calcium-containing inf sol such as Ringer's sol
- Storage of inf sol up to 24 hr at room temp
- Reconstituted sol with sterile water may be refrigerated for ≤24 hr

Y-site compatibilities: Acyclovir, alfentanil, allopurinol, amifostine, amikacin, aminocaproic acid, aminophylline, amphotericin B lipid complex, amphotericin B liposome, ampicillin, anidulafungin, atenolol, atracurium, azithromycin, aztreonam, bivalirudin, bleomycin, bumetanide, buprenorphine, butorphanol, CARBOplatin, carmustine, ceFAZolin, cefepime, cefoperazone, cefotaxime, cefoTEtan, cefOXitin, cefTAZidime, ceftizoxime, cefTRIAxone, cefuroxime, chloramphenicol, chlorproMAZINE, cimetidine, ciprofloxacin, cisatracurium, CISplatin, clindamycin, cyclophosphamide, cycloSPORINE, cytarabine, dacarbazine, DAPTOmycin, dexamethasone, dexmedetomidine, dexrazoxane, digoxin, diltiazem, diphenhydrAMINE, DOBUTamine, DOCEtaxel, dolasetron, DOPamine, doxacurium, DOXOrubicin, doxycycline, droperidol, enalaprilat,

ePHEDrine, EPINEPHrine, epirubicin, ertapenem, erythromycin, esmolol, etoposide, famotidine, fenoldopam, fentaNYL, fluconazole, fludarabine, fluorouracil, foscarnet, fosphenytoin, furosemide, gallium, ganciclovir, gatifloxacin, gemcitabine, gentamicin, glycopyrrolate, granisetron, haloperidol, heparin, hetastarch 6%, hydrALAZINE, hydrocortisone, HYDROmorphone, hydrOXYzine, ifosfamide, imipenem-cilastatin, inamrinone, insulin (regular), isoproterenol, ketorolac, labetalol, levofloxacin, levorphanol, lidocaine, linezolid, LORazepam, magnesium sulfate, mannitol, mechlorethamine, melphalan, meperidine, meropenem, mesna, metaraminol, methotrexate, methyldopate, methylPREDNISolone, metoclopramide, metoprolol, metroNIDAZOLE, midazolam, milrinone, minocycline, mitoXANtrone, mivacurium, morphine, mycophenolate, nafcillin, nalbuphine, naloxone, nesiritide, niCARdipine, nitroglycerin, nitroprusside, norepinephrine, octreotide, ondansetron, oxytocin, PACLitaxel, palonosetron, pancuronium, PEMEtrexed, pentamidine, pentazocine, PENTobarbital, PHENobarbital, phenylephrine, piperacillin, polymyxin B, potassium chloride/phosphates, procainamide, prochlorperazine, promethazine, propranolol, quiNIDine, quinupristin-dalfopristin, ranitidine, remifentanyl, rocuronium, sodium acetate/bicarbonate/phosphates, succinylcholine, SUFentanyl, sulfamethoxazole-trimethoprim, teniposide, theophylline, thiopental, thiotepa, ticarcillin, ticarcillin-clavulanate, tigecycline, tirofiban, tobramycin, tolazoline, topotecan, trimethobenzamide, vancomycin, vasopressin, vecuronium, verapamil, vinBLASTine, vinCRISTine, vinorelbine, voriconazole, zidovudine

SIDE EFFECTS

CNS: *Fever, fatigue*

CV: Hypertension, **atrial fibrillation**

EENT: Ocular pain, inflammation, vision impairment

GI: Abdominal pain, anorexia, constipation, nausea, vomiting, dyspepsia

GU: **Renal failure**

HEMA: **Thrombocytopenia, anemia, leukopenia**

INTEG: Redness, swelling, induration, pain on palpation at site of catheter insertion

META: *Hypokalemia, hypomagnesemia, hypophosphatemia, hypocalcemia,*

hypothyroidism

MS: Severe bone pain, myalgia, osteonecrosis of the jaw

RESP: Coughing, dyspnea, upper respiratory tract infection

SYST: Angioedema, anaphylaxis

PHARMACOKINETICS

Rapidly cleared from circulation and taken up mainly by bones, primarily in areas of high bone turnover; eliminated primarily by kidneys; half-life 21-35 hr, terminal half-life in bone is 300 days

INTERACTIONS

Increase: hypokalemia—loop diuretics

Increase: nephrotoxicity—aminoglycosides, NSAIDs, vancomycin, radiopaque contrast agents, cycloSPORINE, tacrolimus

Increase: effect of entecavir

Decrease: pamidronate effect—calcium, vit D

Drug/Lab Test

Increase: creatinine

Decrease: potassium, magnesium, phosphate, calcium, WBC, platelets

NURSING CONSIDERATIONS

Assess:

- **Hypocalcemia:** nausea, vomiting, constipation, thirst, dysrhythmias, hypocalcemia, paresthesia, twitching, laryngospasm, Chvostek's sign, Trousseau's sign; **hypercalcemia:** thirst, nausea, vomiting, dysrhythmias
- Dehydration/hypovolemia: should be corrected during treatment of hypercalcemia, before therapy, maintain adequate urine output • Monitor WBCs, platelets, electrolytes, creatinine, BUN, Hgb/Hct before beginning treatment
- **Dental health:** cover with antiinfectives for dental extractions
- Temperature may be elevated during the first 3 days after a dose, risk of fever increases as dose increases • Renal disease: Max 90-mg single dose, longer infusions >2 hr may increase risk for renal toxicity • Bone pain; use analgesics
- I&O, check for fluid overload edema, crackles, increased B/P; BUN, creatinine

Evaluate:

- Therapeutic response: decreased calcium levels

Teach patient/family

- To notify prescriber if pregnancy is planned or suspected, pregnancy (D)
- To report hypercalcemic relapse: nausea, vomiting, bone pain, thirst; unusual muscle twitching, muscle spasms; severe diarrhea, constipation • To continue with dietary recommendations, including calcium and vit D
- To obtain analgesic from provider for bone pain
- That, if nausea, vomiting occur, small, frequent meals may help
- To report ocular symptoms to prescriber: blurred vision, edema, inflammation

🍁 Canada only Side effects: *italics* = common; **bold** = life-threatening ⚠️
Nurse Alert

pancrelipase (Rx)

(pan-kre-li'pase)

Creon, DMH , Pancrease , Pancreaze, Pancrecarb MS, Pertzye, Ultrase MT, Ultresa, Viokase, Zenpep *Func. class.: Digestant*

Chem. class.: Pancreatic enzyme—bovine/porcine

ACTION:

Pancreatic enzyme needed for the breakdown of substances released from the pancreas

USES:

Exocrine pancreatic secretion insufficiency, cystic fibrosis (digestive aid), steatorrhea, pancreatic enzyme deficiency

CONTRAINDICATIONS:

Allergy to pork

Precautions: Pregnancy (B), ileus, pancreatitis, Crohn's disease

DOSAGE AND ROUTES

Calculator

Many products listed above are not interchangeable

- **Adult/adolescent/child ≥ 4 yr (del rel caps: Creon Caps, Zenpap Caps, Pancreaze Caps): PO** 500 lipase units/kg/meal, titrate based on patient response, max 2500 lipase units/kg/meal
- **Child 1-4 yr: PO** 1000 lipase units/kg/meal, titrate based on patient response, max 2500 lipase units/kg/meal

Available forms: Tabs (Viokase) 10, 204; cap, del rel 4, 8, 154 (Pancrecarb MS), 12, 18, 20 (Ultrase MT), Ultrase; cap 3000, 4200, 5000, 6000, 8000, 10,500, 12,000, 15,000, 16,000, 16,800, 24,000, 25,000 units

Administer:

- After antacid or cimetidine; decreased pH inactivates product
- Low-fat diet for GI symptoms
- Have patient sit up during administration; give with meals
- Do not crush, chew del rel products, caps

- Viokase is not interchangeable with other products

SIDE EFFECTS

GI: Anorexia, nausea, vomiting, diarrhea, cramping, bloating

GU: Hyperuricuria, hyperuricemia

INTERACTIONS

Decrease: absorption—cimetidine, antacids, oral iron

Decrease: effect of acarbose, miglitol

NURSING CONSIDERATIONS

Assess:

- Appropriate height, weight development before and periodically; may be delayed
- I&O ratio; watch for increasing urinary output
- Fecal fat, nitrogen, PT during treatment
- **Diabetes mellitus:** for polyuria, polydipsia, polyphagia
- Pork sensitivity; cross-sensitivity may occur

Perform/provide:

- Adequate hydration
- Storage in tight container at room temp

Evaluate:

- Therapeutic response: improved digestion of carbohydrates, protein, fat; absence of steatorrhea

Teach patient/family:

- To notify prescriber of allergic reactions, abdominal pain, cramping, or blood in urine
- To always take with food, not to crush, chew del rel product, caps
- To store at room temperature, away from moisture

☼ Canada only Side effects: *italics* = common; **bold** = life-threatening ⚠
Nurse Alert

HIGH ALERT

pancuronium (Rx)

(pan-kyoo-roe'nee-um)

Func. class.: Neuromuscular blocker (nondepolarizing)

Chem. class.: Synthetic curariform

ACTION:

Inhibits transmission of nerve impulses by binding with cholinergic receptor sites, antagonizing action of acetylcholine

USES:

Facilitation of endotracheal intubation, skeletal muscle relaxation during mechanical ventilation, surgery, or general anesthesia

CONTRAINDICATIONS:

Hypersensitivity to bromide ion

Precautions: Pregnancy (C), breastfeeding, children <2 yr, neuromuscular/cardiac/renal/hepatic disease, electrolyte imbalances, dehydration, previous anaphylactic reactions (other neuromuscular blockers)

Black Box Warning:

Respiratory insufficiency

DOSAGE AND ROUTES

Calculator

- **Adult/child/infant >1 mo:** IV 0.04-0.1 mg/kg initially or 0.05 mg/kg after initial dose of succinylcholine; maintenance 0.01 mg/kg 60-100 min after initial dose then 0.01 mg/kg q25-60min as needed; for obese patients, use ideal body weight
- **Neonate <1 mo:** IV Test dose 0.02 mg/kg then 0.03 mg/kg/dose initially, repeat 2× as needed at 5-10 min intervals; maintenance 0.03-0.09 mg/kg/dose q30min-4 hr as needed

Available forms: Inj 1, 2 mg/ml

Administer:

Direct IV route

- May be given undiluted over 1-2 min (1 mg/ml [10-ml vial], 2 mg/ml [2-, 5-ml vial])

Intermittent IV INF route

- Add 100 mg of product to 250 ml D₅W, NS, LR (0.4 mg/ml)

Additive compatibilities: Verapamil, ciprofloxacin

Y-site compatibilities: Aminophylline, ceFAZolin, cefuroxime, cimetidine, DOBUTamine, DOPamine, EPINEPHrine, esmolol, fenoldopam, fentaNYL, fluconazole, gentamicin, heparin, hydrocortisone, isoproterenol, levofloxacin, LORazepam, midazolam, morphine, nitroglycerin, ranitidine, trimethoprim-sulfamethoxazole, vancomycin

SIDE EFFECTS

CV: Bradycardia; tachycardia; increased, decreased B/P; ventricular extrasystoles, edema, hypertension

EENT: Increased secretions

INTEG: Rash, flushing, pruritus, urticaria, sweating, salivation

MS: Weakness to prolonged skeletal muscle relaxation

RESP: Prolonged apnea, bronchospasm, cyanosis, respiratory depression, dyspnea

SYST: Anaphylaxis

PHARMACOKINETICS

IV: Onset 3-5 min, dose dependent, peak 3-5 min; metabolized (small amounts), excreted in urine (unchanged), crosses placenta

INTERACTIONS

- Dysrhythmias: theophylline

Increase: neuromuscular blockade—aminoglycosides, clindamycin, enflurane, isoflurane, lincomycin, lithium, local anesthetics, opioid analgesics, polymyxin antiinfectives, quiniDine, thiazides

Drug/Lab Test

Decrease: cholinesterase

NURSING CONSIDERATIONS

Assess:

- **Respiratory recovery:** decreased paralysis of face, diaphragm, leg, arm, rest of body; allow to recover fully before neurologic assessment • Electrolyte imbalances (K, Mg); may lead to increased action of product
- VS (B/P, pulse, respirations, airway) until fully recovered; rate, depth, pattern of respirations, strength of hand grip • I&O ratio; check for urinary retention, frequency, hesitancy

⚠ **Allergic reactions, anaphylaxis:** rash, fever, respiratory distress, pruritus; product should be discontinued

Perform/provide:

- Storage in refrigerator; do not store in plastic; use only fresh sol
- Reassurance if communication is difficult during recovery from neuromuscular blockade
- Frequent (q2hr) instillation of artificial tears, covering of eyes to prevent drying of cornea

Evaluate:

- Therapeutic response: paralysis of jaw, eyelid, head, neck, rest of body

TREATMENT OF OVERDOSE:

Neostigmine, atropine, monitor VS; may require mechanical ventilation

☼ Canada only Side effects: *italics* = common; **bold** = life-threatening ⚠
Nurse Alert

panitumumab (Rx)

(pan-i-tue'moo-mab)

Vectibix

Func. class.: Antineoplastic—miscellaneous

Chem. class.: Multikinase inhibitor, signal transduction inhibitor

ACTION:

Decreases growth and survival of cancer cells by competitive inhibition of EGF receptor

USES:

EGFR expressing metastatic colorectal cancer; not beneficial with KRAS mutations in codon 12 or 13

CONTRAINDICATIONS:

Hypersensitivity

Precautions: Pregnancy (C), breastfeeding, children, hepatic disease, acute bronchospasm, diarrhea, hamster protein allergy, hypomagnesemia, hypotension, pulmonary fibrosis, sepsis, KRAS mutations

Black Box Warning:

Exfoliative dermatitis, infusion-related reactions

DOSAGE AND ROUTES

Calculator

• **Adult: IV INF** 6 mg/kg over 60 min every 2 wk; doses >1000 mg over 90 min

Available forms: Sol for inj 20 mg/ml (100 mg/5 ml, 400 mg/20 ml)

Administer:

Intermittent IV INF route

- Give in hospital or clinic setting with full resuscitation equipment
- Only as IV inf using controlled IV inf pump; do not give IV push or bolus; use low-protein binding 0.2-or 0.22-micron in-line filter; flush line with 0.9% NaCl before and after administration
- Give over 60 min through a peripheral line or indwelling catheter; infuse doses of >1000 mg over 90 min
- Dilute in 100 ml of 0.9% NaCl; dilute doses >1000 mg in 150 ml of 0.9% NaCl; mix by inverting; do not exceed 10 mg/ml; use within 6 hr if stored at room temp;

can be stored between 2° C and 8° C for up to 24 hr • **Dosage adjustment for infusion/dermatologic reaction**

- Grade 1 or 2: reduce infusion by 50%; Grade 3 or 4: terminate, permanently discontinue depending on severity/resistance

SIDE EFFECTS

CNS: Fatigue

CV: Peripheral edema

EENT: Ocular irritation, ocular toxicity

GI: Nausea, diarrhea, vomiting, anorexia, mouth ulceration, abdominal pain, constipation

HEMA: Thrombophlebitis

INTEG: Rash, pruritus, exfoliative dermatitis, skin fissure, angioedema, severe/fatal INF reactions

META: Hypocalcemia, hypomagnesemia, antibody formation

RESP: Bronchospasm, cough, dyspnea, hypoxia, pulmonary fibrosis/embolism, pneumonitis, wheezing, interstitial lung disease

PHARMACOKINETICS

Bioavailability 38%-49%; elimination half-life 7.5 days; peak 3 hr; high-fat meal decreases bioavailability; plasma protein binding 99.5%; metabolized in liver; oxidative metabolism by CYP3A4, glucuronidation by UGT1A9; 77% excreted in feces

INTERACTIONS

- Do not use in combination with other antineoplastics

NURSING CONSIDERATIONS

Assess:

Black Box Warning:

Serious skin disorders: fever, sore throat, fatigue, then lesions in mouth, lips; withhold product, notify prescriber

- Serum electrolytes periodically (calcium, magnesium)
- **Infection:** increased temp

Black Box Warning:

Inf reactions: bronchospasm, fever, chills, hypotension; may require discontinuation, have emergency

equipment available

- **Ocular toxicity:** ocular irritation, hyperemia
- **Pulmonary fibrosis:** dyspnea, cough, wheezing; may require discontinuation

Perform/provide:

- Storage of unopened vials in refrigerator; do not shake; protect from direct sunlight; do not freeze

Evaluate:

- Therapeutic response: decrease in colon carcinoma progression

Teach patient/family:

 To report adverse reactions immediately: difficulty breathing, mouth sores, skin rash, ocular toxicity • About reason for treatment, expected results, adverse reactions

- To use contraception while taking product, for 6 mo after treatment; not to breastfeed for ≥ 2 mo after stopping treatment • To avoid the sun, use sunscreen while taking product

🍁 Canada only Side effects: *italics* = common; **bold** = life-threatening 

Nurse Alert

pantoprazole (Rx)

(pan-toe-pray'zole)

Panto , Pantoloc , Protonix, Prontonix IV

Func. class.: Proton pump inhibitor

Chem. class.: Benzimidazole

ACTION:

Suppresses gastric secretion by inhibiting hydrogen/potassium ATPase enzyme system in gastric parietal cell; characterized as gastric acid pump inhibitor because it blocks the final step of acid production

USES:

Gastroesophageal reflux disease (GERD), severe erosive esophagitis; maintenance of long-term pathologic hypersecretory conditions, including Zollinger-Ellison syndrome

Unlabeled uses: Duodenal/gastric ulcer, NSAID ulcer prophylaxis, *Helicobacter pylori*-associated ulcer, dyspepsia

CONTRAINDICATIONS:

Hypersensitivity to this product or benzimidazole

Precautions: Pregnancy (C), breastfeeding, children, proton pump hypersensitivity

DOSAGE AND ROUTES

Calculator

GERD

- **Adult: PO** 40 mg/day $\times$ 8 wk, may repeat course

Erosive esophagitis

- **Adult: IV** 40 mg/day $\times$ 7-10 day; **PO** 40 mg/day $\times$ 8 wk; may repeat **PO** course

Pathologic hypersecretory conditions

- **Adult: PO** 40 mg bid; **IV** 80 mg q12hr, max 240 mg/day

Duodenal ulcer/gastric ulcer/NSAID ulcer prophylaxis (unlabeled)

- **Adult: PO** 40 mg/day

***H. pylori*–associated ulcers (unlabeled)**

- **Adult: PO** 40 mg bid; may be used with other products

Available forms: Del rel tabs 20, 40 mg; powder for inj 40 mg/vial; del rel granules for susp 40 mg

Administer:

PO route

- Swallow del rel tabs whole; do not break, crush, or chew; take del rel tabs at same time of day • May take with/without food
- **Suspension:** give in apple juice 30 min before a meal or sprinkled on 1 Tbsp of applesauce • **NG tube:** Empty contents of packet of granules into barrel of a 60 ml catheter tip syringe (plunger removed) connected to ≥ 16 F NG tube, add 10 ml apple juice and tap or shake barrel of syringe to empty into the tube; add another 10 ml of apple juice, rinse with additional apple juice until syringe is clear

IV route

- Use of Protonix IV vials with spiked IV system adaptors is not recommended
- Visually inspect for particulate matter and discoloration before use
- Give as an IV infusion over 15 min either through a dedicated line or a **Y**-site; a 2-min slow-injection regimen is also approved, do not give fast IV push • When using a **Y**-site, immediately stop use if a precipitation or discoloration occurs • **Reconstitution of vial:** Use 40 mg vial/10 ml NS, do not freeze
- **Two-minute slow IV infusion injection:** Dilute one or two 40-mg vials with 10 ml NS per vial to 4 mg/ml, store ≤ 24 hr at room temperature before use; infuse slowly over ≥ 2 min; do not give with other IV fluids or medications; flush line with D₅W, NS, or LR before and after each dose
- **Fifteen-minute IV infusion:** Dilute each 40-mg dose with 10 ml NS; the reconstituted vial should be further admixed with 100 ml (for one vial) or 80 ml (for 2 vials) of D₅W, NS, or LR (to 0.4 mg/ml or 0.8 mg/ml, respectively); store ≤ 6 at room temperature before further dilution; the admixed solution (0.4 mg/ml or 0.8 mg/ml) may be stored at room temperature and must be used within 24 hr from the time of initial reconstitution; infuse over 15 min at 7 ml/min; do not administer with other IV fluids or medications; flush IV line

with D₅W, NS, or LR before and after each dose

Y-site compatibilities: Acyclovir, allopurinol, amifostine, amikacin, aminocaproic acid, aminophylline, amoxicillin-clavulanate, amphotericin B liposome, ampicillin, ampicillin-sulbactam, anidulafungin, azithromycin, bleomycin, bumetanide, calcium gluconate, CARBOplatin, carmustine, ceFAZolin, cefOXitin, cefTAZidime, ceftizoxime, cefTRIAxone, cefuroxime, clindamycin, cyclophosphamide, cycloSPORINE, cytarabine, dextrose 3.3% in sodium chloride 0.3%, digoxin, dimenhyDRINATE, DOCEtaxel, DOPamine, doripenem, doxycycline, enalaprilat, EPINEPHrine, ertapenem, fluorouracil, foscarnet, fosphenytoin, furosemide, ganciclovir, gentamicin, granisetron, heparin, hydrocortisone HYDROmorphone, imipenem-cilastatin, inamrinone, insulin (regular), irinotecan, isoproterenol, magnesium, mannitol, mesna, methohexital, methyldopate, metoclopramide, nafcillin, nitroglycerin, nitroprusside, ofloxacin, oxytocin, PACLitaxel, pentazocine, PENTobarbital, phenylephrine, piperacillin-tazobactam, potassium chloride, procainamide, rifampin, sodium bicarbonate, succinylcholine, SUFentanil, sulfamethoxazole-trimethoprim, teniposide, theophylline, thiopental, ticarcillin, ticarcillin-clavulanate, tigecycline, tirofiban, tobramycin, traMADol, vasopressin, zidovudine

SIDE EFFECTS

CNS: *Headache*, insomnia, asthenia, fatigue, malaise, insomnia, somnolence

GI: *Diarrhea, abdominal pain*, flatulence, **pancreatitis**, weight changes

INTEG: *Rash*

META: Hyperglycemia, weight gain/loss, hyponatremia, hypomagnesemia

MS: **Rhabdomyolysis, myalgia**

RESP: **Pneumonia**

SYST: **Stevens-Johnson syndrome, toxic epidermal necrolysis, anaphylaxis, angioedema**

PHARMACOKINETICS

Peak 2.4 hr, duration >24 hr, half-life 1.5 hr, protein binding 97%, eliminated in urine as metabolites and in feces; in geriatric patients, elimination rate decreased; some Asian patients (15%-20%) may be poor metabolizers

INTERACTIONS

Increase: pantoprazole serum levels—diazepam, phenytoin, flurazepam, triazolam, clarithromycin

Increase: bleeding—warfarin

Decrease: absorption of these products—sucralfate, calcium carbonate, vit B₁₂, ketoconazole, itraconazole, atazanavir, ampicillin, iron salts

Decrease: clopidogrel effect

Drug/Herb

Decrease: effect of pantoprazole—St. John's wort

NURSING CONSIDERATIONS

Assess:

- **GI system:** bowel sounds q8hr; abdomen for pain, swelling; anorexia
- **Hepatic studies:** AST, ALT, alk phos during treatment
- For vit B₁₂ deficiency in patients receiving long-term therapy

⚠ **Serious skin reactions:** toxic epidermal necrolysis, Stevens-Johnson syndrome, exfoliative dermatitis: fever, sore throat, fatigue, thin ulcers; lesions in the mouth, lips • **Electrolyte imbalances:** hyponatremia; hypomagnesemia in patients using product 3 mo to 1 year; if hypomagnesemia occurs, use of magnesium supplements may be sufficient; if severe, discontinuation of product may be required ⚠ **Rhabdomyolysis, myalgia:** muscle pain, increased CPK; weakness, swelling of affected muscles

Evaluate:

- Therapeutic response: absence of epigastric pain, swelling, fullness

Teach patient/family:

- To report severe diarrhea; black, tarry stools; abdominal pain; product may have to be discontinued
- That hyperglycemia may occur in diabetic patients
- To avoid alcohol, salicylates, NSAIDs; may cause GI irritation
- To notify prescriber if pregnant or planning to become pregnant; **not to breastfeed**
- To continue taking even if feeling better

✳ Canada only Side effects: *italics* = common; **bold** = life-threatening ⚠
Nurse Alert

paricalcitol (Rx)

(par-ih-cal'sih-tol)

Zemlar

Func. class.: Vit D analog

Chem. class.: Fat-soluble vitamin

ACTION:

Reduces parathyroid hormone (PTH) levels; suppresses PTH levels in patients with chronic renal failure with absence of hypercalcemia/hyperphosphatemia; serum PO_4 , calcium, CaXP may increase

USES:

Hyperparathyroidism in chronic renal failure

Unlabeled uses: Renal osteodystrophy

CONTRAINDICATIONS:

Hypersensitivity, hypercalcemia

Precautions: Pregnancy (C), breastfeeding, children, geriatric patients, CV disease, renal calculi

DOSAGE AND ROUTES

Calculator

• **Adult: IV BOL** 0.04-0.1 mcg/kg (2.8-7 mcg) no more than every other day during dialysis; may increase by 2-4 mcg q2-4wk until target serum intact PTH (1.5–3× nonuremic upper limit of normal) achieved; **PO** 1 mcg/day or 2 mcg 3×/wk (IPTH ≤500 pg/ml); 2 mcg/day or 4 mcg 3×/wk (IPTH >500 pg/ml)

Available forms: Inj 2, 5 mcg/ml; caps 1, 2, 4 mcg

Administer:

PO route

• Daily or 3×/wk; may give without regard to food

IV route

• By IV bolus only

SIDE EFFECTS

CNS: Lightheadedness

CV: Palpitations

GI: Nausea, vomiting, anorexia, dry mouth

OTHER: Pneumonia, edema, chills, fever, flu, sepsis

PHARMACOKINETICS

Crosses placenta, enters breast milk

INTERACTIONS

Decrease: paricalcitol effect—cholestyramine, colestipol, mineral oil, orlistat, corticosteroids, barbiturates, hydantoins, CYP3A4 enzymes (nevirapine, rifampin, bosentan)

Increase: calcium levels—thiazide diuretics, calcium products, vit D supplements

Increase: effect of cardiac glycosides

Altered: paricalcitol effect—CYP3A4 inhibitors (amiodarone, protease inhibitors, systemic azole antifungals, chloramphenicol, clarithromycin, delavirdine, erythromycin)

NURSING CONSIDERATIONS

Assess:

- **Hypocalcemia:** twitching, dysrhythmias, Chvostek's/Trousseau's signs, paresthesia, laryngospasm, prolonged QTc/ST interval
- Serum calcium, serum intact parathyroid hormone concentrations (iPTH), phosphate 2×/wk during initial therapy; after dose is established, take calcium and phosphorus monthly

Evaluate:

- Decreased hypoparathyroidism with chronic renal disease, normal serum calcium, phosphate, iPTH

Teach patient/family:

- To report weakness, lethargy, headache, anorexia, loss of weight
 - To report nausea, vomiting, palpitations
 - To adhere to dietary regimen of calcium supplementation/phosphorus restriction
 - To avoid excessive use of aluminum compounds, antacids
 - Not to breastfeed
 - Not to take mineral oil, antacids (magnesium) while taking vit D
-

🍁 Canada only Side effects: *italics* = common; **bold** = life-threatening ⚠️
Nurse Alert

PARoxetine (Rx)

(par-ox'e-teen)

Paxil, Paxil CR, Pexeva

Func. class.: Antidepressant, SSRI

Chem. class.: Phenylpiperidine derivative

Do not confuse: PARoxetine/PACLitaxel

Paxil/PACLitaxel/Taxol

ACTION:

Inhibits CNS neuron uptake of serotonin but not of norepinephrine or dopamine

USES:

Major depressive disorder, obsessive-compulsive disorder, panic disorder, generalized anxiety disorder, posttraumatic stress disorder, premenstrual disorders, social anxiety disorder

Unlabeled uses: Premature ejaculation, hot flashes, menopause

CONTRAINDICATIONS:

Pregnancy (D), hypersensitivity, MAOI use, alcohol use

Precautions: Breastfeeding, geriatric patients, seizure history; patients with history of mania, renal/hepatic disease

Black Box Warning:

Children, suicidal ideation

DOSAGE AND ROUTES

Calculator

Generalized anxiety disorder

- **Adult: PO** 20 mg/day in AM, range 20-50 mg/day

Posttraumatic stress disorder

- **Adult: PO** 20 mg/day, range 20-60 mg/day

Depression

- **Adult: PO** 20 mg/day in AM; after 4 wk, if no clinical improvement is noted, dose may be increased by 10 mg/day each wk to desired response, max 50 mg/day or **CONT REL** 25 mg/day, may increase by 12.5 mg/day/wk up to 62.5 mg/day

- **Geriatric: PO** 10 mg/day, increase by 10 mg to desired dose, max 40 mg/day

Obsessive-compulsive disorder

- **Adult: PO** 40 mg/day in AM, start with 20 mg/day, increase in 10-mg/day increments, max 60 mg/day

Panic disorder

- **Adult: PO** Start with 10 mg/day, increase in 10-mg/day increments to 40 mg/day, max 60 mg/day or **CONT REL** 12.5 mg/day, max 75 mg/day

Premenstrual disorders

- **Adult: CONT REL** 12.5 mg/day in AM

Renal dose

- **Adult: PO** CCr 30-60 ml/min, lower doses may be needed; CCr <30 ml/min, 10 mg/day initially, regular rel, max 40 mg/day; **CONT REL** 12.5 mg/day initially, max 50 mg/day

Hepatic dose

- **Adult: PO** 10 mg/day initially, max 40 mg **regular rel**; 12.5 mg/day initially, max 50 mg/day (**CONT REL**)

Menopause symptoms/hot flashes (unlabeled)

- **Adult: PO (CONT REL)** 12.5 mg/day, may increase to 25 mg/day after 1 wk

Premature ejaculation (unlabeled)

- **Adult: PO** 20 mg/day

Available forms: Tabs 10, 20, 30, 40 mg; oral susp 10 mg/5 ml; cont rel tab 12.5, 25, 37.5 mg

Administer:

- **Do not substitute Pexeva with Paxil, Paxil CR, or generic PARoxetine**
- Increased fluids, bulk in diet for constipation, urinary retention
- With food, milk for GI symptoms
- Crushed if patient is unable to swallow medication whole (regular rel only)
- Gum, hard candy, frequent sips of water for dry mouth
- Avoid use with other CNS depressants
- **Oral susp:** shake, measure with oral syringe or calibrated measuring device
- **Cont rel tab:** do not cut, chew, crush; do not give concurrently with antacids

SIDE EFFECTS

CNS: *Headache*, nervousness, insomnia, *drowsiness*, *anxiety*, *tremor*, *dizziness*, fatigue, *sedation*, abnormal dreams, agitation, apathy, euphoria, hallucinations,

delusions, psychosis, **seizures, neuroleptic-malignant-syndrome–like reactions,** restless leg syndrome

CV: Vasodilation, postural hypotension, palpitations, bleeding

EENT: Visual changes

GI: *Nausea, diarrhea, dry mouth,* anorexia, dyspepsia, *constipation,* cramps, vomiting, taste changes, flatulence, decreased appetite

GU: Dysmenorrhea, decreased libido, urinary frequency, UTI, amenorrhea, cystitis, impotence; decreased sperm quality, decreased fertility, *abnormal ejaculation (male)*

INTEG: *Sweating,* rash

MS: Pain, arthritis, myalgia, myopathy, myosthenia

RESP: Infection, pharyngitis, nasal congestion, sinus headache, sinusitis, cough, dyspnea, yawning

SYST: Asthenia, fever, abrupt withdrawal syndrome

PHARMACOKINETICS

PO: Peak 5.2 hr, ext rel peak 6-10 hr; metabolized in liver by CYP2D6 enzyme system, unchanged products and metabolites excreted in feces and urine; half-life 21 hr (reg rel); 15-20 hr (cont rel); protein binding 95%

INTERACTIONS

⚠ Increase: serotonin syndrome—SSRIs, SNRIs, atypical psychotics, serotonin-receptor agonists, tricyclics, amphetamines, methylphenidate, traMADol

Decrease: level of digoxin

⚠ Do not use with MAOIs, pimozide, thioridazine; potentially fatal reactions can occur

Increase: bleeding—NSAIDs, thrombolytics, salicylates, platelet inhibitors, anticoagulants

Increase: PARoxetine plasma levels—cimetidine

Increase: agitation—L-tryptophan

Increase: side effects—highly protein-bound products

Increase: theophylline levels—theophylline

Increase: toxicity—CYP2D6 inhibitors (aprepitant, delavirdine, imatinib, nefazodone)

Decrease: PARoxetine levels—PHENobarbital and phenytoin

Drug/Herb

- Avoid use with St. John's wort, kava
- Possible serotonin syndrome: St. John's wort
- Hypertensive crisis: ephedra

NURSING CONSIDERATIONS

Assess:

Black Box Warning:

Depression/OCD/anxiety/panic attacks: mental status: mood, sensorium, affect, suicidal tendencies (especially in child/young adult), increase in psychiatric symptoms, decreasing obsessive thoughts, compulsive behaviors, restrict amount available

- **Postural hypotension:** B/P (lying/standing), pulse q4hr; if systolic B/P drops 20 mm Hg, hold product, notify prescriber; take vital signs q4hr for patients with CV disease • **Hepatic/renal studies:** AST, ALT, bilirubin, creatinine
- Weight weekly; appetite may decrease with product, constipation
- **ECG for flattening of T wave, bundle branch or AV block, dysrhythmias in cardiac patients**
- **EPS,** primarily in geriatric patients: rigidity, dystonia, akathisia
- **Renal status:** BUN, creatinine, urinary retention
- **Withdrawal symptoms:** headache, nausea, vomiting, muscle pain, weakness; not usual unless product discontinued abruptly, taper over 1-2 wk • **Alcohol intake;** if alcohol is consumed, hold dose until morning

⚠ Serotonin, neuroleptic malignant syndrome: hallucinations, coma, headache, agitation, shivering, sweating, tachycardia, diarrhea, tremor, hypertension, hyperthermia, rigidity, delirium, coma, myoclonus, agitation, nausea, vomiting

Perform/provide:

- Storage at room temp; do not freeze

Evaluate:

- Therapeutic response: decreased depression

Teach patient/family:

- That therapeutic effect may take 1-4 wk
- To use caution when driving, performing other activities requiring alertness because of drowsiness, dizziness, blurred vision • Not to discontinue medication quickly after long-term use; may cause nausea, headache, malaise (abrupt

withdrawal syndrome)

Black Box Warning:

That depression may worsen, suicidal thoughts/behaviors; children/adolescents, young adults, to notify prescriber

- To avoid alcohol ingestion, OTC products unless approved by prescriber
- To report bleeding, headache, nausea, anxiety, or if depression continues
- To discuss sexual side effects: impotence, possible male infertility while taking product

TREATMENT OF OVERDOSE:

Gastric lavage, airway; for seizures, give diazepam, symptomatic treatment

☼ Canada only Side effects: *italics* = common; **bold** = life-threatening ⚠
Nurse Alert

pegfilgrastim (Rx)

(peg-fill-grass'stim)

Neulasta

Func. class.: Hematopoietic agent

Chem. class.: Granulocyte colony-stimulating factor

ACTION:

Stimulates proliferation and differentiation of neutrophils

USES:

To decrease infection in patients receiving antineoplastics that are myelosuppressive; to increase WBC count in patients with product-induced neutropenia

CONTRAINDICATIONS:

Hypersensitivity to proteins of *Escherichia coli*, filgrastim

Precautions: Pregnancy (C), breastfeeding, children <45 kg, adolescents, myeloid malignancies, sickle cell disease, leukocytosis, splenic rupture, ARDS, allergic-type reactions, peripheral blood stem cell (PBSC) mobilization

DOSAGE AND ROUTES

Calculator

• **Adult:** SUBCUT 6 mg, give 1× per chemotherapy cycle

Available forms: Sol for inj 6 mg/0.6 ml

Administer:

SUBCUT route

- Using single-use vials; after dose is withdrawn, do not reenter vial
- Do not use 6-mg fixed dose in infants, children, or others <45 kg
- Inspect sol for discoloration, particulates; if present, do not use
- Do not administer during the period 14 days before and 24 hr after cytotoxic chemotherapy

SIDE EFFECTS

CNS: Fever, fatigue, headache, dizziness, insomnia, peripheral edema

GI: Nausea, vomiting, diarrhea, mucositis, anorexia, constipation, dyspepsia,

abdominal pain, stomatitis, splenic rupture

HEMA: Leukocytosis, granulocytopenia, sickle cell crisis, hemoglobin S disease with crisis

INTEG: Alopecia

MISC: Chest pain, hyperuricemia, anaphylaxis, influenza-like illness, angioedema, antibody formation

MS: Skeletal pain

RESP: Respiratory distress syndrome

PHARMACOKINETICS

Half-life: 15-80 hr; 20-38 hr (children)

INTERACTIONS

- Do not use product concomitantly, 2 wk before, or 24 hr after administration of cytotoxic chemotherapy

Increase: release of neutrophils—lithium

Drug/Lab Test

Increase: uric acid, LDH, alk phos

NURSING CONSIDERATIONS

Assess:

⚠️ **Allergic reactions, anaphylaxis:** rash, urticaria; discontinue product, have emergency equipment nearby ⚠️ **ARDS:** dyspnea, fever, tachypnea, occasionally confusion; obtain ABGs, chest x-ray; product may need to be discontinued

- **Bone pain;** give mild analgesics
- Blood studies: CBC with differential, platelet count before treatment, 2× weekly; neutrophil counts may be increased for 2 days after therapy • B/P, respirations, pulse before and during therapy

Perform/provide:

- Storage in refrigerator; do not freeze; may store at room temp up to 6 hr; avoid shaking, protect from light

Evaluate:

- Therapeutic response: absence of infection

Teach patient/family:

- How to perform the technique for self-administration if product to be given at home: dose, side effects, disposal of containers and needles; provide instruction

sheet • To notify prescriber immediately of allergic reaction, trouble breathing, abdominal pain

🍁 Canada only Side effects: *italics* = common; **bold** = life-threatening ⚠️
Nurse Alert

peginterferon alfa-2a (Rx)

(peg-in-terfeer'on)

Pegasys

peginterferon alfa-2b (Rx)

PegIntron, SYLATRON

Func. class.: Immunomodulator

ACTION:

Stimulates genes to modulate many biologic effects, including the inhibition of viral replication; inhibits cell proliferation, immunomodulation; stimulates effector proteins; decreases leukocyte, platelet counts

USES:

Chronic hepatitis C infections in adults with compensated liver disease; chronic hepatitis B in adults who are HBe AG positive, HBe AG negative; HCV patients coinfecting with HIV; nonresponders or relapsers with chronic hepatitis C, malignant melanoma

Unlabeled uses: Adenovirus, coronavirus, encephalomyocarditis virus, herpes simplex types 1 and 2, hepatitis D, acute hepatitis C, HIV, HPV, polio virus, rhinovirus, varicella-zoster, variola, vesicular stomatitis

CONTRAINDICATIONS:

Neonates, infants, sepsis; hypersensitivity to interferons, benzyl alcohol, *Escherichia coli* protein

Precautions: Pregnancy (C), breastfeeding, children <18 yr, geriatric patients, thyroid disorders, myelosuppression, renal/hepatic disease, suicidal/homicidal ideation, preexisting ophthalmologic disorders, pancreatitis, hemodialysis

Black Box Warning:

Cardiac disease, depression, autoimmune disease, infection, use with ribavirin

DOSAGE AND ROUTES

Calculator

Pegasys

- **Adult:** SUBCUT 180 mcg q wk × 48 wk; if poorly tolerated, reduce dose to 135 mcg q wk; in some cases, reduction to 90 mcg may be needed

PegIntron

(chronic hepatitis C with compensated liver disease)

- **Adult >105 kg: SUBCUT** 1.5 mcg/kg/wk plus ribavirin 600 mg in AM and 800 mg in PM plus a HCV NS3/4A protease inhibitor; **86-105 kg:** 150 mcg/0.5 ml (0.5 ml of 150 mcg vial or Redipen) per wk plus ribavirin 1200 mg/day in 2 divided doses plus a HCV NS3/4A protease inhibitor; **81-85 kg:** 120 mcg/0.5 ml (0.5 ml of 120 mcg vial or Redipen) per wk plus ribavirin 1200 mg/day in 2 divided doses plus a HCV NS3/4A protease inhibitor; **76-80 kg:** 120 mcg/0.5 ml (0.5 ml of 120 mcg vial or Redipen) per wk plus ribavirin 400 mg in AM and 600 mg in PM plus a HCV NS3/4A protease inhibitor; **66-75 kg:** 96 mcg/0.4 ml (0.4 ml of 120 mcg vial or Redipen) per wk plus ribavirin 400 mg in AM and 600 mg in PM plus a HCV NS3/4A protease inhibitor; **61-65 kg:** 96 mcg/0.4 ml (0.4 ml of 120 mcg vial or Redipen) per wk plus ribavirin 800 mg/day in 2 divided doses plus a HCV NS3/4A protease inhibitor; **51-60 kg:** 80 mcg/0.5 ml (0.5 ml of 80 mcg vial or Redipen) per wk plus ribavirin 800 mg/day in 2 divided doses plus a HCV NS3/4A protease inhibitor; **40-50 kg:** 64 mcg/0.4 ml (0.4 ml of 80 mcg vial or Redipen) per wk plus ribavirin 800 mg/day in 2 divided doses plus a HCV NS3/4A protease inhibitor; **<40 kg:** 50 mcg/0.5 ml (0.5 ml of 50 mcg vial or Redipen) per wk plus ribavirin 800 mg/day in 2 divided doses plus a HCV NS3/4A protease inhibitor

Malignant Melanoma (SYLATRON only)

- **Adult: SUBCUT** 6 mcg/kg/wk × 8 wk then 3 mcg/kg/wk × ≤5 yr, premedicate with acetaminophen 500-1000 mg 30 min prior to first dose, prn for subsequent doses

Available forms: Pegasys: inj 180 mcg/0.5 ml; Pegintron: 50, 80, 120, 150 mcg/0.5 ml; SYLATRON 296, 444, 888 mcg powder for inj

Administer:

- In evening to reduce discomfort, to allow patient to sleep through some side effects
- Continue pediatric dose in those who turn 18 yr

Interferon alfa-2a

- Use prefilled syringes, store in refrigerator

Interferon alfa-2b

SUBCUT/IM route

- Reconstitute with 1 ml of provided diluent/10-, 18-, or 50-million unit vials, swirl; sol for inj vials do not need reconstitution

SIDE EFFECTS

CNS: *Headache, insomnia, dizziness, anxiety, hostility, lability, nervousness, depression, fatigue, poor concentration, pyrexia, suicidal ideation, homicidal ideation*, relapse of drug addiction, emotional lability, mania, psychosis

CV: *Ischemic CV events*

ENDO: Hypothyroidism, diabetes

GI: *Abdominal pain, nausea, diarrhea, anorexia, vomiting, dry mouth, fatal colitis, fatal pancreatitis*

HEMA: *Thrombocytopenia*, neutropenia, anemia, lymphopenia

INTEG: *Alopecia, pruritus, rash, dermatitis*

MISC: Blurred vision, inj site reaction, rigors

MS: *Back pain, myalgia, arthralgia*

RESP: Cough, dyspnea

PHARMACOKINETICS

Half-life 15-80 hr, large variability in other pharmacokinetics

INTERACTIONS

- Use caution when giving with theophylline, myelosuppressive agents

Increase: hepatic damage-NNRTIs, NRTIs, protein inhibitors

Drug/Lab Test

Increase: triglycerides, ALT, neutrophils, platelets

Abnormal: thyroid function test

NURSING CONSIDERATIONS

Assess:

- **Neuropsychiatric symptoms:** severe depression with suicidal ideation; monitor q3wk then 8 wk then q6mo
- B/P, blood glucose, ophthalmic exam, pulmonary function
- ALT, HCV viral load; patients who show no reduction in ALT, HCV unlikely to show benefit of treatment after 6 mo
- Platelet counts, heme concentration, ANC, serum creatinine concentration, albumin, bilirubin, TSH, T₄, AFP

 **Myelosuppression:** hold dose if neutrophil count is $<500 \times 10^6/L$ or if platelets are $<50 \times 10^9/L$

- **Hypersensitivity:** discontinue immediately if hypersensitivity occurs
- **Infection:** vital signs, increased WBCs, fever; product may need to be discontinued  **Colitis/pancreatitis:** may be fatal; diarrhea, fever, nausea, vomiting, severe abdominal pain; if these occur, product should be discontinued

Evaluate:

- Therapeutic response: decreased chronic hepatitis C signs, symptoms; undetectable viral load

Teach patient/family:

- Provide patient or family member with written, detailed information about product
- Use 2 forms of effective contraception throughout treatment and for 6 mo after treatment (men and women) (combination therapy with ribavirin) • To avoid driving, other hazardous activity if dizziness, confusion, fatigue, somnolence occur
- To use puncture-resistant container for disposal of needles/syringes if using at home

 To report suicidal/homicidal ideation, visual changes, bleeding/bruising, pulmonary symptoms

🍁 Canada only Side effects: *italics* = common; **bold** = life-threatening 
Nurse Alert

pegloticase (Rx)

(peg-loe'ti-kase)

Krystexxa

Func. class.: Antigout agent

Chem. class.: Pegylated, recombinant, mammalian urate oxidase enzyme

ACTION:

Lowers plasma uric acid concentration by converting uric acid to allantoin, which is readily excreted by the kidneys

USES:

Chronic gout in patients experiencing treatment failure

CONTRAINDICATIONS:

Hypersensitivity, G6PD deficiency

Precautions: Pregnancy (C), breastfeeding, children/infants/neonates, African-American patients, heart failure

Black Box Warning:

Requires specialized setting, experienced clinician

DOSAGE AND ROUTES

Calculator

• **Adult:** IV INF 8 mg over 2 hr q2wk

Available forms: Sol for inj 8 mg/ml

Administer:

Intermittent IV INF route

• **Reconstitute:** Visually inspect for particulate matter, discoloration whenever sol/container permits, use aseptic technique, withdraw 8 mg (1 ml) of product/250 ml 0.9% NaCl or 0.45% NaCl, invert several times to mix, do not shake; discard remaining product in vial • **Premedicate:** With antihistamines and corticosteroids in all patients and acetaminophen if deemed necessary to prevent anaphylaxis, inf site reactions • **Infusion:** If refrigerated, allow to come to room temp, do not warm artificially; give over 120 min, do not give IV push or bolus; use inf by gravity feed, syringe-type pump, or inf pump; given in a specialized setting by those who can manage anaphylaxis or inj site

reactions; monitor during and for 1 hr after infusion; if reaction occurs, slow or stop infusion, may be restarted at a slower rate; do not admix • Storage of diluted product in refrigerator or at room temp for up to 4 hr; refrigerator is preferred, protect from light, do not freeze, use within 4 hr of preparation

SIDE EFFECTS

CNS: Dizziness, fatigue, fever

CV: Chest pain, heart failure, hypotension

GI: Nausea, vomiting, diarrhea, constipation

GU: Nephrolithiasis

HEMA: Anemia

INTEG: Ecchymosis, erythema, pruritus, urticaria

MS: Back pain, arthralgia, muscle spasm

SYST: Antibody formation, infection, anaphylaxis, infusion-related reactions

RESP: Dyspnea, upper respiratory infection

PHARMACOKINETICS

Remains primarily in intravascular space after administration, elimination half-life 2 wk, mean nadir uric acid concentration 24-72 hr

Interactions

Do not use with urate-lowering agents (allopurinol, probenecid, febuxostat, sulfinpyrazone)

NURSING CONSIDERATIONS

Assess:

• **Gout:** pain in big toe, feet, knees, redness, swelling, tenderness lasting a few days to weeks; intake of alcohol, purines, if patient is overweight or taking diuretics • Obtain uric acid levels at baseline, before administration; 2 consecutive uric acid levels of >6 mg/dl may indicate therapy failure; greater chance of anaphylaxis; infection-related reactions

Black Box Warning:

Specialized care setting: use only in facility where emergency equipment is available, anaphylaxis may occur

Black Box Warning:

Infusion reactions: monitor for reactions for ≥1 hr after use

Evaluate:

- Therapeutic response: decrease uric acid levels; relief of pain, swelling, redness in toes, feet, knees

Teach patient/family:

- About reason for inf, expected results
- To notify prescriber during inf of allergic reactions or redness, swelling, pain at inf site
- That continuing follow-up exams and uric acid levels will be needed

🍁 Canada only Side effects: *italics* = common; **bold** = life-threatening ⚠️
Nurse Alert

HIGH ALERT

PEMEtrexed (Rx)

(pem-ah-trex'ed)

Alimta

Func. class.: Antineoplastic-antimetabolite

Chem. class.: Folic acid antagonist

ACTION:

Inhibits multiple enzymes that reduce folic acid, which is needed for cell replication

USES:

Malignant pleural mesothelioma in combination with CISplatin; non–small-cell lung cancer as single agent; nonsquamous, non–small-cell lung cancer (1st-line treatment)

Unlabeled uses: Bladder, breast, colorectal, gastric, head/neck, pancreatic, renal cancers

CONTRAINDICATIONS:

Pregnancy (D), hypersensitivity, ANC <1500 cells/mm³, CCr <45 ml/min, thrombocytopenia (<100,000/mm³), anemia

Precautions: Breastfeeding, children, renal/hepatic disease

DOSAGE AND ROUTES

Calculator

• **Adult: IV INF** 500-600 mg/m² given over 10 min on day 1 of 21-day cycle with CISplatin 75 mg/m² infused over 2 hr beginning 1/2 hr after end of pemetrexed inf

Renal dose

• **Adult: IV INF CCr <45 ml/min, not recommended**

Available forms: Inj, single-use vials, 100, 500 mg

Administer:

• Vit B₁₂ and low-dose folic acid as prophylactic measure to treat related

hematologic, GI toxicity; 400-1000 mcg/day $\times$ 7 days prior to 1st dose and $\times$ 21 days after last dose, vit B₁₂ 1 mg IM 1 wk prior to 1st dose and q 3 cycles (9 wk) thereafter • Premedicate with corticosteroid (dexamethasone) given PO bid day before, day of, and day after administration of PEMEtrexed

Intermittent IV INF route

- **Use cytotoxic handling procedures**
- Reconstitute 500-mg vial/20 ml 0.9% NaCl inj (preservative free) = 25 mg/ml, swirl until dissolved, further dilute with 100 ml 0.9% NaCl inj (preservative free), give as IV inf over 10 mg • Use only 0.9% NaCl inj (preservative free) for reconstitution, dilution
- **Do not begin a new cycle unless neutrophils (ANC) are ≥ 1500 cells/mm³, platelets are $\geq 100,000$ cells/mm³, CCr is ≥ 45 ml/min • **Platelet nadir $< 50,000$ /mm³ regardless of the ANC:** If necessary, delay until platelet count recovery, reduce PEMEtrexed and CISplatin by 50%; grade 3/4 toxicity occurs after 2 reductions, discontinue both products • **ANC nadir < 500 /mm³ when platelet nadir is $\geq 50,000$ /mm³:** If necessary, delay until ANC recovery, reduce PEMEtrexed and CISplatin by 75%; if grade 3/4 toxicity occurs after 2 reductions, discontinue both products • **CTC Grade 3/4 nonhematologic toxicity including diarrhea requiring hospitalization and excluding neurotoxicity, mucositis, and grade 3 transaminase elevations:** Withhold therapy until pretherapy value or condition, reduce by 75% both products, if grade 3 or 4 toxicity occurs after 2 reductions, discontinue both products • **CTC grade 3/4 mucositis:** Withhold therapy until pretherapy condition, reduce 50% of PEMEtrexed, if grade 3 or 4 mucositis occurs after 2 dosage reductions, discontinue both products • **CTC grade 2 neurotoxicity:** Withhold therapy until pretherapy value or condition, reduce dose of CISplatin by 50%**
- **CTC grade 3/4 neurotoxicity:** discontinue both products

Y-site compatibilities: Acyclovir sodium, alfentanil, allopurinol, amifostine, amikacin, aminocaproic acid, aminophylline, amiodarone, amphotericin B lipid complex, amphotericin B liposome, ampicillin, ampicillin-sulbactam, atenolol, atracurium, azithromycin, aztreonam, bivalirudin, bleomycin, bumetanide, buprenorphine, butorphanol, CARBOplatin, carmustine, ceftizoxime, cefTRIAxone, cefuroxime, cimetidine, cisatracurium, CISplatin, clindamycin, cyclophosphamide, cycloSPORINE, cytarabine, DACTINomycin, DAPTOmycin, dexamethasone, digoxin, diltiazem, diphenhydrAMINE,

DOCEtaxel, dolasetron, DOPamine, doxacurium, enalaprilat, ePHEDrine, EPINEPHrine, eptifibatide, ertapenem, esmolol, etoposide, famotidine, fenoldopam, fentaNYL, fluconazole, fludarabine, fluorouracil, foscarnet, fosphenytoin, furosemide, ganciclovir, gatifloxacin, glycopyrrolate, granisetron, haloperidol, heparin, hydrocortisone, HYDROmorphine, hydrOXYzine, ifosfamide, imipenem-cilastatin, insulin (regular), isoproterenol, ketorolac, labetalol, leucovorin, levofloxacin, lidocaine, linezolid, LORazepam, magnesium, mannitol, meperidine, meropenem, mesna, methyldopate, methylPREDNISolone, metoclopramide, metoprolol, midazolam, milrinone, mitoMYcin, mivacurium, morphine, moxifloxacin, nafcillin, naloxone, nesiritide, nitroglycerin, norepinephrine, octreotide, oxaliplatin, PACLitaxel, pamidronate, pancuronium, PENTobarbital, PHENobarbital, piperacillin-tazobactam, polymyxin B, potassium chloride/phosphates, procainamide, promethazine, propranolol, ranitidine, remifentanyl, rocuronium, sodium acetate/bicarbonate/phosphates, succinylcholine, SUFentanyl, sulfamethoxazole-trimethoprim, tacrolimus, theophylline, thiopental, thiotepa, ticarcillin, ticarcillin-clavulanate, tigecycline, tirofiban, trimethobenzamide, vancomycin, vecuronium, verapamil, vinBLASTine, vinCRISTine, vinorelbine, zidovudine, zoledronic acid

SIDE EFFECTS

CNS: *Fatigue, fever, mood alteration, neuropathy*

CV: **Thrombosis/embolism**, chest pain, arrhythmia exacerbation

GI: *Nausea, vomiting, anorexia, diarrhea, ulcerative stomatitis, constipation, dysphagia, dehydration*

GU: **Renal failure**, creatinine elevation

HEMA: **Neutropenia, leukopenia, thrombocytopenia, myelosuppression, anemia**

INTEG: *Rash, desquamation*

RESP: *Dyspnea*

SYST: **Infection with/without neutropenia, radiation recall reaction, toxic epidermal necrolysis, Stevens-Johnson syndrome, anaphylaxis**

PHARMACOKINETICS

Not metabolized; excreted in urine (unchanged 70%-90%); not known if excreted in breast milk; half-life 3.5 hr, 81% protein binding

INTERACTIONS

Increase: bleeding risk—NSAIDs, anticoagulants, platelet inhibitors, salicylates, thrombolytics

Decrease: clearance of PEMEtrexed—nephrotoxic products

NURSING CONSIDERATIONS

Assess:

⚠️ Previous radiation treatments; radiation recall reactions have occurred (erythema, exfoliative dermatitis, pain, burning) ⚠️ **Bone marrow depression:** CBC, differential, platelet count; monitor for nadir, recovery; new cycle should not begin if ANC <1500 cells/mm³, platelets <100,000 cells/mm³, CCr <45 ml/min • Renal studies: BUN, serum uric acid, urine CCr, electrolytes before, during therapy

- I&O ratio; report fall in urine output to <30 ml/hr
- Monitor temp q4hr; fever may indicate beginning infection; no rectal temp
- ⚠️ **Neurotoxicity:** CTC grade 2: withhold until resolution to at least pretherapy value/condition, reduce CISplatin by 50%; CTC grade 3-4: immediately discontinue product and CISplatin if given in combination • **Mucositis:** CTC 3-4: withhold until resolution to at least pretherapy value/condition, reduce dose by 50%; if grade 3/4 occurs after 2 dosage reductions, discontinue product and CISplatin • **Bleeding:** bleeding time, coagulation time during treatment; bleeding: hematuria, guaiac, bruising or petechiae, mucosa or orifices q8hr
- Buccal cavity q8hr for dryness, sores, ulceration, white patches, oral pain, bleeding, dysphagia ⚠️ **Severe allergic reaction/toxic epidermal necrolysis:** rash, urticaria, itching, flushing

Perform/provide:

- Rinsing of mouth tid-qid with water, club soda; brushing of teeth bid-tid with soft brush or cotton-tipped applicators for stomatitis; use unwaxed dental floss
- Storage at 77° F, excursions permitted at 59° F to 86° F, not light sensitive, discard unused portions

Evaluate:

- Therapeutic response: decreased spread of malignancy

Teach patient/family:

- To report any complaints, side effects to nurse or prescriber: black, tarry stools, chills, fever, sore throat, bleeding, bruising, cough, SOB, dark or bloody urine
- To avoid foods with citric acid, hot or rough texture if stomatitis is present

- To report stomatitis: any bleeding, white spots, ulcerations in mouth to prescriber; to examine mouth daily, to report symptoms to nurse, to use good oral hygiene
 - That contraceptive measures recommended during therapy, for #8 wk after cessation of therapy; to discontinue breastfeeding because toxicity to infant may occur
 - To avoid alcohol, salicylates, live vaccines
 - To avoid use of razors, commercial mouthwash
 - To eat foods high in folic acid; to take supplements as prescribed
-

🍁 Canada only Side effects: *italics* = common; **bold** = life-threatening ⚠️
Nurse Alert

penciclovir topical

See [Appendix B](#)

PENICILLINS

penicillin G benzathine (Rx)

(pen-i-sill'in)

Bicillin L-A

penicillin G (Rx)

Pfizerpen

penicillin G procaine (Rx)

penicillin V (Rx)

Apo-Pen-VK , Penicillin VK

Func. class.: Broad-spectrum antiinfective

Chem. class.: Natural penicillin

ACTION:

Interferes with cell-wall replication of susceptible organisms; lysis is mediated by cell-wall autolytic enzymes, results in cell death

USES:

Respiratory infections, scarlet fever, erysipelas, otitis media, pneumonia, skin and soft-tissue infections, gonorrhea; effective for gram-positive cocci (*Staphylococcus*, *Streptococcus pyogenes*, *S. viridans*, *S. faecalis*, *S. bovis*, *S. pneumoniae*), gram-negative cocci (*Neisseria gonorrhoeae*), gram-positive bacilli (*Actinomyces*, *Bacillus anthracis*, *Clostridium perfringens*, *C. tetani*, *Corynebacterium diphtheriae*, *Listeria monocytogenes*), gram-negative bacilli (*Escherichia coli*, *Proteus mirabilis*, *Salmonella*, *Shigella*, *Enterobacter*, *Streptobacillus moniliformis*), spirochetes (*Treponema pallidum*)

CONTRAINDICATIONS:

Hypersensitivity to penicillins, corn

Precautions: Pregnancy (B), breastfeeding; hypersensitivity to cephalosporins, carbapenem, sulfites; severe renal disease, GI disease, asthma

DOSAGE AND ROUTES

Calculator

Penicillin G benzathine

Early syphilis

- **Adult: IM** 2.4 million units in single dose

Congenital syphilis

- **Child <2 yr: IM** 50,000 units/kg in single dose, max 2.4 million units as single inj

Prophylaxis of rheumatic fever, glomerulonephritis

- **Adult: IM** 1.2 million units in single dose
- **Child >27 kg: IM** 900,000-1.2 million units as single dose
- **Child ≤27 kg: IM** 300,000-600,000 units as single dose

Upper respiratory infections (group A streptococcal)

- **Adult: IM** 1.2 million units as single dose
- **Child >27 kg: IM** 900,000-1.2 million units as single dose
- **Child <27 kg: IM** 300,000-600,000 units as single dose

Available forms: Inj 600,000 units/ml

Penicillin G

Pneumococcal/streptococcal infections (serious)

- **Adult: IM/IV** 5-24 million units in divided doses q4-6hr
- **Child <12 yr: IV** 150,000-300,000 units/kg/day in 4-6 divided doses; max 24 million units/day

Renal dose

- **CCr <10 ml/min**, give full loading dose then 1/2 of loading dose q8-10hr

Available forms: Powder for inj 1, 5, 20 million units/vial; inj 1, 2, 3 million units/50 ml

Penicillin G procaine

Moderate to severe pneumococcal infections

- **Adult/child: IM** 600,000-1 million units as single dose or divided bid doses/day for 10 days to 2 wk

Pneumococcal pneumonia

• **Adult/child >12 yr: IM 600,000-1 million units/day × 7-10 days**
Moderately severe group a streptococcal/staphylococcal pneumonia

- **Adult/adolescent/child ≥60 lbs: IM 600,000-1 million units/day**
- **Adolescent/child <60 lbs: IM 300,000 units/day**

Available forms: Inj 600,000, 1,200,000 units/unit dose

Penicillin V

Pneumococcal/staphylococcal infections

- **Adult/adolescents/child >12 yr: PO 250-500 mg q6hr**
- **Child <12 yr: PO 25-50 mg/kg/day in divided doses q6-8hr; max 2 g/day**

Streptococcal infections

- **Adult/adolescent/child ≥12 yr: PO 125-250 mg q6-8hr × 10 days**
- **Child <12 yr and >27 kg: PO 500 mg q8 or 12 hr × 10 days**
- **Child <12 yr and ≤27 kg: PO 250 mg q8hr or q12hr or 40 mg/kg/day in 3 divided doses × 10 days**

Prevention of recurrence of rheumatic fever/chorea

- **Adult: PO 125-250 mg bid continuously**

Vincent's gingivitis/pharyngitis

- **Adult: PO 250-500 mg q6-8hr**

Renal dose

- **Dosage reduction indicated with renal impairment (CCr <50 ml/min) based on clinical response, degree of impairment**

Available forms: Tabs 250, 500 mg; powder for oral sol 125, 250 mg/5 ml

Administer:

Penicillin G benzathine

- No dilution needed, shake well, deep IM inj in large muscle mass; avoid intravascular inj; aspirate; do not give IV

Penicillin G

- Penicillin G sodium or potassium can be given IM or IV, vials containing 10 or 20 million units not for IM use

Intermittent IV INF route

- Vials/bulk packages: dilute according to manufacturer's directions
- Frozen bags: thaw at room temp, do not force thaw, no reconstitution needed
- Final conc (100,000-500,000 units/ml—adults; 50,000 units/ml—neonate/infant)
- Total daily dose divided q4-6hr and given over 1-2 hr (adult), 15 min

(infant/neonate)

Penicillin G potassium

Y-site compatibilities: Acyclovir, amiodarone, cyclophosphamide, diltiazem, enalaprilat, esmolol, fluconazole, foscarnet, heparin, HYDROMorphone, labetalol, magnesium sulfate, meperidine, morphine, perphenazine, potassium chloride, tacrolimus, theophylline, verapamil, vit B/C

Penicillin G procaine

- No dilution needed, give deep IM inj; avoid intravascular inj; aspirate; do not give IV

Penicillin V

- Orally on empty stomach for best absorption
- Oral susp: tap bottle to loosen, add 1/2 total amount of water, shake, add remaining water, shake; final conc (125 or 250 mg/ml) store in refrigerator after reconstitution, discard after 14 days

SIDE EFFECTS

CNS: Lethargy, hallucinations, anxiety, depression, twitching, **coma, seizures, hyperreflexia**

GI: *Nausea, vomiting, diarrhea*, increased AST, ALT, abdominal pain, glossitis, colitis, **pseudomembranous colitis**

GU: **Oliguria, proteinuria, hematuria, vaginitis, moniliasis, glomerulonephritis, renal tubular damage**

HEMA: Anemia, increased bleeding time, **bone marrow depression, granulocytopenia, hemolytic anemia**

META: Hypo/hyperkalemia, alkalosis, hyponatremia

MISC: **Anaphylaxis, serum sickness, Stevens-Johnson syndrome, local pain, tenderness and fever with IM inj**

PHARMACOKINETICS

Penicillin G benzathine:

IM: Very slow absorption; time to peak 12-24 hr; duration 21-28 days; excreted in urine, feces, breast milk; crosses placenta

Penicillin G:

IV: Peak immediate

IM: Peak 1/4-1/2 hr

PO: Peak 1 hr, duration 6 hr

Excreted in urine unchanged, excreted in breast milk, crosses placenta, half-life 30-60 min

Penicillin G procaine:

IM: Peak 1-4 hr, duration 15 hr, excreted in urine

Penicillin V:

PO: Peak 30-60 min, half-life 30 min, excreted in urine, breast milk

INTERACTIONS

Increase: penicillin effect—aspirin, probenecid

Increase: effect of heparin, methotrexate

Decrease: effect of oral contraceptives, typhoid vaccine

Decrease: antimicrobial effect of penicillin—tetracyclines

Drug/Lab Test

False positive: urine glucose, urine protein

NURSING CONSIDERATIONS

Assess:

- **Infection:** temp; characteristics of sputum; wounds; urine; stools before, during, after treatment; C&S before therapy; product may be given as soon as culture is taken
- I&O ratio; report hematuria, oliguria because penicillin in high doses is nephrotoxic; renal tests: urinalysis, protein, blood ⚠️ Any patient with compromised renal system because product is excreted slowly with poor renal system function; toxicity may occur rapidly
- Hepatic studies: AST, ALT
- Blood studies: WBC, RBC, Hct, Hgb, bleeding time

⚠️ **Pseudomembranous colitis:** diarrhea, mucus, pus; bowel pattern before, during treatment

- **Respiratory status:** rate, character, wheezing, tightness in chest

⚠️ **Allergies** before initiation of treatment, reaction of each medication; because of prolonged action, allergic reaction may be prolonged and severe; watch for anaphylaxis: rash, dyspnea, pruritus, laryngeal edema; skin eruptions after administration of penicillin to 1 wk after discontinuing product

Perform/provide:

- EPINEPHrine, suction, tracheostomy set, endotracheal intubation equipment
- Adequate fluid intake (2 L) during diarrhea episodes
- Scratch test to assess allergy after securing order from prescriber; usually done

when penicillin is only product of choice • Storage in dry, tight container; oral susp refrigerated 2 wk

Evaluate:

- Therapeutic response: resolution of infection

Teach patient/family:

- To report sore throat, fever, fatigue; may indicate superinfection; CNS effects: depression, hallucinations, seizures • To wear or carry emergency ID if allergic to penicillins
- To report diarrhea, with blood, pus, mucous to prevent dehydration
- To shake susp well before each dose; to store in refrigerator for up to 2 wk
- To use all medication prescribed
- To use additional contraception if using any of these products

TREATMENT OF ANAPHYLAXIS:

Withdraw product; maintain airway; administer EPINEPHrine, aminophylline, O₂, IV corticosteroids

🍁 Canada only Side effects: *italics* = common; **bold** = life-threatening ⚠️
Nurse Alert

pentamidine (Rx)

(pen-tam'i-deen)

Nebupent, Pentam 300

Func. class.: Antiprotozoal

Chem. class.: Aromatic diamide derivative

ACTION:

Interferes with DNA/RNA synthesis in protozoa

USES:

Treatment/prevention of *Pneumocystis jiroveci* infections

Unlabeled uses: *Leishmania*/*Trypanosoma* infections

CONTRAINDICATIONS:

Hypersensitivity

Precautions: Pregnancy (C), breastfeeding, children, blood dyscrasias, cardiac/renal/hepatic disease, diabetes mellitus, hypocalcemia, hypo/hypertension, anemia

DOSAGE AND ROUTES

Calculator

• **Adult and child ≥ 4 mo:** IV/IM 4 mg/kg/day $\times$ 2-3 wk; **NEB** 300 mg via specific nebulizer given q4wk for prevention

Available forms: Inj, aerosol 300 mg/vial; sol for aerosol 60 mg/vial ✱

Administer:

Inhalation route

• Through nebulizer, using Raspigard II jet nebulizer; mix contents in 6 ml of sterile water; do not use low pressure (<20 psi); flow rate should be 5-7 L/min (40-50 psi) air or O₂ source over 30-45 min until chamber is empty

IM route

• 300 mg diluted in 3 ml sterile water; give deep IM by Z-track; if painful by this route, rotate inj site

Intermittent IV INF route

• Reconstitute 300 mg/3-5 ml of sterile water for inj, D₅W, withdraw dose and

further dilute in 50-250 ml D₅W, give over 1-2 hr with patient lying down;
check B/P often

Y-site compatibilities: Alfentanil, atracurium, atropine, benztropine, buprenorphine, calcium gluconate, CARBOplatin, caspofungin, chlorproMAZINE, cimetidine, CISplatin, cyclophosphamide, cycloSPORINE, cytarabine, DACTINomycin, diltiazem, gatifloxacin, zidovudine

SIDE EFFECTS

CNS: Disorientation, hallucinations, *dizziness*, confusion, drowsiness

CV: Hypotension, ventricular tachycardia, **QT prolongation, dysrhythmias**

GI: *Nausea, vomiting, anorexia*; increased AST, ALT; **acute pancreatitis**, metallic taste

GU: **Acute renal failure, increased serum creatinine, renal toxicity**, decreased urination

HEMA: Anemia, **leukopenia, thrombocytopenia**

INTEG: Sterile abscess, pain at inj site, pruritus, urticaria, *rash*

META: *Hyperkalemia*, hypocalcemia, hypoglycemia, hypomagnesemia

MISC: Fatigue, fever, chills, night sweats, **anaphylaxis, Stevens-Johnson syndrome**

RESP: Cough, SOB, **bronchospasm** (with aerosol), sore throat

PHARMACOKINETICS

IV: Peak 1 hr

IM: Peak 30 min

Excreted unchanged in urine (66%); half-life 9-12 hr (IM), 6 hr (IV)

INTERACTIONS

- Nephrotoxicity: aminoglycosides, amphotericin B, CISplatin, NSAIDs, vancomycin

⚠ Fatal dysrhythmias: erythromycin IV

Increase: QT prolongation—class IA/III antidysrhythmics, some phenothiazines, β -agonists, local anesthetics, tricyclics, haloperidol, chloroquine, droperidol, pentamidine; CYP3A4 inhibitors (amiodarone, clarithromycin, erythromycin, telithromycin, troleandomycin, arsenic trioxide, levomethadyl); CYP3A4 substrates (methadone, pimozide, QUetiapine, quiNIDine, risperiDONE, ziprasidone)

Increase: myelosuppression—antineoplastics, radiation

Drug/Lab Test

Decrease: WBC, platelets, Hbg, Hct

Increase: BUN, creatinine

NURSING CONSIDERATIONS

Assess:

- Blood tests, blood glucose, CBC, platelets, calcium, magnesium
- I&O ratio; report hematuria, oliguria
- ECG for cardiac dysrhythmias; patient should be lying down when receiving product; severe hypotension may develop; monitor B/P during administration and until B/P stable • Hepatic studies: AST, ALT
- Renal studies: urinalysis, BUN, creatinine; nephrotoxicity may occur; any patient with compromised renal system; product is excreted slowly with poor renal system function; toxicity may occur rapidly • Signs of infection, anemia
- Bowel pattern before, during treatment
- Sterile abscess, pain at inj site
- Respiratory status: rate, character, wheezing, dyspnea
- Dizziness, confusion, hallucination
- Allergies before treatment, reaction of each medication; place allergies on chart in bright red letters; notify all people giving products • Diabetic patients, hypoglycemia may occur, then hyperglycemia with prolonged therapy

Perform/provide:

- Storage in refrigerator protected from light

Evaluate:

- Therapeutic response: resolution of AIDS-related PCP

Teach patient/family:

- To report sore throat, fever, fatigue (may indicate superinfection)
- To maintain adequate fluid intake

✳ Canada only Side effects: *italics* = common; **bold** = life-threatening 
Nurse Alert

HIGH ALERT

pentazocine (Rx)

(pen-taz'oh-seen)

Talwin, Talwin NX

Func. class.: Opiate analgesic, antagonist

Chem. class.: Synthetic benzomorphan

Controlled Substance Schedule IV

ACTION:

Inhibits ascending pain pathways in CNS, increases pain threshold, alters pain perception

USES:

Moderate to severe pain

CONTRAINDICATIONS:

Hypersensitivity to this product or sulfites; addiction (opiate)

Precautions: Pregnancy (C), breastfeeding, children <18 yr, addictive personality, increased intracranial pressure, MI (acute), severe heart disease, respiratory depression, renal/hepatic disease, seizure disorder, head trauma, bowel impaction, geriatric patients

DOSAGE AND ROUTES

Calculator

- **Adult:** IV/IM/SUBCUT 30 mg q3-4hr prn, max 360 mg/day

Labor

- **Adult:** IM 30 mg as a single dose; IV 20 mg q2-3hr when contractions are regular, max 2-3 times

Renal dose

- **Adult:** CCr 10-50 ml/min, reduce dose by 25%; CCr <10 ml/min, reduce dose by 50%

Available forms: Inj 30 mg/ml

Administer:

- With antiemetic if nausea, vomiting occur
- When pain is beginning to return; determine dosage interval by patient response

IM/SUBCUT route

- Give IM deeply into large muscle mass, rotate sites; SUBCUT may cause necrosis with repeated inj

Direct IV route

- Undiluted or diluted in 5 mg/ml of sterile water for inj; give ≤ 5 mg over 1 min

Syringe compatibilities: Atropine, benzquinamide, butorphanol, chlorproMAZINE, cimetidine, dimenhyDRINATE, diphenhydrAMINE, droperidol, fentaNYL, HYDROmorphone, hydrOXYzine, meperidine, metoclopramide, morphine, perphenazine, prochlorperazine, promazine, promethazine, ranitidine, scopolamine

Y-site compatibilities: Heparin, hydrocortisone, potassium chloride, vit B/C

SIDE EFFECTS

CNS: *Drowsiness, dizziness, confusion, headache, sedation, euphoria, hallucinations, dreaming, insomnia, lightheadedness*

CV: Palpitations, bradycardia, change in B/P, tachycardia, increased B/P (high doses), hypotension, syncope, flushing

EENT: Tinnitus, blurred vision, miosis, diplopia

GI: *Nausea, vomiting, anorexia, constipation, cramps, dry mouth*

GU: Increased urinary output, dysuria, urinary retention

HEMA: Eosinophilia, decreased WBC

INTEG: *Rash, urticaria, bruising, flushing, diaphoresis, pruritus, severe irritation at inj sites, Stevens-Johnson syndrome*

RESP: Respiratory depression

PHARMACOKINETICS

Metabolized by liver, excreted by kidneys, crosses placenta, half-life 2-3 hr, extensive first-pass metabolism with $<20\%$ entering circulation

IM/SUBCUT: Onset 15-30 min, peak 1-2 hr, duration 2-4 hr

IV: Onset 2-3 min, duration 4-6 hr

INTERACTIONS

Unpredictable reactions: MAOIs

Increase: effects—CNS depressants; alcohol, sedative/hypnotics, antipsychotics, skeletal muscle relaxants

Decrease: effects—opiates

Drug/Lab Test

Increase: amylase

NURSING CONSIDERATIONS

Assess:

- **Pain:** intensity, duration, location prior to and 1 hr after SUBCUT/IM dose or 30 min after IV dose
- I&O ratio; check for decreasing output; may indicate urinary retention
- Bowel status: constipation; may need stimulant laxatives/stool softeners
- **Withdrawal symptoms** in opiate-dependent patients
- Abscesses, ulcerations, WBC count
- CNS changes: dizziness, drowsiness, hallucinations, euphoria, LOC, pupil reaction
- Allergic reactions: rash, urticaria
- **Respiratory depression:** character, rate, rhythm; notify prescriber if respirations are <10/min
- Need for pain medication, physical dependence

Perform/provide:

- Storage in light-resistant area at room temp
- Assistance with ambulation
- Safety measures: nightlight, call bell within easy reach

Evaluate:

- Therapeutic response: decrease in pain

Teach patient/family:

- To report any symptoms of CNS changes, allergic reactions
- That physical dependency may result from extended use
- That withdrawal symptoms may occur: nausea, vomiting, cramps, fever, faintness, anorexia
- To avoid CNS depressants, alcohol
- To avoid driving, operating machinery if drowsiness occurs

- To use good oral hygiene, frequent rinsing of mouth to decrease dry mouth; to avoid gum, candy if drowsy

TREATMENT OF OVERDOSE:

Naloxone (Narcan) 0.2-0.8 mg IV, O₂, IV fluids, vasopressors

✳ Canada only Side effects: *italics* = common; **bold** = life-threatening ⚠
Nurse Alert

pentoxifylline (Rx)

(pen-tox'ih-fill-in)

Trental

Func. class.: Hemorheologic agent

Chem. class.: Dimethylxanthine derivative

ACTION:

Decreases blood viscosity, stimulates prostacyclin formation, increases blood flow by increasing flexibility of RBCs; decreases RBC hyperaggregation; reduces platelet aggregation, decreases fibrinogen concentration

USES:

Intermittent claudication related to chronic occlusive vascular disease

Unlabeled uses: Behçet's syndrome, Kawasaki disease to reduce coronary artery lesions, diabetic neuropathies, sickle cell anemia

CONTRAINDICATIONS:

Hypersensitivity to this product or xanthines, retinal/cerebral hemorrhage

Precautions: Pregnancy (C), breastfeeding, children, angina pectoris, impaired renal function, recent surgery, peptic ulceration, cardiac disease, bleeding disorders

DOSAGE AND ROUTES

Calculator

• **Adult: PO** 400 mg tid with meals, may decrease to bid if side effects occur; must be taken for ≥ 8 wk for maximal effect

Behçet's syndrome (unlabeled)

• **Adult: PO** 300 mg bid $\times$ 2 wk then 300 mg/day

Acute claudication in sickle cell disease/diabetic neuropathy (unlabeled)

• **Adult: PO** 400 mg tid

Kawasaki disease (unlabeled)

• **Child: PO** 20 mg/kg/day in 3 divided doses with aspirin and IVIG

Available forms: Cont rel tabs 400 mg; ext rel tabs 400 mg

Administer:

• Do not break, crush, or chew ext rel tabs

- With meals to prevent GI upset

SIDE EFFECTS

CNS: *Headache, anxiety, tremors, confusion, dizziness*

GI: *Dyspepsia, nausea, vomiting*

PHARMACOKINETICS

PO: Peak 2-4 hr, half-life 1/2-1 hr, degradation in liver, excreted in urine

INTERACTIONS

Increase: bleeding risk—warfarin, abciximab, eptifibatide, tirofiban, ticlopidine, clopidogrel, thrombin inhibitor

Increase: theophylline level—theophylline

Increase: hypotension—antihypertensives, nitrates

Increase: pentoxifylline—cimetidine, ciprofloxacin

NURSING CONSIDERATIONS

Assess:

- B/P, respirations of patient also taking antihypertensives; intermittent claudication at baseline and throughout
- PT, Hgb, Hct in patients at risk for hemorrhage
- Serum creatinine/BUN

Evaluate:

- Therapeutic response: decreased pain, cramping, increased ambulation

Teach patient/family:

- That therapeutic response may take 2-4 wk, 8-12 wk to reach full benefit
- To observe feet for arterial insufficiency
- To wear cotton socks, well-fitted shoes; not to go barefoot
- To watch for bleeding, bruises, petechiae, epistaxis
- To avoid smoking to prevent blood vessel constriction
- That there are many drug, herb interactions

☛ Canada only Side effects: *italics* = common; **bold** = life-threatening ⚠

Nurse Alert

perindopril (Rx)

(per-in'doe-pril)

Aceon, Coversyl 

Func. class.: Antihypertensive

Chem. class.: Angiotensin-converting enzyme inhibitor

ACTION:

Selectively suppresses the renin-angiotensin-aldosterone system; inhibits ACE; prevents the conversion of angiotensin I to angiotensin II and the dilation of arterial and venous vessels

USES:

Hypertension, stable coronary artery disease

Unlabeled uses: Heart failure

CONTRAINDICATIONS:

Hypersensitivity, history of angioedema

Black Box Warning:

Pregnancy (D)

Precautions: Breastfeeding, renal disease, hyperkalemia, hepatic failure, dehydration, bilateral renal artery stenosis, cough, angioedema, severe CHF

DOSAGE AND ROUTES

Calculator

Hypertension

- **Adult: PO** 4 mg/day, may increase or decrease to desired response, range 4-8 mg/day; may give in 2 divided doses or as single dose, max 16 mg/day

Patients on diuretics

- **Adult: PO** 2-4 mg/day in 1-2 divided doses, range 4-8 mg/day

Stable CAD

- **Adult: PO** 4 mg/day $\times$ 2 wk then increase as tolerated to 8 mg/day

Renal dose

- **Adult: PO** CCr 16-29 ml/min, 2 mg every other day; CCr 30-59 ml/min, 2 mg/day

Available forms: Tabs scored 2, 4, 8 mg

Administer:

- As single dose or in 2 divided doses, without regard to meals

SIDE EFFECTS

CNS: *Insomnia, dizziness*, paresthesias, headache, fatigue, anxiety, depression

CV: *Hypotension*, chest pain, tachycardia, dysrhythmias, syncope

EENT: *Tinnitus*; visual changes; sore throat; double vision; dry, burning eyes

GI: Nausea, vomiting, colitis, cramps, diarrhea, constipation, flatulence, dry mouth, loss of taste

GU: **Proteinuria, renal failure**, increased frequency of polyuria or oliguria

HEMA: **Agranulocytosis, neutropenia**

INTEG: Rash, purpura, alopecia, hyperhidrosis

META: Hyperkalemia

RESP: Dyspnea, *dry cough*, crackles

SYST: **Angioedema**

PHARMACOKINETICS

Bioavailability 75%; peak 1 hr parent product, 3-7 hr prodrug; protein binding 68%; metabolized by liver (active metabolite perindoprilat); half-life 0.8-10 hr; excreted in urine

INTERACTIONS

Increase: effects of neuromuscular blocking agents, antihypertensives, lithium

Increase: antihypertensive effect—diuretics, NSAIDs

Increase: hypersensitivity—allopurinol

Increase: severe hypotension—diuretics, other antihypertensives

Increase: hyperkalemia—salt substitutes, potassium-sparing diuretics, potassium supplements

Decrease: effects of NSAIDs

Decrease: antihypertensive effect—NSAIDs, salicylates

Drug/Herb

Increase: antihypertensive effect—hawthorn

Decrease: antihypertensive effect—ephedra

Drug/Lab Test

Interference: glucose/insulin tolerance tests

NURSING CONSIDERATIONS

Assess:

- **Hypertension:** B/P, pulse q4hr; note rate, rhythm, quality
- Electrolytes: K, Na, Cl during 1st 2 wk of therapy
- Baselines of renal, hepatic studies before therapy begins, 1 wk into therapy
- Skin turgor, dryness of mucous membranes for hydration status, dry mouth
- **CHF:** edema, dyspnea, wet crackles
- **Angioedema:** facial swelling, urticaria; product should be discontinued, may be more common in African Americans

Evaluate:

- Therapeutic response: decreased B/P

Teach patient/family:

- Not to use OTC (cough, cold, allergy) products unless directed by prescriber; to avoid salt substitutes • To avoid sunlight or to wear sunscreen for photosensitivity
- To comply with dosage schedule, even if feeling better
- To notify prescriber of mouth sores, sore throat, fever, swelling of hands or feet, irregular heartbeat, chest pains, signs of angioedema • That excessive perspiration, dehydration, vomiting, diarrhea may lead to fall in B/P; to consult prescriber if these occur • That product may cause dizziness, fainting; that lightheadedness may occur during 1st few days of therapy • That product may cause skin rash or impaired perspiration; that angioedema may occur and to discontinue product if it occurs • Not to discontinue product abruptly
- To rise slowly to sitting or standing position to minimize orthostatic hypotension

Black Box Warning:

To notify prescriber if pregnancy is planned or suspected; pregnancy category (D)

TREATMENT OF OVERDOSE:

Lavage, IV atropine for bradycardia, IV theophylline for bronchospasm, digoxin, O₂, diuretic for cardiac failure

☛ Canada only Side effects: *italics* = common; **bold** = life-threatening 
Nurse Alert

HIGH ALERT

PHENobarbital (Rx)

(fee-noe-bar'bi-tal)

Func. class.: Anticonvulsant

Chem. class.: Barbiturate

Controlled Substance Schedule IV

Do not confuse: **PHENobarbital**/PENTobarbital

ACTION:

Decreases impulse transmission; increases seizure threshold at cerebral cortex level

USES:

All forms of epilepsy, status epilepticus, febrile seizures in children, sedation, insomnia

Unlabeled uses: Neonatal hyperbilirubinemia, chronic cholestasis, neonatal abstinence syndrome, febrile seizures in children

CONTRAINDICATIONS:

Pregnancy (D), breastfeeding, geriatric patients, hypersensitivity to barbiturates, porphyria, hepatic/respiratory disease, nephritis, hyperthyroidism, diabetes mellitus

Precautions: Anemia, renal disease

DOSAGE AND ROUTES

Calculator

Seizures

- **Adult:** PO 1-3 mg/kg/day in divided doses bid-tid or total dose at bedtime
- **Child 5-12 yr:** PO 3-6 mg/kg/day in 1-2 divided doses
- **Child 1-5 yr:** PO 6-8 mg/kg/day in 1-2 divided doses
- **Infant:** PO 5-6 mg/kg/day in 1-2 divided doses
- **Neonate:** PO 3-4 mg/kg/day as single dose

Status epilepticus

- **Adult: IV INF** 10 mg/kg; run no faster than 50 mg/min; may give up to 30 mg/kg
- **Child: IV INF** 5-10 mg/kg; may repeat q10-15min up to 20 mg/kg; run no faster than 50 mg/min

Insomnia

- **Adult: PO/IM/SUBCUT** 100-200 mg
- **Child (unlabeled): PO/IM/SUBCUT** 3-5 mg/kg

Sedation

- **Adult: PO/IM** 30-120 mg/day in 2-3 divided doses
- **Child: PO** 6 mg/kg/day in 3 divided doses

Preoperative sedation

- **Adult: IM** 100-200 mg 1-1 1/2 hr before surgery
- **Child: PO/IM/IV** 1-3 mg/kg 1-1 1/2 hr before surgery

Available forms: Caps 15 mg; elix 20 mg/5 ml; tabs 15, 30, 32, 60, 65, 100 mg; inj 30, 60, 65, 130 mg/ml

Administer:

PO route

- Tabs may be crushed and mixed with food or fluids
- **Oral sol:** use undiluted or mixed with water or other fluids; use calibrated measuring device

IM route

- IM inj deep in large muscle mass to prevent tissue sloughing; use <5 ml at each site

IV route

- Reconstitute powder for IV with ≥ 3 ml sterile water for inj; slow IV after dilution with ≥ 10 ml sterile water for inj regardless of dose; give ≤ 50 mg/min; titrate to patient response

Y-site compatibilities: Doxapram, enalaprilat, fentaNYL, fosphenytoin, levofloxacin, linezolid, meropenem, methadone, morphine, propofol, SUFentanil

SIDE EFFECTS

CNS: Paradoxical excitement (geriatric patients), drowsiness, lethargy, hangover headache, flushing, hallucinations, **coma**

GI: Nausea, vomiting, diarrhea, constipation

HEMA: Agranulocytosis, megaloblastic anemia, thrombocytopenia, thrombophlebitis

INTEG: Rash, urticaria, Stevens-Johnson syndrome, angioedema, local pain, swelling, necrosis, scaling eczema

PHARMACOKINETICS

Metabolized by liver; crosses placenta; excreted in urine, breast milk; half-life 53-118 hr

PO: Onset 20-60 min, duration 6-10 hr

IM/SUBCUT: Onset 10-30 min, duration 4-6 hr

IV: Onset 5 min, peak 30 min, duration 4-6 hr

INTERACTIONS

Increase: effects—CNS depressants, alcohol, chloramphenicol, valproic acid, disulfiram, nondepolarizing skeletal muscle relaxants, sulfonamides, MAOIs

Increase: orthostatic hypotension—furosemide

Decrease: effects—theophylline, oral anticoagulants, corticosteroids, metroNIDAZOLE, doxycycline, quiNIDine, estrogens, hormonal contraceptives

Drug/Herb

Increase: CNS depression—chamomile, eucalyptus, hops, kava, valerian

Decrease: barbiturate effect—St. John's wort

NURSING CONSIDERATIONS

Assess:

- Mental status: mood, sensorium, affect, memory (long, short)
- **Blood dyscrasias:** fever, sore throat, bruising, rash, jaundice • **Seizures:** type, duration, precipitating factors
- Blood studies, LFTs during long-term treatment
- Therapeutic blood level periodically: 15-40 mcg/ml
- Respiratory status: rate, rhythm, depth, respiratory depression; have emergency equipment nearby • **Dependence:** physical or psychological, monitor amount given to patient; if patient suicidal, may save medication for attempt • **Pain:** use pain scale if product used for pain; product may increase pain level

Perform/provide:

- Supervision of ambulation because dizziness, drowsiness may occur

Evaluate:

- Therapeutic response: decreased seizures, increased sedation, adequate sleep

Teach patient/family:

- To use exactly as ordered
 - To avoid alcohol, other CNS depressants
 - To avoid hazardous activities until patient stabilized on product because drowsiness may occur
 - Never to withdraw product abruptly because withdrawal symptoms may occur
 - That therapeutic effects (PO) may not be seen for 2-3 wk
 - To use additional nonhormonal contraception during treatment; to notify prescriber if pregnancy (D) is planned or suspected
-

🍁 Canada only Side effects: *italics* = common; **bold** = life-threatening ⚠️
Nurse Alert

phentolamine (Rx)

(fen-tole'a-meen)

Func. class.: Antihypertensive

Chem. class.: α -Adrenergic blocker

Do not confuse: **phentolamine**/phentermine

ACTION:

α -Adrenergic blocker, binds to α -adrenergic receptors, dilating peripheral blood vessels, lowering peripheral resistances, lowering blood pressure

USES:

Hypertension; pheochromocytoma; prevention/treatment of dermal necrosis following extravasation of norepinephrine, DOPamine, EPINEPHrine

Unlabeled uses: Impotence, hypertensive crisis due to MAOIs, sympathomimetic amines, heart failure

CONTRAINDICATIONS:

Hypersensitivity, MI, coronary insufficiency, angina

Precautions: Pregnancy (C), breastfeeding, dysrhythmia

DOSAGE AND ROUTES

Calculator

Treatment of hypertensive episodes in pheochromocytoma

- **Adult:** IM/IV 5 mg, repeat if necessary
- **Child:** IV 0.05-0.1 mg/kg/dose, repeat if necessary; max 5 mg

Diagnosis of pheochromocytoma

- **Adult:** IV 2.5 mg; if negative, repeat with 5 mg IV
- **Child:** IV 0.05 mg/kg; if negative, repeat with 0.1 mg/kg IV

Treatment of necrosis

- **Adult:** 5-10 mg/10 ml NS injected into area of norepinephrine extravasation within 12 hr
- **Child:** 0.1-0.2 mg/kg, max 5 mg

Prevention of necrosis

- **Adult:** 10 mg/L of norepinephrine-containing sol

- **Child:** IV 0.1-0.2 mg/kg, max 5 mg

Left ventricular heart failure (unlabeled)

- **Adult:** IV 0.17-0.4 mg/min

Erectile dysfunction (unlabeled)

- **Adult:** PO 40-80 mg

Hypertensive emergency due to MAOIs, sympathomimetic amines (unlabeled)

- **Adult:** IV BOL 5-15 mg

Available forms: Inj 5 mg/ml

Administer:

- Gum, frequent rinsing of mouth, or hard candy for dry mouth
- With vasopressor available
- After discontinuing all medication for 24 hr
- Treatment during required bed rest, 1 hr after

IV route

- After diluting 5 mg/1 ml sterile H₂O for inj; give 5 mg or less/min; patient to remain recumbent during administration

Continuous IV INF route

- Dilute 5-10 mg/500 ml D₅W, titrate to patient response
- 10 mg/L may be added to norepinephrine in IV sol for prevention of dermal necrosis

Additive compatibilities: DOBUTamine, verapamil

Syringe compatibilities: Papaverine

Y-site compatibilities: Amiodarone

SIDE EFFECTS

CNS: *Dizziness*, flushing, weakness, **cerebrovascular spasm**

CV: *Hypotension, tachycardia, angina, dysrhythmias*, **MI**

EENT: Nasal congestion

GI: *Dry mouth, nausea, vomiting, diarrhea, abdominal pain*

PHARMACOKINETICS

Metabolized in liver, excreted in urine

IM: Peak 15-20 min, duration 3-4 hr

IV: Peak 2 min, duration 10-15 min

INTERACTIONS

Increase: effects of EPINEPHrine, antihypertensives

Drug/Herb

Increase: toxicity, death—aconite

Increase: antihypertensive effect—barberry, betony, black catechu, black cohosh, bloodroot, broom, burdock, cat's claw, dandelion, goldenseal, hawthorn, Irish moss, Jamaican dogwood, kelp, khella, mistletoe, parsley

Increase or decrease: antihypertensive effect—astragalus, cola tree

Decrease: antihypertensive effect—coltsfoot, guarana, khat, licorice, yohimbe

NURSING CONSIDERATIONS

Assess:

- Weight daily, I&O
- B/P lying, standing before starting treatment, q4hr after
- Nausea, vomiting, diarrhea, edema in feet, legs daily; skin turgor, dryness of mucous membranes for hydration status, postural hypotension, cardiac system: pulse, ECG

Evaluate:

- Therapeutic response: decreased B/P

Teach patient/family:

- That bed rest is required during treatment, 1 hr after

TREATMENT OF OVERDOSE:

Administer norepinephrine; discontinue product

☼ Canada only Side effects: *italics* = common; **bold** = life-threatening ⚠
Nurse Alert

phenylephrine (Rx)

(fen-ill-ef'rin)

Neo-Synephrine

Func. class.: Adrenergic, directacting

Chem. class.: Substituted phenylethylamine

ACTION:

Powerful and selective (α_1) receptor agonist that causes the contraction of blood vessels

USES:

Hypotension, paroxysmal supraventricular tachycardia, shock; maintain B/P for spinal anesthesia

CONTRAINDICATIONS:

Hypersensitivity, ventricular fibrillation, tachydysrhythmias, pheochromocytoma, closed-angle glaucoma, severe hypertension

Precautions: Pregnancy (C), breastfeeding, geriatric patients, arterial embolism, peripheral vascular disease, hyperthyroidism, bradycardia, myocardial disease, severe arteriosclerosis, partial heart block

Black Box Warning:

Cardiac disease, extravasation

DOSAGE AND ROUTES

Calculator

Hypotension

- **Adult:** SUBCUT/IM 2-5 mg; may repeat q10-15min if needed; do not exceed initial dose; IV 0.1-0.5 mg; may repeat q10-15min if needed; do not exceed initial dose

- **Child:** IM/SUBCUT 0.1 mg/kg/dose q1-2hr prn

Supraventricular tachycardia

- **Adult:** IV BOL max 0.5 mg; max single dose 1 mg

Shock

- **Adult:** IV INF 10 mg/500 ml D₅W given 100-180 mcg/min (if 20 gtt/ml inf device) then maintenance of 40-60 mcg/min; use inf device

• **Child: IV BOL** 5-20 mcg/kg/dose q10-15min; **IV INF** 0.1-0.5 mcg/kg/min

Available forms: Inj 1% (10 mg/ml)

Administer:

IV route

- Plasma expanders for hypovolemia
- IV after diluting 1 mg/9 ml sterile water for inj; give dose over 1/2-1 min; may be diluted 10 mg/500 ml of D₅W or NS; titrate to response (normal B/P); check for extravasation, check site for infiltration, use inf pump

Additive compatibilities: Chloramphenicol, DOBUTamine, lidocaine, potassium chloride, sodium bicarbonate

Y-site compatibilities: Amiodarone, amrinone, cisatracurium, famotidine, haloperidol, remifentanyl, zidovudine

SIDE EFFECTS

CNS: Headache, anxiety, tremor, insomnia, dizziness

CV: Palpitations, tachycardia, hypertension, ectopic beats, angina, reflex bradycardia, **dysrhythmias**

GI: Nausea, vomiting

INTEG: Necrosis, tissue sloughing with extravasation, **gangrene**

SYST: **Anaphylaxis**

PHARMACOKINETICS

IM/SUBCUT: Onset 10-15 min, duration 45-60 min

IV: Onset immediate, duration 20-30 min

INTERACTIONS

• Dysrhythmias: general anesthetics, digoxin

⚠ Do not use within 2 wk of MAOIs because hypertensive crisis may result

Increase: in B/P—oxytocics

Increase: pressor effect—tricyclics, β -blockers, H₁ antihistamines

Decrease: phenylephrine action— α -blockers

NURSING CONSIDERATIONS

Assess:

• I&O ratio; notify prescriber if output <30 ml/hr

- ECG during administration continuously; if B/P increases, product is decreased
- B/P and pulse q5min after parenteral route
- CVP or PWP during inf if possible
- Paresthesias and coldness of extremities; peripheral blood flow may decrease

Perform/provide:

- Storage of reconstituted sol if refrigerated for ≤ 24 hr
- Discard discolored sol

Evaluate:

- Therapeutic response: increased B/P with stabilization

Teach patient/family:

- About the reason for administration
- To report pain at inf site or other adverse reactions immediately

TREATMENT OF OVERDOSE:

Administer α -blocker

🍁 Canada only Side effects: *italics* = common; **bold** = life-threatening ⚠️

Nurse Alert

phenylephrine nasal agent

See [Appendix B](#)

phenylephrine ophthalmic

See [Appendix B](#)

phenytoin (Rx)

(fen'i-toh-in)

Dilantin, Dilantin Infatabs, Phenytek

Func. class.: Anticonvulsant; antidysrhythmic (IB)

Chem. class.: Hydantoin

ACTION:

Inhibits spread of seizure activity in motor cortex by altering ion transport; increases AV conduction

USES:

Generalized tonic-clonic seizures; status epilepticus; nonepileptic seizures associated with Reye's syndrome or after head trauma; Bell's palsy, complex partial seizures

Unlabeled uses: Migraines, diabetic neuropathy, neuropathic pain, paroxysmal atrial tachycardia, ventricular tachycardia

CONTRAINDICATIONS:

Pregnancy (D), hypersensitivity, psychiatric condition, bradycardia, SA and AV block, Stokes-Adams syndrome, hepatic failure, acute intermittent porphyria

Precautions: Geriatric patients, allergies, renal/hepatic disease, petit mal seizures, hypotension, myocardial insufficiency, Asian patients positive for HLA-B1502

Black Box Warning:

IV use

DOSAGE AND ROUTES

Calculator

Seizures

- **Adult: PO** 15-20 mg/kg (ext rel) in 3-4 divided doses given q2hr or 400 mg then 300 mg q2hr × 2 doses; maintenance 4-7 mg/kg/day; **IV** 15-20 mg/kg, max 25-50 mg/min, then 100 mg q6-8hr
- **Child: PO** 5 mg/kg/day in 2-3 divided doses, maintenance 4-8 mg/kg/day in 2-3 divided doses, max 300 mg/day; **IV** 15-20 mg/kg at 1-3 mg/kg/min

Status epilepticus

- **Adult: IV** 10-15 mg/kg, max 25-50 mg/min, may give 100 mg q6-8hr thereafter
- **Child: IV** 15-20 mg/kg, max in divided doses 1-3 mg/kg/min

Ventricular dysrhythmias

- **Adult: PO** Loading dose 1 g divided over 24 hr then 500 mg/day × 2 days; **IV** 250 mg over 5 min until dysrhythmias subside or until 1 g is given or 100 mg q15min until dysrhythmias subside or until 1 g is given
- **Child: PO** 3-8 mg/kg or 250 mg/m²/day as single dose or 2 divided doses; **IV** 3-8 mg/kg over several min or 250 mg/m²/day as single dose or 2 divided doses

Renal/hepatic dose

- Do not use loading dose if CCr <10 ml/min or hepatic failure

Neuropathic pain/diabetic neuropathy (unlabeled)

- **Adult: PO** 300 mg/day in divided doses

Migraine prophylaxis (unlabeled)

- **Adult: PO** 200-400 mg/day

Available forms: Susp 25 mg/5 ml; chewable tabs 50 mg; inj 50 mg/ml; ext rel caps 100, 200, 300 mg; prompt rel caps 100 mg

Administer:

PO route

- Do not interchange chewable product with caps, not equivalent; only ext rel caps to be used for once-a-day dosing • **Oral susp:** shake well before each dose given via G tube/NG tube; dilute susp prior to administration; flush tube with 20 ml water after dose, hold tube feedings 1 hr before and 1 hr after dose • Allow 7-10 days between dosage changes

- Divided PO doses with or after meals to decrease adverse effects
- 2 hr before or after antacid, enteral feeding

Direct IV route

Black Box Warning:

Give undiluted at ≤ 50 mg/min (adult) 1-3 mg/kg/min (neonates), monitor for CV reactions

Intermittent IV INF route

Black Box Warning:

Dilute dose in NS to ≤ 6.7 mg/ml, complete inf within 1 hr of preparation, use 0.22 or 0.45 micron in-line particulate final filter between IV catheter and tubing, flush IV line or catheter with NS before and after use, give at ≤ 50 mg/min (adult), 0.5-1 mg/kg/min (child, infant, neonate)

Additive compatibilities: Do not admix

Y-site compatibilities: CISplatin, foscarnet, temocillin

SIDE EFFECTS

CNS: Drowsiness, dizziness, insomnia, paresthesias, depression, **suicidal tendencies**, aggression, headache, confusion, slurred speech, peripheral neuropathy

CV: Hypotension, **ventricular fibrillation**

EENT: Nystagmus, diplopia, blurred vision

ENDO: Diabetes insipidus

GI: Nausea, vomiting, constipation, anorexia, weight loss, **hepatitis**, jaundice, gingival hyperplasia

GU: **Nephritis**, urine discoloration

HEMA: **Agranulocytosis**, leukopenia, aplastic anemia, thrombocytopenia, megaloblastic anemia

INTEG: Rash, **lupus erythematosus**, **Stevens-Johnson syndrome**, hirsutism, **toxic epidermal necrolysis**

SYST: Hypocalcemia, **purple glove syndrome (IV)**, **DRESS**, anaphylaxis

PHARMACOKINETICS

Metabolized by liver, excreted by kidneys, protein binding 90%-95%, half-life 7-42 hr, dose dependent

PO: Onset 2-24 hr, peak 11/2-21/2 hr, duration 6-12 hr

PO-ER: Onset 2-24 hr, peak 4-12 hr, duration 12-36 hr

IV: Onset 1-2 hr, duration 12-24 hr

INTERACTIONS

- Do not use with delavirdine, decreased response, resistance

Increase: phenytoin effect—benzodiazepines, cimetidine, tricyclics, salicylates, valproate, cycloSERINE, diazepam, chloramphenicol, disulfiram, alcohol, amiodarone, sulfonamides, FLUoxetine, gabapentin, H₂ antagonists, azole antifungals, estrogens, succinamides, phenothiazines, methylphenidate, felbamate, trazodone

Decrease: phenytoin effects—alcohol (chronic use), antacids, barbiturates, carbamazepine, rifampin, calcium (high dose), folic acid

Drug/Food

Enteral tube feeding: may decrease absorption of oral product; do not use enteral feedings 2 hr before or 2 hr after dose

Drug/Lab Test

Increase: glucose, alk phos, GGT

Decrease: dexamethasone, metyrapone test serum, PBI, urinary steroids

NURSING CONSIDERATIONS

Assess:

⚠ **Phenytoin hypersensitivity syndrome** 3-12 wk after start of treatment: rash, temp, lymphadenopathy; may cause hepatotoxicity, renal failure, rhabdomyolysis

⚠ **Serious skin disorders:** for beginning rash that may lead to Stevens-Johnson syndrome or toxic epidermal necrolysis; phenytoin should not be used again; may occur more often among Asian patients with HLA-B 1502

⚠ **Purple glove syndrome** with IV use

- Phenytoin level: toxic level 30-50 mcg/ml, therapeutic level: 7.5-20 mcg/ml; wait ≥1 wk to draw levels
- **Seizures:** duration, type, intensity, precipitating factors; obtain EEG periodically, monitor therapeutic level
- **Blood studies:** CBC, platelets q2wk until stabilized, then monthly × 12, then q3mo; discontinue product if neutrophils <1600/mm³; renal function: albumin conc; folic acid levels, LFTs
- ⚠ **Mental status:** mood, sensorium, affect, memory (long, short), suicidal thoughts/behaviors
- **Respiratory depression:** rate, depth, character
- **Blood dyscrasias:** fever, sore throat, bruising, rash, jaundice

Evaluate:

- Therapeutic response; decrease in severity of seizures, ventricular dysrhythmias

Teach patient/family:

- That, if diabetic, blood glucose should be monitored
- That urine may turn pink
- **Not to discontinue product abruptly because seizures may occur**
- **Oral hygiene:** about the proper brushing of teeth using a soft toothbrush, flossing to prevent gingival hyperplasia; about the need to see dentist frequently
- To avoid hazardous activities until stabilized on product
- To carry emergency ID stating product use
- That heavy use of alcohol may diminish effect of product; to avoid OTC medications
- Not to change brands or forms once stabilized on therapy because brands may vary
- Not to use antacids within 2 hr of product
- **To use nonhormonal contraception; to notify prescriber if pregnancy is planned or suspected, pregnancy (D)**
- **To notify prescriber of unusual bleeding, bruising, petechiae (bleeding), clay-colored stools, abdominal pain, dark urine, yellowing of skin or eyes (hepatotoxicity); slurred speech, headache, drowsiness**

☼ Canada only Side effects: *italics* = common; **bold** = life-threatening ⚠
Nurse Alert

phosphate/biphosphate (OTC)

Fleet Enema, Phospho-Soda

Func. class.: Laxative, saline

ACTION:

Increases water absorption in the small intestine by osmotic action; laxative effect occurs by increased peristalsis and water retention

USES:

Constipation, bowel or rectal preparation for surgery, exam

CONTRAINDICATIONS:

Hypersensitivity, rectal fissures, abdominal pain, nausea, vomiting, appendicitis, acute surgical abdomen, ulcerated hemorrhoids, sodium-restricted diet, renal failure, hyperphosphatemia, hypocalcemia, hypokalemia, hypernatremia, Addison's disease, CHF, ascites, bowel perforation, megacolon, imperforate anus

Black Box Warning:

GI obstruction, renal failure

Precautions: Pregnancy (C)

Black Box Warning:

Colitis, geriatric hypovolemia, renal disease

DOSAGE AND ROUTES

Calculator

- **Adult: PO** 20-30 ml (Phospho-Soda)
- **Child: PO** 5-15 ml (Phospho-Soda)
- **Adult and child >12 yr: RECT** 1 enema (118 ml)
- **Child 2-12 yr: RECT** 1/2 enema (59 ml)

Available forms: Enema 7 g phosphate/19 g biphosphate/118 ml; oral sol 18 g phosphate/48 g biphosphate/100 ml

Administer:

- Alone for better absorption; do not take within 1-2 hr of other products

SIDE EFFECTS

CV: Dysrhythmias, cardiac arrest, hypotension, widening QRS complex

GI: *Nausea, cramps*, diarrhea

META: Electrolyte, fluid imbalances

PHARMACOKINETICS

Onset 30 min-3 hr, excreted in feces

NURSING CONSIDERATIONS

Assess:

• **Stools:** color, amount, consistency; bowel pattern, bowel sounds, flatulence, distention, fever, dietary patterns, exercise; cramping, rectal bleeding, nausea, vomiting; if these occur, product should be discontinued • Blood, urine electrolytes if product used often

Evaluate:

• Therapeutic response: decrease in constipation

Teach patient/family:

• Not to use laxatives for long-term therapy because bowel tone will be lost
• That normal bowel movements do not always occur daily
• Not to use in presence of abdominal pain, nausea, vomiting
• To notify prescriber if constipation unrelieved or if symptoms of electrolyte imbalance occur: muscle cramps, pain, weakness, dizziness, excessive thirst • To maintain fluid consumption

🍁 Canada only Side effects: *italics* = common; **bold** = life-threatening ⚠️

Nurse Alert

physostigmine ophthalmic

See [Appendix B](#)

phytonadione (Rx)

(fye-toe-na-dye'one)

Mephyton, Vit K

Func. class.: Vit K₁, fat-soluble vitamin

ACTION:

Needed for adequate blood clotting (factors II, VII, IX, X)

USES:

Vit K malabsorption, hypoprothrombinemia, prevention of hypoprothrombinemia caused by oral anticoagulants, prevention of hemorrhagic disease of the newborn

CONTRAINDICATIONS:

Hypersensitivity, severe hepatic disease, last few weeks of pregnancy

Precautions: Pregnancy (C), neonates, hepatic disease

Black Box Warning:

IV use

DOSAGE AND ROUTES

Calculator

Hypoprothrombinemia caused by vit K malabsorption

- **Adult: PO/IM** 2.5-25 mg, may repeat or increase to 50 mg
- **Child: PO** 2.5-5 mg
- **Infant: PO/IM** 2 mg

Prevention of hemorrhagic disease of the newborn

- **Neonate: IM** 0.5-1 mg within 1 hr after birth, repeat after 2-3 wk if required

Hypoprothrombinemia caused by oral anticoagulants

- **Adult and child: PO/SUBCUT/IM** 1-10 mg, may repeat 12-48 hr after **PO** dose or 6-8 hr after **SUBCUT/IM** dose based on INR

Available forms: Tabs 5 mg; inj 10 mg/ml, 1 mg/0.5 ml

Administer:

Intermittent IV INF route

- After diluting with ≥ 10 ml D₅NS; give max 1 mg/min

⚠ IV only when other routes not possible (deaths have occurred)

Y-site compatibilities: Alfentanil, amikacin, aminophylline, ascorbic acid, atracurium, atropine, azaTHIOprine, aztreonam, bumetanide, buprenorphine, butorphanol, calcium chloride/gluconate, ceFAZolin, cefonicid, cefoperazone, cefotaxime, cefoTEtan, cefOXitin, cefTAZidime, ceftizoxime, cefTRIAxone, cefuroxime, chloramphenicol, chlorproMAZINE, cimetidine, clindamycin, cyanocobalamin, cycloSPORINE, dexamethasone, digoxin, diphenhydrAMINE, DOPamine, doxycycline, enalaprilat, ePHEDrine, EPINEPHrine, epoetin alfa, erythromycin, esmolol, famotidine, fentaNYL, fluconazole, folic acid, furosemide, ganciclovir, gentamicin, glycopyrrolate, heparin, hydrocortisone, imipenem/cilastatin, indomethacin, insulin, isoproterenol, ketorolac, labetalol, lidocaine, mannitol, meperidine, metaraminol, methoxamine, methyl dopate, metoclopramide, metoprolol, metroNIDAZOLE, midazolam, morphine, multivitamins, nafcillin, nalbuphine, naloxone, nitroglycerin, nitroprusside, norepinephrine, ondansetron, oxacillin, oxytocin, papaverine, penicillin G potassium, pentamidine, pentazocine, PENTobarbital, PHENobarbital, phentolamine, phenylephrine, potassium chloride, procainamide, prochlorperazine, propranolol, pyridoxime, ranitidine, sodium bicarbonate, succinylcholine, SUFentanil, theophylline, thiamine, ticarcillin/clavulanate, tobramycin, tolazoline, trimetaphan, urokinase, vancomycin, vasopressin, verapamil, vitamin B with C

SIDE EFFECTS

CNS: Headache, **brain damage** (large doses)

GI: Nausea, decreased LFTs

HEMA: **Hemolytic anemia, hemoglobinuria, hyperbilirubinemia**

INTEG: Rash, urticaria

RESP: **Bronchospasm**, dyspnea, feeling of chest constriction, **respiratory arrest**

PHARMACOKINETICS

PO/INJ: Metabolized, crosses placenta

INTERACTIONS

Decrease: action of phytonadione—bile acid sequestrants, sucralfate, antiinfectives, salicylates, mineral oil

Decrease: action of warfarin—large dose of product

NURSING CONSIDERATIONS

Assess:

- **Bleeding:** emesis, stools, urine; pressure on all venipuncture sites; avoid all inj if possible
- PT during treatment (2-sec deviation from control time, bleeding time, clotting time); monitor for bleeding, pulse, and B/P

Perform/provide:

- Storage in tight, light-resistant container

Evaluate:

- Therapeutic response: prevention of hemorrhagic disease of the newborn, resolution of hypoprothrombinemia

Teach patient/family:

- Not to take other supplements, OTC products, prescription products unless directed by prescriber
- About the necessary foods for associated diet
- To avoid IM inj; to use soft toothbrush; not to floss, use electric razor until coagulation defect corrected
- To report symptoms of bleeding
- About the importance of frequent lab tests to monitor coagulation factors
- To notify all health care providers of use of this product
- To carry emergency ID describing condition and products used

🌿 Canada only Side effects: *italics* = common; **bold** = life-threatening ⚠️
Nurse Alert

pilocarpine ophthalmic

See [Appendix B](#)

pimecrolimus topical

See [Appendix B](#)

pioglitazone (Rx)

(pie-oh-glye'ta-zone)

[Actos](#)

Func. class.: Antidiabetic, oral

Chem. class.: Thiazolidinedione

ACTION:

Specifically targets insulin resistance; an insulin sensitizer; regulates the transcription of a number of insulin-responsive genes

USES:

Type 2 diabetes mellitus

CONTRAINDICATIONS:

Breastfeeding, children, hypersensitivity to thiazolidinedione, diabetic ketoacidosis

Black Box Warning:

NYHA Class III/IV heart failure

Precautions: Pregnancy (C), geriatric patients, geriatric patients with CV disease, renal/hepatic/thyroid disease, edema, polycystic ovary syndrome, bladder cancer, osteoporosis, pulmonary disease, secondary malignancy

DOSAGE AND ROUTES

Calculator

Monotherapy

- **Adult: PO** 15 or 30 mg/day, may increase to 45 mg/day; with strong CYP2C8, max 15 mg/day; with NYHA class I/II heart failure, max 15 mg/day

Combination therapy

- **Adult: PO** 15 or 30 mg/day with a sulfonylurea, metformin, or insulin; decrease sulfonylurea dose if hypoglycemia occurs; decrease insulin dose by 10%-25% if hypoglycemia occurs or if plasma glucose is <100 mg/dl, max 45 mg/day

Hepatic dose

- Do not use in active hepatic disease or if ALT >2.5 times ULN

Available forms: Tabs 15, 30, 45 mg

Administer:

- Once a day; without regard to meals
- Tabs crushed and mixed with food or fluids for patients with difficulty swallowing

SIDE EFFECTS

CNS: *Headache*

CV: MI, heart failure, death (geriatric patients)

ENDO: Hypo/hyperglycemia

MISC: Sinusitis, upper respiratory tract infection, pharyngitis, hepatotoxicity, edema, weight gain, anemia, macular edema; risk of bladder cancer (use >1 yr)

MS: Rhabdomyolysis, fractures (females), myalgia

PHARMACOKINETICS

Maximal reduction in FBS after 12 wk; half-life 3-7 hr, terminal 16-24 hr; protein binding >99%

INTERACTIONS

Decrease: effect of atorvastatin

Decrease: effect of oral contraceptives; use alternative contraceptive method

Decrease: pioglitazone effect—CYP2C8 inducers (ketoconazole, fluconazole, itraconazole, miconazole, voriconazole)

Drug/Herb

Increase: hypoglycemia—garlic, green tea, horse chestnut

Drug/Lab Test

Increase: CPK, LFTs, HDL, cholesterol

Decrease: glucose, Hct/Hgb

NURSING CONSIDERATIONS

Assess:

Black Box Warning:

Heart failure: do not use in NYHA Class III/IV; excessive/rapid weight gain >5 lb, dyspnea, edema; may need to be reduced or discontinued

- **Bladder cancer:** avoid use in a history of bladder cancer; use of pioglitazone >1 yr has shown an increase in bladder cancer
- **Hypoglycemic reactions:** sweating, weakness, dizziness, anxiety, tremors, hunger; hyperglycemic reactions soon after meals (rare); may occur more often with insulin or other antidiabetics
- **Hepatic disease:** check LFTs periodically: AST, LDH; do not start treatment in active heart disease or if ALT >2.5× upper limit of normal; if treatment has already begun, follow closely with continuing ALT levels; if ALT increases to >3× upper limit of normal, recheck ALT as soon as possible; if ALT remains >3× upper limit of normal, discontinue
- **FBS, glycosylated HbA1c, plasma lipids/lipoproteins, B/P, body weight during treatment**
- CBC with differential prior to and during therapy; more necessary in those with anemia, Hct/Hgb (may be decreased in first few months of treatment)

Perform/provide:

- Conversion from other oral hypoglycemic agents; change may be made with gradual dosage change; monitor serum glucose during conversion
- Storage in tight container in cool environment

Evaluate:

- Therapeutic response: decrease in polyuria, polydipsia, polyphagia; clear sensorium; absence of dizziness; stable gait; blood glucose A1c improvement

Teach patient/family:

- To self-monitor using a blood glucose meter
- About the symptoms of hypo/hyperglycemia, what to do about each
- That product must be continued on daily basis; about the consequences of discontinuing product abruptly
- To avoid OTC medications or herbal preparations unless approved by prescriber
- That diabetes is a lifelong illness; that product is not a cure, it only controls symptoms
- To notify prescriber if oral contraceptives are used, effect may be decreased; not to use product if breastfeeding
- **To report symptoms of hepatic dysfunction: nausea, vomiting, abdominal pain, fatigue, anorexia, dark urine, jaundice**

- To report weight gain, edema
- That lab work, eye exams will be needed periodically

🍁 Canada only Side effects: *italics* = common; **bold** = life-threatening ⚠️
Nurse Alert

piperacillin/tazobactam (Rx)

(pip'er-ah-sill'in/ta-zoe-bak'tam)

Zosyn

Func. class.: Antiinfective, broad spectrum

Chem. class.: Extended-spectrum penicillin, β -lactamase inhibitor

ACTION:

Interferes with cell-wall replication of susceptible organisms; osmotically unstable cell wall swells and bursts from osmotic pressure; tazobactam is a β -lactamase inhibitor that protects piperacillin from enzymatic degradation

USES:

Moderate to severe infections: piperacillin-resistant, β -lactamase-producing strains causing infections in respiratory, skin, urinary tract, bone, gonorrhea, pneumonia; effective for resistant *Staphylococcus aureus*, resistant *Escherichia coli*, *Bacteroides fragilis*, *Bacteroides ovatus*, *Bacteroides thetaiotaomicron*, *Bacteroides vulgatus*, *Haemophilus influenzae*

CONTRAINDICATIONS:

Hypersensitivity to penicillins; neonates; carbapenem allergy

Precautions: Pregnancy (B), breastfeeding, renal insufficiency in children, hypersensitivity to cephalosporins, CHF, seizures, GI disease, electrolyte imbalances

DOSAGE AND ROUTES

Calculator

Nosocomial pneumonia

- **Adult:** IV 4.5 g q6hr or 3.375 g q4hr with an aminoglycoside or antipseudomonal fluoroquinolone $\times$ 1-2 wk; continue aminoglycoside only if *Pseudomonas aeruginosa* is isolated

Other infections

- **Adult:** IV INF 6-12 g/day given 2.25 g q8hr to 3.375 g q6hr over 30 min $\times$ 7-10 days

Appendicitis/peritonitis

- **Child ≥ 40 kg (88 lb): IV 3.375 g q6hr $\times$ 7-10 days**
- **Child ≥ 9 mo and < 40 kg: IV 100 mg/kg (piperacillin)/kg q8hr $\times$ 7-10 days**
- **Infant 2 mo to < 9 mo: IV 80 mg (piperacillin) q8hr $\times$ 7-10 days**

Renal dose

- **Adult: IV CCr 20-40 ml/min, give 3.375 g q6hr (nosocomial pneumonia); give 2.25 g q6hr (all other indications); CCr < 20 ml/min, give 2.25 g q6hr (nosocomial pneumonia), give 2.25 g q8hr (all other indications)**

Available forms: Powder for inj 2 g piperacillin/0.25 g tazobactam, 3 g piperacillin/0.375 g tazobactam, 4 g piperacillin/0.5 g tazobactam, 36 g piperacillin/4.5 g tazobactam

Administer:

- **Separate aminoglycoside from piperacillin to avoid inactivation**
- Product after C&S is complete

Intermittent IV INF route

- Reconstitute each 1 g of product/5 ml 0.9% NaCl for inj or sterile water for inj, dextrose 5%; shake well; further dilute in ≥ 50 ml compatible IV sol, run as int inf over ≥ 30 min

Y-site compatibilities: Alfentanil, allopurinol, amifostine, amikacin, aminocaproic acid, aminophylline, amphotericin B lipid complex, amphotericin B liposome, anidulafungin, atenolol, aztreonam, bivalirudin, bleomycin, bumetanide, buprenorphine, busulfan, butorphanol, calcium acetate/chloride/gluconate, CARBOplatin, carmustine, cefepime, chloramphenicol, cimetidine, clindamycin, cyclophosphamide, cycloSPORINE, cytarabine, DACTINomycin, DAPTOmycin, dexamethasone, dexrazoxane, diazepam, digoxin, diphenhydrAMINE, DOCEtaxel, DOPamine, doxacurium, enalaprilat, ePHEDrine, EPINEPHrine, eptifibatide, erythromycin, esmolol, etoposide, fenoldopam, fentaNYL, floxuridine, fluconazole, fludarabine, fluorouracil, foscarnet, fosphenytoin, furosemide, gallium, granisetron, heparin, hydrocortisone, HYDROmorphone, ifosfamide, isoproterenol, ketorolac, lansoprazole, leucovorin, lidocaine, linezolid, LORazepam, magnesium sulfate, mannitol, mechlorethamine, melphalan, meperidine, mesna, metaraminol, methotrexate, methylPREDNISolone, metoclopramide, metoprolol, metroNIDAZOLE, milrinone, morphine, naloxone, nitroglycerin, nitroprusside, norepinephrine, octreotide, ondansetron, oxytocin, PACLitaxel, palonosetron,

pamidronate, pancuronium, pantoprazole, PEMEtrexed, PENTobarbital, PHENobarbital, phenylephrine, plicamycin, potassium chloride/phosphates, procainamide, ranitidine, remifentanyl, ritUXimab, sargramostim, sodium acetate/bicarbonate/phosphates, succinylcholine, SUFentanyl, sulfamethoxazole-trimethoprim, tacrolimus, teniposide, theophylline, thiotepa, tigecycline, tirofiban, trimethobenzamide, vasopressin, vinBLAStine, vinCRISTine, voriconazole, zidovudine, zoledronic acid

SIDE EFFECTS

CNS: Lethargy, hallucinations, anxiety, depression, twitching, insomnia, headache, fever, dizziness, **seizures**, vertigo

CV: **Cardiac toxicity**

GI: *Nausea, vomiting, diarrhea*; increased AST, ALT; abdominal pain, glossitis, **pseudomembranous colitis**, constipation

GU: **Oliguria, proteinuria, hematuria, vaginitis, moniliasis, glomerulonephritis, renal failure**

HEMA: Anemia, increased bleeding time, **bone marrow depression, agranulocytosis, hemolytic anemia**

INTEG: Rash, pruritus, **exfoliative dermatitis**

META: Hypokalemia, hypernatremia

SYST: **Serum sickness, anaphylaxis, Stevens-Johnson syndrome**

PHARMACOKINETICS

Half-life 0.7-1.2 hr; excreted in urine, bile, breast milk; crosses placenta; 33% bound to plasma proteins

IV: Peak completion of IV

INTERACTIONS

Increase: effect of neuromuscular blockers, oral anticoagulants, methotrexate

Increase: piperacillin concentrations—**aspirin, probenecid**

Decrease: antimicrobial effect of piperacillin—**tetracyclines, aminoglycosides**
IV

Drug/Lab Test

Increase: platelet count, eosinophilia, neutropenia, leukopenia, serum creatinine, PTT, AST, ALT, alk phos, bilirubin, BUN, electrolytes

Decrease: Hct, Hgb, electrolytes

False positive: urine glucose, urine protein, Coombs' test

NURSING CONSIDERATIONS

Assess:

- **Infection:** temp, stools, urine, sputum, wounds
- I&O ratio; report hematuria, oliguria because penicillin in high doses is nephrotoxic; maintain hydration unless contraindicated • Hepatic studies: AST, ALT before treatment and periodically thereafter
- Blood studies: WBC, RBC, Hct, Hgb, bleeding time before treatment and periodically thereafter; serum potassium • Renal studies: urinalysis, protein, blood, BUN, creatinine before treatment and periodically thereafter • C&S before product therapy; product may be given as soon as culture is taken
- **Pseudomembranous colitis:** diarrhea, bloody stools, fever, abdominal cramps; may occur ≤ 2 mo after treatment; bowel pattern before and during treatment
- Skin eruptions after administration of penicillin to 1 wk after discontinuing product • Respiratory status: rate, character, wheezing, tightness in chest
- **Anaphylaxis:** wheezing, laryngeal edema, rash, itching; discontinue product, have emergency equipment nearby

Perform/provide:

- Adequate intake of fluids (2 L) during diarrhea episodes
- Discard after 24 hr if stored at room temp or after 48 hr if refrigerated; use single-dose vials immediately after reconstitution; stable in ambulatory IV pump for 12 hr

Evaluate:

- Therapeutic response: absence of fever, purulent drainage, redness, inflammation; culture shows decreased organisms

Teach patient/family:

- That culture may be taken after completed course of medication
- To report sore throat, fever, fatigue (superinfection); CNS effects (anxiety, depression, hallucinations, seizures); **pseudomembranous colitis:** fever, diarrhea with blood, pus, mucous
- To wear or carry emergency ID if allergic to penicillins
- To notify nurse of diarrhea

TREATMENT OF OVERDOSE:

Withdraw product, maintain airway, administer EPINEPHrine, aminophylline, O₂, IV corticosteroids for anaphylaxis

🍁 Canada only Side effects: *italics* = common; **bold** = life-threatening ⚠️
Nurse Alert

pirbuterol (Rx)

(peer-byoo'ter-ole)

Maxair

Func. class.: Bronchodilator

Chem. class.: β -Adrenergic agonist

ACTION:

Causes bronchodilation with little effect on heart rate by action on β -receptors, causing increased cAMP and relaxation of smooth muscle

USES:

Reversible bronchospasm (prevention, treatment) including asthma; may be given with theophylline or steroids

CONTRAINDICATIONS:

Hypersensitivity to sympathomimetics, tachycardia

Precautions: Pregnancy (C), breastfeeding, cardiac disorders, hyperthyroidism, hypertension, diabetes mellitus, prostatic hypertrophy

DOSAGE AND ROUTES

Calculator

• **Adult and child >12 yr:** INH 1-2 puffs (0.4 mg) q4-6hr; max 12 INH/day

Available forms: Aerosol delivery 0.2 mg pirbuterol/actuation

Administer:

• After shaking; exhale; place mouthpiece in mouth; inhale slowly; hold breath; remove; exhale slowly • Gum, sips of water for dry mouth

SIDE EFFECTS

CNS: Tremors, anxiety, insomnia, headache, dizziness, stimulation, restlessness, hallucinations, drowsiness, irritability

CV: Palpitations, tachycardia, hypertension, angina, hypotension, dysrhythmias

EENT: Dry nose and mouth, irritation of nose, throat

GI: Gastritis, nausea, vomiting, anorexia

MS: Muscle cramps

RESP: Paradoxical bronchospasm, dyspnea, coughing

PHARMACOKINETICS

INH: Onset 3 min, peak ½-1 hr, duration 5 hr, terminal half-life 2 hr

INTERACTIONS

 **Hypertensive crisis: MAOIs**

Increase: action of other aerosol bronchodilators

Increase: pirbuterol action—tricyclics, antihistamines, levothyroxine

Decrease: pirbuterol action—β-blockers

Drug/Herb

Increase: action of both—cola nut, guarana, yerba maté

Increase: effect—green tea (large amounts), guarana

NURSING CONSIDERATIONS

Assess:

- Respiratory function: vital capacity, forced expiratory volume, ABGs, B/P, lung sounds, pulse, characteristics of sputum  Paradoxical bronchospasm, that can occur rapidly, hold product, notify prescriber

Perform/provide:

- Storage in light-resistant container; do not expose to temperatures over 86° F (30° C)
- Fluid intake >2 L/day to liquefy thick secretions

Evaluate:

- Therapeutic response: absence of dyspnea, wheezing over 1 hr

Teach patient/family:

- Not to use OTC medications; extra stimulation may occur
- Use of inhaler; review package insert with patient
- To avoid getting aerosol in eyes
- Actuator is for Maxair autoinhaler; do not use with other inhaler canister
- About all aspects of product; avoid smoking, smoke-filled rooms, persons with respiratory infections
- To keep fluid intake >2 L/day to liquefy thick secretions

TREATMENT OF OVERDOSE:

Administer a β-adrenergic blocker

✳ Canada only Side effects: *italics* = common; **bold** = life-threatening 
Nurse Alert

pitavastatin (Rx)

(pit'a-va-stat'-in)

Livalo

Func. class.: Antilipidemic

Chem. class.: HMG-CoA reductase inhibitor

Do not confuse: pitavastatin/pravastatin

ACTION:

Inhibits HMG-CoA reductase enzyme, which reduces cholesterol synthesis; high doses lead to plaque regression

USES:

As an adjunct for primary hypercholesterolemia (types Ia, Ib), dysbetalipoproteinemia, elevated triglyceride levels, prevention of CV disease by reduction of heart risk in those with mildly elevated cholesterol

Unlabeled uses: Atherosclerosis

CONTRAINDICATIONS:

Pregnancy (X), breastfeeding, hypersensitivity, active hepatic disease, cholestasis

Precautions: Past hepatic disease, alcoholism, severe acute infections, trauma, severe metabolic disorders, electrolyte imbalance, seizures, surgery, organ transplant, endocrine disease, females, hypotension, renal disease

DOSAGE AND ROUTES

Calculator

- **Adult: PO** 2 mg/day, usual range 1-4, max 4 mg/day

Renal dose

- **Adult: PO** CCr 30-<60 ml/min, 1 mg daily, max 2 mg daily; CCr <30 ml/min on hemodialysis, 1 mg daily, max 2 mg daily; CCr <30 ml/min, not recommended

Atherosclerosis (unlabeled)

- **Adult: PO** 4 mg/day

Available forms: Tabs 1, 2, 4 mg

Administer:

- Total daily dose any time of day without regard to meals
- Storage in cool environment in tight container protected from light

SIDE EFFECTS

CNS: Headache

GI: Constipation, diarrhea

INTEG: Rash, pruritus, alopecia

MS: Arthralgia, myalgia, **rhabdomyolysis**

RESP: Pharyngitis

PHARMACOKINETICS

Peak 1 hr; metabolized in liver, excreted in urine, feces; half-life 12 hr; protein binding 99%; concentrations lower in healthy African Americans

INTERACTIONS

Increase: risk for possible rhabdomyolysis—azole antifungals, cycloSPORINE, erythromycin, niacin, gemfibrozil, clofibrate

Increase: levels of pitavastatin—erythromycin

Drug/Herb

Increase: pitavastatin—red yeast rice

Drug/Lab Test

Increase: bilirubin, alk phos, ALT, AST

Interference: thyroid function tests

NURSING CONSIDERATIONS**Assess:**

- **Diet;** obtain diet history including fat, cholesterol in diet
- Cholesterol, triglyceride levels periodically during treatment; check lipid panel 6 wk after changing dose • Hepatic studies at 12 wk after starting treatment, then q6mo; if AST $>3\times$ normal, reduce or discontinue; AST, ALT, LFTs may be increased • Renal studies in patients with compromised renal system: BUN, I&O ratio, creatinine  **Rhabdomyolysis:** muscle pain, tenderness; obtain CPK baseline; if markedly increased, product may need to be discontinued

Evaluate:

- Therapeutic response: decrease in cholesterol to desired level after 6 wk

Teach patient/family:

- That blood work will be necessary during treatment
 - To report blurred vision, severe GI symptoms, headache, muscle pain, weakness, tenderness
 - That previously prescribed regimen will continue: low-cholesterol diet, exercise program, smoking cessation
 - **Not to take product if pregnant (X) or if pregnancy is planned or suspected (notify prescriber); to avoid breastfeeding**
-

☼ Canada only Side effects: *italics* = common; **bold** = life-threatening ⚠
Nurse Alert

plasma protein fraction (Rx)

Plasmanate

Func. class.: Hematological agent

Chem. class.: Plasma volume expander

ACTION:

Exerts similar oncotic pressure as human plasma, expands blood volume

USES:

Hypovolemic shock, hypoproteinemia, ARDS, preoperative cardiopulmonary bypass, acute hepatic failure, nephrotic syndrome, cardiogenic shock

CONTRAINDICATIONS:

Hypersensitivity to this product or albumin; CHF, severe anemia, renal insufficiency, hyponatremia, cardiopulmonary bypass

Precautions: Pregnancy (C), decreased salt intake, decreased cardiac reserve, lack of albumin deficiency, hepatic disease

DOSAGE AND ROUTES

Calculator

Hypovolemia

- **Adult:** IV INF 250-500 ml (12.5-25 g protein), max 10 ml/min
- **Child:** IV INF 10-30 ml/kg at max 5-10 ml/min

Hypoproteinemia

- **Adult:** IV INF 1000-1500 ml/day, max 8 ml/min

Available forms: Inj 5%

Administer:

IV route

- IV access at distant site from infection or trauma; no dilution required; use inf pump, use large-gauge needle (≥ 20 G); discard unused portion; infuse slowly to prevent hypotension • Within 4 hr of opening, discard partially used vials
- Do not use sol that has been frozen
- Adjust rate to changes in B/P

Additive compatibilities: Carbohydrate and electrolyte sol, whole blood, packed RBCs, chloramphenicol, tetracycline

SIDE EFFECTS

CNS: Fever, chills, headache, paresthesias, flushing

CV: Fluid overload, hypotension, erratic pulse

GI: Nausea, vomiting, increased salivation

INTEG: Rash, urticaria, cyanosis

RESP: Altered respirations, dyspnea, PE

PHARMACOKINETICS

Metabolized as a protein/energy source

INTERACTIONS

Drug/Lab Test

False increase: alk phos

NURSING CONSIDERATIONS

Assess:

- Blood studies: Hct, Hgb, electrolytes, serum protein; if serum protein declines, dyspnea, hypoxemia can result
- B/P (decreased), pulse (erratic), respiration during inf

- I&O ratio; urinary output may decrease

- Allergy: fever, rash, itching, chills, flushing, urticaria, nausea, vomiting, hypotension requires discontinuation of inf; use new lot if therapy reinstituted; premedicate with diphenhydrAMINE

- Increased CVP reading: distended neck veins indicate circulatory overload; SOB, anxiety, insomnia, expiratory crackles, frothy blood-tinged cough, cyanosis indicate pulmonary overload

Perform/provide:

- Adequate hydration before administration

- Storage at room temp, max 86° F

Evaluate:

- Therapeutic response: increased B/P, decreased edema, increased serum albumin

🍁 Canada only Side effects: *italics* = common; **bold** = life-threatening ⚠️
Nurse Alert

plerixafor (Rx)

(pler-ix'a-fore)

Mozobil

Func. class.: Biologic modifier

Chem. class.: Colony-stimulating factor

ACTION:

Competitively inhibits the binding of stromal-derived factors, thereby allowing hematopoietic stem cells to mobilize into peripheral blood

USES:

For peripheral blood stem cell (PBSC) mobilization for collection and autologous transplant in patients with non-Hodgkin's lymphoma, multiple myeloma; used with a granulocyte colony-stimulating factor (G-CSF)

CONTRAINDICATIONS:

Hypersensitivity, breastfeeding, pregnancy (D)

Precautions: Children, renal disease, thrombocytopenia

DOSAGE AND ROUTES

Calculator

• **Adult:** **SUBCUT** 0.24 mg/kg daily about 11 hr prior to initiation of apheresis, give for up to 4 consecutive days; give filgrastim 10 mcg/kg; **SUBCUT** daily each AM beginning 4 days prior to the 1st evening dose of plerixafor and on each day of apheresis; give filgrastim before procedure

Available forms: Inj 300 mcg/ml, 480 mcg/1.6 ml, 480 mcg/0.8 ml, 3000 mcg/0.5 ml

Administer:

SUBCUT route

• Each single-use vial contains 24 mg of plerixafor (1.2 ml of 20 mg/ml sol); volume calculated by multiplying 0.012 by actual body weight (kg) • Give 11 hr before apheresis

• Max 40 mg/day or 27 mg/day in patients with renal disease

SIDE EFFECTS

CNS: Syncope, dizziness, fatigue, headache, insomnia, malaise, paresthesias

GI: *Nausea*, vomiting, diarrhea, abdominal pain, constipation

HEMA: **Thrombocytopenia**, leukocytosis

INTEG: Rash, skin irritation, pruritus, inj site reaction, erythema, urticaria

MS: Musculoskeletal pain

RESP: Dyspnea, hypoxia

PHARMACOKINETICS

SUBCUT: 30-60 min, peak mobilization 6-9 hr, 58% protein binding, 70% excreted via kidneys (parent drug), terminal half-life 3-5 hr

INTERACTIONS

Increase: adverse reactions—do not use this product concomitantly with lithium, may increase leukocytosis

NURSING CONSIDERATIONS

Assess:

- Blood studies: CBC, differential
- B/P, respirations, pulse before and during therapy
- Bone pain; give mild analgesics

Perform/provide:

- Storage at room temp

Evaluate:

- Therapeutic response: collection of stem cells

Teach patient/family:

- About reason for use and expected results
- **Pregnancy (D):** notify prescriber if pregnancy is planned or suspected, do not breastfeed

☼ Canada only Side effects: *italics* = common; **bold** = life-threatening ⚠
Nurse Alert

posaconazole (Rx)

(poe'sa-kon'a-zole)

Noxafil, Posanol 

Func. class.: Antifungal—systemic

Chem. class.: Triazole derivative

ACTION:

Inhibits a portion of cell-wall synthesis; alters cell membranes and inhibits several fungal enzymes

USES:

Prevention of aspergillus, candida infection, oropharyngeal candidiasis in immunocompromised patients, chemotherapy-induced neutropenia, mucocutaneous, candidiasis

Unlabeled uses: Aspergillosis, cellulitis, coccidioidomycosis, endocarditis, endophthalmitis, esophageal candidiasis, febrile neutropenia, fungal keratitis, fusariosis, histoplasmosis, infectious arthritis, myocarditis, osteomyelitis, pericarditis, sinusitis, tracheobronchitis

CONTRAINDICATIONS:

Hypersensitivity to this product or other systemic antifungals or azoles; fungal meningitis, onchomycosis or dermatomycosis in cardiac dysfunction

Precautions: Pregnancy (C), breastfeeding, children, cardiac/hepatic disease

DOSAGE AND ROUTES

Calculator

- **Adult, adolescent:** PO 800 mg/day in 2-4 divided doses
- **Child:** PO 100 mg tid

Available forms: Oral susp 200 mg/5 ml

Administer:

PO route

- **Oral susp:** shake well; use calibrated measuring device; take only with full meal or liquid nutritional supplements such as Ensure; rinse measuring device after each use

SIDE EFFECTS

CNS: Headache, dizziness, insomnia, fever, rigors, weakness, anxiety

CV: Hypo/hypertension, tachycardia, anemia

GI: Nausea, vomiting, anorexia, diarrhea, cramps, abdominal pain, flatulence, GI bleeding, hepatotoxicity

GU: Gynecomastia, impotence, decreased libido

INTEG: Pruritus, fever, rash, toxic epidermal necrolysis

MISC: Edema, fatigue, malaise, hypokalemia, tinnitus, rhabdomyolysis

PHARMACOKINETICS

Well absorbed, enhanced by food, protein binding 98%-99%, peak 3-5 hr, half-life 35 hr, metabolized in liver, excreted in feces (77% unchanged)

INTERACTIONS

- Do not use with lovastatin, atorvastatin

⚠ Increase: QT prolongation—class IA/III antidysrhythmics, some phenothiazines, β agonists, local anesthetics, tricyclics, haloperidol, chloroquine, droperidol, pentamidine; CYP3A4 inhibitors (amiodarone, clarithromycin, erythromycin, telithromycin, troleandomycin), arsenic trioxide, levomethadyl; CYP3A4 substrates (methadone, pimozide, QUetiapine, quiNIDine, risperiDONE, ziprasidone)

Increase: tinnitus, hearing loss—quiNIDine

Increase: hepatotoxicity—other hepatotoxic products

Increase: severe hypoglycemia—oral hypoglycemics

Increase: sedation—triazolam, oral midazolam

Increase: levels, toxicity—busPIRone, busulfan, calcium-channel blockers, clarithromycin, cycloSPORINE, diazepam, digoxin, felodipine, HMG-CoA reductase inhibitors, indinavir, isradipine, midazolam, niCARDipine, NIFEdipine, niMODipine, phenytoin, quiNIDine, ritonavir, saquinavir, sirolimus, tacrolimus, vinca alkaloids, warfarin

Decrease: posaconazole level—cimetidine, phenytoin

Decrease: posaconazole action—antacids, H₂-receptor antagonists, rifamycin, didanosine

Drug/Food

- Food increases absorption

NURSING CONSIDERATIONS

Assess:

⚠ **Infection:** type of, may begin treatment prior to obtaining results; temp, WBC, sputum at baseline and periodically, break-through infections may occur when used with fosamprenavir • I&O ratio, electrolytes; correct electrolyte imbalances before starting treatment

- For allergic reaction: rash, photosensitivity, urticaria, dermatitis

⚠ **Rhabdomyolysis:** muscle pain, increased CPK; weakness, swelling of affected muscles; if these occur and if confirmed by CPK, product should be discontinued ⚠ **Hepatotoxicity:** nausea, vomiting, jaundice, clay-colored stools, fatigue; hepatic studies (ALT, AST, bilirubin) if patient receiving long-term therapy

⚠ **QT prolongation:** ECG for QT prolongation, ejection fraction; assess for chest pain, palpitations, dyspnea

Perform/provide:

- Storage in tight container in refrigerator; do not freeze

Evaluate:

- Therapeutic response: decreased symptoms of fungal infection, negative C&S for infecting organism

Teach patient/family:

- That long-term therapy may be needed to clear infection (1 wk-6 mo, depending on infection) • To avoid hazardous activities if dizziness occurs
- To take 2 hr before administration of other products that increase gastric pH (antacids, H₂-blockers, omeprazole, sucralfate, anticholinergics); to notify health care provider of all medications taken • About the importance of compliance with product regimen; to use alternative method of contraception • To notify prescriber of GI symptoms, signs of hepatic dysfunction (fatigue, nausea, anorexia, vomiting, dark urine, pale stools)

☼ Canada only Side effects: *italics* = common; **bold** = life-threatening ⚠
Nurse Alert

potassium acetate

potassium bicarbonate (OTC, Rx)

K Effervescent, Klor-Con EF, K-Vescent

potassium bicarbonate and potassium chloride (OTC, Rx)

Neo-K 

potassium bicarbonate and potassium citrate (OTC, Rx)

potassium chloride (OTC, Rx)

Epiklor, Klor-Con, K-Tab, Micro-K, Odan K-20 

potassium gluconate (OTC, Rx)

Equaline Potassium Gluconate, Walgreens Finest Natural Potassium Gluconate

Func. class.: Electrolyte, mineral replacement

Chem. class.: Potassium

ACTION:

Needed for the adequate transmission of nerve impulses and cardiac contraction, renal function, intracellular ion maintenance

USES:

Prevention and treatment of hypokalemia

CONTRAINDICATIONS:

Renal disease (severe), severe hemolytic disease, Addison's disease, hyperkalemia, acute dehydration, extensive tissue breakdown

Precautions: Pregnancy (C), cardiac disease, potassium-sparing diuretic therapy, systemic acidosis

DOSAGE AND ROUTES

Calculator

Hypokalemia (prevention) (bicarbonate, chloride, gluconate)

- **Adult: PO** 20 mEq/day in 1-2 divided doses
- **Child: PO** 1-2 mEq/kg/day in 1-2 divided doses

Hypokalemia, digoxin toxicity (acetate, chloride)

- **Adult:** serum potassium conc >2.5 mEq/L: **IV** max 10 mEq/1 hr with 24-hr max dose 200 mEq, initial dose of 20-40 mEq has been recommended; **PO** 40-100 mEq/day in 2-4 divided doses
- **Child: IV** 0.25-0.5 mEq/kg/dose at 0.25-0.5 mEq/kg/hr; **PO** 2-5 mEq/day in divided doses

Available forms: Tabs for sol 6.5, 25 mEq; ext rel caps 8, 10 mEq; powder for sol 3.3, 5, 6.7, 10, 13.3 mEq/5 ml; tabs 2, 4, 5, 13.4 mEq; ext rel tabs 6.7, 8, 10 mEq; elix 6.7 mEq/5 ml; oral sol 2.375 mEq/5 ml; inj for prep of IV 1.5, 2, 2.4, 3, 3.2, 4.4, 4.7 mEq/ml

Administer:**PO route**

- Do not break, crush, or chew ext rel tabs, caps or enteric products
- With or after meals; dissolve effervescent tabs, powder in 8 oz cold water or juice; do not give IM, SUBCUT
- Caps with full glass of liquid

IV route

- Through large-bore needle to decrease vein inflammation; check for extravasation; in large vein, avoid scalp vein in child (IV)

Potassium acetate

Additive compatibilities: Metoclopramide

Y-site compatibilities: Ciprofloxacin

Potassium chloride

- **Potassium chloride:** must be diluted; concentrated potassium injections fatal

Continuous IV INF route

- Conc max 80 mcg/L for peripheral line, 120 mEq/L for central line
- Dehydrated patients should receive 1 L of potassium-free hydrating solution then infuse 10 mEq/hr; in severe hypokalemia, rate may be 40 mEq/hr

Additive compatibilities: Aminophylline, amiodarone, atracurium, calcium gluconate, cefepime, cephalothin, cephapirin, chloramphenicol, cimetidine, ciprofloxacin, cisatracurium, clindamycin, cloxacillin, corticotropin, cytarabine,

dimenhydrinate, dopamine, doxorubicin liposome, enalaprilat, erythromycin, floxacillin, fluconazole, fosphenytoin, furosemide, heparin, hydrocortisone, isoproterenol, lidocaine, metaraminol, methicillin, methyldopate, metoclopramide, mitoxantrone, nafcillin, netilmicin, norepinephrine, oxacillin, penicillin G potassium, phenylephrine, piperacillin, ranitidine, sodium bicarbonate, thiopental, vancomycin, verapamil, vit B/C

Y-site compatibilities: Acyclovir, aldesleukin, allopurinol, amifostine, aminophylline, amiodarone, ampicillin, amrinone, atropine, aztreonam, betamethasone, calcium gluconate, cephalothin, cephapirin, chloridiazepoxide, chlorpromazine, ciprofloxacin, cladribine, cyanocobalamin, dexamethasone, digoxin, diltiazem, diphenhydramine, dobutamine, dopamine, droperidol, edrophonium, enalaprilat, epinephrine, esmolol, estrogens, ethacrynate, famotidine, fentanyl, filgrastim, fludarabine, fluorouracil, furosemide, gallium, granisetron, heparin, hydralazine, idarubicin, indomethacin, insulin (regular), isoproterenol, kanamycin, labetalol, lidocaine, lorazepam, magnesium sulfate, melphalan, meperidine, methicillin, methoxamine, methylergonovine, midazolam, minocycline, morphine, neostigmine, norepinephrine, ondansetron, oxacillin, oxytocin, paclitaxel, penicillin G potassium, pentazocine, phytonadione, piperacillin/tazobactam, prednisolone, procainamide, prochlorperazine, propofol, propranolol, pyridostigmine, remifentanyl, sargramostim, scopolamine, sodium bicarbonate, succinylcholine, tacrolimus, teniposide, theophylline, thiotepa, trimethaphan, trimethoprim, vinorelbine, warfarin, zidovudine

SIDE EFFECTS

CNS: Confusion

CV: Bradycardia, cardiac depression, dysrhythmias, arrest; peaking T waves, lowered R, depressed RST, prolonged P-R interval, widened QRS complex

GI: Nausea, vomiting, cramps, pain, diarrhea, ulceration of small bowel

GU: Oliguria

INTEG: Cold extremities, rash

PHARMACOKINETICS

PO: Excreted by kidneys and in feces; onset of action ≈30 min

IV: Immediate onset of action

INTERACTIONS

Increase: hyperkalemia—potassium phosphate IV; products containing calcium or magnesium; potassium-sparing diuretic or other potassium products; ACE inhibitors

NURSING CONSIDERATIONS

Assess:

- **Hyperkalemia:** indicates toxicity; fatigue, muscle weakness, confusion, dyspnea, palpitation; ECG for peaking T waves, lowered R, depressed RST, prolonged P-R interval, widening QRS complex, hyperkalemia; product should be reduced or discontinued, administer sodium bicarbonate (metabolic acidosis)
- Potassium level during treatment (3.5-5 mg/dl is normal level)
- Determine hydration status, I&O ratio; watch for decreased urinary output; notify prescriber immediately
- Cardiac status: rate, rhythm, CVP, PWP, PAWP if being monitored directly

Perform/provide:

- Storage at room temp

Evaluate:

- Therapeutic response: absence of fatigue, muscle weakness; decreased thirst, urinary output; cardiac changes

Teach patient/family:

- To add potassium-rich foods to diet: bananas, orange juice, avocados, whole grains, broccoli, carrots, prunes, cocoa after product is discontinued
- To avoid OTC products: antacids, salt substitutes, analgesics, vitamin preparations unless specifically directed by prescriber; to avoid licorice in large amounts because it may cause hypokalemia, sodium retention
- To report hyperkalemia symptoms (lethargy, confusion, diarrhea, nausea, vomiting, fainting, decreased output) or continued hypokalemia symptoms (fatigue, weakness, polyuria, polydipsia, cardiac changes)
- To dissolve powder or tablet completely in ≥ 120 ml water or juice
- About the importance of regular follow-up visits
- That potassium levels will need to be monitored periodically

Nurse Alert

potassium iodide (Rx)

Lugol's, SSKI, Strong Iodine

Func. class.: Thyroid hormone antagonist

Chem. class.: Iodine product

ACTION:

Inhibits secretion of thyroid hormone, fosters colloid accumulation in thyroid follicles, decreases vascularity of gland

USES:

Preparation for thyroidectomy, thyrotoxic crisis, neonatal thyrotoxicosis, radiation protectant, thyroid storm

Unlabeled uses: Erythema multiforme, erythema nodosum leprosum (ENL), sporotrichosis, thyroid involution induction

CONTRAINDICATIONS:

Pregnancy (D), pulmonary edema, pulmonary TB, bronchitis, hypersensitivity to iodine

Precautions: Breastfeeding, children

DOSAGE AND ROUTES

Calculator

Hyperthyroidism/thyrotoxicosis

- **Adult and child: PO** (SSKI) 250 mg tid × 10-14 days preoperatively

Preparation for thyroidectomy

- **Adult and child: PO** 3-5 gtt strong iodine sol tid or 1-5 drops SSKI in water tid after meals for 10 days prior to surgery

Radiation exposure (radioactive iodine)

- **Adult: PO** 130 mg/day (distribution by government/public health officials or OTC purchase)
- **Child ≥3 yr: PO** 65 mg q day
- **Child/infant >1 mo-3 yr: PO** 32 mg/day
- **Neonate: PO** 16 mg/day

Available forms: Oral sol (Lugol's solution) iodine 5%/potassium iodide 10%;

oral sol (SSKI) 1 g/ml

Administer:

- Products are not interchangeable
- Strong iodine solution after diluting with water or juice to improve taste
- Through straw to prevent tooth discoloration
- With meals to decrease GI upset
- At same time each day to maintain product level
- At lowest dose that relieves symptoms; discontinue before RAIU

SIDE EFFECTS

CNS: Headache, confusion, paresthesias

EENT: Metallic taste, stomatitis, salivation, periorbital edema, sore teeth and gums, cold symptoms

ENDO: Hypothyroidism, hyperthyroid adenoma

GI: *Nausea, diarrhea, vomiting*, small-bowel lesions, upper gastric pain, metallic taste

INTEG: Rash, urticaria, **angioneurotic edema**, acne, mucosal hemorrhage, fever

MS: Myalgia, arthralgia, weakness

PHARMACOKINETICS

PO: Onset 24-48 hr, peak 10-15 days after continuous therapy, uptake by thyroid gland or excreted in urine, crosses placenta

INTERACTIONS

- Hypothyroidism: lithium, other antithyroid agents

Increased: hyperkalemia—angiotensin II receptor antagonist, ACE inhibitors, potassium salts, potassium-sparing diuretics

Drug/Lab Test

Interference: urinary 17-OHCS

NURSING CONSIDERATIONS

Assess:

- Pulse, B/P, temp; serum potassium
- I&O ratio; check for edema: puffy hands, feet, periorbit; indicate hypothyroidism
- Weight daily; same clothing, scale, time of day

- T₃, T₄, which is increased; serum TSH, which is decreased; free thyroxine index, which is increased if dosage is too low; discontinue product 3-4 wk before RAIU

 **Overdose:** peripheral edema, heat intolerance, diaphoresis, palpitations, dysrhythmias, severe tachycardia, fever, delirium, CNS irritability

- **Hypersensitivity:** rash; enlarged cervical lymph nodes may indicate product should be discontinued

- **Hypoprothrombinemia:** bleeding, petechiae, ecchymosis

- Clinical response: after 3 wk should include increased weight, pulse; decreased T₄

Perform/provide:

- Fluids to 3-4 L/day unless contraindicated

Evaluate:

- Therapeutic response: weight gain; decreased pulse, T₄, size of thyroid gland

Teach patient/family:

- To abstain from breastfeeding after delivery

- To keep graph of weight, pulse, mood

- To avoid OTC products that contain iodine

- That seafood, other iodine products may be restricted

- Not to discontinue product abruptly; that thyroid crisis may occur as part of stress response

- That response may take several mo if thyroid is large

- To discontinue product, notify prescriber of fever, rash, metallic taste, swelling of throat; burning of mouth, throat; sore gums, teeth; severe GI distress, enlargement of thyroid, cold symptoms

☼ Canada only Side effects: *italics* = common; **bold** = life-threatening 
Nurse Alert

pramipexole (Rx)

(pra-mi-pex'ol)

Mirapex, Mirapex ER

Func. class.: Antiparkinson agent

Chem. class.: DOPamine-receptor agonist, non-ergot

ACTION:

Selective agonist for D₂ receptors (presynaptic/postsynaptic sites); binding at D₃ receptor contributes to antiparkinson effects

USES:

Idiopathic Parkinson's disease, restless leg syndrome

CONTRAINDICATIONS:

Hypersensitivity

Precautions: Pregnancy (C), cardiac/renal disease, MI with dysrhythmias, affective disorders, psychosis, preexisting dyskinesias, history of falling asleep during daily activities

DOSAGE AND ROUTES

Calculator

Parkinson's disease

- **Adult: PO** 0.125 mg tid; increase gradually by 0.125 mg/dose at 5-to 7-day intervals until total daily dose of 4.5 mg/day reached; ER 0.375 mg daily initially then up to 0.75 mg/day, may increase by 0.75 mg/day no more than q5-7days as needed, max 4.5 mg/day

Restless leg syndrome

- **Adult: PO** 0.125 mg 2-3 hr prior to bedtime, increase gradually, max 0.5 mg/day

Renal dose

- **Adult: PO** CCr 35-59 ml/min, 0.125 mg bid, may increase q5-7days to 1.5 mg bid if required; CCr 15-34 ml/min, 0.125 mg/day, increase q5-7days to 1.5 mg/day

Available forms: Tabs 0.125, 0.25, 0.5, 1, 1.5 mg; ER tab 0.375, 0.75, 1.5, 3.0,

4.5 mg

Administer:

- Adjust dosage to patient response, titrate slowly, taper when discontinuing
- With meals to minimize GI symptoms
- Do not crush, chew, or break ext rel product

SIDE EFFECTS

CNS: *Agitation, insomnia, psychosis, hallucinations, depression, dizziness, headache, confusion, amnesia, dream disorder, asthenia, dyskinesia, hypersomnolence, sudden sleep onset, impulse control disorders*

CV: *Orthostatic hypotension, edema, syncope, tachycardia, increased B/P, heart rate, heart failure*

EENT: Blurred vision, retinal/vision deterioration

GI: *Nausea, anorexia, constipation, dysphagia, dry mouth*

GU: Impotence, urinary frequency

HEMA: *Hemolytic anemia, leukopenia, agranulocytosis*

INTEG: Pruritus

PHARMACOKINETICS

Minimally metabolized, peak 2 hr, half-life 8 hr, 8.5-12 hr in geriatric patients

INTERACTIONS

Increase: pramipexole levels—levodopa, cimetidine, ranitidine, diltiazem, triamterene, verapamil, quinidine

Decrease: pramipexole levels—DOPAmine antagonists, phenothiazines, metoclopramide, butyrophenones

NURSING CONSIDERATIONS

Assess:

- **Parkinson's disease:** involuntary movements: bradykinesia, tremors, staggering gait, muscle rigidity, drooling • B/P, ECG, respiration during initial treatment; hypo/hypertension should be reported
- Mental status: affect, mood, behavioral changes, depression; complete suicide assessment, worsening of symptoms of restless leg syndrome, impulse control disorders  **Sleep attacks:** may fall asleep during activities without warning;

may need to discontinue medication

Perform/provide:

- Assistance with ambulation during beginning therapy
- Testing for diabetes mellitus, acromegaly if patient receiving long-term therapy

Evaluate:

- Therapeutic response: movement disorder improves

Teach patient/family:

- That therapeutic effects may take several weeks to a few months
- To change positions slowly to prevent orthostatic hypotension
- To use product exactly as prescribed: if product is discontinued abruptly, parkinsonian crisis may occur; to avoid alcohol, OTC sleeping products
- To notify prescriber if pregnancy is planned or suspected
- To notify prescriber of impulse control disorders: shopping

🍁 Canada only Side effects: *italics* = common; **bold** = life-threatening ⚠️
Nurse Alert

pramlintide (Rx)

(pram'lintide)

Symlin

Func. class.: Antidiabetic

Chem. class.: Synthetic human amylin analog

ACTION:

Modulates and slows stomach emptying, prevents postprandial rise in plasma glucagon, decreases appetite, leads to decreased caloric intake and weight loss

USES:

As an adjunct to insulin therapy for uncontrolled type 1 or type 2 diabetes

CONTRAINDICATIONS:

Hypersensitivity to this product or cresol; gastroparesis

Black Box Warning:

Hypoglycemia

Precautions: Pregnancy (C), breastfeeding

DOSAGE AND ROUTES

Calculator

Type 1 diabetes

- **Adult:** SUBCUT before each meal (≥ 30 g carbohydrate), titrate up in 15-mcg increments to target dose of 60 mcg/dose; each dose titration should occur after no nausea for 3 days

Type 2 diabetes

- **Adult:** SUBCUT 60 mcg prior to each meal (≥ 30 g CHO), titrate up to 120 mcg SUBCUT with each meal after no nausea for 3-7 days

Available forms: Inj 5-ml vials (0.6 mg/ml)

Administer:

- Premeal insulin should be decreased by 50% when starting and adjusted to therapeutic dose to prevent hypoglycemia

SUBCUT route

- Rotate injection sites, allow solution to warm to room temperature before use

- Take immediately before mealtime or if 30 g of carbohydrates will be consumed
- Do not use if a meal is skipped
- Do not use if discolored; do not give in arm; absorption is variable

Syringe compatibilities: Do not mix with insulin; give separately

SIDE EFFECTS

CNS: *Headache*, fatigue, dizziness

GI: *Nausea, vomiting, anorexia*, abdominal pain

INTEG: Inj site reactions

META: Hypoglycemia

MS: Arthralgia

RESP: *Cough*, pharyngitis

SYST: *Systemic allergy*

PHARMACOKINETICS

Bioavailability 30%-40%, not extensively bound to blood cells or albumin, 40% bound in plasma, half-life 48 min, metabolized by kidneys, peak 20 min, duration 3 hr

INTERACTIONS

- **Do not use with erythromycin, metoclopramide**

Increase: effect of acetaminophen

Increase: pramlintide action—antimuscarinics, α -glucosidase inhibitors, diphenoxylate, loperamide, octreotide, opiate agonist, tricyclics

Increase: hypoglycemia—ACE inhibitors, disopyramide, anabolic steroids, androgens, fibric acid derivatives, alcohol, corticosteroids, insulin

Increase: hyperglycemia—phenothiazines

Decrease: hypoglycemia—niacin, dextrothyroxine, thiazide diuretics, triamterene, estrogens, progestins, oral contraceptives, MAOIs

NURSING CONSIDERATIONS

Assess:

- Fasting blood glucose, 2 hr post-prandial (80-150 mg/dl, normal fasting level; 70-130 mg/dl, normal 2 hr level); A1c may also be drawn to identify treatment

effectiveness; also monitor weight, appetite • **Hypoglycemic reaction** sweating; weakness; dizziness; chills; confusion; headache; nausea; rapid, weak pulse; fatigue; tachycardia; memory lapses; slurred speech; staggering gait; anxiety; tremors; hunger • **Hyperglycemia**: acetone breath; polyuria; fatigue; polydipsia; flushed, dry skin; lethargy

Perform/provide:

- Storage at room temp for ≤30 days; keep away from heat and sunlight; refrigerate all other supply

Evaluate:

- Therapeutic response: decrease in polyuria, polydipsia, polyphagia; clear sensorium; absence of dizziness; stable gait; improving blood glucose, A1c

Teach patient/family:

- That product does not cure diabetes but rather controls symptoms
- To carry emergency ID as diabetic
- To recognize hypoglycemia reaction: headache, fatigue, weakness
- About the dosage, route, mixing instructions, diet restrictions, disease process
- To carry a glucose source (candy or lump sugar) to treat hypoglycemia
- About the symptoms of ketoacidosis: nausea; thirst; polyuria; dry mouth; decreased B/P; dry, flushed skin; acetone breath; drowsiness; Kussmaul respirations
- That a plan is necessary for diet, exercise; that all food on diet should be eaten; that exercise routine should not vary
- About blood glucose testing; how to determine glucose level
- To avoid OTC products, alcohol unless directed by prescriber
- Not to operate machinery or drive until effect is known
- About how to use pen

TREATMENT OF OVERDOSE:

Glucose 25 g IV or 50 ml dextrose 50% sol or 1 mg glucagon SUBCUT

☼ Canada only Side effects: *italics* = common; **bold** = life-threatening ⚠
Nurse Alert

pramoxine topical

See [Appendix B](#)

prasugrel (Rx)

(pra'soo-grel)

[Effient](#)

Func. class.: Platelet aggregation inhibitor

Chem. class.: ADP receptor antagonist

ACTION:

Inhibits ADP-induced platelet aggregation

USES:

Reducing the risk of stroke, MI, vascular death, peripheral arterial disease in high-risk patients

CONTRAINDICATIONS:

Hypersensitivity, stroke, TIA

Black Box Warning:

Active bleeding

Precautions: Pregnancy (B), breastfeeding, children, geriatric patients, hepatic disease, increased bleeding risk, neutropenia, agranulocytosis, renal disease, surgery, trauma, thrombotic thrombocytopenic purpura, Asian patients, weight <60 kg, CABG, abrupt discontinuation

DOSAGE AND ROUTES

Calculator

- **Adult/geriatric <75 yr and ≥ 60 kg:** PO 60-mg loading dose then 10 mg daily with aspirin (75-325 mg/day)
- **Adult/geriatric <75 yr and <60 kg:** PO 60 mg loading dose then 5 mg daily
- **Geriatric >75 yr:** not recommended

Available forms: Tabs 5, 10 mg

Administer:

- With food to decrease gastric symptoms

- Do not break tablets
- Do not discontinue therapy abruptly

SIDE EFFECTS

CNS: Headache, dizziness

CV: Edema, atrial fibrillation, bradycardia, chest pain, hypo/hypertension

GI: Nausea, vomiting, diarrhea

HEMA: Epistaxis, leukopenia, thrombocytopenia, neutropenia, anaphylaxis, angioedema, anemia

INTEG: Rash, hypercholesterolemia

MISC: Fatigue, intracranial hemorrhage, secondary malignancy, angioedema

MS: Back pain

PHARMACOKINETICS

Rapidly absorbed; peak 30 min; metabolized by liver (CYP3A4; CYP2B6); excreted in urine, feces; half-life 7 hr

INTERACTIONS

Increase: bleeding risk—anticoagulants, aspirin, NSAIDs, abciximab, eptifibatide, tirofiban, thrombolytics, ticlopidine, SSRIs, treprostinil, rifampin

NURSING CONSIDERATIONS

Assess:

- **Thrombotic/thrombocytic purpura:** fever, thrombocytopenia, neurolytic anemia
- **Hepatic studies:** AST, ALT, bilirubin, creatinine with long-term therapy
- **Blood studies:** CBC, differential, Hct, Hgb, PT, cholesterol with long-term therapy

Black Box Warning:

Bleeding: may be fatal, decreased B/P in those who have had CABG may be the first indication; bleeding should be controlled while continuing product; may use transfusion; do not use within 1 wk of CABG; may use lower doses in those <60 kg

Evaluate:

- Therapeutic response: absence of stroke, MI

Teach patient/family:

- That blood work will be necessary during treatment
- To report any unusual bruising, bleeding to prescriber; that it may take longer

to stop bleeding • To take with food or just after eating to minimize GI discomfort

- To report diarrhea, skin rashes, subcutaneous bleeding, chills, fever, sore throat
 - To tell all health care providers that prasugrel is being used; that product may be held before surgery
-

🍁 Canada only Side effects: *italics* = common; **bold** = life-threatening ⚠️
Nurse Alert

pravastatin (Rx)

(pra'va-sta-tin)

Pravachol

Func. class.: Antilipemic

Chem. class.: HMG-CoA reductase enzyme

Do not confuse: **Pravachol**/Prevacid/propranolol

ACTION:

Inhibits HMG-CoA reductase enzyme, which reduces cholesterol synthesis

USES:

As an adjunct for primary hypercholesterolemia (types IIa, IIb, III, IV), to reduce the risk for recurrent MI, atherosclerosis, primary/secondary CV events, stroke, TIAs

CONTRAINDICATIONS:

Pregnancy (X), breastfeeding, hypersensitivity, active hepatic disease

Precautions: Past hepatic disease, alcoholism, severe acute infections, trauma, severe metabolic disorders, electrolyte imbalances

DOSAGE AND ROUTES

Calculator

- **Adult: PO** 40 mg/day at bedtime (range 10-80 mg/day); start at 10 mg/day if patient also taking immunosuppressants
- **Adolescent 14-18 yr: PO** 40 mg/day
- **Child 8-13 yr: PO** 20 mg/day
- **Geriatric/renal/hepatic disease: PO** 10 mg/day initially

Renal dose

- **Adult: PO** 10-20 mg daily at bedtime, increase at 4-wk intervals

Available forms: Tabs 10, 20, 40, 80 mg

Administer:

- Without regard to meals, at bedtime
- Give 4 hr after bile acid sequestrants

SIDE EFFECTS

CNS: Headache, dizziness, fatigue

CV: Chest pain

EENT: Lens opacities

GI: Nausea, constipation, diarrhea, flatus, abdominal pain, heartburn, **hepatic dysfunction**, pancreatitis, **hepatitis**

GU: **Renal failure (myoglobinuria)**

INTEG: Rash, pruritus

MS: Muscle cramps, myalgia, **myositis**, **rhabdomyolysis**

RESP: Common cold, rhinitis, cough

PHARMACOKINETICS

Peak 1-1½ hr; metabolized by liver; protein binding 50%; excreted in urine 20%, feces 70%, breast milk; crosses placenta; half-life 1.25-2.25 hr

INTERACTIONS

Increase: myopathy, rhabdomyolysis risk—erythromycin, niacin, cycloSPORINE, gemfibrozil, clofibrate, clarithromycin, itraconazole, protease inhibitors

Decrease: bioavailability of pravastatin —bile acid sequestrants

Drug/Herb

Increase: adverse reactions—red yeast rice

Increase: hepatotoxicity—eucalyptus

Decrease: effect—St. John's wort

Drug/Lab Test

Increase: CK, LFTs

Altered: thyroid function tests

NURSING CONSIDERATIONS

Assess:

- Fasting lipid profile: LDL, HDL, triglycerides, cholesterol at baseline, q12wk, then q6mo when stable; obtain diet history
- Hepatic studies: baseline, q12wk, then q6mo for remainder of yr; AST, ALT, LFTs may increase
- Renal studies of patients with compromised renal systems: BUN, I&O ratio, creatinine ⚠

Rhabdomyolysis: muscle tenderness, pain; obtain CPK at baseline and if these occur, therapy should be discontinued

Perform/provide:

- Storage in cool environment in tight container protected from light

Evaluate:

- Therapeutic response: decrease in LDL total cholesterol, triglycerides; increase in HDL

Teach patient/family:

- That blood work will be necessary during treatment

⚠ To report blurred vision, severe GI symptoms, dizziness, headache, muscle pain, weakness, fever • That regimen will continue: low-cholesterol diet, exercise program

⚠ To report suspected, planned pregnancy; not to use product during pregnancy, pregnancy category (X); not to breastfeed

- **Hepatic disease:** to notify prescriber of lack of appetite, yellow sclera/skin, dark urine, abdominal pain, weakness

🌿 Canada only Side effects: *italics* = common; **bold** = life-threatening ⚠
Nurse Alert

prazosin (Rx)

(pray'zoe-sin)

Minipress

Func. class.: Antihypertensive

Chem. class.: α_1 -Adrenergic blocker, peripheral

ACTION:

Blocks α -mediated vasoconstriction of adrenergic receptors, thereby inducing peripheral vasodilation

USES:

Hypertension

Unlabeled uses: Benign prostatic hypertrophy to decrease urine outflow obstruction, heart failure, hypertensive urgency, Raynaud's phenomenon, posttraumatic stress disorder (PTSD)

CONTRAINDICATIONS:

Hypersensitivity

Precautions: Pregnancy (C), breastfeeding, children, geriatric patients, renal/hepatic disease, prostate cancer, ocular surgery, orthostatic hypotension

DOSAGE AND ROUTES

Calculator

Hypertension

- **Adult: PO** 1 mg bid or tid increasing to 20 mg/day in divided doses, if required; usual range 6-15 mg/day, max 1 mg initially; max 20 mg/day, some may require 40 mg/day
- **Child (unlabeled): PO** 5 mcg/kg q6hr; max 400 mcg/kg/day or 15 mg/day

Benign prostatic hyperplasia (unlabeled)

- **Adult: PO** 2 mg bid

Raynaud's phenomenon (unlabeled)

- **Adult: PO** 0.5-3 mg bid

CHF (unlabeled)

- **Adult: PO** 1 mg bid-tid, may gradually increase to max 20 mg/day

- **Child: PO** 5 mcg/kg q6hr, may gradually increase to 25 mcg/kg q6hr

Hypertensive urgency (unlabeled)

- **Adult: PO** 10-20 mg, may repeat after 30 min

Available forms: Caps 1, 2, 5 mg

Administer:

- 1st dose at bedtime to avoid fainting
- Without regard to meals
- Store at room temperature

SIDE EFFECTS

CNS: *Dizziness, headache, drowsiness*, anxiety, depression, vertigo, *weakness*, fatigue

CV: *Palpitations*, orthostatic hypotension, tachycardia, edema, rebound hypertension

EENT: Blurred vision, epistaxis, tinnitus, dry mouth, red sclera

GI: *Nausea*, vomiting, diarrhea, constipation, abdominal pain

GU: Urinary frequency, incontinence, impotence, priapism; water, sodium retention

PHARMACOKINETICS

Onset 2 hr, peak 2-4 hr, duration 6-12 hr, half-life 2-4 hr; metabolized in liver, excreted via bile, feces (>90%), urine (<10%); protein binding 97%

INTERACTIONS

Increase: hypotensive effects— β -blockers, nitroglycerin, alcohol, phosphodiesterase inhibitors (vardenafil, tadalafil, sildenafil); diuretics, other antihypertensives, MAOIs

Decrease: antihypertensive effect—NSAIDs

Increase: antihypertensive effect—hawthorn

Drug/Lab Test

Increase: urinary norepinephrine, VMA

NURSING CONSIDERATIONS

Assess:

- **Hypertension/CHF:** B/P (sitting, standing) during initial treatment,

periodically thereafter; pulse, jugular venous distention

- BUN, uric acid if patient receiving long-term therapy
- Weight daily, I&O; edema in feet, legs daily
- **Benign prostatic hypertrophy (unlabeled):** urinary patterns, frequency, stream, dribbling; flow before, during, and after therapy

Evaluate:

- Therapeutic response: decreased B/P

Teach patient/family:

- That fainting occasionally occurs after 1st dose; to take 1st dose at bedtime; not to drive or operate machinery for 4 hr after 1st dose; that full effect may take 4-6 wk
- To change positions slowly to prevent orthostatic hypotension
- To avoid OTC medications unless approved by prescriber

TREATMENT OF OVERDOSE:

Administer volume expanders or vasopressors, discontinue product, place patient in supine position

☼ Canada only Side effects: *italics* = common; **bold** = life-threatening ⚠
Nurse Alert

prednisoLONE (Rx)

(predniss'oh-lone)

Flo-Pred, Millipred, Orapred, Orapred ODT, Veripred

Func. class.: Corticosteroid, synthetic

Chem. class.: Glucocorticoid, immediate acting

Do not confuse: prednisoLONE/predniSONE

ACTION:

Decreases inflammation by the suppression of migration of polymorphonuclear leukocytes, fibroblasts; reversal to increase capillary permeability and lysosomal stabilization

USES:

Severe inflammation, immunosuppression, neoplasms

CONTRAINDICATIONS:

Hypersensitivity, fungal infections, viral infection, varicella

Precautions: Pregnancy (C), breastfeeding, children, diabetes mellitus, glaucoma, osteoporosis, seizure disorders, ulcerative colitis, CHF, myasthenia gravis, abrupt discontinuation, children, acute MI, GI ulcers, hypertension, hepatitis, psychosis

DOSAGE AND ROUTES

Calculator

Rheumatic disorders

- **Adult: PO** 5-60 mg/day or in divided doses

Asthma/antiinflammatory

- **Adult: PO** 40-80 mg/day in 1-2 divided doses
- **Child: PO** 1 mg/kg/day in 2 divided doses

Available forms: Tabs 5 mg; oral dissolving tab 10, 15, 30 mg; oral sol 5 mg/5 ml, 10 mg/5 ml, 15 mg/5 ml, 25 mg/5 ml; syrup 5 mg/5 ml

Administer:

- **Oral sol:** use calibrated measuring device
- **Orally disintegrating tabs:** place on tongue; allow to dissolve, swallow or

swallow whole; do not cut, split

SIDE EFFECTS

CNS: *Depression*, flushing, sweating, headache, mood changes

CV: *Hypertension*, **circulatory collapse**, **thrombophlebitis**, **embolism**, tachycardia

EENT: Fungal infections, increased intraocular pressure, blurred vision

GI: *Diarrhea*, *nausea*, *abdominal distention*, **GI hemorrhage**, increased appetite, **pancreatitis**

HEMA: **Thrombocytopenia**

INTEG: Acne, poor wound healing, ecchymosis, petechiae

MS: Fractures, osteoporosis, weakness, arthralgia, myopathy, tendon rupture

PHARMACOKINETICS

PO: Peak 1-2 hr, duration 2 days

INTERACTIONS

Increase: side effects—alcohol, salicylates, indomethacin, amphotericin B, digitalis, cycloSPORINE, diuretics

Increase: prednisolone action—salicylates, estrogens, indomethacin, oral contraceptives, ketoconazole, macrolide antibiotics

Increase: **toxicity—azole antifungals, cycloSPORINE**

Decrease: prednisolone action—cholestyramine, colestipol, barbiturates, rifampin, ePHEDrine, phenytoin, theophylline

Decrease: effects of anticoagulants, anticonvulsants, antidiabetics, ambenonium, neostigmine, isoniazid, toxoids, vaccines, anticholinesterases, salicylates, somatrem

Drug/Lab Test

Increase: cholesterol, sodium, blood glucose, uric acid, calcium, urine glucose

Decrease: calcium, potassium, T₄, T₃, thyroid ¹³¹I uptake test, urine 17-OHCS, 17-KS, PBI

False negative: skin allergy tests

NURSING CONSIDERATIONS

Assess:

- Potassium, blood glucose, urine glucose while patient receiving long-term therapy; hypokalemia, hyperglycemia • Weight daily; notify prescriber if weekly gain of >5 lb
- B/P q4hr, pulse; notify prescriber if chest pain occurs
- I&O ratio; be alert for decreasing urinary output, increasing edema
- Plasma cortisol levels with long-term therapy; normal level: 138-635 nmol/L SI units when drawn at 8 AM
- **Infection:** increased temp, WBC, even after withdrawal of medication; product masks infection • **Potassium depletion:** paresthesias, fatigue, nausea, vomiting, depression, polyuria, dysrhythmias, weakness • Edema, hypertension, cardiac symptoms
- Mental status: affect, mood, behavioral changes, aggression
- **Adrenal insufficiency:** nausea, vomiting, lethargy, restlessness, confusion, weight loss, hypotension before, during treatment; HPA suppression may be precipitated by abrupt withdrawal

Evaluate:

- Therapeutic response: ease of respirations, decreased inflammation

Teach patient/family:

- That emergency ID as steroid user should be carried
- To notify prescriber if therapeutic response decreases; that dosage adjustment may be needed • Not to discontinue abruptly; that adrenal crisis can result; to take product exactly as prescribed • To avoid OTC products: salicylates, cough products with alcohol, cold preparations unless directed by prescriber • About cushingoid symptoms
- **About the symptoms of adrenal insufficiency:** nausea, anorexia, fatigue, dizziness, dyspnea, weakness, joint pain

☼ Canada only Side effects: *italics* = common; **bold** = life-threatening ⚠
Nurse Alert

prednisoLONE ophthalmic (Rx)

See [Appendix B](#)

predniSONE (Rx)

(pred'ni-sone)

Rayos, Winpred 

Func. class.: Corticosteroid

Chem. class.: Intermediate-acting glucocorticoid

Do not confuse:

predniSONE/methylPREDNISolone/prednisoLONE/PriLOSEC

ACTION:

Decreases inflammation by increasing capillary permeability, and lysosomal stabilization, minimal mineralocorticoid activity

USES:

Severe inflammation, immunosuppression, neoplasms, multiple sclerosis, collagen disorders, dermatologic disorders

Unlabeled uses: Adjunct for refractory seizures, infantile spasms, acute interstitial nephritis, amyloidosis, autoimmune hepatitis, Behçet's syndrome, Bell's palsy, carpal tunnel syndrome, Churg-Strauss syndrome, dermatomyositis, Duchenne muscular dystrophy, endophthalmitis, Lennox-Gastaut syndrome, lupus nephritis, mixed connective-tissue disease, pericarditis, pneumonia, polyarteritis nodosa, polychondritis, polymyositis, pulmonary fibrosis, rheumatic carditis, temporal arteritis, TB, Wegener's granulomatosis

CONTRAINDICATIONS:

Fungal infections

Precautions: Pregnancy (C), diabetes mellitus, glaucoma, osteoporosis, seizure disorders, ulcerative colitis, CHF, myasthenia gravis, renal disease, esophagitis, peptic ulcer, cataracts, coagulopathy, abrupt discontinuation, children, corticosteroid hypersensitivity, Cushing's syndrome, diabetes mellitus, ulcerative colitis

DOSAGE AND ROUTES

Calculator

- **Adult: PO** 5-60 mg/day or divided bid-qid
- **Child: PO** 0.05-2 mg/kg/day divided 1-4×/day

Nephrosis

- **Child: PO** 2 mg/kg/day in divided doses, max 28 days, then 1-1.5 mg/kg/day every other day × 4 wk

Multiple sclerosis

- **Adult: PO** 200 mg/day × 1 wk then 80 mg every other day × 1 mo

Available forms: Tabs 1, 2.5, 5, 10, 20, 50 mg; oral sol 5 mg/5 ml; syr 5 mg/5 ml, del rel tab 1, 2, 5 mg

Administer:

- For long-term use, alternate-day therapy recommended to decrease adverse reactions; give in AM to coincide with normal cortisol secretion • Titrated dose; use lowest effective dose
- With food or milk to decrease GI symptoms
- **Oral sol:** use calibrated measuring device
- **Del rel tab:** swallow whole, do not break, crush, chew; give once a day

SIDE EFFECTS

CNS: Depression, flushing, sweating, headache, mood changes

CV: Hypertension, **circulatory collapse, thrombophlebitis, embolism,** tachycardia

EENT: Fungal infections, increased intraocular pressure, blurred vision

GI: Diarrhea, nausea, abdominal distention, **GI hemorrhage,** increased appetite, pancreatitis

HEMA: **Thrombocytopenia**

INTEG: Acne, poor wound healing, ecchymosis, petechiae

META: Hyperglycemia

MS: Fractures, osteoporosis, weakness

PHARMACOKINETICS

PO: Well absorbed PO, peak 1-2 hr, duration 1-1½ days, half-life 3½-4 hr, biologic terminal half-life 18-36 hr, crosses placenta, enters breast milk,

metabolized by liver after conversion, excreted in urine

INTERACTIONS

Increase: side effects—alcohol, salicylates, indomethacin, amphotericin B, digoxin, cycloSPORINE, diuretics

Increase: predniSONE action—salicylates, estrogens, indomethacin, oral contraceptives, ketoconazole, macrolide antiinfectives

Decrease: predniSONE action—cholestyramine, colestipol, barbiturates, rifampin, ePHEDrine, phenytoin, theophylline

Decrease: effects of anticoagulants, anticonvulsants, antidiabetics, ambenonium, neostigmine, isoniazid, toxoids, vaccines, anticholinesterases, salicylates, somatrem

Drug/Herb

Decrease: predniSONE effect—ephedra (ma huang)

Drug/Lab Test

Increase: cholesterol, sodium, blood glucose, uric acid, calcium, urine glucose

Decrease: calcium, potassium, T₄, T₃, thyroid ¹³¹I uptake test, urine 17-OHCS, 17-KS, PBI

False negative: skin allergy tests

NURSING CONSIDERATIONS

Assess:

- **Adrenal insufficiency:** nausea, vomiting, anorexia, confusion, hypotension, weight loss before, during treatment; HPA suppression may be precipitated by abrupt withdrawal • Potassium, blood glucose, urine glucose while patient receiving long-term therapy; hypokalemia and hyperglycemia; plasma cortisol with long-term therapy, normal: 138-635 nmol/L SI units drawn at 8 AM
- Weight daily; notify prescriber of weekly gain of >5 lb
- B/P, pulse; notify prescriber of chest pain; monitor for crackles, dyspnea if edema is present; hypertension, cardiac symptoms • I&O ratio; be alert for decreasing urinary output, increasing edema
- **Infection:** increased temp, WBC, even after withdrawal of medication; product masks infection • Potassium depletion: paresthesias, fatigue, nausea, vomiting, depression, polyuria, dysrhythmias, weakness • Mental status: affect, mood, behavioral changes, aggression

Evaluate:

- Therapeutic response: ease of respirations, decreased inflammation

Teach patient/family:

- That emergency ID as corticosteroid user should be carried; provide information about product being taken and condition • To notify prescriber if therapeutic response decreases; that dosage adjustment may be needed • To avoid vaccinations

⚠ Not to discontinue abruptly because adrenal crisis can result • To avoid OTC products: salicylates, cough products with alcohol, cold preparations unless directed by prescriber • **Cushingoid symptoms:** moon face, weight gain; symptoms of adrenal insufficiency: nausea, anorexia, fatigue, dizziness, dyspnea, weakness, joint pain • That product causes immunosuppression; to report any symptoms of infection (fever, sore throat, cough) • To notify prescriber if pregnancy is planned or suspected; cleft palate, stillbirth, abortion reported

🍁 Canada only Side effects: *italics* = common; **bold** = life-threatening ⚠
Nurse Alert

pregabalin (Rx)

(pre-gab'a-lin)

Lyrica

Func. class.: Anticonvulsant

Chem. class.: γ -Aminobutyric acid (GABA) analog

Controlled Substance Schedule V

ACTION:

Binds to high-voltage-gated calcium channels in CNS tissues; this may lead to anticonvulsant action similar to the inhibitory neurotransmitter GABA; anxiolytic, analgesics, and antiepileptic properties

USES:

Neuropathic pain associated with spinal cord injury/diabetic peripheral neuropathy, partial-onset seizures, postherpetic neuralgia, fibromyalgia

Unlabeled uses: Moderate pain, social anxiety disorder

CONTRAINDICATIONS:

Hypersensitivity, abrupt discontinuation

Precautions: Pregnancy (C), breastfeeding, children <12 yr, geriatric patients, renal disease, PR interval prolongation, creatine kinase elevations, CHF (class III, IV), decreased platelets, substance abuse, dependence, glaucoma, myopathy, angioedema history, suicidal behavior

DOSAGE AND ROUTES

Calculator

Diabetic peripheral neuropathic pain

- **Adult: PO** 50 mg tid, may increase to 300 mg/day (max) within 1 wk, adjust in patients with renal disease

Partial-onset seizures

- **Adult: PO** 75 mg bid or 50 mg tid; may increase to 600 mg/day (max)

Postherpetic neuralgia

- **Adult: PO** 150 mg/day in 2-3 divided doses, may increase to 300 mg/day in 2-3 divided doses; if higher dose is required after 2-4 wk, may increase to 600

mg/day in 2-3 divided doses

Fibromyalgia

- **Adult: PO** 75 mg bid, may increase to 150 mg bid within 1 wk and 225 mg bid after 1 wk

Renal dose

- **Adult: PO** CCr 30-60 ml/min, 75-300 mg/day in 2-3 divided doses; CCr 15-30 ml/min, 25-150 mg/day in 1-2 divided doses; CCr <15 ml/min, 25-75 mg/day as a single dose

Social phobia (unlabeled)

- **Adult: PO** 150-600 mg/day in 3 divided doses

Available forms: Caps 25, 50, 75, 100, 150, 200, 225, 300 mg; oral sol 20 mg/ml

Administer:

- Do not crush or chew caps; caps may be opened and contents put in applesauce or dissolved in juice
- Give without regard to meals
- Gradually withdraw over 7 days; abrupt withdrawal may precipitate seizures

SIDE EFFECTS

CNS: Dizziness, fatigue, confusion, euphoria, incoordination, nervousness, neuropathy, tremor, vertigo, somnolence, ataxia, amnesia, abnormal thinking, **suicidal ideation**

EENT: Dry mouth, blurred vision, nystagmus, amblyopia, sinusitis

GI: Constipation, flatulence, abdominal pain, weight gain

GU: Gynecomastia

HEMA: Ecchymosis, **thrombocytopenia**

MS: Back pain, **rhabdomyolysis**, myopathy

OTHER: Pruritus, orgasm/erectile dysfunction, peripheral edema, **angioedema**

RESP: Dyspnea

PHARMACOKINETICS

Well absorbed, absorption decreased with food; peak 1.5 hr; 90% recovered in urine unchanged; negligible metabolism; not bound to plasma proteins; half-life 6 hr

INTERACTIONS

Increase: weight gain/fluid retention—thiazolidinedione; avoid use if possible

Increase: CNS depression—anxiolytics, sedatives, hypnotics, barbiturates, general anesthetics, opiate agonists, phenothiazines, sedating H₁ blockers, thiazolidinediones, tricyclics, alcohol

Drug/Lab Test

Increase: creatine kinase

Decrease: platelets

NURSING CONSIDERATIONS

Assess:

- **Seizures:** aura, location, duration, activity at onset, use seizure precaution
- **Pain:** location, duration, characteristics if using for diabetic neuropathy
- **Renal studies:** urinalysis, BUN, urine creatinine q3mo, creatine kinase; if markedly increased, discontinue product
- **Mental status:** mood, sensorium, affect, behavioral changes, suicidal thoughts/behaviors; if mental status changes, notify prescriber
- **Angioedema/hypersensitivity:** monitor for blisters, hives, rash, dyspnea, wheezing; angioedema; if these occur, discontinue; cross-hypersensitivity with this product and gabapentin may occur
- **Rhabdomyolysis and creatinine kinase elevations:** monitor for muscle pain, tenderness, weakness accompanied by malaise or fever; product should be discontinued

Evaluate:

- Therapeutic response: decreased seizure activity; decrease in neuropathic pain

Teach patient/family:

- To carry emergency ID stating patient's name, products taken, condition, prescriber's name and phone number
- To avoid driving, other activities that require alertness because dizziness, drowsiness may occur
- Not to discontinue medication quickly after long-term use, to taper over ≥ 1 wk; that withdrawal-precipitated seizures may occur; not to double doses if dose is missed, to take if 2 hr or more before next dose
- To notify prescriber if pregnancy planned or suspected; to avoid breastfeeding
- To report muscle pain, tenderness, weakness when accompanied by fever, malaise, suicidal thoughts/behaviors
- To avoid alcohol

TREATMENT OF OVERDOSE:

Lavage, VS, hemodialysis

🍁 Canada only Side effects: *italics* = common; **bold** = life-threatening ⚠️
Nurse Alert

primaquine (Rx)

(prim'a-kween)

Func. class.: Antimalarial

Chem. class.: Synthetic 8-aminoquinolone

ACTION:

Unknown; thought to destroy exoerythrocytic forms by gametocidal action

USES:

Malaria caused by *Plasmodium vivax*; in combination with clindamycin for *Pneumocystis jiroveci* pneumonia

CONTRAINDICATIONS:

Lupus erythematosus, rheumatoid arthritis; hypersensitivity to this product or idoquinol

Precautions: Pregnancy (C), breastfeeding, methemoglobin reductase deficiency

Black Box Warning:

Bone marrow suppression, hemolytic anemia, G6PD deficiency

DOSAGE AND ROUTES

Calculator

- **Adult: PO** 15-30 mg (base)/day $\times$ 2 wk or 45 mg (base)/day $\times$ 8 wk; 26.3-mg tab is 15-mg base

- **Child: PO** 0.5 mg/kg (0.3 mg/base/day) daily $\times$ 2 wk

Available forms: Tabs 26.3 mg

Administer:

PO route

- Before or after meals at same time each day to maintain product level; take with food to decrease GI upset

SIDE EFFECTS

CNS: Headache, dizziness

CV: Hypertension, dysrhythmias

EENT: Blurred vision, difficulty focusing

GI: Nausea, vomiting, anorexia, cramps

HEMA: Agranulocytosis, granulocytopenia, leukopenia, hemolytic anemia, leukocytosis, mild anemia, methemoglobinemia

INTEG: Pruritus, skin eruptions, pallor, weakness

PHARMACOKINETICS

PO: Metabolized by liver (metabolites), half-life 3.7-9.6 hr

INTERACTIONS

- Toxicity: quinacrine

Decrease: effect of carbamazepine, phenobarbital, phenytoins, rifamycins, nafcillin

Drug/Food

Increase: primaquine effect—food

Decrease: primaquine effect—grapefruit juice

Drug/Lab Test

Increase: WBC

Decrease: WBC, RBC, Hgb

NURSING CONSIDERATIONS

Assess:

- Ophthalmic test if patient receiving long-term treatment or product dosage of >150 mg/day
- Hepatic studies weekly: AST, ALT, bilirubin if patient receiving long-term therapy

- Blood studies: CBC; blood dyscrasias occur

- Allergic reactions: pruritus, rash, urticaria

- Blood dyscrasias: malaise, fever, bruising, bleeding (rare)

- Renal status: dark urine, hematuria, decreased output

 **Hemolytic reaction:** chills, fever, chest pain, cyanosis; product should be discontinued immediately; hemolytic anemia may be severe in patients of Asian, Mediterranean descent

Evaluate:

- Therapeutic response: decreased symptoms of malaria

Teach patient/family:

- To report visual problems, fever, fatigue, dark urine, bruising, bleeding; may indicate blood dyscrasias
- To complete full course of therapy

- That an eye exam will be needed q4-6mo if using product for an extended period of time

🍁 Canada only Side effects: *italics* = common; **bold** = life-threatening ⚠️
Nurse Alert

primidone (Rx)

(pri'mi-done)

Mysoline, Sertan 

Func. class.: Anticonvulsant

Chem. class.: Barbiturate derivative

ACTION:

Raises seizure threshold by conversion of product to PHENobarbital, decreases neuron firing

USES:

Generalized tonic-clonic (grand mal), complex seizures

Unlabeled uses: Benign familial tremor (essential tremor)

CONTRAINDICATIONS:

Pregnancy (D), breastfeeding, hypersensitivity, porphyria, hepatic encephalopathy

Precautions: Hyperactive children, COPD, renal/hepatic disease, suicidal ideation/behavior

DOSAGE AND ROUTES

Calculator

- **Adult and child >8 yr:** PO 125-250 mg at bedtime, increase by 125-250 mg/day q3-7days, usual dose 750-1500 mg/day in 3-4 divided doses, max 2 g/day in divided doses
- **Child <8 yr:** PO 50-125 mg at bedtime, increase by 50-125 mg/day q3-7days, usual dose 10-25 mg/kg/day in 3-4 divided doses
- **Neonate:** PO 12-20 mg/kg/day in 2-4 divided doses, start at lower dose and titrate

Benign familial tremor/essential tremor (unlabeled)

- **Adult:** PO 50-62.5 mg, increase as tolerated up to 750 mg/day in 3 divided doses

Renal dose

- **Adult:** PO CCr 10-50 ml/min, increase interval between doses to 8-12 hr; CCr <10 ml/min, increase interval to 12-24 hr

Available forms: Tabs 50, 250 mg; susp 250 mg/5 ml 🍁; chew tabs 125 mg 🍁

Administer:

PO route

- After shaking liquid susp well
- With food for GI upset
- Tablets crushed and mixed with food or fluid for swallowing difficulties
- Avoid use with CNS depressants

SIDE EFFECTS

CNS: *Stimulation, drowsiness, irritability, psychosis, ataxia, vertigo, fatigue, emotional disturbances, mood changes, paranoia, suicidal ideation*

EENT: Diplopia, nystagmus, edema of eyelids

GI: *Nausea, vomiting, anorexia, hepatitis*

GU: Impotence

HEMA: *Thrombocytopenia, leukopenia, neutropenia, eosinophilia, megaloblastic anemia, decreased serum folate level, lymphadenopathy*

INTEG: *Rash, edema, alopecia, lupuslike syndrome*

PHARMACOKINETICS

PO: Peak 4 hr; metabolized in liver; excreted by kidneys, in breast milk; half-life 10-12 hr (primidone)

INTERACTIONS

- Primidone levels decreased by acetaZOLAMIDE, succinimides
- May decrease effect of oral contraceptives, acebutolol, metoprolol, propranolol, tricyclics, phenothiazines, lamoTRIGine, estrogens, non-oral combination contraceptives, progestins

Increase: primidone levels—alcohol, heparin, CNS depressants, isoniazid, nicotinamide, MAOIs

Increase: toxicity—CYP3A4 inhibitors (aprepitant, antiretroviral protease inhibitors, delavirdine, fluconazole, imatinib, voriconazole)

Decrease: primidone effect—CYP3A4 inducers (barbiturates, carBAMazepine, efavirenz, phenytoins, nevirapine)

Drug/Herb

- Avoid use with kava, St. John's wort, valerian

Increase: effect—ginkgo

Decrease: effect—ginseng, santonica

NURSING CONSIDERATIONS

Assess:

- **Seizures:** location, duration, type; folic acid deficiency; fatigue, weakness, neuropathy, depression
- Product level: therapeutic level 5-15 mcg/ml; CBC, LFTs should be obtained q6mo

- **Mental status:** mood, sensorium, affect, memory (long, short), suicidal thoughts/behaviors
- Respiratory depression, wheezing

- Blood dyscrasias: fever, sore throat, bruising, rash, jaundice

Evaluate:

- Therapeutic response: decreased seizures

Teach patient/family:

- Not to withdraw product quickly because withdrawal symptoms may occur
- To avoid hazardous activities until stabilized on product because drowsiness, dizziness may occur
- To carry emergency ID with condition, medication listed
- To recognize signs of blood dyscrasias; about when to notify prescriber
- To avoid alcohol
- **Contraception:** Use additional contraceptive during and for 1 mo after therapy, contraceptive may be reduced

☼ Canada only Side effects: *italics* = common; **bold** = life-threatening ⚠
Nurse Alert

probenecid (Rx)

(proe-ben'e-sid)

Func. class.: Uricosuric, antigout agent

Chem. class.: Sulfonamide derivative

ACTION:

Inhibits tubular reabsorption of urates, with increased excretion of uric acids

USES:

Hyperuricemia in gout, gouty arthritis, adjunct to penicillin treatment

CONTRAINDICATIONS:

Hypersensitivity, severe renal/hepatic disease, CCr <50 mg/min, history of uric acid calculus

Precautions: Pregnancy (C), children <2 yr, sulfonamide hypersensitivity, peptic ulcer

DOSAGE AND ROUTES

Calculator

Adjunct to penicillin

- **Adult/adolescent >15 yr, >50 kg (110 lb):** PO 500 mg qid

Gout/gouty arthritis

- **Adult:** PO 250 mg bid for 1 wk, then 500 mg bid, max 2 g/day; maintenance 500 mg/day × 6 mo

Adjunct in penicillin treatment

- **Adult and adolescent >50 kg:** PO 500 mg qid
- **Child <50 kg:** PO 25 mg/kg, then 40 mg/kg in divided doses qid

Renal dose

- **Avoid use if CCr <50 ml/min**

Available forms: Tabs 500 mg

Administer:

- After meals or with milk if GI symptoms occur
- Increase fluid intake to 2-3 L/day to prevent urinary calculi

SIDE EFFECTS

CNS: Drowsiness, headache, flushing

CV: Bradycardia

GI: *Gastric irritation, nausea, vomiting, anorexia*, **hepatic necrosis**

GU: Glycosuria, thirst, frequency, **nephrotic syndrome**

INTEG: Rash, dermatitis, pruritus, fever

META: *Acidosis, hypokalemia, hyperchloremia*, hyperglycemia

RESP: **Apnea**, irregular respirations

PHARMACOKINETICS

Peak 2-4 hr, duration 8 hr, half-life 5-8 hr; metabolized by liver; excreted in urine

INTERACTIONS

Increase: effect of acyclovir, barbiturates, allopurinol, benzodiazepines, dyphylline, zidovudine, cephalosporins, penicillins, sulfonamides

Increase: toxicity—**sulfa products, dapson, clofibrate, indomethacin, rifampin, naproxen, methotrexate**

Decrease: action of probenecid—salicylates

Drug/Lab Test

Increase: theophylline levels

NURSING CONSIDERATIONS

Assess:

- Uric acid levels (3-7 mg/dl); mobility, joint pain, swelling
- Respiratory rate, rhythm, depth; notify prescriber of abnormalities
- Electrolytes; CO₂ before, during treatment
- Urine pH, output, glucose during beginning treatment

⚠ For CNS symptoms: confusion, twitching, hyperreflexia, stimulation, headache; may indicate overdose

Evaluate:

- Therapeutic response: absence of pain, stiffness in joints

Teach patient/family:

- To avoid OTC preparations (aspirin) unless directed by prescriber; increase water intake, avoid alcohol, caffeine

Nurse Alert

procainamide (Rx)

(proe-kane-ah'mide)

Func. class.: Antidysrhythmic (class IA)

Chem. class.: Procaine HCl amide analog

ACTION:

Depresses excitability of cardiac muscle to electrical stimulation and slows conduction velocity in atrium, bundle of His, and ventricle; increases refractory period

USES:

Life-threatening ventricular dysrhythmias

Unlabeled uses: Atrial fibrillation, flutter

CONTRAINDICATIONS:

Hypersensitivity, severe heart block, torsades de pointes

Black Box Warning:

Lupus erythematosus

Precautions: Pregnancy (C), breastfeeding, children, renal/hepatic disease, CHF, respiratory depression, cytopenia, dysrhythmia associated with digoxin toxicity, myasthenia gravis, digoxin toxicity

Black Box Warning:

Bone marrow failure, cardiac arrhythmias

DOSAGE AND ROUTES

Calculator

Ventricular tachycardia during CPR

- **Adult:** IV loading dose 20 mg/min; either ventricular tachycardia resolves or patient becomes hypotensive; QRS complex is widened by 50% of original width or total is 17 mg/kg (1.2 g for a 70-kg patient); may give up to 50 mg/min in urgent situations; maintenance: 1-4 mg/min **CONT IV INF; IM** 50 mg/kg/day in divided doses q3-6hr

- **Child:** IV PALS 15 mg/kg over 30-60 min

Renal dose

- **Adult:** IV CCr 35-59 ml/min, give 70% maintenance dose; CCr 15-34 ml/min,

give 40%-60% maintenance dose; CCr <15 ml/min, individualize dose

Available forms: Inj 100, 500 mg/ml

Administer:

IM route

- IM inj in deltoid; aspirate to avoid intravascular administration, use only when unable to use IV

Direct IV route

- Dilute each 100 mg/10 ml of 0.9% NaCl, give at max 50 mg/min

Intermittent IV INF route

- Dilute 0.2-1 g/50-500 ml of D₅W (2-4 mg/ml), give over 30-60 min at max 25-50 mg/min, use inf pump

Y-site compatibilities: Alfentanil, amikacin, aminocaproic acid, aminophylline, amiodarone, amphotericin B lipid complex, amphotericin B liposome, anidulafungin, ascorbic acid, atenolol, atracurium, atropine, aztreonam, benztropine, bivalirudin, bleomycin, bumetanide, buprenorphine, butorphanol, calcium chloride/gluconate, caspofungin, ceFAZolin, cefmetazole, cefonicid, cefoperazone, cefotaxime, cefoTEtan, cefOXitin, cefTAZidime, cefTRIAxone, cefuroxime, cephalothin, chlorproMAZINE, cimetidine, cisatracurium, CISplatin, clindamycin, cyanocobalamin, cyclophosphamide, cycloSPORINE, cytarabine, DACTINomycin, DAPTOmycin, dexamethasone, digoxin, diphenhydrAMINE, DOBUTamine, DOCEtaxel, DOPamine, doxacurium, DOXOrubicin, doxycycline, enalaprilat, ePHEDrine, EPINEPHrine, epirubicin, epoetin alfa, eptifibatide, ertapenem, erythromycin, esmolol, etoposide, etoposide phosphate, famotidine, fenoldopam, fentaNYL, fluconazole, fludarabine, fluorouracil, folic acid, furosemide, gatifloxacin, gemcitabine, gentamicin, glycopyrrolate, granisetron, heparin, hydrocortisone, HYDROmorphone, IDArubicin, ifosfamide, indomethacin, insulin (regular), irinotecan, isoproterenol, ketorolac, labetalol, lidocaine, linezolid, LORazepam, magnesium sulfate, mannitol, mechlorethamine, meperidine, metaraminol, methicillin, methotrexate, methoxamine, methyl dopate, methylPREDNISolone, metoclopramide, metoprolol, mezlocillin, miconazole, midazolam, mitoXANtrone, morphine, moxalactam, multivitamins, mycophenolate, nafcillin, nalbuphine, naloxone, netilmicin, nitroglycerin, nitroprusside, norepinephrine, octreotide, ondansetron, oxacillin, oxaliplatin, oxytocin,

PACLitaxel, palonosetron, pamidronate, pancuronium, pantoprazole, papaverine, PEMEtrexed, penicillin G potassium/sodium, pentamidine, pentazocine, PENTobarbital, PHENobarbital, phenylephrine, phytonadione, piperacillin, piperacillin-tazobactam, polymyxin B, potassium chloride, prochlorperazine, promethazine, propranolol, protamine, pyridoxine, quiNIDine, quinupristin-dalfopristin, ranitidine, remifentanyl, ritodrine, rocuronium, sodium bicarbonate, succinylcholine, SUFentanyl, tacrolimus, teniposide, theophylline, thiamine, thiotepa, ticarcillin, ticarcillin-clavulanate, tigecycline, tirofiban, tobramycin, tolazoline, trimetaphan, urokinase, vancomycin, vasopressin, vecuronium, verapamil, vinCRISTine, vinorelbine, vitamin B complex/C, voriconazole, zoledronic acid

SIDE EFFECTS

CNS: *Headache, dizziness, confusion, psychosis, restlessness, irritability, weakness, depression*

CV: *Hypotension, heart block, cardiovascular collapse, arrest, torsades de pointes*

GI: *Nausea, vomiting, anorexia, diarrhea, hepatomegaly, pain, bitter taste*

HEMA: *SLE syndrome, agranulocytosis, thrombocytopenia, neutropenia, hemolytic anemia*

INTEG: *Rash, urticaria, edema, swelling (rare), pruritus, flushing, angioedema*

SYST: *SLE*

PHARMACOKINETICS

Metabolized in liver to active metabolites, excreted unchanged by kidneys (60%), protein binding 15%

IM: Peak 10-60 min, half-life 3 hr

INTERACTIONS

Increase: effects of neuromuscular blockers

Increase: procainamide effects—cimetidine, quiNIDine, trimethoprim, β -blockers, ranitidine

Increase: toxicity—other antidysrhythmics, thioridazine, quinolones

Drug/Lab Test

Increase: ALT, AST, alk phos, LDH, bilirubin

NURSING CONSIDERATIONS

Assess:

Black Box Warning:

Cardiac dysrhythmias: ECG continuously if using IV to determine increased PR or QRS segments; discontinue immediately; watch for increased ventricular ectopic beats, maximum need to rebolus

- Therapeutic blood levels, 4-10 mcg/ml or NAPA levels 10-20 mcg/ml

Black Box Warning:

Bone marrow suppression: CBC q2wk $\times$ 3 mo; leukocyte, neutrophil, platelet counts may be decreased, treatment may need to be discontinued

- I&O ratio; electrolytes (K, Na, Cl), weight weekly, report gain of >2 lb
- ⚠ **Toxicity:** confusion, drowsiness, nausea, vomiting, tachydysrhythmias, oliguria • ANA titer; during long-term treatment, watch for lupuslike symptoms
- Cardiac rate, rhythm, character, B/P continuously for fluctuations
- Respiratory status: rate, rhythm, character, lung fields; bilateral crackles may occur in CHF patient; watch for respiratory depression ⚠ CNS effects: dizziness, confusion, psychosis, paresthesias, seizures; product should be discontinued

Evaluate:

- Therapeutic response: decreased dysrhythmias

Teach patient/family:

- That wax matrix may appear in stools
- Not to discontinue without provider's approval

Black Box Warning:

To notify prescriber immediately if lupuslike symptoms appear (joint pain, butterfly rash, fever, chills, dyspnea)

Black Box Warning:

To notify prescriber of leukopenia (sore mouth, gums, throat) or thrombocytopenia (bleeding, bruising)

- How to take pulse and when to report to prescriber
- To avoid driving, other hazardous activities until product effect is known

TREATMENT OF OVERDOSE:

O₂, artificial ventilation, ECG, administer DOPamine for circulatory depression, diazepam or thiopental for seizures, isoproterenol

☼ Canada only Side effects: *italics* = common; **bold** = life-threatening ⚠
Nurse Alert

procarbazine (Rx)

(proe-kar'ba-zeen)

Matulane

Func. class.: Antineoplastic, alkylating agent

Chem. class.: Hydrazine derivative

ACTION:

Inhibits DNA, RNA, protein synthesis; has multiple sites of action; nonvesicant

USES:

Lymphoma, Hodgkin's disease, cancers resistant to other therapy

Unlabeled uses: Brain, lung malignancies; other lymphomas; multiple myeloma, malignant melanoma, polycythemia vera

CONTRAINDICATIONS:

Pregnancy (D), breastfeeding, hypersensitivity, thrombocytopenia, bone marrow depression

Precautions: Cardiac/renal/hepatic disease, radiation therapy, seizure disorder, anemia, bipolar disorder, Parkinson's disease

Black Box Warning:

Requires a specialized care setting and an experienced clinician

DOSAGE AND ROUTES

Calculator

- **Adult: PO** 2-4 mg/kg/day for 1st wk; maintain dosage of 4-6 mg/kg/day until platelets, WBC fall; after recovery, 1-2 mg/kg/day
- **Child: PO** 50 mg/m²/day for 7 days then 100 mg/m² until desired response, leukopenia, or thrombocytopenia occurs; 50 mg/m²/day maintenance after bone marrow recovery

Available forms: Caps 50 mg

Administer:

- In divided doses and at bedtime to minimize nausea and vomiting
- Nonphenothiazine antiemetic 30-60 min before product and 4-10 hr after treatment to prevent vomiting

SIDE EFFECTS

CNS: Headache, dizziness, insomnia, hallucinations, confusion, **coma**, pain, chills, fever, sweating, paresthesias, **seizures**, peripheral neuropathy

EENT: Retinal hemorrhage, nystagmus, photophobia, diplopia, dry eyes

GI: *Nausea, vomiting*, anorexia, diarrhea, constipation, dry mouth, stomatitis, elevated hepatic enzymes

GU: Azoospermia, cessation of menses

HEMA: **Thrombocytopenia, anemia, leukopenia, myelosuppression, bleeding tendencies**, purpura, petechiae, epistaxis, **hemolysis**

INTEG: *Rash*, pruritus, dermatitis, alopecia, herpes, hyperpigmentation

MS: Arthralgias, myalgias

RESP: Cough, pneumonitis, hemoptysis

SYST: **Secondary malignancy**

PHARMACOKINETICS

Half-life 1 hr; concentrates in liver, kidney, skin; metabolized in liver, excreted in urine

INTERACTIONS

⚠ Increase: hypotension—meperidine; do not use together

Increase: neuroleptic malignant syndrome, seizures, hyperpyrexia—alcohol, MAOIs, tricyclics, sympathomimetic products, SSRIs, SNRIs

Increase: hypertension—guanethidine, levodopa, methyldopa, reserpine, caffeine

⚠ Life-threatening hypertension: sympathomimetics

Increase: bleeding risk—NSAIDs, anticoagulants, platelet inhibitors, thrombolytics

Increase: CNS depression—barbiturates, antihistamines, opioids, hypotensive agents, phenothiazines

Drug/Food

- **Hypertensive crisis:** tyramine foods

NURSING CONSIDERATIONS

Assess:

- **Bone marrow suppression:** CBC, differential, platelet count weekly; withhold

product if WBC is $<4000/\text{mm}^3$ or platelet count is $<100,000/\text{mm}^3$; notify prescriber • **Hepatic/renal disease:** can cause accumulation of drug, increased toxicity; renal studies: BUN; serum uric acid; urine CCr; electrolytes before, during therapy; I&O ratio, report fall in urine output to $<30 \text{ ml/hr}$; hepatic studies before, during therapy: bilirubin, AST, ALT, alk phos, LDH prn or monthly • Monitor temp; fever may indicate beginning infection

Black Box Warning:

To be used only in a specialized care setting with emergency equipment

Black Box Warning:

To be given only by an experienced clinician knowledgeable in cytotoxic products

- CNS changes: confusion, paresthesias, neuropathies; product should be discontinued

⚠ Tyramine foods in diet; hypertensive crisis can occur ⚠ **Toxicity:** facial flushing, epistaxis, increased PT, thrombocytopenia; product should be discontinued • **Bleeding:** hematuria, guaiac stools, bruising or petechiae, mucosa or orifices q8hr • Effects of alopecia on body image; discuss feelings about body changes

- Jaundiced skin, sclera; dark urine, clay-colored stools, itchy skin, abdominal pain, fever, diarrhea • Buccal cavity for dryness, sores or ulceration, white patches, oral pain, bleeding, dysphagia • GI symptoms: frequency of stools, cramping

- **Acidosis, signs of dehydration:** rapid respirations, poor skin turgor, decreased urine output, dry skin, restlessness, weakness

Evaluate:

- Therapeutic response: decreasing malignancy

Teach patient/family:

- To report any complaints, side effects to nurse or prescriber: CNS changes, diarrhea, cough, SOB, fever, chills, sore throat, bleeding, bruising, vomiting blood; black, tarry stools • That hair may be lost during treatment and wig or hairpiece may make patient feel better; that new hair may be different in color, texture • To avoid sunlight or UV exposure; to wear sunscreen or protective clothing

- To avoid foods with citric acid, hot or rough texture

- To report any bleeding, white spots, ulcerations in mouth to prescriber; to examine mouth daily • To avoid driving, activities requiring alertness because dizziness may occur

- To use effective contraception; to avoid breastfeeding; that product may cause infertility • To avoid the ingestion of alcohol, caffeine, tyramine-containing foods; that cold, hay fever, and weight-reducing products may cause serious product interactions; to avoid smoking • To avoid crowds, persons with infections if granulocytes are low
 - To avoid vaccines
-

🍁 Canada only Side effects: *italics* = common; **bold** = life-threatening ⚠️
Nurse Alert

prochlorperazine (Rx)

(proe-klor-pair'a-zeen)

Compro

Func. class.: Antiemetic, antipsychotic

Chem. class.: Phenothiazine, piperazine derivative

Do not confuse: **prochlorperazine**/chlorproMAZINE

ACTION:

Decreases dopamine neurotransmission by increasing dopamine turnover through the blockade of the D₂ somatodendritic autoreceptor in the mesolimbic system

USES:

Nausea, vomiting, psychotic disorders

Unlabeled uses: Migraine

CONTRAINDICATIONS:

Hypersensitivity to phenothiazines, coma; infants, neonates, children <2 yr or <20 lb; surgery

Precautions: Pregnancy (C), breastfeeding, geriatric patients, seizure, encephalopathy, glaucoma, hepatic disease, Parkinson's disease, BPH

Black Box Warning:

Increased mortality in elderly patients with dementia-related psychosis

DOSAGE AND ROUTES

Calculator

Postoperative nausea/vomiting

• **Adult:** **IM** 5-10 mg 1-2 hr before anesthesia; may repeat after 30 min; **IV** 5-10 mg 15-30 min before anesthesia; **IV INF** 20 mg/L D₅W or **NS** 15-30 min before anesthesia, max 40 mg/day

Severe nausea/vomiting

• **Adult:** **PO** 5-10 mg tid-qid; **SUS REL** 15 mg/day in AM or 10 mg q12hr;

RECT 25 mg/bid; **IM** 5-10 mg q3-4hr prn, max 40 mg/day

• **Child 18-39 kg:** **PO** 2.5 mg tid or 5 mg bid; **IM** 0.132 mg/kg q3-4hr prn, max

15 mg/day

- **Child 14-17 kg: PO/RECT** 2.5 mg bid-tid; **IM** 0.132 mg/kg q3-4hr prn, max 10 mg/day

- **Child 9-13 kg: PO/RECT** 2.5 mg/day-bid; **IM** 0.132 mg/kg q3-4hr prn, max 7.5 mg/day

Antipsychotic

- **Adult and child ≥12 yr: PO** 5-10 mg tid-qid; may increase q2-3days, max 150 mg/day; **IM** 10-20 mg q2-4hr up to 4 doses then 10-20 mg q4-6hr

- **Child 2-12 yr: PO** 2.5 mg bid-tid; **IM** 0.132 mg/kg change to oral ASAP

Antianxiety

- **Adult and child ≥12 yr: PO** 5 mg tid-qid, max 20 mg/day

- **Child 2-12 yr: IM** 0.132 mg/kg change to oral ASAP

Available forms: Tabs 5, 10 mg; supp 25 mg

Administer:

- Avoid other CNS depressants

IM route

- IM inj in large muscle mass; aspirate to avoid IV administration

- Keep patient recumbent for 1/2 hr

Direct IV route

- No dilution needed, inject directly in a vein ≤5 mg/min, do not give as bolus

Intermittent IV INF route

- May dilute 20 mg/L NaCl and give as inf 15-30 min before anesthesia induction

Syringe compatibilities: Atropine, butorphanol, chlorproMAZINE, cimetidine, diamorphine, diphenhydrAMINE, droperidol, fentaNYL, glycopyrrolate, hydrOXYzine, meperidine, metoclopramide, nalbuphine, pentazocine, perphenazine, promazine, promethazine, ranitidine, scopolamine, SUFentanil

Y-site compatibilities: Amsacrine, calcium gluconate, cisatracurium, CISplatin, cladribine, cyclophosphamide, cytarabine, DOXOrubicin, DOXOrubicin liposome, fluconazole, granisetron, heparin, hydrocortisone, melphalan, methotrexate, ondansetron, PACLitaxel, potassium chloride, propofol, remifentanil, sargramostim, SUFentanil, teniposide, thiotepa, vinorelbine, vit B/C

SIDE EFFECTS

CNS: Neuroleptic malignant syndrome, extrapyramidal reactions, tardive dyskinesia, euphoria, depression, drowsiness, restlessness, tremor, dizziness, headache

CV: Circulatory failure, tachycardia, hypotension, ECG changes

EENT: Blurred vision

GI: Nausea, vomiting, anorexia, dry mouth, diarrhea, constipation, weight loss, metallic taste, cramps

HEMA: Agranulocytosis

MISC: Impotence

RESP: Respiratory depression

PHARMACOKINETICS

Metabolized by liver; excreted in urine, breast milk; crosses placenta; 91%-99% protein binding

PO: Onset 30-40 min, duration 3-4 hr

RECT: Onset 60 min, duration 3-4 hr

IM: Onset 10-20 min, duration 4-6 hr; children: 12 hr

INTERACTIONS

Increase: anticholinergic action—anticholinergics, antiparkinson products, antidepressants

Increase: CNS depression—CNS depressants

Increase: serotonin syndrome, neuroleptic malignant syndrome—SSRIs, SNRIs

Decrease: prochlorperazine effect—barbiturates, antacids, lithium

Drug/Herb

Increase: CNS depression—chamomile, hops, kava, St. John's wort, valerian

Increase: EPS—kava

Drug/Lab Test

Increase: LFTs, cardiac enzymes, cholesterol, blood glucose, prolactin, bilirubin, PBI, ¹³¹I, alk phos, leukocytes, granulocytes, platelets

Decrease: hormones (blood and urine)

False positive: pregnancy tests, urine bilirubin

False negative: urinary steroids, 17-OHCS, pregnancy tests

NURSING CONSIDERATIONS

Assess:

- **EPS:** abnormal movement, tardive dyskinesia, akathisia
- VS, B/P; check patients with cardiac disease more often

⚠ Neuroleptic malignant syndrome: seizures, hypo/hypertension, fever, tachycardia, dyspnea, fatigue, muscle stiffness, loss of bladder control; notify prescriber immediately **⚠** CBC, LFTs during course of treatment; blood dyscrasias, hepatotoxicity may occur • Respiratory status before, during, after administration of emetic; check rate, rhythm, character; respiratory depression can occur rapidly among geriatric or debilitated patients

Evaluate:

- Therapeutic response: absence of nausea, vomiting; reduced anxiety, agitation, excitability

Teach patient/family:

- To avoid hazardous activities, activities requiring alertness because dizziness may occur
- To avoid alcohol
- Not to double or skip doses
- That urine may be pink to reddish brown
- That suppositories may contain coconut/palm oil
- To report dark urine, clay-colored stools, bleeding, bruising, rash, blurred vision
- To avoid sun; wear sunscreen, protective clothing

🍁 Canada only Side effects: *italics* = common; **bold** = life-threatening ⚠
Nurse Alert

progesterone (Rx)

(proe-jess'ter-one)

Crinone, Endometrin, First-Progesterone, Prochieve, Prometrium

Func. class.: Progestogen

Chem. class.: Progesterone derivative

ACTION:

Inhibits secretion of pituitary gonadotropins, which prevents follicular maturation, ovulation; stimulates growth of mammary tissue; antineoplastic action against endometrial cancer

USES:

Contraception, amenorrhea, premenstrual syndrome, abnormal uterine bleeding, endometrial hyperplasia prevention, assisted reproductive technology (ART) gel

Unlabeled uses: Corpus luteum insufficiency, early pregnancy failure, PMS, preterm delivery prophylaxis

CONTRAINDICATIONS:

Pregnancy (B), ectopic pregnancy; hypersensitivity to this product, peanuts, or peanut oil; thromboembolic disorders, reproductive cancer, genital bleeding (abnormal, undiagnosed), cerebral hemorrhage, PID, STDs, thrombophlebitis

Black Box Warning:

Breast cancer

Precautions: Breastfeeding, hypertension, asthma, blood dyscrasias, CHF, diabetes mellitus, bone disease, depression, migraine headache, seizure disorders, gallbladder/renal/hepatic disease, family history of breast/reproductive tract cancer

Black Box Warning:

Cardiac disease, dementia

DOSAGE AND ROUTES

Calculator

Infertility

- **Adult: VAG** 90 mg/day (micronized gel); 100 mg 2-3 times/day starting day after oocyte retrieval and for ≤10 wk total (insert)

Amenorrhea/functional uterine bleeding

- **Adult: IM** 5-10 mg/day × 6-8 doses

Endometrial hyperplasia prevention

- **Adult: PO** 200 mg/day × 12 days

Assisted reproductive therapy

- **Adult: GEL** 90 mg (8%) vaginally daily for supplementation; 90 mg (8%) vaginally bid for replacement; if pregnancy occurs, continue × 10-12 wk

Corpus luteum insufficiency (unlabeled)

- **Adult: VAG INSERT** 90-100 mg bid-tid starting at oocyte retrieval and continuing up to 10-12 wk gestation

Available forms: Inj 50 mg/ml; vag gel 4%, 8%; caps 100, 200 mg; vag insert 100 mg; vag supp 25, 100, 200, 500 mg; compounding kit 25, 50, 100, 200, 400 mg

Administer:

PO route

- Do not break, crush, or chew caps
- Titrated dose; use lowest effective dose
- In 1 dose in AM
- With food or milk to decrease GI symptoms
- Start progesterone 14 days after estrogen dose if given concomitantly

Vaginal route

- Wait at least 6 hr after any vaginal treatment before using vaginal gel

IM route

- Shake vial, inject deeply into large muscle, aspirate
- Check for particulate matter and discoloration before injecting

SIDE EFFECTS

CNS: *Dizziness, headache, migraines, depression, fatigue, mood swings, dementia, drowsiness*

CV: Hypotension, **thrombophlebitis**, edema, **thromboembolism, stroke, pulmonary embolism, MI**

EENT: Diplopia, retinal thrombosis

GI: *Nausea, vomiting, anorexia, cramps, increased weight, **cholestatic jaundice, constipation**, abdominal pain*

GU: *Amenorrhea, cervical erosion, breakthrough bleeding, dysmenorrhea, vaginal candidiasis, nocturia, breast changes, **gynecomastia, testicular atrophy**,*

impotence, endometriosis, **spontaneous abortion**, breast pain, ectopic pregnancy

INTEG: Rash, urticaria, acne, hirsutism, alopecia, oily skin, seborrhea, purpura, melasma

META: Hyperglycemia

SYST: **Angioedema, anaphylaxis**

PHARMACOKINETICS

Excreted in urine, feces; metabolized in liver

IM/RECT/VAG: Duration 24 hr

INTERACTIONS

Increase: progesterone effect—CYP3A4 inhibitors (ketoconazole, cimetidine, clarithromycin, danazol, diltiazem, erythromycin, fluconazole, itraconazole, troleandomycin, verapamil, voriconazole)

Decrease: progesterone effect—barbiturates, phenytoin

Drug/Lab Test

Increase: alk phos, nitrogen (urine), pregnanediol, amino acids, factors VII, VIII, IX, X

Decrease: GTT, HDL

NURSING CONSIDERATIONS

Assess:

- **Abnormal uterine bleeding:** vaginal bleeding; obtain pad count, patient menstrual history, breast exam, cervical cytology
- Weight daily; notify prescriber of weekly weight gain of >5 lb
- B/P at beginning of treatment and periodically
- I&O ratio; be alert for decreasing urinary output, increasing edema
- Hepatic studies: ALT, AST, bilirubin periodically during long-term therapy
- Edema, hypertension, cardiac symptoms, jaundice, thromboembolism
- Mental status: affect, mood, behavioral changes, depression
- Hypercalcemia

Perform/provide:

- Storage in dark area

Evaluate:

- Therapeutic response: decreased abnormal uterine bleeding, absence of

amenorrhea

Teach patient/family:

⚠ To report breast lumps, vaginal bleeding, edema, jaundice, dark urine, clay-colored stools, dyspnea, headache, blurred vision, abdominal pain, numbness or stiffness in legs, chest pain • To avoid gel with other vaginal products; if to be used together, to separate by ≥ 6 hr; for vaginal route, on proper insertion technique • To report suspected pregnancy

- To monitor blood glucose if diabetic
- To avoid activities requiring mental alertness until effects are realized, can cause dizziness

🇨🇦 Canada only Side effects: *italics* = common; **bold** = life-threatening ⚠
Nurse Alert

promethazine (Rx)

(proe-meth'a-zeen)

Phenadoz, Phenergan, Promethagan

Func. class.: Antihistamine, H₁-receptor antagonist, antiemetic *Chem. class.:* Phenothiazine derivative

Do not confuse: **Phenergan**/Theragran

ACTION:

Acts on blood vessels, GI, respiratory system by competing with histamine for H₁-receptor sites; decreases allergic response by blocking histamine

USES:

Motion sickness, rhinitis, allergy symptoms, sedation, nausea, preoperative and postoperative sedation

Unlabeled uses: Allergic rhinitis, acute peripheral vestibular nystagmus, hyperemesis gravidarum

CONTRAINDICATIONS:

Hypersensitivity, breastfeeding, agranulocytosis, bone marrow suppression, coma, jaundice, Reye's syndrome

Black Box Warning:

Infants, neonates, children, intraarterial/SUBCUT administration, extravasation

Precautions: Pregnancy (C), cardiac/renal/hepatic disease, asthma, seizure disorder, prostatic hypertrophy, bladder obstruction, glaucoma, COPD, GI obstruction, ileus, CNS depression, diabetes, sleep apnea, urinary retention

Black Box Warning:

IV use

DOSAGE AND ROUTES

Calculator

Nausea/vomiting

- **Adult:** PO/IM/IV/RECT 12.5-25 mg; q4-6hr prn
- **Child >2 yr:** PO/IM/IV/RECT 0.25-0.5 mg/kg q4-6hr prn

Motion sickness

- **Adult:** PO 25 mg bid, give 1/2-1 hr before departure then q8-12hr prn
- **Child ≥2 yr:** PO/IM/RECT 12.5-25 mg bid, give 1/2-1 hr before departure

then q8-12hr prn

Sedation

- **Adult: PO/IM** 25-50 mg at bedtime
- **Child ≥ 2 yr: PO/IM/RECT** 12.5-25 mg at bedtime

Sedation (preoperative/postoperative)

- **Adult: PO/IM/IV** 25-50 mg
- **Child > 2 yr: PO/IM/IV** 0.5-1.1 mg/kg

Allergy/rhinitis (unlabeled)

- **Adult: PO** 12.5 mg qid or 25 mg at bedtime
- **Child ≥ 2 yr: PO** 6.25-12.5 mg tid or 25 mg at bedtime

Hyperemesis gravidarum (unlabeled)

- **Pregnant females: PO/RECT/IM/IV** 12.5-25 mg q4hr

Nystagmus (unlabeled)

- **Adult: PO** 12.5-25 mg q4-6hr for ≤ 48 hr

Available forms: Tabs 12.5, 25, 50 mg; supp 12.5, 25, 50 mg; inj 25, 50 mg/ml

Administer:

- Avoid use with other CNS depressants

PO route

- With meals for GI symptoms; absorption may slightly decrease
- When used for motion sickness, 30 min-1 hr before travel

IM route

- IM inj deep in large muscle; rotate site

Direct IV route

Black Box Warning:

Check for extravasation: burning, pain, swelling at IV site; can cause tissue necrosis

- Do not use if precipitate is present
- Rapid administration may cause transient decrease in B/P
- After diluting each 25-50 mg/9 ml of NaCl for inj; give ≤ 25 mg/2 min

Syringe compatibilities: Butorphanol, chlorproMAZINE, cimetidine, dihydroergotamine, diphenhyDRAMINE, droperidol, fentaNYL, glycopyrrolate, HYDROmorphine, hydrOXYzine, meperidine, metoclopramide, midazolam, pentazocine, perphenazine, prochlorperazine, promazine, ranitidine, scopolamine

Y-site compatibilities: Alfentanil, amifostine, amikacin, aminocaproic acid, amsacrine, anidulafungin, ascorbic acid, atenolol, atracurium, atropine,

aztreonam, benztropine, bivalirudin, bleomycin, bumetanide, buprenorphine, butorphanol, calcium chloride/gluconate, CARBOplatin, caspofungin, chlorproMAZINE, cimetidine, ciprofloxacin, cisatracurium, CISplatin, cladribine, codeine, cyanocobalamin, cyclophosphamide, cycloSPORINE, cytarabine, DACTINomycin, DAPTOMycin, dexmedetomidine, digoxin, diltiazem, diphenhydrAMINE, DOBUTamine, DOCEtaxel, DOPamine, doxacurium, DOXOrubicin, doxycycline, enalaprilat, ePHEDrine, EPINEPHrine, epirubicin, epoetin, eptifibatide, erythromycin, esmolol, etoposide, famotidine, fenoldopam, fentaNYL, filgrastim, fluconazole, fludarabine, gemcitabine, gentamicin, glycopyrrolate, granisetron, HYDROmorphine, hydrOXYzine, IDArubicin, ifosfamide, insulin (regular), irinotecan, isoproterenol, labetalol, levofloxacin, lidocaine, linezolid, LORazepam, magnesium sulfate, mannitol, mechlorethamine, melphalan, meperidine, metaraminol, methoxamine, methyldopate, metoclopramide, metoprolol, metroNIDAZOLE, miconazole, midazolam, milrinone, mitoXANtrone, morphine, mycophenolate, nalbuphine, naloxone, netilmicin, nitroglycerin, norepinephrine, octreotide, ondansetron, oxaliplatin, oxytocin, PACLitaxel, palonosetron, pamidronate, pancuronium, PEMEtrexed, pentamidine, pentazocine, phenylephrine, polymyxin B, procainamide, prochlorperazine, propranolol, protamine, pyridoxine, quiNIDine, quinupristin-dalfopristin, ranitidine, remifentanyl, Ringer's, ritodrine, riTUXimab, rocuronium, sargramostim, sodium acetate, succinylcholine, SUFentanyl, tacrolimus, teniposide, theophylline, thiamine, thiotepa, tigecycline, tirofiban, TNA, tobramycin, tolazoline, trastuzumab, trimetaphan, vancomycin, vasopressin, vecuronium, verapamil, vinCRISTine, vinorelbine, voriconazole

SIDE EFFECTS

CNS: *Dizziness, drowsiness, poor coordination, fatigue, anxiety, euphoria, confusion, paresthesia, neuritis, EPS, neuroleptic malignant syndrome*

CV: Hypo/hypertension, palpitations, tachycardia

EENT: Blurred vision, dilated pupils, tinnitus, nasal stuffiness; dry nose, throat, mouth; photosensitivity

GI: *Constipation, dry mouth, nausea, vomiting, anorexia, diarrhea*

GU: *Urinary retention, dysuria, frequency*

HEMA: Thrombocytopenia, agranulocytosis, hemolytic anemia

INTEG: Rash, urticaria, photosensitivity

RESP: Increased thick secretions, wheezing, chest tightness; apnea in neonates, infants, young children

PHARMACOKINETICS

Metabolized in liver; excreted by kidneys, GI tract (inactive metabolites)

PO: Onset 20 min, duration 4-12 hr

IV: Onset 3-5 min

INTERACTIONS

Increase: CNS depression—barbiturates, opioids, hypnotics, tricyclics, alcohol

Increase: promethazine effect—MAOIs

Decrease: oral anticoagulants effect—heparin

Drug/Lab Test

False negative: skin allergy test

False positive: urine pregnancy test

Interference: blood grouping (ABO), GTT

NURSING CONSIDERATIONS

Assess:

Black Box Warning:

Not to be used in children <2 yr, fatal respiratory depression may occur; use cautiously in children >2 yr, seizures, paradoxical CNS stimulation may occur

- **Antiemetic/motion sickness:** nausea, vomiting before, after dose
- I&O ratio; be alert for urinary retention, frequency, dysuria; product should be discontinued ⚠ CBC with differential, LFTs during long-term therapy; blood dyscrasias, jaundice may occur
- **Respiratory status:** rate, rhythm, increase in bronchial secretions, wheezing, chest tightness
- **Cardiac status:** palpitations, increased pulse, hypo/hypertension, B/P in those receiving IV doses
- **Neuroleptic malignant syndrome:** fever, confusion, diaphoresis, rigid muscles, elevated CPK, encephalopathy; discontinue product, notify prescriber

Perform/provide:

- Hard candy, gum, frequent rinsing of mouth for dryness
- Storage in tight, light-resistant container

Evaluate:

- Therapeutic response: absence of running, congested nose; rashes; absence of motion sickness, nausea; sedation

Teach patient/family:

- That product may cause photosensitivity; to avoid prolonged exposure to sunlight
 - To notify prescriber of confusion, sedation, hypotension, jaundice, fever
 - To avoid driving, other hazardous activity if drowsy
 - To avoid concurrent use of alcohol or other CNS depressants
 - That product may reduce sweating; that there is a risk of heat stroke
 - How to use frequent sips of water, gum to decrease dry mouth
-

Nurse Alert

propafenone (Rx)

(pro-paff'e-nown)

Rythmol, Rythmol SR

Func. class.: Antidysrhythmic (class IC)

ACTION:

Slows conduction velocity; reduces membrane responsiveness; inhibits automaticity; increases ratio of effective refractory period to action potential duration; β -blocking activity

USES:

Sustained ventricular tachycardia, atrial fibrillation (single dose), paroxysmal supraventricular tachycardia (PSVT) prophylaxis, supraventricular dysrhythmias

Unlabeled uses: Wolff-Parkinson-White (WPW) syndrome

CONTRAINDICATIONS:

2nd/3rd-degree AV block, right bundle branch block, cardiogenic shock, hypersensitivity, bradycardia, uncontrolled CHF, sick-sinus syndrome, marked hypotension, bronchospastic disorders, electrolyte imbalance

Precautions: Pregnancy (C), breastfeeding, children, geriatric patients, CHF, hypo/hyperkalemia, nonallergic bronchospasm, renal/hepatic disease, hematologic disorders, myasthenia gravis

Black Box Warning:

Recent MI, cardiac arrhythmias, QT prolongation, torsades de pointes

DOSAGE AND ROUTES

Calculator

• **Adult: PO** 150 mg q8hr; allow 3-4 day interval before increasing dose, max 900 mg/day

Atrial fibrillation

• **Adult: PO** 450 or 600 mg as single dose; SR 225 mg q12hr, may increase to 325 q12hr, max 425 mg q12hr

Available forms: Tabs 150, 225, 300 mg; SR cap 225, 325, 425 mg

Administer:

• Do not break, crush, or chew tabs; swallow whole

- To hospitalized patients because heart monitoring is required
- After hypo/hyperkalemia is corrected
- With dosage adjustment q3-4days
- Without regard to meals

SIDE EFFECTS

CNS: Headache, dizziness, abnormal dreams, syncope, confusion, **seizures**, insomnia, tremor, anxiety, fatigue

CV: **Supraventricular dysrhythmia, ventricular dysrhythmia, bradycardia, prodysrhythmia, palpitations, AV block, intraventricular conduction delay, AV dissociation, hypotension, chest pain, asystole**

EENT: Blurred vision, altered taste, tinnitus

GI: *Nausea, vomiting*, constipation, dyspepsia, cholestasis, abnormal hepatic studies, dry mouth, diarrhea, anorexia

HEMA: **Leukopenia, agranulocytosis, granulocytopenia, thrombocytopenia**, anemia, bruising

INTEG: Rash

RESP: Dyspnea

PHARMACOKINETICS

Peak 3-8 hr, half-life 2-10 hr; metabolized in liver; excreted in urine (metabolite)

INTERACTIONS

Increase: propafenone effects—CYP1A2, CYP2D6, CYP3A4 inhibitors (protease inhibitors, quinine, PARoxetine, saquinavir, erythromycin, azole antifungals, sertraline, tricyclics)

Increase: QT prolongation—other class IA/IC antidysrhythmics, arsenic trioxide, chloroquine, clarithromycin, droperidol, erythromycin, haloperidol, levomethadyl, methadone, pentamidine, chlorpromazine, mesoridazine, thioridazine

Increase: anticoagulation—warfarin

Increase: CNS effects—local anesthetics

Increase: digoxin level—digoxin

Increase: β -blocker effect—propranolol, metoprolol

Increase: cycloSPORINE levels—cycloSPORINE

Decrease: propafenone effect—rifampin, cimetidine, quinine

Drug/Lab Test

Increase: CPK

NURSING CONSIDERATIONS

Assess:

- GI status: bowel pattern, number of stools

Black Box Warning:

QT/PR prolongation: ECG or Holter monitor prior to and during therapy

Black Box Warning:

CHF: dyspnea, jugular venous distention, crackles, edema in extremities, I&O ratio; check for decreasing output; daily weight

- CBC, ANA titer, LFTs
- Chest x-ray, pulmonary function test during treatment
- Lung fields; bilateral crackles, dyspnea, peripheral edema, weight gain; jugular venous distention may occur in patient with CHF

 **Toxicity:** fine tremors, dizziness, hypotension, drowsiness, abnormal heart rate

Evaluate:

- Therapeutic response: absence of ventricular dysrhythmias; decreasing recurrence of PAF, PSVT

Teach patient/family:

- To avoid hazardous activities until response is known
- To report fever, chills, sore throat, bleeding, SOB, chest pain, palpitations, blurred vision
- To take tab with food
- To carry emergency ID identifying medication and prescriber
- To avoid abrupt discontinuation of product; to take as prescribed; not to miss, double doses

TREATMENT OF OVERDOSE:

O₂, artificial ventilation, defibrillation ECG; administer DOPamine for circulatory depression, diazepam or thiopental for seizures, isoproterenol

☛ Canada only Side effects: *italics* = common; **bold** = life-threatening 

Nurse Alert

proparacaine ophthalmic

See [Appendix B](#)

 **HIGH ALERT**

propofol (Rx)

(pro'poh-fole)

Diprivan, Fresenius Propoven

Func. class.: General anesthetic

ACTION:

Produces dose-dependent CNS depression by activation of GABA receptor

USES:

Induction or maintenance of anesthesia as part of balanced anesthetic technique; sedation in mechanically ventilated patients

CONTRAINDICATIONS:

Hypersensitivity to this product or soybean oil, egg, benzyl alcohol (some products)

Precautions: Pregnancy (B), breastfeeding, children, geriatric patients, respiratory depression, severe respiratory disorders, cardiac dysrhythmias, labor and delivery, renal disease, hyperlipidemia

DOSAGE AND ROUTES

Calculator

Anesthesia

- **Adult <55 yr and asa I/II IV (diprivan or generic):** **IV** 40 mg q10sec until induction onset, maintenance 100-200 mcg/kg/min or **IV BOL** 20-50 mg prn, allow 3-5 min between adjustments; Fresenius Propoven 1% **IV** 20-40 q10sec until induction then 3-6 mg/kg/hr
- **Child ≥3 yr or asa I or II: IV induction:** 2.5-3.5 mg/kg over 20-30 sec when not premedicated or lightly premedicated

• **Child 2 mo-16 yr maintenance: IV** 125-300 mcg/kg/min, lower dose for ASA III or IV

ICU sedation

• **Adult: IV** 5 mcg/kg/min over 5 min; may increase by 5-10 mcg/kg/min over 5-10 min until desired response (Diprivan or generic): 0.3-4 mg/kg/hr, max 4 mg/kg/hr (Fresenius Propoven)

Available forms: Inj 10 mg/ml in 20-ml ampule, 50-ml and 100-ml vials

Administer:

IV route

- Shake well before use; dilution is not necessary but, if diluted, use only D₅W to ≥ 2 mg/ml; give over 3-5 min, titrate to needed level of sedation; use only glass containers when mixing, not stable in plastic; use aseptic technique when transferring from original container • **Fresenius Propoven 1%:** dilution is not necessary but, if diluted, use D₅W or NS to ≥ 2 mg/ml (max dilution max 1 part Fresenius Propoven/4 parts D₅W or NS); do not admix; lidocaine can be used to reduce pain at site • May be given by cont inf; give by inf pump
- Only with resuscitative equipment available; only by qualified persons trained in anesthesia

Y-site compatibilities: Acyclovir, alfentanil, aminophylline, ampicillin, aztreonam, bumetanide, buprenorphine, butorphanol, calcium gluconate, CARBOplatin, ceFAZolin, cefoperazone, cefotaxime, cefoTEtan, cefOXitin, ceftizoxime, cefTRIAxone, cefuroxime, chlorproMAZINE, cimetidine, CISplatin, clindamycin, cyclophosphamide, cycloSPORINE, cytarabine, dexamethasone, diphenhydrAMINE, DOBUTamine, DOPamine, doxycycline, droperidol, enalaprilat, ePHEDrine, EPINEPHrine, esmolol, famotidine, fentaNYL, fluconazole, fluorouracil, furosemide, ganciclovir, glycopyrrolate, granisetron, haloperidol, heparin, hydrocortisone, HYDROmorphone, hydrOXYzine, ifosfamide, imipenem/cilastatin, inamrinone, regular insulin, isoproterenol, ketamine, labetalol, levorphanol, lidocaine, LORazepam, magnesium sulfate, mannitol, meperidine, mezlocillin, miconazole, morphine, nafcillin, nalbuphine, naloxone, nitroglycerin, norepinephrine, ofloxacin, PACLitaxel, PENTobarbital, PHENobarbital, piperacillin, potassium chloride, prochlorperazine, propranolol, ranitidine, scopolamine, sodium bicarbonate,

sodium nitroprusside, succinylcholine, SUFentanil, thiopental ticarcillin, ticarcillin/clavulanate, vecuronium, verapamil

Solution compatibilities: if given together via **Y-site**: D₅W, D₅LR, LR, D₅/0.45% NaCl, D₅/0.2% NaCl

SIDE EFFECTS

CNS: Involuntary movement, headache, jerking, fever, dizziness, shivering, tremor, confusion, somnolence, paresthesia, agitation, abnormal dreams, euphoria fatigue, **increased intracranial pressure, impaired cerebral flow, seizures**

CV: *Bradycardia, hypotension*, hypertension, PVC, PAC, tachycardia, abnormal ECG, ST segment depression, **asystole, bradydysrhythmias**

EENT: Blurred vision, tinnitus, eye pain, strange taste, diplopia

GI: *Nausea, vomiting, abdominal cramping*, dry mouth, swallowing, hypersalivation, **pancreatitis**

GU: Urine retention, green urine, cloudy urine, oliguria

INTEG: *Flushing, phlebitis, hives, burning/stinging at inj site*, rash, pain of extremities

MS: Myalgia

RESP: **Apnea**, *cough, hiccups*, dyspnea, hypoventilation, sneezing, wheezing, tachypnea, hypoxia, respiratory acidosis

SYST: **Propofol infusion syndrome**

PHARMACOKINETICS

Onset 15-30 sec, rapid distribution, half-life 1-8 min, terminal half-life 3-12 hr; 70% excreted in urine; metabolized in liver by conjugation to inactive metabolites, 95%-99% protein binding

INTERACTIONS

- **Do not use within 10 days of MAOIs**

Increase: CNS depression—alcohol, opioids, sedative/hypnotics, antipsychotics, skeletal muscle relaxants, inhalational anesthetics

Drug/Herb

Increase: propofol effect—St. John's wort

NURSING CONSIDERATIONS

Assess:

- Inj site: phlebitis, burning, stinging
- **ECG** for changes: PVC, PAC, ST segment changes; monitor VS
- **Neurologic excitatory symptoms:** movement, tremors, dizziness, LOC, pupil reaction • Allergic reactions: hives

⚠ Respiratory dysfunction: respiratory depression, character, rate, rhythm; notify prescriber if respirations are <10/min • **Propofol infusion syndrome:** rhabdomyolysis, renal failure, hyperkalemia, metabolic acidosis, cardiac dysrhythmias, heart failure usually between 35 and 93 hr after inf begun at >5 mg/kg/hr for >58 hr

Perform/provide:

- Storage in light-resistant area at room temp, use within 6 hr of opening
- If transferred from original container to another container, complete inf within 12 hr (Dipravan), 6 hr (generic propofol)

Evaluate:

- Therapeutic response: induction of anesthesia

Teach patient/family:

- That product will cause dizziness, drowsiness, sedation; to avoid hazardous activities until drug effect wears off

TREATMENT OF OVERDOSE:

Discontinue product; administer vasopressor agents or anticholinergics, artificial ventilation

☼ Canada only Side effects: *italics* = common; **bold** = life-threatening ⚠
Nurse Alert

propranolol (Rx)

(proe-pran'oh-lole)

Inderal, Inderal LA, InnoPran XL

Func. class.: Antihypertensive, antianginal, antidysrhythmic (class II) *Chem. class.:* β -Adrenergic blocker

Do not confuse: **propranolol**/Pravachol

Inderal/Toradol/Inderide/Adderall/Imuran

ACTION:

Nonselective β -blocker with negative inotropic, chronotropic, dromotropic properties

USES:

Chronic stable angina pectoris, hypertension, supraventricular dysrhythmias, migraine prophylaxis, pheochromocytoma, cyanotic spells related to hypertrophic subaortic stenosis

Unlabeled uses: Anxiety, Parkinson's tremor, prevention of variceal bleeding caused by portal hypertension, akathisia induced by antipsychotics, acute MI, portal hypertension, sclerodermal renal crisis, unstable angina, infantile capillary hemangioma, lithium-induced tremor

CONTRAINDICATIONS:

Hypersensitivity to this product; cardiogenic shock, AV heart block; bronchospastic disease; sinus bradycardia; bronchospasm; asthma

Precautions: Pregnancy (C), breastfeeding, children, diabetes mellitus, hyperthyroidism, COPD, renal/hepatic disease, myasthenia gravis, peripheral vascular disease, hypotension, cardiac failure, Raynaud's disease, sick sinus syndrome, vasospastic angina, smoking, Wolff-Parkinson-White syndrome, thyrotoxicosis

Black Box Warning:

Abrupt discontinuation

DOSAGE AND ROUTES

Calculator

Dysrhythmias

- **Adult: PO** 10-30 mg tid-qid; **IV BOL** 1-3 mg give 1 mg/min; may repeat after 2 min, may repeat q4hr thereafter

- **Child: PO** 1 mg/kg/day in 2 divided doses; **IV** 0.01-0.1 mg/kg over 5 min

Hypertension

- **Adult: PO** 40 mg bid or 80 mg/day (ext rel) initially; usual dose 120-240 mg/day bid-tid or 120-160 mg/day (ext rel)

- **Child: PO** 0.5-1 mg/kg/day divided q6-12hr

Angina

- **Adult: PO** 10-20 mg bid-qid, increase at 3-7 day intervals up to 160-320 mg/day or 80 mg daily

MI prophylaxis

- **Adult: PO** 180-240 mg/day tid-qid starting 5 days to 2 wk after MI

Pheochromocytoma

- **Adult: PO** 60 mg/day × 3 days preoperatively in divided doses or 30 mg/day in divided doses (inoperable tumor)

Migraine

- **Adult: PO** 80 mg/day (ext rel) or in divided doses; may increase to 160-240 mg/day in divided doses

- **Child >35 kg (unlabeled): PO** 20-40 mg tid

- **Child ≤35 kg (unlabeled): PO** 10-20 mg tid

Essential tremor

- **Adult: PO** 40 mg bid; usual dose 120 mg/day

Acute MI (unlabeled)

- **Adult: PO** 180-320 mg/day in 3-4 divided doses

Anxiety (unlabeled)

- **Adult: PO** 10-80 mg given 1 hr prior to anxiety-producing event

Scleroderma renal crisis (unlabeled)

- **Adult: PO** 40 mg bid, may increase q3-7days, max 160-480 mg/day

Esophageal varices (portal hypertension) (unlabeled)

- **Adult: PO** 40 mg bid, titrate to heart rate reduction of 25%

Infantile capillary hemangioma (unlabeled)

- **Infant: PO** 2-3 mg/kg/day

Available forms: Ext rel caps 60, 80, 120, 160 mg; tabs 10, 20, 40, 60, 80, 90 mg; inj 1 mg/ml; oral sol 4 mg/ml, 8 mg/ml

Administer:

PO route

- Do not break, crush, chew, or open ext rel cap
- Do not use ext rel cap for essential tremor, MI, cardiac dysrhythmias; do not use InnoPran XL in hypertrophic subaortic stenosis, migraine, angina pectoris
- Ext rel caps should be taken daily; InnoPran XL should be taken at bedtime
- May mix oral sol with liquid or semisolid food; rinse container to get entire dose
- With 8 oz water with food; food enhances bioavailability
- Do not give with aluminum-containing antacid; may decrease GI absorption

Direct IV route

- IV undiluted or diluted 10 ml D₅W for inj; give ≤1 mg/min

Intermittent IV INF route

- May be diluted in 50 ml NaCl and run 1 mg over 10-15 min

Y-site compatibilities: Acyclovir, alfentanil, alteplase, amikacin, aminocaproic acid, aminophylline, anidulafungin, ascorbic acid, atracurium, atropine, azaTHIOprine, aztreonam, benztropine, bivalirudin, bleomycin, bumetanide, buprenorphine, butorphanol, calcium chloride/gluconate, CARBOplatin, carmustine, caspofungin, cefamandole, ceFAZolin, cefmetazole, cefonicid, cefoperazone, cefotaxime, cefoTEtan, cefOXitin, cefTAZidime, ceftizoxime, cefTRIAxone, cefuroxime, cephalothin, cephapirin, chloramphenicol, chlorproMAZINE, cimetidine, CISplatin, clindamycin, cyanocobalamin, cyclophosphamide, cycloSPORINE, cytarabine, DACTINomycin, DAPTOmycin, dexamethasone, digoxin, diltiazem, diphenhydrAMINE, DOBUTamine, DOCEtaxel, DOPamine, doxacurium, DOXOrubicin, doxycycline, enalaprilat, ePHEDrine, EPINEPHrine, epirubicin, epoetin alfa, eptifibatide, ertapenem, erythromycin, esmolol, etoposide, etoposide phosphate, famotidine, fenoldopam, fentaNYL, fluconazole, fludarabine, fluorouracil, folic acid, furosemide, ganciclovir, gatifloxacin, gemcitabine, gemtuzumab, gentamicin, glycopyrrolate, granisetron, heparin, hydrocortisone, HYDROmorphone, hydrOXYzine, IDArubicin, ifosfamide, imipenem-cilastatin, inamrinone, irinotecan, isoproterenol, ketorolac, labetalol, levofloxacin, lidocaine, linezolid, LORazepam, magnesium, mannitol, mechlorethamine, meperidine, metaraminol, methicillin, methotrexate, methoxamine, methylDopate, methylPREDNISolone, metoclopramide, metoprolol,

metroNIDAZOLE, mezlocillin, miconazole, midazolam, milrinone, minocycline, mitoXANtrone, morphine, moxalactam, multiple vitamins, mycophenolate, nafcillin, nalbuphine, naloxone, nesiritide, netilmicin, nitroglycerin, nitroprusside, norepinephrine, octreotide, ondansetron, oxacillin, oxaliplatin, oxytocin, palonosetron, pamidronate, pancuronium, papaverine, PEMEtrexed, penicillin G potassium/sodium, pentamidine, pentazocine, PENTobarbital, PHENobarbital, phenylephrine, phytonadione, piperacillin, polymyxin B, potassium chloride, procainamide, prochlorperazine, promethazine, propofol, protamine, pyridoxine, quiNIDine, quinupristin-dalfopristin, ranitidine, ritodrine, rocuronium, sodium acetate/bicarbonate, succinylcholine, SUFentanil, tacrolimus, teniposide, theophylline, thiamine, thiotepa, ticarcillin, ticarcillin-clavulanate, tigecycline, tirofiban, tobramycin, tolazoline, trimetaphan, urokinase, vancomycin, vasopressin, vecuronium, verapamil, vinCRIStine, vinorelbine, vitamin B complex/C, voriconazole, zoledronic acid

SIDE EFFECTS

CNS: Depression, hallucinations, dizziness, *fatigue*, lethargy, paresthesias, bizarre dreams, disorientation

CV: **Bradycardia**, hypotension, **CHF**, palpitations, AV block, peripheral vascular insufficiency, vasodilation, cold extremities, **pulmonary edema**, **dysrhythmias**

EENT: Sore throat, **laryngospasm**, blurred vision, dry eyes

GI: Nausea, vomiting, diarrhea, colitis, constipation, cramps, dry mouth, hepatomegaly, gastric pain, acute pancreatitis

GU: Impotence, decreased libido, UTIs

HEMA: **Agranulocytosis**, **thrombocytopenia**

INTEG: Rash, pruritus, fever

META: Hyperglycemia, hypoglycemia

MISC: Facial swelling, weight change, Raynaud's phenomenon

MS: Joint pain, arthralgia, muscle cramps, pain

RESP: Dyspnea, respiratory dysfunction, *bronchospasm*, cough

PHARMACOKINETICS

Metabolized by liver; crosses placenta, blood-brain barrier; excreted in breast milk; protein binding 90%

PO: Onset 30 min, peak 1-1½ hr, duration 12 hr, half-life 3-8 hr

PO-ER: Peak 6 hr, duration 24 hr, half-life 8-11 hr

IV: Onset 2 min, peak 1 min, duration 5 min

INTERACTIONS

Increase: toxicity—phenothiazines

Increase: propranolol level—propafenone

Increase: effect of calcium channel blockers, neuromuscular blocker

Increase: negative inotropic effects—disopyramide

Increase: β-blocking effect—cimetidine

Increase: hypotension—quinidine, haloperidol, prazosin

Decrease: β-blocking effects—barbiturates

Decrease: propranolol levels—smoking

Drug/Herb

- Avoid use with feverfew

Increase: antihypertensive effect—hawthorn

Decrease: antihypertensive effect—ma huang

Drug/Lab Test

Increase: serum potassium, serum uric acid, ALT, AST, alk phos, LDH

Decrease: blood glucose

Interference: glaucoma testing

NURSING CONSIDERATIONS

Assess:

Black Box Warning:

Abrupt withdrawal: taper over a few weeks, do not discontinue abruptly; dysrhythmias, angina, myocardial ischemia, or MI may occur, taper over at least a few weeks

- B/P, pulse, respirations during beginning therapy; notify prescriber if pulse <50 bpm or systolic B/P <90 mm Hg ⚠️ **ECG** continuously if using as antidysrhythmic IV, PCWP (pulmonary capillary wedge pressure), CVP (central venous pressure)
- Hepatic enzymes: AST, ALT, bilirubin
- Angina pain: duration, time started, activity being performed, character
- Tolerance with long-term use
- Headache, lightheadedness, decreased B/P; may indicate need for decreased dosage; may aggravate symptoms of arterial insufficiency
- **Fluid overload:**

weight daily; report gain of >5 lb

⚠️ I&O ratio, CCr if kidney damage is diagnosed; fatigue, weight gain, jugular distention, dyspnea, peripheral edema, crackles

Perform/provide:

- Protection from light

Evaluate:

- Therapeutic response: decreased B/P, dysrhythmias

Teach patient/family:

⚠️ Not to discontinue abruptly; may precipitate life-threatening dysrhythmias, exacerbation of angina, MI; to take product at same time each day, either with or without food consistently; to decrease dosage over 2 wk • To avoid OTC products unless approved by prescriber; to avoid alcohol

- To avoid hazardous activities if dizzy
- About the importance of compliance with complete medical regimen; to monitor blood glucose, may mask symptoms of hypoglycemia • To make position changes slowly to prevent fainting
- That sensitivity to cold may occur
- How to take pulse, B/P; to withhold product if <50 bpm or systolic B/P <90 mm Hg

🌿 Canada only Side effects: *italics* = common; **bold** = life-threatening ⚠️
Nurse Alert

propylhexadrine nasal agent

See [Appendix B](#)

propylthiouracil (Rx)

(proe-pill-thye-oh-yoor'a-sill)

Propyl-Thyracil 

Func. class.: Thyroid hormone antagonist (antithyroid)

Chem. class.: Thioamide

ACTION:

Blocks synthesis peripherally of T₃, T₄ (triiodothyronine, thyroxine), inhibits organification of iodine

USES:

Preparation for thyroidectomy, thyrotoxic crisis, hyperthyroidism, thyroid storm

CONTRAINDICATIONS:

Pregnancy (D), breastfeeding, hypersensitivity, agranulocytosis, hepatitis, jaundice

Precautions: Infants, bone marrow depression, fever

Black Box Warning:

Hepatic disease

DOSAGE AND ROUTES

Calculator

Thyrotoxic crisis

- **Adult and child:** PO 200-400 mg q4hr for 1st 24 hr

Preparation for thyroidectomy

- **Adult:** PO 600-1200 mg/day
- **Child:** PO 10 mg/kg/day in divided doses

Hyperthyroidism

- **Adult:** PO 100 mg tid increasing to 300 mg q8hr if condition is severe; continue to euthyroid state then 100 mg daily-tid

- **Child >6 yr: PO** 50 mg/day divided q8hr, titrate based on TSH/free T₄ levels
- **Neonate (unlabeled): PO** 5-10 mg/kg/day in divided doses q8hr

Available forms: Tabs 50 mg

Administer:

- With meals to decrease GI upset
- At same time each day to maintain product level
- At lowest dose that relieves symptoms

SIDE EFFECTS

CNS: *Drowsiness, headache, vertigo, fever, paresthesias, neuritis*

GI: *Nausea, diarrhea, vomiting, jaundice, hepatitis, loss of taste, liver failure, death*

GU: *Nephritis*

HEMA: *Agranulocytosis, leukopenia, thrombocytopenia, hypothermia, lymphadenopathy, bleeding, vasculitis, periarteritis*

INTEG: *Rash, urticaria, pruritus, alopecia, hyperpigmentation, lupuslike syndrome*

MS: *Myalgia, arthralgia, nocturnal muscle cramps, osteoporosis*

PHARMACOKINETICS

Onset up to 3 wk, peak 6-10 wk, duration 1 wk to 1 mo, half-life 1-2 hr; excreted in urine, bile, breast milk; crosses placenta; concentration in thyroid gland

INTERACTIONS

- Bone marrow suppression: radiation, antineoplastics
- Agranulocytosis: phenothiazines

Increase: effects—potassium/sodium iodide, lithium

Decrease: anticoagulant effect—heparin, oral anticoagulants

Drug/Lab Test

Increase: PT, AST, ALT, alk phos

NURSING CONSIDERATIONS

Assess:

- **Hyperthyroidism:** weight loss, nervousness, insomnia, fever, diaphoresis, tremors; **hypothyroidism:** constipation, dry skin, weakness, headache; monitor

T₃, T₄, which are increased; serum TSH, which is decreased; free thyroxine index, which is increased if dosage is too low; discontinue product 3-4 wk before RAIU

- Pulse, B/P, temp
- I&O ratio; check for edema: puffy hands, feet, periorbits; indicates hypothyroidism
- Weight daily; same clothing, scale, time of day

⚠ **Blood dyscrasias:** CBC with differential; leukopenia, thrombocytopenia, agranulocytosis ⚠ **Overdose:** peripheral edema, heat intolerance, diaphoresis, palpitations, dysrhythmias, severe tachycardia, increased temp, delirium, CNS irritability ⚠ **Hypersensitivity:** rash, enlarged cervical lymph nodes; product may have to be discontinued • **Hypoprothrombinemia:** bleeding, petechiae, ecchymosis

- Clinical response: after 3 wk should include increased weight, pulse; decreased T₄
- **Bone marrow suppression:** sore throat, fever, fatigue

Black Box Warning:

Hepatotoxicity: LFTs before, during treatment; jaundice, nausea, vomiting, abdominal pain, anorexia, diarrhea, fatigue

Perform/provide:

- Storage in light-resistant container
- Fluids to 3-4 L/day unless contraindicated

Evaluate:

- Therapeutic response: weight gain, decreased pulse, decreased T₄, decreased B/P

Teach patient/family:

- To abstain from breastfeeding after delivery
- To take pulse daily
- To report redness, swelling, sore throat, mouth lesions, which indicate blood dyscrasias; to report symptoms of hepatic dysfunction • To keep graph of weight, pulse, mood
- To avoid OTC products that contain iodine
- That seafood, other iodine products may be restricted
- Not to discontinue product abruptly because thyroid crisis may occur; about stress response • That response may take several months if thyroid is large

- About the symptoms/signs of overdose: periorbital edema, cold intolerance, mental depression • About the symptoms of an inadequate dose: tachycardia, diarrhea, fever, irritability
 - To take medication as prescribed; not to skip or double dose; that missed doses should be taken when remembered up to 1 hr before next dose • To carry emergency ID listing condition, medication
-

🍁 Canada only Side effects: *italics* = common; **bold** = life-threatening ⚠️
Nurse Alert

protamine (Rx)

(proe'ta-meen)

Func. class.: Heparin antagonist

Chem. class.: Low-molecular-weight protein

ACTION:

Binds heparin, thereby making it ineffective

USES:

Heparin, LMWH toxicity, hemorrhage

CONTRAINDICATIONS:

Hypersensitivity

Precautions: Pregnancy (C), breastfeeding, fish allergy, diabetes, previous exposure to protamine, insulins, heparin rebound or bleeding

DOSAGE AND ROUTES

Calculator

Heparin overdose

- **Adult and child: IV** 1 mg of protamine/100 units heparin given; administer slowly over 1-3 min; max 50 mg/10 min

Enoxaparin overdose

- **Adult: IV** 1 mg protamine/1 mg enoxaparin

Dalteparin/tinzaparin overdose

- **Adult: IV** 1 mg protamine/100 anti-Xa unit

Available forms: Inj 10 mg/ml

Administer:

Direct IV route

- After reconstituting 50 mg/5 ml sterile bacteriostatic water for inj; shake, give ≤ 20 mg over 1-3 min

Y-site compatibilities: Alfentanil, amikacin, aminophylline, ascorbic acid, atracurium, atropine, azaTHIOprine, aztreonam, benztropine, bumetanide, buprenorphine, butorphanol, calcium chloride/gluconate, cefTAZidime, chlorproMAZINE, cimetidine, clindamycin, cyanocobalamin, cycloSPORINE,

digoxin, diphenhydrAMINE, DOBUTamine, DOPamine, doxycycline, enalaprilat, ePHEDrine, EPINEPHrine, epoetin alfa, erythromycin, esmolol, famotidine, fentaNYL, fluconazole, ganciclovir, gentamicin, glycopyrrolate, hydrOXYzine, imipenem-cilastatin, inamrinone, iohexol, iopamidol, iothalamate, isoproterenol, labetalol, lidocaine, magnesium, mannitol, meperidine, metaraminol, methoxamine, methyl dopate, metoclopramide, metoprolol, miconazole, midazolam, minocycline, morphine, multiple vitamins, nalbuphine, naloxone, netilmicin, nitroglycerin, nitroprusside, norepinephrine, ondansetron, oxytocin, papaverine, pentazocine, phenylephrine, polymyxin B, potassium chloride, procainamide, prochlorperazine, promethazine, propranolol, pyridoxine, quiNIDine, ranitidine, Ringer's, ritodrine, sodium bicarbonate, succinylcholine, SUFentanil, theophylline, thiamine, tobramycin, tolazoline, trimetaphan, urokinase, vancomycin, vasopressin, verapamil

SIDE EFFECTS

CNS: Lassitude, flushing

CV: Hypotension, bradycardia, **circulatory collapse**, capillary leak

GI: Nausea, vomiting, anorexia

HEMA: Bleeding

INTEG: *Rash*, dermatitis, urticaria

RESP: Dyspnea, **pulmonary edema**, **severe respiratory distress**, bronchospasm

SYST: **Anaphylaxis**, **angioedema**

PHARMACOKINETICS

IV: Onset 5 min, duration 2 hr

NURSING CONSIDERATIONS

Assess:

⚠ Hypersensitivity: urticaria, cough, wheezing, have emergency equipment nearby; **allergy to fish;** use with caution; men who have had vasectomies may be more prone to hypersensitivity • Blood studies (Hct, platelets, occult blood in stools) q3mo

- Coagulation tests (aPTT, ACT) 15 min after dose then again after several hours
- VS, B/P, pulse after 30 min then 3 hr after dose
- Skin rash, urticaria, dermatitis

Perform/provide:

- Storage at 36° F-46° F (2° C-8° C)

Evaluate:

- Therapeutic response: reversal of heparin overdose

Teach patient/family:

- Not to take if allergic to fish
-

✳ Canada only Side effects: *italics* = common; **bold** = life-threatening ⚠

Nurse Alert

pseudoephedrine (OTC, Rx)

(soo-doh-eh-fed'rin)

Elix Sure Cold, Eltor , Nasofed, Sudafed, Sudafed 24 Hour, Sudogest *Func. class.:* Adrenergic
Chem. class.: Substituted phenylethylamine

ACTION:

Primary activity through α -effects on respiratory mucosal membranes reducing congestion hyperemia, edema; minimal bronchodilation secondary to β -effects

USES:

Nasal decongestant, adjunct for otitis media; with antihistamines

CONTRAINDICATIONS:

Hypersensitivity to sympathomimetics, closed-angle glaucoma

Precautions: Pregnancy (C), breastfeeding, cardiac disorders, hyperthyroidism, diabetes mellitus, prostatic hypertrophy, hypertension

DOSAGE AND ROUTES

Calculator

- **Adult and child >12 yr:** PO 60 mg q6hr; **EXT REL** 120 mg q12hr or 240 mg q24hr
- **Geriatric:** PO 30-60 mg q6hr prn
- **Child 6-12 yr:** PO 30 mg q6hr, max 120 mg/day
- **Child 2-6 yr:** PO 15 mg q6hr, max 60 mg/day

Available forms: Ext rel caps 120, 240 mg; oral sol 15 mg, 30 mg/5 ml; drops 7.5 mg/0.8 ml; tabs 30, 60 mg; caps 60 mg; ext rel tabs 120, 240 mg

Administer:

- Avoid taking at or near bedtime; stimulation can occur

SIDE EFFECTS

CNS: Tremors, anxiety, stimulation, insomnia, headache, dizziness, hallucinations, **seizures** (geriatric patients)

CV: Palpitations, tachycardia, hypertension, chest pain, **dysrhythmias, CV collapse**

EENT: Dry nose; irritation of nose and throat

GI: *Anorexia, nausea, vomiting*, dry mouth, ischemic colitis

GU: Dysuria

PHARMACOKINETICS

PO: Onset 15-30 min; duration 4-6 hr, 8-12 hr (ext rel); metabolized in liver; excreted in feces and breast milk; terminal half-life 9-16 hr

INTERACTIONS

 **Do not use with MAOIs or tricyclics; hypertensive crisis may occur**

Increase: effect of this product—urinary alkalizers, adrenergics, β -blockers, phenothiazines, tricyclics

Decrease: effect of this product—urinary acidifiers

NURSING CONSIDERATIONS

Assess:

- Nasal congestion: auscultate lung sounds; check for tenacious bronchial secretions
- B/P, pulse throughout treatment
- CNS side effects in geriatric patients: excitation, seizures, hallucinations

Perform/provide:

- Storage at room temperature

Evaluate:

- Therapeutic response: decreased nasal congestion

Teach patient/family:

- About the reason for product administration
 - Ext rel: do not divide, crush, chew, or dissolve
 - Do not use within 14 days of MAOIs
 - Not to use continuously or to take more than recommended dose because rebound congestion may occur  To notify prescriber immediately of anxiety; slow or fast heart rate; dyspnea; seizures
 - To check with prescriber before using other products because product interactions may occur
 - To avoid taking near bedtime because stimulation can occur
 - **Not to use if stimulation, restlessness, tremors occur**
 - **That use in children may cause excessive agitation**
-

🍁 Canada only Side effects: *italics* = common; **bold** = life-threatening ⚠️
Nurse Alert

pseudoephedrine nasal agent

See [Appendix B](#)

psyllium (OTC, Rx)

(sill'ee-um)

Hydrocil, Leader Fiber Laxative, Metamucil, Natural Fiber, Natural Vegetable Fiber, Reguloid, Wal-Mucil

Func. class.: Bulk laxative

Chem. class.: Psyllium colloid

ACTION:

Bulk-forming laxative

USES:

Chronic constipation, ulcerative colitis

Unlabeled uses: Diarrhea, diverticulosis, irritable bowel syndrome, hypercholesterolemia

CONTRAINDICATIONS:

Hypersensitivity, intestinal obstruction, abdominal pain, nausea, vomiting, fecal impaction

Precautions: Pregnancy (C)

DOSAGE AND ROUTES

Calculator

• **Adult: PO** 1-2 tsp in 8 oz water bid or tid then 8 oz water or 1 premeasured packet in 8 oz water bid or tid, then 8 oz water

• **Child >6 yr: PO** 1 tsp in 4 oz water at bedtime

Available forms: Chew pieces 1.7, 3.4 g/piece; effervescent powder 3.4, 3.7 g/packet; powder 3.3, 3.4, 3.5, 4.94 g/tsp; wafers 3.4 g/wafer

Administer:

PO route

• Alone for better absorption, separate from other products by 1-2 hr

- In morning or evening (oral dose)
- Immediately after mixing with water or will congeal
- With 8 oz water or juice followed by another 8 oz of fluid

SIDE EFFECTS

GI: *Nausea, vomiting, anorexia, diarrhea*, cramps, intestinal esophageal blockage

PHARMACOKINETICS

Onset 12-72 hr, excreted in feces, not absorbed in GI tract

INTERACTIONS

Decrease: absorption of cardiac glycosides, oral anticoagulants, salicylates

Drug/Herb

Increase: laxative effect—flax, senna

NURSING CONSIDERATIONS

Assess:

- Blood, urine electrolytes if used often
- I&O ratio to identify fluid loss
- **Constipation:** cause of constipation; fluids, bulk, exercise missing; bowel sounds, distention, usual bowel function; color, consistency, amount
- Cramping, rectal bleeding, nausea, vomiting; product should be discontinued

Evaluate:

- Therapeutic response: decrease in constipation, decreased diarrhea with colitis

Teach patient/family:

- To maintain adequate fluid consumption
- That normal bowel movements do not always occur daily
- Not to use in presence of abdominal pain, nausea, vomiting
- To notify prescriber if constipation unrelieved or if symptoms of electrolyte imbalance occur: muscle cramps, pain, weakness, dizziness, excessive thirst

☛ Canada only Side effects: *italics* = common; **bold** = life-threatening ⚠

Nurse Alert

pyridostigmine (Rx)

(peer-id-oh-stig'meen)

Mestinon, Mestinon Timespan, Regonol

Func. class.: Cholinergic; anticholinesterase

Chem. class.: Tertiary amine carbamate

ACTION:

Inhibits destruction of acetylcholine, which increases concentration at sites where acetylcholine is released; this facilitates the transmission of impulses across the myoneural junction

USES:

Nondepolarizing muscle relaxant antagonist, myasthenia gravis, pretreatment for nerve gas exposure (military only)

CONTRAINDICATIONS:

Bradycardia; hypotension; obstruction of intestine, renal system; bromide, benzyl alcohol sensitivity; adrenal insufficiency; cholinesterase inhibitor toxicity

Precautions: Pregnancy (C), seizure disorders, bronchial asthma, coronary occlusion, hyperthyroidism, dysrhythmias, peptic ulcer, megacolon, poor GI motility

DOSAGE AND ROUTES

Calculator

Myasthenia gravis

- **Adult:** **PO** 600 mg/day in 5-6 divided doses, max 1.5 g/day; **IM/IV** 2 mg or 1/30 of **PO** dose; **SUS REL** 180-540 mg/day or bid at intervals of ≥ 6 hr
- **Child:** **PO** 7 mg/kg/day in 5-6 divided doses; **IM/IV** 0.05-0.15 mg/kg/dose

Nondepolarizing neuromuscular blocker antagonist

- **Adult:** **0.6-1.2 mg IV** atropine then 0.1-0.25 mg/kg/dose
- **Child:** **IV** 0.1-0.25 mg/kg/dose

Nerve gas exposure prophylaxis (military)

- **Adult:** **PO** 30 mg q8hr if threat of exposure to Soman gas is anticipated; start several hours prior to exposure and discontinue upon exposure; after product is

discontinued, give antidotes (atropine, pralidoxime)

Available forms: Tabs 60 mg; ext rel tabs 180 mg; syr 60 mg/5 ml; inj 5 mg/ml

Administer:

- Only with atropine sulfate available for cholinergic crisis
- Only after all other cholinergics have been discontinued
- Increased doses for tolerance as ordered
- Larger doses after exercise or fatigue as ordered
- Do not break, crush, or chew sus rel tabs

PO route

- On empty stomach for better absorption

Direct IV route

- Undiluted (5 mg/ml), give through **Y**-tube or 3-way stopcock, give ≤ 0.5 mg/min (myasthenia gravis); 5 mg/min (reversal of nondepolarizing neuromuscular blockers)

Syringe compatibilities: Glycopyrrolate

Y-site compatibilities: Heparin, hydrocortisone, potassium chloride, vit B/C

SIDE EFFECTS

CNS: Dizziness, headache, sweating, weakness, **seizures**, incoordination, **paralysis**, drowsiness, LOC

CV: Tachycardia, dysrhythmias, bradycardia, AV block, hypotension, ECG changes, **cardiac arrest**, syncope

EENT: Miosis, blurred vision, lacrimation, visual changes

GI: *Nausea, diarrhea, vomiting, cramps, increased salivary and gastric secretions, peristalsis*

GU: Urinary frequency, incontinence, urgency

INTEG: Rash, urticaria, flushing

RESP: **Respiratory depression, bronchospasm, constriction, laryngospasm, respiratory arrest**

SYST: **Cholinergic crisis**

PHARMACOKINETICS

Metabolized in liver, excreted in urine (unchanged)

PO: Onset 20-30 min, duration 3-6 hr

PO-EXT rel: Onset 30-60 min, duration 6-12 hr

IM/IV/SUBCUT: Onset 2-15 min, duration 2½-4 hr

INTERACTIONS

Increase: action—succinylcholine

Decrease: action—gallamine, metocurine, pancuronium, tubocurarine, atropine

Decrease: pyridostigmine action—aminoglycosides, anesthetics, procainamide, quiniDine, mecamylamine, polymyxin, magnesium, corticosteroids, antidysrhythmics, quinolones

NURSING CONSIDERATIONS

Assess:

- **Myasthenia gravis:** fatigue, ptosis, diplopia, difficulty swallowing, SOB, hand/gait before, after product; improvement should be seen after 1 hr • VS, respiration q8hr
- I&O ratio; check for urinary retention or incontinence
- **Toxicity:** bradycardia, hypotension, bronchospasm, headache, dizziness, seizures, respiratory depression; product should be discontinued if toxicity occurs

Evaluate:

- Therapeutic response: increased muscle strength, hand grasp, improved gait, absence of labored breathing (if severe); reversal of nondepolarizing neuromuscular blockers; prevention of nerve gas toxicity

Teach patient/family:

- **Myasthenia gravis:** that product is not a cure, only relieves symptoms
- To wear emergency ID specifying myasthenia gravis, products taken
- To avoid driving, other hazardous activities until effect is known
- **To report muscle weakness (cholinergic crisis or underdosage), bradycardia**
- Not to drink alcohol
- To take with food to decrease gastric side effects

TREATMENT OF OVERDOSE:

Discontinue product, atropine 1-4 mg IV

☛ Canada only Side effects: *italics* = common; **bold** = life-threatening ⚠
Nurse Alert

pyridoxine (vit B₆) (Rx, OTC)

(peer-i-dox'een)

Equaline Vitamin B6, Neuro-K, Walgreens Finest B-6, Walgreens Gold Seal Vitamin B6

Func. class.: Vit B₆, water soluble

ACTION:

Needed for fat, protein, carbohydrate metabolism; enhances glycogen release from liver and muscle tissue; needed as coenzyme for metabolic transformations of a variety of amino acids

USES:

Vit B₆ deficiency of inborn errors of metabolism, seizures, isoniazid therapy, oral contraceptives, alcoholic polyneuritis

Unlabeled uses: Palmar-plantar erythrodysesthesia syndrome

CONTRAINDICATIONS:

Hypersensitivity

Precautions: Pregnancy (A), breastfeeding, children, Parkinson's disease; patients taking levodopa should avoid supplemental vitamins with >5 mg pyridoxine

DOSAGE AND ROUTES

Calculator

RDA

- **Adult: PO** (male) 1.7-2 mg; (female) 1.4-1.6 mg
- **Child 9-13 yr: PO** 1 mg/day
- **Child 4-8 yr: PO** 0.6 mg/day
- **Child 1-3 yr: PO** 0.5 mg/day
- **Infant 7-12 mo: PO** 0.3 mg/day

Vit B₆ deficiency

- **Adult: PO** 5-25 mg/day × 3 wk
- **Child: PO** 10 mg until desired response

Pyridoxine deficiency neuritis/seizure (not drug induced)

- **Adult: PO** *without neuritis* 2.5-10 mg/day after corrected 2-5 mg/day; *with*

neuritis 100-200 mg/day × 3wk then 2-5 mg/day

- **Child: PO** *without neuritis* 5-25 mg/day × 3wk then 1.5-2.5 mg/day in a multivitamin; *with neuritis*: 10-50 mg/day × 3wk then 1-2 mg/day
- **Neonate with seizures: IM/IV** 50-100 mg as single dose

Deficiency caused by isoniazid, cycloserine, hydralazine, penicillamine

- **Adult: PO** 100-300 mg/day
- **Child: PO** 10-50 mg/day

Prevention of deficiency caused by isoniazid, cycloserine, hydralazine, penicillamine

- **Adult: PO** 25-100 mg/day
- **Child: PO** 1-2 mg/kg/day

Palmar-plantar erythrodysesthesia syndrome (unlabeled)

- **Adult: PO** 50-150 mg/day

Available forms: Tabs 10, 25, 50, 100 mg; ext rel tabs 100 mg; inj 100 mg/ml; ext rel caps 150 mg

Administer:

PO route

- Do not break, crush, or chew ext rel tabs/caps

IM route

- Rotate sites; burning or stinging at site may occur
- Z-track to minimize pain

IV route

- Undiluted or added to most IV sol; give ≤50 mg/1 min if undiluted

Syringe compatibilities: Doxapram

SIDE EFFECTS

CNS: Paresthesia, flushing, warmth, lethargy (rare with normal renal function)

INTEG: Pain at inj site

PHARMACOKINETICS

PO/INJ: Half-life 2-3 wk, metabolized in liver, excreted in urine

INTERACTIONS

Decrease: effects of levodopa

Decrease: effects of pyridoxine—oral contraceptives, isoniazid, cycloSERINE,

hydrALAZINE, penicillamine, chloramphenicol, immunosuppressants

NURSING CONSIDERATIONS

Assess:

- **Pyridoxine deficiency:** seizures, irritability, cheilitis, conjunctivitis, anemia, confusion, red tongue, weakness, fatigue prior to and during treatment; monitor pyridoxine levels
- Nutritional status: yeast, liver, legumes, bananas, green vegetables, whole grains
- Blood studies: Hct, Hgb

Perform/provide:

- Storage in tight, light-resistant container

Evaluate:

- Therapeutic response: absence of nausea, vomiting, anorexia, skin lesions, glossitis, stomatitis, edema, seizures, restlessness, paresthesia

Teach patient/family:

- To avoid vitamin supplements unless directed by prescriber
- To increase meat, bananas, potatoes, lima beans, whole grain cereals in diet
- To take as directed; to continue with follow-up exams, blood work

☼ Canada only Side effects: *italics* = common; **bold** = life-threatening ⚠

Nurse Alert

pyrimethamine (Rx)

(peer-i-meth'a-meen)

Daraprim

Func. class.: Antimalarial, antiprotozoal

Chem. class.: Folic acid antagonist

ACTION:

Inhibits folic acid metabolism in parasite, prevents transmission by stopping growth of fertilized gametes

USES:

Malaria prophylaxis, *Plasmodium vivax*, *Pneumocystis jiroveci*

Unlabeled uses: Isosporiasis, pneumocystis pneumonia prophylaxis, toxoplasmic encephalitis prophylaxis

CONTRAINDICATIONS:

Hypersensitivity, chloroquine-resistant malaria, megaloblastic anemia caused by folate deficiency

Precautions: Pregnancy (C), breastfeeding, geriatric patients, blood dyscrasias, seizure disorder, G6PD disease, renal/hepatic disease

DOSAGE AND ROUTES

Calculator

Prophylaxis of malaria

Begin 2 wk before entering endemic area, continue for 6-10 wk after return

- **Adult/child >10 yr: PO** 25 mg/wk
- **Child 4-10 yr: PO** 12.5 mg/wk
- **Child <4 yr: PO** 6.25 mg/wk

Malaria treatment

- **Adult/adolescent/child >10 yr: PO** 25 mg q day × 2 days with a sulfonamide
- **Child 4-10 yr: PO** 25 mg/day × 2 days

Toxoplasmosis

- **Adult: PO** 50-75 mg, then reduce by about 50% for 4-5 wk with 1-4 g sulfadoxine × 1-3 wk, then reduce by 50% for 4-5 wk

- **Child: PO** 1 mg/kg/day in 2 divided doses or 2 mg/kg/day × 3 days then 1 mg/kg/day or divided twice daily × 4 wk, max 25 mg/day

Toxoplasmosis in AIDS patients

- **Adult: PO** 100-200 mg/day × 1-2 days, then 50-100 mg/day × 3-6 wk, then 25-50 mg/day for life (given with clindamycin or sulfADIAZINE)

Isosporiasis (unlabeled)

- **Adult: PO** 75 mg/day with leucovorin 10 mg/day × 14 days

Available forms: Tabs 25 mg; combo tabs 500 mg sulfadoxine/25 mg pyrimethamine

Administer:

PO route

- Leucovorin IM 3-9 mg/day × 3 days if folic acid deficiency occurs
- Before or after meals at same time each day to maintain product level, decrease GI symptoms • **Extemporaneous susp:** tabs may be crushed and mixed with 25 ml distilled water, sucrose-containing solution (1 mg/ml); shake well, stable for 5-7 days at room temperature if mixed with sucrose-containing solutions

SIDE EFFECTS

CNS: Stimulation, irritability, **seizures**, tremors, ataxia, fatigue, fever

CV: **Dysrhythmias**

GI: *Nausea, vomiting, cramps, anorexia*, diarrhea, atrophic glossitis, gastritis

HEMA: **Thrombocytopenia, leukopenia, pancytopenia, megaloblastic anemia**, decreased folic acid, **agranulocytosis**

INTEG: Skin eruptions, photosensitivity, **Stevens-Johnson syndrome**

RESP: **Respiratory failure**

PHARMACOKINETICS

PO: Peak 2 hr, half-life 96 hr, half-life accelerated to 23 hr in AIDS patients, metabolized in liver, highly protein bound, excreted in urine (metabolites)

INTERACTIONS

- Synergistic action: folic acid

Increase: Megaloblastic anemia risk, agranulocytosis, thrombocytopenia—**zidovudine**

Increase: bone marrow suppression—bone marrow depressants, folate antagonists, radiation therapy

NURSING CONSIDERATIONS

Assess:

- Folic acid level; megaloblastic anemia occurs

⚠ **Blood dyscrasias:** blood studies, CBC, platelets; 2×/wk if dosage is increased

⚠ **Toxicity:** vomiting, anorexia, seizure, blood dyscrasia, glossitis; product should be discontinued immediately • **Serious skin disorders:** Stevens-Johnson syndrome (swelling of face, lips, throat, fever)

Perform/provide:

- Storage in tight, light-resistant container

Evaluate:

- Therapeutic response: decreased symptoms of malaria, toxoplasmosis

Teach patient/family:

- To report visual problems, fever, fatigue, bruising, bleeding, sore throat; may indicate **blood dyscrasias**

TREATMENT OF OVERDOSE:

Gastric lavage, short-acting barbiturate, leucovorin, respiratory support if needed

🍁 Canada only Side effects: *italics* = common; **bold** = life-threatening ⚠

Nurse Alert

QUEtiapine (Rx)

(kwe-tie'a-peen)

Seroquel, Seroquel XR

Func. class.: Antipsychotic, atypical

Chem. class.: Dibenzothiazepine

ACTION:

Functions as an antagonist at multiple neurotransmitter receptors in the brain, including 5HT_{1A}, 5HT₂, dopamine D₁, D₂, H₁, and adrenergic α_1 , α_2 receptors

USES:

Bipolar disorder, bipolar I disorder, depression, mania, schizophrenia

Unlabeled uses: Agitation, dementia, OCD, acute psychosis

CONTRAINDICATIONS:

Hypersensitivity, breastfeeding

Precautions: Pregnancy (C), geriatric patients, hepatic/cardiac disease, breast cancer, long-term use, seizures, QT prolongation, brain tumor, hematologic disease, torsades de pointes, cataracts, dehydration, abrupt discontinuation

Black Box Warning:

Children, suicidal ideation, increased mortality in elderly patients with dementia-related psychosis

DOSAGE AND ROUTES

Calculator

Bipolar I disorder

- **Adult: PO** (monotherapy or adjunct to lithium, divalproex), not at increased risk for hypotension 50 mg bid on day 1, 100 mg on day 2 in 2 divided doses as tolerated to 400 mg/day on day 4, range 400-800 mg/day
- **Geriatric, debilitated, or at risk for hypotension: PO** 25 mg bid, titrate upward slowly
- **Child ≥ 10 yr/adolescents: PO** 25 mg bid day 1, 50 mg, bid day 2, 100 mg bid day 3, 150 mg bid day 4, 300 mg bid beginning day 5 dose adjusted

Schizophrenia

- **Adult: PO** (not at risk for hypotension) 25 mg bid, titrate upward; (XR) 300 mg/day in PM, range 400-800 mg/day

Depressive disorder (inadequate response to antidepressants alone)

- **Adult: PO EXT REL** 50 mg/day in PM on days 1, 2; on day 3, give 150 mg in PM

- **Geriatric, debilitated or at risk for hypotension: PO EXT REL** 50 mg, may increase by 50 mg/day based on response

Available forms: Tabs 25, 50, 100, 200, 300, 400 mg; ext rel tab 50, 150, 200, 300, 400 mg

Administer:

- Reduced dose to geriatric patients
- Anticholinergic agent on order from prescriber for EPS
- Avoid use of CNS depressants
- **Immediate release:** without regard to meals
- **Ext rel:** without food or with light meal ≤ 300 calories; swallow whole; do not split, crush, chew, can switch from immediate release to extended release by giving total daily dose q day

SIDE EFFECTS

CNS: EPS, pseudoparkinsonism, akathisia, dystonia, tardive dyskinesia; *drowsiness*, insomnia, agitation, anxiety, *headache*, **seizures**, **neuroleptic malignant syndrome**, *dizziness*, dystonia, restless legs

CV: Orthostatic hypotension, **tachycardia**, **QT prolongation**, CV disease, Parkinson's disease, cardiomyopathy, myocarditis

ENDO: SIADH, hyperglycemia

GI: *Nausea*, *anorexia*, *constipation*, abdominal pain, dry mouth

HEMA: **Leukopenia**, **agranulocytosis**

INTEG: Rash

META: Hyponatremia

MISC: Asthenia, back pain, fever, ear pain

MS: **Rhabdomyolysis**

RESP: Rhinitis

SYST: **Stevens-Johnson syndrome**, **anaphylaxis**

PHARMACOKINETICS

Extensively metabolized by liver, half-life ≥ 6 hr, peak 1½ hr, ext rel 6 hr, inhibits P450 CYP3A4 enzyme system, 83% protein binding, excretion: 73% urine, 20%

feces

INTERACTIONS

⚠ Increase: QT prolongation—class IA/III antidysrhythmics, some phenothiazines, β -agonists, local anesthetics, tricyclics, haloperidol, methadone, chloroquine, clarithromycin, droperidol, erythromycin, pentamidine

Increase: CNS depression—alcohol, opioid analgesics, sedative/hypnotics, antihistamines

Increase: hypotension—alcohol, antihypertensives

Increase: QUetiapine clearance, decrease QUetiapine effect—phenytoin, thioridazine, barbiturates, glucocorticoids, carbamazepine, rifampin

Increase: QUetiapine action—fluconazole, itraconazole, ketoconazole (CYP3A4 inhibitors)

Increase: effects of erythromycin

Decrease: QUetiapine clearance—cimetidine

Decrease: effects of dopamine agonists, levodopa, lorazepam

Drug/Lab Test

Increase: cholesterol, triglycerides, LFTs, glucose

Decrease: thyroid tests, WBC

NURSING CONSIDERATIONS

Assess:

⚠ CV status: QT prolongation, tachycardia, orthostatic B/P

Black Box Warning:

Mental status before initial administration, AIMS assessment; affect, orientation, LOC, reflexes, gait, coordination, sleep pattern disturbances; suicidal thoughts/behaviors (child/young adult); dementia (geriatric patients)

⚠ Suicide: restrict amount of product given; usually suicidal thoughts/behaviors occur early during treatment and among children/adolescents/young adults

- Baseline blood glucose, LFTs, neurologic function, ophthalmologic exam, cholesterol profile, weight, monitor glucose often in diabetes mellitus
- B/P standing, lying; pulse, respirations; determine q4hr during initial treatment; establish baseline before starting treatment; report drops of 30 mm Hg; watch for ECG changes
- Dizziness, faintness, palpitations, tachycardia on rising
- **EPS:** including akathisia (inability to sit still, no pattern to movements), tardive dyskinesia (bizarre movements of jaw, mouth, tongue, extremities),

pseudoparkinsonism (rigidity, tremors, pill rolling, shuffling gait)  **Neuroleptic malignant syndrome:** hyperthermia, increased CPK, altered mental status, muscle rigidity, seizures, tachycardia, diaphoresis, hypo/hypertension, fatigue; notify prescriber immediately if symptoms occur • Constipation, urinary retention daily; if these occur, increase bulk, water in diet

Perform/provide:

- Supervised ambulation until patient stabilized on medication; do not involve patient in strenuous exercise program because fainting possible; patient should not stand still for long period of time • Storage in tight, light-resistant container

Evaluate:

- Therapeutic response: decrease in emotional excitement, hallucinations, delusions, paranoia; reorganization of patterns of thought, speech

Teach patient/family:

- Not to become overheated
- Not to use if pregnancy is planned or suspected, not to breastfeed
- To rise slowly to prevent orthostatic hypotension
- To take medication only as prescribed, not to crush, chew ext rel product, not to use with alcohol, to take regular tabs without regard to food, ext rel without food
- That follow-up is necessary, including LFTs, blood glucose, neurologic, cholesterol profile, weight • If drowsiness occurs, to avoid hazardous activities such as driving, not to stand quickly, may be worse during first few days of dose change • To avoid use of OTC meds unless directed by prescriber
- **To notify prescriber if pregnancy planned, suspected; not to breastfeed**
- To notify prescriber immediately of fever, difficulty breathing, fatigue, sore throat, rash, bleeding • **Suicide:** thoughts/behaviors, primarily among children/adolescents/young adults • To have eye exam before treatment and q6mo, cataracts may occur

🍁 Canada only Side effects: *italics* = common; **bold** = life-threatening 
Nurse Alert

quinapril (Rx)

(kwin'a-pril)

Accupril

Func. class.: Antihypertensive

Chem. class.: Angiotensin-converting enzyme (ACE) inhibitor

ACTION:

Selectively suppresses renin-angiotensin-aldosterone system; inhibits ACE, prevents conversion of angiotensin I to angiotensin II; results in dilation of arterial, venous vessels

USES:

Hypertension, alone or in combination with thiazide diuretics; systolic CHF

CONTRAINDICATIONS:

Children, hypersensitivity to ACE inhibitors, angioedema

Black Box Warning:

Pregnancy (D)

Precautions: Breastfeeding, geriatric patients, impaired renal/hepatic function, dialysis patients, hypovolemia, blood dyscrasias, COPD, bilateral renal stenosis, asthma, cough, hyperkalemia

DOSAGE AND ROUTES

Calculator

Hypertension

- **Adult: PO** 10-20 mg/day initially then 20-80 mg/day divided bid or daily (monotherapy); start at 5 mg/day (with diuretics)
- **Geriatric: PO** 10 mg/day, titrate to desired response (monotherapy); start at 2.5 mg/day (with diuretics)

Congestive heart failure

- **Adult: PO** 5 mg bid, may increase weekly until 20-40 mg/day in 2 divided doses

Renal dose

- **Adult: PO** CCr 30-60 ml/min, 5 mg/day initially; CCr <30 ml/min, 2.5 mg/day initially

Available forms: Tabs 5, 10, 20, 40 mg

Administer:

- Tabs may be crushed if necessary
- Take 1-2 hr before food or antacids; avoid high-fat foods
- Store in airtight container at room temp

SIDE EFFECTS

CNS: *Headache, dizziness, fatigue, somnolence, depression, malaise, nervousness, vertigo*

CV: *Hypotension, postural hypotension, syncope, palpitations, angina pectoris, MI, tachycardia, vasodilation, chest pain*

GI: *Nausea, diarrhea, constipation, vomiting, gastritis, GI hemorrhage, dry mouth*

GU: Increased BUN, creatinine; decreased libido, impotence

INTEG: *Angioedema, rash, sweating, photosensitivity, pruritus*

META: Hyperkalemia

MISC: Back pain, amblyopia

MS: Myalgia

RESP: *Cough, pharyngitis, dyspnea*

PHARMACOKINETICS

Bioavailability $\geq 60\%$, onset < 1 hr, peak 1-2 hr, duration 24 hr, protein binding 97%, half-life 2 hr, metabolized by liver (active metabolites quinaprilat), metabolites excreted in urine (60%)/feces (37%)

INTERACTIONS

- Use caution with vasodilators, hydralazine, prazosin, potassium-sparing diuretics, sympathomimetics, potassium supplements, ACE/angiotensin II receptor antagonists

Increase: hypotension—diuretics, other antihypertensives, ganglionic blockers, adrenergic blockers, phenothiazines, nitrates, acute alcohol ingestion

Increase: toxicity of lithium

Decrease: absorption of tetracycline, quinolone antibiotics

Decrease: hypotensive effect of quinapril—NSAIDs

Drug/Lab Test

Increase: potassium, creatinine, BUN, LFTs

NURSING CONSIDERATIONS

Assess:

⚠️ **Collagen-vascular disease:** blood studies: neutrophils, decreased platelets; WBC with differential at baseline, periodically, q3mo; if neutrophils $<1000/\text{mm}^3$, discontinue treatment • **Hypertension:** B/P, orthostatic hypotension, syncope, monitor B/P before giving and after 2 hr, African American patients are more resistant to antihypertension effect • **Renal studies:** protein, BUN, creatinine; watch for increased levels; may indicate nephrotic syndrome • **Baselines of hepatic studies** before therapy, periodically; increased LFTs; uric acid, glucose may be increased • **Potassium levels;** hyperkalemia rare • **CHF:** edema in feet, legs daily; weight daily

⚠️ **Allergic reactions:** rash, fever, pruritus, urticaria, swelling of eyes/face/throat/neck, SOB, difficulty breathing; product should be discontinued, angioedema is more common in African American patients

Black Box Warning:

For pregnancy (D), 2nd/3rd trimester, if pregnancy is suspected, discontinue use

Evaluate:

- Therapeutic response: decrease in B/P

Teach patient/family:

- Not to discontinue product abruptly
- Not to use OTC products (cough, cold, allergy); not to use salt substitutes containing potassium unless directed by prescriber, avoid high-fat meal at same time as product • To comply with dosage schedule, even if feeling better
- To rise slowly to sitting or standing position to minimize orthostatic hypotension • To notify prescriber of mouth sores, sore throat, fever, swelling of hands/feet, irregular heartbeat, chest pain, persistent dry cough • To report excessive perspiration, dehydration, vomiting, diarrhea; may lead to fall in B/P
- That product may cause dizziness, fainting, lightheadedness; may occur during first few days of therapy • That product may cause skin rash, impaired taste perception
- How to take B/P, normal readings for age group

Black Box Warning:

Pregnancy: to report if pregnancy planned, suspected; pregnancy category (D) 2nd/3rd trimester, do not breastfeed

TREATMENT OF OVERDOSE:

0.9% NaCl IV inf

🍁 Canada only Side effects: *italics* = common; **bold** = life-threatening ⚠️
Nurse Alert

quiNIDine gluconate (Rx)

(kwin'i-deen)

quiNIDine sulfate (Rx)

Func. class.: Antidysrhythmic (Class IA)

Chem. class.: Quinine dextroisomer

Do not confuse: quiNIDine/quiNINE

ACTION:

Prolongs duration of action potential and effective refractory period, thus decreasing myocardial excitability; anticholinergic properties

USES:

PVCs, atrial fibrillation, PAT, ventricular tachycardia, atrial flutter, malaria/IV quiNIDine gluconate

CONTRAINDICATIONS:

Hypersensitivity, idiosyncratic response, digoxin toxicity, blood dyscrasias, myasthenia gravis

Black Box Warning:

History of long QT syndrome, product-induced torsades de pointes, severe heart block

Precautions: Pregnancy (C), breastfeeding, children, geriatric patients, potassium imbalance, renal/hepatic disease, CHF, respiratory depression, bradycardia, hypotension, syncope

Black Box Warning:

Cardiac arrhythmias, MI

DOSAGE AND ROUTES

Calculator

QuiNIDine gluconate

• **Adult: PO** (ext rel) 324-648 mg q8-12hr; **IM** 600 mg then 400 mg q2hr; **IV** give 16 mg/min

Malaria

• **Adult/adolescents/children/infants: IV Regimen 1:** Loading dose 24/kg (15 mg/kg base) over 4 hr, then 12 mg/kg (7.5 mg/kg base) over 4 hr q8hr, starting 8 hr after beginning of loading dose × 7 days in SE Asia, 3 days in Africa or South

America, maintenance infusions may be replaced with PO if feasible; **Regimen 2:** Loading dose IV 10 mg/kg (6.25 base) over 1-2 hr, then 0.02 mg/kg (0.0125/kg/min base) for ≥ 24 hr

QuiNIDine sulfate

Atrial fibrillation/flutter

- **Adult: PO** 200 mg q2-3hr $\times$ 5-8 doses; may increase daily until sinus rhythm restored; max 4 g/day given only after digitalization; maintenance 200-300 mg tid-qid or **EXT REL** 300-600 mg q8-12hr

Paroxysmal supraventricular tachycardia

- **Adult: PO** 400-600 mg q2-3hr then 200-300 mg q6-8hr or **EXT REL** 300-600 mg q8-12hr

Premature atrial/ventricular contraction

- **Adult: PO** 200-300 mg q6-8hr or **EXT REL** 300-600 mg q8-12hr; max 4 g/day

- **Child: PO** 30 mg/kg/day or 900 mg/m²/day in 5 divided doses

Available forms: *Gluconate:* ext rel tabs 324, 330 mg; inj gluconate 80 mg/ml; *sulfate:* tabs 200, 300 mg; sus rel tabs 300 mg

Administer:

- AV node blocker (digoxin) before starting quinidine to avoid increased ventricular rate

PO route

- Do not break, crush, chew ext rel products
- With full glass of water on empty stomach; if GI upset occurs, may take with food
- Sus rel forms not interchangeable
- Do not use with grapefruit juice

IM route

- IM inj in deltoid; aspirate to avoid intravascular administration

Intermittent IV INF route

- After diluting 800 mg/50 ml D₅W (16 mg/ml); give ≤ 1 mg/min, use infusion pump; quiNIDine absorbed by PVC tubing, minimize length

Y-site compatibilities: Alfentanil, amikacin, anidulafungin, ascorbic acid, atenolol, atracurium, atropine, benztropine, bleomycin, bumetanide, buprenorphine, butorphanol, calcium gluconate, caspofungin, chlorproMAZINE, cimetidine, CISplatin, cyanocobalamin, cycloSPORINE, DACTINomycin,

digoxin, diltiazem, diphenhydramine, DOBUTamine, DOCEtaxel, DOPamine, doxycycline, enalaprilat, ePHEDrine, EPINEPHrine, epoetin alfa, erythromycin, esmolol, etoposide, famotidine, fenoldopam, fentaNYL, fluconazole, fludarabine, gatifloxacin, gemcitabine, gentamicin, glycopyrrolate, granisetron, HYDROMorphone, IDArubicin, imipenem-cilastatin, irinotecan, isoproterenol, labetalol, lidocaine, linezolid, LORazepam, magnesium sulfate, mannitol, mechlorethamine, meperidine, metaraminol, methoxamine, methyldopate, metoclopramide, metoprolol, metroNIDAZOLE, miconazole, milrinone, mitoXANtrone, morphine, multiple vitamins, mycophenolate, nalbuphine, naloxone, nesiritide, netilmicin, nitroglycerin, norepinephrine, octreotide, ondansetron, oxaliplatin, PACLitaxel, palonosetron, pamidronate, pancuronium, papaverine, pentamidine, pentazocine, phenylephrine, phytonadione, polymyxin B, potassium chloride, procainamide, prochlorperazine, promethazine, propranolol, protamine, pyridoxine, ranitidine, ritodrine, succinylcholine, SUFentanil, tacrolimus, teniposide, theophylline, thiamine, thiotepa, tirofiban, tobramycin, tolazoline, trimetaphan, urokinase, vancomycin, vasopressin, verapamil, vinorelbine, voriconazole, zoledronic acid

SIDE EFFECTS

CNS: Headache, dizziness, involuntary movement, confusion, psychosis, restlessness, irritability, syncope, excitement, depression, ataxia

CV: Hypotension, bradycardia, PVCs, heart block, CV collapse, arrest, torsades de pointes, widening QRS complex, ventricular tachycardia

EENT: Cinchonism: tinnitus, blurred vision, hearing loss, mydriasis, disturbed color vision

GI: Nausea, vomiting, anorexia, abdominal pain, diarrhea, hepatotoxicity

HEMA: Thrombocytopenia, hemolytic anemia, agranulocytosis, hypoprothrombinemia

INTEG: Rash, urticaria, angioedema, swelling, photosensitivity, flushing with severe pruritus

RESP: Dyspnea, respiratory depression

PHARMACOKINETICS

PO: Peak 0.5-6 hr, duration 6-8 hr, half-life 6-7 hr, metabolized in liver, excreted unchanged (10%-50%) by kidneys, protein bound (80%-90%)

INTERACTIONS

- Additive vagolytic effect: anticholinergic blockers

Increase: cardiac depression: other antidysrhythmics, phenothiazines, reserpine

Increase: effects of neuromuscular blockers, digoxin, warfarin, tricyclics, propranolol

Increase: QT prolongation—macrolides, quinolones, tricyclics procainamide, antipsychotics

Increase: quinine effects—cimetidine, sodium bicarbonate, carbonic anhydrase inhibitors, antacids, hydroxide suspensions, amiodarone, verapamil, nifedipine, protease inhibitors

Decrease: quinine effects—barbiturates, phenytoin, rifampin, sucralfate, cholinergics

Drug/Herb

Increase: quinine effect—hawthorn

Drug/Food

- Delayed absorption, decreased metabolism: grapefruit juice

Drug/Lab Test

Increase: Hgb

Decrease: platelets

Interference: triamterene therapy interferes with quinine test levels

NURSING CONSIDERATIONS

Assess:

⚠ ECG B/P, pulse continuously during IV, baseline, and periodically (PO) to determine increased PR or QRS segments, QT interval; discontinue product or reduce dose • Blood levels (therapeutic level 2-7 mcg/ml), CBC, LFTs

⚠ **For cinchonism:** tinnitus, headache, nausea, dizziness, fever, vertigo, tremor; may lead to hearing loss • **Cardiac toxicity:** asystole, ventricular dysrhythmias, widening QRS, torsades de pointes • CNS effects: dizziness, confusion, psychosis, paresthesias, seizures; product should be discontinued

- **Hepatotoxicity:** monitor LFTs for first 1-2 mo of treatment

Evaluate:

- Therapeutic response: decreased dysrhythmias

Teach patient/family:

- That if dizziness, drowsiness occurs, to avoid driving or hazardous activities

- To use sunglasses; product may cause sensitivity to light
 - To carry emergency ID stating disease, medication use
 - How to take pulse, when to notify prescriber
 - To avoid all products unless approved by prescriber
 - Not to crush, chew ext rel product
 - Do not use grapefruit juice with this product
 - **QuiNIDine toxicity:** visual changes, nausea, headache, ringing in the ears, report immediately • To report signs of cinchonism, diarrhea, anorexia, decreased B/P
-

🍁 Canada only Side effects: *italics* = common; **bold** = life-threatening ⚠️
Nurse Alert

RABEprazole (Rx)

(rah-bep'rah-zole)

Aciphex, Pariet 

Func. class.: Antiulcer, proton pump inhibitor

Chem. class.: Benzimidazole

Do not confuse: **Aciphex**/Aricept/Accupril

ACTION:

Suppresses gastric secretion by inhibiting hydrogen/potassium ATPase enzyme system in the gastric parietal cells; characterized as a gastric acid pump inhibitor because it blocks the final step of acid production

USES:

Gastroesophageal reflux disease (GERD), severe erosive esophagitis, poorly responsive systemic GERD, pathologic hypersecretory conditions (Zollinger-Ellison syndrome, systemic mastocytosis, multiple endocrine adenomas); treatment of active duodenal ulcers with/without antiinfectives for *Helicobacter pylori*; daytime, nighttime heartburn

Unlabeled uses: Gastric ulcer, heartburn, *H. pylori* eradication in children

CONTRAINDICATIONS:

Hypersensitivity to this product or proton pump inhibitors (PPIs)

Precautions: Pregnancy (C), breastfeeding, children, Asian patients, diarrhea, geriatric patients, gastric cancer, hepatic/GI disease, IBS, osteoporosis, pseudomembranous colitis, ulcerative colitis, vit B₁₂ deficiency

DOSAGE AND ROUTES

Calculator

Healing of duodenal ulcers

- **Adult:** PO 20 mg/day $\times \leq 4$ wk; to be taken after breakfast

Healing of erosive esophagitis or ulcerative GERD

- **Adult:** PO 20 mg/day $\times 4-8$ wk
- **Adolescent and child ≥ 12 yr:** PO 20 mg/day up to 8 wk

Pathologic hypersecretory conditions

- **Adult: PO** 60 mg/day; may increase to 120 mg in 2 divided doses

Gastric ulcer (unlabeled)

- **Adult: PO** 20 mg/day after AM meal × 3-6 wk

Dyspepsia/heartburn (unlabeled)

- **Adult: PO** 20 mg/day × ≤14 days

Available forms: Del rel tabs 20 mg

Administer:

- **PO:** Do not break, crush, chew del rel tab; after breakfast daily with full glass of water, without regard to food

SIDE EFFECTS

CNS: Headache, dizziness, asthenia

CV: Chest pain, angina, tachycardia, bradycardia, palpitations, peripheral edema

EENT: Tinnitus, taste perversion

GI: Diarrhea, abdominal pain, vomiting, nausea, constipation, flatulence, acid regurgitation, abdominal swelling, anorexia, irritable colon, esophageal candidiasis, dry mouth, pseudomembranous colitis

GU: UTI, urinary frequency, increased creatinine, proteinuria, hematuria, testicular pain, glycosuria

HEMA: Pancytopenia, thrombocytopenia, neutropenia, leukocytosis, anemia

INTEG: Rash, dry skin, urticaria, pruritus, alopecia

META: Hypoglycemia, increased hepatic enzymes, weight gain

MISC: Back pain, fever, fatigue, malaise, Stevens-Johnson syndrome

RESP: Upper respiratory tract infections, cough, epistaxis, pneumonia

PHARMACOKINETICS

Eliminated in urine as metabolites and in feces, terminal half-life 1-2 hr, metabolized by CYP2C19 enzyme system, protein binding 96.3%

INTERACTIONS

Increase: bleeding risk—warfarin, clopidogrel

Increase: serum levels of RABEprazole—benzodiazepines, phenytoin, clarithromycin, antacids, other proton pump inhibitors, H₂ blockers

Increase: levels of—digoxin, nelfinavir/omeprazole

Decrease: levels of RABEprazole—sucralfate, calcium carbonate, vit B₁₂

Decrease: levels of ketoconazole, itraconazole, iron salts, atazanavir/ritonavir, ampicillin

Drug/Herb

Decrease: RABEprazole—St. John's wort

Drug/Lab Test

Decrease: magnesium

NURSING CONSIDERATIONS

Assess:

• GI system: bowel sounds, abdomen for pain, swelling, anorexia, emesis/stool for occult blood • **Pseudomembranous colitis:** may occur with most antibiotic therapy; watery diarrhea, abdominal pain, fever • **Vit B₁₂**

deficiency/cyanocobalamin/hypomagnesemia: may occur after 3-12 mo of treatment; use magnesium, vit B₁₂, cyanocobalamin supplement; if severe, discontinuing of product may be needed • Hepatic studies: AST, ALT, alk phos during treatment; CBC with differential periodically ⚠️ Serious skin reactions: Stevens-Johnson syndrome • CBC with differential before, periodically during treatment; blood dyscrasias may occur (rare) • Obtain susceptibility testing if *H. Pylori* treatment is ineffective, another antiinfective may be needed

Evaluate:

• Therapeutic response: absence of epigastric pain, swelling, fullness; decreased symptoms of GERD after 4-8 wk

Teach patient/family:

• To report severe diarrhea or black, tarry stools; product may have to be discontinued • That hypoglycemia may occur if patient is diabetic
• To avoid hazardous activities because dizziness, drowsiness may occur
• To avoid alcohol, salicylates, NSAIDs because they may cause GI irritation; to avoid other OTC, herbal products unless approved by prescriber • To use as directed for length of time prescribed; to take missed dose when remembered; not to double dose • To notify prescriber if pregnancy planned, suspected

✳️ Canada only Side effects: *italics* = common; **bold** = life-threatening ⚠️
Nurse Alert

radioactive iodine (sodium iodide) ^{131}I (Rx)

Func. class.: Antithyroid

Chem. class.: Radiopharmaceutical

ACTION:

Converted to protein-bound iodine by thyroid gland for use when needed

USES:

High dose: Thyroid cancer, hyperthyroidism

Low dose: Visualization to determine thyroid cancer, diagnostic aid for thyroid function studies

CONTRAINDICATIONS:

Pregnancy (X), breastfeeding, age <30 yr, recent MI, large nodular goiter, vomiting/diarrhea, acute hyperthyroidism, use of thyroid products

DOSAGE AND ROUTES

Calculator

Thyroid cancer

- **Adult: PO** 50-150 mCi; may repeat, depending on clinical status

Hyperthyroidism

- **Adult: PO** 4-10 mCi, depending on serum thyroxine level

Available forms: Caps 1-50, 0.8-100 mCi; oral sol 7.05 mCi/ml, 3.5-150 mCi/vial; concentrated oral solution 1000 mCi/ml

Administer:

- Only after discontinuing all other antithyroid agents $\times$ 5-7 days
- After NPO overnight; food delays action
- During or within 10 days of menstruation
- Do not take antithyroid agents except propranolol, which decreases hyperthyroid symptoms, until total effect of taking ^{131}I has occurred (about 6 wk)

SIDE EFFECTS

CV: Chest pain, tachycardia

EENT: Sore throat, cough

ENDO: Hypothyroidism, **hyperthyroid adenoma**, transient thyroiditis, goiter

GI: *Nausea, diarrhea, vomiting*

HEMA: **Eosinophilia, lymphedema, leukemia, bone marrow depression, leukopenia**, anemia, lymph node swelling

INTEG: Alopecia, rash, pruritus

RESP: Cough

PHARMACOKINETICS

PO: Onset 3-6 days; excreted in urine, sweat, feces, breast milk; crosses placenta; excreted in 56 days

INTERACTIONS

Increase: Hypothyroidism—lithium

Decrease: effect of I^{131} —amiodarone

Decrease: uptake—recent intake of stable iodine, thyroid, antithyroid products

Drugj/Lab Test

Decrease: Hgb, T4, TSH

NURSING CONSIDERATIONS

Assess:

- Weight daily with same clothing, scale, time of day
- Blood work, including CBC for blood dyscrasias (leukopenia, thrombocytopenia, agranulocytosis) • **Overdose:** **peripheral edema, heat intolerance, diaphoresis, palpitations, dysrhythmias, severe tachycardia, increased temp, delirium, CNS irritability**
- **Hypersensitivity:** rash, enlarged cervical lymph nodes; product may have to be discontinued
- **Hypoprothrombinemia:** bleeding, petechiae, ecchymosis
- Clinical response: after 3 wk should include increased weight, pulse; decreased T_4
- **Bone marrow depression:** sore throat, fever, fatigue

Perform/provide:

- Limited contact with patient: 1/2 hr/day for each person

- Adequate rest after treatment
- Fluids to 3-4 L/day for 48 hr to remove agent from body

Evaluate:

- Therapeutic response: weight gain, decreased pulse, decreased T₄, B/P

Teach patient/family:

- To fast overnight before treatment, consume increased fluids for 48 hr after therapy
- To empty bladder often during treatment; to avoid irradiation of gonads
- To report redness, swelling, sore throat, mouth lesions; may indicate blood dyscrasias
- To avoid extended contact with children, spouse for 1 wk
- That bathroom may be used by entire family; to flush toilet several times
- To avoid coughing, expectorating for 24 hr (saliva and vomitus highly radioactive for 6-8 hr)

☼ Canada only Side effects: *italics* = common; **bold** = life-threatening ⚠
Nurse Alert

raloxifene (Rx)

(ral-ox'ih-feen)

Evista

Func. class.: Bone resorption inhibitor

Chem. class.: Hormone modifier, selective estrogen receptor modulator (SERM)

ACTION:

Tissue-selective estrogen agonist/antagonist; agonist activity in bone and on lipid metabolism; antagonist activity on breast and uterus; reduces resorption of bone and decreases bone turnover

USES:

Prevention, treatment of osteoporosis in postmenopausal women; breast cancer prophylaxis in postmenopausal women with osteoporosis or in postmenopausal women at high risk for developing the disease

Unlabeled uses: Uterine leiomyomata in postmenopausal women with osteoporosis or in postmenopausal women who are at high risk for developing the disease

CONTRAINDICATIONS:

Pregnancy (X), breastfeeding, hypersensitivity

Black Box Warning:

Women with active or history of venous thromboembolic events

Precautions: CV/hepatic disease, cervical/uterine cancer, elevated triglycerides, pulmonary embolism

Black Box Warning:

Stroke

DOSAGE AND ROUTES

Calculator

• **Adult: PO** 60 mg/day, max 60 mg/day

Available forms: Tabs 60 mg

Administer:

- PO: without regard to meals, vit D
- Add calcium supplement if inadequate

SIDE EFFECTS

CNS: Insomnia

CV: Hot flashes, peripheral edema, **thromboembolism, stroke**

EENT: Retinal vein occlusion (rare)

GI: *Nausea*, vomiting, diarrhea, dyspepsia

GU: Vaginitis, leukorrhea, cystitis, *hot flashes*, vaginal bleeding

INTEG: Rash, sweating

META: Weight gain, peripheral edema

MS: Arthralgia, myalgia, *leg cramps*, arthritis

RESP: Sinusitis, pharyngitis, increased cough, pneumonia, laryngitis, bronchitis, **pulmonary embolism**, flulike symptoms

PHARMACOKINETICS

Elimination half-life 28-32 hr; excreted in feces, breast milk; highly bound to plasma proteins

INTERACTIONS

- Administer cautiously with other highly protein-bound products, systemic estrogens

Decrease: action of anticoagulants, dessicated thyroid, levothyroxine, liotrix

Decrease: action of raloxifene—ampicillin, cholestyramine

Drug/Food

Decrease: raloxifene—soy

Drug/Lab Test

Increase: apolipoprotein A-1, hormone-binding globulin

Decrease: total cholesterol, LDL, lipoprotein, apolipoprotein B, serum calcium, albumin, total protein

NURSING CONSIDERATIONS

Assess:

Black Box Warning:

History of stroke, TIA, thrombosis, atrial fibrillation, hypertension, smoking; venous thrombosis may occur, avoid prolonged sitting; discontinue 3 days before surgery, other immobilization

- Bone density test at baseline, throughout treatment, bone-specific alk phos, osteocalcin

Evaluate:

- Therapeutic response: prevention, treatment of osteoporosis in postmenopausal women; prevention of breast cancer in postmenopausal women with osteoporosis or in those who are at high risk for developing the disease

Teach patient/family:**Black Box Warning:**

To discontinue product 72 hr before prolonged bedrest; to avoid staying in one position for long periods

- To take calcium supplements, vit D if intake is inadequate
- To increase exercise using weights
- To stop smoking; to decrease alcohol consumption
- That product does not help to control hot flashes

⚠ To report fever, acute migraine, insomnia, emotional distress; urinary tract infection, vaginal burning/itching; swelling, warmth, pain in calves ⚠ To notify prescriber if pregnancy planned, suspected, pregnancy category (X); to avoid breastfeeding

🍁 Canada only Side effects: *italics* = common; **bold** = life-threatening ⚠

Nurse Alert

raltegravir (Rx)

(ral-teg'ra-vir)

Isentress

Func. class.: Antiretroviral

Chem. class.: HIV integrase strand transfer inhibitor (ISTIs)

ACTION:

Inhibits catalytic activity of HIV integrase, which is an HIV-encoded enzyme needed for replication

USES:

HIV in combination with other antiretrovirals

CONTRAINDICATIONS:

Breastfeeding, hypersensitivity

Precautions: Pregnancy (C), children, geriatric patients, hepatic disease, immune reconstitution syndrome, hepatitis, antimicrobial resistance, lactase deficiency

DOSAGE AND ROUTES

Calculator

• **Adult and adolescent ≥16 yr: PO** 400 mg bid; if using with rifampin, give 800 mg bid; max 800 mg/day with/without food

Available forms: Tabs 400 mg

Administer:

- Do not break, crush, chew tabs
- May give without regard to meals, with 8 oz of water

SIDE EFFECTS

CNS: *Fatigue, fever, dizziness, headache, asthenia, suicidal ideation*

CV: **MI**

GI: *Nausea, vomiting, diarrhea, abdominal pain, asthenia, gastritis, hepatitis*

GU: *Oliguria, proteinuria, hematuria, glomerulonephritis, acute renal failure, renal tubular necrosis*

HEMA: *Anemia, neutropenia*

INTEG: Rash, urticaria, pruritus, pain or phlebitis at IV site, unusual sweating, alopecia

META: Hyperamylasia, hyperglycemia

MS: Myopathy, **rhabdomyolysis**

SYST: **Immune reconstitution syndrome**

PHARMACOKINETICS

Max absorption 3 hr if taken on an empty stomach; terminal half-life 9 hr; metabolized in the liver by uridine diphosphate glucuronosyltransferase (UGT A1A enzyme system); excreted in feces 51%, urine 32%

INTERACTIONS

Increase: raltegravir effect—proton pump inhibitors, H₂ blockers; UGT1A1 inhibitors (atazanavir)

⚠ Increase: rhabdomyolysis, myopathy, elevated CPK—fibric acid derivatives, HMG-CoA reductase inhibitors

Decrease: raltegravir levels—rifampin, efavirenz, tenofovir, tipranavir/ritonavir

Drug/Lab Test

Increase: AST, ALT, GGT, total bilirubin, alk phos, amylase/lipase, CK, serum glucose, total/HDL/LDL cholesterol

Decrease: Hgb, platelets, ANC

NURSING CONSIDERATIONS

Assess:

- **HIV infection:** CD4, T-cell count, plasma HIV RNA, viral load; resistance testing before therapy, at treatment failure **⚠ Rhabdomyolysis:** Assess for calf pain, increased CPK, product should be discontinued
- Skin eruptions: rash, urticaria, itching

- **Suicidal thoughts/behaviors:** monitor for depression; more common in those with mental illness

- Immune reconstitution syndrome, usually during initial phase of treatment, may give antiinfective before starting

- Monitor total/HDL/LDL cholesterol baseline and periodically, all may be elevated

Perform/provide:

- Storage at room temp

Evaluate:

- Therapeutic response: improvement in CD4 counts, T-cell counts

Teach patient/family:

- To take as prescribed; if dose missed, to take as soon as remembered up to 1 hr before next dose; not to double dose; not to share with others
- That sexual partners need to be told that patient has HIV; that product does not cure infection, just controls symptoms, does not prevent infecting others ⚠️
- To report sore throat, fever, fatigue (may indicate superinfection)
- That product must be taken in equal intervals 2×/day to maintain blood levels for duration of therapy ⚠️
- To notify prescriber immediately of suicidal thoughts/behaviors
- To notify prescriber if pregnancy planned, suspected; to avoid breastfeeding
- To continue with follow-up exams, blood work

🍁 Canada only Side effects: *italics* = common; **bold** = life-threatening ⚠️
Nurse Alert

ramelteon (Rx)

(rah-mel'tee-on)

Rozerem

Func. class.: Sedative/hypnotic, antianxiety

Chem. class.: Melatonin receptor agonist

ACTION:

Binds selectively to melatonin receptors (MT₁, MT₂); thought to be involved in circadian rhythms and in the normal sleep/wake cycle

USES:

Insomnia (difficulty with sleep onset)

CONTRAINDICATIONS:

Breastfeeding, children, infants, hypersensitivity, alcohol intoxication, hepatic encephalopathy

Precautions: Pregnancy (C), hepatic disease, alcoholism, COPD, seizure disorder, sleep apnea, suicidal ideation, angioedema, depression, sleep-related behaviors (sleepwalking), schizophrenia, bipolar disorder

DOSAGE AND ROUTES

Calculator

- **Adult: PO** 8 mg at bedtime

Hepatic dose

- Do not use with severe hepatic disease; use with caution for mild to moderate hepatic disease

Available forms: Tabs 8 mg

Administer:

- Within 30 min of bedtime for sleeplessness; on empty stomach for fast onset
- Do not break tabs, swallow whole

SIDE EFFECTS

CNS: Dizziness, somnolence, fatigue, headache, insomnia, depression, complex sleep-related reactions (sleep driving, sleep eating), **suicidal thoughts/behaviors**

GI: Nausea, diarrhea, dysgeusia, vomiting

MISC: Myalgia, arthralgia, decreased blood cortisol, influenza, upper RI

SYST: Severe allergic reactions, angioedema

PHARMACOKINETICS

Absorbed rapidly; peak 0.75 hr; protein binding 82%; rapid first pass metabolism via liver; 84% excreted in urine, 4% in feces; half-life 2-5 hr

INTERACTIONS

⚠️ Possible toxicity: antiretroviral protease inhibitors ⚠️ **Increase:** ramelteon effect, toxicity—alcohol; CYP1A2 inhibitors, azole antifungals (ketoconazole, fluconazole), fluvoxamine, anxiolytics, sedatives, hypnotics, barbiturates, ciprofloxacin

Decrease: effect of ramelteon—rifampin

Drug/Food

- Prolonged absorption, sleep onset reduced: high-fat/heavy meal

NURSING CONSIDERATIONS

Assess:

⚠️ **Severe hypersensitive reactions:** Assess for angioedema (facial swelling), product should be discontinued • **Sleep characteristics:** type of sleep problem: falling asleep, staying asleep; complex sleep disorders (sleep walking/driving/eating) after taking product • **Mental status:** mood, sensorium, affect, memory (long, short term), suicidal ideation

- LFTs: before treatment, periodically

Perform/provide:

- Storage in tight container in cool environment

Evaluate:

- Therapeutic response: ability to sleep at night, decreased amount of early morning awakening

Teach patient/family:

- To avoid driving, other activities requiring alertness until product stabilized, drowsiness may continue the next day • To avoid alcohol ingestion, CNS depressants
- About alternative measures to improve sleep: reading, exercise several hr before bedtime, warm bath, warm milk, TV, self-hypnosis, deep breathing • To report if pregnancy is planned or suspected (C), avoid breastfeeding

- To take product immediately before going to bed
- Not to ingest a high-fat/heavy meal before taking product

 To report cessation of menses, galactorrhea (women), decreased libido, infertility, worsening of insomnia, behavioral changes, severe allergic reactions, suicidal thoughts/behaviors, if insomnia gets worse • Med guide should be given to patient and reviewed

 Canada only Side effects: *italics* = common; **bold** = life-threatening 
Nurse Alert

ramipril (Rx)

(ra-mi'pril)

Altace

Func. class.: Antihypertensive

Chem. class.: Angiotensin-converting enzyme inhibitor (ACE)

Do not confuse: ramipril/enalapril

Altace/alteplase

ACTION:

Selectively suppresses renin-angiotensin-aldosterone system; inhibits ACE, prevents conversion of angiotensin I to angiotensin II; results in dilation of arterial, venous vessels

USES:

Hypertension, alone or in combination with thiazide diuretics; CHF (post-MI), reduction in risk for MI, stroke, death from CV disorders

Unlabeled uses: Proteinuria due to diabetic nephropathy

CONTRAINDICATIONS:

Breastfeeding, children, hypersensitivity to ACE inhibitors, history of ACE-inhibitor-induced angioedema

Black Box Warning:

Pregnancy (D) 2nd/3rd trimesters

Precautions: Geriatric patients, impaired renal/hepatic function, dialysis patients, hypovolemia, blood dyscrasias, CHF, COPD, asthma, renal artery stenosis, cough, African American patients

DOSAGE AND ROUTES

Calculator

Hypertension

- **Adult:** PO 2.5 mg/day initially then 2.5-20 mg/day divided bid or daily

CHF post-MI

- **Adult:** PO 1.25-2.5 mg bid; may increase to 5 mg bid

Reduction in risk for MI, stroke, death

- **Adult: PO** 2.5 mg/day × 7 days then 5 mg/day × 21 days, then may increase to 10 mg/day

Renal dose

- **Adult: PO** CCr <40 ml/min, reduce by 50%, titrate upward to max 5 mg/day

Proteinuria due to diabetic nephropathy (unlabeled)

- **Adult: PO** 2.5 mg/day up to 20 mg/day

Available forms: Caps 1.25, 2.5, 5, 10 mg

Administer:

- Without regard to meals
- Caps can be opened, added to food, mixture is stable for 24 hr at room temperature, 48 hr refrigerated

SIDE EFFECTS

CNS: *Headache, dizziness, anxiety, insomnia, paresthesia, fatigue, depression, malaise, vertigo*

CV: *Hypotension, chest pain, palpitations, angina, syncope, dysrhythmia, heart failure, MI*

EENT: Hearing loss

GI: *Nausea, constipation, vomiting, dyspepsia, dysphagia, anorexia, diarrhea, abdominal pain, hepatitis, hepatic failure, pancreatitis, hepatic necrosis*

GU: *Proteinuria, increased BUN, creatinine, impotence*

HEMA: Decreased Hct, Hgb, *eosinophilia, leukopenia, pancytopenia, thrombocytopenia, agranulocytosis (rare)*

INTEG: *Rash, sweating, photosensitivity, pruritus*

META: *Hyperkalemia, hyperglycemia*

MISC: *Angioedema, toxic epidermal necrolysis, anaphylaxis, Stevens-Johnson syndrome*

MS: *Arthralgia, arthritis, myalgia*

RESP: *Cough, dyspnea*

PHARMACOKINETICS

Bioavailability >50%-60%, onset 1-2 hr, peak 3-6 hr, duration 24 hr, protein binding 73%, half-life 1-2 hr, 9-18 hr for active metabolite, metabolized by liver (metabolites excreted in urine, feces)

INTERACTIONS

Increase: hypotension—diuretics, other antihypertensives, ganglionic blockers, adrenergic blockers, nitrates, acute alcohol ingestion

⚠ Increase: toxicity—vasodilators, hydrALAZINE, prazosin, potassium-sparing diuretics, sympathomimetics, potassium supplements

Increase: serum levels of lithium

Decrease: absorption—antacids

Decrease: antihypertensive effect—indomethacin, NSAIDs, salicylates

Drug/Herb

Increase: antihypertensive effect—hawthorn

Decrease: antihypertensive effect—ephedra

Drug/Food

Increase: hyperkalemia—potassium salt substitutes, avoid use

Drug/Lab Test

Increase: LFTs, BUN, creatinine, glucose, potassium

Decrease: RBC, Hgb, platelets

NURSING CONSIDERATIONS

Assess:

⚠ Collagen-vascular disease (SLE, scleroderma): neutrophils, decreased platelets; WBC with differential at baseline, periodically; if neutrophils $<1000/\text{mm}^3$, discontinue treatment • **Hypertension:** Monitor B/P baseline and regularly, orthostatic hypotension, syncope • Potassium levels; hyperkalemia occurs

• **Renal disease:** protein, BUN, creatinine, potassium, sodium at baseline, periodically; increased levels may indicate nephrotic syndrome; renal symptoms: polyuria, oliguria, urinary frequency, dysuria

• **CHF:** edema in feet, legs daily; weight daily

⚠ Serious allergic reactions: angioedema, Stevens-Johnson syndrome, rash, fever, pruritus, urticaria; product should be discontinued if antihistamines fail to help • Monitor electrolytes baseline and periodically, potassium may be increased

Perform/provide:

• Storage in tight container at $\leq 86^\circ \text{F}$ (30°C)

Evaluate:

- Therapeutic response: decrease in B/P; CHF

Teach patient/family:

- Not to discontinue product abruptly; to comply with dosage schedule, even if feeling better
- Not to use OTC products (cough, cold, allergy) unless directed by prescriber
- Not to use salt substitutes containing potassium without consulting prescriber
- To rise slowly to sitting or standing position to minimize orthostatic hypotension

 **To notify prescriber of mouth sores, sore throat, fever, swelling of hands or feet, irregular heartbeat, chest pain** • **To report excessive perspiration, dehydration, vomiting, diarrhea; may lead to fall in B/P**

- That product may cause dizziness, fainting, lightheadedness; that these may occur during first few days of therapy
- That product may cause skin rash, impaired perspiration

- How to take B/P, normal readings for age group

Black Box Warning:

To inform prescriber if pregnancy planned, suspected, pregnancy category (D); not to breastfeed

TREATMENT OF OVERDOSE:

0.9% NaCl IV inf, hemodialysis

☼ Canada only Side effects: *italics* = common; **bold** = life-threatening 

Nurse Alert

ranibizumab (Rx)

(ran-ih-biz'oo-mab)

Lucentis

Func. class.: Ophthalmic

Chem. class.: Selective vascular endothelial growth factor antagonist

ACTION:

Binds to receptor-binding site of active forms of vascular endothelial growth factor A (VEGF-A) that causes angiogenesis and cell proliferation

USES:

Macular degeneration (neovascular) (wet), macular edema after retinal vein occlusion (RVO), diabetic macular edema

CONTRAINDICATIONS:

Hypersensitivity, ocular infections

Precautions: Pregnancy (C), breastfeeding, children, retinal detachment, increased intraocular pressure

DOSAGE AND ROUTES

Calculator

Macular degeneration/macular edema after retinal vein occlusion (RVO)

- **Adult:** INTRAVITREAL 0.5 mg (0.05 ml) monthly

Diabetic macular edema

- **Adults:** INTRAVITREAL 0.5 mg then prompt (within 1 wk) or deferred (≥ 24 wk) laser

Available forms: Sol for inj 0.5 mg/0.05 ml

Administer:

- By ophthalmologist via intravitreal injection using adequate anesthesia; use 19-gauge filter

SIDE EFFECTS

CNS: Dizziness, headache

EENT: Blepharitis, cataract, conjunctival hemorrhage/hyperemia, detachment of retinal pigment epithelium, dry/irritation/pain in eye, visual impairment, vitreous

floaters, ocular infection

GI: Constipation, nausea

MISC: Hypertension, UTI, **thromboembolism, nonocular bleeding**

RESP: Bronchitis, cough, sinusitis, URI

PHARMACOKINETICS

Elimination half-life 9 days

INTERACTIONS

Increase: severe inflammation—verteporfin photodynamic therapy (PDT)

NURSING CONSIDERATIONS

Assess:

- **Eye changes:** redness; sensitivity to light, vision change; increased intraocular pressure change; report infection to ophthalmologist immediately

Perform/provide:

- Storage in refrigerator; do not freeze
- Protect from light

Evaluate:

- Therapeutic response: prevention of increasing macular degeneration

Teach patient/family:

- **That, if eye becomes red, sensitive to light, painful, or if there is a change in vision, to seek immediate care from ophthalmologist**
- About reason for treatment, expected results

☼ Canada only Side effects: *italics* = common; **bold** = life-threatening ⚠

Nurse Alert

ranitidine (Rx, OTC)

(ra-nit'i-deen)

Equaline Heartburn Relief, Nu-Ranit , Top Care Heartburn Relief, Wal-zan, Zantac, Zantac C 

ranitidine bismuth citrate

Tritec

Func. class.: H₂-Histamine receptor antagonist

Do not confuse: ranitidine/amantadine/rimantadine
Zantac/Xanax/Zofran/Zyrtec

ACTION:

Inhibits histamine at H₂-receptor site in parietal cells, which inhibits gastric acid secretion

USES:

Duodenal ulcer, Zollinger-Ellison syndrome, gastric ulcers, hypersecretory conditions, gastroesophageal reflux disease, stress ulcers, erosive esophagitis (maintenance), active duodenal ulcers with *Helicobacter pylori* in combination with clarithromycin, systemic mastocytosis, multiple endocrine adenoma syndrome, heartburn

Unlabeled uses: Prevention of aspiration pneumonitis, upper GI bleeding, angioedema, gastritis, urticaria, NSAID-induced ulcer prophylaxis

CONTRAINDICATIONS:

Hypersensitivity

Precautions: Pregnancy (B), breastfeeding, child <12 yr, renal/hepatic disease

DOSAGE AND ROUTES

Calculator

Ranitidine

Duodenal ulcer

- **Adult: PO** 150 mg bid or 300 mg/day after PM meal or at bedtime; maintenance 150 mg at bedtime

- **Infant and child: PO** 2-4 mg/kg bid, max 300 mg/day

Zollinger-Ellison syndrome

- **Adult: PO** 150 mg bid, may increase if needed

Gastric ulcer

- **Adult: PO** 150 mg bid × 6 wk then 150 mg at bedtime
- **Infant and child: PO** 2-4 mg/kg bid, max 300 mg/day

GERD

- **Adult: PO** 150 mg bid

Erosive esophagitis

- **Adult: PO** 150 mg qid for up to 12 wk
- **Child ≥1 mo: PO** 5-10 mg/kg/day in 2-3 divided doses

Renal dose

- **Adult: CCr <50 ml/min, give 50% of dose or extend dosing interval**

NSAID-induced ulcer prophylaxis (unlabeled)

- **Adult: PO** 150 mg bid

Stress gastritis prophylaxis (unlabeled)

- **Adult: IM/INT IV INF** 50 mg q6-8hr

Severe, acute urticaria/angioedema (unlabeled)

- **Adult: INT IV INF** 50 mg with H₁-blocker

Ranitidine bismuth citrate

- **Adult: PO** 400 mg bid × 4 wk with clarithromycin 500 mg tid × 1st 2 wk

Available forms: *Ranitidine*: tabs 75, 150, 300 mg; sol for inj 25 mg/ml; caps 150, 300 mg; syr 15 mg/ml; *ranitidine bismuth citrate*: tabs 400 mg

Administer:

PO route

- Antacids 1 hr before or 1 hr after ranitidine
- Without regard to meals; **EFFERdose tab**: dissolve 25 mg/≥5 ml, give after dissolved; swallow whole or dissolve on tongue, do not chew

IM route

- No dilution needed; inject in large muscle mass, aspirate

Direct IV route

- Dilute to max 2.5 mg/ml (50 mg/20 ml) using 0.9% NaCl (nonpreserved) or D₅W, give dose over ≥5 min (max 4 mg/ml)

Intermittent IV INF route

- Dilute to max 0.5 mg/ml with D₅W, NS, give over 15-20 min (5-7 ml/min); premixed ready-to-use bags as 1 mg/ml (50 mg/50 ml), inf over 15-20 min

Continuous 24 hr IV INF route

- dilute 150 mg/250 ml of **D₅W** or NS, run over 24 hr (6.25 mg/hr or as directed); use inf device, use within 48 hr; *Zollinger-Ellison Syndrome*: dilute in D₅W, NS; max conc 2.5 mg/ml, use inf device

Y-site: Acyclovir, aldesleukin, alemtuzumab, alfentanil, allopurinol, amifostine, amikacin, aminophylline, amphotericin B liposome, amsacrine, anikinra, anidulafungin, ascorbic acid, atracurium, atropine, aztreonam, bivalirudin, bumetanide, buprenorphine, butorphanol, calcium chloride/gluconate, CARBOplatin, ceFAZolin, cefepime, cefonicid, cefoperazone, cefotaxime, cefoTEtan, cefOXitin, cefTAZidime, ceftizoxime, cefTRIAxone, cefuroxime, chloramphenicol, chlorproMAZINE, cimetidine, ciprofloxacin, cisatracurium, CISplatin, clindamycin, cyanocobalamin, cyclophosphamide, cycloSPORINE, cytarabine, DACTINomycin, DAPTOmycin, dexamethasone, dexmedetomidine, digoxin, diltiazem, DOBUTamine, DOCEtaxel, DOPamine, doripenem, doxacurium, doxapram, DOXOrubicin, DOXOrubicin liposome, doxycycline, enalaprilat, ePHEDrine, EPINEPHrine, epirubicin, epoetin alfa, ertapenem, erythromycin, esmolol, etoposide, etoposide phosphate, famotidine, fenoldopam, fentaNYL, filgrastim, fluconazole, fludarabine, fluorouracil, folic acid, foscarnet, furosemide, ganciclovir, gemcitabine, gentamicin, glycopyrrolate, granisetron, heparin, hydrocortisone, HYDROmorphine, IDArubicin, ifosfamide, imipenem/cilastatin, inamrinone, indomethacin, isoproterenol, ketorolac, labetalol, levofloxacin, lidocaine, linezolid, LORazepam, magnesium sulfate, mannitol, mechlorethamine, melphalan, meperidine, metaraminol, methotrexate, methoxamine, methyl Dopate, methylPREDNISolone, metoclopramide, metoprolol, metroNIDAZOLE, midazolam, milrinone, mitoXANtrone, morphine, multivitamin, nalbuphine, naloxone, nesiritide, niCARdipine, nitroglycerin, nitroprusside, norepinephrine, octreotide, ondansetron, oxacillin, oxaliplatin, oxytocin, PACLitaxel, palonosetron, pancuronium, papaverine, PEMEtrexed, penicillin G, pentamidine, pentazocine, PENTobarbital, PHENobarbital, phentolamine, phenylephrine, phytonadione, piperacillin/tazobactam, potassium chloride, procainamide, prochlorperazine, promethazine, propofol, propranolol, protamine, pyridoxime, remifentanil,

riTUXimab, rocuronium, sargramostim, sodium acetate/bicarbonate, succinylcholine, SUFentanil, tacrolimus, teniposide, theophylline, thiamine, thiopental, thiotepa, ticarcillin/clavulanate, tigecycline, tirofiban, tobramycin, tolazoline, trastuzumab, trimethaphan, urokinase, vancomycin, vecuronium, vinCRIStine, vinorelbine, warfarin, zidovudine, zoledronic acid

SIDE EFFECTS

CNS: Headache, sleeplessness, dizziness, confusion, agitation, depression, hallucination (geriatric patients)

CV: Tachycardia, bradycardia, PVCs

EENT: Blurred vision, increased ocular pressure

GI: Constipation, abdominal pain, diarrhea, nausea, vomiting, **hepatotoxicity**

GU: Impotence, **acute interstitial nephritis (rare)**

INTEG: Urticaria, rash, fever

RESP: **Pneumonia**

SYST: **Anaphylaxis (rare)**

PHARMACOKINETICS

PO: Peak 2-3 hr; duration 8-12 hr; metabolized by liver; excreted in urine (30% unchanged, PO), breast milk; half-life 2-3 hr; protein binding 15%

INTERACTIONS

Increase: effect of pramipexole, procainamide, trospium, triazolam, calcium channel blockers, memantine, saquinavir, adefovir

 **Increase:** GI obstruction risk—NIFEdipine ext rel products

Increase: toxicity—sulfonylureas, procainamide, benzodiazepines, calcium channel blockers

Decrease: absorption of ranitidine—antacids, anticholinergics

Decrease: effects of cephalosporins, iron salts, ketoconazole, itraconazole

Increase: GI obstruction risk—NIFEdipine ext rel products

Drug/Lab Test

Increase: AST, ALT, creatinine

False positive: urine protein (Multistix)

NURSING CONSIDERATIONS

Assess:

- **GI complaints:** nausea, vomiting, diarrhea, cramps, abdominal discomfort, jaundice; report immediately
- I&O ratio, BUN, creatinine, LFTs, serum, stool guaiac before, periodically during therapy

Perform/provide:

- Storage at room temp

Evaluate:

- Therapeutic response: decreased abdominal pain, heartburn

Teach patient/family:

- To avoid driving, other hazardous activities until stabilized on product
- That product must be continued for prescribed time to be effective
- To notify prescriber if pregnancy planned, suspected; to avoid breastfeeding
- Not to take maximum OTC daily dose for >2 wk
- To take once daily dose before bedtime

🍁 Canada only Side effects: *italics* = common; **bold** = life-threatening ⚠️
Nurse Alert

ranolazine (Rx)

(ruh-no'luh-zeen)

Ranexa

Func. class: Antianginal

ACTION:

Antianginal, antiischemic; unknown, may work by inhibiting portal fatty-acid oxidation

USES:

Chronic stable angina pectoris; use in patients who have not responded to other treatment options; should be used in combination with other antianginals such as amlodipine, β -blockers, nitrates

CONTRAINDICATIONS:

Preexisting QT prolongation, hepatic disease (Child-Pugh class A, B, C), hypersensitivity, hypokalemia, renal failure, torsades de pointes, ventricular dysrhythmia, ventricular tachycardia, hepatic cirrhosis

Precautions: Pregnancy (C), breastfeeding, children, geriatric patients, hypotension, renal disease

DOSAGE AND ROUTES

Calculator

• **Adult: PO** 500 mg bid, increased to 1000 mg bid based on response; max 1000 mg bid

Available forms: Ext rel tabs 500, 1000 mg

Administer:

• **Ext rel tabs:** do not break, crush, chew tabs; take product as prescribed; do not double or skip dose • Without regard to meals, bid; do not use with grapefruit juice

SIDE EFFECTS

CNS: Headache, dizziness

CV: Palpitations, QT prolongation

GI: Nausea, vomiting, constipation, dry mouth

MISC: Peripheral edema

RESP: Dyspnea

PHARMACOKINETICS

Absorption varied; peak 2-5 hr; half-life 7 hr; extensively metabolized by the liver (CYP3A and less by CYP2D6); excreted in urine (75%), feces (25%); protein binding 62%

INTERACTIONS

Increase: ranolazine action—diltiazem, ketoconazole, macrolide antibiotics, dofetilide, PARoxetine, protease inhibitors, quinidine, sotalol, thioridazine, verapamil, ziprasidone

Increase: action of digoxin, simvastatin

Increase: ranolazine absorption, toxicity—antiretroviral protease inhibitors

⚠ Increase: QT prolongation and torsades de pointes—class IA/III antidysrhythmics, arsenic trioxide, chloroquine, droperidol, haloperidol, levomethadyl, methadone, pentamidine, chlorpromazine, mesoridazine, thioridazine, pimozide; CYP3A4 inhibitors (ketoconazole, fluconazole, itraconazole, IV miconazole, voriconazole, diltiazem, verapamil)

Drug/Food

- Do not use with grapefruit, grapefruit juice

NURSING CONSIDERATIONS

Assess:

- **Angina:** characteristics of pain (intensity, location, duration, alleviating/precipitating factors) **⚠QT prolongation:** ECG for QT prolongation, ejection fraction; assess for chest pain, palpitations, dyspnea
- Cardiac status: B/P, pulse, respirations

- LFTs, serum creatinine/BUN, magnesium, potassium before treatment, periodically

Evaluate:

- Therapeutic response: decreased anginal pain

Teach patient/family:

- To avoid hazardous activities until stabilized on product, dizziness no longer a problem **⚠To avoid OTC drugs, grapefruit juice, products prolonging QTc**

(quinidine, dofetilide, sotalol, erythromycin, thioridazine, ziprasidone or protease inhibitors, diltiazem, ketoconazole, macrolide antibiotics, verapamil) unless directed by prescriber; to notify prescriber of palpitations, fainting • To comply with all areas of medical regimen

- To take as directed; not to skip dose, double doses
- Not to chew or crush, not to use with grapefruit juice
- To notify all health care providers of product use
- **To notify prescriber of palpitations, dizziness, edema, dyspnea**
- For acute angina, take other products prescribed, this product does not decrease acute attack

☼ Canada only Side effects: *italics* = common; **bold** = life-threatening ⚠
Nurse Alert

rasagiline (Rx)

(ra-sa'ji-leen)

Azilect

Func. class.: Antiparkinson agent

Chem. class.: MAOI, type B

ACTION:

Inhibits MAOI type B at recommended doses; may increase DOPamine levels

USES:

Idiopathic Parkinson's disease monotherapy or with levodopa

CONTRAINDICATIONS:

Breastfeeding; hypersensitivity to this product, MAOIs; pheochromocytoma

Precautions: Pregnancy (C), children, psychiatric disorders, moderate to severe hepatic disorders

DOSAGE AND ROUTES

Calculator

Monotherapy

- **Adult: PO** 1 mg/day

Adjunctive therapy

- **Adult: PO** 0.5 mg/day, may increase 1 mg/day; change of levodopa dose for adjunct therapy; reduced levodopa dose may be needed

Hepatic dose

- **Adult: PO** 0.5 mg for mild hepatic disease

Concomitant ciprofloxacin, other CYP1A2 inhibitors

- **Adult: PO** 0.5 mg; plasma concentrations of rasagiline may double

Available forms: Tabs 0.5, 1 mg

Administer:

 With meals to prevent nausea; continuing therapy usually reduces or eliminates nausea; do not give with foods/liquids containing large amounts of tyramine • Reduced dose of carbidopa/levodopa cautiously

- Renal failure: in dialysis, increase dose slowly

SIDE EFFECTS

CNS: Drowsiness, hallucinations, depression, headache, malaise, paresthesia, vertigo, syncope

CV: Angina, **hypertensive crisis** (ingestion of tyramine products), orthostatic hypotension

GI: Nausea, diarrhea, dry mouth, dyspepsia

GU: Impotence, decreased libido

HEMA: **Leukopenia**

INTEG: **Alopecia, skin cancers**

MISC: Conjunctivitis, fever, flu syndrome, neck pain, allergic reaction, alopecia

MS: Arthralgia, arthritis, dyskinesia

RESP: Rhinitis

PHARMACOKINETICS

Onset, peak, duration unknown; well absorbed; protein binding >88%-94%; metabolized by CYP1A2 in liver; excreted by kidneys

INTERACTIONS

 Do not give with meperidine, other analgesics because serious reactions (including coma and death) may occur; do not give with sympathomimetics
Increase: levels of rasagiline up to 2-fold—ciprofloxacin, CYP1A2 inhibitors (atazanavir, mexiletine, taurine)

Increase: severe CNS toxicity with antidepressants (tricyclics, SSRIs, SNRIs, mirtazapine, cyclobenzaprine)

 **Increase:** hypertensive crisis—MAOIs

Drug/Herb

- Do not give with St. John's wort, yohimbe

Drug/Food

- Do not give with foods/liquids that have large amounts of tyramine

Drug/Lab Test

Increase: LFTs

Decrease: WBCs

NURSING CONSIDERATIONS

Assess:

- **Parkinson's symptoms:** tremor, ataxia, muscle weakness and rigidity at baseline, periodically; increased dyskinesia, postural hypotension if used in

combination with levodopa • Mental status: hallucinations, confusion, notify prescriber

⚠️ **Hypertensive crisis:** severe headache, blurred vision, seizures, chest pain, difficulty thinking, nausea, vomiting, signs of stroke; any unexplained severe headache should be considered to be hypertensive crisis ⚠️ **Melanomas;** periodic skin exams by a dermatologist • Cardiac status: B/P, ECG periodically during beginning treatment

⚠️ **Tyramine products:** foods, other medications may lead to hypertensive crisis (tachycardia, bradycardia, chest pain, nausea, vomiting, sweating, dilated pupils)

Evaluate:

- Therapeutic response: improved symptoms in patients with Parkinson's disease

Teach patient/family:

- To change positions slowly to prevent orthostatic hypotension
- To avoid hazardous activities until stabilized on product; that dizziness can occur
- To rinse mouth frequently; to use sugarless gum to alleviate dry mouth
- To take as prescribed; not to miss dose or double doses; to take missed dose as soon as remembered if several hours before next dose ⚠️ To prevent hypertensive crisis by avoiding high-tyramine foods (>150 mg) • To report signs of hypertensive crisis
- To avoid CNS depressants, alcohol
- To notify all providers of product use; to avoid elective surgery, other procedures involving CNS depressants

🍁 Canada only Side effects: *italics* = common; **bold** = life-threatening ⚠️
Nurse Alert

rasburicase (Rx)

(rass-burr'i-case)

Elitek, Fasturtec 

Func. class.: Enzyme

Chem. class.: Recombinant urate-oxidase enzyme

ACTION:

Catalyzes enzymatic oxidation of uric acid into an inactive and soluble metabolite (allantoin)

USES:

To reduce uric acid levels in children with leukemia, lymphoma, solid tumor malignancies who are receiving chemotherapy

CONTRAINDICATIONS:

Hypersensitivity

Black Box Warning:

G6PD deficiency (Mediterranean, African descendants), hemolytic reactions, methemoglobinemia reactions to product

Precautions: Pregnancy (C), breastfeeding, children <2 yr, anemia

Black Box Warning:

Acute bronchospasm, angina, angioedema, atony, African-American and Mediterranean patients, hypotension, urticaria

DOSAGE AND ROUTES

Calculator

• **Adult/adolescent/infant:** IV INF 0.2 mg/kg as single daily dose given as IV INF over 1/2 hr × 5 days

Available forms: Powder for inj 1.5, 7.5 mg/vial

Administer:

Intermittent IV INF route

- Reconstitute with diluent provided, add 1 ml of diluent/each vial, swirl, withdraw amount needed, mix with NS to final volume of 50 ml, use within 24 hr, give over 30 min, do not use filter, use different line; if not possible, flush with ≥15 ml of saline before, after use
- Chemotherapy started 4-24 hr

after 1st dose

SIDE EFFECTS

CNS: *Headache*, fever

CV: Chest pain, hypotension

GI: *Nausea, vomiting, anorexia, diarrhea, abdominal pain, constipation, dyspepsia, mucositis*

HEMA: Neutropenia with fever, hemolysis, methemoglobinemia

INTEG: *Rash*

MISC: Edema

RESP: Bronchospasm, wheezing, dyspnea

SYST: Anaphylaxis, hemolysis, methemoglobinemia, sepsis

PHARMACOKINETICS

Elimination half-life 16-21 hr

INTERACTIONS

⚠ **Increase:** toxicity—allopurinol

NURSING CONSIDERATIONS

Assess:

- Blood studies: BUN, serum uric acid, urine creatinine clearance, electrolytes, CBC with differential before, during therapy
- Monitor temp; fever may indicate beginning infection; no rectal temps

⚠ **Anaphylaxis:** dyspnea, urticaria, flushing, wheezing, swelling of lips, tongue, throat; have emergency equipment nearby ⚠ **G6PD deficiency, hemolytic reactions, methemoglobinemia;** these patients should not be given this product; screen patients who are at higher risk for these disorders

- GI symptoms: frequency of stools, cramping; if severe diarrhea occurs, fluid, electrolytes may need to be given

Evaluate:

- Therapeutic response: decreased uric acid levels in children when antineoplastics causing high uric acid levels used

Teach patient/family:

- About the reason for therapy, expected results

⚠ To report trouble breathing, jaundice, chest pain

🍁 Canada only Side effects: *italics* = common; **bold** = life-threatening ⚠️
Nurse Alert

HIGH ALERT

remifentanyl (Rx)

(rem-ih-fin'ta-nill)

Ultiva

Func. class.: Opiate agonist analgesic

Chem. class.: μ -Opioid agonist

Controlled Substance Schedule II

ACTION:

Inhibits ascending pain pathways in limbic system, thalamus, midbrain, hypothalamus

USES:

In combination with other products for general anesthesia to provide analgesia

CONTRAINDICATIONS:

Hypersensitivity

Precautions: Pregnancy (C), breastfeeding, children <12 yr, geriatric patients, increased intracranial pressure, acute MI, severe heart disease, GI/renal/hepatic disease, asthma, respiratory conditions, seizures disorders, bradyarrhythmias

DOSAGE AND ROUTES

Calculator

- **Adult:** Induction **IV** 0.5-1 mcg/kg/min with hypnotic or volative agent; maintenance with isoflurane (0.4-1.5 MAC) or propofol (100-200 mcg/kg/min); **CONT INF** 0.25-0.4 mcg/kg/min

- **Child 1-12 yr:** **CONT IV INF** 0.25 mcg/kg/min with isoflurane

- **Full-term neonate and infant up to 2 mo:** **CONT IV INF** 0.4 mcg/kg/min with nitrous oxide

Available forms: Powder for inj lyophilized 1, 2, 5 mg

Administer:

- Add 1 ml diluent per mg remifentanyl
- Shake well; further dilute to a final concentration of 20, 25, 50 or 250 mcg/mg

- Interruption of inf results in rapid reversal (no residual opioid effect within 5-10 min)

Direct IV route

- To be used only during maintenance of general anesthesia; inject into tubing close to venous cannula; give to nonintubated patients over 30-60 sec

Continuous IV INF route

- Use inf device, max 16 hr; do not use same tubing as blood, do not admix

Y-site compatibilities: Acyclovir, alfentanil, amikacin, aminophylline, ampicillin, ampicillin/sulbactam, aztreonam, bumetanide, buprenorphine, butorphanol, calcium gluconate, ceFAZolin, cefepine, cefotaxime, cefoTEtan, cefOXitin, cefTAZidime, ceftizoxime, cefTRIAxone, cefuroxime, cimetidine, ciprofloxacin, cisatracurium, clindamycin, dexamethasone, digoxin, diltiazem, diphenhydrAMINE, DOBUTamine, DOPamine, doxacurium, doxycycline, droperidol, enalaprilat, EPINEPHrine, esmolol, famotidine, fentaNYL, fluconazole, furosemide, ganciclovir, gatifloxacin, gentamicin, haloperidol, heparin, hydrocortisone sodium succinate, HYDROmorphine, hydrOXYzine, imipenem-cilastatin, inamrinone, isoproterenol, ketorolac, lidocaine, LORazepam, magnesium sulfate, mannitol, meperidine, methylPREDNISolone sodium succinate, metoclopramide, metroNIDAZOLE, midazolam, morphine, nalbuphine, nitroglycerin, norepinephrine, ondansetron, phenylephrine, piperacillin, potassium chloride, procainamide, prochlorperazine, promethazine, ranitidine, SUFentanil, theophylline, thiopental, ticarcillin/clavulanate, tobramycin, vancomycin, zidovudine

Solution compatibilities: D₅, 0.45% NaCl, LR, D₅ LR, 0.9% NaCl

SIDE EFFECTS

CNS: Drowsiness, *dizziness*, confusion, *headache*, sedation, euphoria, delirium, agitation, anxiety

CV: Palpitations, *bradycardia*, change in B/P, facial flushing, syncope, **asystole**

EENT: Tinnitus, blurred vision, miosis, diplopia

GI: *Nausea, vomiting*, anorexia, constipation, cramps, dry mouth

GU: Urinary retention, dysuria

INTEG: Rash, urticaria, bruising, flushing, diaphoresis, pruritus

MS: Rigidity

RESP: Respiratory depression, apnea

PHARMACOKINETICS

70% protein binding, terminal half-life 3-10 min, excreted in urine; onset: 1-3 min

INTERACTIONS

Increase: respiratory depression, hypotension, profound sedation: alcohol, sedatives, hypnotics, other CNS depressants; antihistamines, phenothiazines, MAOIs

Drug/Herb

Increase: CNS depression—kava

NURSING CONSIDERATIONS

Assess:

- I&O ratio; check for decreasing output; may indicate urinary retention, especially in geriatric patients
- CNS changes; dizziness, drowsiness, hallucinations, euphoria, LOC, pupil reaction
- GI status: nausea, vomiting, anorexia, constipation
- Allergic reactions: rash, urticaria
- **Respiratory dysfunction:** respiratory depression, character, rate, rhythm; notify prescriber if respirations <12/min; CV status; bradycardia, syncope

Perform/provide:

- Storage in light-resistant area at room temp

Evaluate:

- Therapeutic response: maintenance of anesthesia

Teach patient/family:

- To call for assistance when ambulating or smoking; that drowsiness, dizziness may occur
- To make position changes slowly to prevent orthostatic hypotension

☼ Canada only Side effects: *italics* = common; **bold** = life-threatening ⚠

Nurse Alert

repaglinide (Rx)

(re-pag'lih'nide)

Gluconorm , Prandin

Func. class.: Antidiabetic

Chem. class.: Meglitinide

ACTION:

Causes functioning β -cells in pancreas to release insulin, thereby leading to a drop in blood glucose levels; closes ATP-dependent potassium channels in the β -cell membrane; this leads to the opening of calcium channels; increased calcium influx induces insulin secretion

USES:

Type 2 diabetes mellitus

CONTRAINDICATIONS:

Hypersensitivity to meglitinides; diabetic ketoacidosis, type 1 diabetes

Precautions: Pregnancy (C), breastfeeding, children, geriatric patients, thyroid/cardiac disease, severe renal/hepatic disease, severe hypoglycemic reactions

DOSAGE AND ROUTES

Calculator

• **Adult: PO** 1-2 mg with each meal, max 16 mg/day; adjust at weekly intervals; oral-hypoglycemic-naïve patients or patients with A1c <8% should start with 0.5 mg with each meal

Renal/hepatic dose

• **Adult: PO** CCr 20-39 ml/min, 0.5 mg/day; titrate upward cautiously

Available forms: Tabs 0.5, 1, 2 mg

Administer:

- Up to 15-30 min before meals; 2, 3, or 4×/day preprandially
- Skip dose if meal skipped; add dose if meal added

SIDE EFFECTS

CNS: Headache, weakness, paresthesia

ENDO: Hypoglycemia

GI: Nausea, vomiting, diarrhea, constipation, dyspepsia

INTEG: Rash, allergic reactions

MISC: Chest pain, UTI, allergy

MS: Back pains, arthralgia

RESP: URI, sinusitis, rhinitis, bronchitis

PHARMACOKINETICS

Completely absorbed by GI route; onset 30 min; peak 1 hr; duration <4 hr; half-life 1 hr; metabolized in liver; excreted in urine, feces (metabolites); crosses placenta; 98% protein bound

INTERACTIONS

 **Do not use with gemfibrozil**

Increase: repaglinide effect—CYP3A4, OATP101, CYP2C9 inhibitors

Increase: in both—levonorgestrel/ethinyl estradiol

Increase: repaglinide metabolism—CYP3A4 inducers: rifampin, barbiturates, carbamazepine

Increase: repaglinide effect—NSAIDs, salicylates, sulfonamides, chloramphenicol, MAOIs, coumarins, β -blockers, probenecid, gemfibrozil, simvastatin, fenofibrate, deferasirox

Decrease: repaglinide metabolism—CYP3A4 inhibitors: antifungals (ketoconazole, miconazole), erythromycin, macrolides

Decrease: repaglinide action—calcium channel blockers, corticosteroids, oral contraceptives, thiazide diuretics, thyroid preparations, estrogens, phenothiazines, phenytoin, rifampin, isoniazid, PHENobarbital, sympathomimetics

Drug/Herb

Increase: antidiabetic effect—garlic, chromium, horse chestnut

Drug/Food

Decrease: repaglinide level; give before meals

Drug/Lab Test

Increase/decrease: glucose

NURSING CONSIDERATIONS

Assess:

 **Hypo/hyperglycemic reaction**, which can occur soon after meals: dizziness, weakness, headache, tremor, anxiety, tachycardia, hunger, sweating, abdominal pain, A1c, fasting, postprandial glucose during treatment

Perform/provide:

- Storage in tight container at room temp

Evaluate:

- Therapeutic response: decrease in polyuria, polydipsia, polyphagia; clear sensorium; absence of dizziness; stable gait; blood glucose, A1c improvement

Teach family/patient:

- About technique for blood glucose monitoring; how to use blood glucose meter
- About the symptoms of hypo/hyperglycemia, what to do about each
- That product must be continued on daily basis; about the consequences of discontinuing product abruptly
- To avoid OTC medications unless ordered by prescriber
- That diabetes is a lifelong illness; that product will not cure disease
- That all food included in diet plan must be eaten to prevent hypoglycemia; that if a meal is omitted, dose should be omitted; to have glucagon emergency kit available; to take repaglinide 15-30 min before meals 2, 3, or 4×/day; to carry emergency ID

TREATMENT OF OVERDOSE:

Glucose 25 g IV via dextrose 50% solution, 50 ml or 1 mg glucagon

☼ Canada only Side effects: *italics* = common; **bold** = life-threatening 
Nurse Alert

retapamulin (topical)

(re-te-pam'you-lin)

Altabax

Func. class.: Topical antiinfective

Chem. class.: Pleuromutilin

ACTION:

Antibacterial activity results from inhibition of protein synthesis

USES:

For the treatment of impetigo

CONTRAINDICATIONS:

Hypersensitivity to this product

Precautions: Children

DOSAGE AND ROUTES

Calculator

- **Adult/child ≥9 mo: TOP** apply to affected area bid × 5 days

Available forms: Topical ointment 1%

Administer:

Topical route

- Do not use skin products near the eyes, nose, or mouth
- Wash hands before and after use
- **Ointment:** Apply a thin film to the cleansed affected area and massage gently into affected areas

SIDE EFFECTS

INTEG: Pruritus, irritation, headache, diarrhea, nausea

NURSING CONSIDERATIONS

Assess:

Allergic reaction

- Hypersensitivity, product may need to be discontinued

Infection

- Number of lesions, severity of impetigo

Evaluate:

- Decreased lesions, infection in impetigo

Teach patient/family:

Topical route

- Not to use skin products near the eyes, nose, or mouth
- To wash hands before and after use
- **Ointment:** To apply a thin film to the cleansed affected area

🍁 Canada only Side effects: *italics* = common; **bold** = life-threatening ⚠️
Nurse Alert

Rh_o(D) immune globulin standard dose IM (Rx)

BayRho-D, HyperRHO SD, RhoGAM Ultra-Filtered Plus

Rh_o(D) immune globulin microdose IM (Rx)

MICRhoGAM Ultra-Filtered Plus

Rh_o(D) immune globulin IV (Rx)

Rhophylac, WinRho SDF

Func. class.: Immune globulins

ACTION:

Suppresses immune response of nonsensitized Rh_o(D or D^u)-negative patients who are exposed to Rh_o(D or D^u)-positive blood

USES:

Prevention of isoimmunization in Rh-negative women given Rh-positive blood after abortions, miscarriages, amniocentesis; chronic idiopathic thrombocytopenia purpura (Rhophylac)

CONTRAINDICATIONS:

Previous immunization with this product, Rh_o(O)-positive/D^u-positive patient

Black Box Warning:

Hemolysis

Precautions: Pregnancy (C)

Black Box Warning:

Requires a specialized setting

DOSAGE AND ROUTES

Calculator

To reduce risk of Rh isoimmunization antepartum/suppression of Rh isoimmunization postpartum following delivery of full-term infant

- **Adult and adolescent ≥16 yr: IM** (BayRho-D [HyperRHO SD] full dose only) 300 mcg (1500 international units) at 28 wk gestation, repeat within 72 hr of delivery of confirmed Rho(D)-positive infant; dose not needed after delivery if delivery within 3 wk of last dose and no fetal maternal hemorrhage of >15 ml

of RBC; **IM** (RhoGam only) 300 mcg (1500 international units) at 26-28 wk gestation, repeat within 72 hr even if status of Rho unknown or if 72 hr have passed; **IM/IV** (WinRho SDF only) 300 mcg (1500 international units) at 28 wk gestation; if given earlier during pregnancy, give at 12-wk intervals during pregnancy, 120-mcg (600 international units) dose; IM/IV should be given as soon as possible and preferably within 72 hr of delivery of confirmed Rho(D)-positive infant and even if status unknown; give ≤ 28 days after delivery

Known or suspected massive fetomaternal hemorrhage (>15 ml of fetal RBC or >30 ml of fetal whole blood)

- **Adult and adolescent ≥ 16 yr:** **IM** (BayRho-D [HyperRHO SD] full dose only) 300 mcg (1500 international units) per every 15 ml of fetal blood cells or 30 ml of whole blood; multiple syringes may be injected IM at same time in different sites, give within 72 hr of exposure, repeat dose within 72 hr of delivery; **IM** (RhoGAM only) 300 mcg (1500 international units) for every 15 ml of fetal blood cells or 30 ml of whole blood, give total dose within 72 hr of exposure; **IM/IV** (WinRho SDF only) if large fetomaternal hemorrhage suspected, give **IV** 9 mcg (45 international units) or **IM** 12 mcg (60 international units) for every ml of fetal whole blood, give **IV** 600 mcg (3000 international units) q8hr or **IM** 1200 mcg (6000 international units) q12hr until total dose given, total dose should be given within 72 hr of exposure

Threatened abortion at any stage of pregnancy

- **Adult and adolescent ≥ 16 yr:** **IM** (BayRho-D [HyperRHO SD] full dose only) 300 mcg (1500 international units) as soon as possible; if given at 13-18 wk gestation, give another 300 mcg (1500 international units) at 26-28 wk gestation; repeat dose within 72 hr of delivery; **IM** (RhoGam only) 300 mcg (1500 international units) as soon as possible and within 72 hr of exposure; **IM/IV** (Rhophylac only) 300 mcg (1500 international units) as soon as possible and within 72 hr; **IM/IV** (WinRho SDF only) 300 mcg (1500 international units) as soon as possible and within 72 hr, repeat dose at 12-wk intervals during pregnancy and give 120 mcg (600 international units) as soon as possible after delivery and within 72 hr

After spontaneous abortion, induced termination of pregnancy, or ectopic pregnancy that occurs at ≤ 12 wk gestation

- **Adult and adolescent ≥ 16 yr:** **IM** (BayRho-D Minidose, HyperRHO

Minidose, MICRhoGAM only) 50 mcg (250 international units) as soon as possible, give within 3 hr of spontaneous or surgical removal, if possible within 72 hr

After spontaneous abortion, induced termination of pregnancy, or ruptured tubal pregnancy that occurs at ≥ 13 wk

- **Adult and adolescent ≥ 16 yr: IM** (BayRho-D [HyperRHO SD] full dose, RhoGAM only) 300 mcg (1500 international units) as soon as possible and within 72 hr of event

After spontaneous abortion, induced termination of pregnancy, amniocentesis, chorionic villus sampling, abdominal trauma, ruptured tubal pregnancy, or percutaneous umbilical cord sampling at ≤ 34 wk gestation

- **Adult and adolescent ≥ 16 yr: IM/IV** (WinRho SDF only) 300 mcg (1500 international units) within 72 hr, repeat at 12-wk intervals during pregnancy, give 120 mcg (600 international units) as soon as possible and preferably within 72 hr of delivery

Available forms: BayRho-D sol for inj 300 mcg/ml (HyperRHO SD sol for inj), MICRhoGAM Ultra Filtered Plus Solution for inj 50 mcg/ml; RhoGam Ultra Filtered Plus Solution for inj 50 mcg; Rhophylac Pre-Filled Syringes Solution for inj 300 mcg/2 ml; WinRho SDF liquid for inj; WinRho powder for inj

Administer:

- BayRho-D (HyperRHO SD), MICRhoGAM, RhoGAM given by IM only; do not give IV
- WinRho SDF and Rhophylac can be given IM or IV
- Inspect for particulate matter; do not use if particulate matter present
- Reconstitute/dilution: no reconstitution or dilution needed for BayRho-D (HyperRHO SD); Rhophylac, MICRhoGAM, RhoGAM, or liquid formulation of WinRho SDF
- WinRho SDF powder for IV use: if giving IV, reconstitute 600 international units or 1500 international units immediately before use with 2.5 ml of sterile diluent; reconstitute 5000 international units with 8.5 ml sterile diluent; add diluent to vial slowly down wall of vial; gently swirl until powder dissolved; do not shake
- WinRho SDF powder for IM use: IV giving IM, reconstitute 600 international units or 1500 international units immediately before use with 1.25 ml of sterile diluent; 5000 international units with 8.5 ml of sterile diluent; add diluent to vial slowly down wall of vial; gently swirl until powder dissolved; do

not shake

IM route

- Use aseptic technique, observe for 20 min after administration
- Bring Rhophylac to room temp before use
- Inject into deltoid muscle of upper arm or anterolateral portion of upper thigh; do not inject into gluteal muscle • If dose calculated requires multiple vials or syringes, use different sites at same time

IV route

- Use aseptic technique
- WinRho SDF: remove entire contents of vial to obtain calculated dose; if partial vial required for dosage calculation, withdraw entire vial contents to ensure correct calculation; infuse correct calculated dose over 3-5 min; do not infuse with other fluids, products • Rhophylac: bring to room temp; infuse by slow IV; observe for 20 min

SIDE EFFECTS

CNS: Lethargy

CV: Hypo/hypertension

INTEG: Irritation at inj site, fever

MISC: Infection, ARDs, anaphylaxis, pulmonary edema, DIC

MS: Myalgia, arthralgia

INTERACTIONS

Decrease: antibody response—live virus vaccines (measles, mumps, rubella)

NURSING CONSIDERATIONS

Assess:

⚠ Allergies, reactions to immunizations; previous immunization with product ⚠

Intravascular hemolysis: back pain, chills, hemoglobinuria, renal insufficiency; usually when WinRho SDF is given in those with immune thrombocytopenia purpura • Type, crossmatch mother and newborn's cord blood; if mother Rh_o(D)-negative, D^u-negative and newborn Rh_o(D)-positive, product should be given

Perform/provide:

- Storage in refrigerator

Evaluate:

- Rh₀(D) sensitivity in transfusion error, prevention of erythroblastosis fetalis for normal vision

Teach patient/family:

- How product works; that product must be given after subsequent deliveries if subsequent babies are Rh-positive ⚠ To report immediately: shaking, fever, chills, dark urine, swelling of hands or feet, back pain, SOB (intravascular hemolysis)
-

🍁 Canada only Side effects: *italics* = common; **bold** = life-threatening ⚠
Nurse Alert

riboflavin (vit B₂) (OTC)

(rye'boh-flay-vin)

Func. class.: Vit B₂, water soluble

ACTION:

Needed for respiratory reactions by catalyzing proteins

USES:

Vit B₂ deficiency or polyneuritis; cheilosis adjunct with thiamine

Unlabeled uses: Migraine prophylaxis

DOSAGE AND ROUTES

Calculator

Deficiency

- **Adult: PO** 5-30 mg/day
- **Child ≥12 yr: PO** 3-10 mg/day then 0.6 mg/1000 calories ingested

RDA

- **Adult: PO** (males) 1.3 mg, (females) 1.1 mg

Migraine prophylaxis (unlabeled)

- **Adult: PO** 400 mg/day × 3 mo

Available forms: Tabs 5, 10, 25, 50, 100, 250 mg

Administer:

- With food for better absorption

SIDE EFFECTS

GU: Yellow discoloration of urine

Precautions: Pregnancy (A)

PHARMACOKINETICS

Half-life 65-85 min, 60% protein bound, unused amounts excreted in urine (unchanged)

INTERACTIONS

Increase: riboflavin need—alcohol, probenecid, tricyclics, phenothiazines

Decrease: action of tetracyclines

Drug/Lab Test

- May cause false elevations of urinary catecholamines

NURSING CONSIDERATIONS

Assess:

- Nutritional status: liver, eggs, dairy products, yeast, whole grains, green vegetables

Perform/provide:

- Storage in airtight, light-resistant container

Evaluate:

- Therapeutic response: absence of headache, GI problems, cheilosis, skin lesions, depression; burning, itchy eyes; anemia

Teach patient/family:

- That urine may turn bright yellow
- About the addition of needed foods rich in riboflavin
- To avoid alcohol

☛ Canada only Side effects: *italics* = common; **bold** = life-threatening ⚠
Nurse Alert

rifabutin (Rx)

(riff'a-byoo-ten)

Mycobutin

Func. class.: Antimycobacterial agent

Chem. class.: Rifamycin S derivative

Do not confuse: rifabutin/rifampin/rifapentine

ACTION:

Inhibits DNA-dependent RNA polymerase in susceptible strains of *Escherichia coli* and *Bacillus subtilis*; mechanism of action against *Mycobacterium avium* unknown

USES:

Prevention of *M. avium* complex (MAC) in patients with advanced HIV infection

Unlabeled uses: *Helicobacter pylori* that has not responded to other treatment

CONTRAINDICATIONS:

Hypersensitivity, active TB, WBC $<1000/\text{mm}^3$ or platelet count $<50,000/\text{mm}^3$

Precautions: Pregnancy (B), breastfeeding, children, hepatic disease, blood dyscrasias

DOSAGE AND ROUTES

Calculator

- **Adult: PO** 300 mg/day (may take as 150 mg bid); max 600 mg/day

Renal dose

- **Adult: PO** CCr <30 ml/min, reduce by 50%

Available forms: Caps 150 mg

Administer:

- With food if GI upset occurs; better to take on empty stomach 1 hr before or 2 hr after meals; high-fat foods slow absorption; may take in 2 divided doses, may open capsule, mix with applesauce if unable to swallow whole cap
- Antiemetic if vomiting occurs
- After C&S completed; monthly to detect resistance

SIDE EFFECTS

CNS: Headache, fatigue, anxiety, confusion, insomnia

GI: Nausea, vomiting, anorexia, diarrhea, heartburn, hepatitis, discolored saliva, pseudomembranous colitis

GU: Discolored urine

HEMA: Hemolytic anemia, eosinophilia, thrombocytopenia, leukopenia

INTEG: Rash

MISC: Flulike symptoms, shortness of breath, chest pressure

MS: Asthenia, arthralgia, myalgia

PHARMACOKINETICS

53% absorbed, peak 2-3 hr, duration >24 hr, half-life 45 hr, metabolized in liver (active/inactive metabolites), excreted in urine primarily as metabolites

INTERACTIONS

Increase: levels of rifabutin: ritonavir

Decrease: action of amprenavir, anticoagulants, β -blockers, barbiturates, busPIRone, clofibrate, corticosteroids, cycloSPORINE, dapsone, delavirdine, disopyramide, doxycycline, efavirenz, estrogens, fluconazole, indinavir, ketoconazole, losartan, nelfinavir, nevirapine, oral contraceptives, phenytoin, quiNIDine, saquinavir, sulfonylureas, theophylline, tricyclic antidepressants, zidovudine, zolpidem

Drug/Food

- High-fat diet decreases absorption

Drug/Lab Test

Interference: folate level, vit B₁₂, BSP, gallbladder studies

NURSING CONSIDERATIONS

Assess:

 **Acute TB:** chest x-ray, sputum culture, blood culture, biopsy of lymph nodes, PPD; product should not be given for active TB

- CBC for neutropenia, thrombocytopenia, eosinophilia

 **Pseudomembranous colitis:** diarrhea, abdominal pain/cramping, fever, bloody stools • Signs of anemia: Hct, Hgb, fatigue

- Hepatic studies weekly: ALT, AST, bilirubin

- Renal status before, each mo: BUN, creatinine, output, specific gravity, urinalysis

- Hepatic status: decreased appetite, jaundice, dark urine, fatigue

Evaluate:

- Therapeutic response: not used for active TB because of risk for development of resistance to rifampin; culture negative

Teach patient/family:

 That patients using oral contraceptives should consider using nonhormonal methods of birth control, may decrease effect; to notify prescriber if pregnancy planned, suspected • That compliance with dosage schedule, duration necessary

- That scheduled appointments must be kept because relapse may occur

- That urine, feces, saliva, sputum, sweat, tears may be colored red-orange; soft contact lenses may be permanently stained  To report flulike symptoms: excessive fatigue, anorexia, vomiting, sore throat; unusual bleeding, yellowish discoloration of skin, eyes; myositis: muscle or bone pain; diarrhea, fever, abdominal cramping, bloody stools

🍁 Canada only Side effects: *italics* = common; **bold** = life-threatening 
Nurse Alert

rifampin (Rx)

(rif'am-pin)

Rifadin, Rofact 

Func. class.: Antitubercular

Chem. class.: Rifamycin B derivative

Do not confuse: rifampin/rifabutin

ACTION:

Inhibits DNA-dependent polymerase, decreases tubercle bacilli replication

USES:

Pulmonary TB, meningococcal carriers (prevention)

Unlabeled uses: Endocarditis, *Haemophilus influenzae type B* prophylaxis, Hansen's disease, *Mycobacterium avium* complex (MAC), orthopedic-device-related infection, pruritus

CONTRAINDICATIONS:

Hypersensitivity to this product, rifamycins; active *Neisseria meningitidis* infection

Precautions: Pregnancy (C), breastfeeding, children <5 yr, hepatic disease, blood dyscrasias

DOSAGE AND ROUTES

Calculator

Tuberculosis

- **Adult: PO/IV** Max 600 mg/day as single dose 1 hr before meals or 2 hr after meals or 10 mg/kg/day 2-3×/wk
- **Child >5 yr: PO/IV** 10-20 mg/kg/day as single dose 1 hr before meals or 2 hr after meals, max 600 mg/day with other antituberculars
- **6-mo regimen:** 2 mo treatment of isoniazid, rifampin, pyrazinamide, and possibly streptomycin or ethambutol then rifampin and isoniazid 3-4 mo
- **9-mo regimen:** rifampin and isoniazid supplemented with pyrazinamide, streptomycin, or ethambutol

Meningococcal carriers

- **Adult: PO/IV** 600 mg bid × 2 days, max 600 mg/dose
- **Child >5 yr: PO/IV** 10-20 mg/kg × 2 days, max 600 mg/dose
- **Infant 3 mo-1 yr: 5 mg/kg PO** bid × 2 days

Prevention of *H. influenzae* type B infection (unlabeled)

- **Adult: PO** 600 mg/day × 4 days
- **Child: PO** 20 mg/kg/day × 4 days

MAC (unlabeled)

- **Adult: PO/IV** 600 mg/day used with ≥3 other active microbials
- **Child: PO/IV** 10-20 mg/kg/day used with ≥3 other active microbials

Endocarditis with prosthetic valves (unlabeled)

- **Adult: PO** 300 mg q8hr with gentamicin and vancomycin
- **Child: PO** 20 mg/kg/day in 2 divided doses with gentamicin and vancomycin, max 900 mg/day

Available forms: Caps 150, 300 mg; powder for inj 600 mg/vial

Administer:

- After C&S completed; monthly to detect resistance
- Do not give IM, SUBCUT

PO route

- On empty stomach, 1 hr before or 2 hr after meals with full glass of water, give with other products for TB
- Antiemetic if vomiting occurs
- Capsules may be opened, mixed with applesauce or jelly

Intermittent IV INF route

- After diluting each 600 mg/10 ml of sterile water for inj (60 mg/ml), swirl, withdraw dose and dilute in 100 ml or 500 ml of D₅W given as inf over 3 hr; if diluted in 100 ml, give over 1/2 hr; do not admix with other sol or products

Y-site compatibilities: amiodarone, bumetanide, midazolam, pantoprazole, vancomycin

SIDE EFFECTS

CNS: Headache, fatigue, anxiety, drowsiness, confusion

EENT: Visual disturbances

GI: Nausea, vomiting, anorexia, diarrhea, pseudomembranous colitis, heartburn, sore mouth and tongue, pancreatitis, increased LFTs

GU: Hematuria, acute renal failure, hemoglobinuria

HEMA: Hemolytic anemia, eosinophilia, thrombocytopenia, leukopenia

INTEG: Rash, pruritus, urticaria

MISC: Flulike symptoms, menstrual disturbances, edema, SOB, Stevens-Johnson syndrome, toxic epidermal necrolysis, angioedema, anaphylaxis

MS: Ataxia, weakness

PHARMACOKINETICS

PO: Peak 1-4 hr, duration >24 hr, half-life 3 hr, metabolized in liver (active/inactive metabolites), excreted in urine as free product (30% crosses placenta) and in breast milk

INTERACTIONS

 **Do not use with protease inhibitors**

Increase: hepatotoxicity—isoniazid

Decrease: action of acetaminophen, alcohol, anticoagulants, antidiabetics, β -blockers, barbiturates, benzodiazepines, chloramphenicol, clofibrate, corticosteroids, cycloSPORINE, dapsone, digoxin, doxycycline, haloperidol, hormones, imidazole antifungals, NIFEdipine, oral contraceptives, phenytoin, protease inhibitors, theophylline, verapamil, zidovudine

Increase: LFTs

Decrease: Hgb

Drug/Lab Test

Interference: folate level, vit B₁₂

NURSING CONSIDERATIONS

Assess:

- **Infection:** sputum culture, lung sounds, characteristics of sputum
- Signs of anemia: Hct, Hgb, fatigue
- Hepatic function monthly: ALT, AST, bilirubin, decreased appetite, jaundice, dark urine, fatigue
- Renal status before, each mo: BUN, creatinine, output, specific gravity, urinalysis

 **Serious skin reactions:** fever, sore throat, fatigue, ulcers; lesions in mouth, lips, rash; can be fatal

 **Pseudomembranous colitis:** diarrhea, fever, abdominal pain/cramping, bloody stools, product should be discontinued, prescriber

notified

Evaluate:

- Therapeutic response: decreased symptoms of TB, culture negative

Teach patient/family:

- That compliance with dosage schedule, duration necessary
- That scheduled appointments must be kept because relapse may occur
- **To avoid alcohol because hepatotoxicity may occur**
- That urine, feces, saliva, sputum, sweat, tears may be colored red-orange; that soft contact lenses may be permanently stained ⚠ To report flulike symptoms: excessive fatigue, anorexia, vomiting, sore throat; unusual bleeding; yellowish discoloration of skin, eyes; diarrhea with pus, mucous, blood • To use nonhormonal form of birth control; to notify prescriber if pregnancy planned, suspected; not to breastfeed

🌿 Canada only Side effects: *italics* = common; **bold** = life-threatening ⚠
Nurse Alert

rifapentine (Rx)

(riff'ah-pen-teen)

Priftin

Func. class.: Antitubercular

Chem. class.: Rifamycin derivative

ACTION:

Inhibits DNA-dependent polymerase, decreases tubercle bacilli replication

USES:

Pulmonary TB; must be used with at least one other antitubercular agent

CONTRAINDICATIONS:

Hypersensitivity to rifamycins, porphyria

Precautions: Pregnancy (C), breastfeeding, children <12 yr, geriatric patients, hepatic disease, blood dyscrasias, HIV

DOSAGE AND ROUTES

Calculator

Intensive phase

- **Adult: PO** 600 mg (four 150-mg tabs) 2×/wk with an interval of 72 hr between doses × 2 mo; must be given with at least 1 other antitubercular agent

Continuation phase

- **Adult: PO** 600 mg q wk × 4 mo in combination with isoniazid or other appropriate antitubercular product

Available forms: Tabs 150 mg

Administer:

- May give with food for GI upset, use other products for TB
- Antiemetic if vomiting occurs
- After C&S completed; monthly to detect resistance

SIDE EFFECTS

CNS: Headache, fatigue, anxiety, dizziness

EENT: Visual disturbances

GI: Nausea, vomiting, anorexia, diarrhea, bilirubinemia, hepatitis, increased

ALT, AST, *heartburn*, **pancreatitis**, **pseudomembranous colitis**

GU: **Hematuria**, pyuria, proteinuria, urinary casts, urine discoloration

HEMA: **Thrombocytopenia**, **leukopenia**, **neutropenia**, **lymphopenia**, anemia, **leukocytosis**, purpura, hematoma

INTEG: Rash, pruritus, urticaria, acne

MISC: Increased B/P

MS: Gout, arthrosis

PHARMACOKINETICS

Peak 5-6 hr; half-life 13 hr; metabolized in liver (active/inactive metabolites); excreted in urine, feces, breast milk; protein binding 97%; steady state 10 days; CYP450 3A4, 2C8/9 inducer

INTERACTIONS

 **Do not use with protease inhibitors**

Decrease: action of amitriptyline, anticoagulants, antidiabetics, barbiturates, β -blockers, chloramphenicol, clarithromycin, clofibrate, corticosteroids, cycloSPORINE, dapsone, delavirdine, diazepam, digoxin, diltiazem, disopyramide, doxycycline, fentaNYL, fluconazole, haloperidol, indinavir, itraconazole, ketoconazole, methadone, mexiletine, nelfinavir, NIFEdipine, nortriptyline, oral contraceptives, phenothiazines, phenytoin, progestins, quiNIDine, quiNINE, ritonavir, saquinavir, sildenafil, tacrolimus, theophylline, thyroid preparations, tocainide, verapamil, warfarin, zidovudine

Drug/Food

Increase: absorption with food

Drug/Lab Test

Increase: LFTs, platelets

Decrease: Hgb, WBC

Interference: folate level, vit B₁₂

NURSING CONSIDERATIONS

Assess:

- Baselines of CBC, AST, ALT, bilirubin, platelets
- **Infection:** sputum culture, lung sounds
- Signs of anemia: Hct, Hgb, fatigue

- Hepatic studies monthly: ALT, AST, bilirubin; decreased appetite, jaundice, dark urine, fatigue

- Renal status monthly: BUN, creatinine, output, specific gravity, urinalysis

 **Pseudomembranous colitis:** diarrhea, fever, abdominal pain/cramping, bloody diarrhea; discontinue if present, notify prescriber

Evaluate:

- Therapeutic response: decreased symptoms of TB, culture negative

Teach patient/family:

- That compliance with dosage schedule, duration necessary

- That scheduled appointments must be kept because relapse may occur

- That urine, feces, saliva, sputum, sweat, tears may be colored red-orange; that soft contact lenses, dentures may be permanently stained

 To use alternative method of contraception; that oral contraceptive action may be decreased; to notify prescriber if pregnancy planned, suspected; to avoid breastfeeding

 To report flulike symptoms: excessive fatigue, anorexia, vomiting, sore throat; unusual bleeding, yellowish discoloration of skin, eyes; diarrhea with pus, mucous, blood

☼ Canada only Side effects: *italics* = common; **bold** = life-threatening

rifaximin (Rx)

(rif-ax'i-min)

Xifaxan

Func. class.: Antiinfective—miscellaneous

Chem. class.: Analog of rifampin

Do not confuse: rifaximin/rifampin

ACTION:

Binds to bacterial-DNA–dependent RNA polymerase, thereby inhibiting bacterial RNA synthesis

USES:

Traveler's diarrhea in those ≥ 12 yr caused by *E. coli*, hepatic encephalopathy

Unlabeled uses: Crohn's disease, diverticulitis

CONTRAINDICATIONS:

Hypersensitivity to product, rifamycins; diarrhea with fever, blood in stool

Precautions: Pregnancy (C), breastfeeding, children, geriatric patients

DOSAGE AND ROUTES

Calculator

Traveler's diarrhea

- **Adult and child ≥ 12 yr:** PO 200 mg tid $\times$ 3 days without regard to meals

Hepatic encephalopathy

- **Adult:** PO 550 mg bid

Crohn's disease (unlabeled)

- **Adult:** PO 200 mg tid $\times$ 16 wk

Diverticulitis (unlabeled)

- **Adult:** PO 400 mg bid with mesalamine 800 mg tid $\times$ 7 days then 7 days/mo

Irritable bowel syndrome (unlabeled)

- **Adult:** PO 550 mg tid $\times$ 14 day

Available forms: Tabs 200, 550 mg

Administer:

- Without regard to food

SIDE EFFECTS

CNS: Abnormal dreams, dizziness, insomnia

CV: Hypotension, chest pain, peripheral edema

GI: *Abdominal pain, constipation, defecation urgency, flatulence, nausea, rectal tenesmus, vomiting, ascites, **pseudomembranous colitis***

MISC: *Headache, pyrexia, motion sickness, tinnitus, rash, photosensitivity, **exfoliative dermatitis***

MS: Arthralgia

RESP: Dyspnea, cough, pharyngitis

PHARMACOKINETICS

Half-life 1.8-4.5 hr, excreted in feces, peak 1-4 hr

NURSING CONSIDERATIONS

Assess:

- GI symptoms: amount, character of diarrhea; abdominal pain, nausea, vomiting, blood in stool, do not use in those with blood in stool, increased temperature with diarrhea

 **Overgrowth of infection, pseudomembranous colitis**

Evaluate:

- Therapeutic response: absence of infection

Teach patient/family:

 **To discontinue rifaximin, notify prescriber if diarrhea persists >24-48 hr, if diarrhea worsens, or if blood in stools and fever present**

- To avoid hazardous activities if dizziness occurs
- To notify prescriber if pregnancy planned, suspected
- That headache, rash, insomnia, abnormal dreams, tinnitus may occur
- To take without regard to food
- To take as directed, consume all of the product prescribed

✳ Canada only Side effects: *italics* = common; **bold** = life-threatening 
Nurse Alert

rilpivirine

Edurant

Func. class.: Antiretroviral

Chem. class.: Nonnucleoside transcriptase inhibitors (NNTIs)

ACTION:

Inhibits HIV-1 reverse transcriptase; unlike nucleoside reverse transcriptase inhibitors (NRTIs), it does not compete for binding nor does it require phosphorylation to be active. Binds directly to a site on reverse transcriptase causing disruption of the enzyme's active site thereby blocking RNA-dependent and DNA-dependent DNA polymerase activities

USES:

HIV in combination with other antiretrovirals

CONTRAINDICATIONS:

Hypersensitivity

Precautions: Pregnancy (B), breastfeeding, neonates, infants, children, adolescents <18 yr, immune reconstitution syndrome, antimicrobial resistance, pancreatitis, coinfection hepatitis B or C and HIV, hepatic disease, depression, suicidal ideation, QT prolongation, torsades de pointes, hyperlipidemia, hypertriglyceridemia, hypercholesterolemia, immune reconstitution syndrome

DOSAGE AND ROUTES

Calculator

Antiretroviral treatment-naïve adults (HIV) with other antiretroviral agents

- **Adults:** PO 25 mg/day with a meal

Available forms: Tab 25 mg

Administer:

- Give in combination with other antiretroviral agents; in antiretroviral treatment-naïve adults, rilpivirine is utilized as an alternative to efavirenz in NNRTI-based treatment regimens; potential rilpivirine-based treatment regimens combine rilpivirine with either tenofovir plus emtricitabine or lamivudine; or

abacavir plus emtricitabine or lamivudine; or zidovudine plus emtricitabine or lamivudine

- Give with a meal

SIDE EFFECTS

CNS: Depressed mood, dysphoria, major depression, mood alteration, negative thoughts, **suicide attempts**, fatigue, headache, dizziness, drowsiness

GI: Nausea, vomiting, abdominal pain, diarrhea, cholecystitis, cholelithiasis, decreased appetite, elevated hepatic enzymes, hyperbilirubinemia, hypercholesterolemia

GU: **Glomerulonephritis membranous/glomerulonephritis mesangioproliferative**

PHARMACOKINETICS:

Protein binding (99.7%) to albumin; metabolism via oxidation CYP3A; terminal elimination half-life 50 hr, excretion feces (85%), 25% excreted unchanged; urine (6.1%); peak 4-5 hr; increased effect 40% (food), decreased effect 50% (high protein drink)

INTERACTIONS:

Increase: rilpivirine effect—CYP3A4 inhibitors (delavirdine, efavirenz, darunavir, tipranavir, atazanavir, fosamprenavir, indinavir, nelfinavir, aldesleukin IL-2, amiodarone, aprepitant, basiliximab, boceprevir, bromocriptine, chloramphenicol, clarithromycin, conivaptan, danazol, dalfopristin, dasatinib, diltiazem, dronedarone, erythromycin, ethinyl estradiol, fluconazole, FLUoxetine, fluvoxamine, fosaprepitant, imatinib, isoniazid, itraconazole, ketoconazole, lanreotide, lapatinib, miconazole, nefazodone, nifedipine, octreotide, posaconazole, quinidine, ranolazine, rifaximin, tamoxifen, telaprevir, telithromycin, troleandomycin, verapamil, voriconazole, zafirlukast)

⚠ Increase: QT prolongation—class IA/III antidysrhythmics, some phenothiazines, β -agonists, local anesthetics, tricyclics, chloroquine, droperidol, haloperidol, pentamidine; CYP3A4 inhibitors (amiodarone, clarithromycin, erythromycin, telithromycin, troleandomycin, arsenic trioxide, levomethadyl); CYP3A4 substrates (methadone, pimozone, quetiapine, quinidine, risperidone, ziprasidone, lopinavir, saquinavir, fluconazole, posaconazole, dasatinib, dronedarone, lapatinib, octreotide, ranolazine, citalopram, abarelix, alfuzosin, amoxapine, apomorphine, artemether, lumefantrine, asenapine,

ofloxacin, ciprofloxacin, cloZAPine, cyclobenzaprine, dolasetron, eribulin, flecainide, gatifloxacin, gemifloxacin, halogenated anesthetics, iloperidone, levofloxacin, maprotiline, mefloquine, moxifloxacin, nilotinib, norfloxacin, OLANZapine, ondansetron, paliperidone, palonosetron, QUEtiapine)

Increase: rilpivirine adverse reactions, fungal infections—fluconazole, voriconazole

Decrease: rilpivirine effect, treatment failure—CYP3A4 inducers (phenytoin, fosphenytoin, barbiturates, OXcarbazepine, carBAMazepine, rifabutin, rifampin, rifapentine, dexamethasone), efavirenz, nevirapine, ritonavir; aminoglutethimide, bexarotene, bosentan, griseofulvin, metyrapone, modafinil, flutamide, nafcillin, pioglitazone, primidone, topiramate); proton pump inhibitors (PPIs)

Decrease: rilpivirine effect, treatment failure—H₂ receptor antagonists (cimetidine, famotidine, nizatidine, ranitidine), give 12 hr before or 4 hr after rilpivirine

Decrease: rilpivirine effect—antacids, use >2 hrs before, or 4 hr after rilpivirine

Drug/Food

Increase: adverse reactions—grapefruit juice

NURSING CONSIDERATIONS

Assess:

- **HIV:** Assess symptoms of HIV including opportunistic infections before and during treatment, some may be life-threatening; monitor plasma HIV RNA, CD4+, CD8 + cell counts, serum β -2 microglobulin, serum ICD+24 antigen levels; treatment failures occur more frequently in those with baseline HIV-1 RNA concentrations >100,000 copies/ml than in patients with concentrations <100,000 copies/ml; monitor serum cholesterol, lipid panel
- Antiretroviral drug resistance testing is recommended before initiation of therapy in antiretroviral treatment-naïve patients
- For adults and adolescents, initiation of antiretroviral therapy is recommended in any patient with a history of an AIDS-defining infection; with a CD4 $\leq 500/\text{mm}^3$; who is pregnant; who has HIV-associated nephropathy; or who is being treated for hepatitis B (HBV) infection

⚠ Suicidal thoughts/behaviors: Assess frequently for suicidal ideation, report any increase in depressive symptoms

- Hepatic disease: monitor for elevated hepatic enzymes ($>2.5 \times \text{ULN}$); grade 3 and 4 may be higher in patients coinfecting with hepatitis B or C

Perform/Provide:

- Storage at room temperature away from heat and moisture

Teach Patient/family:

- That product is not a cure but controls symptoms
- That product must be taken in combination with other prescribed products

🍁 Canada only Side effects: *italics* = common; **bold** = life-threatening ⚠️
Nurse Alert

riluzole (Rx)

(rill'yoo-zole)

Rilutek

Func. class.: ALS agent

Chem. class.: Benzothiazole

ACTION:

May act by modulating the release of glutamate and inactivating voltage-dependent sodium channels

USES:

Amyotrophic lateral sclerosis (ALS)

CONTRAINDICATIONS:

Hypersensitivity

Precautions: Pregnancy (C), breastfeeding, children, geriatric patients, neutropenia, renal/hepatic disease, cigarette smoking, febrile illness, pneumonia

DOSAGE AND ROUTES

Calculator

• **Adult: PO** 50 mg q12hr, take 1 hr before or 2 hr after meals

Available forms: Tabs 50 mg

Administer:

• 1 hr before or 2 hr after meals; high-fat meal decreases absorption

SIDE EFFECTS

CNS: Hypertonia, depression, dizziness, insomnia, somnolence, vertigo, paresthesia

CV: Hypertension, tachycardia, phlebitis, palpitation, postural hypertension

GI: Nausea, vomiting, dyspepsia, anorexia, diarrhea, flatulence, stomatitis, dry mouth, increased LFTs, jaundice, abdominal pain

GU: UTI, dysuria

HEMA: Neutropenia

INTEG: Pruritus, eczema, alopecia, exfoliative dermatitis

MS: Arthralgia

RESP: Decreased lung function, rhinitis, increased cough, pneumonia

PHARMACOKINETICS

Well absorbed; extensively metabolized by liver; excretion in urine, feces

INTERACTIONS

Increase: elimination of riluzole—cigarette smoking, rifampin, omeprazole, charcoal-broiled food

Increase: hepatic injury—allopurinol, methyldopa, sulfaSALazine, leflunomide, methotrexate, tacrine

Increase: LFTs—barbiturates, carbamazepine

Decrease: elimination of riluzole—caffeine, theophylline, amitriptyline, quinolones

Drug/Food

Decrease: absorption—high-fat meal

NURSING CONSIDERATIONS

Assess:

- Clinical improvement of neurologic function
- Hepatic studies: AST, ALT, bilirubin, GGT at baseline, monthly × 3 mo, then q3mo; monitor LFTs
- Neutropenia <500/mm

Evaluate:

- Therapeutic response: improvement in neurologic status

Teach patient/family:

- **To report febrile illness, signs of infection, cardiac/respiratory changes, which may indicate neutropenia**
- About the reason for the product, expected results

☛ Canada only Side effects: *italics* = common; **bold** = life-threatening ⚠
Nurse Alert

rimantadine (Rx)

(ri-man'tah-deen)

Flumadine

Func. class.: Synthetic antiviral

Chem. class.: Tricyclic amine

Do not confuse: **rimantadine**/amantadine/ranitidine

ACTION:

Prevents uncoating of nucleic acid in viral cell, thereby preventing the penetration of the virus to the host; causes the release of dopamine from neurons

USES:

Prophylaxis or treatment of influenza type A

CONTRAINDICATIONS:

Hypersensitivity to this product, amantadine

Precautions: Pregnancy (C), breastfeeding, children <1 yr, seizure disorders, renal/hepatic disease

DOSAGE AND ROUTES

Calculator

Influenza type A

Prophylaxis

- **Adult and child >10 yr: PO** 100 mg bid
- **Child 1-10 yr: PO** 5 mg/kg/day, max 150 mg

Treatment

- **Adult: PO** 100 mg bid; start treatment at onset of symptoms, continue for ≥ 1 wk
- **Child ≥ 10 yr (unlabeled): PO** 200 mg/day either as single dose or in 2 divided doses
- **Child 1-9 yr (unlabeled): PO** 6.6 mg/kg/day in 2 divided doses, max 150 mg/day in 2 divided doses
- **Geriatric: PO** 100 mg/day

Renal/hepatic dose

- **Adult: PO** ≤ 10 ml/min, 100 mg daily

Available forms: Tabs 100 mg; syr 50 mg/5 ml

Administer:

- Give with full glass of water
- Within 48 hr of exposure to influenza; continue for 10 days after contact
- At least 4 hr before bedtime to prevent insomnia
- After meals for better absorption, to decrease GI symptoms
- In divided doses to prevent CNS disturbances: headache, dizziness, fatigue, drowsiness

SIDE EFFECTS

CNS: *Headache, dizziness, fatigue, depression, hallucinations, tremors, seizures, insomnia, poor concentration, asthenia, gait abnormalities, anxiety, confusion*

CV: Pallor, palpitations, edema

EENT: Tinnitus, taste abnormality, eye pain

GI: *Nausea, vomiting, constipation, dry mouth, anorexia, abdominal pain, diarrhea, dyspepsia*

INTEG: Rash

PHARMACOKINETICS

PO: Peak 6 hr, elimination half-life 13-65 hr, plasma protein binding (40%)

INTERACTIONS

Increase: rimantadine concentration—cimetidine

Decrease: peak concentration of rimantadine—acetaminophen, aspirin; intranasal influenza vaccine (separate by ≥ 48 hr)

NURSING CONSIDERATIONS

Assess:

 **Seizures;** if seizures occur, product should be discontinued

- Bowel pattern before, during treatment
- CNS effects in geriatric patients, patients with severe renal/hepatic disease
- Skin eruptions, photosensitivity after administration of product
- Respiratory status: rate, character, wheezing, tightness in chest
- Signs of infection

Perform/provide:

- Storage in tight, dry container

Evaluate:

- Therapeutic response: absence of fever, malaise, cough, dyspnea with infection

Teach patient/family:

- About aspects of product therapy: the need to report dyspnea, dizziness, poor concentration, behavioral changes
- To avoid hazardous activities if dizziness occurs

🍁 Canada only Side effects: *italics* = common; **bold** = life-threatening ⚠️
Nurse Alert

rimexolone ophthalmic

See [Appendix B](#)

risedronate (Rx)

(rih-sed'roh-nate)

[Actonel](#), [Atelvia](#)

Func. class.: Bone resorption inhibitor

Chem. class.: Bisphosphonate

Do not confuse: [Actonel](#)/Actos

ACTION:

Inhibits bone resorption, absorbs calcium phosphate crystal in bone, and may directly block dissolution of hydroxyapatite crystals of bone

USES:

Paget's disease; prevention, treatment of osteoporosis in postmenopausal women; glucocorticoid-induced osteoporosis; osteoporosis in men

Unlabeled uses: Osteolytic metastases

CONTRAINDICATIONS:

Hypersensitivity to bisphosphonates, inability to stand or sit upright for ≥ 30 min, esophageal stricture, achalasia, hypocalcemia

Precautions: Pregnancy (C), breastfeeding, children, renal disease, active upper GI disorders, dental disease, hyperparathyroidism, infection, vit D deficiency, coagulopathy, chemotherapy, asthma

DOSAGE AND ROUTES

Calculator

Paget's disease

- **Adult: PO** 30 mg/day $\times$ 2 mo; patients with Paget's disease should receive calcium and vit D if dietary intake lacking; if relapse occurs, retreatment advised

Treatment/prevention of postmenopausal osteoporosis

- **Adult: PO** 5 mg/day or 35 mg/wk or 75 mg/day $\times$ 2 consecutive days 2 $\times$ monthly or 150 mg/mo

Glucocorticoid osteoporosis

- **Adult: PO** 5 mg/day

Osteoporosis in men

- **Adult: PO** 35 mg/wk

Osteolytic metastases (unlabeled)

- **Adult: PO** 30 mg/day × 6 mo

Renal dose

- **Adult: PO** CCr <30 ml/min, avoid use

Available forms: Tabs 5, 30, 35, 150 mg; tab, gastro-resistant, weekly 35 mg; tab, weekly 35 mg

Administer:

- For 2 months to be effective for Paget's disease
- With a full glass of water; patient should be in upright position for 1/2 hr; swallow whole; do not crush, break, chew
- Supplemental calcium and vit D for Paget's disease if instructed by prescriber
- Give daily ≥30 min before meals or give weekly

SIDE EFFECTS

CNS: Dizziness, headache, depression

CV: *Chest pain*, hypertension, **atrial fibrillation**

GI: *Abdominal pain, diarrhea, nausea*, constipation, esophagitis

MISC: Rash, UTI, pharyngitis, hypocalcemia, hypophosphatemia, increase PTH

MS: **Osteonecrosis of the jaw**, severe muscle/joint/bone pain, fractures

SYST: Angioedema

PHARMACOKINETICS

Rapidly cleared from circulation, taken up mainly by bones (50%), eliminated primarily through kidneys, absorption decreased by food, terminal half-life 220 hr

INTERACTIONS

Increase: GI irritation—NSAIDs, salicylates

Decrease: absorption of risedronate—aluminum, calcium, iron, magnesium salts, antacids

Drug/Food

Decrease: bioavailability—take 1/2 hr before food or drinks other than water

Drug/Lab Test

Decrease: calcium

NURSING CONSIDERATIONS

Assess:

- **Paget's disease:** headache, bone pain, increased head circumference
- **Osteoporosis:** in men or postmenopausal women; bone density study before and periodically during treatment
- Phosphate, alk phos, calcium; creatinine, BUN (renal disease)
- **Hypocalcemia:** paresthesia, twitching, laryngospasm, Chvostek's/Trousseau's signs

⚠ **Serious skin reactions:** angioedema

- **Dental health:** assess dental health, provide antiinfectives for dental extraction; cover with antiinfectives before dental extraction

⚠ **For atrial fibrillation**

Perform/provide:

- Storage in cool environment, out of direct sunlight

Evaluate:

- Therapeutic response: increased bone mass, absence of fractures

Teach patient/family:

- To sit upright for 1/2 hr after dose to prevent irritation
- To comply with diet, vitamin/mineral supplements
- To notify prescriber if pregnancy is suspected or if breastfeeding
- To maintain good oral hygiene
- To notify all health care providers of use
- That musculoskeletal pain may occur within a few days/mo after starting but usually resolves; use acetaminophen
- To exercise regularly; to avoid alcohol, tobacco

✳ Canada only Side effects: *italics* = common; **bold** = life-threatening ⚠
Nurse Alert

risperiDONE (Rx)

(ris-pehr'ih-dohn)

RisperDAL, RisperDAL Consta, RisperDAL M-TAB

Func. class.: Antipsychotic

Chem. class.: Benzisoxazole derivative

Do not confuse: RisperDAL/reserpine

ACTION:

Unknown; may be mediated through both dopamine type 2 (D₂) and serotonin type 2 (5-HT₂) antagonism

USES:

Irritability associated with autism, bipolar disorder, mania, schizophrenia

Unlabeled uses: Acute psychosis, agitation, ADHD, dementia, psychotic depression, Tourette's syndrome

CONTRAINDICATIONS:

Hypersensitivity, breastfeeding

Precautions: Pregnancy (C), children, geriatric patients, cardiac/renal/hepatic disease, breast cancer, Parkinson's disease, CNS depression, brain tumor, dehydration, diabetes, hematologic disease, seizure disorders, abrupt discontinuation

Black Box Warning:

Increased mortality in elderly patients with dementia-related psychosis

DOSAGE AND ROUTES

Calculator

- **Adult:** PO 2 mg/day as single dose or in 2 divided doses, adjust dose at intervals of ≥ 24 hr and 1-2 mg/day as tolerated to 4-8 mg/day; IM establish dosing with PO before IM 25 mg q2wk, may increase to max 50 mg q2wk
- **Adolescent:** PO 0.5 mg/day in AM or PM, adjust dose at intervals of ≥ 24 hr and 0.5-1 mg/day as tolerated to 3 mg/day
- **Geriatric:** PO 0.5 mg daily-bid, increase by 1 mg/wk; IM 25 mg q2wk

Hepatic/renal dose

- **Adult: PO** 0.5 mg bid, increase by 0.5 mg bid, increase to 1.5 mg bid at intervals ≥ 1 wk

Available forms: Tabs 0.25, 0.5, 1, 2, 3, 4 mg; oral sol 1 mg/ml; orally disintegrating tabs 0.5, 1, 2, 3, 4 mg; long-acting inj kit (Risperdal Consta) 12.5, 25, 37.5, 50 mg

Administer:

- Reduced dose in geriatric patients
- Anticholinergic agent on order from prescriber, to be used for EPS
- Avoid use with CNS depressants
- Conventional tabs: give without regard to meals
- **Oral disintegrating tab** (Risperdal M-TAB): do not open blister pack until ready to use; tear 1 of the 4 units apart at perforation; bend corner where indicated; peel back foil; do not push tab through foil; remove from pack and place product on patient's tongue; tab disintegrates in seconds and can be swallowed with/without liquids, do not split or chew
- **Oral sol:** May dilute 3-4 oz of beverage, measure dose using calibrated pipette; not compatible with coffee, tea

IM route

Preparation

- Only suspend in the diluent provided and with the supplied needle; do not substitute any components of the dose pack including the SmartSite Needle-Free Vial Access Device or Needle-Pro device
- Before admixing, remove the dose pack from the refrigerator and allow to come to room temperature for about 30 min before reconstituting
- Remove the plastic colored cap from the vial without removing the gray rubber stopper; wipe top of the gray stopper with an alcohol wipe and allow to dry
- Peel back the blister pouch and remove the Vial Access Device by holding between the white Luer cap and the skirt; do not touch the spike tip at any time
- Place the vial on a hard surface and hold the base; orient the Vial Access Device vertically over the vial so that the spike tip is at the center of the vial's rubber stopper
- With a straight downward push, press the spike tip of the Vial Access Device through the center of the vial's rubber stopper until the device securely snaps onto the vial top; improper placement of the Vial Access Device on the vial

could result in leakage of the diluent upon transfer

- Hold the base of the vial and swab the syringe connection point (blue circle) of the Vial Access Device with an alcohol wipe and allow to dry before attaching the syringe
- During syringe assembly steps, avoid over-tightening or syringe component parts might loosen from the syringe body
- To open the syringe, hold syringe only by the white collar and snap off the smooth white cap; do not twist or cut off the white cap; remove white cap together with the rubber tip cap inside
- While holding the white collar of the syringe, insert and press the syringe tip into the blue circle of the Vial Access Device and twist in a clockwise motion to secure the connection of the syringe to the Vial Access Device; hold the skirt of the Vial Access Device during attachment to prevent it from spinning; keep the syringe and the Vial Access Device aligned
- Inject the entire contents of the syringe containing the diluent into the vial
- Holding the plunger down with the thumb, shake the vial vigorously for a minimum of 10 sec; suspension should appear uniform, thick, and milky colored, and all the powder is dispersed in liquid; the microspheres will be visible in liquid, but no dry microspheres remain
- Invert completely and slowly withdraw the contents of the suspension from the vial into the syringe; tear the section of the vial label at the perforation and apply the detached label to the syringe
- While holding the white collar of the syringe, unscrew the syringe from the Vial Access Device, then discard both the vial and the Vial Access Device appropriately
- Select the appropriate color-coded needle provided with the kit; two distinct needles are provided: The needle with the yellow hub and print is for injection into the gluteal muscle (2-inch needle) and the needle with the green hub and print is for deltoid muscles (1-inch needle); they are not interchangeable; do not use the needle intended for gluteal injection for deltoid injection, and vice versa
- Peel the blister pouch of the Needle-Pro safety device open halfway; grasp the transparent needle sheath using the plastic peel pouch; to prevent contamination, do not touch the orange Needle-Pro safety device's Luer connector; while holding the white collar of the syringe, attach the Luer connection of the orange

Needle-Pro safety device to the syringe with an easy clockwise twisting motion

- While holding the white collar of the syringe, grasp the transparent needle sheath and seat the needle firmly on the orange Needle-Pro safety device with a push and a clockwise twist; seating the needle will secure the connection between the needle and the orange Needle-Pro safety device
- While holding the white collar of the syringe, pull the transparent needle sheath straight away from the needle; do not twist the sheath because this can loosen the luer connection
- Resuspension is necessary before administration, because settling occurs after reconstitution; resuspend the microspheres in the syringe by shaking vigorously
- Refer to the Instructions for Use section of the product labeling for detailed visual aids that accompany the written instructions

Administration

- Only for IM; do not give IV
- Resuspension is necessary before administration, because settling occurs after reconstitution; resuspend the microspheres in the syringe by shaking vigorously
- Remove any air bubbles by tapping the syringe and slowly depressing the plunger with the needle in an upright position
- Inject the entire contents of the syringe into the upper outer quadrant of the gluteal area or the deltoid muscle; inject immediately after reconstitution to avoid settling; gluteal injections should be alternated between the two buttocks
- After the injection is complete, press the needle into the orange Needle-Pro safety device by gently pressing the orange Needle-Pro safety device against a flat surface with one hand; as the orange Needle-Pro safety device is pressed, the needle firmly engages into the orange Needle-Pro safety device
- Visually confirm full engagement of the needle into the Needle-Pro safety device, then appropriately discard both the used and unused needle provided in the dose pack
- Do not store the vial after reconstitution or the suspension will settle
- Do not combine 2 different dosage strengths of RisperDAL Consta in a single administration
- The dose pack device is for single use only; do not reprocess for subsequent reuse because the integrity of the device may be compromised, leading to a deterioration in performance

Stability after reconstitution

- Once in suspension, the product may remain at room temperature, but it must be used within 6 hr; always resuspend before administration if not used immediately

SIDE EFFECTS

CNS: EPS, pseudoparkinsonism, akathisia, dystonia, tardive dyskinesia; drowsiness, insomnia, agitation, anxiety, headache, **seizures, neuroleptic malignant syndrome**, dizziness, **suicidal ideation**, head titubation (shaking)

CV: Orthostatic hypotension, **tachycardia; heart failure, sudden death (geriatric patients)**, AV block

EENT: Blurred vision, tinnitus

GI: Nausea, vomiting, anorexia, constipation, jaundice, weight gain

GU: Hyperprolactinemia, gynecomastia, dysuria

HEMA: **Neutropenia, granulocytopenia**

MISC: **Renal artery occlusion**; hyperprolactinemia (child)

MS: **Rhabdomyolysis**

RESP: Rhinitis; sinusitis, upper respiratory infection, cough

PHARMACOKINETICS

PO: Extensively metabolized by liver to major active metabolite, plasma protein binding 90%, peak 1-2 hr, excreted 90% in urine, terminal half-life 3-24 hr

INTERACTIONS

⚠ Increase: possible death in dementia-related psychosis: furosemide

Increase: sedation—other CNS depressants, alcohol

⚠ Increase: serotonin syndrome, neuroleptic malignant syndrome—CYP2D6 inhibitors (SSRIs, SNRIs)

Increase: EPS—other antipsychotics

Increase: risperiDONE excretion—carBAMazepine

⚠ Increase: QT prolongation—class IA/ III antidysrhythmics, some phenothiazines, β -agonists, local anesthetics, tricyclics, haloperidol, methadone, chloroquine, clarithromycin, droperidol, erythromycin, pentamidine

Increase: risperiDONE levels: acetylcholinesterase, inhibitors, CYP2D6 inhibitors, SSRIs, valproic acid, verapamil

Decrease: risperiDONE action—CYP2D6 inducers (carBAMazepine,

barbiturates, phenytoins, rifampin)

Decrease: levodopa effect—levodopa

Drug/Herb

Decrease: risperidone effect—echinacea

Drug/Lab Test

Increase: prolactin levels, blood, glucose, lipids

NURSING CONSIDERATIONS

Assess:

⚠ Suicidal thoughts/behaviors: often when depression is lessened; mental status before initial administration

- Bilirubin, CBC, hepatic studies monthly
- Affect, orientation, LOC, reflexes, gait, coordination, sleep pattern disturbances

⚠ QT prolongation: B/P standing, lying; pulse, respirations; take these q4hr during initial treatment; establish baseline before starting treatment; report drops of 30 mm Hg; watch for ECG changes

- Dizziness, faintness, palpitations, tachycardia on rising
- **EPS:** akathisia, tardive dyskinesia (bizarre movements of the jaw, mouth, tongue, extremities), pseudoparkinsonism (rigidity, tremors, pill rolling, shuffling gait)

⚠ Serious reactions in geriatric patient: fatal pneumonia, heart failure, sudden death, dementia

⚠ Neuroleptic malignant syndrome: hyperthermia, increased CPK, altered mental status, muscle rigidity, seizures, change in B/P, fatigue, tachycardia

- Constipation, urinary retention daily; if these occur, increase bulk, water in diet
- Weight gain, hyperglycemia, metabolic changes in diabetes, increased lipids

Perform/provide:

- Decreased stimuli by dimming lights, avoiding loud noises
- Supervised ambulation until patient stabilized on medication; do not involve patient in strenuous exercise program because fainting is possible; patient should not stand still for a long time
- Increased fluids to prevent constipation
- Storage in tight, light-resistant container (PO); unopened vials in refrigerator, protect from light; do not freeze

Evaluate:

- Therapeutic response: decrease in emotional excitement, hallucinations, delusions, paranoia; reorganization of patterns of thought, speech

Teach patient/family:

- That orthostatic hypotension may occur; to rise from sitting or lying position gradually
- To avoid abrupt withdrawal of product because EPS may result; product should be withdrawn slowly
- To avoid OTC preparations (cough, hay fever, cold) unless approved by prescriber; that serious product interactions may occur; to avoid use of alcohol because increased drowsiness may occur
- To avoid hazardous activities if drowsy or dizzy
- To comply with product regimen
- To report impaired vision, tremors, muscle twitching
- That heat stroke may occur in hot weather; to take extra precautions to stay cool; to avoid hot tubs, hot showers, tub baths
- To use contraception; to inform prescriber if pregnancy is planned or suspected, do not breastfeed
- To notify provider of suicidal thoughts/behaviors

TREATMENT OF OVERDOSE:

Lavage if orally ingested; provide airway; *do not induce vomiting*

☼ Canada only Side effects: *italics* = common; **bold** = life-threatening ⚠
Nurse Alert

ritonavir (Rx)

(ri-toe'na-veer)

Norvir

Func. class.: Antiretroviral

Chem. class.: Protease inhibitor

Do not confuse: ritonavir/Retrovir

ACTION:

Inhibits human immunodeficiency virus (HIV-1) protease and prevents maturation of the infectious virus

USES:

HIV-1 in combination with at least 2 other antiretrovirals

CONTRAINDICATIONS:

Hypersensitivity

Black Box Warning:

Coadministration with other drugs

Precautions: Pregnancy (B), breastfeeding, hepatic disease, pancreatitis, diabetes, hemophilia, AV block, hypercholesterolemia, immune reconstitution syndrome, neonates, cardiomyopathy, immune reconstitution syndrome, infants 1-6 mo (overdose)

DOSAGE AND ROUTES

Calculator

- **Adult and adolescent >16 yr: PO** 600 mg bid; if nausea occurs, begin at 1/2 dose and gradually increase, max 1200 mg/day
- **Adolescent ≤16 yr and child, infant: PO** 400 mg/m² bid up to 1200 mg/day, may start lower and escalate

Available forms: Caps 100 mg; oral sol 80 mg/ml; tab 100 mg

Administer:

Tablet/capsule

- Take with food, swallow whole; do not crush, break, chew
- When switching from cap to tab, more GI symptoms may occur, will lessen

over time

- Use dosage titration to minimize side effects
- **Oral sol:** shake well, use calibrated measuring device
- Mix liquid formulation with chocolate milk or liquid nutritional supplement to improve taste
- **Overdose:** infants, children, alcohol 43.2% alcohol, 26.57% propylene glycol oral sol, calculate total amount of alcohol, propylene glycol from all products given

SIDE EFFECTS

CNS: *Paresthesia, headache, seizures, fever, dizziness, insomnia, asthenia, intracranial bleeding*

CV: *QT, PR interval prolongation*

GI: *Diarrhea, buccal mucosa ulceration, abdominal pain, nausea, taste perversion, dry mouth, vomiting, anorexia*

INTEG: *Rash*

MISC: *Asthenia, angioedema, anaphylaxis, Stevens-Johnson syndrome, increase lipids, lipodystrophy, toxic epidermal necrolysis*

MS: *Pain, rhabdomyolysis, myalgia*

PHARMACOKINETICS

Well absorbed, 98% protein binding, hepatic metabolism, peak 2-4 hr, terminal half-life 3-5 hr

INTERACTIONS

Black Box Warning:

Increase: toxicity—amiodarone, astemizole, azole antifungals, benzodiazepines, buPROPion, CISapride, cloZAPine, desipramine, dihydroergotamine, encainide, ergotamine, flecainide, HMG-CoA reductase inhibitors, interleukins, meperidine, midazolam, pimozide, piroxicam, propafenone, propoxyphene, quiNIDine, ranolazine, saquinavir, terfenadine, triazolam, zolpidem; CYP2D6 inhibitors

Black Box Warning:

Increase: QT prolongation—class 1A/III antidysrhythmics, some phenothiazines, β -agonists, local anesthetics, tricyclics, haloperidol, chloroquine, droperidol, pentamidine, CYP3A4 inhibitors (amiodarone, clarithromycin, dasatinib, erythromycin, telithromycin, troleandomycin), arsenic trioxide, levomethadyl, CYP3A4 substrates (methadone, pimozide, QUetiapine, quiNIDine, risperiDONE, ziprasidone)

Increase: ritonavir levels—fluconazole

Increase: level of both products—clarithromycin, ddI

Increase: levels of—bosentan

Decrease: ritonavir levels—rifamycins, nevirapine, barbiturates, phenytoin

Decrease: levels of anticoagulants, atovaquone, divalproex, ethinyl estradiol, lamotrigine, phenytoin, sulfamethoxazole, theophylline, voriconazole, zidovudine

Drug/Herb

Decrease: ritonavir levels—St. John's wort; avoid concurrent use

- Avoid use with red yeast rice

Drug/Lab Test

Increase: AST, ALT, K, CK, cholesterol, GGT, triglycerides, uric acid

Decrease: Hct, Hgb, RBC, neutrophils, WBC

NURSING CONSIDERATIONS

Assess:

- **HIV:** viral load, CD4 at baseline, throughout therapy; blood glucose, plasma HIV RNA, serum cholesterol/lipid profile; resistance testing before starting therapy and after treatment failure
- **Immune reconstitution syndrome:** may occur with combination therapy, may develop inflammatory response with opportunistic infection (MAC, Graves' disease, Guillain-Barré Syndrome, TB, PCP), may occur during initial treatment or months after
- Signs of infection, anemia
- Hepatic studies: ALT, AST, in those with hepatic disease, monitor q3mo
- Bowel pattern before, during treatment; if severe abdominal pain with bleeding occurs, discontinue product; monitor hydration
- Skin eruptions; rash

⚠ Rhabdomyolysis: muscle pain, increased CPK, weakness, swelling of affected muscles; if these occur and if confirmed by CPK, product should be discontinued

⚠ QT prolongation: ECG for QT prolongation, ejection fraction; assess for chest pain, palpitations, dyspnea

⚠ Serious skin disorders: Stevens-Johnson syndrome, angioedema, anaphylaxis, toxic epidermal necrolysis

Perform/provide:

- Store caps in refrigerator

Evaluate:

- Therapeutic response: improvement in HIV symptoms; improving viral load, CD4+ T cells

Teach patient/family:

- To take as prescribed; if dose is missed, to take as soon as remembered up to 1 hr before next dose; not to double dose
 - That product not a cure for HIV; that opportunistic infections may continue to be acquired
 - That redistribution of body fat or accumulation of body fat may occur
 - That others may continue to contract HIV from patient
 - To avoid OTC, prescription medications, herbs, supplements unless approved by prescriber; not to use St. John's wort because it decreases product's effect
 - That regular follow-up exams and blood work will be required
-

🍁 Canada only Side effects: *italics* = common; **bold** = life-threatening ⚠️
Nurse Alert

riTUXimab (Rx)

(rih-tuks'ih-mab)

Rituxan

Func. class.: Antineoplastic—miscellaneous; DMARDs

Chem. class.: Murine/human monoclonal antibody

ACTION:

Directed against the CD20 antigen that is found on malignant B lymphocytes; CD20 regulates a portion of cell-cycle initiation/differentiation

USES:

Non-Hodgkin's lymphoma (CD20 positive, B-cell), bulky disease (tumors >10 cm), rheumatoid arthritis, Wegener's granulomatosis, microscopic polyangitis

Unlabeled uses: Acquired blood factor deficiency, acute lymphocytic leukemia (ALL), Burkitt's lymphoma, chronic lymphocytic leukemia (CLL), hemolytic anemia, human herpesvirus 8, mantle cell lymphoma (MCL), multicentric Castleman's disease, peripheral blood stem cell (PBSC) mobilization, refractory pemphigus vulgaris, relapsing/remitting MS, ITP with dexamethasone, steroid refractory chronic graft-versus-host disease

CONTRAINDICATIONS:

Hypersensitivity, murine proteins

Precautions: Pregnancy (C), breastfeeding, children, geriatric patients, pulmonary/cardiac/renal conditions

Black Box Warning:

Exfoliative dermatitis, infusion-related reactions, progressive multifocal leukoencephalopathy

DOSAGE AND ROUTES

Calculator

Relapsed or refractory low-grade or follicular, CD20-positive, B-cell non-Hodgkin's lymphoma (NHL)

• **Adult:** IV 375 mg/m² every wk × 4 doses, may retreat with 4 more doses of 375 mg/m²/wk

First-line treatment of follicular, CD20-positive, B-cell NHL in combination with chemotherapy

- **Adult:** IV 375 mg/m² on day 1 of each cycle for up to 8 cycles; may be given with cyclophosphamide IV 750 mg/m² on day 1, vinCRISTine IV 1.4 mg/m² (max 2 mg) on day 1, and predniSONE 40 mg/m²/day PO on days 1–5

Single-agent maintenance therapy in patients with follicular, CD20-positive, B-cell NHL (complete or partial response following first-line treatment with riTUXimab in combination with chemotherapy)

- **Adult:** IV 375 mg/m² IV every 8 wk × 12 doses as maintenance therapy starting 8 wk after the completion of induction chemotherapy with 8 doses of riTUXimab with 6–8 cycles of cyclophosphamide, vinCRISTine, and predniSONE 4–6 cycles of cyclophosphamide, DOXOrubicin, vinCRISTine, and predniSONE

Component of the Zevalin (ibritumomab tiuxetan) regimen

- **Adult:** IV As a required component of the ibritumomab regimen; riTUXimab 250 mg/m² given within 4 hr before administration of Yttrium-90 ibritumomab that may occur on day 7, 8, or 9

First-line treatment of diffuse large B-cell, CD20-positive NHL in combination with chop or other anthracycline-based chemotherapy regimen

- **Adult 18–59 yr:** IV 375 mg/m² on day 1 of each cycle for up to 8 infusions

Single-agent maintenance therapy in patients with low-grade, CD20-positive, B-cell NHL with nonprogressing disease (stable disease or better) following first-line treatment with cyclophosphamide, vinCRISTine, and predniSONE (CVP)

- **Adult:** IV 375 mg/m² q wk × 4 wk repeated every 6 mo × 2 yr (total of 16 doses) as maintenance therapy starting 4 wk after the completion of first-line chemotherapy with 6 to 8 cycles of cyclophosphamide, vinCRISTine, and predniSONE (CVP)

Available forms: Inj 10 mg/ml (100 mg/10 ml, 500 mg/50 ml)

Administer:

Rheumatoid arthritis:

- Give methylPREDNISolone 100 mg or similar product 30 min before inf to decrease reactions

Intermittent IV INF route

- Hold antihypertensives 12 hr before administration
- After diluting to final conc of 1-4 mg/ml; use 0.9% NaCl, D₅W, gently

invert bag to mix; do not mix with other products, give 50 mg/hr initially, if no reaction increase rate by 50 mg/hr to max 400 mg/hr

Y-site compatibilities: Amcyclovir, amifostine, amikacin, aminophylline, ampicillin, ampicillin/sulbactam, aztreonam, bleomycin, bumetanide, buprenorphine, busulfan, butorphanol, calcium gluconate, CARBOplatin, carmustine, ceFAZolin, cefoperazone, cefotaxime, cefoTEtan, cefOXitin, cefTAZidime, ceftizoxime, cefTRIAxone, cefuroxime, chlorproMAZINE, cimetidine, CISplatin, clindamycin, cyclophosphamide, cytarabine, DACTINomycin, DAUNOrubicin hydrochloride, dexamethasone, dexrazoxane, digoxin, diphenhydrAMINE, DOBUTamine, DOCEtaxel, DOPamine, DOXOrubicin liposome, doxycycline, droperidol, enalaprilat, etoposide phosphate, famotidine, fentaNYL, filgrastim, floxuridine, fluconazole, fludarabine, fluorouracil, ganciclovir, gemcitabine, gentamicin, granisetron, haloperidol, heparin, hydrocortisone, HYDROmorphine, IDArubicin, ifosfamide, imipenem/cilastatin, irinotecan, leucovorin, levorphanol, LORazepam, magnesium sulfate, mannitol, meperidine, mesna, methotrexate, methylPREDNISolone, metoclopramide, metroNIDAZOLE, mitoMYcin, mitoXANtrone, morphine, nalbuphine, netilmicin, PACLitaxel, pentamidine, piperacillin/tazobactam, plicamycin, potassium chloride, prochlorperazine, promethazine, ranitidine, sargramostim, streptozocin, teniposide, theophylline, thiotepa, ticarcillin/clavulanate, tobramycin, trimethoprim/sulfamethoxazole, trimethobenzamide, vinBLASline, vincCRISline, vinorelbine, zidovudine

SIDE EFFECTS

CNS: Life-threatening brain infection (progressive multifocal leukoencephalopathy)

CV: Cardiac dysrhythmias, heart failure, hypertension, MI, supraventricular tachycardia, angina

GI: Nausea, vomiting, anorexia, GI obstruction/perforation

GU: Renal failure

HEMA: Leukopenia, neutropenia, thrombocytopenia, anemia

INTEG: Irritation at site, rash, fatal mucocutaneous infections (rare)

MISC: Fever, chills, asthenia, headache, angioedema, hypotension, myalgia, bronchospasm, ARDs

SYST: Toxic epidermal necrolysis, tumor lysis syndrome, Stevens-Johnson syndrome, exfoliative dermatitis

PHARMACOKINETICS

Half-life 60-174 hr, binds to CD20 sites on lymphoma cells

INTERACTIONS

Increase: hypotension—antihypertensives, separate by 12 hr

Increase: nephrotoxicity—CISplatin, avoid concurrent use; if used, monitor renal status

Increase: bleeding—anticoagulants

- Avoid with vaccines, toxoids

NURSING CONSIDERATIONS

Assess:

Black Box Warning:

Fatal inf reaction: hypoxia, pulmonary infiltrates, ARDS, MI, ventricular fibrillation, cardiogenic shock; most fatal reactions occur with 1st inf; potentially fatal

Black Box Warning:

Severe mucocutaneous reactions: Stevens-Johnson syndrome, lichenoid dermatitis, toxic epidermal lysis; occur 1-13 wk after product given, discontinue treatment immediately

Black Box Warning:

Tumor lysis syndrome: acute renal failure requiring hemodialysis, hyperkalemia, hypocalcemia, hyperuricemia, hyperphosphatemia; allopurinol and adequate hydration may be needed

Black Box Warning:

Multifocal leukoencephalopathy: confusion, dizziness, lethargy, hemiparesis; monitor periodically

- CBC, differential, platelet count weekly; withhold product if WBC is $<3500/\text{mm}^3$ or platelet count $<100,000/\text{mm}^3$; notify prescriber of results; product should be discontinued
- ECG, serum creatinine/BUN, electrolytes, uric acid
- GI symptoms: frequency of stools, abdominal pain, perforation/obstruction may occur
- **Infection:** fever, increased temperature, flu-like symptoms in those with Wegener's granulomatosis and microscopic polyangiitis in those using DMARDs

Perform/provide:

- Storage of vials at 36° F-40° F, protect vials from direct sunlight, inf sol is stable at 36° F-46° F × 24 hr and at room temp for another 12 hr

Evaluate:

- Therapeutic response: prevention of increasing cancer progression

Teach patient/family:

- To avoid use with vaccines, toxoids
- To use contraception during, for up to 12 mo after therapy
- ⚠ To report to prescriber possible infection (cough, fever, chills, sore throat), renal issues (painful urination, back/side pain), bleeding (gums, stools, urine, bruising, emesis, fatigue)
- To avoid OTC products
- To avoid crowds, those with known infections
- To maintain fluid intake

🇨🇦 Canada only Side effects: *italics* = common; **bold** = life-threatening ⚠
Nurse Alert

rivaroxaban

Xarelto

Func. class.: Anticoagulant

Chem. class.: Factor Xa inhibitor

ACTION:

A novel, oral anticoagulant that selectively and potently inhibits coagulation factor Xa

USES:

For deep venous thrombosis (DVT) prophylaxis/treatment, which may lead to pulmonary embolism (PE), in patients undergoing knee or hip replacement surgery; for stroke prophylaxis and systemic embolism prophylaxis in patients with nonvalvular atrial fibrillation

CONTRAINDICATIONS

Severe hypersensitivity

Black Box Warning:

Active bleeding

Precautions

Pregnancy (category C), breastfeeding, neonates, infants, children, adolescents, geriatric patients, moderate or severe hepatic disease (Child-Pugh Class B or C), hepatic disease associated with coagulopathy, creatinine clearance <30 ml/min for use as DVT prophylaxis and <15 ml/min for stroke and systemic embolism prophylaxis in nonvalvular atrial fibrillation, dental procedures, aneurysm, diabetes retinopathy, diverticulitis, endocarditis, GI bleeding, hypertension, obstetric delivery, peptic ulcer disease, stroke, surgery

Black Box Warning:

Abrupt discontinuation, epidermal/spinal anesthesia

Patients, especially those with dental disease, should be instructed in proper oral hygiene, including caution in use of regular toothbrushes, dental floss, toothpicks

DOSAGE AND ROUTES

Calculator

DVT prophylaxis, which may lead to pulmonary embolism (PE) (Knee or hip replacement)

- **Adult: PO** 10 mg/day × 12 days after knee replacement surgery or × 35 days after hip replacement; administer the initial dose ≥6-10 hr after surgery once hemostasis has been established

DVT/PE treatment/reduction of risk

- **Adult: PO** 15 mg bid with food × 21 days then 20 mg q day for a total of 6 mo, may continue after 6 mo to reduce risk

Stroke prophylaxis and systemic embolism prophylaxis (with nonvalvular atrial fibrillation)

- Unless pathological bleeding occurs, do not discontinue rivaroxaban in the absence of alternative
- **Adult: PO** 20 mg/day with evening meal (CrCl >50 ml/min)

Converting from warfarin to rivaroxaban

- Discontinue warfarin and start rivaroxaban when INR is <3

Converting from another anticoagulant other than warfarin to rivaroxaban

- Start rivaroxaban 0-2 hr before the next scheduled evening administration of anticoagulant (omit that dose of anticoagulant); for continuous inf of unfractionated heparin, stop the inf and initiate rivaroxaban simultaneously

Converting from rivaroxaban to another anticoagulant with rapid onset (not warfarin)

- Discontinue rivaroxaban and give the first dose of the other anticoagulant (oral or parenteral) at the time that the next dose of rivaroxaban would have been administered

Available forms: Tabs 10, 20, 50 mg

Administer:

⚠ **For DVT prophylaxis:** give daily without regard to food, give initial dose ≥6-10 hr after surgery when hemostasis has been established

⚠ **For stroke/systemic embolism prophylaxis:** give daily with evening meal

- If dose is not given at correct time, give as soon as possible on the same day

SIDE EFFECTS

GI: Increased hepatic enzymes, hyperbilirubinemia, jaundice, nausea, cholestasis, **cytolytic hepatitis**

HEMA: Bleeding, intracranial bleeding, epidural hematoma, GI bleeding, retinal hemorrhage, adrenal bleeding, retroperitoneal hemorrhage, cerebral hemorrhage, subdural hematoma, epidural hematoma, hemiparesis, thrombocytopenia

INTEG: Pruritus, blister, hypersensitivity, anaphylactic reaction, anaphylactic shock

SYST: Stevens-Johnson syndrome

PHARMACOKINETICS

Bioavailability 80%-100%, protein binding (92%-95%) albumin, excreted in urine 66% (36% unchanged, 30% metabolites), 28% in feces (7% unchanged, 21% metabolites), unchanged drug excreted in urine (via active tubular secretion, glomerular filtration); terminal elimination half-life 5-9 hr, peak 2-4 hr; increased effect in hepatic/renal disease, Japanese patients, increased terminal half-life in geriatric patients

INTERACTIONS

Increase: rivaroxaban effect, possible bleeding—ketoconazole itraconazole, ritonavir, lopinavir/ritonavir; conivaptan, clarithromycin, erythromycin, salicylates, NSAIDs, other anticoagulants, thrombolytics, platelet inhibitors, niCARDipine

Decrease: rivaroxaban effect—carbamazepine, phenytoin, rifampin

Increase: rivaroxaban effect in renal impairment—telithromycin, darunavir, mifepristone, nelfinavir, pantoprazole, posaconazole, saquinavir, tamoxifen, lapatinib, azithromycin, diltiazem, verapamil, quinidine, ranolazine, dronedarone, amiodarone, felodipine

Drug/Herb:

Decrease: rivaroxaban effect—St. John's wort

Drug/Food:

Increase: rivaroxaban effect in renal disease—grapefruit juice

Decrease: rivaroxaban effect—food

NURSING CONSIDERATIONS

Assess:

Black Box Warning:

Bleeding: monitor for bleeding, including bleeding during dental procedures (easy bruising, blood in urine, stools, emesis, sputum, epistaxis); there is no specific antidote

Black Box Warning:

Abrupt discontinuation: avoid abrupt discontinuation unless an alternative anticoagulant in those with atrial fibrillation; discontinuing puts patients at an increased risk of thrombotic events; if product must be discontinued for reasons other than pathological bleeding, consider administering another anticoagulant

- **Pregnancy/breastfeeding:** pregnancy category C; identify if pregnancy is suspected or planned; pregnancy related hemorrhage may occur and anticoagulation cannot be monitored with standard laboratory testing; breastfeeding should be discontinued before beginning use of this product

Black Box Warning:

Epidural/spinal anesthesia: epidural or spinal hematomas that result in long-term or permanent paralysis may occur in patients who have received anticoagulants and are receiving neuraxial anesthesia or undergoing spinal puncture; epidural catheter should not be removed <18 hr after the last dose of rivaroxaban; do not administer the next rivaroxaban dose <6 hr after the catheter removal; delay rivaroxaban administration for 24 hr if traumatic puncture occurs; monitor for neuro changes

- **Hepatic/renal disease:** increase in effect of product in hepatic disease (Child-Pugh Class B or C), hepatic disease with coagulopathy; renal failure/severe renal impairment (creatinine clearance <30 ml/min in DVT prophylaxis and <15 ml/min for stroke or systemic embolism prophylaxis in nonvalvular atrial fibrillation); product should be discontinued in acute renal failure; reduce dose in those with atrial fibrillation and CrCl 15-50 ml/min; monitor renal function periodically (creatinine clearance, BUN)

Perform/provide:

- Storage at room temperature

Evaluate:

- Prevention of DVT, stroke and systemic embolism

Teach patient/family:

- To report if pregnancy is planned or suspected, not to breastfeed

Black Box Warning:

To report bleeding (bruising, blood in urine, stools, sputum, emesis, heavy menstrual flow); use soft toothbrush, electric shaver

- To inform all health care providers of use

Black Box Warning:

To avoid abrupt discontinuation without another blood thinner

☛ Canada only Side effects: *italics* = common; **bold** = life-threatening ⚠
Nurse Alert

rivastigmine (Rx)

(riv-as-tig'mine)

Exelon, Exelon Patch

Func. class.: Anti-Alzheimer agent

Chem. class.: Cholinesterase inhibitor

ACTION:

Potent, selective inhibitor of brain acetylcholinesterase (AChE) and butyrylcholinesterase (BChE)

USES:

Mild to moderate Alzheimer's dementia, mild to moderate Parkinson's disease dementia (PDD)

Unlabeled uses: Vascular dementia, dementia with Lewy bodies, Pick's disease

CONTRAINDICATIONS:

Hypersensitivity to this product, other carbamates

Precautions: Pregnancy (B), breastfeeding, children, respiratory/cardiac/renal/hepatic disease, seizure disorder, peptic ulcer, urinary obstruction, asthma, increased intracranial pressure, surgery, GI bleeding, jaundice

DOSAGE AND ROUTES

Calculator

• **Adult: PO** 1.5 mg bid with food; after ≥ 4 wk, may increase to 3 mg bid; may increase to 4.5 mg bid and thereafter 6 mg bid, max 12 mg/day;

TRANSDERMAL apply 4.6 mg/24 hr/day, after ≥ 4 wk may increase to 9.5 mg/24 hr/day

Available forms: Caps 1.5, 3, 4.5, 6 mg; sol 2 mg/ml; transdermal patch 4.6, 9.5, 13.3 mg/24 hr

Administer:

- Oral sol, caps are interchangeable
- With meals; take with morning and evening meal even though absorption may be decreased

- Discontinue treatment for several doses, restart at same or next lower dosage level if adverse reactions cause intolerance
- If treatment is interrupted for more than several days, treatment should be initiated with lowest daily dose and titrated as indicated previously
- **Oral sol:** measure dose with supplied syringe; may be given undiluted or diluted in a small amount of water, fruit juice, or soda; stir diluted sol well, entire amount should be swallowed; stable for 4 hr when mixed

Transdermal route

- Once a day to hairless, clean, dry skin, not in an area that clothing will rub; rotate sites daily, do not apply to same site more than once q14days; remove liner; apply firmly; may be used during bathing, swimming; avoid saunas, excess sunlight or external heat such as saunas; each 5 cm² patch contains 9 mg base, rate of 4.6 mg/24 hr, each 10 cm² patch 18 mg base, rate of 9.5 mg/24 hr

SIDE EFFECTS

CV: QT prolongation, AV block, cardiac arrest, angina, MI, palpitations

CNS: Tremors, confusion, insomnia, psychosis, hallucination, depression, dizziness, headache, anxiety, somnolence, fatigue, syncope, EPS, exacerbation of Parkinson's disease

GI: Nausea, vomiting, anorexia, abdominal distress, flatulence, diarrhea, constipation, dyspepsia, colitis, eructation, fecal incontinence, GI bleeding/obstruction, GERD, gastritis, pancreatitis

MISC: Urinary tract infection, asthenia, increased sweating, hypertension, flulike symptoms, weight change

PHARMACOKINETICS

Rapidly and completely absorbed; metabolized to decarbamylated metabolite; half-life 1.5 hr; excreted via kidneys (metabolites); clearance lowered in geriatric patients, hepatic disease and increased with nicotine use; 40% protein binding

INTERACTIONS

Increase: synergistic effect—cholinergic agonists, other cholinesterase inhibitors

Increase: metabolism—nicotine

Increase: GI effects—NSAIDs

Decrease: rivastigmine effect—anticholinergics, sedating H₁ blockers, tricyclics, phenothiazines

NURSING CONSIDERATIONS

Assess:

- Hepatic studies: AST, ALT, alk phos, LDH, bilirubin, CBC
- **Severe GI effects:** nausea, vomiting, anorexia, weight loss, diarrhea
- B/P, heart rate, respiration during initial treatment; hypo/hypertension should be reported
- **Cognitive/mental status:** affect, mood, behavioral changes, depression, insomnia; complete suicide assessment

Perform/provide:

- Assistance with ambulation during beginning therapy; dizziness may occur

Evaluate:

- Therapeutic response: improved mood/cognition

Teach patient/family:

- About the procedure for giving oral sol; use instruction sheet provided; how to apply transdermal product, to fold in half and throw away, not to get in eyes, to wash hands after application; not to use heating pad, sauna, tanning bed
- To notify prescriber of severe GI effects
- That product may cause dizziness, anorexia, weight loss
- That effect may take weeks or months
- To notify prescriber if pregnancy is planned or suspected

🍁 Canada only Side effects: *italics* = common; **bold** = life-threatening ⚠️

Nurse Alert

rizatriptan (Rx)

(rye-zah-trip'tan)

Maxalt, Maxalt-MLT

Func. class.: Migraine agent

Chem. class.: 5-HT_{1D} receptor agonist, abortive agent-triptan

ACTION:

Binds selectively to the vascular 5-HT_{1B/1D} receptor subtype; exerts antimigraine effect; causes vasoconstriction of the cranial arteries

USES:

Acute treatment of migraine

CONTRAINDICATIONS:

Angina pectoris, history of MI, documented silent ischemia, Prinzmetal's angina, ischemic heart disease, concurrent ergotamine-containing preparations, uncontrolled hypertension, hypersensitivity, basilar or hemiplegic migraine

Precautions: Pregnancy (C), breastfeeding, children, geriatric patients, postmenopausal women, men >40 yr, risk factors for CAD, hypercholesterolemia, obesity, diabetes, impaired renal/hepatic function

DOSAGE AND ROUTES

Calculator

• **Adult: PO** 5-10 mg single dose, redosing separated by ≥ 2 hr, max 30 mg/24 hr; use 5 mg for patient receiving propranolol, max 15 mg/24 hr

Available forms: Tabs (Maxalt) 5, 10 mg; orally disintegrating tabs (Maxalt-MLT) 5, 10 mg

Administer:

• **Orally disintegrating tab:** do not open blister until use; peel blister open with dry hands; place tab on patient's tongue, where it will dissolve, and have patient swallow with saliva (contains phenylalanine)

SIDE EFFECTS

CNS: Dizziness, drowsiness, headache, fatigue, warm/cold sensations, flushing

CV: MI, ventricular fibrillation, ventricular tachycardia, coronary artery vasospasm, palpitations, hypertension, peripheral vascular ischemia, ECG changes

ENDO: Hot flashes, mild increase in growth hormone

GI: Nausea, dry mouth, diarrhea, abdominal pain, ischemic colitis

RESP: Chest tightness, pressure, dyspnea

PHARMACOKINETICS

Onset of pain relief 10 min-2 hr; peak 1-1½ hr; duration 14-16 hr; 14% plasma protein binding; metabolized in liver (metabolite); excreted in urine (82%), feces (12%); half-life 2-3 hr

INTERACTIONS

 **Weakness, hyperreflexia, incoordination: SSRIs**

Increase: levels of sibutramine

Increase: rizatriptan action—cimetidine, oral contraceptives, MAOIs, nonselective MAOI (type A and B), isocarboxazide, pargyline, phenelzine, propranolol, tranylcypromine

Increase: vasospastic effects—ergot, ergot derivatives, other 5-HT receptor agonists

Drug/Herb

 **Serotonin syndrome: St. John's wort**

NURSING CONSIDERATIONS

Assess:

- **Migraine symptoms:** visual disturbances, aura, intensity, nausea, vomiting, photophobia
- Stress level, activity, recreation, coping mechanisms
- Neurologic status: LOC, blurring vision, nausea, vomiting, tingling in extremities preceding headache
- **Ingestion of tyramine foods** (pickled products, beer, wine, aged cheese), food additives, preservatives, colorings, artificial sweeteners, chocolate, caffeine, which may precipitate these types of headaches
- Renal status: urine output

Perform/provide:

- Quiet, calm environment with decreased stimulation: noise, bright light, excessive talking

Evaluate:

- Therapeutic response: decrease in frequency, severity of headache

Teach patient/family:

- **About use of orally disintegrating tab:** instruct patient not to open blister until use, to peel blister open with dry hands, to place tab on tongue, where it will dissolve, and to swallow with saliva (contains phenylalanine)
- To report any side effects to prescriber
- To use alternative contraception while taking product if oral contraceptives are being used
- That product does not prevent or reduce number of migraines; if 1st dose does not relieve pain, do not use more, notify prescriber

🍁 Canada only Side effects: *italics* = common; **bold** = life-threatening ⚠️
Nurse Alert

roflumilast

Daliresp

Func. class.: Respiratory anti-inflammatory agent

Chem. class.: Phosphodiesterase-4 (PDE4) inhibitor

ACTION:

Roflumilast (and the active metabolite roflumilast N-oxide) selectively inhibit phosphodiesterase-4 (PDE4); not a bronchodilator; inhibition of the PDE4 enzyme blocks the hydrolyses and inactivation of cyclic adenosine monophosphate (cAMP), resulting in intracellular cAMP accumulation; decreases inflammatory activity, PDE4 inhibition may affect migration and actions of pro-inflammatory cells (neutrophils, other leukocytes, T-lymphocytes, monocytes, macrophages, fibroblasts)

USES:

For the prevention of COPD exacerbations in patients with severe COPD associated with chronic bronchitis and a history of exacerbations

CONTRAINDICATIONS:

Moderate to severe hepatic disease (Child-Pugh B or C)

Precautions: Pregnancy (category C), breastfeeding, neonates, infants, children, adolescents, acute bronchospasm, anxiety, insomnia, depression, suicidal ideation or behavior

DOSAGE AND ROUTES

Calculator

- **Adult: PO** 500 mcg/day

Available forms: Tabs 500 mcg

Administer:

PO route

- Give without regard to meals

SIDE EFFECTS

CNS: Insomnia, anxiety, depression, headache, dizziness, tremor, **suicidal**

ideation

EENT: Rhinitis, sinusitis

GI: *Weight loss, diarrhea, nausea*, anorexia, abdominal pain, dyspepsia, gastritis, vomiting

GU: Urinary tract infection

MS: Back pain, muscle cramps/spasm

SYST: Infections, influenza

PHARMACOKINETICS

80% absolute bioavailability; protein binding 99% (roflumilast); 97% (N-oxide metabolite); low penetration across the blood–brain barrier; extensively metabolized (liver); metabolism by CYP3A4 and CYP1A2 produces (active metabolite N-oxide); half-life parent drug 17 hr, metabolite 30; steady state 4 days (parent drug), 6 days (metabolite); 70% excreted in urine; parent drug peak 1 hr (range, 0.5-2 hr), metabolite peak 8 hr (range, 4-13 hr); contraindicated in moderate to severe hepatic impairment; use with caution in patients with mild hepatic

INTERACTIONS

Increase: roflumilast effect—CYP3A4/CYP1A2 inhibitors (enoxacin, cimetidine, delavirdine, indinavir, isoniazid, itraconazole, dalfopristin, quinupristin, tipranavir)

Increase: roflumilast effect—oral contraceptives (gestodene and ethinyl estradiol)

Decrease: roflumilast effect—CYP3A4 inducers (rifampin, barbiturates, carbamazepine, phenytoin, erythromycin, ketoconazole, fluvoxamine, alcohol, etravirine, ritonavir, bexarotene, rifabutin, oxcarbazepine, nevirapine, modafinil, metyrapone, phenobarbital, bosentan, dexamethasone)

Altered effect of: fosamprenavir

Drug/Herb

Decrease: roflumilast effect—St. John's wort

NURSING CONSIDERATIONS

Assess:

- Lung sounds and respiratory function baseline and periodically thereafter

⚠ Behavioral changes including mood, depression, suicidal thoughts/behaviors

- Liver function tests baseline and periodically thereafter; if increases in liver function studies occur, product should be discontinued
- Weight; weight loss is common

Perform/provide:

- Storage at room temperature

Evaluate:

- Decreasing exacerbations in COPD

Teach patient/family:

- To take product as directed, not to skip or double doses, to take missed doses as soon as remembered unless almost time for next dose
- Not to use OTC or other products without prescriber approval; not to discontinue other respiratory products unless approved by prescriber
- Not to be used for acute bronchospasm but may be continued during acute asthma attacks

⚠ Suicidal thoughts/behaviors: To notify prescriber of worsening depression or suicidal thoughts/behaviors

🍁 Canada only Side effects: *italics* = common; **bold** = life-threatening ⚠
Nurse Alert

romiPLOStim (Rx)

(roe-mi-ploe'stim)

Nplate

Func. class.: Hematopoietin

Chem. class.: Thrombopoietin receptor agonist

ACTION:

Thrombopoietin-like fusion protein produced by DNA recombinant technology

USES:

Chronic idiopathic thrombocytopenic purpura in patients who have had an insufficient response to corticosteroids, immunoglobulins, or splenectomy

CONTRAINDICATIONS:

Hypersensitivity to this product or mannitol

Precautions: Pregnancy (C), breastfeeding, children, malignancies, bleeding, bone marrow suppression

DOSAGE AND ROUTES

Calculator

Thrombocytopenia in chronic idiopathic thrombocytopenic purpura (ITP) with insufficient response to corticosteroids, immunoglobulins, splenectomy

- **Adult: SUBCUT** The initial dosage is 1 mcg/kg SC every wk (based on actual body weight); increase the weekly dosage by 1 mcg/kg until the patient achieves a platelet count $\geq 50,000/\text{mm}^3$; do not exceed a maximum weekly dosage of 10 mcg/kg; use the lowest dosage needed to achieve and maintain a platelet count $\geq 50,000/\text{mm}^3$; monitor CBC, including platelet counts, every wk until a stable platelet count is achieved with platelets $\geq 50,000/\text{mm}^3 \geq 4$ wk without dosage adjustment; then monitor the CBC, including platelet counts, monthly; once a stable dosage is achieved, if the platelet count falls to $< 50,000/\text{mm}^3$, increase the dosage by 1 mcg/kg/wk; if the platelet count increases to $> 200,000/\text{mm}^3$ for 2 consecutive weeks, reduce the dosage by 1 mcg/kg; if the platelet count is $> 400,000/\text{mm}^3$, temporarily stop romiPLOStim and continue to monitor the platelet count every wk; once the platelets are $< 200,000/\text{mm}^3$, restart, but reduce

the previous dosage by 1 mcg/kg/wk; romiPLOstim may be administered concomitantly with other medical ITP therapies; if platelet counts exceed 50,000/mm³, other medical ITP therapies may be reduced or discontinued; discontinue romiPLOstim if the platelet count does not increase to avoid important bleeding after 4 wk of therapy at max dosage of 10 mcg/kg

Available forms: Inj vials 250, 500 mcg

Administer:

SUBCUT route

- Use syringe with 0.01-ml graduations
- Discard any unused portion in vial; do not pool unused portions from vials
- Dilute 250 mcg/0.72 preservative-free sterile water for inj; 500 mcg/1.2 preservative-free sterile water for inj; final conc 500 mcg/ml
- Gently swirl until dissolved; do not shake
- Do not use if discolored or if particulate matter is present
- Inject into outer aspect of upper arm or abdomen except for 2 inches around navel or front aspect of middle thigh; do not use areas that are bruised, scratched, or scarred
- Rotate inj sites

SIDE EFFECTS

CNS: *Dizziness, insomnia, headache, fatigue*

GI: Abdominal pain, dyspepsia, diarrhea

HEMA: **Thromboembolism, thrombosis**, bleeding, myelofibrosis, erythromelalgia

MS: Myalgia

SYST: **Secondary malignancy**, antibody formation

PHARMACOKINETICS

Peak 7-50 hr, half-life 1-34 days

INTERACTIONS

- Possible bleeding risk: anticoagulants, NSAIDs, platelet inhibitors, thrombolytics, salicylates

NURSING CONSIDERATIONS

Assess:

- Blood studies: CBC during treatment weekly and for 2 wk after discontinuing
- **Bone marrow suppression:** If cytopenias occur, product should be discontinued, may use a bone marrow biopsy and staining for fibrosis
- **Thromboembolic disease:** Do not use to normalize patients, use only in those with thrombocytopenia in idiopathic thrombocytopenic purpura, maintain platelets $\geq 50,000/\text{mm}^3$

Perform/provide:

- Refrigerated storage of vials, do not freeze; protect from light; diluted sol is stable refrigerated or at room temp for 24 hr

Evaluate:

- Therapeutic response: increase in platelet counts, absence of bleeding

Teach patient/family:

- To report bleeding
- About the reason for product and expected results, to avoid hazardous activities that may cause bleeding
- To report a missed dose to prescriber due to increased risk of bleeding
- That lab tests will be done weekly and dose may be changed; if dose is not changed, lab will be checked monthly; after drug is discontinued, labs will be checked weekly $\times 2$ wk
- To advise prescriber if spleen has been removed, bleeding or clotting problems
- To notify prescriber if pregnancy is planned or suspected, pregnancy category (C); if pregnancy occurs, call registry 1-877-675-2831

☼ Canada only Side effects: *italics* = common; **bold** = life-threatening ⚠
Nurse Alert

rOPINIRole (Rx)

(roh-pin'ih-role)

Requip, Requip XL

Func. class.: Antiparkinson agent

Chem. class.: DOPamine-receptor agonist, nonergot

Do not confuse: rOPINIRole/risperiDONE

ACTION:

Selective agonist for D₂ receptors (presynaptic/postsynaptic sites); binding at D₃ receptor contributes to antiparkinson effects

USES:

Parkinson's disease, restless leg syndrome (RLS)

CONTRAINDICATIONS:

Hypersensitivity

Precautions: Pregnancy (C), dysrhythmias, affective disorder, psychosis, cardiac/renal/hepatic disease

DOSAGE AND ROUTES

Calculator

Parkinson's disease

- **Adult: PO (regular release)** Initially, 0.25 mg PO tid × 1 wk; gradually titrate at weekly intervals: **Week 2**, 0.5 mg tid; **Week 3**, 0.75 mg tid; **Week 4**, 1 mg tid; **After week 4**, may increase by 1.5 mg/day each week, max 9 mg/day total dosage, and then by 3 mg/day each week, max 24 mg/day
- **PO (ext rel)** Initially, 2 mg/day × 1–2 wk, may increase by mg/day at intervals ≥1 wk based upon response; max 24 mg/day; if significant interruption of therapy occurs, retitration may be necessary

Conversion from immediate-release to extended-release tablets

- **Adult: PO** Currently taking 0.75–2.25 mg/day imm rel: give 2 mg/day ext rel
- **PO** Currently taking 3–4.5 mg/day imm rel: give 4 mg/day ext rel
- **PO** Currently taking 6 mg/day imm rel: give 6 mg/day ext rel
- **PO** Currently taking 7.5–9 mg/day imm rel: give 8 mg/day ext rel

- **PO** Currently taking 12 mg/day imm rel: give 12 mg/day ext rel
- **PO** Currently taking 15–18 mg/day imm rel: give 16 mg/day ext rel
- **PO** Currently taking 21 mg/day imm rel: give 20 mg/day ext rel
- **PO** Currently taking 24 mg/day imm rel: give 24 mg/day ext rel

Restless legs syndrome

- **Adult: PO (reg rel)** Initially, 0.25 mg every day 1–3 hr before bedtime; days 3–7, may increase to 0.5 mg every day; at the beginning of wk 2 (day 8) the dosage may be increased to 1 mg every day × 1 wk; weeks 3–6, dosage may be titrated up by 0.5 mg each wk (from 1.5–3 mg over the 5-wk period) as needed to achieve desired effect; wk 7, may increase dosage to 4 mg/day; dosage is titrated based on clinical response; give all doses 1–3 hr before bedtime

Available forms: Tabs 0.25, 0.5, 1, 2, 3, 4, 5 mg; ext rel tab 2, 4, 8, 12 mg

Administer:

- Product until NPO before surgery
- Adjust dosage to patient response; taper when discontinuing
- With meals to reduce nausea
- *Extended release:* do not chew, crush, or divide

SIDE EFFECTS

CNS: *Agitation, insomnia, psychosis, hallucination, dystonia, depression, dizziness, somnolence, sleep attacks, impulse control disorders*

CV: *Orthostatic hypotension, tachycardia, hypo/hypertension, syncope, palpitations*

EENT: *Blurred vision*

GI: *Nausea, vomiting, anorexia, dry mouth, constipation, dyspepsia, flatulence*

GU: *Impotence, urinary frequency*

HEMA: *Hemolytic anemia, leukopenia, agranulocytosis*

INTEG: *Rash, sweating*

RESP: *Pharyngitis, rhinitis, sinusitis, bronchitis, dyspnea*

PHARMACOKINETICS

Peak 1–2 hr, half-life 6 hr, extensively metabolized by liver by P450 CYP1A2 enzyme system, protein binding 40%

INTERACTIONS

Increase: rOPINIRole effect—cimetidine, ciprofloxacin, diltiazem, enoxacin, erythromycin, fluvoxamine, mexiletine, norfloxacin, tacrine, digoxin, theophylline, L-dopa

Decrease: rOPINIRole effects—butyrophenones, metoclopramide, phenothiazines, thioxanthenes

NURSING CONSIDERATIONS

Assess:

- **Parkinsonism:** akinesia, tremors, staggering gait, muscle rigidity, drooling
- B/P, respirations during initial treatment; hypo/hypertension should be reported

 **Sleep attacks:** drowsiness, falling asleep without warning even during hazardous activities

- Mental status: affect, mood, behavioral changes, depression; complete suicide assessment; worsening of symptoms in restless leg syndrome

Perform/provide:

- Testing for diabetes mellitus, acromegaly if patient receiving long-term therapy

Evaluate:

- Therapeutic response: improvement in movement disorder

Teach patient/family:

- To notify prescriber if pregnancy is planned or suspected, pregnancy category (C)

- To take with food to prevent nausea

- To report hallucinations, confusion (usually in geriatric patients)

- That therapeutic effects may take several weeks to a few months

- To change positions slowly to prevent orthostatic hypotension

- To use product exactly as prescribed; if product is discontinued abruptly, parkinsonian crisis may occur

- That drowsiness, sleep attacks may occur; to avoid driving, other hazardous activities until response known

- To avoid alcohol, CNS depressants cough and cold products

 **To notify prescriber if unusual urges occur**

☼ Canada only Side effects: *italics* = common; **bold** = life-threatening 

Nurse Alert

rosiglitazone (Rx)

(ros-ih-glīt'ah-zone)

Avandia

Func. class.: Antidiabetic, oral

Chem. class.: Thiazolidinedione

ACTION:

Improves insulin resistance by hepatic glucose metabolism, insulin receptor kinase activity, insulin receptor phosphorylation

USES:

Type 2 diabetes mellitus, alone or in combination with sulfonylureas, metformin, insulin

Unlabeled uses: Increased ovulation frequency in those with polycystic ovary syndrome; reduced instent restenosis in those with diabetes

CONTRAINDICATIONS:

Breastfeeding, children, hypersensitivity to thiazolidinediones, diabetic ketoacidosis, jaundice

Black Box Warning:

NYHA III, IV acute heart failure, heart failure

Precautions: Pregnancy (C), geriatric patients, thyroid disease, renal/hepatic disease, heart failure, class I, II NYHA

Black Box Warning:

MI

DOSAGE AND ROUTES

Calculator

- **Adult: PO** 4 mg/day or in 2 divided doses, may increase to 8 mg/day or in 2 divided doses after 12 wk; may be added to metformin, sulfonylurea for adult dose

Available forms: Tabs 2, 4, 8 mg

Administer:

PO route

- Once or in 2 divided doses, without regard to food

- Tabs crushed and mixed with food or fluids for patients with difficulty swallowing
- Only through the REMS Program 1-800-Avandia

SIDE EFFECTS

CNS: Fatigue, *headache*

CV: MI, CHF, death (geriatric patients)

ENDO: Hypo/hyperglycemia

GI: Weight gain, **hepatotoxicity**, increase total, LDL, HDL cholesterol; decrease free fatty acids, diarrhea

MISC: Accidental injury, URI, sinusitis, anemia, back pain, diarrhea, edema, bone fractures (female)

SYST: **Anaphylaxis**, **Stevens-Johnson syndrome**, **lactic acidosis**

PHARMACOKINETICS

Maximal reductions in FBS after 6-12 wk; protein binding 99.8%; excreted in urine, feces; elimination half-life 3-4 hr; may be excreted in breast milk

INTERACTIONS

Increase: hypoglycemia—gemfibrozil, fluvoxamine, ketoconazole, trimethoprim; monitor glucose

- Avoid concurrent use with insulin, nitrates
- May increase or decrease level: CYP2C5 inducer/inhibitors

Drug/Herb

Increase: antidiabetic effect—garlic, horse chestnut

Drug/Lab Test

Increase: ALT, HDL, LDL, total cholesterol, blood glucose

Decrease: Hgb/Hct

NURSING CONSIDERATIONS

Assess:

Black Box Warning:

CHF/MI: dyspnea, crackles, edema, weight gain ≥ 5 lb, jugular venous distention; may need to change dose or discontinue product, do not use in acute coronary syndrome, NYHA Class 3/IV heart failure

Lactic acidosis: dyspnea, abdominal pain, muscle pain; notify prescriber

- Hypoglycemic reactions (sweating, weakness, dizziness, anxiety, tremors,

hunger), hyperglycemic reactions soon after meals

⚠️ **Systemic reactions:** anaphylaxis, Stevens-Johnson syndrome, lactic acidosis

⚠️ **Hepatotoxicity:** LFTs periodically AST, ALT (if ALT >2.5 × ULN, do not use product)

- Fasting blood sugar, A1c, plasma lipids/lipoproteins, B/P, body weight during treatment
- To use product provider/patient must be enrolled in the Avandia-Rosiglitazone Medicines Access Program

Perform/provide:

- Conversion from other oral hypoglycemic agents if needed; change may be made without gradual dosage change; monitor blood glucose during conversion
- Storage in tight container in cool environment

Evaluate:

- Therapeutic response: decrease in polyuria, polydipsia, polyphagia; clear sensorium; absence of dizziness; stable gait; blood glucose, A1c improvement

Teach patient/family:

- To monitor blood glucose; that periodic liver function tests mandatory; to report edema, weight gain
- About the symptoms of hypo/hyperglycemia, what to do about each
- That product must be continued on daily basis; about the consequences of discontinuing the product abruptly
- To avoid OTC medications, herbal preparations, nitrates, or insulin unless approved by prescriber
- That diabetes is lifelong; that product is not a cure, only controls symptoms
- That all food included in diet plan must be eaten to prevent hypoglycemia
- To carry emergency ID and glucagon emergency kit

⚠️ **To report symptoms of hepatic dysfunction (nausea, vomiting, abdominal pain, fatigue, anorexia, dark urine, jaundice)**

- That 2 wk is needed to see reduction in blood glucose level and 2-3 mo needed to see full effect of product
- To notify prescriber if oral contraceptives are used
- **Not to use if breastfeeding, may be secreted in breast milk**
- That a medication guide should be dispensed with each prescription/refill

Nurse Alert

rosuvastatin (Rx)

(roe-soo'va-sta-tin)

Crestor

Func. class.: Antilipemic

Chem. class.: HMG-CoA reductase inhibitor

ACTION:

Inhibits HMG-CoA reductase enzyme, which reduces cholesterol synthesis

USES:

As an adjunct for primary hypercholesterolemia (types IIa, IIb) and mixed dyslipidemia, elevated serum triglycerides, homozygous/heterozygous familial hypercholesterolemia (FH), slowing of atherosclerosis, CV disease prophylaxis

Unlabeled uses: MI, stroke prophylaxis (normal LDL)

CONTRAINDICATIONS:

Pregnancy (X), breastfeeding, hypersensitivity, active hepatic disease

Precautions: Children, geriatric patients, past hepatic disease, alcoholism, severe acute infections, trauma, hypotension, uncontrolled seizure disorders, severe metabolic disorders, electrolyte imbalances, severe renal impairment, hypothyroidism, Asian patients

DOSAGE AND ROUTES

Calculator

Hypercholesterolemia

- **Adult: PO** 5-40 mg/day; initial dose 10 mg/day, reanalyze lipid levels at 2-4 wk, adjust dosage accordingly

Homozygous familial hypercholesterolemia

- **Adult: PO** 20 mg/day, max 40 mg

Dose in patients taking

cycloSPORINE/gemfibrozil/lopinavir/ritonavir/atazanavir

- **Adult: PO** 5 mg/day, max 10 mg/day

Asian patients/patients with predisposition for myopathy

- **Adult: PO** 5 mg/day

Atherosclerosis slowing

- **Adult: PO** 10 mg/day (for those not taking cycloSPORINE or gemfibrozil)

Heterozygous familial hypercholesterolemia

- **Females ≥ 1 yr postmenarche and ≥ 10 yr): PO** 5-20 mg/day individualized MI/stroke prophylaxis (unlabeled)

- **Adult: PO** 20 mg daily

Renal/hepatic dose

- **Adult: PO** CCr < 30 ml/min, 5 mg/day; max 10 mg/day; avoid use with hepatic disease

Available forms: Tabs 5, 10, 20, 40 mg

Administer:

- May be taken at any time of day, with/without food

SIDE EFFECTS

CNS: Headache, dizziness, insomnia, paresthesia

GI: Nausea, constipation, abdominal pain, flatulence, diarrhea, dyspepsia, heartburn, kidney failure, liver dysfunction, vomiting

HEMA: Thrombocytopenia, hemolytic anemia, leukopenia

INTEG: Rash, pruritus

MS: Asthenia, muscle cramps, arthritis, arthralgia, myalgia, myositis, rhabdomyolysis; leg, shoulder, or localized pain

RESP: Rhinitis, sinusitis, pharyngitis, increased cough

PHARMACOKINETICS

Peak 3-5 hr, minimal live metabolism (about 10%), 88% protein bound, excreted primarily in feces (90%), crosses placenta, half-life 19 hr, not dialyzable

INTERACTIONS

Increase: hepatotoxicity—alcohol

Increase: rosuvastatin effect—bile acid sequestrants

⚠ Increase: myalgia, myositis, rhabdomyolysis—cycloSPORINE, gemfibrozil, niacin, clofibrate, azole antifungals, antiretroviral protease inhibitors, fibric acid derivatives

Increase: bleeding risk—warfarin

Drug/Lab Test

Increase: LFTs

NURSING CONSIDERATIONS

Assess:

- Diet; obtain diet history including fat, cholesterol in diet
- Fasting cholesterol, LDL, HDL, triglycerides at baseline and q4-6wk, then periodically
- Liver function: LFTs at baseline, 12 wk, then q6mo; AST, ALT, LFTs may increase
- Renal function in patients with compromised renal system: BUN, creatinine, I&O ratio

 **Rhabdomyolysis:** muscle pain, tenderness, obtain CPK; if these occur, product may need to be discontinued; for patients with Asian ancestry: increased blood levels, rhabdomyolysis

Perform/provide:

- Storage in cool environment in airtight, light-resistant container

Evaluate:

- Therapeutic response: decreased LDL, cholesterol, triglycerides, increased HDL, slowing CAD

Teach patient/family:

 To report suspected pregnancy; to use contraception while taking product, pregnancy category (X); not to breastfeed

 To report weakness, muscle tenderness, pain, fever; liver injury (jaundice, anorexia, abdominal pain)

- That blood work and follow-up exams will be necessary during treatment
- To report severe GI symptoms, dizziness, headache, muscle pain, weakness
- That previously prescribed regimen will continue: low-cholesterol diet, exercise program, smoking cessation

🍁 Canada only Side effects: *italics* = common; **bold** = life-threatening 
Nurse Alert

rufinamide (Rx)

(roo-fin'a-mide)

Banzel

Func. class.: Anticonvulsant

Chem. class.: Triazole derivative

ACTION:

May act through action at sodium channels; exact action is unknown

USES:

Lennox-Gastaut syndrome

Unlabeled uses: Partial seizures

CONTRAINDICATIONS:

Hypersensitivity, familial short QT syndrome

Precautions: Pregnancy (C), breastfeeding, children <16 yr, geriatric patients, renal/hepatic disease, depression, dialysis, hazardous activities, suicidal ideation

DOSAGE AND ROUTES

Calculator

• **Adult: PO** 400-800 mg/day divided bid, increase by 400-800 mg/day q2days to 3200 mg/day

• **Child ≥4 yr: PO** 10 mg/kg/day divided equally bid; increase by 10 mg/kg/day every other day to 45 mg/kg/day or 3200 mg/day, whichever is less

Available forms: Tabs 200, 400 mg; oral susp 40 mg/ml

Administer:

• **PO tabs:** give with food; may give whole, crushed, or halved

• **Oral susp:** shake well before use, use provided adapter and calibrated oral dosing syringe, insert adapter firmly in neck of bottle before use, keep in place for duration of bottle use; insert dosing syringe into adapter, withdraw dose from inverted bottle; replace cap after each use, use within 90 days of opening, give with food

SIDE EFFECTS

CNS: Dizziness, ataxia, drowsiness, fever, seizures, tremor, fatigue, headache,

gait disturbance

EENT: Diplopia, blurred vision, nystagmus

GI: Nausea, hepatitis, vomiting

HEMA: **Anemia, leukopenia, neutropenia, thrombocytopenia**, lymphadenopathy

INTEG: Rash, urticaria

MISC: Edema, hematuria, influenzae, nephrolithiasis

PHARMACOKINETICS

Peak 4-6 hr, half-life 6-10 hr, metabolized by liver, excreted by kidneys, 34% protein binding

INTERACTIONS

Increase: rufinamide effect—valproate

Decrease: effect of hormonal contraceptives

Decrease: effect of rufinamide—carbamazepine, phenytoin, primidone, phenobarbital

Drug/Lab Test

Increase: LFTs

NURSING CONSIDERATIONS

Assess:

- **Seizures:** duration, type, intensity precipitating factors

- **Mental status:** mood, sensorium, affect, memory (long, short), increased suicidal thoughts/actions

Evaluate:

- Therapeutic response: decrease in severity of seizures

Teach patient/family:

- Not to discontinue product abruptly because seizures may occur

- To avoid hazardous activities until stabilized on product

- To carry emergency ID stating product use

- **To notify prescriber if pregnancy is planned or suspected; to use alternative form of contraception because effect of hormonal contraceptives may be decreased**

- To consume adequate fluids

Nurse Alert

salicylic acid topical

See [Appendix B](#)

salmeterol (Rx)

(sal-met'er-ole)

Serevent , Serevent Diskus

Func. class.: β_2 -Adrenergic agonist, bronchodilator

ACTION:

Causes bronchodilation by action on β_2 (pulmonary) receptors by increasing levels of cAMP, which relaxes smooth muscle with little effect on heart rate; maintains improvement in FEV from 3 to 12 hr; prevents nocturnal asthma symptoms

USES:

Prevention of exercise-induced bronchospasm, COPD, asthma

CONTRAINDICATIONS:

Hypersensitivity to sympathomimetics, tachydysrhythmias, severe cardiac disease, monotherapy treatment of asthma

Precautions: Pregnancy (C), breastfeeding, cardiac disorders, hyperthyroidism, diabetes mellitus, hypertension, closed-angle glaucoma, seizures, acute asthma, as a substitute to corticosteroids, QT prolongation

Black Box Warning:

Asthma-related death, children <4 yr

DOSAGE AND ROUTES

Calculator

• **Adult/child ≥ 4 yr:** INH 50 mcg (1 inhalation as dry powder) q12hr; exercise-induced bronchospasm 50 mcg (1 inhalation) 1/2-1 hr before exercise

Available forms: Inhalation powder 50 mcg/blister

Administer:

- Gum, sips of water for dry mouth
- Use 1 hr before exercise for exercise-induced bronchospasm prevention

SIDE EFFECTS

CNS: Tremors, anxiety, insomnia, headache, dizziness, fever

CV: Palpitations, tachycardia, hypo/hypertension, angina, dysrhythmias

EENT: Dry nose, irritation of nose and throat

GI: Heartburn, nausea, vomiting, abdominal pain

MS: Muscle cramps

RESP: Bronchospasm, cough

PHARMACOKINETICS

INH: Onset 30-50 min; peak 4 hr; duration 12 hr; metabolized in liver; excreted in urine, breast milk; crosses placenta, blood-brain barrier; protein binding 94%-98%; terminal half-life 3-5 hr

INTERACTIONS

Increase: CV effect—CYP3A4 inhibitors (itraconazole, ketoconazole, nelfinavir, nefazodone, saquinavir)

Increase: action of aerosol bronchodilators

Increase: action of salmeterol—tricyclics, MAOIs

Decrease: salmeterol action—other β -blockers

NURSING CONSIDERATIONS

Assess:

- **Respiratory function:** vital capacity, forced expiratory volume, ABGs, lung sounds, heart rate and rhythm  **Paradoxical bronchospasm:** dyspnea, wheezing, chest tightness

Black Box Warning:

Children should not use this product as monotherapy for asthma, use only with persistent asthma in those whose symptoms are not well controlled with a long-term asthma product

Perform/provide:

- Storage in foil pouch; do not expose to temp $>86^{\circ}\text{F}$ (30°C); discard 6 wk after removal from foil pouch

Evaluate:

- Therapeutic response: absence of dyspnea, wheezing

Teach patient/family:

- Not to use for exercise-induced bronchospasm, never to exhale into diskus, to

hold level, keep mouthpiece dry • Not to use OTC medications because extra stimulation may occur

- Review package insert with patient
- To avoid getting powder in eyes
- To avoid smoking, smoke-filled rooms, persons with respiratory infections
- Not for treatment of acute exacerbation, a fast-acting β -blocker should be used instead ⚠ To immediately report dyspnea after use if ≥ 1 canister is used in 2 mo time

TREATMENT OF OVERDOSE:

β_2 -Adrenergic blocker

🇨🇦 Canada only Side effects: *italics* = common; **bold** = life-threatening ⚠
Nurse Alert

sargramostim (GM-CSF) (Rx)

(sargram'oh-stim)

Leukine, GM-CSF

Func. class.: Biologic modifier

Chem. class.: Granulocyte macrophage colony-stimulating factor (GM-CSF)

Do not confuse: **Leukine**/leucovorin/Leukeran

ACTION:

Stimulates proliferation and differentiation of hematopoietic progenitor cells (granulocytes, macrophages)

USES:

Acceleration of myeloid recovery in patients with non-Hodgkin's lymphoma, acute lymphoblastic leukemia, acute myelogenous leukemia, autologous bone marrow transplantation in Hodgkin's disease; bone marrow transplantation failure or engraftment delay, mobilization and transplant of peripheral blood progenitor cells (PBPCs)

Unlabeled uses: Aplastic anemia, Crohn's disease, HIV, ganciclovir-or zidovudine-induced neutropenia, malignant melanoma

CONTRAINDICATIONS:

Neonates; hypersensitivity to GM-CSF, benzyl alcohol, yeast products; excessive leukemic myeloid blast in bone marrow, peripheral blood

Precautions: Pregnancy (C), breastfeeding, children; lung/cardiac/renal/hepatic disease; pleural, pericardial effusions, peripheral edema, leukocytosis, mannitol hypersensitivity, hepatic/renal disease

DOSAGE AND ROUTES

Calculator

Myeloid reconstitution after autologous bone marrow transplantation

- **Adult:** IV 250 mcg/m²/day × 3 wk; give over 2 hr, begin 2-4 hr after bone marrow inf, not <24 hr after last dose of antineoplastics and 12 hr after last dose of radiotherapy, bone marrow transplantation failure, or engraftment delay

Acceleration of myeloid recovery

- **Adult: IV** 250 mcg/m²/day × 14 days; give over 2 hr; may repeat in 7 days, may repeat 500 mcg/m²/day × 14 days after another 7 days if no improvement

Mobilization of PBPCs

- **Adult: IV/SUBCUT** 250 mcg/m²/day during collection of PBPCs

After PBPC transplantation

- **Adult: IV/SUBCUT** 250 mcg/m²/day until ANC >1500 cells/mm³ × 3 days

Aplastic anemia (unlabeled)

- **Adult: SUBCUT** 250-500 mcg/day or 5 mcg/kg/day × 14-90 days, used with erythropoietin or immunosuppressive therapy

Malignant melanoma (unlabeled)

- **Adult: SUBCUT** 125 mcg/m²/day × 14 days, alternate with 14 days off

HIV (unlabeled)

- **Adult: SUBCUT** 250 mcg/day 3×/wk for ≤20 mo

Available forms: Powder for inj lyophilized 250 mcg; sol for inj 500 mcg/ml

Administer:

SUBCUT route

- No further dilution of reconstituted sol is needed; take care not to inject intradermally

Intermittent IV INF route

- After reconstituting with 1 ml sterile water for inj without preservative; do not reenter vial; discard unused portion; direct reconstitution sol at side of vial; rotate contents; do not shake • Dilute in 0.9% NaCl inj to prepare IV inf; if final concentration is <10 mcg/ml, add human albumin to make final conc of 0.1% to NaCl before adding sargramostim to prevent adsorption; for a final conc of 0.1% albumin, add 1 mg human albumin/1 ml 0.9% NaCl inj run over 2 hr **(bone marrow transplant or failure of graft)**; over 4 hr **(chemotherapy for AML)**; over 24 hr as cont inf **(PBPCs)**; give within 6 hr after reconstitution

Y-site compatibilities: Amikacin, aminophylline, aztreonam, bleomycin, butorphanol, calcium gluconate, CARBOplatin, carmustine, ceFAZolin, cefepime, cefotaxime, cefoTEtan, ceftizoxime, cefTRIAxone, cefuroxime, cimetidine, CISplatin, clindamycin, cyclophosphamide, cycloSPORINE, cytarabine, dacarbazine, DACTINomycin, dexamethasone, diphenhydrAMINE, DOPamine, DOXOrubicin, doxycycline, droperidol, etoposide, famotidine,

fentaNYL, floxuridine, fluconazole, fluorouracil, furosemide, gentamicin, granisetron, heparin, IDArubicin, ifosfamide, immune globulin, magnesium sulfate, mannitol, mechlorethamine, meperidine, mesna, methotrexate, metoclopramide, metroNIDAZOLE, minocycline, mitoXANtrone, netilmicin, pentostatin, piperacillin/tazobactam, potassium chloride, prochlorperazine, promethazine, ranitidine, teniposide, ticarcillin, ticarcillin-clavulanate, trimethoprim-sulfamethoxazole, vinBLASStine, vinCRISStine, zidovudine

SIDE EFFECTS

CNS: Fever, malaise, CNS disorder, weakness, chills, dizziness, syncope, headache

CV: Transient supraventricular tachycardia, peripheral edema, pericardial effusion, hypotension, tachycardia

GI: Nausea, vomiting, diarrhea, anorexia, GI hemorrhage, stomatitis, liver damage, hyperbilirubinemia

GU: Urinary tract disorder, abnormal kidney function

HEMA: Blood dyscrasias, hemorrhage

INTEG: Alopecia, rash, peripheral edema

MS: Bone pain, myalgia

RESP: Dyspnea

PHARMACOKINETICS

Half-life elimination: IV 60 min, SUBCUT 2-3 hr; detected within 5 min after administration, peak 2 hr

INTERACTIONS

- Do not use product concomitantly with antineoplastics or radiation, separate by ≥ 24 hr

Increase: myeloproliferation—lithium, corticosteroids

Drug/Lab Test

Increase: bilirubin, BUN, creatinine, eosinophils, LFTs, leukocytes

NURSING CONSIDERATIONS

Assess:

⚠ Blood studies: CBC, differential count before treatment, 2 $\times$ weekly; leukocytosis may occur (WBC $>50,000$ cells/mm³, ANC $>20,000$ cells/mm³),

platelets; if ANC $>20,000/\text{mm}^3$ or $10,000/\text{mm}^3$ after nadir has occurred or platelets $>500,000/\text{mm}^3$, reduce dose by 1/2 or discontinue; if blast cells occur, discontinue • Renal, hepatic studies before treatment: BUN, creatinine, urinalysis; AST, ALT, alk phos; 2 × weekly monitoring is needed in renal/hepatic disease • **Hypersensitivity**, rashes, local inj site reactions; usually transient • Body weight, hydration status; increased fluid retention in cardiac disease; pulmonary function • Constitutional symptoms: asthenia, chills, fever, headache, malaise

- Myalgia, arthralgia in legs, feet; use analgesics, antipyretics

Perform/provide:

- **Gasping syndrome in neonates:** due to benzyl alcohol hypersensitivity
- Storage in refrigerator; do not freeze

Evaluate:

- Therapeutic response: WBC and differential recovery

Teach patient/family:

- To report dyspnea to health care provider
- Review all aspects of product use

☼ Canada only Side effects: *italics* = common; **bold** = life-threatening ⚠
Nurse Alert

saxagliptin (Rx)

(sax-a-glip'tin)

Onglyza

Func. class.: Antidiabetic, oral

Chem. class.: Dipeptidyl-peptidase-4 inhibitor (DPP-4 inhibitor)

Do not confuse: saxagliptin/sitaGLIPTin

ACTION:

Slows the inactivation of incretin hormones; improves glucose homeostasis, improves glucose-dependent insulin synthesis, lowers glucagon secretions, and slows gastric emptying time

USES:

In adults, type 2 diabetes mellitus as monotherapy or in combination with other antidiabetic agents

CONTRAINDICATIONS:

Hypersensitivity, diabetic ketoacidosis (DKA), type 1 diabetes

Precautions: Pregnancy (B), geriatric patients, GI obstruction, surgery, thyroid/renal/hepatic disease, trauma

DOSAGE AND ROUTES

Calculator

- **Adult: PO** 2.5-5 mg; may use with other antidiabetic agents other than insulin; if used with insulin, a lower dose is needed

Renal dose

- **Adult: PO** CCr ≤ 50 ml/min, 2.5 mg daily

Available forms: Tabs 2.5, 5 mg

Administer:

PO route

- May be taken with/without food

SIDE EFFECTS

CNS: Headache

ENDO: Hypoglycemia (renal impairment)

GI: Nausea, vomiting, abdominal pain

INTEG: Urticaria, angioedema, anaphylaxis

MISC: Lymphopenia, peripheral edema

PHARMACOKINETICS

Rapidly absorbed, excreted by the kidneys (unchanged 24%), terminal half-life 2.5 hr, 3.1 hr metabolite, peak 2 hr, duration 24 hr

INTERACTIONS

Increase: hypoglycemia—androgens, insulins, β -blockers, cimetidine, corticosteroids, salicylates, MAOIs, fibric acid derivatives, FLUoxetine, insulin, sulfonylureas, ACE inhibitors; CYP3A4/5 inhibitors

Drug/Herb

Increase: antidiabetic effect—garlic, horse chestnut

Drug/Lab Test

Decrease: lymphocytes, glucose

NURSING CONSIDERATIONS

Assess:

• **Hypoglycemic reactions** (sweating, weakness, dizziness, anxiety, tremors, hunger); monitor blood glucose, HbA1c **renal studies:** BUN, creatinine during treatment

Perform/provide:

• Conversion from other antidiabetic agents; change may be made with gradual dosage change • Storage in tight container at room temp

Evaluate:

• Therapeutic response: decrease in polyuria, polydipsia, polyphagia; clear sensorium; absence of dizziness; stable gait, blood glucose at normal level

Teach patient/family:

• To perform regular self-monitoring of blood glucose using blood-glucose meter
• About the symptoms of hypo/hyperglycemia, what to do about each
• That product must be continued on daily basis; about consequences of discontinuing product abruptly • To avoid OTC medications, alcohol, digoxin, exenatide, insulins, nateglinide, repaglinide, and other products that lower blood glucose unless approved by prescriber • That diabetes is lifelong; that this

product is not a cure, only controls symptoms

- That all food included in diet plan must be eaten to prevent

hypo/hyperglycemia

- To carry emergency ID
- To take product without regard to food
- To notify prescriber when surgery, trauma, stress, occurs because dose may need to be adjusted

🌿 Canada only Side effects: *italics* = common; **bold** = life-threatening ⚠️
Nurse Alert

scopolamine (Rx)

(skoe-pol'a-meen)

Maldemar, Scopace, Transderm Scop

Func. class.: Cholinergic blocker

Chem. class.: Belladonna alkaloid

ACTION:

Inhibits acetylcholine at receptor sites in autonomic nervous system, which controls secretions, free acids in stomach; blocks central muscarinic receptors, which decreases involuntary movements

USES:

Preoperatively to produce amnesia, sedation and to decrease secretions; motion sickness, parkinsonian symptoms

CONTRAINDICATIONS:

Hypersensitivity, closed-angle glaucoma, myasthenia gravis, GI/GU obstruction, hypersensitivity to belladonna, barbiturates

Precautions: Pregnancy (C), breastfeeding, children, geriatric patients, prostatic hypertrophy, CHF, hypertension, dysrhythmia, gastric ulcer, renal/hepatic disease, hiatal hernia, GERD, ulcerative colitis, hyperthyroidism

DOSAGE AND ROUTES

Calculator

Motion sickness

- **Adult: TD** 1 patch 4 hr before travel and q3days

Parkinsonian symptoms

- **Adult: PO** 0.4-0.8 mg q8hr

Preoperatively

- **Adult: IM/IV/SUBCUT** 0.32-0.65 mg; **TD** apply 1 patch PM before surgery or 1 hr before c-section

Nausea and vomiting

- **Adult: SUBCUT** 0.6-1 mg
- **Child: SUBCUT** 0.006 mg/kg; max 0.3 mg/dose

Available forms: Inj 0.4 mg/ml; TD patch 72 hr (1.5 mg)

Administer:

- Parenteral dose with patient recumbent to prevent postural hypotension
- Parenteral dose slowly; keep patient in bed for ≥ 1 hr after dose
- With or after meals for GI upset; may give with fluids other than water
- At bedtime to avoid daytime drowsiness in patients with parkinsonism
- With analgesic to avoid behavioral changes when given preoperatively

Direct IV route

- Dilute with equal sterile water; give over 2-3 min

Syringe compatibilities: Atropine, benzquinamide, butorphanol, chlorproMAZINE, cimetidine, diamorphine, dimenhyDRINATE, diphenhydrAMINE, droperidol, fentaNYL, glycopyrrolate, HYDROmorphone, hydrOXYzine, meperidine, metoclopramide, midazolam, morphine, nalbuphine, oxyCODONE, pentazocine, PENTobarbital, perphenazine, prochlorperazine, promazine, promethazine, ranitidine, SUFentanil, thiopental

Y-site compatibilities: FentaNYL, heparin, hydrocortisone, HYDROmorphone, methadone, morphine, potassium chloride, propofol, SUFentanil, vit B/C

SIDE EFFECTS

CNS: Confusion, anxiety, restlessness, irritability, delusions, hallucinations, headache, sedation, depression, incoherence, dizziness, excitement, delirium, flushing, weakness, fatigue, loss of memory

CV: Palpitations, tachycardia, postural hypotension, paradoxical bradycardia

EENT: Blurred vision, photophobia, dilated pupils, difficulty swallowing, mydriasis, cycloplegia

GI: *Dryness of mouth, constipation*, nausea, vomiting, abdominal distress, **paralytic ileus**

GU: Urinary hesitancy, retention

INTEG: Urticaria, dry skin

MISC: Suppression of breastfeeding, nasal congestion, decreased sweating

PHARMACOKINETICS

Excreted in urine, bile, feces (unchanged), half-life 8 hr

SUBCUT/IM: Peak 30-60 min, duration 7 hr

IV: Peak 10-15 min, duration 2 hr

INTERACTIONS

Increase: anticholinergic effect—alcohol, opioids, antihistamines, phenothiazines, tricyclics

NURSING CONSIDERATIONS

Assess:

- VS periodically
- I&O ratio; retention commonly causes decreased urinary output
- **Parkinsonism, EPS:** shuffling gait, muscle rigidity, involuntary movements; affect, mood, CNS depression, worsening of mental symptoms during early therapy • Urinary hesitancy, retention; palpate bladder if retention occurs
- Constipation; increase fluids, bulk, exercise
- Tolerance during long-term therapy; dose may have to be increased or changed

Perform/provide:

- Storage at room temp in light-resistant container
- Hard candy, frequent drinks, sugarless gum to relieve dry mouth

Evaluate:

- Therapeutic response: decreased secretions

Teach patient/family:

- Not to discontinue product abruptly; to taper off over 1 wk
- To avoid driving, other hazardous activities because drowsiness may occur
- To avoid OTC medication: cough, cold preparations with alcohol, antihistamines unless directed by prescriber • **Transdermal route:** to apply with clean, dry hands; to wash, dry hands before and after applying to surface behind ear; to press patch firmly • To avoid hazardous activities, activities requiring alertness because dizziness may occur • To change patch q72hr
- To apply at least 4 hr before traveling
- If blurred vision, severe dizziness, drowsiness occurs, to discontinue use, use another type of antiemetic, or to rotate patch to other ear • To read label of all OTC medications; if any scopolamine is found in product, avoid use • To keep out of children's reach

☛ Canada only Side effects: *italics* = common; **bold** = life-threatening ⚠
Nurse Alert

scopolamine ophthalmic

See [Appendix B](#)

selegiline (Rx)

(se-le'ji-leen)

Eldepryl, Emsam, Zelapar

Func. class.: Antiparkinson agent

Chem. class.: MAOI, type B

Do not confuse: [Eldepryl](#)/enalapril

ACTION:

Increased dopaminergic activity by inhibition of MAO type B activity; not fully understood

USES:

Adjunct management of Parkinson's disease for patients being treated with levodopa/carbidopa who had poor response to therapy; depression (transdermal)

Unlabeled uses: Alzheimer's disease, depression

CONTRAINDICATIONS:

Children/adolescents (suicide/hypertensive crisis), hypersensitivity, breastfeeding

Precautions: Pregnancy (C)

DOSAGE AND ROUTES

Calculator

• **Adult: PO** 10 mg/day given with levodopa/carbidopa in divided doses, 5 mg at breakfast and lunch; after 2-3 days, begin to reduce dose of levodopa/carbidopa 10%-30%; **ORAL DISINTEGRATING** 1.25 mg (1 tab) × 6 wk or more initially then 2.5 mg (2 tabs) dissolved on tongue daily before breakfast; max 2.5 mg/day; **TRANSDERMAL** 6 mg/24 hr initially, increase by 3 mg/24 hr at ≥2 wk, up to 12 mg/24 hr if needed

Alzheimer's disease (unlabeled)

- **Adult: PO** 5 mg bid AM, PM

Available forms: Tabs 5 mg; caps 5 mg; oral disintegrating tabs 1.25 mg; transdermal 6 mg/24 hr (20 mg/20 cm²), 9 mg/24 hr (30 mg/30 cm²), 12 mg/24 hr (40 mg/40 cm²)

Administer:

PO route

 **Do not use in children due to risk for hypertensive crisis • Product until NPO before surgery**

- Adjust dosage to response
- With meals; limit protein taken with product
- Dosing bid in AM and afternoon; avoid PM or bedtime dosing • At doses of <10 mg/day because of risks associated with nonselective inhibition of MAO
- **Oral disintegrating tab:** peel back foil; remove tab, do not push through foil; place tab on tongue, allow to dissolve, swallow with saliva

Transdermal route

- Apply to dry, intact skin on upper torso, upper thigh, or outer surface of upper arm q12hr

SIDE EFFECTS

CNS: Increased tremors, chorea, restlessness, blepharospasm, increased bradykinesia, grimacing, tardive dyskinesia, dystonic symptoms, involuntary movements, increased apraxia, hallucinations, *dizziness*, mood changes, nightmares, delusions, lethargy, apathy, overstimulation, sleep disturbances, headache, migraine, numbness, muscle cramps, confusion, anxiety, tiredness, vertigo, personality change, back/leg pain, **suicide in child/adolescent, suicidal ideation in adults**

CV: Orthostatic hypotension, hypo/hypertension, dysrhythmia, palpitations, angina pectoris, **tachycardia**, edema, **sinus bradycardia**, syncope, **hypertensive crisis (children)**

EENT: Diplopia, dry mouth, blurred vision, tinnitus

GI: Nausea, vomiting, constipation, weight loss, anorexia, diarrhea, heartburn, rectal bleeding, poor appetite, dysphagia, xerostomia

GU: Slow urination, nocturia, prostatic hypertrophy, urinary hesitation, retention, frequency, sexual dysfunction

INTEG: Increased sweating, alopecia, hematoma, rash, photosensitivity, facial

hair

RESP: Asthma, SOB

PHARMACOKINETICS

Absorption (tab) 40-90 min, (oral disintegrating tab) 10-15 min; peak 1/2-2 hr; rapidly metabolized (active metabolites: *N*-desmethyldoprenyl, amphetamine, methamphetamine); metabolites excreted in urine; half-life 10 hr, orally disintegrating tab 1.3 hr; protein binding up to 85%

INTERACTIONS

⚠️ **Fatal interaction:** opioids (especially meperidine); do not administer together ⚠️ Serotonin syndrome (confusion, seizures, fever, hypertension, agitation); death —FLUoxetine, PARoxetine, sertraline, fluvoxamine (discontinue 5 wk before selegiline treatment); do not use together ⚠️ **Fatal interaction:** do not use with tricyclics

Increase: side effects of levodopa/carbidopa

Increase: unusual behavior, psychosis —dextromethorphan

Increase: hypotension—antihypertensives

Drug/Lab Test

Decrease: VMA

False positive: urine ketones, urine glucose

False negative: urine glucose (glucose oxidase)

False increase: uric acid, urine protein

NURSING CONSIDERATIONS

Assess:

- **Parkinson's symptoms:** decreased rigidity, unsteady gait, weakness, tremors
- Cardiac status: tachycardia/bradycardia; B/P, respiration throughout treatment
- Mental status: affect, mood, behavioral changes, depression; perform suicide assessment on all patients, **suicidal ideation may occur** ⚠️ Opioids; if patient has received, do not administer selegiline, fatal reactions have occurred

Perform/provide:

- Assistance with ambulation during beginning therapy

Evaluate:

- Therapeutic response: decrease in akathisia, improved mood

Teach patient/family:

- To change positions slowly to prevent orthostatic hypotension
- **Hypertensive crisis:** nausea, vomiting, sweating, agitation, change in mental status, headache, chest pain; to notify prescriber immediately
- **Serotonin syndrome:** to report twitching, sweating, shivering, diarrhea to prescriber immediately
- To use product exactly as prescribed; if discontinued abruptly, parkinsonian crisis may occur
- **Pregnancy:** to report if pregnancy is planned or suspected, pregnancy (C), avoid breastfeeding
- To use during the day to prevent insomnia
- To avoid heating pads, hot tubs when using transdermal products
- To avoid hazardous activities until response is known
- To avoid foods high in tyramine: cheese, pickled products, wine, beer, large amounts of caffeine ⚠️ Not to exceed recommended dose of 10 mg (PO) because this might precipitate hypertensive crisis; to report severe headache, other unusual symptoms

TREATMENT OF OVERDOSE:

IV fluids for hypertension, IV dilute pressure agent for B/P titration

🍁 Canada only Side effects: *italics* = common; **bold** = life-threatening ⚠️
Nurse Alert

selenium topical

See [Appendix B](#)

sertraline (Rx)

(ser'tra-leen)

[Zoloft](#)

Func. class.: Antidepressant

Chem. class.: SSRI

Do not confuse: [Zoloft](#)/Zocor

ACTION:

Inhibits serotonin reuptake in CNS; increases action of serotonin; does not affect dopamine, norepinephrine

USES:

Major depressive disorder, obsessive-compulsive disorder (OCD), posttraumatic stress disorder (PTSD), panic disorder, social anxiety disorder, premenstrual dysphoric disorder (PMDD)

Unlabeled uses: Premature ejaculation, pruritus with cholestatic liver disease, hot flashes during menopause, breast cancer patients taking tamoxifen; men with prostate cancer secondary to androgen-deprivation therapy

CONTRAINDICATIONS:

Hypersensitivity to this product or SSRIs

Precautions: Pregnancy (C), breastfeeding, geriatric patients, renal/hepatic disease, epilepsy, recent MI, latex sensitivity (dropper of oral conc)

Black Box Warning:

Children, suicidal ideation

DOSAGE AND ROUTES

Calculator

Major depression/OCD

- **Adult/geriatric patient/adolescent (unlabeled):** PO 25-50 mg/day; may increase to max of 200 mg/day; do not change dose at intervals of <1 wk; administer daily in AM or PM

- **Child 6-12 yr (unlabeled): PO** 25 mg/day, increase by 25-50 mg/wk

Premenstrual dysphoric disorder

- **Adult: PO** 50-150 mg nightly

Premature ejaculation (unlabeled)

- **Adult: PO** 50 mg/day

Pruritus (unlabeled)

- **Adult: PO** 50-100 mg/day

Hot flashes (unlabeled)

- **Adult: PO** 50 mg/day × 4 wk; men with prostate cancer (androgen deprivation), 50-100 mg/day

Hepatic dose

- **Adult: PO** Use lower dose or less frequent dosing intervals

Available forms: Tabs 25, 50, 100 mg; oral sol 20 mg/ml

Administer:

- Increased fluids, bulk in diet for constipation, urinary retention
- With food, milk for GI symptoms
- Crushed if patient is unable to swallow medication whole
- Sugarless gum, hard candy, frequent sips of water for dry mouth
- **Oral conc:** dilute before use with 4 oz (1/2 cup) of water, orange juice, ginger ale, or lemon/lime soda; do not mix with other liquids
- Avoid use with other CNS depressants

SIDE EFFECTS

CNS: *Insomnia, agitation, somnolence, dizziness, headache, tremor, fatigue, paresthesia, twitching, confusion, ataxia, gait abnormality (geriatric patients), seizures, neuroleptic malignant-syndrome–like reaction, serotonin syndrome, suicidal ideation*

CV: Palpitations, chest pain

EENT: Vision abnormalities, yawning

ENDO: SIADH (geriatric patients)

GI: *Diarrhea, nausea, constipation, anorexia, dry mouth, dyspepsia, vomiting, flatulence, weight gain/loss*

GU: *Male sexual dysfunction, micturition disorder*

INTEG: Increased sweating, rash, hot flashes

MISC: Hyponatremia

PHARMACOKINETICS

PO: Peak 4.5-8.4 hr; steady state 1 wk; plasma protein binding 98%; elimination half-life 26 hr; extensively metabolized; metabolite excreted in urine, bile; weak inhibitor of CYP3A4, moderate inhibitor of CYP2D6

INTERACTIONS

- Altered lithium levels: lithium
- Disulfiram reaction: disulfiram and oral conc due to alcohol content

 **Fatal reactions: MAOIs, pimozone**

Increase: sertraline levels—cimetidine, warfarin, other highly protein-bound products

Increase: effects of antidepressants (tricyclics), diazepam, TOLBUTamide, warfarin, benzodiazepines, SUMATriptan, phenytoin, cloZAPine

Increase: bleeding risk—anticoagulants, NSAIDs, thrombolytic, platelet inhibitors, salicylates

Increase: serotonin syndrome, neuroleptic malignant syndrome—SSRIs, SNRIs, serotonin-receptor agonists, tricyclics, sibutramine, traZODone, busPIRone, linezolid, traMADol

Drug/Herb

Increase: of SSRI, serotonin syndrome—St. John's wort, SAM-e, tryptophan; do not use together

Increase: CNS effect—kava kava, valerian

Drug/Lab Test

Increase: AST, ALT

False positive: urine screen for benzodiazepines

NURSING CONSIDERATIONS

Assess:

Black Box Warning:

Mental status: mood, sensorium, affect, suicidal tendencies (child/young adult), increase in psychiatric symptoms, depression, panic attacks, OCD, PTSD, social anxiety disorder

 **Serotonin syndrome** (hyperthermia, hypertension, rigidity, delirium, coma, myoclonus) or neuroleptic malignant-like syndrome (muscle cramps, fever, unstable B/P, agitation, tremors, mental changes)  **Bleeding** (platelet serotonin depletion): GI bleeding, ecchymoses, epistaxis, hematomas, petechiae, hemorrhage • LFTs at baseline and periodically

- B/P (lying/standing), pulse q4hr; if systolic B/P drops 20 mm Hg, hold product, notify prescriber; VS q4hr in patients with CV disease • Weight q wk; appetite may decrease with product
- Urinary retention, constipation, especially in geriatric patients
- Alcohol consumption; hold dose until morning

Perform/provide:

- Storage at room temp; do not freeze

Evaluate:

- Therapeutic response: significant improvement in depression, OCD

Teach patient/family:

- That therapeutic effect may take ≥ 1 wk
- To use caution when driving, performing other activities requiring alertness because drowsiness, dizziness, blurred vision may occur • Not to discontinue medication quickly after long-term use; may cause nausea, headache, malaise
- To avoid alcohol
- May be taken without regard to food
- **Serotonin syndrome:** agitation, nausea, vomiting, diarrhea, twitching, sweating, shivering; report to prescriber immediately • To notify prescriber if pregnant or if planning to become pregnant, pregnancy (C) or breastfeed

Black Box Warning:

That suicidal thoughts/behaviors may occur in children/adolescents

☼ Canada only Side effects: *italics* = common; **bold** = life-threatening ⚠
Nurse Alert

sildenafil (Rx)

(sil-den'a-fill)

Revatio, Viagra

Func. class.: Erectile agent, antihypertensive, peripheral vasodilator *Chem. class.:* Phosphodiesterase type-5 inhibitor

Do not confuse: **Viagra**/Allegra

ACTION:

Enhances the effect of nitric oxide (NO) by inhibiting phosphodiesterase type 5 (PDE5), which is necessary for degrading cGMP in the corpus cavernosum

USES:

Treatment of erectile dysfunction, improvement in exercise ability, pulmonary hypertension

Unlabeled uses: Sexual dysfunction (women); lower urinary tract symptoms and erectile dysfunction (with alfuzosin); altitude sickness, Raynaud's disease

CONTRAINDICATIONS:

Hypersensitivity to this product or nitrates

Precautions: Pregnancy (B), anatomical penile deformities, sickle cell anemia, leukemia, multiple myeloma, retinitis pigmentosa, bleeding disorders, active peptic ulceration, CV/renal/hepatic disease, multiproduct antihypertensive regimens, geriatric patients

DOSAGE AND ROUTES

Calculator

Erectile dysfunction (Viagra only)

- **Adult male <65 yr:** PO 50 mg 1 hr before sexual activity; may be increased to 100 mg or decreased to 25 mg; max 1×/day
- **Adult ≥65 yr (male):** PO 25 mg as needed about 1 hr before sexual activity

Renal/hepatic dose

- **Adult:** PO (Child-Pugh A, B) 25 mg, take 1 hr before sexual activity; max 1×/day; CCr <30 ml/min, 25 mg starting dose

Pulmonary hypertension (Revatio only)

- **Adult: PO** 20 mg tid; take 4-6 hr apart; **IV BOL** 10 mg tid

Pulmonary hypertension induced by altitude sickness (unlabeled)

- **Adult: PO** 40 mg 6-8 hr after arriving at 14,272 ft, then 40 mg tid × 6 days

Anorgasm in antidepressant therapy/sexual dysfunction in women (unlabeled)

- **Adult: PO** 50 mg 60-90 min prior to sexual activity

Available forms: Tabs 20, 25, 50, 100 mg; sol for inj 10 mg/12.5 ml

Administer:

- **Erectile dysfunction:** give approximately 1 hr before sexual activity; do not use more than 1×/day, give on empty stomach for better absorption
- **Pulmonary hypertension:** give 3×/day, 4-6 hr apart

SIDE EFFECTS

CNS: Headache, flushing, dizziness, transient global amnesia, seizures

CV: MI, sudden death, CV collapse, TIAs, ventricular dysrhythmias, CV hemorrhage

MISC.: Dyspepsia, nasal congestion, UTI, abnormal vision, diarrhea, rash, nonarteritic ischemic optic neuropathy, hearing loss, priapism, sickle cell crisis

PHARMACOKINETICS

Rapidly absorbed; bioavailability 40%; metabolized by P45 CYP3A4, 2C9 in the liver (active metabolites); terminal half-life 4 hr; peak 15-30 min; reduced absorption with high-fat meal; excreted in feces, urine

INTERACTIONS

 **Do not use with nitrates; fatal fall in B/P**

Increase: sildenafil levels—cimetidine, erythromycin, ketoconazole, itraconazole, antiretroviral protease inhibitors, tacrolimus

Decrease: sildenafil levels—CYP-450 inducers, rifampin, barbiturates, bosentan, carbamazepine, dexamethasone, phenytoin, nevirapine, rifabutin, troglitazone; antacids

Decrease: B/P—α-blockers, alcohol, amlodipine, angiotensin II receptor blockers

Drug/Food

Increase: product effect—grapefruit

Decrease: absorption—high-fat meal

NURSING CONSIDERATIONS

Assess:

- **Phosphodiesterase type 5 inhibitors with lopinavir/ritonavir (Kaletra):** assess for hypotension, visual changes, prolonged erection, syncope; give only 25 mg q48hr and monitor for adverse reactions • Erectile dysfunction prior to use

⚠ Any severe loss of vision while taking this or any similar products; products should not be used ⚠ Use of organic nitrates that should not be used with this product • **MI, sudden death, CV collapse:** those with an MI within 6 mo, resting hypotension <90/50, resting hypertension >170/100, fluid depletion should use this product cautiously; may occur right after sexual activity to days afterward • **Sickle cell crisis (vasoocclusive crisis):** when used for pulmonary hypertension, may require hospitalization

- Cardiac status, hemodynamic parameters, exercise tolerance in pulmonary hypertension: B/P, pulse

Evaluate:

- Therapeutic response: decreasing pulmonary hypertension/improved exercise tolerance; ability to perform sexually (male)

Teach patient/family:

- That product does not protect against sexually transmitted diseases, including HIV
- That product absorption is reduced with a high-fat meal
- That product should not be used with nitrates in any form
- That tabs may be split

⚠ To notify prescriber immediately and to stop taking product if vision/hearing loss occurs or erection lasts >4 hr • That erections lasting >4 hr may occur, report to prescriber immediately

- Do not use more than 100 mg in 24 hr

✳ Canada only Side effects: *italics* = common; **bold** = life-threatening ⚠
Nurse Alert

silodosin (Rx)

(si-lo'do-seen)

Rapaflo

Func. class.: Selective α_1 -adrenergic blocker, BPH agent *Chem. class.:* Sulfamoylphenethylamine derivative

ACTION:

Binds preferentially to α_{1A} -adrenoceptor subtype located mainly in the prostate

USES:

Symptoms of benign prostatic hyperplasia (BPH)

CONTRAINDICATIONS:

Hypersensitivity, renal failure, hepatic disease

Precautions: Pregnancy (B), breastfeeding, children, females, geriatric patients, renal/hepatic disease, hypotension, ocular surgery, orthostatic hypotension, prostate cancer, syncope

DOSAGE AND ROUTES

Calculator

• **Adult: PO** 8 mg/day with meal; max 8 mg/day

Renal dose

• **Adult: PO** CCr 30-49 ml/min, 4 mg/day; CCr <30 ml/min, not recommended

Available forms: Cap 4, 8 mg

Administer:

- Give with meal at same time each day
- Cap may be opened and sprinkled in applesauce

SIDE EFFECTS

CNS: Dizziness, headache, asthenia, insomnia, syncope

CV: Orthostatic hypotension

EENT: Nasal congestion, rhinorrhea, sinusitis

GI: Diarrhea, abdominal pain, jaundice

GU: Abnormal ejaculation, priapism, urinary incontinence

HEMA: Purpura

PHARMACOKINETICS

Decreased absorption with high-fat/high-calorie meal, half-life of metabolite 24 hr, metabolized in liver, excreted via urine, extensively protein bound (97%)

INTERACTIONS

Increase: silodosin effect—CYP3A4 inhibitors (clarithromycin, itraconazole, ritonavir, antiretroviral protease inhibitors, aprepitant, chloramphenicol, conivaptan, dalfopristin, danazol, delavirdine, efavirenz, fosaprepitant, fluconazole, fluvoxamine, imatinib, isoniazid, mifepristone, nefazodone, tamoxifen, telithromycin, troleandomycin, voriconazole, zileuton, zafirlukast)

Drug/Food

Increase: silodosin effect—grapefruit juice

Drug Lab/Test

Increase: LFTs

NURSING CONSIDERATIONS

Assess:

- **Prostatic hyperplasia:** change in urinary patterns at baseline and throughout treatment, testing for prostate cancer, before administration is recommended
- BUN, uric acid, urodynamic studies (urinary flow rates, residual volume)
- I&O ratios, weight daily; edema, report weight gain or edema
- B/P, monitor for orthostatic hypotension

Perform/provide:

- Storage at room temp; protect from light and moisture

Evaluate:

- Therapeutic response: decreased symptoms of BPH

Teach patient/family

- Not to drive, operate machinery until effect known
- **Not to use with grapefruit juice**
- To take with same meal each day

☛ Canada only Side effects: *italics* = common; **bold** = life-threatening ⚠

Barriere , Equaline Extra Strength Gas Relief, Gas Relief , Gas-Relief, Gas-X, Good Sense Ultra Strength Gas Relief, Mylanta Gas Relief, Mylanta Gas, Mylicon, Ovol , Phazyme, Top Care Gas Relief Extra Strength, Walgreens Gas Relief *Func. class.: Antiflatulent*

Do not confuse: **Mylicon**/Mylanta Gas

ACTION:

Disperses/prevents mucus gas pockets in GI system, lowers surface tension of gas bubbles

USES:

Flatulence

Unlabeled uses: Dyspepsia

CONTRAINDICATIONS:

Hypersensitivity, GI obstruction/perforation

Precautions: Pregnancy (C), abdominal pain, fistula, hiatal hernia

DOSAGE AND ROUTES

Calculator

- **Adult and child >12 yr: PO** 40-125 mg after meals and at bedtime prn, max 500 mg/day
- **Child 2-12 yr: PO** 40-50 mg after meals and at bedtime prn, max 240 mg/day
- **Child <2 yr: PO** 20 mg qid prn

Available forms: Chew tabs 40, 150, 166 mg; tabs 60, 80, 95, 125 mg; drops 20 mg/0.3 ml, 95 mg/1.425 ml; caps 95, 180 mg; soft gel caps 125, 180 mg; oral dissolving film 62.5 mg

Administer:

- After meals, at bedtime; shake susp well before giving; chew tabs should be chewed

SIDE EFFECTS

GI: Belching, rectal flatus, diarrhea

NURSING CONSIDERATIONS

Assess:

- Reason for excess gas production, decreased bowel sounds, recent surgery, other GI conditions

Evaluate:

- Therapeutic response: reduction of abdominal gas, discomfort

Teach patient/family:

- That tablets must be chewed
- To shake susp well before pouring

☼ Canada only Side effects: *italics* = common; **bold** = life-threatening ⚠
Nurse Alert

simvastatin (Rx)

(sim-va-sta'tin)

Zocor

Func. class.: Antilipemic

Chem. class.: HMG-CoA reductase inhibitor

Do not confuse: Zocor/Cozaar/Zoloft

ACTION:

Inhibits HMG-CoA reductase enzyme, which reduces cholesterol synthesis

USES:

As an adjunct for primary hypercholesterolemia (types IIa, IIb), isolated hypertriglyceridemia (Frederickson type IV) and type III hyperlipoproteinemia, CAD, heterozygous familial hypercholesterolemia

CONTRAINDICATIONS:

Pregnancy (X), breastfeeding, hypersensitivity, active hepatic disease

Precautions: Past hepatic disease, alcoholism, severe acute infections, trauma, severe metabolic disorders, electrolyte imbalances, Chinese patients

DOSAGE AND ROUTES

Calculator

- **Adult: PO** 20-40 mg/day in PM initially; usual range 5-40 mg/day in PM, max 40 mg/day for most patients, max 80 mg/day for patients taking 80 mg/day chronically without myopathy; dosage adjustments may be made in ≥ 4 -wk intervals; those taking verapamil and amiodarone max 20 mg/day; max < 80 mg for Chinese patients taking lipid-modifying niacin doses

- **Child/adolescent ≥ 10 yr including girls ≥ 1 yr postmenarche: PO** 10 mg in PM, range 10-40 mg/day

With diltiazem/verapamil/dronedarone

- **Adult: PO** 5-10 mg in PM, max 10 mg/day

With amiodarone, amlodipine, ranolazine

- **Adult: PO** 5-20 mg daily in evening, max 20 mg/day

Heterozygous familial hypercholesterolemia

- **Adolescent 10-17 yr: PO** 10 mg/day, max 40 mg/day

Available forms: Tabs 5, 10, 20, 40, 80 mg

Administer:

- Total daily dose in evening

SIDE EFFECTS

CNS: Headache, cognitive impairment

GI: Nausea, constipation, diarrhea, dyspepsia, flatus, abdominal pain, **liver dysfunction, pancreatitis**, hyperglycemia

INTEG: Rash, pruritus

MS: Muscle cramps, myalgia, **myositis, rhabdomyolysis**, myopathy

RESP: Upper respiratory tract infection

PHARMACOKINETICS

Metabolized in liver (active metabolites); >98% protein bound; excreted primarily in bile, feces (60%), kidneys (15%); peak 1-2 hr; half-life 3 hr

INTERACTIONS

⚠ Do not use with cycloSPORINE, gemfibrozil ⚠ **Increase:** effects of warfarin ⚠

Increase: rhabdomyolysis, myalgia; do not use concurrently—niacin, erythromycin, clofibrate, clarithromycin, ketoconazole, itraconazole, protease inhibitors, macrolide antibiotics, danazol, delavirdine, nefazodone, verapamil, diltiazem, amiodarone, azole antifungals, telithromycin, voriconazole

Increase: serum level of digoxin

Drug/Herb

Increase: effect—red yeast, rice

Decrease: effect—St. John's wort

Drug/Lab Test

Increase: CK, LFTs

NURSING CONSIDERATIONS

Assess:

- Diet history: fat consumption; baseline and lipid profile: LDL, HDL, TG, cholesterol
- Hepatic studies at baseline, after 4-6 wk, periodically thereafter; AST, ALT, may increase ⚠ **Rhabdomyolysis:** muscle tenderness, increased CPK levels (10× above upper normal limit); therapy should be discontinued, more

likely in those receiving >80 mg/day, first year of treatment, those ≥65 yr, females • Renal studies in patients with compromised renal systems: BUN, I&O ratio, creatinine

Perform/provide:

- Storage in cool environment in tight container protected from light

Evaluate:

- Therapeutic response: decrease in LDL, total cholesterol, triglycerides; increase in HDL; slowing CAD

Teach patient/family:

- That blood work will be necessary during treatment
- To report severe GI symptoms, headache
- That previously prescribed regimen will continue: low-cholesterol diet, exercise program • To notify prescriber if pregnancy is suspected or planned; pregnancy (X); not to breastfeed

🍁 Canada only Side effects: *italics* = common; **bold** = life-threatening ⚠️
Nurse Alert

sirolimus (Rx)

(seer-oh-lie'mus)

Rapamune

Func. class.: Immunosuppressant

Chem. class.: Macrolide

ACTION:

Produces immunosuppression by inhibiting T-lymphocyte activation and proliferation

USES:

Organ transplants to prevent rejection; recommended use is with cycloSPORINE and corticosteroids

CONTRAINDICATIONS:

Breastfeeding, hypersensitivity to this product, components of product

Precautions: Pregnancy (C), children <13 yr, severe cardiac/renal/hepatic disease; diabetes mellitus, hyperkalemia, hyperuricemia, hypertension, interstitial lung disease, hyperlipidemia

Black Box Warning:

Lymphomas, infection, other malignancies

DOSAGE AND ROUTES

Calculator

- **Adult/adolescent ≥ 40 kg:** PO 2 mg/day with 6 mg loading dose
- **Child >13 yr weighing <40 kg (88 lb):** PO 1 mg/m²/day, 3 mg/m² loading dose

Hepatic dose

- **Adult/child ≥ 13 yr/<40 kg:** PO reduce by 33% for maintenance dose (mild to moderate hepatic impairment); reduce by 50% for maintenance dose (severe hepatic impairment)

Available forms: Oral sol 1 mg/ml; tabs 0.5 mg, 1 mg, 2 mg

Administer:

- Prophylaxis for *Pneumocystis jiroveci* pneumonia for 1 yr after transplantation; prophylaxis for CMV is recommended for 90 days after transplantation in those at increased risk for CMV

- All medications PO if possible, avoid IM inj; bleeding may occur
- For 3 days before transplant surgery; patients should be placed in protective isolation; give at same time of day, give 4 hr after cycloSPORINE oral sol or caps; do not give with grapefruit juice • Use amber oral dose syringe and withdraw amount of oral sol needed from bottle, empty correct dose into plastic/glass container holding 60 ml of water/orange juice, stir vigorously and have patient drink at once, refill container with additional 120 ml water/orange juice, stir vigorously and have patient drink at once; if using a pouch, squeeze entire contents into container, follow above directions • Store protected from light, refrigerate; stable for 30 days after opening (sol)
- Do not crush, chew; store tabs at room temp

SIDE EFFECTS

CNS: Tremors, headache, insomnia, paresthesia, chills, fever

CV: Hypertension, atrial fibrillation, CHF, hypotension, palpitation, tachycardia, peripheral edema, thrombosis

EENT: Blurred vision, photophobia

GI: Nausea, vomiting, diarrhea, constipation, hepatotoxicity

GU: UTIs, albuminuria, hematuria, proteinuria, renal failure, nephrotic syndrome, increased creatinine

HEMA: Anemia, leukopenia, thrombocytopenia, purpura, pancytopenia

INTEG: Rash, acne, photosensitivity

META: Hyperglycemia, increased creatinine, edema, hypercholesterolemia, hyperlipemia, hypophosphatemia, weight gain, hypo/hyperkalemia, hyperuricemia, hypomagnesemia, hypertriglyceridemia

MS: Arthralgia

RESP: Pleural effusion, atelectasis, dyspnea, pneumonitis, pulmonary embolism/fibrosis

SYST: Lymphoma, exfoliative dermatitis

PHARMACOKINETICS

Rapidly absorbed; peak 1 hr single dose, 2 hr multiple dosing; protein binding 92%; extensively metabolized by CYP3A4 enzyme system, half-life 57-63 hr

INTERACTIONS

⚠ Increase: angioedema—ACE inhibitors, angiotensin-II–receptor antagonists, cephalosporins, iodine-containing radiopaque contrast media, neuromuscular blockers, NSAIDs, penicillins, salicylates, thrombolytics

Increase: blood levels—antifungals, calcium channel blockers, cimetidine, danazol, erythromycin, cycloSPORINE, metoclopramide, bromocriptine, HIV-protease inhibitors

Decrease: blood levels—carbamazepine, phenobarbital, phenytoin, rifamycin, rifapentine

Decrease: effect of vaccines

Drug/Herb

- St. John's wort: may decrease the effect of sirolimus

Drug/Food

- Alters bioavailability; use consistently with/without food; do not use with grapefruit juice

Drug/Lab Test

Increase: LFTs, alk phos, lipids, triglycerides, total cholesterol, BUN, creatinine, LDH, phosphate

Decrease: platelets, sodium

Increase or Decrease: magnesium, glucose, calcium

NURSING CONSIDERATIONS

Assess:

- Blood levels in patients who may have altered metabolism, trough level ≥ 15 ng/ml are associated with increased adverse reactions; monitor trough concentrations in all patients
- Creatinine/BUN, CBC, serum potassium
- **Lipid profile:** cholesterol, triglycerides; lipid-lowering agent may be needed

Black Box Warning:

Infection and development of lymphoma; only those experienced in immunosuppressant therapy and organ transplantation should use this product; use only in renal transplant

- **High risk:** those with Baniff grade 3 acute rejection or vascular rejection before cycloSPORINE withdrawal, dialysis dependent, creatinine >4.5 mg/dl, African American patient, re-transplants, multiorgan transplant, high panel of reactive antibodies
- **Pulmonary fibrosis, pulmonary effusion, pneumonitis:** dyspnea, cough, hypoxia; some fatal cases have occurred
- **Wound dehiscence and anastomotic disruption:** wound, vascular, airway, ureteral, biliary,

inhibition of growth factors; do not combine with corticosteroids • **Anaphylaxis, angioedema, exfoliative dermatitis:** more common when given with ACE inhibitors; do not use if a hypersensitivity reaction occurs  **Bone marrow suppression:** Hgb, WBC, platelets during treatment each mo; if leukocytes $<3000/\text{mm}^3$ or platelets $<100,000/\text{mm}^3$, product should be discontinued or reduced; decreased hemoglobin level  **Hepatotoxicity:** alk phos, AST, ALT, amylase, bilirubin, dark urine, jaundice, itching, light-colored stools; product should be discontinued

Evaluate:

- Therapeutic response: absence of graft rejection; immunosuppression with autoimmune disorders

Teach patient/family:

 To report fever, rash, severe diarrhea, chills, sore throat, fatigue; serious infections may occur; clay-colored stools, cramping (**hepatotoxicity**)

- To avoid crowds, persons with known infections to reduce risk for infection
- To use contraception before, during, for 12 wk after product discontinued; to avoid breastfeeding
- To use sunscreen, protective clothing to prevent burns, skin cancer
- Not to use with grapefruit juice
- To avoid vaccines
- That lifelong use will be required to prevent rejection
- That continuing follow-up exams and blood work will be required
- Not to get on skin
- How to use product
- To take with or without regard to food, at same time, consistently
- Take 4 hr after cycloSPORINE

🌿 Canada only Side effects: *italics* = common; **bold** = life-threatening 
Nurse Alert

sitaGLIPtin (Rx)

(sit-a-glip'tin)

Januvia

Func. class.: Antidiabetic, oral

Chem. class.: Dipeptidyl-peptidase-4 inhibitor (DPP-4 inhibitor)

ACTION:

Slows the inactivation of incretin hormones; improves glucose homeostasis, improves glucose-dependent insulin secretion, lowers glucagon secretions, and slows gastric emptying time

USES:

Type 2 diabetes mellitus as monotherapy or in combination with other antidiabetic agents

CONTRAINDICATIONS:

Hypersensitivity, diabetic ketoacidosis (DKA)

Precautions: Pregnancy (B), geriatric patients, GI obstruction, surgery, thyroid/renal/hepatic disease, trauma, breastfeeding, pancreatitis, hypercortisolism, hyperglycemia, hyperthyroidism, hypoglycemia, ileus, pituitary insufficiency, surgery, type 1 diabetes mellitus, diabetic ketoacidosis

DOSAGE AND ROUTES

Calculator

• **Adult: PO** 100 mg/day; may use with antidiabetic agents other than insulin

Renal dose

• **Adult: PO** CCr 30-50 ml/min, 50 mg daily; CCr <30 ml/min, 25 mg daily

Available forms: Tabs 25, 50, 100 mg

Administer:

- May be taken with/without food
- Do not split, crush, chew; swallow whole

SIDE EFFECTS

CNS: Headache

ENDO: Hypoglycemia

GI: Nausea, vomiting, abdominal pain, diarrhea, pancreatitis, constipation

MISC: Peripheral edema

SYST: Anaphylaxis, Stevens-Johnson syndrome, angioedema

PHARMACOKINETICS

Rapidly absorbed, excreted by the kidneys (unchanged 79%), terminal half-life 12.4 hr, peak 1-4 hr

INTERACTIONS

Increase: sitagliptin level—cimetidine, disopyramide

Increase: levels of digoxin

Increase: hypoglycemia—androgens, insulins, β -blockers, cimetidine, corticosteroids, salicylates, MAOIs, fibric acid derivatives, fluoxetine, sulfonylureas

Decrease: antidiabetic effect—thiazide diuretics, ACE inhibitors, protease inhibitors, sympathomimetics, aripiprazole, clozapine, olanzapine, quetiapine, risperidone, ziprasidone, phenytoin, fosphenytoin, phenothiazines, estrogens, progestins, oral contraceptives

Drug/Herb

Increase: antidiabetic effect—garlic, green tea, horse chestnut

Drug/Lab Test

Increase: creatinine, LFTs

NURSING CONSIDERATIONS

Assess:

• **Hypoglycemic reactions:** sweating, weakness, dizziness, anxiety, tremors, hunger; hyperglycemic reactions soon after meals  **Serious skin reactions:** swelling of face, mouth, lips, dyspnea, wheezing  **Pancreatitis:** severe abdominal pain, nausea, vomiting; discontinue product • **Renal studies:** BUN, creatinine during treatment, especially in geriatric patients or those with renal disease • Glycosylated hemoglobin A1c; monitor blood glucose (BG) as needed

Perform/provide:

• Conversion from other antidiabetic agents; change may be made with gradual dosage change • Storage in tight container at room temp

Evaluate:

- Therapeutic response: decrease in polyuria, polydipsia, polyphagia; clear sensorium; absence of dizziness; stable gait, blood glucose, A1c improvement

Teach patient/family:

- To perform regular self-monitoring of blood glucose using blood-glucose meter
- About the symptoms of hypo/hyperglycemia, what to do about each; to carry emergency ID
- To notify prescriber if pregnancy is planned, suspected
- That product must be continued on daily basis; about consequences of discontinuing product abruptly; to continue health regimen (diet, exercise)
- To avoid OTC medications, alcohol, digoxin, exenatide, insulins, nateglinide, repaglinide, and other products that lower blood glucose unless approved by prescriber
- That diabetes is a lifelong illness; that product is not a cure, only controls symptoms
- That all food included in diet plan must be eaten to prevent hypo/hyperglycemia
- To immediately notify prescriber of hypersensitivity reactions (rash, swelling of face, trouble breathing)

☼ Canada only Side effects: *italics* = common; **bold** = life-threatening ⚠
Nurse Alert

sodium bicarbonate (Rx, OTC)

Baking soda, Neut, Sellymin 

Func. class.: Alkalinizer

Chem. class.: NaHCO_3

ACTION:

Orally neutralizes gastric acid, which forms water, NaCl , CO_2 ; increases plasma bicarbonate, which buffers H^+ ion concentration; reverses acidosis IV

USES:

Acidosis (metabolic), cardiac arrest, alkalinization (systemic/urinary) antacid, salicylate poisoning

Unlabeled uses: Contrast media nephrotoxicity prevention

CONTRAINDICATIONS:

Metabolic/respiratory alkalosis, hypochloremia, hypocalcemia

Precautions: Pregnancy (C), children, CHF, cirrhosis, toxemia, renal disease, hypertension, hypokalemia, breastfeeding, hypernatremia, Bartter's syndrome, Cushing's syndrome, hyperaldosteronism

DOSAGE AND ROUTES

Calculator

Acidosis, metabolic (not associated with cardiac arrest)

- **Adult and child:** IV INF 2-5 mEq/kg over 4-8 hr depending on CO_2 , pH, ABGs

Cardiac arrest

- **Adult and child:** IV BOL 1 mEq/kg of 7.5% or 8.4% sol, then 0.5 mEq/kg q10min, then doses based on ABGs
- **Infant:** IV 1 mEq/kg over several min (use only the 0.5 mEq/ml [4.2%] sol for inj)

Alkalinization of urine

- **Adult:** PO 325 mg to 2 g qid or 48 mEq (4 g) then 12-24 mEq q4hr
- **Child:** PO 84-840 mg/kg/day (1-10 mEq/kg) in divided doses q4-6hr

Antacid

- **Adult: PO** 300 mg to 2 g chewed, taken with water daily-qid

Available forms: Tabs 300, 325, 600, 650 mg; inj 4.2%, 5%, 7.5%, 8.4%

Administer:

PO route

- Chew antacid tablets and drink 8 oz water
- Do not take antacid with milk because milk-alkali syndrome may result

Direct IV route

- Use for cardiac emergencies, not used often in cardiac arrest
- Use ampules or prefilled syringes only; give by rapid bolus dose; flush with NS before, after use

Continuous IV INF route

- Diluted in an equal amount of compatible sol given 2-5 mEq/kg over 4-8 hr, max 50 mEq/hr; slower rate in children • Extravasation with IV administration (tissue sloughing, ulceration, necrosis)

Y-site compatibilities: Acyclovir, amifostine, asparaginase, aztreonam, bivalirudin, bumetanide, ceFAZolin, cefepime, cefTAZidime, ceftizoxime, cefTRIAXone, chloramphenicol, cimetidine, cladribine, clindamycin, cyclophosphamide, cycloSPORINE, cytarabine, DAPTOmycin, DAUNOrubicin, dexamethasone sodium phosphated exmedetomidine, digoxin, DOCEtaxel, DOXOrubicin, enalaprilat, ertapenem, erythromycin, esmolol, etoposide, etoposide phosphate, famotidine, fentaNYL, filgrastim, fluconazole, fludarabine, furosemide, gallium nitrate, gemcitabine, gentamicin, granisetron, heparin, hydrocortisone sodium succinate, ifosfamide, indomethacin, insulin, ketorolac, labetalol, levofloxacin, lidocaine, linezolid, LORazepam, magnesium sulfate, melphalan, mesna, meperidine, methylPREDNISolone sodium succinate, metoclopramide, metoprolol, metroNIDAZOLE, milrinone, morphine, nafcillin, nitroglycerin, nitroprusside, PACLitaxel, palonosetron, pantoprazole, PEMEtrexed, penicillin G potassium, phenylephrine, phytonadione, piperacillin/tazobactam, potassium chloride, procainamide, propranolol, propofol, protamine, ranitidine, remifentanyl, tacrolimus, teniposide, thiotepa, ticarcillin/clavulanate, tirofiban, tobramycin, tolazoline, vasopressin, vit B complex with C, voriconazole

SIDE EFFECTS

CNS: Irritability, headache, confusion, stimulation, tremors, *twitching*, *hyperreflexia*, **tetany**, weakness, **seizures** of alkalosis

CV: Irregular pulse, **cardiac arrest**, water retention, edema, weight gain

GI: Flatulence, *belching*, *distention*

META: *Metabolic alkalosis*

MS: Muscular twitching, tetany, irritability

PHARMACOKINETICS

PO: Onset rapid, duration 10 min

IV: Onset 15 min, duration 1-2 hr, excreted in urine

INTERACTIONS

Increase: effects—amphetamines, mecamylamine, quinine, quinidine, pseudoephedrine, flecainide, anorexiant, sympathomimetics

Increase: sodium and decrease potassium—corticosteroids

Decrease: effects—lithium, chlorpropamide, barbiturates, salicylates, benzodiazepines, ketoconazole, corticosteroids

Drug/Lab Test

Increase: sodium, lactate

Decrease: potassium

NURSING CONSIDERATIONS

Assess:

- Respiratory and pulse rate, rhythm, depth, lung sounds; notify prescriber of abnormalities
- **Fluid balance** (I&O, weight daily, edema); notify prescriber of fluid overload; assess for edema, crackles, shortness of breath
- Electrolytes, blood pH, PO₂, HCO₃⁻, during treatment; ABGs frequently during emergencies
- Weight daily with initial therapy
- **Alkalosis:** irritability, confusion, twitching, hyperreflexia stimulation, slow respirations, cyanosis, irregular pulse
- **Milk-alkali syndrome:** confusion, headache, nausea, vomiting, anorexia, urinary stones, hypercalcemia
- For GI perforation secondary to carbon dioxide in GI tract; may lead to perforation if ulcer is severe enough

Evaluate:

- Therapeutic response: ABGs, electrolytes, blood pH, HCO₃⁻ WNL

Teach patient/family:

- Not to take antacid with milk because milk-alkali syndrome may result; not to use antacid for >2 wk ⚠️ To notify prescriber if indigestion accompanied by chest pain; trouble breathing; diarrhea; dark, tarry stools; vomit that looks like coffee grounds; swelling of feet/ankles
 - About sodium-restricted diet; to avoid use of baking soda for indigestion
-

🍁 Canada only Side effects: *italics* = common; **bold** = life-threatening ⚠️
Nurse Alert

sodium polystyrene sulfonate (Rx)

(po-lee-stye'reen)

Kayexalate, Kionex, SPS

Func. class.: Potassium-removing resin

Chem. class.: Cation exchange resin

ACTION:

Removes potassium by exchanging sodium for potassium in body, primarily in large intestine

USES:

Hyperkalemia in conjunction with other measures

CONTRAINDICATIONS:

Hypersensitivity to saccharin or parabens that may be in some products, GI obstruction, neonate (reduced gut motility)

Precautions: Pregnancy (C), geriatric patients, renal failure, CHF, severe edema, severe hypertension, sodium restriction, constipation, GI bleeding, hypocalcemia

DOSAGE AND ROUTES

Calculator

• **Adult:** **PO** 15 g daily-qid; **RECT** enema 30-50 g q1-2hr initially prn then q6hr prn

• **Child (unlabeled):** **PO** 1 g/kg q6hr prn; **RECT** 1 g/kg q2-6hr prn

Available forms: Powder for susp 453.6 g, 454 g; oral susp 15 g/60 ml

Administer:

PO route

• **Powdered resin:** Each dose of the powdered resin is usually given orally as a suspension in water or in a syrup; usually, the amount of fluid ranges from 20 to 100 ml, depending on the dosage, or 3–4 ml/g of resin; suspensions should be freshly prepared and not stored for >24 hr; the suspension may be also be introduced into the stomach via a tube, or the powdered resin may be mixed with the patient's food; the powder should not be mixed with foods or liquids that

contain a large amount of potassium (bananas or orange juice)

Rectal route

- Precede retention enema with a cleansing enema
- Instruct patient to lie down on left side with lower leg extended and the upper leg flexed for support, or place the patient in the knee–chest position; gently insert a soft, large (28 Fr) rubber tube into the rectum for a distance of about 20 cm; the tip should be well into the sigmoid colon; tape the tube in place; suspend the sodium polystyrene sulfonate powdered resin in 100 ml of an aqueous vehicle (water or sorbitol) that has been warmed to body temperature and introduce through the tube by gravity; the particles should be kept suspended by stirring the suspension during administration; alternatively, 120–180 ml of a commercially available suspension may be administered as a retention enema after the suspension has been warmed to body temperature; following administration, flush the tube with 50–100 ml of fluid and clamp the tube and leave in place; the suspension should be retained in the colon for at least 30–60 min or for several hours, if possible
- After several hours have passed, administer a cleansing enema using a non–sodium-containing solution at body temperature; up to 2 quarts of fluid may be necessary; drain fluid through a Y-tube connection; observe the drainage if sorbitol was used

SIDE EFFECTS

GI: Constipation, anorexia, nausea, vomiting, diarrhea (sorbitol), fecal impaction, gastric irritation

META: Hypocalcemia, hypokalemia, hypomagnesemia, sodium retention

INTERACTIONS

Increase: hypokalemia—loop diuretics, cardiac glycosides

Increase: metabolic alkalosis—magnesium/calcium antacids

 **Increase:** colonic necrosis—sorbitol; do not use concurrently

Decrease: effect of—lithium, thyroid hormones

NURSING CONSIDERATIONS

Assess:

- **Hyperkalemia:** confusion, dyspnea, weakness, dysrhythmias; ECG for spiked T waves, depressed ST segments, prolonged QT and widening QRS complex

- Bowel function daily; note consistency of stools, times/day
- **Hypotension:** confusion, irritability, muscular pain, weakness
- **Electrolytes:** serum potassium, calcium, magnesium, sodium; acid-base balance • I&O ratio, weight daily; crackles, dyspnea, jugular venous distension, edema
- **Digoxin toxicity** (nausea, vomiting, blurred vision, anorexia, dysrhythmias) in those receiving digoxin

Perform/provide:

- Storage of freshly prepared sol 24 hr at room temp

Evaluate:

- Therapeutic response: potassium level 3.5-5 mg/dl

Teach patient/family:

- About reason for medication and expected results
- To follow a low potassium diet, provide sample diet
- To avoid laxatives, antacids, electrolyte-based products unless approved by prescriber

🌿 Canada only Side effects: *italics* = common; **bold** = life-threatening ⚠️
Nurse Alert

solifenacin (Rx)

(sol-i-fen'a-sin)

VESicare

Func. class.: Urinary antispasmodic, anticholinergic

Chem. class.: Anti-muscarinic

ACTION:

Relaxes smooth muscles in urinary tract by inhibiting acetylcholine at postganglionic sites

USES:

Overactive bladder (urinary frequency, urgency, incontinence)

CONTRAINDICATIONS:

Hypersensitivity, uncontrolled closed-angle glaucoma, urinary retention, gastric retention

Precautions: Pregnancy (C), breastfeeding, children, geriatric patients, renal/hepatic disease, controlled closed-angle glaucoma, bladder outflow obstruction, GI obstruction, decreased GI motility, history of QT prolongation

DOSAGE AND ROUTES

Calculator

- **Adult: PO** 5 mg/day, max 10 mg/day

Renal/hepatic dose

- **Adult: PO** (Child-Pugh B) max 5 mg/day; CCr ≤ 30 ml/min, 5 mg/day

Available forms: Tabs 5, 10 mg

Administer:

PO route

- Without regard to meals
- Swallow product whole with water, liquid

SIDE EFFECTS

CNS: Anxiety, paresthesia, fatigue, *dizziness*, headache, confusion

CV: Chest pain, hypertension, **QTc prolongation**, peripheral edema

EENT: *Vision abnormalities, xerophthalmia*, nasal dryness

GI: Nausea, vomiting, anorexia, abdominal pain, constipation, dry mouth, dyspepsia

GU: Dysuria, urinary retention, frequency, UTI

INTEG: Rash, pruritus, **angioedema**, exfoliative dermatitis, erythema multiforme

MISC: Hyperthermia

RESP: Bronchitis, cough, pharyngitis, upper respiratory tract infection

PHARMACOKINETICS

90% absorbed; 98% protein bound; extensively metabolized by CYP3A4; excreted in urine 69% (metabolites), feces 22%; terminal half-life 45-68 hr

INTERACTIONS

Increase: QT prolongation—Class IA, III antidysrhythmias

Increase: CNS depression—sedatives, hypnotics, benzodiazepines, opioids

Increase: effects—CYP3A4 inhibitors (ketoconazole, clarithromycin, diclofenac, doxycycline, erythromycin, isoniazid, nefazodone, propofol, protease inhibitors, verapamil), max dose 5 mg

Decrease: effects—CYP3A4 inducers (carbamazepine, nevirapine, phenobarbital, phenytoin)

Drug/Herb

Decrease: effects—St. John's wort

Drug/Food

Increase: effect—grapefruit juice

NURSING CONSIDERATIONS

Assess:

- **Urinary patterns:** distention, nocturia, frequency, urgency, incontinence

- **Allergic reactions:** rash

- **Angioedema:** of the face, lips, tongue, larynx

⚠️ **Cardiac patients:** monitor ECG for QTc prolongation; avoid products that increase QT prolongation

Evaluate:

- Decreasing dysuria, frequency, nocturia, incontinence

Teach patient/family:

- To avoid hazardous activities because dizziness may occur

- That constipation, blurred vision may occur, to notify prescriber if abdominal pain with constipation occurs • To take without regard to food
 - To swallow tab whole, do not split, crush, chew
 - To call prescriber if severe abdominal pain or constipation lasts for ≥ 3 days
 - That heat prostration may occur if used in hot environment, sweating is decreased
 - About **anticholinergic effects**: blurred vision, constipation, urinary retention, hyperthermia
-

🍁 Canada only Side effects: *italics* = common; **bold** = life-threatening ⚠️

somatropin (Rx)

(soe-ma-troe'pin)

Genotropin, Humatrope, Norditropin, Norditropin Flexpro, Nutropin, Nutropin AQ, Omnitrope, Saizen, Serostim, Tev-Tropin, Zorbtive *Func. class.:* Pituitary hormone

Chem. class.: Growth hormone

Do not confuse: somatropin/SUMAtriptan/somatrem

ACTION:

Stimulates growth; somatropin is similar to natural growth hormone; both preparations were developed with the use of recombinant DNA

USES:

Pituitary growth hormone deficiency (hypopituitary dwarfism), children with human growth hormone deficiency/growth failure, AIDS wasting syndrome, cachexia, adults with somatropin deficiency syndrome (SDS), short stature in Noonan syndrome, SHOX deficiency, Turner's syndrome, Prader-Willi syndrome

CONTRAINDICATIONS:

Hypersensitivity to benzyl alcohol, creosol; closed epiphyses, intracranial lesions, acute respiratory failure, Prader-Willi syndrome with obesity, trauma

Precautions: Pregnancy (C), breastfeeding, newborn, geriatric patients, diabetes mellitus, hypothyroidism, prolonged treatment in adults, scoliosis, sleep apnea, chemotherapy, respiratory disease, glycerin hypersensitivity (with formulations that contain these products)

DOSAGE AND ROUTES

Calculator

Genotropin

- **Child:** SUBCUT 0.16-0.24 mg/kg/wk divided into 6 or 7 daily inj, give in abdomen, thigh, buttocks
- **Adult:** SUBCUT 0.04-0.08 mg/kg/wk divided into 6-7 daily doses

Humatrope

- **Adult:** IM 0.006 international units/kg/day, max 0.0125 units/kg/day

- **Child:** SUBCUT/IM 0.18 mg/kg divided into equal doses either on 3 alternate days or 6×/wk, max weekly dose 0.3 mg/kg

Nutropin/nutropin AQ (growth hormone deficiency)

- **Child:** SUBCUT 0.3 mg/kg/wk

Serostim

- **Adult:** SUBCUT at bedtime >55 kg, 6 mg; 45-55 kg, 5 mg; 35-45 kg, 4 mg

Norditropin

- **Child:** SUBCUT 0.024-0.034 mg/kg 6-7×/wk

Accretropin

- **Child:** SUBCUT 0.18-0.3 mg/kg/wk divided into 6 or 7 equal daily inj

Replacement of GH in GH deficiency

- **Adult:** SUBCUT (Saizen) 0.005 mg/kg/day; may increase after 4 wk to max 0.01 mg/kg/day

Available forms: Powder for inj (lyophilized) 1.5 mg (4 international units/ml), 4 mg (12 international units/vial), 5 mg (13 international units/vial), 5 mg (15 international units/vial) rDNA origin, 5.8 mg (15 international units/ml), 6 mg (18 international units/ml), 8 mg (24 international units/vial), 10 mg (26 international units/vial); inj 10 mg (30 international units/vial), 5 mg/1.5 ml, 10 mg/1.5 ml, 15 mg/1.5 ml

Administer:

- Give IM or subcut, do not use IV
- Discontinue therapy if final height is achieved or epiphyseal fusion occurs
- Visually inspect parenteral products for particulate matter and discoloration

Reconstitution and storage

Accretropin:

- No reconstitution needed; before use, swirl the contents of the vial with a gentle rotary motion, do not shake; the solution should be clear • Store unopened vials refrigerated, do not freeze, protect from light; once opened, the vial may be stored refrigerated ≤14 days

Genotropin:

- This product is supplied as a powder, filled in a two-chamber cartridge with the active substance in the front chamber and the diluent in the rear chamber; the product is available in a 5-mg cartridge (green tip) and a 12-mg cartridge (purple tip); the 5-and 12-mg cartridges may be used with the Genotropin Pen or the

Genotropin Mixer; genotropin is also available, in various doses ranging from 0.2 mg to 2 mg, in single use, auto-mix devices called Genotropin Miniquicks

- **Cartridges:** Store cartridges refrigerated before reconstitution, do not freeze; protect from light; a reconstitution device supplied by the manufacturer is used to mix the powder and the diluent; after the powder and diluent are mixed, gently tip the cartridge upside down a few times until powder is completely dissolved; *do not shake*; this can cause denaturation of the protein; if the solution is cloudy, do not use; following reconstitution, the 5-mg cartridge contains a 5 mg/ml solution and the 12 mg cartridge contains a 12 mg/ml solution; the 5-mg and 12-mg cartridges contain overfill; the cartridges contain diluent with preservative (m-cresol) and may be stored refrigerated ≤ 28 days after reconstitution; do not use the 5-mg and 12-mg cartridges in patients with m-cresol hypersensitivity
- **Genotropin Miniquicks:** After dispensing but before reconstitution, store at ≤ 77 degrees ≤ 3 months; a reconstitution device supplied by the manufacturer is used to mix the powder and diluent; ten different strengths are available that each deliver a fixed volume of 0.25 ml; this product contains a diluent with no preservative, refrigerate after reconstitution and use within 24 hr; use the reconstituted solution only once and discard any remaining solution

Humatrope:

- Before reconstitution, store refrigerated
- **Vials:** Reconstitute each 5-mg vial with 1.5–5 ml of the supplied diluent (contains m-cresol as a preservative) or bacteriostatic water for injection (contains benzoyl alcohol as a preservative); sterile water for injection may be used for patients with a hypersensitivity to m-cresol and benzoyl alcohol; direct the liquid against the glass vial wall; swirl vial with a gentle rotary motion until contents are dissolved completely; do not shake; if the solution is cloudy, do not use; small, colorless particles may be present after refrigeration, this is not unusual for solutions containing proteins; vials reconstituted with the diluent or bacteriostatic water are stable for 14 days when stored refrigerated; for vials reconstituted with sterile water, use the vial only once and discard the unused portion; if not used immediately, refrigerate and use within 24 hr; avoid freezing reconstituted solutions
- **Cartridges:** Reconstitute cartridges using *only* the supplied diluent syringe; the cartridges are designed for use only with the

Humatrope injection device; once reconstituted, the cartridges are stable for up to 28 days when stored refrigerated; store the injection device without the needle attached; avoid freezing reconstituted solutions

Norditropin:

- Do not use reconstituted solution if it is cloudy or contains particulate matter
- Before use, store refrigerated
- Reconstitution of the cartridges is not required; the cartridge is intended for use only with the NordiPen injector; a prefilled, disposable pen, NordiFlex Pen injector, is also available; each cartridge size (5 mg, 10 mg, or 15 mg per 1.5-ml cartridge) has a color-coded corresponding pen, which is graduated to deliver an appropriate dose based on the solution's concentration; NordiPen and NordiFlex Pen allow administration of a minimum 0.25-mg dose to a maximum 4.5-mg dose, depending on cartridge concentrations; follow directions provided in NordiPen injector instruction booklet
- After a cartridge has been inserted into the NordiPen injector or once a NordiFlex pen is in use, the pen should be stored refrigerated and used within 4 wk; alternatively, the 5-mg and 10-mg cartridges may be stored in the pen at room temperature, no higher than 77 degrees, for up to 3 wk; NovoFine needles are recommended for administration; wipe the stopper of the pen cartridge with rubbing alcohol

Nutropin:

- Before reconstitution, store refrigerated
- Reconstitute each 5-mg vial with 1–5 ml bacteriostatic water for injection (benzyl alcohol preserved) and each 10-mg vial with 1–10 ml of bacteriostatic water for injection (benzyl alcohol preserved); if using for newborns, reconstitute with sterile water for injection; direct the liquid against the glass vial wall; swirl vial with a gentle rotary motion until contents are dissolved completely; do not shake; if the solution is cloudy after reconstitution or refrigeration, do not use; small, colorless particles may be present after refrigeration, this is not unusual for solutions containing proteins
- Solutions reconstituted with bacteriostatic water for injection are stable for 14 days refrigerated
- Solutions reconstituted with sterile water for injection should be used immediately and only once; discard any unused portions; avoid freezing reconstituted solutions

Nutropin AQ:

- Does not require reconstitution; solution should be clear; small, colorless particles may be present after refrigeration, this is not unusual for solutions containing proteins; allow vial or pen cartridge to come to room temperature, and gently swirl; if solution is cloudy, do not use
- **Vials:** Before inserting needle, wipe the vial septum with rubbing alcohol or antiseptic solution to prevent contamination by microorganisms that may be introduced by repeated needle insertions; administer using sterile disposable syringes and needles; use syringes with small enough volume that the prescribed dose may be drawn from the vial with reasonable accuracy
- **Pen cartridge:** Two strengths are available, 10 mg and 20 mg; intended for use only with Nutropin AQ Pen; each pen and cartridge are color coded to ensure accurate placement of the 10-mg or 20-mg cartridge into the appropriate pen; do not use the 20-mg cartridge in the pen intended for the 10-mg cartridge, and vice versa; wipe septum of pen cartridge with rubbing alcohol or antiseptic solution to prevent contamination by microorganisms that may be introduced by repeated needle insertions; administer using sterile, disposable needles; follow the directions provided in the Nutropin AQ Pen Instructions for Use; the Nutropin AQ 10 pen allows administration of a minimum 0.1-mg dose to a maximum 4-mg dose, in 0.1-mg increments; the Nutropin AQ 20 pen allows administration of a minimum 0.2-mg dose to a maximum 8-mg dose, in 0.2-mg increments
- **Prefilled device:** A prefilled multidose, dial-a-dose device is available in 3 strengths; administer using disposable needles; follow the directions provided in the Nutropin AQ NuSpin Instructions for Use; the Nutropin AQ Nuspin 5 allows administration of a minimum dose of 0.05 mg to a maximum dose of 1.75 mg, in increments of 0.05 mg; the Nutropin AQ Nuspin 10 allows administration of a minimum dose of 0.1 mg to a maximum dose of 3.5 mg, in increments of 0.1 mg; the Nutropin AQ Nuspin 20 allows administration of a minimum dose of 0.2 mg to a maximum dose of 7 mg, in increments of 0.2 mg
- After initial use, vials, cartridges, and prefilled devices are stable for 28 days refrigerated; avoid freezing; vials, cartridges, and prefilled devices are light sensitive; protect from light

Omnitrope:

- Before reconstitution, store vials refrigerated; store in the carton; Omnitrope is sensitive to light
- **Vials:** Reconstitute the vial with diluent provided using a sterile disposable syringe; swirl the vial gently, but do not shake; if the solution

is cloudy after reconstitution, the contents must not be injected; after reconstitution, the 1.5-mg vial may be refrigerated ≤ 24 hr; the 1.5-mg vial does not contain a preservative and should only be used once; discard any remaining solution; the 5.8-mg vial diluent contains benzoyl alcohol as a preservative; after reconstitution, the contents must be used within 3 wk; after the first injection, store the 5.8-mg vial in the carton, to protect from light, in the refrigerator; avoid freezing • **Omnitrope Pen 5 cartridge:** Each 5-mg cartridge must be inserted into the Omnitrope Pen 5 delivery system; follow the directions provided in the Omnitrope Instructions for Use; the cartridge contains benzoyl alcohol as a preservative; after the first use, store refrigerated ≤ 28 days; protect from light, avoid freezing • **Omnitrope Pen 10 cartridge:** Each 10-mg cartridge must be inserted into the Omnitrope Pen 10 delivery system; follow the directions provided in the Omnitrope Instructions for Use; after the first use, store refrigerated ≤ 28 days; protect from light, avoid freezing

Saizen:

- Before reconstitution, store at room temperature
- **Vials:** Reconstitute each 5-mg vial with 1–3 ml bacteriostatic water for injection; reconstitute each 8.8-mg vial with 2–3 ml bacteriostatic water for injection (benzoyl alcohol preserved); in patients with hypersensitivity to benzyl alcohol, the vials may be mixed with sterile water for injection; Direct the liquid against the glass vial wall; swirl vial with a gentle rotary motion until contents are dissolved completely; do not shake; the solution should be clear; if it is cloudy immediately after reconstitution or refrigeration, do not use; small colorless particles may be present after refrigeration, this is not unusual for solutions containing proteins; after reconstitution, store vials mixed with bacteriostatic water for injection refrigerated and use within 14 days; for vials mixed with sterile water for injection, the solution should be used immediately, and any unused portion should be discarded; avoid freezing • **Cartridges:** Available in 4 mg and 8.8 mg click.easy cartridges for use in a compatible injection device; a reconstitution device supplied by the manufacturer is used to mix the Saizen with accompanying diluent containing metacresol; cartridges reconstituted with the diluent containing metacresol are stable under refrigeration for ≤ 21 days; avoid freezing

Serostim:

• Before reconstitution, store vials and diluent at room temperature (15–30 degrees C; 59–86 degrees F) • **Vials:** Reconstitute the 5-mg or 6-mg vials with 0.5–1 ml of supplied diluent (sterile water for injection); reconstitute the 4-mg vial with 0.5–1 ml of bacteriostatic water for injection (benzoyl alcohol preserved) and the 8.8-mg vial with 1–2 ml of bacteriostatic water for injection (benzoyl alcohol preserved); direct the liquid against the glass vial wall; swirl vial with a gentle rotary motion until contents are dissolved completely; do not shake; the solution should be clear; if it is cloudy immediately after reconstitution or refrigeration, do not use; small colorless particles may be present after refrigeration, this is not unusual for solutions containing proteins; if reconstituted with sterile water for injection, use within 24 hr; if reconstituted with bacteriostatic water for injection (benzoyl alcohol preserved), the solution is stable for up to 14 days under refrigeration (2–8 degrees C or 36–46 degrees F); avoid freezing • **Cartridges:** Available in 8.8-mg click.easy cartridges for use in a compatible injection device; a reconstitution device is supplied by the manufacturer and is used to mix the Serostim with accompanying diluent containing metacresol; after reconstitution, cartridges are stable under refrigeration for ≤21 days; avoid freezing

Serostim lq:

• Before use, store refrigerated
• Available in 6-mg single-use cartridges that do not require reconstitution; administer using sterile disposable syringes and needles • Bring to room temperature before use; discard single-use cartridge after use, even if some drug remains; discard cartridges after the expiration date stated on the product; do not freeze; protect from light

Tev-tropin:

• Before reconstitution, store refrigerated
• Reconstitute each 5-mg vial with 1–5 ml bacteriostatic 0.9% sodium chloride (benzoyl alcohol preserved) for injection; direct the liquid against the glass vial wall; swirl vial with a gentle rotary motion until contents are dissolved completely; do not shake; the solution should be clear; if it is cloudy immediately after reconstitution, do not inject; small, colorless particles may be present after refrigeration, this is not unusual for solutions containing proteins; when administering to newborns, reconstitute with sterile normal saline for

injection that is unpreserved • Solution reconstituted with bacteriostatic 0.9% sodium chloride is stable for 14 days when stored refrigerated; solution reconstituted with sterile normal saline should be used only once; discard any remaining solution; avoid freezing

Valtropin:

- Before dispensing, store vials and diluent refrigerated; after dispensing to patients, may be stored at or below 77 degrees F for up to 3 mo • Reconstitute each 5-mg vial with the entire contents of the accompanying diluent, which contains metacresol as a preservative; if patients are allergic to metacresol, sterile water for injection may be used; direct the liquid against the glass vial wall; swirl vial with a gentle rotary motion until contents are dissolved completely; do not shake; the solution should be clear, if it is cloudy or contains particulate matter immediately after reconstitution or after refrigeration, do not inject; the final concentration of the reconstituted solution is 3.33 mg/ml • After reconstitution with the provided diluent, solutions may be stored refrigerated for up to 14 days; after reconstitution with sterile water for injection, use only one dose of Valtropin per vial and discard the unused portion if not used immediately

Zorbtive:

- Unreconstituted vials of drug and diluent may be stored at room temperature until expiration date • Reconstitute each vial of 4 mg, 5 mg, or 6 mg with 0.5–1 ml sterile water for injection, USP; reconstitute each 8.8 mg with 1–2 ml bacteriostatic water for injection (0.9% benzyl alcohol preserved); in newborns or patients with a benzoyl alcohol hypersensitivity, sterile water for injection may be used; review manufacturer's labeling for expected concentrations; direct the liquid against the glass vial wall; swirl vial with a gentle rotary motion until contents are dissolved completely; do not shake; the solution should be clear, if it is cloudy after reconstitution or refrigeration, do not use; small colorless particles may be present after refrigeration, this is not unusual for solutions containing proteins • After reconstitution with sterile water for injection, use the solution immediately and discard any unused portion; when using bacteriostatic water for injection, reconstituted solutions are stable for up to 14 days refrigerated; avoid freezing vials of drug or diluent or reconstituted vials

IM route

- Inject deeply into a large muscle; aspirate before injection; rotate injection sites

daily

SUBCUT route

- Volumes >1 ml of reconstituted solution is not recommended, do not inject intradermally • Allow refrigerated solutions to come to room temperature before injection
- Subcutaneous injections may be given in the thigh, buttocks, or abdomen; rotate injection sites daily

SIDE EFFECTS

CNS: Headache, growth of intracranial tumor, fever, aggressive behavior

ENDO: Hyperglycemia, ketosis, hypothyroidism, thyroid hormone replacement may be needed

GI: Nausea, vomiting, **pancreatitis**

GU: *Hypercalciuria*

INTEG: Rash, urticaria, pain; inflammation at inj site, hematoma

MS: Tissue swelling, joint and muscle pain

SYST: **Antibodies to growth hormone**

PHARMACOKINETICS

Half-life 15-60 min, duration 7 days, metabolized in liver

INTERACTIONS

Increase: epiphyseal closure—androgens, thyroid hormones

Decrease: growth—glucocorticosteroids

Decrease: insulin, antidiabetic effect—dosage adjustment may be needed

Drug/Lab Test

Increase: glucose, urine glucose

Decrease: glucose thyroid hormones

NURSING CONSIDERATIONS

Assess:

- Signs/symptoms of diabetes
- Growth hormone antibodies if patient fails to respond to therapy
- Thyroid function tests: T₃, T₄, T₇, TSH to identify hypothyroidism • **Allergic reaction:** rash, itching, fever, nausea, wheezing

- **Hypercalciuria:** urinary stones; groin, flank pain; nausea, vomiting, urinary frequency, hematuria, chills • Growth rate, bone age of child at intervals during treatment

- **Respiratory infection:** in those with Prader-Willi syndrome, may have sleep apnea, upper airway obstruction; discontinue if obstruction occurs • Rapid growth: assess for slipped capital femoral epiphysis may also occur in endocrine disorders • Monitor ophthalmologic status baseline and periodically; intracranial hypertension may occur

Perform/provide:

- Storage in refrigerator for <1 mo; if reconstituted, <1 wk; do not use discolored or cloudy sol

Evaluate:

- Therapeutic response: growth in children

Teach patient/family:

- That treatment may continue for years; that regular assessments are required
- To maintain a growth record; to report knee/hip pain or limping
- That treatment is very expensive
- Identify creosol or benzyl-alcohol hypersensitivity before use

☼ Canada only Side effects: *italics* = common; **bold** = life-threatening ⚠
Nurse Alert

sotalol (Rx)

(sot'ah-lahl)

Betapace, Betapace AF, Sorine

Func. class.: Antidysrhythmic group III

Chem. class.: Nonselective β -blocker

ACTION:

Blockade of β_1 - and β_2 -receptors leads to antidysrhythmic effect, prolongs action potential in myocardial fibers without affecting conduction, prolongs QT interval, no effect on QRS duration

USES:

Life-threatening ventricular dysrhythmias; Betapace AF: to maintain sinus rhythm with symptomatic atrial fibrillation/flutter

Unlabeled uses: Atrial fibrillation prophylaxis, cardiac surgery, PSVT, Wolff-Parkinson-White (WPW) syndrome

CONTRAINDICATIONS:

Hypersensitivity to β -blockers, cardiogenic shock, heart block (2nd/3rd degree), sinus bradycardia, CHF, bronchial asthma, $\text{CCr} < 40 \text{ ml/min}$

Black Box Warning:

Congenital or acquired long QT syndrome, hypokalemia

Precautions: Pregnancy (B), breastfeeding, major surgery, diabetes mellitus, renal/thyroid disease, COPD, well-compensated heart failure, CAD, nonallergic bronchospasm, electrolyte disturbances, bradycardia, peripheral vascular disease

Black Box Warning:

Cardiac dysrhythmias, torsades de pointes, ventricular dysrhythmias, ventricular fibrillation

DOSAGE AND ROUTES

Calculator

- **Adult: PO** initial 80 mg bid, may increase to 240-320 mg/day
- **Child >2 yr with normal renal function (unlabeled): PO** 30 mg/m² tid, adjust dose gradually after $\geq 36 \text{ hr}$ to max 60 mg/m² tid

Renal dose

- **Adult: PO** $\text{CCr} 30\text{-}60 \text{ ml/min}$, give q24hr; $\text{CCr} 10\text{-}29 \text{ ml/min}$, give q36-48hr; $\text{CCr} < 10 \text{ ml/min}$, individualize dose

Life-threatening ventricular dysrhythmias

- **Adult (CCR 40-60 ml/min):** IV 75 mg over 5 hr daily, monitor QTc at end of each inf during initiation and titration; 80 mg PO = 75 mg IV; 120 mg PO = 112.5 mg IV; 160 mg PO = 150 mg IV

Betapace AF

- **Adult: PO** initial 80 mg bid, titrate upward to 120 mg bid during initial hospitalization

Renal dose (Betapace AF)

- **Adult: PO** CCr >60 ml/min, give q12hr; CCr 40-60 ml/min, give q24hr; CCr <40 ml/min, do not use

Available forms: Tabs 80, 120, 160, 240 mg; (Betapace AF) 80, 120, 160 mg; inj 150 mg/10 ml (15 mg/ml)

Administer:

PO route

- Before, at bedtime; tablet may be crushed or swallowed whole; give 1 hr before or 2 hr after meals • Reduced dosage in renal dysfunction
- **Betapace and Betapace AF are not interchangeable**
- Do not give within 2 hr of antacids

IV route

- Dilute to vol of either 120 ml or 300 ml with D₅W, LR
- **75 mg dose:** withdraw 6 ml sotalol inj (90 mg), add 114 ml dilute to make 120 ml (0.75 mg/ml) or withdraw 6 ml sotalol inj (90 mg), add 294 ml dilute to make 300 ml (0.3 mg/ml) • **112.5 mg dose:** withdraw 9 ml sotalol inj (135 mg), add 111 ml dilute to make 120 ml (1.125 mg/ml); or withdraw 9 ml sotalol (135 mg), add 291 ml dilute to make 300 ml (0.45 mg/ml) • **150 mg dose:** withdraw 12 ml of sotalol (180 mg), add 108 ml to make 120 ml (1.5 mg/ml) or withdraw 12 ml sotalol (180 mg), add 288 ml to make 300 ml (0.6 mg/ml) • Use inf pump and infuse 100 or 250 ml over 5 hr at a constant rate

SIDE EFFECTS

CNS: Dizziness, mental changes, drowsiness, fatigue, headache, catatonia, depression, anxiety, nightmares, paresthesia, lethargy, insomnia, decreased concentration

CV: **Prodysrhythmia, prolonged QT**, orthostatic hypotension, bradycardia, **CHF**, chest pain, ventricular dysrhythmias, AV block, peripheral vascular

insufficiency, palpitations, torsades de pointes; **life-threatening ventricular dysrhythmias (Betapace AF)**

EENT: Tinnitus, visual changes, sore throat, double vision; dry, burning eyes

GI: Nausea, vomiting, diarrhea, dry mouth, flatulence, constipation, anorexia, indigestion

GU: Impotence, dysuria, ejaculatory failure, urinary retention

HEMA: **Agranulocytosis, thrombocytopenic purpura (rare), thrombocytopenia, leukopenia**

INTEG: Rash, alopecia, urticaria, pruritus, fever, diaphoresis

MISC: Facial swelling, decreased exercise tolerance, weight change, Raynaud's disease

MS: Joint pain, arthralgia, muscle cramps, pain

RESP: **Bronchospasm**, dyspnea, wheezing, nasal stuffiness, pharyngitis

PHARMACOKINETICS

PO: Onset 1-2 hr, peak 2-4 hr, duration 8-12 hr, half-life 12 hr, excreted unchanged in urine, crosses placenta, excreted in breast milk, protein binding 0%

INTERACTIONS

Black Box Warning:

Increase: QT prolongation—class IA/III antidysrhythmics, some phenothiazines, β agonists, local anesthetics, tricyclics, haloperidol, chloroquine, droperidol, pentamidine; CYP3A4 inhibitors (amiodarone, clarithromycin, erythromycin, telithromycin, troleandomycin), arsenic trioxide, levomethadyl; CYP3A4 substrates (methadone, pimozide, QUetiapine, quiNIDine, risperiDONE, ziprasidone)

Increase: hypoglycemia effect—insulin

Increase: effects of lidocaine

Increase: hypotension—diuretics, other antihypertensives, nitroglycerin

Decrease: β -blocker effects—sympathomimetics

Decrease: bronchodilating effects of theophylline, β_2 -agonists

Decrease: hypoglycemic effects of sulfonylureas

Drug/Lab Test

False increase: urinary catecholamines

Interference: glucose, insulin tolerance tests

NURSING CONSIDERATIONS

Assess:

- I&O, weight daily; edema in feet, legs daily
- B/P, pulse q4hr; note rate, rhythm, quality
- Potassium, magnesium levels

Black Box Warning:

Requires a specialized care setting: for a minimum of at least 3 days on maintenance dose with continuous ECG monitoring, creatinine clearance; calculate before dosing

Black Box Warning:

Cardiogenic shock, acute pulmonary edema: Do not use, effect can further depress cardiac output

⚠ QT syndrome: apical/radial pulse before administration: notify prescriber of any significant changes; monitor ECG continuously (Betapace AF); use QT interval to determine patient eligibility; baseline QT must be ≤ 450 msec, if ≥ 500 msec, frequency or dosage must be decreased or drug discontinued • Baselines of renal studies before therapy begins

- **Abrupt discontinuation:** do not discontinue abruptly, taper over 1-2 wk
- Dose should be adjusted slowly, with at least 3 days between changes, monitor ECG for QT interval • Monitor electrolytes (hypokalemia, hypomagnesia) may increase dysrhythmias

Perform/provide:

- Storage in dry area at room temp; do not freeze

Evaluate:

- Therapeutic response: absence of life-threatening dysrhythmias

Teach patient/family:

- Not to discontinue product abruptly; to taper over 2 wk or may precipitate angina; to take exactly as prescribed • Not to use antacids or OTC products containing α -adrenergic stimulants (nasal decongestants, OTC cold preparations) unless directed by prescriber • To report bradycardia, dizziness, confusion, depression, fever
- To take pulse at home; advise patient when to notify prescriber
- To avoid alcohol, smoking, sodium intake
- To carry emergency ID to identify product being taken, allergies
- To avoid hazardous activities if dizziness present
- To report symptoms of CHF including difficulty breathing, especially on exertion or when lying down; night cough, swelling of extremities • To wear support hose to minimize effects of orthostatic hypotension
- To monitor blood glucose if diabetic
- That hospitalization will be required for ≥ 3 days

TREATMENT OF OVERDOSE:

Lavage, IV atropine for bradycardia, IV theophylline for bronchospasm, digoxin, O₂, diuretic for cardiac failure; hemodialysis is useful for removal; administer vasopressor (norepinephrine) for hypotension, isoproterenol for heart block

☼ Canada only Side effects: *italics* = common; **bold** = life-threatening ⚠
Nurse Alert

spironolactone (Rx)

(speer'on-oh-lak'tone)

Aldactone, Novo-Spiroton 

Func. class.: Potassium-sparing diuretic

Chem. class.: Aldosterone antagonist

Do not confuse: **Aldactone**/Aldactazide

ACTION:

Competes with aldosterone at receptor sites in distal tubule, thereby resulting in the excretion of sodium chloride and water and the retention of potassium and phosphate

USES:

Edema of CHF, hypertension, diuretic-induced hypokalemia, primary hyperaldosteronism (diagnosis, short-term treatment, long-term treatment), edema of nephrotic syndrome, cirrhosis of liver with ascites

Unlabeled uses: CHF, hirsutism in women, bronchopulmonary dysplasia (BPD), PMS, polycystic ovary syndrome, acne vulgaris, premenstrual syndrome

CONTRAINDICATIONS:

Hypersensitivity, anuria, severe renal disease, hyperkalemia

Precautions: Breastfeeding, dehydration, hepatic disease, renal impairment, electrolyte imbalances, metabolic acidosis, gynecomastia, pregnancy (C)

Black Box Warning:

Secondary malignancy

DOSAGE AND ROUTES

Calculator

Edema/hypertension

- **Adult:** PO 25-200 mg/day in 1-2 divided doses

CHF

- **Adult:** PO 12.5-25 mg/day; max 50 mg/day

Edema

- **Child:** PO 1.5-3.3 mg/kg/day as single dose or in divided doses

Hypertension

- **Child (unlabeled): PO** 1.5-3.3 mg/kg/day in divided doses

Hypokalemia

- **Adult: PO** 25-100 mg/day; if **PO**, potassium supplements must not be used

Primary hyperaldosteronism diagnosis

- **Adult: PO** 400 mg/day × 4 days or 4 wk depending on test, then 100-400 mg/day maintenance

Edema (nephrotic syndrome, CHF, hepatic disease)

- **Adult: PO** 100 mg/day given as single dose or in divided doses, titrate to response
- **Child: PO** 1.5-3.3 mg/kg/day or 60 mg/m²/day given daily or in 2-4 divided doses

Renal dose

- **Adult: PO** CCr 10-50 ml/min; give dose q12-24hr; CCr <10 ml/min, avoid use

Polycystic ovary syndrome/hirsutism in women (unlabeled)

- **Adult: PO** 50-200 mg in 1-2 divided doses

Available forms: Tabs 25, 50, 100 mg

Administer:

- In AM to avoid interference with sleep
- With food; if nausea occurs, absorption may be decreased slightly
- Effect may take 2 wk

SIDE EFFECTS

CNS: *Headache*, confusion, drowsiness, lethargy, ataxia

ELECT: Hyperchloremic metabolic acidosis, **hyperkalemia**, hyponatremia

ENDO: Impotence, gynecomastia, irregular menses, amenorrhea, postmenopausal bleeding, hirsutism, deepening voice, breast pain

GI: *Diarrhea*, cramps, **bleeding**, gastritis, *vomiting*, anorexia, nausea, **hepatocellular toxicity**

HEMA: **Agranulocytosis**

INTEG: *Rash*, *pruritus*, urticaria

PHARMACOKINETICS

Onset 24-48 hr, peak 48-72 hr, metabolized in liver, excreted in urine, crosses placenta, protein binding >90%, terminal half-life 10-35 hr

INTERACTIONS

Increase: action of antihypertensives, digoxin, lithium

Increase: hyperchloremic acidosis in cirrhosis—cholestyramine

Increase: hyperkalemia—potassium-sparing diuretics, potassium products, ACE inhibitors, salt substitutes

Decrease: effect of anticoagulants, monitor INR/PT

Decrease: effect of spironolactone—ASA, NSAIDs

Drug/Food

Increase: hyperkalemia—potassium rich foods, potassium salt substitutes

Drug/Herb

Increase: hypotension—hawthorn, horse chestnut

Decrease: antihypertensive effect—ephedra

Increase: severe photosensitivity—St. John's wort

Increase: BUN, potassium

Decrease: sodium, magnesium

Drug/Lab Test

Interference: 17-OHCS, 17-KS, radioimmunoassay, digoxin assay

NURSING CONSIDERATIONS

Assess:

- **Hypokalemia:** polyuria, polydipsia; dysrhythmias, including a U wave on ECG
- **Hyperkalemia:** weakness, fatigue, dyspnea, dysrhythmias, confusion, fatigue
- Electrolytes: sodium, chloride, potassium, BUN, serum creatinine, ABGs, CBC
- Weight, I&O daily to determine fluid loss; effect of product may be decreased if used daily; ECG periodically with long-term therapy
- Signs of metabolic acidosis: drowsiness, restlessness
- Confusion, especially in geriatric patients; take safety precautions if needed
- **Hydration:** skin turgor, thirst, dry mucous membranes

Evaluate:

- Therapeutic response: improvement in edema of feet, legs, sacral area daily if medication is being used in CHF

Teach patient/family:

- To avoid foods with high potassium content: oranges, bananas, salt substitutes, dried apricots, dates; to avoid potassium salt substitutes
- That drowsiness,

ataxia, mental confusion may occur; to observe caution when driving

- To notify prescriber of cramps, diarrhea, lethargy, thirst, headache, skin rash, menstrual abnormalities, deepening voice, breast enlargement
- To take in AM, to prevent sleeplessness
- To avoid hazardous activities until reaction is known
- To notify prescriber if pregnancy is planned or suspected, pregnancy (C), do not breastfeed

TREATMENT OF OVERDOSE:

Lavage if taken orally; monitor electrolytes, administer IV fluids, monitor hydration, renal, CV status

🌿 Canada only Side effects: *italics* = common; **bold** = life-threatening ⚠️
Nurse Alert

stavudine d4t (Rx)

(sta'vyoo-deen)

Zerit

Func. class.: Antiretroviral

Chem. class.: Nucleoside reverse transcriptase inhibitor (NRTI)

ACTION:

Prevents replication of HIV by the inhibition of the enzyme reverse transcriptase; causes DNA chain termination

USES:

Treatment of HIV-1 in combination with other antiretrovirals

CONTRAINDICATIONS:

Hypersensitivity to this product or zidovudine; didanosine, zalcitabine; severe peripheral neuropathy

Black Box Warning:

Lactic acidosis

Precautions: Breastfeeding, advanced HIV infection, bone marrow suppression, renal disease, peripheral neuropathy, osteoporosis, obesity

Black Box Warning:

Pregnancy (C), hepatic disease, pancreatitis

DOSAGE AND ROUTES

Calculator

- **Adult >60 kg: PO 40 mg q12hr**
- **Adult <60 kg: PO 30 mg q12hr**
- **Child <30 kg: PO 1 mg/kg q12hr**
- **Child ≥30 kg, ≤60 kg: PO 30 mg q12hr**
- **Child >60 kg: PO 40 mg q12hr**

Renal dose

- **Adult: PO** CCr 26-50 ml/min, reduce by 50%, give q12hr; CCr 10-25 ml/min, reduce by 50%, give q24hr

Available forms: Caps 15, 20, 30, 40 mg; powder for oral sol 1 mg/ml

Administer:

- With/without meals; absorption does not appear to be lowered when taken with food
- Use after hemodialysis
- Every 12 hr around the clock
- Shake suspension well before using

SIDE EFFECTS

CNS: *Peripheral neuropathy*, insomnia, anxiety, depression, dizziness, confusion, *headache*, chills/fever, malaise, neuropathy

CV: Chest pain, vasodilation, hypertension

EENT: Conjunctivitis, abnormal vision

GI: **Hepatotoxicity**, *diarrhea*, *nausea*, *vomiting*, anorexia, dyspepsia, constipation, stomatitis, **pancreatitis**

HEMA: **Bone marrow suppression**, leukopenia, macrocytosis

INTEG: *Rash*, sweating, pruritus, benign neoplasms

MISC: **Lactic acidosis**, asthenia, lipodystrophy

MS: Myalgia, arthralgia

RESP: Dyspnea, pneumonia, asthma

PHARMACOKINETICS

Excreted in urine, breast milk; peak 1 hr; half-life: elimination 1-1.6 hr

INTERACTIONS

Increase: myelosuppression—other myelosuppressants

Increase: peripheral neuropathy—lithium, dapsone, chloramphenicol, didanosine, ethambutol, hydrALAZINE, phenytoin, vinCRISTine, zalcitabine

Increase: stavudine levels—probenecid

Decrease: stavudine effect—methadone, zidovudine

NURSING CONSIDERATIONS

Assess:

Black Box Warning:

Lactic acidosis and severe hepatomegaly with steatosis: death may result

⚠️ Pancreatitis: severe upper abdominal pain, radiating to back, nausea, vomiting usually when used in combination with didanosine • Blood studies:

WBC, differential, RBC, Hct, Hgb, platelets, serum amylase, lipase

- Renal tests: urinalysis, protein, blood, serum creatinine
- C&S before product therapy; product may be given as soon as culture taken
- Bowel pattern before, during treatment
- Weakness, tremors, confusion, dizziness; product may have to be decreased, discontinued
- Viral load, CD4 counts, plasma HIV RNA at baseline and throughout treatment
- **Peripheral neuropathy:** tingling, pain in extremities; discontinue product

Evaluate:

- Therapeutic response: decreased symptoms of HIV

Teach patient/family:

- **About the signs of peripheral neuropathy:** burning, weakness, pain, prickling feeling in extremities
- That product should not be given with antineoplastics
- That product is not a cure for AIDS but will control symptoms
- To notify prescriber if sore throat, swollen lymph nodes, malaise, fever occur; that other products may be needed to prevent other infections
- That, even with use of product, patient may pass AIDS virus to others
- That follow-up visits are necessary; that serious toxicity may occur; that blood counts must be done q2wk ⚠️ That serious product interactions may occur if other medications are ingested; to see prescriber before taking chloramphenicol, dapsone, CISplatin, didanosine, ethambutol, lithium, antifungals, antineoplastics

Black Box Warning:

To notify prescriber if pregnancy is planned or suspected, fatal lactic acidosis may occur, pregnancy (C), avoid breastfeeding

- That product may cause fainting or dizziness

✳ Canada only Side effects: *italics* = common; **bold** = life-threatening ⚠️
Nurse Alert

HIGH ALERT

succinylcholine (Rx)

(suk-sin-ill-koe'leen)

Anectine, Quelicin

Func. class.: Neuromuscular blocker (depolarizing, ultra short)

ACTION:

Inhibits transmission of nerve impulses by binding with cholinergic receptor sites, thus antagonizing action of acetylcholine; causes release of histamine

USES:

Facilitation of endotracheal intubation, skeletal muscle relaxation during orthopedic manipulations

CONTRAINDICATIONS:

Hypersensitivity, malignant hyperthermia, trauma

Precautions: Pregnancy (C), breastfeeding, geriatric or debilitated patients, cardiac disease, severe burns, fractures (fasciculations may increase damage) electrolyte imbalances, dehydration, neuromuscular/respiratory/cardiac/renal/hepatic disease, collagen diseases, glaucoma, eye surgery

Black Box Warning:

Children <2 yr, hyperkalemia, myopathy, rhabdomyolysis

DOSAGE AND ROUTES

Calculator

• **Adult: IV** 0.3-1.1 mg/kg, max 150 mg, maintenance 0.04-0.07 mg/kg q5-10min as needed; **CONT IV INF** dilute to conc of 1-2 mg/ml in D₅W or NS 10-100 mcg/kg/min

• **Child: IV** initially 1-2 mg/kg; **CONT IV INF** not recommended

Available forms: Inj 20, 50, 100 mg/ml; powder for inj 100, 500 mg/vial, 1 g/vial

Administer:

• Give IV or IM; only experienced clinicians familiar with the use of

neuromuscular blocking drugs should administer or supervise the use of this product • Visually inspect parenteral products for particulate matter and discoloration before use • Monitor heart rate and mechanical ventilator status during use

IM route

- Recommended for infants and other patients in whom a suitable vein is not accessible
- Inject into a large muscle, preferably high into the deltoid muscle; aspirate before injection

Rapid IV injection route

- Owing to tachyphylaxis and prolonged apnea, this method is not recommended for prolonged procedures; rapid IV injection of succinylcholine can result in profound bradycardia or asystole in pediatric patients; as with adults, the risk increases with repeated doses; pretreatment with atropine may be needed • No dilution of injection solution is necessary
- Inject rapidly IV over 10–30 sec

Continuous IV infusion route

- Not recommended for infants and children owing to risk of malignant hyperthermia
- This route is preferred for long surgical procedures owing to possible tachyphylaxis and prolonged apnea associated with administration of repeated fractional doses • Dilute succinylcholine to a concentration of 1–2 mg/ml with D₅W, D₅NS, NS, or 1/6 M sodium lactate injection; one gram of the powder for injection or 20 ml of a 50-mg/ml solution may be added to 1 L or 500 ml of diluent to give solutions containing 1 or 2 mg/ml, respectively; alternatively, 500 mg of the powder for injection or 10 ml of a 50 mg/ml solution may be added to 500 ml or 250 ml of diluent to give solutions containing 1 or 2 mg/ml, respectively • Infuse IV at a rate of 2.5 mg/minute (range = 0.5–10 mg/min); adjust rate based on patient's response and requirements

Additive compatibilities: Amikacin, cephalixin, isoproterenol, meperidine, methyldopate, morphine, norepinephrine, scopolamine

Syringe compatibilities: Heparin

Y-site compatibilities: Etomidate, heparin, potassium chloride, propofol, vit

B/C

SIDE EFFECTS

CV: Bradycardia, tachycardia; increased, decreased B/P; **sinus arrest, dysrhythmias**, edema

EENT: Increased secretions, intraocular pressure

HEMA: **Myoglobulinemia**

INTEG: Rash, flushing, pruritus, urticaria

MS: Weakness, muscle pain, fasciculations, prolonged relaxation, myalgia, **rhabdomyolysis**

RESP: **Prolonged apnea, bronchospasm, cyanosis, respiratory depression**, wheezing, dyspnea

SYST: **Anaphylaxis, angioedema**

PHARMACOKINETICS

Hydrolyzed in blood, excreted in urine (active/inactive metabolites)

IM: Onset 2-3 min, duration 10-30 min

IV: Onset 1 min, peak 2-3 min, duration 6-10 min

INTERACTIONS

- Dysrhythmias: theophylline

Increase: neuromuscular blockade—aminoglycosides, β -blockers, cardiac glycosides, clindamycin, lincomycin, procainamide, quiniDine, local anesthetics, polymyxin antibiotics, lithium, opioids, thiazides, enflurane, isoflurane, magnesium salts, oxytocin

Drug/Herb

- Blocks succinylcholine: melatonin

NURSING CONSIDERATIONS

Assess:

- Electrolyte imbalances (K, Mg); may lead to increased action of product
- VS (B/P, pulse, respirations, airway) until fully recovered; rate, depth, pattern of respirations, strength of hand grip • I&O ratio; check for urinary retention, frequency, hesitancy
- **Recovery:** decreased paralysis of face, diaphragm, leg, arm, rest of body

• **Allergic reactions:** rash, fever, respiratory distress, pruritus; product should be discontinued • **Myopathy, rhabdomyolysis:** in pediatric patients (rare)

Perform/provide:

- Storage in refrigerator, powder at room temp; close tightly
- Reassurance if communication is difficult during recovery from neuromuscular blockade; postoperative stiffness is normal, soon subsides

Evaluate:

- Therapeutic response: paralysis of jaw, eyelid, head, neck, rest of body

TREATMENT OF OVERDOSE:

Neostigmine, atropine, monitor VS; may require mechanical ventilation

🍁 Canada only Side effects: *italics* = common; **bold** = life-threatening ⚠️
Nurse Alert

sucralfate (Rx)

(soo-kral'fate)

Carafate, Sulcrate 

Func. class.: Protectant, antiulcer

Chem. class.: Aluminum hydroxide, sulfated sucrose

Do not confuse: **Carafate**/Cafergot

ACTION:

Forms a complex that adheres to ulcer site, adsorbs pepsin

USES:

Duodenal ulcer, oral mucositis, stomatitis after radiation of head and neck

Unlabeled uses: Gastric/aphthous ulcers, gastroesophageal reflux, NSAID-induced ulcer prophylaxis, proctitis, stomatitis, stress gastritis prophylaxis, *C. difficile*

CONTRAINDICATIONS:

Hypersensitivity

Precautions: Pregnancy (B), breastfeeding, children, renal failure; hypoglycemia (diabetics)

DOSAGE AND ROUTES

Calculator

Duodenal ulcers

- **Adult:** PO 1 g qid 1 hr before meals, at bedtime
- **Child:** PO 40-80 mg/kg/day divided

Aphthous ulcer/stomatitis (unlabeled)

- **Adult:** PO 5-10 ml (500 mg-1 g) swished in mouth for several min; spit or swallow qid

Gastric ulcer/nsaid-induced ulcer prophylaxis/esophagitis/gerd (unlabeled)

- **Adult:** PO 1 g qid, 1 hr before meals and at bedtime

Available forms: Tabs 1 g; oral susp 1 g/10 ml

Administer:

PO route

- Do not crush or chew tabs; tabs may be broken or dissolved in water
- Do not take antacids 30 min before or after sucralfate
- On an empty stomach 1 hr before meals or other medications and at bedtime

SIDE EFFECTS

CNS: Drowsiness, dizziness

GI: *Dry mouth, constipation*, nausea, gastric pain, vomiting, bezoar (for critically ill patients)

INTEG: Urticaria, rash, pruritus

PHARMACOKINETICS

PO: Duration up to 6 hr

INTERACTIONS

Decrease: action of tetracyclines, phenytoin, fat-soluble vitamins, digoxin, ketoconazole, theophylline

Decrease: absorption of fluoroquinolones

Decrease: absorption of sucralfate—antacids, cimetidine, ranitidine

NURSING CONSIDERATIONS

Assess:

- **GI symptoms:** abdominal pain, blood in stools
- **Hypoglycemia:** may occur in patients with diabetes mellitus

Perform/provide:

- Storage at room temp

Evaluate:

- Therapeutic response: absence of pain, GI complaints

Teach patient/family:

- To take on empty stomach
- To take full course of therapy; not to use for >8 wk; to avoid smoking
- To avoid antacids within 1/2 hr of product
- To increase fluids, bulk, exercise to lessen constipation

✳ Canada only Side effects: *italics* = common; **bold** = life-threatening ⚠

Nurse Alert

sulfaSALazine (Rx)

(sul-fa-sal'a-zeen)

Azulfidine, Azulfidine EN-tabs, Salazopyrin 

Func. class.: GI antiinflammatory, antirheumatic (DMARD) *Chem. class.:* Sulfonamide

Do not confuse: sulfaSALazine/sulfiSOXAZOLE

ACTION:

Prodrug to deliver sulfapyridine and 5-aminosalicylic acid to colon;
antiinflammatory in connective tissue also

USES:

Ulcerative colitis; RA; juvenile RA (Azulfidine EN-tabs)

Unlabeled uses: Crohn's disease

CONTRAINDICATIONS:

Pregnancy at term, children <2 yr; hypersensitivity to sulfonamides or salicylates; intestinal, urinary obstruction; porphyria

Precautions: Pregnancy (B), breastfeeding, impaired renal/hepatic function, severe allergy, bronchial asthma, megaloblastic anemia

DOSAGE AND ROUTES

Calculator

Bowel disease

- **Adult: PO** 3-4 g/day in divided doses; maintenance 2 g/day in divided doses q6hr
- **Child ≥6 yr: PO** 40-60 mg/kg/day in 4-6 divided doses then 30 mg/kg/day in 4 doses, max 2 g/day

Rheumatoid arthritis

- **Adult: PO** 0.5-1 g/day then increase daily dose by 500 mg/wk to 2 g/day in 2-3 divided doses

Juvenile rheumatoid arthritis

- **Child ≥6 yr: PO** 30-50 mg/kg/24 hr in 2 divided doses

Renal dose

- Modify dose based on renal impairment, response

Crohn's disease (unlabeled)

- **Adult: PO** 1 g/15 kg, max 5 g/day

Available forms: Tabs 500 mg; oral susp 250 mg/5 ml; del rel tabs 500 mg

Administer:

- Do not break, crush, chew del rel tabs
- With full glass of water to maintain adequate hydration; increase fluids to 2 L/day to decrease crystallization in kidneys • Total daily dose in evenly spaced doses and after meals to help minimize GI intolerance

SIDE EFFECTS

CNS: Headache, confusion, insomnia, hallucinations, depression, vertigo, fatigue, anxiety, **seizures**, product fever, chills

CV: **Allergic myocarditis**

GI: *Nausea, vomiting, abdominal pain*, stomatitis, **hepatitis**, glossitis, pancreatitis, diarrhea

GU: **Renal failure, toxic nephrosis**, increased BUN, creatinine, crystalluria

HEMA: **Leukopenia, neutropenia, thrombocytopenia, agranulocytosis, hemolytic anemia**

INTEG: Rash, dermatitis, urticaria, **Stevens-Johnson syndrome**, erythema, photosensitivity

SYST: **Anaphylaxis**

PHARMACOKINETICS

PO: Partially absorbed; peak 1½-6 hr; duration 6-12 hr; half-life 6 hr; excreted in urine as sulfaSALazine (15%), sulfapyridine (60%), 5-aminosalicylic acid, metabolites (20%-33%); excreted in breast milk; crosses placenta

INTERACTIONS

Increase: leukopenia risk—thiopurines (azaTHIOprine, mercaptopurine)

Increase: hypoglycemic response—oral hypoglycemics

Increase: anticoagulant effects—oral anticoagulants

Decrease: effect of cycloSPORINE, digoxin, folic acid

Decrease: renal excretion of methotrexate

Drug/Food

Decrease: iron/folic acid absorption

Drug/Lab Test

False positive: rinary glucose test

NURSING CONSIDERATIONS

Assess:

- Renal studies: BUN, creatinine, urinalysis (long-term therapy)

⚠ **Blood dyscrasias:** skin rash, fever, sore throat, bruising, bleeding, fatigue, joint pain; monitor CBC before therapy and q3mo ⚠ **Allergic reaction:** rash, dermatitis, urticaria, pruritus, dyspnea, bronchospasm • **Ulcerative colitis, proctitis, other inflammatory bowel disease:** character, amount consistency of stools; abdominal pain, cramping, blood, mucous • **Rheumatoid arthritis:** assess mobility, joint swelling, pain, ability to complete activities of daily living

Perform/provide:

- Storage in tight, light-resistant container at room temp

Evaluate:

- Therapeutic response: absence of fever, mucus in stools, pain in joints

Teach patient/family:

- To take each oral dose with full glass of water to prevent crystalluria
- That contact lenses, urine, skin may be yellow-orange
- To avoid sunlight or use sunscreen to prevent burns
- To notify prescriber of skin rash, sore throat, fever, mouth sores, unusual bruising, bleeding

☼ Canada only Side effects: *italics* = common; **bold** = life-threatening ⚠
Nurse Alert

SUMatriptan (Rx)

(soo-ma-trip'tan)

ALSUMA Auto-injector, Imitrex, Sumavel DosePro

Func. class.: Antimigraine agent

Chem. class.: 5-HT₁B/D receptor agonist, abortive agent, triptan

Do not confuse: SUMatriptan/somatropin

ACTION:

Binds selectively to the vascular 5-HT₁B/D receptor subtype, exerts antimigraine effect; causes vasoconstriction in cranial arteries

USES:

Acute treatment of migraine with/without aura and cluster headache

CONTRAINDICATIONS:

Angina pectoris, history of MI, documented silent ischemia, Prinzmetal's angina, ischemic heart disease, IV use, concurrent ergotamine-containing preparations, uncontrolled hypertension, hypersensitivity, basilar or hemiplegic migraine

Precautions: Pregnancy (C), breastfeeding, children <18 yr, geriatric patients, postmenopausal women, men >40 yr, risk factors for CAD, hypercholesterolemia, obesity, diabetes, impaired renal/hepatic function, overuse

DOSAGE AND ROUTES

Calculator

• **Adult:** SUBCUT ≤6 mg; may repeat in 1 hr; max 12 mg/24 hr; **PO** 25 mg with fluids, if no relief in 2 hr, give another dose, max 200 mg/day; **NASAL** single dose of 5, 10, or 20 mg in 1 nostril, may repeat in 2 hr, max 40 mg/24 hr; 1 puff each nostril q2hr

Hepatic dose

• **Adult:** **PO** 25 mg; if no response after 2 hr, give ≤50 mg

Available forms: Inj 4, 6 mg/0.5 ml; tabs 25, 50, 100 mg; nasal spray 5 mg/100 mcl-U; dose spray device 20 mg/100 mcl-U

Administer:

PO route

- Swallow tabs whole; do not break, crush, or chew
- Take tabs with fluids as soon as symptoms appear; may take a 2nd dose >4 hr; max 200 mg/24 hr

SUBCUT route

SUBCUT only just below the skin; avoid IM or IV administration; use only for actual migraine attack

- Give 1st dose supervised by medical staff to patients with coronary artery disease or those at risk for CAD

Nasal route

- May give as 2 sprays of 5 mg in 1 nostril or 1 spray in each nostril (10 mg)

SIDE EFFECTS

CNS: *Tingling, hot sensation, burning, feeling of pressure, tightness, numbness, dizziness, sedation, headache, anxiety, fatigue, cold sensation*

CV: *Flushing, MI*, hypo/hypertension

EENT: Throat, mouth, nasal discomfort; vision changes

GI: Abdominal discomfort

INTEG: Inj site reaction, sweating

MS: *Weakness, neck stiffness, myalgia*

RESP: Chest tightness, pressure

PHARMACOKINETICS

Onset of pain relief 10 min-2 hr, peak 10-20 min; 10%-20% plasma protein binding; metabolized in liver (metabolite); excreted in urine, feces; nasal spray half-life 2 hr

INTERACTIONS

Increase: vasospastic effects: ergot, ergot derivatives

Increase: serotonin syndrome—SSRIs, SNRIs, serotonin-receptor agonists, sibutramine

Increase: SUMAtriptan effect—MAOIs

Drug/Herb

- Serotonin syndrome: SAM-e, St. John's wort

NURSING CONSIDERATIONS

Assess:

- **Migraine:** type of pain, aura; alleviating, aggravating factors; sensitivity to light, noise ⚠️ **Serotonin syndrome:** delirium, coma, agitation, diaphoresis, hypertension, fever, tremors; may resemble neuroleptic malignant syndrome in patients taking SSRIs, SNRIs • B/P; signs, symptoms of coronary vasospasms, ECG
- Tingling, hot sensation, burning, feeling of pressure, numbness, flushing, inj site reaction • Stress level, activity, recreation, coping mechanisms
- Neurologic status: LOC, blurring vision, nausea, vomiting, tingling in extremities preceding headache • Ingestion of tyramine foods (pickled products, beer, wine, aged cheese), food additives, preservatives, colorings, artificial sweeteners, chocolate, caffeine, which may precipitate these types of headaches
- Renal function, urinary output

Perform/provide:

- Quiet, calm environment with decreased stimuli: noise, bright light, excessive talking

Evaluate:

- Therapeutic response: decrease in frequency, severity of migraine

Teach patient/family:

- To report chest pain, tightness; sudden, severe abdominal pain; swelling of eyelids, face, lips; skin rash to prescriber immediately • To notify prescriber if pregnancy is planned or suspected; to use contraception while taking product
- **Nasal spray:** to use 1 spray in 1 nostril, may repeat if headache returns; not to repeat if pain continues after 1st dose • To have a dark, quiet environment
- To avoid hazardous activities if dizziness, drowsiness occur
- To avoid alcohol; may increase headache
- To use SUBCUT inj technique, nasal route if prescribed
- That product does not reduce number of migraines; to be used for acute migraine; to use as symptoms occur

✳️ Canada only Side effects: *italics* = common; **bold** = life-threatening ⚠️
Nurse Alert

SUNItinib (Rx)

(soo-nit'-in-ib)

Sutent

Func. class.: Antineoplastic—miscellaneous

Chem. class.: Protein-tyrosine kinase inhibitor

ACTION:

Inhibits multiple receptor tyrosine kinases (RTKs); some are responsible for tumor growth

USES:

Gastrointestinal stromal tumors (GIST) after disease progression or intolerance to imatinib; advanced renal carcinoma, pancreatic neuroendocrine tumors (pNET) in patients with unresectable locally advanced/metastatic disease

CONTRAINDICATIONS:

Pregnancy (D), breastfeeding, hypersensitivity

Precautions: Children, geriatric patients, active infections, QT prolongation, torsades de pointes, stroke, heart failure

Black Box Warning:

Hepatic disease

DOSAGE AND ROUTES

Calculator

Gastrointestinal stromal tumors (GIST)/renal cell cancer

- **Adult: PO** 50 mg/day $\times$ 4 wk then 2 wk off; may increase or decrease dose by 12.5 mg; if administered with CYP3A4 inducers, give 87.5 mg/day; if given with CYP3A4 inhibitors, give 37.5 mg/day

Pancreatic neuroendocrine (pNET)

- **Adult: PO** 37.5 mg daily continuously, increase or decrease by 12.5 mg based on tolerance, avoid potent CYP3A4 inhibitors/inducers; if used with CYP3A4 inhibitors, decrease SUNItinib dose to minimum of 25 mg/day; if used with CYP3A4 inducers, increase SUNItinib to max 62.5 mg/day

Available forms: Caps 12.5, 25, 50 mg

Administer:

- With meal and large glass of water to decrease GI symptoms

SIDE EFFECTS

CNS: CNS hemorrhage, headache, dizziness, insomnia, seizures, fatigue

CV: Hypertension, left ventricular dysfunction, QT prolongation, cardiotoxicity, torsades de pointes, thrombotic microangiopathy, cardiac arrest, thromboembolism

ENDO: Hypo/hyperthyroidism

GI: Nausea, hepatotoxicity, vomiting, dyspepsia, anorexia, abdominal pain, altered taste, constipation, stomatitis, mucositis, pancreatitis, diarrhea, GI bleeding/perforation

GU: Nephrotic syndrome

HEMA: Neutropenia, thrombocytopenia, hemolytic anemia, leukopenia

INTEG: Rash, yellow skin discoloration, depigmentation of hair or skin, alopecia, necrotizing fasciitis, pyoderma gangrenosum

MS: Pain, arthralgia, myalgia, myopathy, rhabdomyolysis

RESP: Cough, dyspnea, pulmonary embolism

SYST: Bleeding, electrolyte abnormalities, hand-foot syndrome, serious infection

PHARMACOKINETICS

Protein binding 95%; metabolized by CYP3A4; excreted in feces, small amount in urine; peak plasma levels 6-12 hr; terminal half-life 40-60 hr (SUNItinib); active metabolite 80-110 hr

INTERACTIONS

 **Increase:** microangiopathic hemolytic anemia—bevacizumab; avoid concurrent use  **Increase:** QT prolongation—class IA/III antidysrhythmics, some phenothiazines, β agonists, local anesthetics, tricyclics, haloperidol, chloroquine, droperidol, pentamidine; CYP3A4 inhibitors (amiodarone, clarithromycin, erythromycin, telithromycin, troleandomycin), arsenic trioxide, levomethadyl; CYP3A4 substrates (methadone, pimozide, QUetiapine, quinIDine, risperiDONE, ziprasidone)

Increase: hepatotoxicity—acetaminophen

Increase: plasma concentrations of simvastatin, calcium channel blockers; warfarin; avoid use with warfarin, use low-molecular-weight anticoagulants

instead

Decrease: SUNItinib concentrations—dexamethasone, phenytoin, carbamazepine, rifampin, phenobarbital

Drug/Herb

Decrease: SUNItinib concentration—St. John's wort

Drug/Food

Increase: plasma concentrations—grapefruit juice

NURSING CONSIDERATIONS

Assess:

⚠️ ANC and platelets; if ANC $<1 \times 10^9/L$ and/or platelets $<50 \times 10^9/L$, stop until ANC $>1.5 \times 10^9/L$ and platelets $>75 \times 10^9/L$; if ANC $<0.5 \times 10^9/L$ and/or platelets $<10 \times 10^9/L$, reduce dosage by 200 mg; if cytopenia continues, reduce dosage by another 100 mg; if cytopenia continues for 4 wk, stop product until ANC $\geq 1 \times 10^9/L$

⚠️ **CV status:** hypertension, QT prolongation can occur; monitor left ventricular ejection fraction (LVEF), (MUGA) at baseline, periodically; ECG

⚠️ **Renal toxicity:** if bilirubin $>3 \times IULN$, withhold SUNItinib until bilirubin levels return to $<1.5 \times IULN$; electrolytes ⚠️ **Hepatotoxicity:** monitor LFTs before treatment, monthly; if liver transaminases $>5 \times IULN$, withhold SUNItinib until transaminase levels return to $<2.5 \times IULN$

- **CHF:** adrenal insufficiency in those experiencing trauma
- Bleeding: epistaxis; rectal, gingival, upper GI, genital, wound bleeding; tumor-related hemorrhage may occur rapidly

Perform/provide:

- Nutritious diet with iron, vitamin supplement, low fiber, few dairy products
- Storage at 25° C (77° F)

Evaluate:

- Therapeutic response: decrease in size of tumor

Teach patient/family:

- To report adverse reactions immediately: SOB, bleeding
- About reason for treatment, expected result
- That many adverse reactions may occur: high B/P, bleeding, mouth swelling, taste change, skin discoloration, depigmentation of hair/skin
- To avoid persons with known upper respiratory infections; that immunosuppression is common
- To avoid grapefruit juice

 To report if pregnancy is planned or suspected, pregnancy (D)

✳ Canada only Side effects: *italics* = common; **bold** = life-threatening

Nurse Alert

tacrolimus (Rx) (PO, IV)

(tak-row'lim-us)

Prograf

tacrolimus (topical) (Rx)

Protopic

Func. class.: Immunosuppressant

Chem. class.: Macrolide

ACTION:

Produces immunosuppression by inhibiting T-lymphocytes

USES:

Organ transplants to prevent rejection; **topical:** atopic dermatitis

Unlabeled uses: Severe recalcitrant psoriasis, contact dermatitis, GVHD prophylaxis/disease, pancreas/heart/kidney/liver/lung/small bowel transplant rejection, uveitis, ulcerative colitis, nephrotic syndrome, lichen sclerosus

CONTRAINDICATIONS:

Children <2 yr (topical); hypersensitivity to this product or to some kinds of castor oil (IV); long-term use (topical)

Precautions: Pregnancy (C), breastfeeding, severe renal/hepatic disease; diabetes mellitus, hyperkalemia, hyperuricemia, hypertension, acute bronchospasm, African American patients, heart failure, seizures, QT prolongation

Black Box Warning:

Children <12, lymphomas, infection, neoplastic disease, neonates, infants, requires a specialized setting, requires an experienced clinician

DOSAGE AND ROUTES

Calculator

Kidney transplant rejection prophylaxis

- **Adult: IV** 0.03-0.05 mg/kg/day as **CONT INF**, give no sooner than 6 hr after transplantation

Liver transplant rejection prophylaxis

- **Adult: PO** 0.10-0.15 mg/kg/day in 2 divided doses q12hr, give no sooner than

6 hr after transplantation; **IV** 0.03-0.05 mg/kg/day as **CONT INF**, give no sooner than 6 hr after transplantation

Heart transplant rejection prophylaxis

- **Adult: PO** 0.075 mg/kg/day in 2 divided doses q12hr, give no sooner than 6 hr after transplantation; **IV** 0.01 mg/kg/day as **CONT INF**, give no sooner than 6 hr after transplantation

Atopic dermatitis

- **Adult: TOP** use 0.03% or 0.1% ointment, apply bid × 7 days after clearing of signs
- **Child ≥ 2-15 yr: TOP** 0.03% ointment, apply bid × 7 days after clearing of signs

Graft-versus-host disease (orphan drug)

- **Adult and adolescent: IV** 0.1 mg/kg/day in 2 divided doses given with other immunosuppressants or **PO** 0.3 mg/kg/day in 2 divided doses
- **Child: CONT IV INF** 0.1 mg/kg/day

Graft-versus-host prophylaxis (unlabeled)

- **Adult: CONT IV INF** 0.03 mg/kg/day starting 1-2 days before bone marrow transplant; **PO** 0.12 mg/kg/day in 2 divided doses
- **Adolescent and child: PO** 0.12 mg/kg/day in 2 divided doses

Heart transplant rejection (unlabeled)

- **Adult: IV** 0.05 mg/kg/day or **PO** 0.2-0.3 mg/kg/day in 2 divided doses; adjust to maintain whole blood conc 7-15 ng/ml

Lung transplant rejection (unlabeled)

- **Adult: PO** 0.15 mg/kg/day, maintain 12-hr trough, whole blood conc 1-1.5 ng/ml

Small bowel transplant rejection (unlabeled)

- **Adult: IV** 0.1-0.15 mg/kg/day then **PO** 0.3 mg/kg/day in divided doses

Contact dermatitis (unlabeled)

- **Adult: TOP** 0.1% ointment, apply bid × 8 wk

Available forms: Inj 5 mg/ml; caps 0.5, 1, 5 mg; ointment 0.03%, 0.1%

Administer:

PO route

- Give on empty stomach, food decreases absorption
- For several days before transplant surgery, patients should be placed in protective isolation

Topical route

- Apply thin layers to affected skin only, rub in gently
- Do not use occlusive dressings
- Use on small area of skin
- Topical ointment has risk of developing cancer, use only when other options have failed

Continuous IV INF route

- After diluting in 0.9% NaCl or D₅W to 0.004 to 0.02 mg/ml as continuous inf over 24 hr

Y-site compatibilities: Alemtuzumab, alfentanil, amifostine, amikacin, aminophylline, amiodarone, amphotericin B colloidal, amphotericin B liposome, anidulafungin, argatroban, atracurium, aztreonam, benztropine, bivalirudin, bleomycin, bumetanide, buprenorphine, busulfan, butorphanol, calcium acetate/chloride/gluconate, CARBOplatin, carmustine, caspofungin, ceFAZolin, cefoperazone, cefotaxime, cefoTEtan, cefOXitin, cefTAZidime, ceftizoxime, cefTRIAxone, cefuroxime, chloramphenicol, chlorproMAZINE, cimetidine, ciprofloxacin, cisatracurium, CISplatin, clindamycin, cyclophosphamide, cycloSPORINE, cytarabine, DACTINomycin, DAPTOmycin, dexamethasone, dexmedetomidine, dexrazoxane, digoxin, diltiazem, diphenhydrAMINE, DOBUtamine, DOCEtaxel, dolasetron, DOPamine, doripenem, doxacurium, DOXOrubicin hydrochloride, doxycycline, droperidol, enalaprilat, ePHEDrine, EPINEPHrine, epirubicin, ertapenem, erythromycin, esmolol, etoposide, etoposide phosphate, famotidine, fenoldopam, fentaNYL, fluconazole, fludarabine, foscarnet, fosphenytoin, gemcitabine, gentamicin, glycopyrrolate, granisetron, haloperidol, heparin, hydrALAZINE, hydrocortisone, HYDROmorphine, IDArubicin, ifosfamide, imipenem/cilastatin, inamrinone, insulin, isoproterenol, ketorolac, labetalol, leucovorin, levofloxacin, levorphanol, lidocaine, linezolid, LORazepam, magnesium sulfate, mannitol, mechlorethamine, meperidine, meropenem, mesna, metaraminol, methotrexate, methyl dopate, methylPREDNISolone, metoclopramide, metoprolol, metroNIDAZOLE, micafungin, midazolam, milrinone, mitoMYcin, mitoXANtrone, mivacurium, morphine, multivitamins, nafcillin, nalbuphine, naloxone, nesiritide, niCARDipine, nitroglycerin, nitroprusside, norepinephrine, octreotide, ondansetron, oxacillin, oxaliplatin, oxytocin, PACLitaxel,

palonosetron, pancuronium, PEMEtrexed, penicillin G, pentamidine, pentazocine, perphenazine, phentolamine, phenylephrine, piperacillin/tazobactam, potassium chloride/phosphates, procainamide, prochlorperazine, promethazine, propranolol, quinapristin/dalfopristin, ranitidine, remifentanyl, rocuronium, sodium acetate/bicarbonate/phosphates, streptozocin, succinylcholine, SUFentanyl, teniposide, theophylline, thiotepa, ticarcillin/clavulanate, tigecycline, tirofiban, tobramycin, tolazoline, trimethobenzamide, vancomycin, vasopressin, vecuronium, verapamil, vinCRIStine, vinorelbine, voriconazole, zidovudine, zoledronic acid

SIDE EFFECTS

CNS: Tremors, headache, insomnia, paresthesia, chills, fever, **seizures**, posterior reversible encephalopathy syndrome, BK-virus–associated nephropathy

CV: Hypertension, myocardial hypertrophy, **prolonged QTc**, cardiomyopathy

EENT: Blurred vision, photophobia

GI: Nausea, vomiting, diarrhea, constipation, **GI bleeding**

GU: UTIs, **albuminuria, hematuria, proteinuria, renal failure, hemolytic uremic syndrome**

HEMA: **Anemia, leukocytosis, thrombocytopenia, purpura**

INTEG: Rash, flushing, itching, alopecia

META: Hirsutism, hyperglycemia, hyperuricemia, hypo/hyperkalemia, hypomagnesemia

MS: Back pain, muscle spasms

RESP: **Pleural effusion, atelectasis, dyspnea, interstitial lung disease**

SYST: **Anaphylaxis**, infection, malignancy

PHARMACOKINETICS

PO: Extensively metabolized, half-life 10 hr, 75% protein binding

INTERACTIONS

⚠ Increase: QT prolongation—class IA/III antidysrhythmics, some phenothiazines, β agonists, local anesthetics, tricyclics, haloperidol, chloroquine, droperidol, pentamidine; CYP3A4 inhibitors (amiodarone, clarithromycin, erythromycin, telithromycin, troleandomycin), arsenic trioxide, levomethadyl; CYP3A4 substrates (methadone, pimozone, QUetiapine, quinIDine, risperiDONE, ziprasidone); do not use together **⚠ Increase:** toxicity—

aminoglycosides, CISplatin, cycloSPORINE

Increase: blood levels—antifungals, calcium channel blockers, cimetidine, danazol, mycophenolate, mofetil

Decrease: blood levels—carbamazepine, phenobarbital, phenytoin, rifamycin

Decrease: effect of live-virus vaccines

Drug/Herb

Decrease: immunosuppression—astragalus, echinacea, melatonin

Decrease: effect—ginseng, St. John's wort

Drug/Food

Increase: effect—grapefruit juice

Decreased absorption: food

Drug/Lab Test

Increase: glucose, BUN, creatinine

Increase or decrease: LFTs, potassium

Decrease: magnesium, Hgb, platelets

NURSING CONSIDERATIONS

Assess:

- Blood studies: Hgb, WBC, platelets during treatment monthly; if leukocytes $<3000/\text{mm}^3$ or platelets $<100,000/\text{mm}^3$, product should be discontinued or reduced; decreased hemoglobin level may indicate bone marrow suppression
- Hepatic studies: alk phos, AST, ALT, amylase, bilirubin; for hepatotoxicity: dark urine, jaundice, itching, light-colored stools; product should be discontinued
- Serum creatinine/BUN, serum electrolytes, lipid profile, serum tacrolimus conc

 **Anaphylaxis:** rash, pruritus, wheezing, laryngeal edema; stop infusion, initiate emergency procedures • **QT prolongation:** ECG, ejection fraction; assess for chest pain, palpitations, dyspnea

Evaluate:

- Therapeutic response: absence of graft rejection; immunosuppression in patients with autoimmune disorders

Teach patient/family:

PO route

- To report fever, rash, severe diarrhea, chills, sore throat, fatigue; that serious infections may occur; to report clay-colored stools, cramping (**hepatotoxicity**), **nephrotoxicity**, signs of diabetes mellitus
- To avoid crowds, persons with

known infections to reduce risk for infection; to avoid eating raw shellfish • To avoid exposure to natural or artificial sunlight

- Not to breastfeed while taking product
- That repeated lab tests will be needed during treatment
- To avoid vaccines
- Not to use with alcohol, grapefruit
- To report if pregnancy is planned or suspected

Black Box Warning:

To report symptoms of lymphoma

🍁 Canada only Side effects: *italics* = common; **bold** = life-threatening ⚠️
Nurse Alert

tadalafil (Rx)

(tah-dal'a-fil)

Adcirca, Cialis

Func. class.: Impotence agent

Chem. class.: Phosphodiesterase type 5 inhibitor

ACTION:

Inhibits phosphodiesterase type 5 (PDE5); enhances erectile function by increasing the amount of cGMP, which causes smooth muscle relaxation and increased blood flow into the corpus cavernosum; improves erectile function for up to 36 hr

USES:

Treatment of erectile dysfunction, benign prostatic hyperplasia (BPH) with or without erectile dysfunction pulmonary arterial hypertension (PAH) (Adcirca only)

Unlabeled uses: Sexual dysfunction in males receiving antidepressants

CONTRAINDICATIONS:

Newborns, children, women, hypersensitivity, patients taking organic nitrates either regularly and/or intermittently, patients taking any α -adrenergic antagonist other than 0.4 mg once-daily tamsulosin

Precautions: Pregnancy (B) although not indicated for females, anatomic penile deformities, sickle cell anemia, leukemia, multiple myeloma, CV/renal/hepatic disease, bleeding disorders, active peptic ulcer, prolonged erection

DOSAGE AND ROUTES

Calculator

Erectile dysfunction

- **Adult: PO** (Cialis) 10 mg taken before sexual activity, dose may be reduced to 5 mg or increased to max 20 mg; usual max dosing frequency is 1×/day; once-daily dosing 2.5 mg/day at same time each day

BPH

- **Adult: PO** 5 mg bid at the same time every day

Renal dose

- **Adult: PO** CCr 51-80 ml/min: no adjustment for erectile dysfunction, 20 mg/day initially for pulmonary hypertension; CCr 31-50 ml/min, 5 mg/day, max 10 mg q48hr; CCr <30 ml/min, max 5 mg q72hr

Hepatic dose

- **Adult: PO** (Child-Pugh A, B) max 10 mg/day or 20 mg/day, (pulmonary hypertension) max 40 mg/day; (Child-Pugh C) not recommended

Concomitant medications

- Ketoconazole, itraconazole, ritonavir, max 10 mg q72hr

Pulmonary hypertension

- **Adult: PO (Adcirca only)** 40 mg daily
- **Adult taking ritonavir: PO** 20 mg daily initially then increase to 40 mg daily as tolerated

Male sexual dysfunction (from antidepressants) (unlabeled)

- **Adult: PO** (Cialis) 10-20 mg before sexual activity

Available forms: Tabs 2.5, 5, 10, 20 mg; PO tab (Adcirca) 20 mg

Administer:

- **Product should not be used with nitrates in any form**
- **Sexual dysfunction:** give before sexual activity; do not use more than 1×/day
- **Pulmonary hypertension:** give Adcirca with/without meals

SIDE EFFECTS

CNS: Headache, flushing, dizziness, **seizures**, transient global amnesia

CV: Hypotension, **QT prolongation**

INTEG: **Stevens-Johnson syndrome**, **exfoliative dermatitis**, urticaria

MISC: Back pain/myalgia, *dyspepsia*, *nasal congestion*, *UTI*, blurred vision, changes in color vision, *diarrhea*, pruritus, priapism, **nonarteritic ischemic optic neuropathy (NAION)**, hearing loss

PHARMACOKINETICS

Rapidly absorbed; metabolized by liver by CYP3A4; terminal half-life 17.5 hr; peak 1/2-6 hr; excreted primarily as metabolites in feces, urine; excreted 61% in feces, 36% in urine; 94% protein bound; rate and extent of absorption not influenced by food

INTERACTIONS

⚠ Do not use with nitrates because of unsafe drop in B/P, which could result in

MI or stroke

Increase: tadalafil levels—itraconazole, ketoconazole, ritonavir (although not studied, may also include other HIV protease inhibitors)

Decrease: B/P—alcohol, α -blockers, amLODIPine, angiotensin II receptor blockers, enalapril

Decrease: effects of tadalafil—bosentan, antacids

Drug/Food

Increase: tadalafil effect—grapefruit

NURSING CONSIDERATIONS

Assess:

- **Cialis:** underlying cause of erectile dysfunction before treatment; use of organic nitrates that should not be used with this product; any severe loss of vision while taking this or any similar products
- **Adcirca:** hemodynamic parameters at baseline and periodically

Evaluate:

- Therapeutic response: ability to engage in sexual intercourse, improvement in exercise ability in pulmonary hypertension

Teach patient/family:

- To take 1 hr before sexual activity
- Not to drink large amounts of alcohol
- That product does not protect against sexually transmitted diseases, including HIV
- That product has no effect in the absence of sexual stimulation; to seek medical help if erection lasts >4 hr
- To tell physician about all medicines, vitamins, herbs being taken, especially ritonavir, indinavir, ketoconazole, itraconazole, erythromycin, nitrates, α -blockers; that tadalafil is contraindicated for use with α -blockers except 0.4 mg/day tamsulosin ⚠ To notify prescriber immediately and to stop taking product if vision, hearing loss occur or if erection lasts >4 hr or if chest pain occurs

🌿 Canada only Side effects: *italics* = common; **bold** = life-threatening ⚠
Nurse Alert

tamoxifen (Rx)

(ta-mox'i-fen)

Apo-Tamox , Nolvadex , Tamofen 

Func. class.: Antineoplastic

Chem. class.: Antiestrogen hormone

ACTION:

Inhibits cell division by binding to cytoplasmic estrogen receptors; resembles normal cell complex but inhibits DNA synthesis and estrogen response of target tissue

USES:

Advanced breast carcinoma not responsive to other therapy in estrogen-receptor–positive patients (usually postmenopausal), prevention of breast cancer, after breast surgery/radiation for ductal carcinoma in situ

Unlabeled uses: Mastalgia, to reduce pain/size of gynecomastia, ovulation stimulation, malignant carcinoid tumor, carcinoid syndrome, metastatic melanoma, desmoid tumors, McCune-Albright syndrome (female pediatric patients), osteoporosis, bipolar I disorder, infertility, precocious puberty, gynecomastia, mastalgia

CONTRAINDICATIONS:

Pregnancy (D), breastfeeding, hypersensitivity

Black Box Warning:

Thromboembolic disease

Precautions: Women of childbearing age, leukopenia, thrombocytopenia, cataracts

Black Box Warning:

Endometrial cancer, stroke

DOSAGE AND ROUTES

Calculator

Breast cancer

- **Adult:** PO 20-40 mg/day for 5 yr; doses >20 mg/day, divide AM/PM

High risk for breast cancer

- **Adult: PO** 20 mg/day × 5 yr

DCIS

- **Adult: PO** 20 mg/day × 5 yr

Mccune-albright syndrome/precocious puberty (unlabeled)

- **Child 2-10 yr (girls): PO** 20 mg/day for ≤1 yr

Bipolar I disorder (unlabeled)

- **Adult: PO** 40 mg bid

Stimulation of ovulation with infertility (unlabeled)

- **Adult: PO** 20-80 mg/day × 5 days

Mastalgia (unlabeled)

- **Adult (female): PO** 10-20 mg/day × 3-6 mo

Mastalgia/gynecomastia in men with prostate cancer (unlabeled)

- **Adult (male): PO** 20 mg/day for ≤1 yr

Available forms: Tabs 10, 20 mg

Administer:

- Do not break, crush, or chew tabs
- Antacid before oral agent; give product after evening meal, before bedtime; give with food or fluids for GI symptoms • Antiemetic 30-60 min before product to prevent vomiting

SIDE EFFECTS

CNS: *Hot flashes, headache, lightheadedness, depression, mood changes*

CV: Chest pain, **stroke**, fluid retention, flushing

EENT: Ocular lesions, retinopathy, cataracts, corneal opacity, blurred vision (high doses)

GI: *Nausea, vomiting, altered taste (anorexia)*

GU: Vaginal bleeding, pruritus vulvae, **uterine malignancies**, *altered menses, amenorrhea*

HEMA: **Thrombocytopenia, leukopenia**, DVT

INTEG: *Rash, alopecia*

META: Hypercalcemia

RESP: **Pulmonary embolism**

PHARMACOKINETICS

PO: Peak 4-7 hr, half-life 7 days (1 wk terminal), metabolized in liver, excreted

primarily in feces

INTERACTIONS

⚠ Increase: risk for death from breast cancer—PARoxetine

Increase: bleeding—anticoagulants

Increase: tamoxifen levels—bromocriptine

Increase: thromboembolic events—cytotoxics

⚠ Increase: toxicity—CYP3A4 inhibitors (aprepitant, antiretroviral protease inhibitors, clarithromycin, danazol, delavirdine, diltiazem, erythromycin, fluconazole, FLUoxetine, fluvoxamine, imatinib, ketoconazole, mibefradil, nefazodone, telithromycin, voriconazole)

Decrease: tamoxifen levels—aminoglutethimide, rifamycin

Decrease: letrozole levels—letrozole

Decrease: tamoxifen effect—CYP3A4 inducers (barbiturates, bosentan, carbamazepine, efavirenz, phenytoins, nevirapine, rifabutin, rifampin)

Decrease: tamoxifen effects—CYP2D6 inhibitors (antidepressants)

Drug/Herb

- Avoid use with St. John's wort, dong quai, black cohosh

Drug/Lab Test

Increase: serum calcium, T₄, AST, ALT, cholesterol, triglycerides

NURSING CONSIDERATIONS

Assess:

- CBC, differential, platelet count weekly; withhold product if WBC count is <3500 or platelet count is <100,000; notify prescriber; breast exam, mammogram, pregnancy test, bone mineral density, LFTs, serum calcium, serum lipid profile, periodic eye exams (cataracts, retinopathy)

Black Box Warning:

Bleeding q8hr: hematuria, guaiac, bruising, petechiae, mucosa or orifices

- Effects of alopecia on body image; discuss feelings about body changes

⚠ Uterine malignancies, symptoms of stroke, pulmonary embolism that may occur in women with ductal carcinoma in situ (DCIS) and women at high risk for breast cancer **⚠ Severe allergic reactions:** rash, pruritus, urticaria, purpuric skin lesions, itching, flushing • Bone pain; may give analgesics; pain usually transient

Perform/provide:

- Storage in light-resistant container at room temp

Evaluate:

- Therapeutic response: decreased tumor size, spread of malignancy

Teach patient/family:

- To use nonhormonal contraception during and for 2 months after discontinuing treatment, pregnancy (D) • To notify prescriber of stroke: blurred vision, headache, weakness on one side of the body; PE: chest pain, fainting, sweating, difficulty breathing • To report any complaints, side effects to prescriber; that use may be 5 yr
- To increase fluids to 2 L/day unless contraindicated
- To wear sunscreen, protective clothing, sunglasses
- That vaginal bleeding, pruritus, hot flashes are reversible after discontinuing treatment • To immediately report decreased visual acuity, which may be irreversible; about need for routine eye exams; that care providers should be told about tamoxifen therapy • To report vaginal bleeding immediately
- **Tumor flare**—increase in size of tumor, increased bone pain—may occur and will subside rapidly; may take analgesics for pain • That premenopausal women must use mechanical birth control because ovulation may be induced • That hair may be lost during treatment; that a wig or hairpiece may make patient feel better; that new hair may be different in color, texture

☼ Canada only Side effects: *italics* = common; **bold** = life-threatening ⚠

Nurse Alert

tamsulosin (Rx)

(tam-sue-lo'sen)

Flomax

Func. class.: Selective α_1 -peripheral adrenergic blocker, BPH agent *Chem. class.:*

Sulfamoylphenethylamine derivative

Do not confuse: Flomax/Fosamax/Volmax

ACTION:

Binds preferentially to α_{1A} - adrenoceptor subtype, which is located mainly in the prostate

USES:

Symptoms of benign prostatic hyperplasia (BPH)

CONTRAINDICATIONS:

Hypersensitivity

Precautions: Pregnancy (B), breastfeeding, children, hepatic disease, CAD, severe renal disease, prostate cancer; cataract surgery (floppy iris syndrome)

DOSAGE AND ROUTES

Calculator

• **Adult: PO** 0.4 mg/day increasing to 0.8 mg/day if required after 2-4 wk

Available forms: Caps 0.4 mg

Administer:

- Without regard to food
- Swallow caps whole; do not break, crush, or chew
- Give 1/2 hr after same meal each day
- If treatment is interrupted for several days, restart at lowest dose (0.4 mg/day)

SIDE EFFECTS

CNS: Dizziness, headache, asthenia, insomnia

CV: Chest pain, orthostatic hypotension

EENT: Amblyopia, floppy iris syndrome

GI: Nausea, diarrhea, dysgeusia

GU: Decreased libido, abnormal ejaculation, **priapism**

INTEG: Rash, pruritus, urticaria

MS: Back pain

RESP: Rhinitis, pharyngitis, cough

SYST: **Angioedema**

PHARMACOKINETICS

Peak 4-5 hr, duration 9-15 hr, half-life 9-13 hr, metabolized in liver, excreted via urine, extensively protein bound (98%)

INTERACTIONS

Increase: B/P—prazosin, terazosin, doxazosin, α -blockers, vardenafil

Increase: toxicity—cimetidine

NURSING CONSIDERATIONS

Assess:

- **Prostatic hyperplasia:** change in urinary patterns at baseline and throughout treatment; I&O ratios, weight daily; edema; report weight gain or edema
- **Orthostatic hypotension:** monitor B/P, standing, sitting

Perform/provide:

- Storage in tight container in cool environment

Evaluate:

- Therapeutic response: decreased symptoms of benign prostatic hyperplasia

Teach patient/family:

- Not to drive or operate machinery for 4 hr after 1st dose or after dosage increase
- To continue to take even if feeling better
- To advise providers of all products, herbs taken
- To make position changes slowly because orthostatic hypotension may occur
- To take 1/2 hr before same meal each day
- To teach about priapism (rare)
- Not to crush, break, chew

☛ Canada only Side effects: *italics* = common; **bold** = life-threatening ⚠

Nurse Alert

tapentadol (Rx)

(ta-pen'ta-dol)

Nucynta, Nucynta ER

Func. class.: Analgesic, misc.

Chem. class.: μ -Opioid receptor agonist

Controlled Substance Schedule II

ACTION:

Centrally acting synthetic analgesic; μ -opioid agonist activity is thought to result in analgesia; inhibits norepinephrine uptake

USES:

Moderate to severe pain, diabetic peripheral neuropathy

CONTRAINDICATIONS:

Hypersensitivity, asthma, ileus, respiratory depression

Black Box Warning:

Respiratory depression

Precautions: Pregnancy (C), breastfeeding, children <18 yr, increased intracranial pressure, MI (acute), severe heart disease, respiratory depression, renal/hepatic disease, GI obstruction, ulcerative colitis, sleep apnea, seizure disorder

Black Box Warning:

Accidental exposure, avoid ethanol, substance abuse

DOSAGE AND ROUTES

Calculator

• **Adult: PO** 50-100 mg q4-6hr, may give 2nd dose ≥ 1 hr after 1st dose, max 700 mg on day 1, max 600 mg/day thereafter; ext rel 50 mg q12hr (opioid-naive), titrate to 100-250 mg q12hr, max 250 mg q12hr

Available forms: Tabs 50, 75, 100 mg; tabs ext rel 50, 100, 150, 200, 250 mg

Administer:

- With antiemetic if nausea, vomiting occur
- When pain is beginning to return; determine dosage interval by response
- Do not crush, chew, break, or use with alcohol, ext rel product

SIDE EFFECTS

CNS: *Drowsiness, dizziness, confusion, headache, euphoria*, hallucinations, restlessness, syncope, anxiety, flushing, psychological dependence, insomnia, lethargy, tremor, **seizures**

CV: Palpitations, bradycardia, hypo/hypertension, orthostatic hypotension, sinus tachycardia

GI: *Nausea, vomiting, anorexia, constipation, cramps*, gastritis, dyspepsia, biliary spasms

GU: Urinary retention/frequency

INTEG: *Rash*, urticaria, diaphoresis, pruritus

RESP: **Respiratory depression**, cough

SYST: **Anaphylaxis**, infection, serotonin syndrome

PHARMACOKINETICS

Bioavailability 32%, extensively metabolized by liver, excreted in urine 99%, terminal half-life 4 hr, protein binding 20%

INTERACTIONS

Increase: effects with other CNS depressants—alcohol, opioids, sedative/hypnotics, antipsychotics, skeletal muscle relaxants

Increase: toxicity—MAOIs

Increase: serotonin syndrome—SSRIs, SNRIs, serotonin-receptor agonists, tricyclics

Drug/Herb

Increase: sedative effect—kava, St. John's wort, valerian

NURSING CONSIDERATIONS

Assess:

- **Pain:** intensity, location, type, characteristics; need for pain medication by pain/sedation scoring; physical dependence • I&O ratio; check for decreasing output; may indicate urinary retention
- CNS changes: dizziness, drowsiness, hallucinations, euphoria, LOC, pupil reaction

⚠ Serotonin syndrome: increased heart rate, shivering, sweating, dilated pupils, tremors, high B/P, hyperthermia, headache, confusion; if these occur, stop

product, administer serotonin antagonist if needed • Allergic reactions: rash, urticaria, anaphylaxis

Black Box Warning:

Respiratory dysfunction: respiratory depression, character, rate, rhythm; notify prescriber if respirations are <10/min; B/P, pulse

Perform/provide:

- Storage in light-resistant area at room temp
- Assistance with ambulation
- Safety measures: nightlight, call bell within easy reach

Evaluate:

- Therapeutic response: decrease in pain

Teach patient/family:

- To report any symptoms of CNS changes, allergic reactions, seizures, serotonin syndrome
- That physical dependency may result from extended use
- That withdrawal symptoms may occur: nausea, vomiting, cramps, fever, faintness, anorexia
- To avoid CNS depressants, alcohol
- To avoid driving, operating machinery if drowsiness, dizziness occur
- To change positions slowly to decrease orthostatic hypotension
- To notify prescriber if pregnancy planned, suspected or if breastfeeding

☼ Canada only Side effects: *italics* = common; **bold** = life-threatening ⚠
Nurse Alert

telaprevir

Incivek

Func. class.: Antivirals, antihepatitis agent

Chem. class.: NS3/4A protease inhibitor

ACTION:

Prevents hepatitis C viral (HCV) replication by blocking the proteolytic activity of HCV NS3/4A serine protease; hepatitis C virus NS3/4A serine protease is an enzyme responsible for the conversion of HCV encoded polyproteins to mature/functioning viral proteins. These proteins (NS4A, NS4B, NS5A, NS5B) are needed for viral replication.

USES:

Chronic hepatitis C

CONTRAINDICATIONS:

Pregnancy (X) in combination, male partners of women who are pregnant

Precautions: Breastfeeding, neonates, infants, children, adolescents <18 years of age, anemia, neutropenia, thrombocytopenia, HIV, hepatitis B, decompensated hepatic disease, liver or other organ transplants, serious rashes

DOSAGE AND ROUTES

Calculator

Chronic hepatitis C infection (genotype 1) in compensated liver disease without cirrhosis who are previously untreated or have relapsed after treatment with interferon and ribavirin therapy

- **Adults:** PO 750 mg tid (q7-9 hr) with peginterferon alfa and ribavirin; duration is determined by patient's HCV RNA level at treatment wk 4, 12; if the HCV RNA is undetectable at wk 4, 12, give three-drug regimen for 12 wk then give an additional 12 wk of only peginterferon alfa and ribavirin (24 wk total); if the HCV RNA is detectable but <1000 international units/ml at wk 4 or 12, give three-drug regimen × 12 wk then an additional 36 wk of only peginterferon alfa and ribavirin (48 wk total)

Without cirrhosis who are previously partial or null responders to interferon and ribavirin therapy/or those with cirrhosis:

- **Adults:** PO 750 mg tid (q7-9 hr) with peginterferon alfa and ribavirin; give three-drug regimen × 12 wk then another 36 wk (48 wk total) of only peginterferon alfa and ribavirin

Available forms: Tab 375 mg

Administer:

- Only use in combination with peginterferon alfa and ribavirin; never give as monotherapy

⚠ **Discontinue** in all patients with hepatitis C virus RNA concentrations ≥ 1000 IU/ml at wk 4 or 12 or a confirmed detectable HCV RNA concentration at wk 24

⚠ Any contraindication to peginterferon alfa or ribavirin also applies to this product; see ribavirin or peginterferon alfa monographs for additional information regarding contraindications and warning associated with these products • For relief of mild to moderate rashes, give oral antihistamines and/or topical corticosteroids; treatment with systemic steroids is not recommended

- Give with food, not low-fat

SIDE EFFECTS

CNS: Fatigue

GI: Hemorrhoids, anorectal discomfort, pruritus ani, rectal burning, nausea, diarrhea, vomiting, dysgeusia, hyperbilirubinemia

HEMA: Anemia, decreased Hgb, lymphopenia, leukopenia, neutropenia, thrombocytopenia

INTEG: Drug reaction with eosinophilia, and systemic symptoms (DRESS), Stevens-Johnson Syndrome (SJS), rash, pruritus, severe rashes (bullous rash, vesicular rash, and skin ulcerations)

META: Increased uric acid

PHARMACOKINETICS

59%-76% plasma protein binding, primarily to α 1-acid glycoprotein and albumin; metabolized extensively in liver by hydrolysis, oxidation, reduction by CYP3A4; excreted in feces (82%), exhaled (9%), excreted in urine (1%); elimination half life 4-4.7 hr; steady state half life 9-11 hr, peak 4-5 hr; food increases effect; steady state is reduced by 15% in mild hepatic disease, 46% in moderate hepatic disease (Child-Pugh class B)

INTERACTIONS

⚠ Increase: life-threatening reactions of each product—alfuzosin, ergots (dihydroergotamine, ergotamine, ergonovine, methylergonovine), cisapride, pimozone, lovastatin, simvastatin, ezetimibe, niacin with simvastatin and boceprevir; triazolam, oral midazolam; sildenafil, tadalafil (pulmonary arterial hypertension); do not use concurrently

Increase: effect and adverse reactions of each product—phosphodiesterase type 5 (PDE5) inhibitors (for erectile dysfunction), atorvastatin, lidocaine, atorvastatin, amiodarone, bepridil, flecainide, propafenone, quinidine, digoxin, ketoconazole, itraconazole, posaconazole, voriconazole, desipramine, trazodone, erythromycin, clarithromycin, telithromycin, rifabutin, dexamethasone, felodipine, nicardipine, nifedipine, budesonide, bosentan, warfarin, astemizole, boceprevir, bupivacaine, buspirone, cevimeline, chloroquine, cilostazol, cinacalcet, clomipramine, clonazepam, clopidogrel, clozapine, cyclobenzaprine, dapsone, dextromethorphan, diazepam, diclofenac, disopyramide, disulfiram, dolasetron, donepezil, colchicine, cyclosporine, tacrolimus, sirolimus, buprenorphine, salmeterol, vardenafil, alprazolam, citalopram, amiodipine, diltiazem, nisoldipine, verapamil, systemic corticosteroids, acetaminophen, alfentanil, aliskiren, almotriptan, alosetron, aripiprazole, dutasteride, ebastine, eplerenone, erlotinib, omeprazole, estazolam, eszopiclone, ethosuximide, exemestane, finasteride, flunitrazepam, flurazepam, galantamine, gefitinib, granisetron, halofantrine, haloperidol, hydrocodone, ifosfamide, imipramine, indiplon, isradipine, ivermectin, ixabepilone, losartan, meloxicam, mirtazapine, montelukast, nateglinide, oxybutynin, oxycodone, palonosetron, paricalcitol, prasugrel, praziquantel, quazepam, quetiapine, quinacrine, ramelteon, repaglinide, ropivacaine, selegiline, sibutramine, sitaxsentan, solifenacin, sufentanil, sunitinib, theophylline, aminophylline, tiagabine, tinidazole, tolterodine, tramadol, venlafaxine, amitriptyline, carvedilol, daunorubicin, loratadine, desloratadine, lansoprazole, dextlansoprazole, docetaxel, doxorubicin, droperidol, eletriptan, etoposide, fentanyl, fexofenadine, glyburide, irinotecan, loperamide, maraviroc, mefloquine, mitomycin, morphine, nortriptyline, ondansetron, paclitaxel, plicamycin, risperidone, sertraline, silodosin, teniposide, terfenadine, testosterone, tolvaptan, vinblastine, vincristine and others; use cautiously, may need to reduce dose

Increase: hyperkalemia—drospirenone

Decrease: estrogen levels—ethinyl estradiol

Decrease: telaprevir effect—CYP3A4 inhibitors (phenytoin, carbamazepine, phenobarbital, rifampin)

Decrease: effect of—methadone

Possible treatment failure: efavirenz, ritonavir, atazanavir, lopinavir with ritonavir

Drug/Herb

⚠️ Do not use with St. John's wort

NURSING CONSIDERATIONS

Assess:

⚠️ **Pregnancy:** pregnancy (X) combination therapy; obtain a pregnancy test before, monthly during, and for 6 months after treatment is completed; those who are not willing to practice strict contraception should not receive treatment with these products; report any cases of prenatal ribavirin exposure to the Ribavirin Pregnancy registry at (800) 593-2214

⚠️ **Anemia:** monitor hemoglobin before, at treatment wk 4, 8, 12, and as needed; if Hgb is <10 g/dL, decrease ribavirin dosage; if Hgb is <8.5 g/dL, discontinuation of therapy is recommended; telaprevir dosage should not be altered based on adverse reactions; anemia may be managed through ribavirin dose modifications; never alter the dose of telaprevir; if anemia persists despite a reduction in ribavirin dose, consider discontinuing telaprevir; if management of anemia requires permanent discontinuation of ribavirin, treatment with telaprevir must also be permanently discontinued; once telaprevir has been discontinued, it must not be restarted; monitor CBC with differential at treatment wk 4, 8, 12, and at other treatment points ⚠️ **Stevens-Johnson syndrome:** eosinophilia, fever, mucosal skin erosion, mucosal ulceration, target lesions; if serious skin reaction occurs, immediately discontinue all components of the three-drug regimen and refer the patient for urgent medical care • Thyroid function tests, LFTs, serum bilirubin/creatinine, BUN, bilirubin, serum electrolytes, serum uric acid, baseline and periodically during treatment

Perform/provide:

- Storage of tablet at room temperature

Evaluate:

- Decreasing hepatitis C viral infection

Teach patient/family:

⚠️ To use two forms of effective contraception (intrauterine devices and barrier

methods) during treatment and for 6 months after treatment (pregnancy category X), not to breastfeed ⚠️ That if a serious skin reaction occurs, to seek urgent medical care; all components of the triple-drug regimen must be discontinued immediately

🇨🇦 Canada only Side effects: *italics* = common; **bold** = life-threatening ⚠️
Nurse Alert

telavancin (Rx)

(tel-a-van'sin)

Vibativ

Func. class.: Antiinfective, miscellaneous

Chem. class.: Lipoglycopeptide

ACTION:

Inhibits bacterial cell wall synthesis, blocks glycopeptides

USES:

Skin/skin-structure infections caused by *Enterococcus faecalis*, *E. faecium*, *Staphylococcus aureus* (MSRA), *S. aureus* (MSSA), *S. epidermidis*, *S. haemolyticus*, *Streptococcus agalactiae* (group B), *S. dysgalactiae*, *S. pyogenes* (group A β -tremolytic), *S. anginosus*, *S. intermedius*, *S. constellates*

Unlabeled uses: Nosocomial pneumonia caused by susceptible gram-positive bacteria

CONTRAINDICATIONS:

Hypersensitivity

Precautions: Breastfeeding, children, geriatric patients, renal disease, antimicrobial resistance, diabetes mellitus, diarrhea, GI disease, heart failure, hypertension, pseudomembranous colitis, QT prolongation, vancomycin hypersensitivity

Black Box Warning:

Pregnancy (C), females

DOSAGE AND ROUTES

Calculator

- **Adult: IV INF** 10 mg/kg over 60 min q24hr $\times$ 7-14 days

Nosocomial pneumonia (unlabeled)

- **Adult: IV INF** 10 mg/kg q24hr $\times$ 7-21 days

Available forms: Lyophilized powder for inj 250, 750 mg

Administer:

- Use only for susceptible organisms to prevent drug-resistant bacteria
- Antihistamine if red-man syndrome occurs: decreased B/P; flushing of neck,

face

Intermittent IV INF route

- After reconstitution with 15 ml D₅W sterile water for inj; 0.9% NaCl (15 mg/ml) 250-mg vial; add 45 ml to 750-mg vial (15 mg/ml) for dose of 150-800 mg; further dilute with 100-250 ml of compatible sol; for dose <150 mg or >800 mg, further dilute to conc of 0.6-8 mg/ml with compatible sol; give over 60 min; reconstituted or diluted sol is stable for 4 hr room temperature, 7 hr refrigerated

SIDE EFFECTS

CNS: Anxiety, chills, flushing, headache, insomnia

CV: QT prolongation, irregular heartbeat

EENT: Hearing loss

GI: Nausea, vomiting, pseudomembranous colitis, abdominal pain, constipation, diarrhea, metallic taste

GU: Nephrotoxicity, increased BUN, creatinine, renal failure, foamy urine

HEMA: Leukopenia, eosinophilia, anemia, thrombocytopenia

INTEG: Chills, fever, rash, thrombophlebitis at inj site; urticaria, pruritus, necrosis (red-man syndrome)

SYST: Anaphylaxis, superinfection

PHARMACOKINETICS

Onset rapid, half-life 8-9 hr, excreted in urine (76%), protein binding 90%

INTERACTIONS

⚠ **Increase:** ototoxicity or nephrotoxicity—aminoglycosides, cephalosporins, colistin, polymyxin, bacitracin, CISplatin, amphotericin B, nondepolarizing muscle relaxants, cidofovir ⚠ **Increase:** QT prolongation—class IA, III antidysrhythmics; some phenothiazines; chloroquine, clarithromycin, droperidol, dronedarone, erythromycin, haloperidol, levomethadyl, methadone, pimozide, ziprasidone

Drug/Lab Test

False increase: INR, PT, PTT

NURSING CONSIDERATIONS

Assess:

- **Infection:** WBC, urine, stools, sputum, characteristics of wound throughout treatment C&S

- I&O ratio; report hematuria, oliguria; nephrotoxicity may occur

Black Box Warning:

Obtain a pregnancy test before use; if a woman has taken this product during pregnancy, the national registry should be notified at 866-658-4228

- Auditory function during, after treatment; hearing loss; ringing, roaring in ears; product should be discontinued • B/P during administration; sudden drop may indicate red-man syndrome; also flushing, pruritus, rash • Respiratory status: rate, character, wheezing, tightness in chest

- Allergies before treatment, reaction to each medication

Perform/provide:

- EPINEPHrine, suction, tracheostomy set, endotracheal intubation equipment on unit; anaphylaxis may occur • Adequate intake of fluids (2 L/day) to prevent nephrotoxicity

Evaluate:

- Therapeutic response: negative culture

Teach patient/family:

- About all aspects of product therapy; that culture may be taken after completed course of medication • To report sore throat, fever, fatigue; could indicate superinfection; diarrhea (**pseudomembranous colitis**)

- To use contraception while taking this product, do not breastfeed

🌿 Canada only Side effects: *italics* = common; **bold** = life-threatening ⚠️
Nurse Alert

telbivudine (Rx)

(tel-bi'vyoo-deen)

Sebivo , Tyzeka

Func. class.: Antiretroviral

Chem. class.: Nucleoside reverse transcriptase inhibitor (NRTI)

ACTION:

Inhibits replication of HBV DNA polymerase, which inhibits HBV replication

USES:

Treatment of chronic hepatitis B

CONTRAINDICATIONS:

Hypersensitivity, breastfeeding

Precautions: Pregnancy (B), children, severe renal disease, anemia, organ transplant, dialysis, HIV, obesity, alcoholism; Hispanic or African descendents (safety not established)

Black Box Warning:

Impaired hepatic function, lactic acidosis

DOSAGE AND ROUTES

Calculator

- **Adult and adolescent >16 yr: PO** 600 mg/day; max 600 mg/day

Renal dose

- **Adult: PO** CCr 30-49 ml/min, 600 mg tab q48hr or 400 mg oral sol daily; CCr <30 ml/min (not requiring dialysis), 600 mg tab q72hr or 200 mg oral sol daily

Available forms: Tabs 600 mg

Administer:

- With/without food with a full glass of water

SIDE EFFECTS

CNS: Fever, headache, malaise, weakness, dizziness, insomnia

EENT: Taste change, hearing loss, photophobia

GI: Nausea, vomiting, diarrhea, anorexia, abdominal pain, hepatomegaly

INTEG: Rash

MISC: Lactic acidosis

MS: Myalgia, arthralgia, muscle cramps

RESP: Cough

PHARMACOKINETICS

Excreted by kidneys (unchanged), steady state 5-7 days, protein binding 3.3%, terminal half-life 40-49 hr, peak 1-4 hr

INTERACTIONS

- Altered telbivudine levels: any agent altering renal function
- Do not use with pegylated interferon α -2a

Increase: myopathy risk possible—HMG-CoA reductase inhibitors, fibric acid derivatives, penicillamine, zidovudine, ZDV, cycloSPORINE, erythromycin, niacin, azole antifungals, corticosteroids, hydrochloroquine

NURSING CONSIDERATIONS

Assess:

Black Box Warning:

LFTs, hepatitis B serology, creatine kinase, periodically, monitor HBV DNA after 24 wk; if viral suppression incomplete (≥ 300 copies/ml), start alternate therapy; monitor HBV DNA q6mo

Black Box Warning:

Lactic acidosis: obtain baseline liver function tests; if elevated, discontinue treatment; discontinue even if liver function tests normal but lactic acidosis, hepatomegaly present, may be fatal

Perform/provide:

- Storage at room temp

Evaluate:

- Therapeutic response: decreasing hepatitis B serology

Teach patient/family:

- That GI complaints and insomnia may resolve after 3-4 wk of treatment
 - That product does not cure hepatitis B and does not stop its spread to others
 - That follow-up visits must be continued
 - That serious product interactions may occur if OTC products are ingested; to check with prescriber before taking
 - That product may cause dizziness; to avoid hazardous activities until response is known
 - To report symptoms of cough, difficulty sleeping, excessive headache, muscle pain/weakness
-

🍁 Canada only Side effects: *italics* = common; **bold** = life-threatening ⚠️
Nurse Alert

telmisartan (Rx)

(tel-mih-sar'tan)

Micardis

Func. class.: Antihypertensive

Chem. class.: Angiotensin II receptor (Type AT₁) antagonist

ACTION:

Blocks the vasoconstricting and aldosterone-secreting effects of angiotensin II; selectively blocks the binding of angiotensin II to the AT₁ receptor found in tissues

USES:

Hypertension, alone or in combination; stroke, MI prophylaxis (>55 yr) in patients unable to take ACE inhibitors

Unlabeled uses: Heart failure

CONTRAINDICATIONS:

Hypersensitivity

Black Box Warning:

Pregnancy (D) 2nd/3rd trimesters

Precautions: Pregnancy (C) 1st trimester, breastfeeding, children, geriatric patients; hypersensitivity to ACE inhibitors; renal/hepatic disease, renal artery stenosis, dialysis, CHF, hyperkalemia, hypotension, hypovolemia

DOSAGE AND ROUTES

Calculator

- **Adult: PO** 40 mg/day; range 20-80 mg/day

Stroke, MI prophylaxis

- **Adult >55 yr: PO** 80 mg/day

Available forms: Tabs 20, 40, 80 mg

Administer:

- Without regard to meals
- Increased dose to African American patients or consider alternative agent; B/P response may be reduced

SIDE EFFECTS

CNS: Dizziness, insomnia, *anxiety*, headache, fatigue

GI: Diarrhea, dyspepsia, *anorexia*, vomiting

MS: Myalgia, pain

RESP: Cough, *upper respiratory infection*, sinusitis, pharyngitis

PHARMACOKINETICS

Onset of antihypertensive activity 3 hr, peak 0.5-1 hr, extensively metabolized, terminal half-life 24 hr, protein binding 99.5%, excreted in feces >97%, B/P response is less in African American patients

INTERACTIONS

Increase: digoxin peak/trough concentrations—digoxin

Increase: antihypertensive action—diuretics, other antihypertensives, NSAIDs

Increase: hyperkalemia—potassium-sparing diuretics, potassium salt substitutes

Decrease: antihypertensive effect—NSAIDs, salicylates

Drug/Lab Test

Increase: LFTs

NURSING CONSIDERATIONS

Assess:

- B/P, pulse standing, lying; note rate, rhythm, quality; if severe hypotension occurs, place in supine position and give IV NS
- Baselines of renal, hepatic studies before therapy begins
- **CHF:** edema in feet, legs daily; jugular venous distention; dyspnea, crackles

Evaluate:

- Therapeutic response: decreased B/P

Teach patient/family:

- To comply with dosage schedule, even if feeling better; to take at same time of day; that therapeutic effect may take 2-4 wk
- To notify prescriber of mouth sores, fever, swelling of hands or feet, irregular heartbeat, chest pain, decreased urine output
- That excessive perspiration, dehydration, vomiting, diarrhea may lead to fall in blood pressure; to consult prescriber if these occur
- That product may cause dizziness, fainting, lightheadedness

Black Box Warning:

To notify prescriber if pregnancy is planned or suspected, pregnancy category (D) 2nd/3rd trimester

- To notify prescriber of all prescriptions, OTC products, and supplements taken
- **Overdose:** dizziness, bradycardia or tachycardia

🍁 Canada only Side effects: *italics* = common; **bold** = life-threatening ⚠️
Nurse Alert

temazepam (Rx)

(te-maz'e-pam)

Restoril

Func. class.: Sedative/hypnotic

Chem. class.: Benzodiazepine, short to intermediate acting

Controlled Substance Schedule IV (USA), Schedule F (Canada)

Do not confuse: temazepam/flurazepam

ACTION:

Produces CNS depression at limbic, thalamic, hypothalamic levels of the CNS; may be mediated by neurotransmitter γ -aminobutyric acid (GABA); results are sedation, hypnosis, skeletal muscle relaxation, anticonvulsant activity, anxiolytic action

USES:

Insomnia, short-term treatment (generally 7-10 days)

CONTRAINDICATIONS:

Pregnancy (X), breastfeeding, hypersensitivity to benzodiazepines, intermittent porphyria

Precautions: Children <15 yr, geriatric patients, anemia, renal/hepatic disease, suicidal individuals, drug abuse, psychosis, acute closed-angle glaucoma, seizure disorders, angioedema, sleep-related behaviors (sleepwalking), pulmonary disease

DOSAGE AND ROUTES

Calculator

- **Adult: PO** 7.5 to 30 mg at bedtime
- **Geriatric: PO** 7.5 mg at bedtime

Available forms: Caps 7.5, 15, 22.5, 30 mg

Administer:

- 1/2-1 hr before bedtime for sleeplessness
- On empty stomach for fast onset; may be taken with food if GI symptoms

occur

- Avoid use with CNS depressants; serious CNS depression may result

SIDE EFFECTS

CNS: *Lethargy, drowsiness, daytime sedation*, dizziness, confusion, lightheadedness, headache, anxiety, irritability, complex sleep-related reactions (sleep driving, sleep eating), fatigue

CV: Chest pain, pulse changes, hypotension

EENT: Blurred vision

GI: Nausea, vomiting, diarrhea, heartburn, abdominal pain, constipation, anorexia

SYST: Severe allergic reactions

PHARMACOKINETICS

Onset 30 min, peak 1-2 hr, duration 6-8 hr, half-life 10-20 hr, metabolized by liver, excreted by kidneys, crosses placenta, excreted in breast milk, 98% protein binding

INTERACTIONS

Increase: effects of cimetidine, disulfiram, oral contraceptives

Increase: action of both products—alcohol, CNS depressants

Increase: effect of temazepam—probenecid

Decrease: effect of antacids, theophylline, rifampin

Drug/Herb

Increase: CNS depression—hops, kava, valerian, chamomile, skullcap

Drug/Food

Decrease: temazepam effect—caffeine

Drug/Lab Test

Increase: ALT, AST

NURSING CONSIDERATIONS

Assess:

- Mental status: mood, sensorium, affect, memory (long, short), orientation
- Type of sleep problem: falling asleep, staying asleep, baseline, periodically
- **Dependency:** restrict amount given to patient, assess for

physical/psychological dependency; high-level risk for abuse

Perform/provide:

- Assistance with ambulation after receiving dose
- Storage in tight container in cool environment

Evaluate:

- Therapeutic response: ability to sleep at night, decreased early morning awakening if taking product for insomnia

Teach patient/family:

- To avoid driving, other activities requiring alertness until stabilized
- To avoid alcohol ingestion, other CNS depressants
- That effects may take 2 nights for benefits to be noticed
- To limit to 7-10 days of continuous use
- About alternative measures to improve sleep: reading, exercise several hours before bedtime, warm bath, warm milk, TV, self-hypnosis, deep breathing • Not to discontinue abruptly, withdraw gradually
- That complex sleep-related behaviors may occur: sleep driving/eating
- That hangover, memory impairment are common in geriatric patients but less common than with barbiturates ⚠️ To notify prescriber if pregnancy is planned or suspected, pregnancy (X); to use contraception while taking this product

TREATMENT OF OVERDOSE:

Lavage, activated charcoal; monitor electrolytes, VS

🌿 Canada only Side effects: *italics* = common; **bold** = life-threatening ⚠️
Nurse Alert

temozolomide (Rx)

(tem-oh-zole'oh-mide)

Temodar

Func. class.: Antineoplastic-alkylating agent

Chem. class.: Imidazotetrazine derivative

ACTION:

Prodrug that undergoes conversion to MTIC; MTIC action prevents DNA transcription

USES:

Anaplastic astrocytoma with relapse, glioblastoma multiforme, malignant glioma

Unlabeled uses: Metastatic melanoma

CONTRAINDICATIONS:

Pregnancy (D), breastfeeding; hypersensitivity to this product, carbazine, or gelatin

Precautions: Geriatric patients, radiation therapy, renal/hepatic disease, bone marrow suppression, infection, myelosuppression

DOSAGE AND ROUTES

Calculator

Anaplastic astrocytoma

- **Adult: PO** adjust dose based on nadir neutrophil and platelet counts 150 mg/m²/day × 5 days during a 28-day cycle

Glioblastoma multiforme

- **Adult: PO/IV** 75 mg/m²/day × 42 days with focal radiotherapy then maintenance of 6 cycles

Malignant glioma

- **Adult: IV** 150 mg/m²/day over 90 min on days 1-5 q28days, may increase to 200 mg/m²/day on days 1-5 q28days if hematologic parameters permit

Available forms: Caps 5, 20, 100, 140, 180, 250 mg; powder for inj 100 mg

Administer:

PO route

- Do not break, crush, chew, open caps
- Antiemetic 30-60 min before product to prevent vomiting
- Caps 1 at a time with 8 oz of water at same time of day
- Fluids IV or PO before chemotherapy to hydrate patient
- If caps accidentally damaged, do not allow contact with skin or inhale
- Use proper procedures for handling/disposing of chemotherapy products
- Give on empty stomach at bedtime to prevent nausea/vomiting

IV route

- Bring vial to room temp, discard if cloudy
- Inject 41 ml sterile water for inj into vial (2.5 mg/ml)
- Gently swirl, do not shake

Intermittent IV INF route

- Withdraw up to 40 ml from each vial to make total dose, transfer to empty 250-ml PVC inf bag, flush before and after inf • Run over 90 min
- Use reconstituted sol within 14 hr, including inf time
- Do not admix

SIDE EFFECTS

CNS: *Seizures, hemiparesis, dizziness, poor coordination, amnesia, insomnia, paresthesia, somnolence, paresis, ataxia, anxiety, dysphagia, depression, confusion*

GI: *Nausea, anorexia, vomiting, abdominal pain, constipation*

GU: *Urinary incontinence, UTI, frequency*

HEMA: *Thrombocytopenia, leukopenia, anemia, myelosuppression, neutropenia*

INTEG: *Rash, pruritus*

MISC: *Headache, fatigue, asthenia, fever, edema, back pain, weight increase, diplopia*

RESP: *URI, pharyngitis, sinusitis, coughing*

SYST: *Anaphylaxis, secondary malignancy*

PHARMACOKINETICS

Absorption complete, rapid; crosses blood-brain barrier; excreted in urine, feces; half-life 1.8 hr; peak 1 hr

INTERACTIONS

- Do not use within 24 hr of sargramostim, filgrastim, G-CSF

Increase: myelosuppression—radiation, other antineoplastics

Increase: bleeding risk—NSAIDs, anticoagulants, platelet inhibitors, thrombolytics

Decrease: antibody reaction—live virus vaccines, toxoids

Decrease: action of digoxin

Drug/Food

Decrease: drug absorption

Drug/Lab Test

Decrease: Hgb, platelets, WBC, neutrophils

NURSING CONSIDERATIONS

Assess:

- Tumor response during treatment
- CBC on day 22 (21 days after 1st dose), CBC weekly until recovery if ANC is $<1.5 \times 10^9/L$ and platelets $<100 \times 10^9/L$, do not administer to patients who do not tolerate 100 mg/m^2 , myelosuppression usually occurs late during the treatment cycle • Seizures throughout treatment; mental status
- Monitor temp; may indicate beginning infection
- Hepatic studies before, during therapy (bilirubin, AST, ALT, LDH), as needed or monthly
- Bleeding: hematuria, guaiac, bruising, petechiae, mucosa or orifices

Perform/provide:

- Storage in light-resistant container in a dry area

Evaluate:

- Therapeutic response: decreased tumor size, spread of malignancy

Teach patient/family:

- To report signs of infection: fever, sore throat, flulike symptoms
- To report signs of anemia: fatigue, headache, faintness, SOB, irritability
- To report bleeding; to avoid use of razors, commercial mouthwash
- To notify prescriber if pregnancy is planned or suspected, pregnancy (D); not to breastfeed

Nurse Alert

temsirolimus (Rx)

(tem-sir-oh'li-mus)

Torisel

Func. class.: Biologic response modifier

Chem. class.: Kinase inhibitor, mTOR antagonist

ACTION:

Inhibits mammalian target of rapamycin (mTOR), a protein kinase

USES:

Renal cell carcinoma

Unlabeled uses: Mantle cell lymphoma, relapsed/refractory high-grade malignant gliomas, neuroblastoma, rhabdomyosarcoma in children

CONTRAINDICATIONS:

Pregnancy (D), breastfeeding; hypersensitivity to this product or to sirolimus; polysorbate 80

Precautions: Children <13 yr, females, severe pulmonary/renal/hepatic disease (bilirubin >1-1.5×ULN or AST >ULN but bilirubin ≤ULN), diabetes mellitus, hyperkalemia, hyperuricemia, hypertension, bone marrow suppression, hypertriglyceridemia/hyperlipidemia, surgery, brain tumors

DOSAGE AND ROUTES

Calculator

• **Adult: IV** 25 mg over 30-60 min weekly; treat until disease progression or severe toxicity occurs

Hepatic dose

• **Adult: IV** (mild impairment) bilirubin >1-1.5×ULN or AST >ULN but bilirubin ≤ULN; reduce to 15 mg/wk; (moderate or severe impairment, do not use)

Available forms: 25 mg/ml sol for inj kit

Administer:

- Using in-line filter ≤5 microns and inf pump
- Premedicate with 25-50 mg diphenhydramine IV 30 min before dose; if reaction occurs, stop for 1/2-1 hr, may resume at slower rate
- Over 30-60 min,

complete inf within 6 hr

- Dilute product with 1.8 ml provided diluent, result is 3 ml (10 mg/ml); invert to mix well; withdraw required amount and inject rapidly into 250 ml of NS; do not use PVC inf bags/sets
- Protect from light during preparation, use only glass

SIDE EFFECTS

CNS: Headache, seizures

CV: Hypertension, thrombophlebitis

ENDO: Hypertriglyceridemia, hyperlipidemia, hyperglycemia

GI: Nausea, vomiting, diarrhea, constipation, bowel perforation

GU: UTIs, albuminuria, hematuria, proteinuria, renal failure, mucositis

HEMA: Anemia, leukopenia, thrombocytopenia

INTEG: Rash, pruritus

META: Metabolic acidosis, hyperglycemia, hyperlipidemia

RESP: Interstitial lung disease

SYST: Lymphoma

PHARMACOKINETICS

Rapidly absorbed, peak 0.5-2 hr, extensively metabolized via liver by P450 3A4, eliminated via feces

INTERACTIONS

Increase: blood levels—CYP3A4 inhibitors, antifungals, calcium channel blockers, cimetidine, clarithromycin, danazol, erythromycin, cycloSPORINE, metoclopramide, bromocriptine, HIV-protease inhibitors, benzodiazepines, HMG-CoA reductase inhibitors

Increase: toxicity—SUNItinib

Decrease: blood levels—CYP3A4 inducers, carbamazepine, dexamethasone, PHENobarbital, phenytoin, rifamycin, rifapentine

Decrease: effect of vaccines—avoid with vaccines

Drug/Herb

Decrease: sirolimus effect—St. John's wort

Increase: effect—ginseng, maitake, mistletoe

Decrease: immunosuppression—astragalus, echinacea, melatonin

Drug/Food

- Alters bioavailability; use consistently with/without food; do not use with grapefruit juice

NURSING CONSIDERATIONS

Assess:

- Cardiac status: B/P, heart rate
- Interstitial lung disease
- Hypersensitivity reactions: anaphylaxis
- Lipid profile: cholesterol, triglycerides; lipid-lowering agent may be needed; blood glucose
- ⚠ Infection and development of lymphoma

⚠ Blood studies: Hgb, WBC, platelets during treatment monthly • Renal studies: BUN, creatinine, phosphate potassium; proteinuria, hematuria, albuminemia may indicate renal failure • **Hepatic disease:** monitor liver function tests at baseline and periodically

Evaluate:

- Therapeutic response: decreased time of progression of renal cell carcinoma

Teach patient/family:

• To report fever, rash, severe diarrhea, chills, sore throat, fatigue; that serious infections may occur; to report clay-colored stools, cramping (**hepatotoxicity**), excessive thirst, urinary frequency, new or worsening breathing problems, blood in stool, abdominal pain • To avoid crowds, persons with known infections to reduce risk of infection

⚠ To use contraception before, during, for 12 wk after product discontinued; to avoid breastfeeding; that men should also use reliable contraception during and for 12 wk after cessation of product, pregnancy (D)

🍁 Canada only Side effects: *italics* = common; **bold** = life-threatening ⚠

Nurse Alert

HIGH ALERT

tenecteplase (TNK-tPA)(Rx)

(ten-ek'ta-place)

TNKase

Func. class.: Thrombolytic

Chem. class.: Tissue plasminogen activator

ACTION:

Activates conversion of plasminogen to plasmin (fibrinolysin): plasmin breaks down clots (fibrin), fibrinogen, factors V, VII; occlusion of venous access lines

USES:

Acute myocardial infarction, coronary artery thrombosis

CONTRAINDICATIONS:

Hypersensitivity, arteriovenous malformation, aneurysm, active bleeding, intracranial/intraspinal surgery or trauma within 2 mo, CNS neoplasms, severe hypertension, severe renal/hepatic disease, history of CVA, increased ICP/stroke

Precautions: Pregnancy (C), breastfeeding, children, geriatric patients, arterial emboli from left side of heart, hypocoagulation, subacute bacterial endocarditis, rheumatic valvular disease, cerebral embolism/thrombosis/hemorrhage, intraarterial diagnostic procedure or surgery (10 days), recent major surgery, dysrhythmias, hypertension

DOSAGE AND ROUTES

Calculator

Total dose, max 50 mg based on patient's weight

- **Adult <60 kg: IV BOL** 30 mg, give over 5 sec
- **Adult ≥60-<70 kg: IV BOL** 35 mg, give over 5 sec
- **Adult ≥70-<80 kg: IV BOL** 40 mg, give over 5 sec
- **Adult ≥80-<90 kg: IV BOL** 45 mg, give over 5 sec
- **Adult ≥90 kg: IV BOL** 50 mg, give over 5 sec, max 50 mg total dose

Available forms: Powder for inj, lyophilized 50 mg

Administer:

Intermittent IV INF route

- As soon as thrombi identified; not useful for thrombi >1 wk old
- Cryoprecipitate or fresh frozen plasma if bleeding occurs
- Heparin after fibrinogen level >100 mg/dl; heparin inf to increase PTT to 1.5-2× baseline for 3-7 days; IV heparin with loading dose is recommended
- Aseptically withdraw 10 ml of sterile water for inj from diluent vial, use red cannula syringe-filling device, inject all contents of syringe into product vial, direct into powder, swirl, withdraw correct dose, discard any unused sol; stand shield with dose vertically on flat surface and passively recap red cannula, remove entire shield assembly by twisting counter-clockwise, give by IV BOL
- IV therapy: use upper-extremity vessel that is accessible to manual compression
- If product not used immediately, refrigerate, use within 8 hr; not compatible with dextrose; flush dextrose-containing lines with saline before and after administration

SIDE EFFECTS

CV: Dysrhythmias, hypotension, pulmonary edema, **pulmonary embolism, cardiogenic shock, cardiac arrest, heart failure, myocardial reinfarction, myocardial rupture, tamponade, pericarditis, pericardial effusion, thrombosis, CVA**

HEMA: Decreased Hct, **bleeding**

INTEG: Rash, urticaria, phlebitis at IV inf site, itching, flushing

SYST: **GI, GU, intracranial, retroperitoneal bleeding, surface bleeding, anaphylaxis**

PHARMACOKINETICS

IV: Onset immediate, half-life 20-24 min, metabolized by liver

INTERACTIONS

Increase: bleeding—**aspirin, indomethacin, phenylbutazone, anticoagulants, antithrombolytics, glycoprotein IIb/IIIa inhibitors, dipyridamole, clopidogrel, ticlopidine, NSAIDs, cefamandole, cefoperazone, cefoTEtan, SSRIs, SNRIs**

Drug/Herb

Increase: risk of bleeding—feverfew, garlic, ginger, ginkgo, green tea, horse chestnut

Drug/Lab Test

Increase: INR, PT, PTT

NURSING CONSIDERATIONS

Assess:

- **Allergy:** fever, rash, itching, chills; mild reaction may be treated with antihistamines
- Cholesterol embolism, blue-toe syndrome, renal failure, MI, cerebral/spinal cord/bowel/retinal infarction, hypertension; can be fatal ⚠

Bleeding during 1st hr of treatment; hematuria, hematemesis, bleeding from mucous membranes, epistaxis, ecchymosis; may require transfusion (rare), continue to assess for bleeding for 24 hr

- Blood studies (Hct, platelets, PTT, PT, TT, aPTT) before starting therapy; PT or aPTT must be $<2\times$ control before starting therapy; PTT or PT q3-4hr during treatment
- Hypersensitive reactions: fever, rash, dyspnea; product should be discontinued

- VS, B/P, pulse, respirations, neurologic signs, temp at least q4hr; temp $>104^{\circ}\text{F}$ (40°C) indicates internal bleeding; systolic pressure increase $>25\text{ mm Hg}$ should be reported to prescriber ⚠
- Neurologic changes that may indicate intracranial bleeding ⚠
- Retroperitoneal bleeding: back pain, leg weakness, diminished pulses

Perform/provide:

- Bed rest during entire course of treatment
- Avoidance of venous or arterial puncture, inj, rectal temp, any invasive treatment
- Treatment of fever with acetaminophen or aspirin
- Pressure for 30 sec to minor bleeding sites; inform prescriber if this does not attain hemostasis; apply pressure dressing

Evaluate:

- Therapeutic response: resolution of MI

Teach patient/family:

- About proper dental care to avoid bleeding
 - To notify prescriber immediately of sudden, severe headache
 - To notify prescriber of bleeding; hypersensitivity; fast, slow, or uneven heart rate; feeling of faintness; blood in urine, stools; nose bleeds
-

🍁 Canada only Side effects: *italics* = common; **bold** = life-threatening ⚠️
Nurse Alert

tenofovir (Rx)

(ten-oh-foh'veer)

Viread

Func. class.: Antiretroviral

Chem. class.: Nucleoside reverse transcriptase inhibitor (NRTI)

ACTION:

Inhibits replication of HIV virus by competing with the natural substrate and then incorporating into cellular DNA by viral reverse transcriptase, thereby terminating cellular DNA chain

USES:

HIV-1 infection with at least 2 other antiretrovirals, hepatitis B

CONTRAINDICATIONS:

Hypersensitivity

Black Box Warning:

Lactic acidosis

Precautions: Pregnancy (B), breastfeeding, children, geriatric patients, renal disease, CCr <60 ml/min, osteoporosis, immune reconstitution syndrome

Black Box Warning:

Hepatic disease, hepatitis

DOSAGE AND ROUTES

Calculator

- **Adult: PO** 300 mg/day with meal; if used with didanosine, give tenofovir 2 hr before or 1 hr after didanosine
- **Child ≥2 yr: PO** 8 mg/kg daily approximate; ≥35 kg 300 mg daily; 28-34 kg 250 mg daily; 22-27 kg 200 mg daily; 17-21 kg 150 mg daily

Renal dose

- **Adult: PO** CCr 30-49 ml/min, 300 mg q48hr; CCr 10-29 ml/min, 300 mg q72-96hr; CCr <10 ml/min, not recommended

Available forms: Tabs 150, 200, 250, 300 mg; oral powder 40 mg/scoop

Administer:

- Without regard to food

- 2 hr before or 1 hr after didanosine (if used)
- **Oral powder:** use scoop provided, mix powder into 2-4 oz (1/4-1/2 cup) of applesauce, yogurt, do not mix with liquid, product is bitter, use immediately after mixing, clean scoop

SIDE EFFECTS

CNS: *Headache, asthenia*

GI: *Nausea, vomiting, diarrhea, anorexia, flatulence, abdominal pain, pancreatitis*

GU: *Renal failure, renal tubular acidosis/necrosis, Fanconi syndrome*

HEMA: Neutropenia, osteopenia

INTEG: *Rash, angioedema*

META: *Lactic acidosis*, hypokalemia, hypophosphatemia

MS: Myopathy, *rhabdomyolysis*

SYST: Lipodystrophy

PHARMACOKINETICS

Rapidly absorbed, distributed to extravascular space, excreted unchanged in urine 70%-80%, terminal half-life 17 hr, peak 1-2 hr

INTERACTIONS

Increase: tenofovir level—cidofovir, acyclovir, valacyclovir, ganciclovir, valganciclovir

Increase: level of didanosine when given with tenofovir

Increase: tenofovir level—any product that decreases renal function

NURSING CONSIDERATIONS

Assess:

- Viral load, CD4+ T-cell count, plasma HIV RNA, serum creatinine/BUN/phosphate
- Resistance testing at start of therapy and at treatment failure
- Hepatic studies: AST, ALT, bilirubin; amylase, lipase, triglycerides periodically during treatment
- Bone, renal toxicity: if bone abnormalities are suspected, obtain tests; serum phosphorus, creatinine
- **Lactic acidosis, severe hepatomegaly with steatosis, Fanconi syndrome:** obtain baseline liver

function tests; if elevated, discontinue treatment; discontinue even if liver function tests normal but lactic acidosis, hepatomegaly present, may be fatal

Perform/provide:

- Storage at 25° C (77° F)

Evaluate:

- Therapeutic response: decrease in signs, symptoms of HIV

Teach patient/family:

- To take without regard to food
- That GI complaints resolve after 3-4 wk of treatment
- **Not to breastfeed while taking this product**
- That product must be taken daily even if patient feels better
- That follow-up visits must be continued because serious toxicity may occur; that blood counts must be done q2wk • That product will control symptoms but is not a cure for HIV; that patient is still infectious, may pass HIV virus on to others • That other products may be necessary to prevent other infections
- That changes in body fat distribution may occur
- **To notify prescriber of symptoms of lactic acidosis**

☼ Canada only Side effects: *italics* = common; **bold** = life-threatening ⚠

Nurse Alert

terazosin (Rx)

(ter-ay'zoe-sin)

Func. class.: Antihypertensive

Chem. class.: α -Adrenergic blocker

ACTION:

Decreases total vascular resistance, which is responsible for a decrease in B/P; this occurs by the blockade of α_1 -adrenoreceptors

USES:

Hypertension, as a single agent or in combination with diuretics or β -blockers; BPH

CONTRAINDICATIONS:

Hypersensitivity

Precautions: Pregnancy (C), breastfeeding, children, prostate cancer, renal disease, syncope

DOSAGE AND ROUTES

Calculator

Hypertension

- **Adult: PO** 1 mg at bedtime, may increase dose slowly to desired response; max 20 mg/day

Benign prostatic hyperplasia

- **Adult: PO** 1 mg at bedtime, gradually increase up to 5-10 mg; max 20 mg

Available forms: Caps 1, 2, 5, 10 mg

Administer:

- Give dose at bedtime; patient should not operate machinery because fainting may occur
- If treatment is interrupted for several days, restart with initial dose
- Without regard to food; feeding tube: place cap in 60 ml of warm tap water, stir until liquid spills from ruptured shell (5 min), stir until cap dissolves, draw solution into oral syringe, give through feeding tube, flush with water

SIDE EFFECTS

CNS: *Dizziness, headache, drowsiness, anxiety, depression, vertigo, weakness, fatigue*

CV: Palpitations, orthostatic hypotension, tachycardia, edema, rebound hypertension

EENT: Blurred vision, epistaxis, tinnitus, dry mouth, red sclera, nasal congestion, sinusitis

GI: *Nausea*, vomiting, diarrhea, constipation, abdominal pain

GU: Urinary frequency, incontinence, impotence, priapism

RESP: Dyspnea, cough, pharyngitis

PHARMACOKINETICS

Half-life 9-12 hr; protein binding 90%-94%; metabolized in liver; excreted in urine, feces, peak 2-3 hr, onset 15 min, duration 24 hr

INTERACTIONS

Increase: hypotensive effects— β -blockers, nitroglycerin, verapamil, other antihypertensives, alcohol

Decrease: hypotensive effects—estrogens, NSAIDs, sympathomimetics, salicylates

Drug/Herb

Increase: antihypertensive effect—hawthorn

Decrease: antihypertensive effect—ephedra

Drug/Lab Test

Decrease: Hgb, WBC, platelets, albumin

NURSING CONSIDERATIONS

Assess:

- **BPH:** urinary patterns (hesitancy, frequency, change in stream, dribbling, dysuria, urgency)
- **Hypertension:** crackles, dyspnea, orthopnea q30min; orthostatic B/P, pulse, jugular venous distention q4hr; weight daily, I&O
- BUN, uric acid if patient receiving long-term therapy

Perform/provide:

- Cool storage in tight container

Evaluate:

- Therapeutic response: decreased B/P, edema in feet, legs; decreased symptoms

of BPH

Teach patient/family:

- That fainting occasionally occurs after 1st dose; not to drive or operate machinery for 4 hr after 1st dose or after an increase in dose; to take 1st dose at bedtime
 - To rise slowly from sitting or lying position
 - Not to discontinue abruptly
 - **Hypertension:** to continue with regimen including diet, exercise
-

☼ Canada only Side effects: *italics* = common; **bold** = life-threatening ⚠
Nurse Alert

terbinafine oral (Rx)

(ter-bin'a-feen)

Lamisil

Func. class.: Antifungal

Chem. class.: Synthetic allylamine derivative

Do not confuse: **terbinafine**/terbutaline

LamISIL/LaMICtal

ACTION:

Interferes with cell-membrane permeability of fungi such as *Trichophyton rubrum*, *Trichophyton mentagrophytes*, *Trichophyton tonsurans*, *Epidermophyton floccosum*, *Microsporum canis*, *Microsporum audouinii*, *Microsporum gypseum*, *Candida*; broad-spectrum antifungal

USES:

(Oral) onychomycosis of toenail or fingernail due to dermatophytes, tinea capitis/corporis/cruris/pedis/versicolor

Unlabeled uses: Cutaneous candidiasis, tinea versicolor

CONTRAINDICATIONS:

Hypersensitivity/olfactory, chronic/active hepatic disease, renal disease GFR ≤ 50 ml/min

Precautions: Pregnancy (B), breastfeeding, children, renal disease

DOSAGE AND ROUTES

Calculator

• **Adult: PO** 250 mg/day $\times$ 6 wk (fingernail); $\times$ 12 wk (toenail)

Available forms: Tabs 250 mg; oral granules 125, 187.5 mg

Administer:

- **PO:** without regard to food
- **Granules:** take with food, sprinkle packet contents on pudding or nonacidic soft food, swallow without chewing, do not use fruit-based foods

SIDE EFFECTS

CNS: Depression

EENT: Tinnitus, hearing impairment

GI: Diarrhea, dyspepsia, vertigo, abdominal pain, nausea, hepatitis

HEMA: Neutropenia

INTEG: Rash, pruritus, urticaria, Stevens-Johnson syndrome, photosensitivity

MISC: Headache, hepatic enzyme changes, taste, visual/olfactory disturbance

PHARMACOKINETICS

Peak 1-2 hr, >99% protein binding, half-life 36 hr

INTERACTIONS

Increase: levels of dextromethorphan

Increase: terbinafine clearance—rifampin

Increase: clearance of cycloSPORINE

Decrease: terbinafine clearance—cimetidine

Decrease: metabolism of—CYP2D6 (antidysrthymics IC, III, amoxapine, atomoxetine, cloZAPine)

Drug/Herb

- Side effects: cola nut, guarana, yerba maté, tea (black, green), coffee

Drug/Lab Test

Increase: LFTs

NURSING CONSIDERATIONS

Assess:

- Hepatic studies (ALT, AST) prior to beginning treatment; do not use in presence of hepatic disease
- CBC in treatment >6 wk
- Continuing infection: increased size, number of lesions

Perform/provide:

- Storage at <25° C (77° F), protect from light

Evaluate:

- Therapeutic response: decrease in size, number of lesions

Teach patient/family:

- That treatment may take 10 wk (toenail), 4 wk (fingernail)
 - To notify prescriber of nausea, vomiting, fatigue, jaundice, dark urine, clay-colored stool, RUQ pain; may indicate hepatic dysfunction
-

🍁 Canada only Side effects: *italics* = common; **bold** = life-threatening ⚠️
Nurse Alert

terbinafine topical

See [Appendix B](#)

terbutaline (Rx)

(ter-byoo'ta-leen)

Bricanyl 

Func. class.: Selective β_2 -agonist; bronchodilator *Chem. class.:* Catecholamine

Do not confuse: **terbutaline**/TOLBUTamide/terbinafine

ACTION:

Relaxes bronchial smooth muscle by direct action on β_2 -adrenergic receptors through the accumulation of cAMP at β -adrenergic receptor sites; bronchodilation, diuresis, CNS, cardiac stimulation occur; relaxes uterine smooth muscle

USES:

Bronchospasm

Unlabeled uses: Premature labor, nonresponsive status asthmaticus in children (IV)

CONTRAINDICATIONS:

Hypersensitivity to sympathomimetics, closed-angle glaucoma, tachydysrhythmias

Precautions: Pregnancy (B), breastfeeding, geriatric patients, cardiac disorders, hyperthyroidism, diabetes mellitus, prostatic hypertension, hypertension, seizure disorder

Black Box Warning:

Labor

DOSAGE AND ROUTES

Calculator

Bronchospasm

• **Adult and child >12 yr:** **PO** 2.5-5 mg q8hr; **SUBCUT** 0.25 mg q15-30min, max 0.5 mg in 4 hr

- **Adolescent ≤ 15 yr and child ≥ 12 yr:** PO 2.5 mg tid, max 7.5 mg/day
- **Child 6-11 yr (unlabeled):** PO 0.05 mg/kg q8hr, may increase slowly

Renal dose

- **Adult:** PO CCr 10-50 ml/min, 50% of dose; CCr < 10 ml/min, avoid use

Tocolytic (preterm labor) (unlabeled)

- **Adult:** SUBCUT 0.25 mg q20min to 6 hr, hold if pulse > 120 bpm

Available forms: Tabs 2.5, 5 mg; inj 1 mg/ml

Administer:

- With food; may be crushed
- 2 hr before bedtime to avoid sleeplessness

IV route (unlabeled)

- Only used if subcut is ineffective
- IV after diluting each 5 mg/1 L D₅W for inf
- IV, run 5 mcg/min; may increase 5 mcg q10min, titrate to response; after 1/2-1 hr, taper dose by 5 mcg; switch to PO as soon as possible

Y-site compatibilities: Insulin (regular)

SIDE EFFECTS

CNS: Tremors, anxiety, insomnia, headache, dizziness, stimulation

CV: Palpitations, tachycardia, hypertension, dysrhythmias, cardiac arrest, QT prolongation

GI: Nausea, vomiting

META: Hypokalemia, hyperglycemia

RESP: Paradoxical bronchospasm, dyspnea

PHARMACOKINETICS

PO: Onset 1/2 hr, peak 1-2 hr, duration 4-8 hr, half-life 3.4 hr

SUBCUT: Onset 6-15 min, peak 1/2-1 hr, duration 1½-4 hr, half-life 5.7 hr

INTERACTIONS

- Hypertensive crisis: MAOIs

Increase: effects of both products—other sympathomimetics

Decrease: action— β -blockers; do not use together

Drug/Herb

Increase: effect—green tea (large amounts), guarana

NURSING CONSIDERATIONS

Assess:

- Respiratory function: vital capacity, forced expiratory volume, ABGs, B/P, pulse, respiratory pattern, lung sounds, sputum before and after treatment
- Tolerance in patients receiving long-term therapy; dose may have to be changed; monitor for rebound bronchospasm  **Paradoxical bronchospasm:** dyspnea, wheezing; keep emergency equipment nearby
- **Labor:** maternal heart rate, B/P, contraction, fetal heart rate; can inhibit uterine contractions, labor; monitor for hypoglycemia

Perform/provide:

- Storage at room temp; do not use discolored sol
- Increase in fluids of >2 L/day

Evaluate:

- Therapeutic response: absence of dyspnea, wheezing

Teach patient/family:

- Not to use OTC medications because extra stimulation may occur
- About all aspects of product; to avoid smoking, smoke-filled rooms, persons with respiratory infections
- To increase fluids by >2 L/day; to allow 15 min between inhalation of product and inhaled product containing steroid
- To take on time; if missed, not to make up after 1 hr, to wait until next dose

🍁 Canada only Side effects: *italics* = common; **bold** = life-threatening 
Nurse Alert

terconazole vaginal antifungal

See [Appendix B](#)

teriparatide (Rx)

(tah-ree-par'ah-tide)

[Forteo](#)

Func. class.: Parathyroid hormone (rDNA)

Chem. class.: Teriparatide

ACTION:

Contains human recombinant parathyroid hormone to stimulate new bone growth

USES:

Postmenopausal women with osteoporosis, men with primary or hypogonadal osteoporosis who are at high risk for fracture, glucocorticoid-induced osteoporosis

Unlabeled uses: Hypoparathyroidism

CONTRAINDICATIONS:

Hypersensitivity, increased baseline risk for osteosarcoma (Paget's disease, open epiphyses; previous bone radiation), bone metastases, history of skeletal malignancies, other metabolic bone diseases, preexisting hypercalcemia

Precautions: Pregnancy (C), breastfeeding, children, urolithiasis, hypotension, use >2 yr, cardiac disease

Black Box Warning:

Secondary malignancy

DOSAGE AND ROUTES

Calculator

• **Adult:** SUBCUT 20 mcg/day up to 2 yr (osteoporosis); long-term/lifetime use is recommended (glucocorticoid-induced osteoporosis)

Available forms: Prefilled pen delivery device (delivers 20 mcg/day)

Administer:

SUBCUT route

- Give by SUBCUT using disposable pen only; inject in thigh or abdomen; lightly pinch fold of skin; insert needle; release skin; inject at 90-degree angle over 5 sec; rotate inj sites • Have patient sit or lie down; orthostatic hypotension may occur
- Protect from freezing, light; refrigerate pen

SIDE EFFECTS

CNS: Dizziness, headache, insomnia, depression, vertigo

CV: Hypertension, angina, syncope

GI: Nausea, diarrhea, dyspepsia, vomiting, constipation

INTEG: Rash, sweating

MISC: Pain, asthenia, hyperuricemia

MS: Arthralgia, leg cramps, back/leg pain, weakness, **osteosarcoma (rare)**

RESP: Rhinitis, cough, pharyngitis, pneumonia, dyspnea

PHARMACOKINETICS

SUBCUT: Extensively and rapidly absorbed, metabolized by liver, excreted by kidneys, terminal half-life 1 hr, onset rapid, peak 1/2 hr, duration 3 hr

INTERACTIONS

Increase: digoxin toxicity: digoxin

Drug/Lab Test

Increase: calcium, uric acid, urinary calcium

Decrease: phosphorous, magnesium

NURSING CONSIDERATIONS

Assess:

Black Box Warning:

Secondary malignancy: osteosarcoma, dependent on length of treatment; those at higher risk for osteosarcoma should not use this product

- Uric acid, magnesium, creatinine, BUN, urine pH, vit D, phosphate for normal serum levels; serum calcium may be transiently increased after dosing (max at 4-6 hr after dose)
- Bone pain, headache, fatigue, changes in LOC, leg cramps

- **Signs of persistent hypercalcemia:** nausea, vomiting, constipation, lethargy, muscle weakness
- Nutritional status: diet for sources of vit D (milk, some seafood), calcium (dairy products, dark green vegetables), phosphates (dairy products)

Perform/provide:

- Store refrigerated, do not freeze; may be used for 28 days after first inj

Evaluate:

- Therapeutic response: increased bone mineral density

Teach patient/family:

- About the symptoms of hypercalcemia
- About foods rich in calcium, vit D
- How to use delivery device, dispose of needles; not to share pen with others, to use at same time of day
- To sit or lie down if dizziness or fast heartbeat occurs after 1st few doses
- To rotate administration sites
- To store pen in refrigerator, pen may be used for 28 days

🍁 Canada only Side effects: *italics* = common; **bold** = life-threatening ⚠️
Nurse Alert

tesamorelin

Egrifta

Func. class.: Pituitary hormone, growth hormone modifiers

ACTION:

Binds to growth hormone releasing factor receptors on the pituitary somatotroph cells; binding stimulates the production, release of endogenous growth hormone (GH)

USES:

Treatment of excess abdominal fat in HIV-infected patients with lipodystrophy

CONTRAINDICATIONS:

Hypersensitivity to this product or mannitol, neoplastic disease, pregnancy X, *disruption of the hypothalamic-pituitary axis* (hypothalamic-pituitary-adrenal (HPA) suppression) due to hypophysectomy, hypopituitarism, pituitary tumor/surgery, radiation therapy of the head or head trauma, IV/IM administration

Precautions: Breastfeeding, CABG, diabetes, diabetic retinopathy, edema, geriatrics, children, infants, adolescents

DOSAGE AND ROUTES

Calculator

• **Adult:** SUBCUT 2 mg/day

Available forms: Powder for injection 1 mg

Administer:

Subcut route:

- Visually inspect parenteral products for particulate matter and discoloration before use
- To reconstitute, inject 2.1 ml sterile water for inj into the 2-mg vial; use syringe with needle already attached; to avoid foaming, push plunger in slowly with needle on a slight angle so sterile water goes down the inside wall of vial; with needle and syringe attached to vial, keep vial upright and gently roll vial for 30 sec until mixed; do not shake; withdraw 2.1 ml of the reconstituted sol • To

administer, take syringe out of vial, place needle cap on its side against a clean flat surface, do not touch needle, hold syringe and slide needle into cap, push cap all the way or until it snaps shut; do not touch cap until it covers needle completely; remove needle, insert a 0.5 inch 27-G safety injection needle onto syringe; use immediately; throw away any unused product or used sterile water for inj, sol should be clear, do not use if discolored, cloudy, or has particles; slight foaming is acceptable; inject subcut into abdomen; avoid scar tissues, bruises, or navel; rotate inj sites in abdomen; slowly push plunger down until all sol has been injected • After removing needle from skin, flip back needle shield until it snaps, covering the injection needle completely; keep pressing until you hear a click, which means the injection needle is protected • Use a piece of sterile gauze to rub the inj site clean; if bleeding, apply pressure to site with gauze for 30 sec; if bleeding continues, apply a bandage to site • Properly dispose of used syringe, needles, vial, and sterile water for injection bottle in a sharps container

SIDE EFFECTS

CNS: Depression, peripheral neuropathy paresthesias, hypoesthesia, spasms, flushing, night sweats, insomnia, headache

CV: Chest pain, palpitations, hypertension, edema, peripheral edema

GI: Nausea, vomiting, upper abdominal pain, dyspepsia, diarrhea

INTEG: Pruritus, urticaria, rash, flushing, injection site reactions

MS: Arthralgia, joint swelling, stiffness, myalgias, carpal tunnel syndrome

RESP: Upper respiratory tract infection

SYST: Secondary malignancy

PHARMACOKINETICS

Half-life 26 min in healthy patients, 38 min and those with HIV infection; peak 0.15 hr

INTERACTIONS

Decrease: effect of—simvastatin, ritonavir, cortisone, prednisone

NURSING CONSIDERATIONS

Assess:

- **Lipodystrophy:** Assess for sunken cheeks, thinning arms and legs, fat accumulation in the abdomen, jaws and back of neck; after treatment these should lessen
- Monitor glycosylated hemoglobin A1c (HbA1c), serum IGF-1 concentrations, ophthalmologic exam

Evaluate:

- Decreasing lipodystrophy in HIV patients
-

🍁 Canada only Side effects: *italics* = common; **bold** = life-threatening ⚠️

Delatestryl

testosterone gel (Rx)

AndroGel, FORTESTA, Testim

testosterone pellets (Rx)

Testopel

testosterone transdermal (Rx)

Androderm

testosterone buccal (Rx)

Striant

testosterone topical solution

Axiron

Func. class.: Androgenic anabolic steroid

Chem. class.: Halogenated testosterone derivative

Controlled Substance Schedule III

ACTION:

Increases weight by building body tissue; increases potassium, phosphorus, chloride, nitrogen levels, bone development

USES:

Female breast cancer, hypogonadism, eunuchoidism, male climacteric, oligospermia, impotence, vulvar dystrophies, low testosterone levels, delayed male puberty (inj)

Unlabeled uses: Weight loss in AIDS patients, andropause, anemia, cryptorchidism, lichen sclerosis, microphallus, transsexualism

CONTRAINDICATIONS:

Pregnancy (X), breastfeeding, severe cardiac/renal/hepatic disease, hypersensitivity, genital bleeding (rare), male breast/prostate cancer

Precautions: Diabetes mellitus, CV disease, MI, urinary tract disorders, prostate cancer, hypercalcemia

Black Box Warning:

Children, accidental exposure

DOSAGE AND ROUTES

Calculator

Replacement

- **Adult: IM (enanthate or cypionate)** 50-400 mg q2-4wk; topical sol (Axiron) 60 mg (2 pump actuations), apply each AM
- **Adult (male) and child: SUBCUT (pellets)** 150-450 mg (2-6 pellets) inserted q3-6mo
- **Adult: TRANSDERMAL (Testoderm, Androderm)** 4-6 mg applied q24hr; **GEL (AndroGel)** 1% 5 mg applied q24hr, once daily; 1.62% 40.5 mg (2 pump actuations) q AM; topical sol (**Axiron**) 30 mg/actuation **BUCCAL** 1 buccal system (30 mg) to the gum region q12hr before meals/PM

Breast cancer

- **Adult: IM** 200-400 mg q2-4wk (cypionate or enanthate)

Delayed male puberty

- **Child >12 yr: IM** ≤100 mg/mo for ≤6 mo

Available forms: **Enanthate:** inj 200 mg/ml; **cypionate:** inj 100, 200 mg/ml; pellets 75 mg; **transdermal** 2, 4, mg/24 hr; **gel** 1%, 1.62%, 10 mg/actuation; **buccal system** 30 mg; **topical sol** 30 mg/actuation

Administer:

- Titrated dose; use lowest effective dose
- IM inj deep into upper outer quadrant of gluteal muscle
- **Transdermal patches:** Testoderm to skin of scrotum; Androderm to skin of back, upper arms, thighs, abdomen; area must be dry shaved; may be reapplied after bathing, swimming
- **Gel:** products not interchangeable, dosage and administration for AndroGel 1% differs from that of AndroGel 1.62%; apply daily to clean, dry area on shoulders, upper arms, or abdomen; women, children should not touch treated skin

Buccal system route

- Do not chew or swallow buccal system
- Rotate sites; place above incisor tooth on either side of mouth
- Open packet; place rounded side of surface against gum and hold firmly in place with finger over lip for 30 sec; if product falls off, replace with new system; discard in trash can away from children or pets

Topical solution route

- Using the provided applicator, apply the solution to clean, dry, intact skin of the axilla, preferably at the same time each morning; do not apply to any other part of the body; allow the solution to dry completely before dressing; if an antiperspirant or deodorant is used, apply at least 2 min before applying the solution; the pump must be primed before the first use by fully depressing the pump mechanism 3×, discard any solution that is released during the priming; to dispense the solution, position the nozzle over the applicator cup and carefully depress the pump once fully; the cup should be filled with no more than 1 pump actuation (30 mg); with the applicator upright, place it up into the axilla and wipe steadily down and up into the axilla; do not use fingers or hand to rub the solution; if multiple applications are necessary for the required dose, alternate application between the left and right axilla; when repeat application to the same axilla is necessary, allow the solution to dry completely before the next application; after use, rinse the applicator under running water and pat dry with tissue; wash hands with soap and water • Following application, allow the site to dry before putting on clothing
- Direct contact of the medicated skin with the skin of another person can result in the transfer of residual testosterone and absorption by the other person; to reduce accidental transfer, the patient should cover the application site(s) with clothing (eg, a T-shirt) after the solution has dried; the application site should be washed with soap and water prior to any skin-to-skin contact regardless of the length of time since application; in the case of direct contact, the other person should wash the area of contact with soap and water as soon as possible
- Patients should be advised that the topical solution is flammable; therefore, fire, flame, and smoking should be avoided during use • Advise patients to avoid swimming or washing the application site until 2 hr following application of solution

SIDE EFFECTS

CNS: Dizziness, headache, fatigue, tremors, paresthesias, flushing, sweating, anxiety, lability, insomnia, carpal tunnel syndrome

CV: Increased B/P

EENT: Conjunctival edema, nasal congestion

ENDO: Abnormal glucose tolerance test

GI: Nausea, vomiting, constipation, weight gain, **cholestatic jaundice**

GU: Hematuria, amenorrhea, vaginitis, decreased libido, decreased breast size, clitoral hypertrophy, testicular atrophy, gynecomastia, large prostate

HEMA: Polycythemia

INTEG: Rash, acneiform lesions, oily hair/skin, flushing, sweating, acne vulgaris, alopecia, hirsutism

MS: Cramps, spasms

PHARMACOKINETICS

PO: Metabolized in liver; excreted in urine, breast milk; crosses placenta

INTERACTIONS

• Edema: ACTH, adrenal steroids, buPROPion

Increase: effects of oxyphenbutazone

Increase: PT—anticoagulants

Decrease: glucose levels may alter need for oral antidiabetics, insulin

Drug/Lab Test

Increase: serum cholesterol, blood glucose, urine glucose

Decrease: serum calcium, serum potassium, T₄, T₃, thyroid ¹³¹I uptake test, urine 17-OHCS, 17-KS, PBI

NURSING CONSIDERATIONS

Assess:

- Weight daily; notify prescriber if weekly weight gain >5 lb
- B/P q4hr, Hgb/HCT
- I&O ratio; be alert for decreasing urinary output, increasing edema
- Growth rate, bone age in children; growth rate may be uneven (linear/bone growth) with extended use
- Electrolytes: K, Na, Cl, Ca; cholesterol
- Hepatic studies: ALT, AST, bilirubin
- Edema, hypertension, cardiac symptoms, jaundice

- Mental status: affect, mood, behavioral changes, aggression
- **Signs of masculinization in female:** increased libido, deepening of voice, decreased breast tissue, enlarged clitoris, menstrual irregularities; male: gynecomastia, impotence, testicular atrophy
- **Hypercalcemia:** lethargy, polyuria, polydipsia, nausea, vomiting, constipation; product may have to be decreased
- **Hypoglycemia** in diabetic patients; oral antidiabetic action is increased

Perform/provide:

- Diet with increased calories, protein; decrease sodium if edema occurs

Evaluate:

- Therapeutic response: 4-6 wk with osteoporosis

Teach patient/family:

- That product must be combined with complete health plan: diet, rest, exercise
- To notify prescriber if therapeutic response decreases, if edema occurs
- About changes in sex characteristics: priapism, gynecomastia, increased libido
- That women should report menstrual irregularities, voice changes, acne, facial hair growth; if pregnancy is planned or suspected
- That 1-3-mo course is necessary for response with breast cancer
- About the proper application of patches

☼ Canada only Side effects: *italics* = common; **bold** = life-threatening ⚠

Nurse Alert

tetracaine ophthalmic

See [Appendix B](#)

tetracaine topical

See [Appendix B](#)

tetracycline (Rx)

(tet-ra-sye'kleen)

Apo-Tetra , Nu-Tetra 

Func. class.: Broad-spectrum antiinfective

Chem. class.: Tetracycline

ACTION:

Inhibits protein synthesis and phosphorylation in microorganisms; bacteriostatic

USES:

Syphilis, *Chlamydia trachomatis*, gonorrhea, lymphogranuloma venereum; uncommon gram-positive, gram-negative organisms; rickettsial infections

CONTRAINDICATIONS:

Pregnancy (D), breastfeeding, children <8 yr, hypersensitivity to tetracyclines

Precautions: Renal/hepatic disease, UV exposure

DOSAGE AND ROUTES

Calculator

Susceptible gram-positive/gram-negative infections

- **Adult: PO** 250-500 mg q6hr
- **Child >8 yr: PO** 25-50 mg/kg/day in divided doses q6hr

Chlamydia trachomatis

- **Adult: PO** 500 mg qid × 7 days

Syphilis

- **Adult and adolescent: PO** 500 mg qid × 2 wk; if syphilis duration >1 yr, must treat 30 days

Brucellosis

- **Adult: PO** 500 mg q6hr × 3 wk with **IM** 1 g streptomycin bid × 1st wk then daily × 2nd wk

Urethral, endocervical, rectal infections (*C. trachomatis*)

- **Adult: PO** 500 mg qid × 7 days

Acne

- **Adult and adolescent: PO** 250 mg q6hr then 125-500 mg/day or every other day

Renal dose

- **Adult: PO** CCr 51-90 ml/min, give dose q8-12hr; CCr 10-50 ml/min, give dose q12-24hr; CCr <10 ml/min, give dose q24hr

Available forms: Caps 250, 500 mg

Administer:

- After C&S obtained
- 2 hr before or after iron products; 1 hr after antacid products
- Should be given on empty stomach (1 hr before or 2 hr after meals)

SIDE EFFECTS

CNS: Fever, headache, paresthesia

CV: Pericarditis

EENT: Dysphagia, glossitis, decreased calcification, discoloration of deciduous teeth, oral candidiasis, oral ulcers

GI: Nausea, abdominal pain, vomiting, diarrhea, anorexia, enterocolitis, hepatotoxicity, flatulence, abdominal cramps, epigastric burning, stomatitis, hepatitis, pseudomembranous colitis

GU: Increased BUN, azotemia, acute renal failure

HEMA: Eosinophilia, neutropenia, thrombocytopenia, leukocytosis, hemolytic anemia

INTEG: Rash, urticaria, photosensitivity, increased pigmentation, exfoliative dermatitis, pruritus, angioedema, Stevens-Johnson syndrome

MISC: Increased intracranial pressure, candidiasis

PHARMACOKINETICS

PO: Peak 2-3 hr; duration 6 hr; half-life 6-12 hr; excreted in urine, breast milk; crosses placenta; 65% protein bound

INTERACTIONS

⚠️ Fatal nephrotoxicity: methoxyflurane

Increase: effect of warfarin, digoxin

Decrease: effect of tetracycline—antacids, sodium bicarbonate, alkali products, iron, cimetidine

Decrease: effect of penicillins

Drug/Herb

- Photosensitivity: dong quai

Drug/Food

Decrease: tetracycline effect—dairy products

Drug/Lab Test

Increase: BUN, LFTs

NURSING CONSIDERATIONS

Assess:

⚠️ Pseudomembranous colitis: diarrhea, abdominal pain, fever, fatigue, anorexia; possible anemia, elevated WBC count, low serum albumin; stop product; usually either vancomycin or IV metroNIDAZOLE is given • Signs of anemia: Hct, Hgb, fatigue

- I&O ratio
- Blood studies: PT, CBC, AST, ALT, BUN, creatinine if on prolonged therapy
- **Allergic reactions:** rash, itching, pruritus
- **Serious skin reactions:** angioedema, Stevens-Johnson syndrome, exfoliative dermatitis; report immediately after stopping product • Nausea, vomiting, diarrhea; administer antiemetic, antacids as ordered

⚠️ Superinfection: fever, malaise, redness, pain, swelling, drainage, perineal itching, diarrhea, changes in cough or sputum if on prolonged therapy

Perform/provide:

- Storage in tight, light-resistant container at room temp

Evaluate:

- Therapeutic response: absence of lesions, negative C&S, resolution of infection, prevention of malaria

Teach patient/family:

- To avoid sun exposure; that sunscreen does not seem to decrease photosensitivity
- That all prescribed medication must be taken to prevent superinfection

- To avoid milk products, antacids or to separate by 2 hr; to take with full glass of water, to take 1 hr before bedtime to prevent esophageal ulceration • That tooth discoloration may occur
 - To notify prescriber immediately of diarrhea with pus, mucous, fever, abdominal pain
 - ⚠ To notify prescriber if pregnancy is planned or suspected, pregnancy (D)
 - Not to use outdated products, Fanconi syndrome (nephrotoxicity) may occur
-

🍁 Canada only Side effects: *italics* = common; **bold** = life-threatening ⚠
Nurse Alert

tetrahydrozoline nasal agent

See [Appendix B](#)

tetrahydrozoline ophthalmic

See [Appendix B](#)

theophylline (Rx)

(thee-off'i-lin)

Phyllocontin , Theochron, Theo-24, Uniphyll

Func. class.: Bronchodilator, spasmolytic

Chem. class.: Methylxanthine

ACTION:

Exact mechanism unknown, relaxes smooth muscle of respiratory system by blocking phosphodiesterase, which increases cAMP; increased cAMP alters intracellular calcium ion movements; produces bronchodilation, increased pulmonary blood flow, relaxation of respiratory tract

USES:

Bronchial asthma, bronchospasm associated with chronic bronchitis, emphysema, apnea during infancy for respiratory/myocardial stimulation

Unlabeled uses: Methotrexate toxicity, sleep apnea, status asthmaticus

CONTRAINDICATIONS:

Hypersensitivity to xanthines, tachydysrhythmias

Precautions: Pregnancy (C), breastfeeding, children, geriatric patients, CHF, cor pulmonale, hepatic disease, diabetes mellitus, hyperthyroidism, hypertension, seizure disorder, irritation of the rectum/lower colon, alcoholism, active peptic ulcer disease

DOSAGE AND ROUTES

Calculator

Reversible airway obstruction (bronchospasm prophylaxis) associated with asthma or chronic obstructive pulmonary disease (COPD, emphysema, chronic bronchitis)

Calculate initial mg/kg dose based on ideal body weight as theophylline distributes poorly into body fat

Acute exacerbations of the symptoms and reversible airflow obstruction associated with asthma and other chronic lung diseases (COPD) along with inhaled β -2 selective agonists and systemic corticosteroids

- **Adult <60 yr/adolescent ≥ 16 yr: IV CONT INF** expressed in theophylline; initially, 0.4 mg/kg/hr; max 900 mg/day (otherwise healthy nonsmokers); patients who smoke may require an increased dose; give 0.2 mg/kg/hr (≥ 400 mg/day) in CHF, cor pulmonale, liver dysfunction, sepsis with multiorgan failure, shock; reduced doses may be needed in patients receiving other drugs that decrease theophylline clearance; adjust dosage based on serum concentrations
- **Adult ≥ 60 yr: IV CONT INF** initially, 0.3 mg/kg/hour; give 0.2 mg/kg/hr in CHF, cor pulmonale, liver dysfunction, sepsis with multiorgan failure, shock; reduced doses may be needed in patients receiving other drugs that decrease theophylline clearance; adjust dosage based serum concentrations; max 400 mg/day unless serum concentration and patient condition require a higher dose
- **Child ≥ 12 yr/adolescent ≥ 15 yr: IV CONT INF** Initially, 0.5 mg/kg/hr (healthy nonsmokers (up to 900 mg/day); 0.7 mg/kg/hr in smokers; 0.2 mg/kg/hr (up to 400 mg/day) in cardiac decompensation, cor pulmonale, liver dysfunction, sepsis with multiorgan failure, or shock); adjust dosage based on serum concentrations
- **Child 9-11 yr: IV CONT INF** Initially, 0.7 mg/kg/hr; reduced doses may be needed in patients receiving other drugs that decrease theophylline clearance; give 0.2 mg/kg/hr (up to 400 mg/day) in cardiac decompensation, cor pulmonale, liver dysfunction, sepsis with multiorgan failure, or shock; adjust dosage based on serum concentrations
- **Child 1-8 yr: IV CONT INF** Initially, 0.8 mg/kg/hr; reduced doses may be needed in patients receiving other drugs that decrease theophylline clearance; 0.2 mg/kg/hr (up to 400 mg/day) in cardiac decompensation, cor pulmonale, liver

dysfunction, sepsis with multiorgan failure, or shock; adjust dosage based on serum concentrations

- **Infant 6-52 wk: IV CONT INF** Calculate initial dosage using the following equation: $(0.008 \times \text{age in wk}) + 0.21 = \text{theophylline dosage in mg/kg/hr IV}$; reduced doses may be needed in patients with risk factors for reduced theophylline clearance (cimetidine therapy, cardiac or liver dysfunction, renal impairment in infant <3 mo); adjust dosage based on serum concentrations

For maintenance therapy of asthma or COPD

- **Adult/adolescent/child >45 kg: PO** (expressed in theophylline and reg release products) PO Initially, 300 mg/day in divided doses q6-8hr; after 3 days, if tolerated, increase dose to 400 mg/day in divided doses q6-8hr; after 3 more days, if tolerated, increase dose to 600 mg/day PO in divided doses q6-8hr; adjust dose to maintain therapeutic range; doses of 400-1600 mg/day may be needed, max 400 mg/day in patients with risk factors for decreased theophylline clearance (elderly patients >60 yr); NIH recommends initial dose for asthma of 10 mg/kg/day (max: 300 mg/day) titrated to serum concentration of 5-15 mcg/ml (usual max: 800 mg/day in ≥ 12 yr and 16 mg/kg/day in children 1-11 yr)

- **Child/adolescent ≤ 15 yr old and ≤ 45 kg: PO** Initially, 12-14 mg/kg (max 300 mg) per day in divided doses q4-6hr; after 3 days, if tolerated, may increase to 16 mg/kg (max 400 mg) per day in divided doses q4-6hr; after 3 more days, if tolerated and if needed, increase dose to 20 mg/kg (max 600 mg) per day in divided doses q4-6hr; adjust dose to maintain therapeutic range (doses of 10-36 mg/kg/day in child 1-9 yr may be needed); max 16 mg/kg (400 mg) per day in patients with risk factors for decreased theophylline clearance or who cannot receive recommended serum concentration monitoring; NIH recommends initial dose for asthma of 10 mg/kg/day (max 300 mg/day) titrated to serum concentration of 5-15 mcg/ml (usual max 800 mg/day in patients ≥ 12 yr and 16 mg/kg/day in children 1-11 yr)

- **Neonate/infant ≤ 52 wk: PO** Calculate initial dose using the following equation: $[(0.2 \times \text{age in wks}) + 5] \times (\text{kg body weight}) = \text{theophylline dosage in mg/day}$; in infants ≤ 26 wk, divide dose and administer q8hr and in infant >26 wk, divide dose and give q6hr; adjust dose to maintain a steady-state serum concentration of 5-10 mcg/ml in neonates and 10-15 mcg/ml in infants; NIH recommends initial dose for asthma of 10 mg/kg/day titrated to theophylline

serum concentration of 5-15 mcg/ml, max in mg/kg/day = $[(0.2 \times \text{age in weeks}) + 5]$

- Extended-release products are to be used only for chronic disease management; do not use in treatment of acute symptoms of asthma and reversible bronchospasm

- **Adult/adolescents/child ≥ 12 yr and >45 kg: (Theo-24 Cap) PO** Initially, 300-400 mg/day q24hr; evening dosing is not recommended; after 3 days, if tolerated, increase to 400-600 mg/day q24hr; adjust dose to maintain therapeutic range; doses of 400-1600 mg/day may be needed; max 400 mg/day in patients with decreased theophylline clearance, (elderly >60 yr), and in those who cannot receive recommended serum concentration monitoring

- **Child >12 yr/adolescent <16 yr and <45 kg: (Theo-24 Cap) PO** Initially, 12-14 mg/kg (max 300 mg) per day q24hr; evening dosing is not recommended; after 3 days, if tolerated, may increase to 16 mg/kg (max 400 mg) per day; after 3 more days, if tolerated and if needed, increase to 20 mg/kg (max 600 mg) per day; adjust dose to maintain therapeutic range; max 16 mg/kg/day up to 400 mg/day in patients with decreased theophylline clearance

Treatment of methotrexate toxicity (unlabeled)

- **Adult/adolescents/child ≥ 3 yr: IV** 2.5 mg/kg over 45-60 min

Available forms: Inj 250 mg/10 ml, 500 mg/20 ml, 100 mg/100 ml in 0.45% NaCl, 200 mg/100 ml in 0.45% NaCl; rect supp 250, 500 mg; tabs 100, 200 mg; ext rel tab 100, 200, 300, 400, 450, 600 mg; ext rel cap 100, 200, 300, 400; elixir 80 mg/15 ml

Administer:

- Avoid IM inj; pain and tissue damage may occur

PO route

- Avoid giving with food

Continuous IV INF route

- Only clear sol; flush IV line before dose
- May be **diluted** for IV inf in 100-200 ml in D₅W, D₁₀W, D₂₀W, 0.9% NaCl, 0.45% NaCl, LR
- **Give** loading dose over 1/2 hr; max rate of inf 25 mg/min, use inf pump; after loading dose, give by cont inf

Syringe compatibilities: Heparin, metoclopramide, PENTobarbital, thiopental

Y-site compatibilities: Allopurinol, amifostine, amphotericin B, amrinone, aztreonam, cefTAZidime, cholesteryl sulfate complex, cimetidine, cladribine, DOXOrubicin liposome, enalaprilat, esmolol, famotidine, filgrastim, fluconazole, fludarabine, foscarnet, gallium, granisetron, heparin sodium with hydrocortisone sodium succinate, labetalol, melphalan, meropenem, netilmicin, PACLitaxel, pancuronium, piperacillin/tazobactam, potassium chloride, propofol, ranitidine, remifentanyl, sargramostim, tacrolimus, teniposide, thiotepa, tolazoline, vecuronium

SIDE EFFECTS

CNS: Anxiety, restlessness, insomnia, *dizziness*, *seizures*, headache, light-headedness, muscle twitching, tremors

CV: *Palpitations*, *sinus tachycardia*, hypotension, flushing, *dysrhythmias*, edema

GI: *Nausea*, *vomiting*, diarrhea, dyspepsia, anal irritation (suppositories), epigastric pain, reflux, anorexia

GU: Urinary frequency, SIADH

INTEG: Flushing, urticaria

MISC: Hyperglycemia

RESP: Tachypnea, increased respiratory rate

PHARMACOKINETICS

Metabolized by liver (caffeine); excreted in urine; crosses placenta; appears in breast milk; half-life 6.5-10.5 hr; half-life increased in geriatric patients, hepatic disease, CHF, neonates, premature infants; protein binding 40%, crosses into CSF

PO: Onset 1/4 hr, peak 1-2 hr, duration 6-8 hr, well absorbed

PO-ER: Onset unknown, peak 4-7 hr, duration 8-12 hr, well absorbed slowly

IV: Onset rapid, duration 6-8 hr

RECT: Onset erratic, peak 1-2 hr, duration 6-8 hr, supp absorbed erratically, sol absorbed quickly

INTERACTIONS

- Dose-dependent reversal of neuromuscular blockade
- Dysrhythmias: halothane

- May increase or decrease theophylline levels: carbamazepine, loop diuretics, isoniazid

Increase: action of theophylline, toxicity—cimetidine, nonselective β -blockers, erythromycin, clarithromycin, oral contraceptives, corticosteroids, interferons, fluoroquinolones, disulfiram, mexiletine, fluvoxamine, high doses of allopurinol, influenza vaccines, interferon, benzodiazepines

Increase: adverse reactions—tetracyclines

Increase: elimination—smoking

Decrease: effects of lithium

Decrease: effect of theophylline—nicotine products, adrenergics, barbiturates, phenytoin, ketoconazole, rifampin

Drug/Herb

Increase: effects—cola tree, guarana, yerba maté, tea (black, green), horsetail, ginseng, Siberian ginseng

Decrease: effects—St. John's wort

Drug/Food

Increase: effect—xanthines

Increase: elimination by low-carbohydrate, high-protein diet; charcoal-broiled beef

Decrease: elimination by high-carbohydrate, low-protein diet

Drug/Lab Test

Increase: plasma-free fatty acids

NURSING CONSIDERATIONS

Assess:

- Theophylline blood levels (therapeutic level is 10-20 mcg/ml); toxicity may occur with small increase above 20 mcg/ml, especially in geriatric patients; whether theophylline was given recently (24 hr)
- Monitor I&O; diuresis occurs; dehydration may occur in geriatric patients or children
- Liver function tests: periodically, lower doses may be required in those with moderate to severe hepatic disease
- Respiratory rate, rhythm, depth; auscultate lung fields bilaterally; notify prescriber of abnormalities, monitor pulmonary function tests
- Allergic reactions: rash, urticaria; if these occur, product should be discontinued

Perform/provide:

- Storage of diluted sol for 24 hr if refrigerated

Evaluate:

- Therapeutic response: decreased dyspnea, respiratory stimulation for infants, clear lung fields bilaterally

Teach patient/family:

- To take doses as prescribed, not to skip dose, not to double dose
- To check OTC medications, current prescription medications for ePHEDrine; will increase CNS stimulation; not to drink alcohol or caffeine products (tea, coffee, chocolate, colas); to avoid large amounts of charcoal-grilled beef
- To avoid hazardous activities; dizziness may occur
- If GI upset occurs, to take product with 8 oz water; to avoid food because absorption may be decreased ⚠️ To notify prescriber immediately about **toxicity**: insomnia, anxiety, nausea, vomiting, rapid pulse, seizures, flushing, headache, diarrhea
- To notify prescriber about changes in smoking habits because a change in dose may be required; to avoid smoking because it decreases drug blood levels and terminal half-life
- To increase fluids to 2 L/day to decrease secretion viscosity

🍁 Canada only Side effects: *italics* = common; **bold** = life-threatening ⚠️
Nurse Alert

thiamine (vit B₁) (PO-OTC; IV, IM-Rx)

Vitamin B-1

Func. class.: Vit B₁

Chem. class.: Water soluble

Do not confuse: thiamine/Tenormin

ACTION:

Needed for pyruvate metabolism, carbohydrate metabolism

USES:

Vit B₁ deficiency or polyneuritis, cheilosis adjunct with thiamine beriberi, Wernicke-Korsakoff syndrome, pellagra, metabolic disorders, alcoholism

CONTRAINDICATIONS:

Hypersensitivity

Precautions: Pregnancy (A)

DOSAGE AND ROUTES

Calculator

RDA

- **Adult: PO** (Males) 1.2-1.5 mg; (females) 1.1 mg; (pregnancy) 1.4 mg; (breastfeeding) 1.4 mg
- **Child 9-13 yr: PO** 0.9 mg
- **Child 4-8 yr: PO** 0.6 mg
- **Child 1-3 yr: PO** 0.5 mg
- **Infant 7 mo-1 yr: PO** 0.3 mg
- **Neonate and infant ≤6 mo: PO** 0.2 mg

Beriberi

- **Adult: PO** 5-30 mg daily or in 3 divided doses × 1 mo; **IM/IV** 5-30 mg daily or in 3 divided doses then convert to **PO**
 - **Infant/child: PO** 10-50 mg daily × 2 wk then 5-10 mg daily × 1 mo; **IV/IM** 10-25 mg/day × 2 wk then 5-10 mg daily × 1 mo
- Available forms:** Tabs 50, 100, 250, 500 mg; inj 100 mg/ml; enteric-coated tabs 20 mg

Administer:**IM route**

- By IM inj; rotate sites if pain and inflammation occur; do not mix with alkaline sol; Z-track to minimize pain

Direct IV route

- Undiluted at 100 mg/ml over 5 min

Continuous IV INF route

- Diluted in compatible IV sol

Y-site compatibilities: Famotidine

SIDE EFFECTS

CNS: Weakness, restlessness

CV: Collapse, pulmonary edema, hypotension

EENT: Tightness of throat

GI: Hemorrhage, nausea, diarrhea

INTEG: Angioneurotic edema, cyanosis, sweating, warmth

SYST: Anaphylaxis

PHARMACOKINETICS

PO/INJ: Unused amounts excreted in urine (unchanged)

NURSING CONSIDERATIONS

Assess:

- **Anaphylaxis (IV only):** swelling of face, eyes, lips, throat, wheezing
- **Thiamine deficiency:** anorexia, weakness/pain, depression, confusion, blurred vision, tachycardia
- Nutritional status: yeast, beef, liver, whole or enriched grains, legumes

Perform/provide:

- Storage in tight, light-resistant container
- Application of cold to help decrease pain

Evaluate:

- Therapeutic response: absence of nausea, vomiting, anorexia, insomnia, tachycardia, paresthesias, depression, muscle weakness

Teach patient/family:

- About the necessary foods to be included in diet: yeast, beef, liver, legumes,

whole grains

🍁 Canada only Side effects: *italics* = common; **bold** = life-threatening ⚠️
Nurse Alert

thioridazine (Rx)

(thye-or-rid'a-zeen)

Func. class.: Antipsychotic (typical)

Chem. class.: Phenothiazine piperidine

Do not confuse: thioridazine/thiothixene/Thorazine

ACTION:

Depresses cerebral cortex, hypothalamus, limbic system, which control activity, aggression; blocks neurotransmission produced by dopamine at synapse; exhibits strong α -adrenergic and anticholinergic blocking action; mechanism for antipsychotic effects is unclear

USES:

Psychotic disorders, schizophrenia, behavioral problems in children, anxiety, major depressive disorders, organic brain syndrome

Unlabeled uses: Behavioral symptoms associated with dementia in geriatric patients

CONTRAINDICATIONS:

Children <2 yr, hypersensitivity, coma, CNS depression

Black Box Warning:

QT prolongation, cardiac dysrhythmias

Precautions: Pregnancy (C), breastfeeding, seizure disorders, hypertension, hepatic/pulmonary disease, renal failure, BPH, glaucoma, phenothiazine hypersensitivity, suicidal ideation, smoking, Reye's syndrome, Parkinson's disease

Black Box Warning:

Cardiac disease, dementia, AV block, bundle branch block, torsades de pointes

DOSAGE AND ROUTES

Calculator

Psychosis

- **Adult: PO** 25-100 mg tid, max 800 mg/day; dose gradually increased to desired response then reduced to minimum maintenance

Depression/behavioral problems/organic brain syndrome

- **Adult: PO** 25 mg tid, range from 10 mg bid-qid to 50 mg tid-qid, max 800 mg/day for short period
 - **Geriatric: PO** 10-25 mg daily-bid, increase 4-7 days by 10-25 mg to desired dose, max 300 mg/day for short period
 - **Child 2-12 yr: PO** 0.5-3 mg/kg/day in divided doses, max 3 mg/kg/day
- Available forms:** Tabs 10, 25, 50, 100 mg

Administer:

- Antiparkinsonian agent on order from prescriber for EPS
- Avoid use with CNS depressants
- Antacids separated by 2 hr or more

SIDE EFFECTS

CNS: *EPS: pseudoparkinsonism, akathisia, dystonia, tardive dyskinesia, seizures, headache, confusion, neuroleptic malignant syndrome, dizziness, drowsiness*

CV: Orthostatic hypotension, cardiac arrest, ECG changes, tachycardia, QT prolongation, torsades de pointes

EENT: Blurred vision, glaucoma, dry eyes

GI: Dry mouth, nausea, vomiting, anorexia, constipation, diarrhea, jaundice, weight gain

GU: Urinary retention, urinary frequency, enuresis, impotence, amenorrhea, gynecomastia, ejaculation dysfunction, priapism

HEMA: Anemia, leukopenia, leukocytosis, agranulocytosis

INTEG: Rash, photosensitivity, dermatitis

RESP: Laryngospasm, dyspnea, respiratory depression

PHARMACOKINETICS

PO: Onset erratic; peak 2-4 hr; metabolized by liver; excreted in urine, breast milk; crosses placenta; half-life 26-36 hr; 91%-99% protein binding

INTERACTIONS

⚠ Increase: QT prolongation—class IA/III antidysrhythmics, some phenothiazines, β agonists, local anesthetics, tricyclics, haloperidol, chloroquine, droperidol, pentamidine; CYP3A4 inhibitors (amiodarone, clarithromycin, erythromycin, telithromycin, troleandomycin), arsenic trioxide, levomethadyl; CYP3A4 substrates (methadone, pimozide, QUetiapine, quiniDine,

risperiDONE, ziprasidone), CYP2D6 inhibitors • Oversedation: other CNS depressants, alcohol, barbiturate anesthetics

Increase: anticholinergic effects—anticholinergics

Decrease: antiparkinson's agent effects

Decrease: thioridazine effect—lithium, barbiturates

Decrease: antihypertensive effect—centrally acting antihypertensives

Decrease: absorption—aluminum hydroxide, magnesium hydroxide antacids

Drug/Lab Test

Increase: LFTs, prolactin, bilirubin, alk phos

Decrease: Hct/Hgb, platelets, granulocytes, leukocytes, neutrocytes, eosinophils

NURSING CONSIDERATIONS

Assess:

- Mental status before 1st dose
- I&O ratio; palpate bladder if low urinary output occurs, urinary retention may be the cause • Bilirubin, CBC, LFTs monthly
- Urinalysis recommended before and during prolonged therapy
- Affect, orientation, LOC, reflexes, gait, coordination, sleep pattern disturbances
- B/P standing, lying; include pulse and respirations q4hr during initial treatment; establish baseline before starting treatment; report drops of 30 mm Hg
- Dizziness, faintness, palpitations, tachycardia on rising
- **EPS** including akathisia (inability to sit still, no pattern to movements), tardive dyskinesia (bizarre movements of jaw, mouth, tongue, extremities), pseudoparkinsonism (rigidity, tremors, pill rolling, shuffling gait)

⚠ **Neuroleptic malignancy syndrome:** altered mental status, muscle rigidity, increased CPK, hyperthermia, dyspnea, fatigue ⚠ **QT prolongation:** ECG, ejection fraction; assess for chest pain, palpitations, dyspnea • Constipation, urinary retention daily; increase bulk, water in diet

Perform/provide:

- Supervised ambulation if needed until stabilized on medication; do not involve patient in strenuous exercise program because fainting is possible; patient should not stand still for long periods • Sips of water, candy, gum for dry mouth
- Storage in tight, light-resistant container; avoid contact with skin

Evaluate:

- Therapeutic response: decrease in emotional excitement, hallucinations, delusions, paranoia; reorganization of patterns of thought, speech

Teach patient/family:

- That orthostatic hypotension occurs frequently; to rise from sitting or lying position gradually; to avoid hazardous activities until stabilized on medication
- To avoid hot tubs, hot showers, tub baths because hypotension may occur
- To avoid abrupt withdrawal of thioridazine because EPS may result; that product should be withdrawn slowly
- To avoid OTC preparations (cough, hay fever, cold) unless approved by prescriber; that serious product interactions may occur; to avoid use with alcohol because increased drowsiness may occur
- To use sunscreen to prevent burns
- About compliance with product regimen
- About the necessity for meticulous oral hygiene because oral candidiasis may occur
- To report sore throat, malaise, fever, bleeding, mouth sores; if these occur, CBC should be drawn and product discontinued; that product may cause vision impairment, should be reported to prescriber
- That in hot weather, heat stroke may occur; to take extra precautions to stay cool
- That product may cause discoloration of urine

TREATMENT OF OVERDOSE:

Lavage if orally ingested, provide an airway; do not induce vomiting; CV monitoring, continuous ECG

☼ Canada only Side effects: *italics* = common; **bold** = life-threatening ⚠
Nurse Alert

thyroid USP (desiccated) (Rx)

(thye'roid)

Armour Thyroid, Bio-Throid, Nature Thyroid, NP Thyroid

Func. class.: Thyroid hormone

Chem. class.: Active thyroid hormone in natural state and ratio

ACTION:

Increases metabolic rates, increases cardiac output, O₂ consumption, body temp, blood volume; growth, development at cellular level

USES:

Hypothyroidism, cretinism (juvenile hypothyroidism), myxedema

CONTRAINDICATIONS:

Adrenal insufficiency, MI, thyrotoxicosis, porcine protein hypersensitivity

Black Box Warning:

Obesity treatment

Precautions: Pregnancy (A), breastfeeding, geriatric patients, angina pectoris, hypertension, ischemia, cardiac disease

DOSAGE AND ROUTES

Calculator

Hypothyroidism

- **Adult: PO** 60 mg/day, increased by 30 mg/mo until desired response; maintenance dose 60-120 mg/day
- **Geriatric: PO** 7.5-15 mg/day, increase dose q6-8wk until desired response

Cretinism/juvenile hypothyroidism

- **Child: PO** 15 mg/day, then 30 mg/day after 2 wk, then 60 mg/day after another 2 wk; maintenance dose 60-180 mg/day

Myxedema

- **Adult: PO** 15 mg/day, double dose q2wk, maintenance 60-180 mg/day

Available forms: Tabs 16, 32, 60, 65, 98, 130, 195, 260, 325 mg; enteric-coated tabs 32, 65, 130 mg; sugarcoated tabs 32, 65, 130, 195 mg; caps 65, 130, 195, 325 mg

Administer:

- In AM if possible as single dose to decrease sleeplessness; separate iron, calcium products by 4 hr • At same time each day to maintain product level
- Only for hormone imbalances; not to be used for obesity, male infertility, menstrual disorders, lethargy • Lowest dose that relieves symptoms

SIDE EFFECTS

CNS: *Insomnia, tremors, headache, thyroid storm*

CV: *Tachycardia, palpitations, angina, dysrhythmias, hypertension, cardiac arrest*

GI: Nausea, diarrhea, increased or decreased appetite, cramps

MISC: Menstrual irregularities, weight loss, sweating, heat intolerance, fever

PHARMACOKINETICS

PO: Peak 12-48 hr, half-life 6-7 days

INTERACTIONS

Increase: effects of anticoagulants, sympathomimetics, tricyclics, catecholamines

Decrease: thyroid absorption—bile acid sequestrants, aluminum, magnesium, calcium

Decrease: thyroid effects—estrogens

Drug/Herb

Decrease: thyroid effect—soy

Drug/Lab Test

Increase: CPK, LDH, AST, PBI, blood glucose

Decrease: thyroid function tests

NURSING CONSIDERATIONS**Assess:****Black Box Warning:**

Obesity treatment: use can lead to serious or life-threatening toxicity

- B/P, pulse before each dose
- I&O ratio
- Weight daily in same clothing, using same scale, at same time of day

- Height, growth rate of child
- T₃, T₄, which are decreased; radioimmunoassay of TSH, which is increased; radio uptake, which is decreased if dosage is too low • PT may require decreased anticoagulant; check for bleeding, bruising
- **Hyperthyroidism:** increased nervousness, excitability, irritability; may indicate too high of a dose of medication, usually after 1-3 wk of treatment
- **Hypothyroidism:** lethargy, cold intolerance, weight gain, constipation, muscle cramps; may indicate too low of a dose • Cardiac status: angina, palpitation, chest pain, change in VS

Perform/provide:

- Removal of medication 4 wk before RAIU test

Evaluate:

- Therapeutic response: absence of depression; increased weight loss, diuresis, pulse, appetite; absence of constipation, peripheral edema, cold intolerance; pale, cool, dry skin; brittle nails, alopecia, coarse hair, menorrhagia, night blindness, paresthesias, syncope, stupor, coma, rosy cheeks

Teach patient/family:

- That hair loss will occur in child, is temporary
- To report excitability, irritability, anxiety; indicates overdose
- Not to switch brands unless directed by prescriber
- That strong odor is normal
- That hypothyroid child will show almost immediate behavior/personality change
- That treatment product is not to be taken to reduce weight
- To avoid OTC preparations with iodine; to read labels
- To separate iron, calcium products by 4 hr
- To avoid iodine food, iodized salt, soybeans, tofu, turnips, some seafood, some bread

☛ Canada only Side effects: *italics* = common; **bold** = life-threatening ⚠
Nurse Alert

tiaGABine (Rx)

(tie-ah-ga'been)

Gabitril

Func. class.: Anticonvulsant

Do not confuse: tiaGABine/tiZANidine

ACTION:

Inhibits reuptake and metabolism of GABA, may increase seizure threshold; structurally similar to GABA; tiaGABine binding sites in neocortex, hippocampus

USES:

Adjunct treatment of partial seizures in adults and children ≥ 12 yr

CONTRAINDICATIONS:

Hypersensitivity

Precautions: Pregnancy (C), breastfeeding, children < 12 yr, geriatric patients, renal/hepatic disease, suicidal thoughts/behaviors, status epilepticus, mania, bipolar disorder, abrupt discontinuation, depression

DOSAGE AND ROUTES

Calculator

When not given with a CYP3A4 enzyme, effect of tiaGABine is doubled; lower doses are indicated

- **Adult (those receiving an enzyme-inducing antiepileptic product):** PO 4 mg/day in divided doses, may increase by 4-8 mg/wk until desired response, max 56 mg/day
- **Child 12-18 yr:** PO 4 mg/day, may increase by 4 mg at beginning of wk 2; may increase by 4-8 mg/wk until desired response; max 32 mg/day

Hepatic dose

- **Adult:** PO reduce dose or increase dosing interval

Available forms: Tabs 2, 4, 12, 16 mg

Administer:

- With food

SIDE EFFECTS

CNS: *Dizziness, anxiety, somnolence, ataxia, confusion, asthenia, unsteady gait, depression, suicidal ideation, seizures*

CV: Vasodilation

GI: Nausea, vomiting, diarrhea, increased appetite

INTEG: Pruritus, rash, *Stevens-Johnson syndrome*

RESP: Pharyngitis, coughing

PHARMACOKINETICS

Absorption >95%; peak 45 min; protein binding 96%; metabolized in the liver via CYP3A4; half-life 7-9 hr without enzyme inducers, 2-5 hr with enzyme inducers

INTERACTIONS

- Lower doses may be needed when used with valproate

Increase: CNS depression—CNS depressants, alcohol

Decrease: *tiaGABine* effect—*sevelamer*

Decrease: effect—*carBAMazepine, PHENobarbital, phenytoin, primidone*

Drug/Food

Decrease: rate of absorption—high-fat meal

NURSING CONSIDERATIONS

Assess:

- Renal studies: urinalysis, BUN, urine creatinine q3mo
- Hepatic studies: ALT, AST, bilirubin
- **Seizures:** location, duration, presence of aura; assess for weakness
- Withdraw gradually to prevent seizures
- May cause status epilepticus and unexplained death
-  Mental status: mood, sensorium, affect, behavioral changes, suicidal thoughts/behaviors; if mental status changes, notify prescriber, hypomania may be present before suicide attempt

Perform/provide:

- Storage at room temp, away from heat and light
- Assistance with ambulation during early part of treatment; dizziness occurs
- Seizure precautions: padded side rails; move objects that may harm patient

Evaluate:

- Therapeutic response: decreased seizure activity; document on patient's chart

Teach patient/family:

- To carry emergency ID stating patient's name, products taken, condition, prescriber's name and phone number
- To avoid driving, other activities that require alertness
- Not to discontinue medication quickly after long-term use
- To take with food
- To notify prescriber if pregnancy is planned or suspected, avoid breastfeeding

TREATMENT OF OVERDOSE:

Lavage, VS

☼ Canada only Side effects: *italics* = common; **bold** = life-threatening ⚠

Nurse Alert

ticagrelor

Brilinta

Func. class.: Platelet inhibitor

Chem. class.: ADP receptor antagonist

ACTION:

Reversibly bind to the platelet receptor, preventing platelet activation

USES:

Arterial thromboembolism prophylaxis in acute coronary syndrome (ACS) (unstable angina, acute MI), including in patients undergoing percutaneous coronary intervention (PCI)

CONTRAINDICATIONS:

Hypersensitivity, severe hepatic disease

Black Box Warning:

Bleeding, intracranial bleeding

Precautions: Pregnancy (category C), breastfeeding, infants, neonates, children, GI bleeding, hepatic disease, abrupt discontinuation

Black Box Warning:

Coronary artery bypass graft surgery (CABG), surgery

DOSAGE AND ROUTES

Calculator

• **Adult: PO** loading dose 180 mg with aspirin (usually 325 mg PO); then, give 90 mg bid with aspirin 75-100 mg/day, do not give maintenance doses of aspirin >100 mg/day

Available forms: Tab 90 mg

Administer:

- May be taken without regard to food
- Discontinue 5-7 days before surgery
- May be crushed (90 mg tab) and mixed with purified water, 100 mg (PO) or 50 ml (NG)

SIDE EFFECTS

CNS: Headache, dizziness, fatigue

CV: Hypertension, hypotension, chest pain, atrial fibrillation, bradyarrhythmias, syncope, ventricular pauses

GI: Nausea, diarrhea

HEMA: Serious, fatal bleeding

MISC: Back pain, hyperuricemia, gynecomastia

RESP: Dyspnea, cough

PHARMACOKINETICS

Absolute bioavailability 36%, protein binding (>99%), metabolism by CYP3A4, weak P-glycoprotein substrates and inhibitors, elimination for product and metabolite are hepatic and biliary, 84% excreted in feces, 26% in urine, half-life is 7 hr for ticagrelor, 9 hr for metabolite, maximum inhibition of platelet aggregation (IPA) effect 2 hr, maintained ≥ 8 hr, peak 1.5 hr product, 2.5 hr metabolite

INTERACTIONS

Increase: bleeding risk—CYP3A4 inhibitors (ketoconazole, itraconazole, voriconazole, clarithromycin, telithromycin, nefazodone, ritonavir, lopinavir, ritonavir, saquinavir, nelfinavir, indinavir, atazanavir, delavirdine, isoniazid, dalfopristin, quinupristin, tipranavir)

Decrease: ticagrelor action—CYP3A4 inducers (rifampin, dexamethasone, phenytoin, carbamazepine, phenobarbital)

Increase: effect of—simvastatin lovastatin

Increase: bleeding risk—NSAIDs, anticoagulants, platelet inhibitors

Increase or decrease: digoxin

Drug/Lab Test

Increase: serum creatinine

NURSING CONSIDERATIONS

Assess:

- **Thromboembolism:** Monitor CBC with differential with platelet count baseline and periodically during treatment

Black Box Warning:

Bleeding: Assess for bleeding that may occur when aspirin is combined with this product, some bleeding can be fatal

- **Abrupt discontinuation:** Do not discontinue abruptly, may increase risk for MI, stent thrombosis, death

Perform/provide:

- Storage at room temperature, in original container in dry place

Evaluate:

- Prevention of thromboembolism

Teach patient/family:

- To take only as prescribed, not to skip or double doses; if a dose is missed, to take next dose at scheduled time

Black Box Warning:

To notify prescriber of chills, fever, bruising, bleeding

- Not to use any prescription, OTC products, herbs without approval of prescriber; products with aspirin, NSAIDs may cause bleeding
- To notify all health care providers of product use
- That product can be taken without regard to meals
- That it may take longer for bleeding to stop

☼ Canada only Side effects: *italics* = common; **bold** = life-threatening ⚠
Nurse Alert

ticarcillin/clavulanate (Rx)

Timentin

Func. class.: Broad-spectrum antiinfective

Chem. class.: Extended-spectrum penicillin, β -lactamase inhibitor

ACTION:

Interferes with cell-wall replication of susceptible organisms; osmotically unstable cell wall swells, bursts from osmotic pressure; clavulanate inhibits β -lactamase and protects against enzymatic degradation of ticarcillin

USES:

Respiratory, soft-tissue, and urinary tract infections; bacterial septicemia; effective for gram-positive cocci (*Staphylococcus aureus*, *Streptococcus faecalis*, *Streptococcus pneumoniae*), gram-negative cocci (*Neisseria gonorrhoeae*), gram-positive bacilli (*Clostridium perfringens*, *Clostridium tetani*), gram-negative bacilli (*Bacteroides*, *Fusobacterium nucleatum*, *Escherichia coli*, *Proteus mirabilis*, *Salmonella*, *Morganella morganii*, *Proteus rettgeri*, *Enterobacter*, *Pseudomonas aeruginosa*, *Serratia*); and *Peptococcus*, *Peptostreptococcus*, and *Eubacterium*

CONTRAINDICATIONS:

Neonates, hypersensitivity to penicillins

Precautions: Pregnancy (B), hypersensitivity to cephalosporins, renal disease

DOSAGE AND ROUTES

Calculator

Systemic/urinary tract infections, moderate/severe infections

- **Adult ≥ 60 kg:** IV INF 3.1 g q4-6hr
- **Adult < 60 kg:** IV INF 200-300 mg/kg/day q4-6hr
- **Child > 60 kg:** IV INF 3.1 g q4-6hr
- **Child < 60 kg:** IV INF 300 mg/kg/day q4hr
- **Full-term neonates/infants < 3 mo (unlabeled):** IV 50 mg/kg q4hr for severe infections; IV 50 mg/kg q6hr for mild to moderate infections

Mild to moderate infections

- **Child ≥60 kg: IV INF 3.1 g q6hr**
- **Child <60 kg: IV INF 200 mg/kg/day q6hr**

Renal dose

- **Adult: IV INF loading dose 3.1 g; CCr 60 ml/min, 3.1 g q4hr; CCr 30-60 ml/min, 2 g q4hr; CCr 10-30 ml/min, 2 g q8hr; CCr <10 ml/min, 2 g q12hr; CCr <10 ml/min with hepatic dysfunction, 2 g q24hr**

Available forms: Inj 3 g ticarcillin, 0.1 g clavulanate; IV inf 3 g ticarcillin, 0.1 g clavulanate; powder for inj 3 g ticarcillin, 0.1 g clavulanate

Administer:

- Product after C&S, give ≥q1hr before bactericidal antiinfectives, change IV site q48hr

Intermittent IV INF route

- After diluting ≤3.1 g/13 ml of sterile water or NaCl (200 mg/ml), shake; may further dilute in ≥50-100 ml NS, D₅W, or LR sol and run over 1/2 hr

Y-site compatibilities: Allopurinol, amifostine, amikacin, anidulafungin, atropine, aztreonam, bivalirudin, bumetanide, ceFAZolin, cefepime, cefotaxime, cefOXitin, cefTAZidime, ceftizoxime, cefTRIAxone, cefuroxime, chloramphenicol, cimetidine, clindamycin, cyclophosphamide, cycloSPORINE, dexamethasone, dexmedetomidine, digoxin, diltiazem, diphenhydrAMINE, DOCEtaxel, DOPamine, DOXOrubicin liposome, doxycycline, enalaprilat, EPINEPHrine, esmolol, etoposide phosphate, famotidine, fenoldopam, filgrastim, fluconazole, furosemide, gemcitabine, gentamicin, granisetron, heparin, hydrocortisone, HYDROmorphone, imipenem/cilastatin, insulin, isoproterenol, labetalol, levofloxacin, lidocaine, linezolid, LORazepam, melphalan, meperidine, methylPREDNISolone, metoclopramide, metoprolol, metroNIDAZOLE, milrinone, morphine, nitroglycerin, nitroprusside, norepinephrine, ondansetron, palonosetron, pantoprazole, PEMEtrexed, penicillin G potassium, perphenazine, phenylephrine, procainamide, propofol, propranolol, ranitidine, remifentanyl, sargramostim, sodium bicarbonate, tacrolimus, teniposide, theophylline, thiotepa, tirofiban, tobramycin, vasopressin, verapamil, vinorelbine, voriconazole

SIDE EFFECTS

CNS: Anxiety, **seizures**, confusion, drowsiness

GI: Nausea, vomiting, diarrhea; increased AST, ALT; abdominal pain, glossitis,

colitis, pseudomembranous colitis, hepatotoxicity

HEMA: Anemia, increased bleeding time, bone marrow depression, granulocytopenia

INTEG: Rash, urticaria, toxic epidermal necrolysis, pain at injection site

META: Hypokalemia, hypernatremia

SYST: Anaphylaxis, Stevens-Johnson syndrome, overgrowth of organisms

PHARMACOKINETICS

IV: Peak 30-45 min, duration 4 hr, half-life 64-68 min, excreted in urine

INTERACTIONS

 **Increase:** bleeding—anticoagulants

Increase: methotrexate level—methotrexate, uric acid, bilirubin, BUN, creatinine, alk, phos, LDH

Increase: ticarcillin concentrations—probenecid, sulfipyrazone

Decrease: antimicrobial effect of ticarcillin—tetracyclines, aminoglycosides IV, chloramphenicol, macrolides, sulfonamides

Decrease: effect—oral contraceptives, erythromycin

Drug/Lab Test

False positive: urine glucose, urine protein, Coombs' test

Increase: LFTs, sodium, eosinophils, INR bleeding time

Decrease: Hgb, potassium, platelets, WBC, granulocytes

NURSING CONSIDERATIONS

Assess:

- Infection: WBC, wound, temperature, sputum, urine, baseline and periodically

 **Pseudomembranous colitis:** diarrhea, abdominal pain, fever, fatigue, anorexia; possible anemia, elevated WBC count, low serum albumin; stop product; usually either vancomycin or IV metroNIDAZOLE is given  **Serious skin reactions:** Stevens-Johnson syndrome, toxic epidermal necrolysis; anaphylaxis: wheezing, rash, laryngeal edema; have emergency equipment nearby • **Hepatic studies:** AST, ALT

- Blood studies: WBC, RBC, Hct, Hgb, bleeding time, platelets, baseline and periodically

- Renal studies: BUN, creatinine, sodium, potassium

- Bowel pattern before, during treatment

- Skin eruptions after administration of penicillin to 1 wk after discontinuing product

Perform/provide:

- EPINEPHrine, suction, tracheostomy set, endotracheal intubation equipment
- Storage of reconstituted sol 12-24 hr at room temp, or 3-7 days refrigerated

Evaluate:

- Therapeutic response: Resolution of infection

Teach patient/family:

- To report persistent diarrhea with blood, pus, mucous, or fever
- That culture may be taken after completed course of medication
- To report sore throat, fever, fatigue (may indicate superinfection); CNS effects (anxiety, depression, hallucinations, seizures)
- To wear or carry emergency ID if allergic to penicillins
- To use alternative birth control method instead of hormonal

TREATMENT OF OVERDOSE:

Withdraw product, maintain airway, administer EPINEPHrine, O₂, IV corticosteroids for anaphylaxis

☼ Canada only Side effects: *italics* = common; **bold** = life-threatening ⚠
Nurse Alert

ticlopidine (Rx)

(tye-cloe'pi-deen)

Func. class.: Platelet aggregation inhibitor

Chem. class.: Thienopyridine compound

ACTION:

Irreversible inhibition of platelet aggregation through antagonism of ADP

USES:

Reducing the risk for stroke in high-risk patients

Unlabeled uses: Intermittent claudication, chronic arterial occlusion, subarachnoid hemorrhage, uremic patients with AV shunts/fistulas, open heart surgery, coronary artery bypass grafts, primary glomerulonephritis, sickle cell disease, diabetic retinopathy

CONTRAINDICATIONS:

Hypersensitivity, severe hepatic disease, active bleeding, coagulopathy

Black Box Warning:

Agranulocytosis, neutropenia, thrombocytopenia, thrombotic thrombocytopenic purpura (TTP)

Precautions: Pregnancy (B), breastfeeding, children, geriatric patients, past hepatic disease, renal disease, increased bleeding risk, peptic ulcer disease, surgery

Black Box Warning:

Anemia, hematologic disease

DOSAGE AND ROUTES

Calculator

• **Adult: PO** 250 mg bid with food

Available forms: Tabs 250 mg

Administer:

- With food to decrease gastric symptoms
- Discontinue when absolute neutrophil count falls during treatment to $<1200/\text{mm}^3$ or platelets $<80,000/\text{mm}^3$; may use methylPREDNISolone IV 20 mg to provide normal bleeding time in 2 hr

SIDE EFFECTS

CNS: Dizziness, headache, weakness

EENT: Tinnitus, epistaxis

GI: Nausea, vomiting, *diarrhea*, GI discomfort, **cholestatic jaundice, hepatitis**, increased cholesterol, LDL, VLDL, triglycerides

GU: Hematuria

HEMA: **Bleeding (epistaxis, hematuria, conjunctival hemorrhage, GI bleeding), agranulocytosis, neutropenia, thrombocytopenia, thrombotic thrombocytopenic purpura**

INTEG: *Rash*, pruritus

META: Hypercholesterolemia, hypertriglyceridemia

PHARMACOKINETICS

Peak 1-3 hr; metabolized by liver; excreted in urine, feces; half-life increases with repeated dosing, initially 12-36 hr; antiplatelet effect 2-5 days; 98% protein binding

INTERACTIONS

Increase: levels of CYP2C19, CYP2DC substrates, phenytoin, fosphenytoin, ambrisentan, theophylline

Increase: bleeding tendencies—anticoagulants, salicylates, thrombolytics, NSAIDs, abciximab, eptifibatide, tirofiban, thrombin inhibitors, SSRIs, aspirin

Increase: effects of ticlopidine—cimetidine

Decrease: plasma levels of ticlopidine—antacids

Decrease: plasma levels of digoxin, cycloSPORINE

Drug/Herb

Increase: bleeding risk—ginger, ginkgo, garlic, feverfew, horse chestnut, green tea

NURSING CONSIDERATIONS

Assess:

- Hepatic studies: AST, ALT, bilirubin, creatinine with long-term therapy

Black Box Warning:

Blood dyscrasias, bone marrow depression, do not use in those with a history of these conditions; blood studies: CBC; CBC q2wk × 3 mo, Hct, Hgb, PT with long-term therapy

⚠️ Bleeding time at baseline and throughout treatment; levels may be 2-5× normal limit

Evaluate:

- Therapeutic response: absence of stroke

Teach patient/family:

- That blood work will be necessary during treatment
 - To report any unusual bleeding to prescriber
 - To report side effects such as diarrhea, skin rashes, subcut bleeding, signs of cholestasis (jaundiced skin and sclera, dark urine, light-colored stools) • That product should be discontinued 10-14 days before surgery; not to double a missed dose
 - That there are many product and herbal interactions to avoid all OTC products unless approved by prescriber
-

🍁 Canada only Side effects: *italics* = common; **bold** = life-threatening ⚠️
Nurse Alert

tigecycline (Rx)

(tye-ge-sye'kleen)

Tygacil

Func. class.: Broad-spectrum antiinfective

Chem. class.: Glycylcyclines

ACTION:

Inhibits protein synthesis and phosphorylation in microorganisms; bacteriostatic structurally similar to the tetracyclines

USES:

Complicated skin/skin-structure infections (*Escherichia coli*, *Enterococcus faecalis* [vancomycin-susceptible only] *Staphylococcus aureus*, *Streptococcus agalactiae*, *S. anginosus* group, *S. pyogenes*, *Bacteroides fragilis*; complicated intraabdominal infections [*Citrobacter freundii*] *Enterobacter cloacae*, *E. coli*, *Klebsiella oxytoca*, *K. pneumoniae*, *E. faecalis* [vancomycin-susceptible only], *S. aureus* [methicillin-susceptible only], *S. anginosus* group, *B. fragilis*, *Bacteroides thetaiotaomicron*, *B. uniformis*, *B. vulgatus*, *Clostridium perfringens*, *Peptostreptococcus micros*); community-acquired pneumonia

CONTRAINDICATIONS:

Pregnancy (D), breastfeeding, children <18 yr, hypersensitivity to tigecycline

Precautions: Renal/hepatic disease, hypersensitivity to tetracyclines, ventilator-associated/hospital-acquired pneumonias

DOSAGE AND ROUTES

Calculator

- **Adult: IV** 100 mg then 50 mg q12hr, **IV INF** given over 30-60 min q12hr; given for 5-14 days, depending on infection

Hepatic dose

- **Adult: IV** (Child-Pugh C) 100 mg then 25 mg q12hr

Available forms: Powder for inj, lyophilized 50 mg

Administer:

- Tigecycline allergy test before using, obtain C&S, do not begin treatment

before results or if susceptible organism is strongly suspected

Intermittent IV INF route

- Reconstitute each vial with 5.3 ml of 0.9% NaCl or D₅ (10 mg/ml); swirl to dissolve; immediately withdraw 5 ml of reconstituted sol and add to 100-ml IV bag for inf (1 mg/ml); may be yellow or orange; if not, sol should be discarded; do not give if particulate matter is present, use a dedicated IV line or Y-site, flush with NS before and after use, give over 1/2 hr

Y-site compatibilities: Acyclovir, alfentanil, allopurinol, amifostine, amikacin, aminocaproic acid, aminophylline, amphotericin B liposome, ampicillin, ampicillin/sulbactam, argatroban, azithromycin, aztreonam, bivalirudin, bumetanide, buprenorphine, butorphanol, calcium chloride/gluconate, CARBOplatin, carmustine, caspofungin, ceFAZolin, cefepime, cefotaxime, cefoTEtan, cefOXitin, cefTAZidime, ceftizoxime, cefTRIAxone, cefuroxime, cimetidine, ciprofloxacin, cisatracurium, CISplatin, clindamycin, cyclophosphamide, cycloSPORINE, cytarabine, dacarbazine, DACTINomycin, DAPTOmycin, DAUNOrubicin hydrochloride, dexamethasone, dexmedetomidine, dexrazoxane, digoxin, diltiazem, diphenhydrAMINE, DOBUTamine, DOCEtaxel, dolasetron, DOPamine, doripenem, DOXOrubicin hydrochloride, DOXOrubicin liposome, droperidol, enalaprilat, EPINEPHrine, eptifibatide, ertapenem, erythromycin, esmolol, etoposide, etoposide phosphate, famotidine, fenoldopam, fentaNYL, fluconazole, fludarabine, fluorouracil, foscarnet, fosphenytoin, furosemide, ganciclovir, gemcitabine, gentamicin, glycopyrrolate, granisetron, haloperidol, heparin, hydrocortisone, HYDROmorphone, ifosfamide, imipenem/cilastatin, insulin, irinotecan, isoproterenol, ketorolac, labetalol, lansoprazole, lepirudin, leucovorin, levofloxacin, lidocaine, linezolid, LORazepam, magnesium sulfate, mannitol, mechlorethamine, melphalan, meperidine, meropenem, mesna, methohexital, methotrexate, methyl dopa, metoclopramide, metoprolol, metroNIDAZOLE, midazolam, milrinone, mitoMYcin, mitoXANtrone, morphine, moxifloxacin, mycophenolate, nafcillin, nalbuphine, naloxone, nesiritide, nitroglycerin, nitroprusside, norepinephrine, octreotide, ondansetron, oxaliplatin, oxytocin, PACLitaxel, palonosetron, pamidronate, pancuronium, pantoprazole, PEMEtrexed, pentamidine, pentazocin, PENTobarbital, PHENobarbital, phenylephrine, piperacillin/tazobactam, potassium acetate/chloride/phosphate,

procainamide, prochlorperazine, promethazine, propofol, propranolol, ranitidine, remifentanyl, rocuronium, sodium acetate/bicarbonate/phosphate, streptozocin, succinylcholine, SUFentanyl, tacrolimus, teniposide, theophylline, thiopental, thiotepa, ticarcillin/clavulanate, tirofiban, tobramycin, topotecan, trimethoprim/sulfamethoxazole, vancomycin, vasopressin, vecuronium, vinBLAStine, vinCRIStine, vinorelbine, zidovudine, zoledronic acid

SIDE EFFECTS

CNS: Headache, dizziness, insomnia

CV: Hypo/hypertension, phlebitis

EENT: Tooth discoloration

GI: *Nausea, vomiting, diarrhea*, anorexia, constipation, dyspepsia, abdominal pain, **hepatotoxicity, hepatic failure, pseudomembranous colitis**

HEMA: **Anemia, leukocytosis, thrombocytopenia**

INTEG: *Rash*, pruritus, sweating, photosensitivity

META: Increased ALT, AST, BUN, lactic acid, alk phos, amylase; hyperglycemia, hypokalemia, hypoproteinemia, bilirubinemia

MISC: Back pain, fever, abnormal healing, abdominal pain, abscess, asthenia, infection, pain, peripheral edema, local reactions

RESP: Cough, dyspnea

SYST: **Anaphylaxis**

PHARMACOKINETICS

Not extensively metabolized, 22% of unchanged product excreted in urine, terminal half-life 42 hr, primarily biliary excreted, protein binding 71%-89%

INTERACTIONS

Increase: effect of warfarin

Decrease: effect of oral contraceptives

Drug/Lab Test

Increase: amylase, LFTs, alk phos, BUN, creatinine, LDH, WBC, INR, PTT, PT

Decrease: potassium, calcium, sodium, Hgb/Hct, platelets

NURSING CONSIDERATIONS

Assess:

⚠️ **Pseudomembranous colitis:** diarrhea, abdominal pain, fever, fatigue, anorexia; possible anemia, elevated WBC level, low serum albumin; stop product; usually either vancomycin or IV metroNIDAZOLE is given • Signs of anemia: Hct, Hgb, fatigue

- Blood studies: PT, CBC, AST, ALT, BUN creatinine

⚠️ **Allergic reactions:** rash, itching, pruritus, angioedema • Serious allergic skin reactions: Stevens-Johnson anaphylaxis

- Nausea, vomiting, diarrhea; administer antiemetic, antacids as ordered

- **Toxicity:** pseudotumor cerebri, photosensitivity, antianabolic actions (azotemia, BUN, hypophosphatemia, metabolic acidosis) tigecycline is structurally similar to tetracycline; pancreatitis, hyperamylasemia; (may be fatal) if these occur, discontinue, improvement usually occurs after product is discontinued • **Overgrowth of infection:** fever, malaise, redness, pain, swelling, drainage, perineal itching, diarrhea, changes in cough or sputum

Perform/provide:

- Storage in tight, light-resistant container at room temp, diluted sol at room temp for up to 24 hr, 6 hr in vial, and remaining time in IV bag, ≤48 hr refrigerated

Evaluate:

- Therapeutic response: decreased temp, absence of lesions, negative C&S

Teach patient/family:

- To avoid sun exposure; sunscreen does not seem to decrease photosensitivity

⚠️ To avoid pregnancy while taking this product; fetal harm may occur; avoid breastfeeding • To report infection, increase in temp; to report burning, pain at inj site

☼ Canada only Side effects: *italics* = common; **bold** = life-threatening ⚠️
Nurse Alert

timolol (Rx)

(tye'moe-lole)

Apo-Timol , Novo-Timol 

Func. class.: Antihypertensive

Chem. class.: Nonselective β -blocker

ACTION:

Competitively blocks stimulation of β -adrenergic receptor within vascular smooth muscle (decreases rate of SA node discharge, increases recovery time); slows conduction of AV node and decreases heart rate, which decreases O_2 consumption in myocardium; also decreases renin-aldosterone-angiotensin system; at high doses, inhibits β_2 -receptors in bronchial system

USES:

Mild to moderate hypertension, migraine prophylaxis, to decrease mortality after MI

Unlabeled uses: Tremors, angina pectoris

CONTRAINDICATIONS:

Hypersensitivity to β -blockers, cardiogenic shock, heart block (2nd/3rd degree), sinus bradycardia, CHF, cardiac failure, severe COPD, asthma

Precautions: Pregnancy (C), breastfeeding, major surgery, diabetes mellitus, COPD, well-compensated heart failure, CAD, nonallergic bronchospasm, peripheral vascular disease, thyroid/renal/hepatic disease, diabetes mellitus

Black Box Warning:

Abrupt discontinuation

DOSAGE AND ROUTES

Calculator

Hypertension

- **Adult: PO** 10 mg bid or 20 mg/day, may increase by 10 mg q7days, max 60 mg/day
- **Geriatric patients: PO** initiate dose cautiously

Myocardial infarction

- **Adult: PO** 10 mg bid beginning 1-4 wk after MI

Migraine headache prevention

- **Adult: PO** 10 mg bid or 20 mg/day; may increase to 30 mg/day, 20 mg in AM, 10 mg in PM; discontinue if not effective after 8 wk

Available forms: Tabs 5, 10, 20 mg

Administer:

- PO before or immediately after meals, at bedtime; tab may be crushed or swallowed whole
- Reduced dosage in renal dysfunction

SIDE EFFECTS

CNS: *Insomnia, dizziness, hallucinations, anxiety, fatigue, depression, headache*

CV: Hypotension, bradycardia, **CHF**, edema, chest pain, claudication, angina, AV block, ventricular dysrhythmias

EENT: *Visual changes; sore throat; double vision; dry, burning eyes*

GI: *Nausea, vomiting, ischemic colitis, diarrhea, abdominal pain, mesenteric arterial thrombosis*, flatulence, constipation

GU: Impotence, urinary frequency

HEMA: **Agranulocytosis, thrombocytopenia, purpura**

INTEG: Rash, alopecia, pruritus, fever

META: Hypoglycemia

MUSC: *Joint pain, muscle pain*

RESP: **Bronchospasm, dyspnea**, cough, crackles, nasal stuffiness

PHARMACOKINETICS

Peak 1-2 hr; half-life 4 hr; metabolized by liver; excreted in urine, breast milk; protein binding <10%

INTERACTIONS

Increase: hypotension, bradycardia—hydrALAZINE, methyldopa, prazosin, anticholinergics, alcohol, reserpine, nitrates

Increase: effects of β -blockers, calcium channel blockers

Decrease: antihypertensive effects—NSAIDs, sympathomimetics, thyroid, salicylates

Decrease: hypoglycemic effects—insulin, sulfonylureas

Decrease: bronchodilation—theophyllines

Drug/Lab Test

Increase: renal, hepatic studies, uric acid

Interference: glucose, insulin tolerance test

NURSING CONSIDERATIONS

Assess:

Black Box Warning:

Abrupt discontinuation: may result in myocardial ischemia, MI, severe hypotension, ventricular dysrhythmias in those with preexisting cardiovascular disease

- **Headaches:** location, severity, duration, frequency at baseline and throughout treatment
- I&O, weight daily
- B/P during initial treatment, periodically thereafter, pulse q4hr; note rate, rhythm, quality
- Apical/radial pulse before administration; notify prescriber of any significant changes
- Baselines of renal, hepatic studies before therapy begins
- Edema in feet, legs daily

Perform/provide:

- Dry storage at room temp; do not freeze

Evaluate:

- Therapeutic response: decreased B/P after 1-2 wk

Teach patient/family:

- To take before or immediately after meals

Black Box Warning:

Not to discontinue product abruptly; to taper over 2 wk; may cause precipitate angina

- Not to use OTC products containing α -adrenergic stimulants (nasal decongestants, cold preparations) unless directed by prescriber
- To report bradycardia, dizziness, confusion, depression, fever, sore throat, SOB to prescriber
- To take pulse at home; advise when to notify prescriber
- To avoid alcohol, smoking, sodium intake
- To comply with weight control, dietary adjustments, modified exercise program
- To carry emergency ID to identify product, allergies
- To avoid hazardous activities if dizziness is present
- To report symptoms of **CHF**: difficulty breathing, especially on exertion or

when lying down; night cough; swelling of extremities • To take medication at bedtime; to wear support hose to minimize effect of orthostatic hypotension

TREATMENT OF OVERDOSE:

Lavage, IV atropine for bradycardia, IV theophylline for bronchospasm, digoxin, O₂, diuretic for cardiac failure, hemodialysis; administer vasopressor (norepinephrine)

☛ Canada only Side effects: *italics* = common; **bold** = life-threatening ⚠
Nurse Alert

timolol (ophthalmic)

(tie-moe'lol)

Istalol, Timoptic, Timoptic-XE

Func. class.: Antiglaucoma

Chem. class.: β -Blocker

ACTION:

Can decrease aqueous humor and increase outflows

USES:

Treatment of chronic open-angle glaucoma and ocular hypertension

CONTRAINDICATIONS:

Hypersensitivity, AV block, heart failure, bradycardia, sick sinus syndrome, asthma

Precautions: Abrupt discontinuation, pregnancy, breastfeeding, children, COPD, depression, diabetes mellitus, myasthenia gravis, hyperthyroidism, pulmonary disease, angle-closure glaucoma

DOSAGE AND ROUTES

Calculator

• **Adult:** Instill 1 drop in each affected eye bid (0.25% solution) initially; if no response, 1 drop in each affected eye bid (0.5% solution) or 1 drop of gel in each affected eye daily

Available forms: Ophthalmic solution 0.25, 0.5%; ophthalmic gel 0.25%, 0.5%

Administer:

- For ophthalmic use only
- Do not touch the tip of the dropper to the eye, fingertips, or other surface to prevent contamination • Wash hands before and after use
- Tilt head back slightly and pull the lower eyelid down with the index finger to form a pouch; squeeze the prescribed number of drops into the pouch; close eyes to spread drops; to avoid excessive systemic absorption, apply finger pressure on the lacrimal sac for 1–2 min after use • If >1 topical ophthalmic drug product is being used, the drugs should be administered at least 5 min apart • Administer

other topically applied ophthalmic medications at least 10 min before timolol gel-forming solution • To avoid contamination or the spread of infection, do not use dropper for more than one person • Some products contain the preservative benzalkonium chloride, which can be absorbed by soft contact lenses; remove contact lenses before administration of the solution; lenses may be reinserted 15 min after administration • Decreased intraocular pressure can take several weeks, monitor IOP after a month

SIDE EFFECTS

CNS: Insomnia, headache, dizziness, anxiety, depression, headache, nightmares

CV: Palpitations, heart failure

EENT: Eye stinging/burning, tearing, photophobia, visual disturbances

GI: Nausea, dry mouth

PULM: Bronchospasm

PHARMACOKINETICS

Onset 30 min, peak 1-2 hr, duration 12-24 hr

INTERACTIONS

Increase: β -Blocking effect—oral β -blockers

Increase: Intraocular pressure reduction—topical miotics, dipivefrin, EPINEPHrine, carbonic anhydrase inhibitors; this may be beneficial

Increase: B/P, severe—when abruptly stopping cloNIDine

Increase: Depression of AV nodal conduction, bradycardia, or hypotension—adenosine, cardiac glycosides, disopyramide, other antiarrhythmics, class 1C antiarrhythmic drugs (flecainide, propafenone, moricizine, encainide, quinidine, calcium-channel blockers, or drugs that significantly depress AV nodal conduction)

Increase: AV block nodal conduction, induce AV block—high doses of procainamide

Increase: Antihypertensive effect—other antihypertensives

NURSING CONSIDERATIONS

Assess:

 **Systemic absorption:** When used in the eye, systemic absorption is common

with the same adverse reactions and interactions • Glaucoma: Monitor intraocular pressure

Evaluate:

- Decreasing intraocular pressure

Teach patient/family:

- That product is for ophthalmic use only
- Not to touch the tip of the dropper to the eye, fingertips, or other surface to prevent contamination • To wash hands before and after use
- To tilt the head back slightly and pull the lower eyelid down with the index finger to form a pouch, squeeze the prescribed number of drops into the pouch, close eyes to spread drops
- To apply finger pressure on the lacrimal sac for 1–2 min following use to prevent excessive systemic absorption • To administer drugs at least 5 min apart if more than one topical ophthalmic drug product is being used • To administer other topically applied ophthalmic medications at least 10 min before timolol gel-forming solution • To not use dropper for more than one person to avoid contamination or the spread of infection
- That some products contain the preservative benzalkonium chloride, which may be absorbed by soft contact lenses; to remove contact lenses before administration of the solution; that lenses may be reinserted 15 min after administration

🍁 Canada only Side effects: *italics* = common; **bold** = life-threatening ⚠️
Nurse Alert

tinidazole (Rx)

(tye-ni'da-zole)

Tindamax

Func. class.: Antiprotozoal

Chem. class.: Nitroimidazole derivative

ACTION:

Interferes with DNA/RNA synthesis in protozoa

USES:

Amebiasis, giardiasis, trichomoniasis

Unlabeled uses: *Bacteroides* sp., *Clostridium* sp., *Eubacterium* sp., *Fusobacterium* sp., *Peptococcus* sp., *Peptostreptococcus* sp., gingivitis, urethritis, *Veillonella* sp.

CONTRAINDICATIONS:

Pregnancy, breastfeeding; hypersensitivity to this product or nitroimidazole derivative

Precautions: Children, geriatric patients, hepatic disease, CNS depression, blood dyscrasias, candidiasis, seizures, viral infection, alcoholism, pregnancy

(C) **Black Box Warning:**

Secondary malignancy

DOSAGE AND ROUTES

Calculator

Intestinal amebiasis/amebic involvement of the liver

- **Adult:** PO 2 g daily × 3 days
- **Child ≥3 yr/adolescent:** PO 50 mg/kg/day × 3 days, max 2 g/day

Giardiasis

- **Adult:** PO 2 g as a single dose
- **Child ≥3 yr:** PO 50 mg/kg as a single dose, max 2 g

Trichomoniasis

- **Adult:** PO 2 g as a single dose

Bacterial vaginosis

- **Adult (nonpregnant woman):** PO 2 g/day × 2 days with food or 1 g/day × 5 days with food

Available forms: Tabs 250, 500 mg

Administer:

- Tabs can be crushed and mixed with artificial cherry syrup for children
- With food to increase plasma concentrations, minimize epigastric distress and other GI effects

SIDE EFFECTS

CNS: Dizziness, headache, **seizures**, peripheral neuropathy, malaise, fatigue

GI: Nausea, vomiting, anorexia, increased AST/ALT, constipation, abdominal pain, indigestion, altered taste

HEMA: **Leukopenia**, neutropenia

INTEG: Pruritus, urticaria, *rash*, oral candidiasis

SYST: **Angioedema**, cramping

PHARMACOKINETICS

Peak 1½ hr; metabolized extensively in liver; excreted unchanged (20%-25%) in urine, (12%) feces; half-life 12-14 hr; crosses blood-brain barrier

INTERACTIONS

- Do not use within 2 wk of disulfiram

Increase: tinidazole action—CYP3A4 inhibitors (cimetidine, ketoconazole): increased action of tinidazole

Increase: action of anticoagulants, cycloSPORINE, tacrolimus, fluorouracil, hydantoins, lithium

Decrease: tinidazole action—CYP3A4 inducers (PHENobarbital, rifampin, phenytoin); cholestyramine, oxytetracycline: decreased action of tinidazole

Drug/Herb

Increase or decrease: tinidazole level—St. John's wort

Drug/Lab Test

Increase: triglycerides, LDH, AST/ALT, glucose

Decrease: WBCs

NURSING CONSIDERATIONS

Assess:

- **Giardiasis:** obtain 3 stool samples several days apart beginning q3-4wk after treatment
- **Amebic liver abscess:** Monitor CBC, ESR, amebic gel diffusion test, ultrasound; also total and differential leukocyte count

Black Box Warning:

Secondary malignancy: avoid unnecessary use

- Signs of infection, anemia
- Bowel pattern before, during treatment

Evaluate:

- Therapeutic response: decrease in infection as evidenced by negative culture

Teach patient/family:

- To take with food to increase plasma concentrations, minimize epigastric distress and other GI effects; not to use alcoholic beverages during or for 3 days after treatment
- **Trichomoniasis:** both partners should be treated at the same time
- To avoid alcohol, may cause disulfiram reaction
- To avoid doing hazardous activities until reaction is known
- That product causes taste
- Not to use OTC, Rx, or herbal products unless approved by prescriber

☼ Canada only Side effects: *italics* = common; **bold** = life-threatening ⚠
Nurse Alert

HIGH ALERT

tinzaparin (Rx)

(tin-zay-par'in)

Innohep

Func. class.: Anticoagulant

Chem. class.: Unfractionated porcine heparin

ACTION:

Increases the inhibitory effect of antithrombin factor Xa, thrombin

USES:

Treatment of DVT, PE after abdominal, knee, or hip surgery or after knee or hip replacement

Unlabeled uses: Antiphospholipid antibody syndrome, arterial thromboembolism prophylaxis, cerebral thromboembolism, DVT prophylaxis, PE prophylaxis, thrombosis prophylaxis

CONTRAINDICATIONS:

Hypersensitivity to this product, heparin, pork or benzyl alcohol, sulfites; hemophilia, leukemia with bleeding, peptic ulcer disease, thrombocytopenic purpura, heparin-induced thrombocytopenia

Precautions: Pregnancy (B), breastfeeding, children, geriatric patients, alcoholism, severe renal/hepatic disease, blood dyscrasias; severe, uncontrolled hypertension; subacute bacterial endocarditis, acute nephritis; geriatric patients >70 yr (renal disease with DVT/PE)

Black Box Warning:

Spinal/epidural anesthesia, lumbar puncture

DOSAGE AND ROUTES

Calculator

Treatment of DVT

- **Adult:** SUBCUT 175 anti-Xa international units/kg/day ≥ 6 days and until adequate anticoagulation with warfarin (therapeutic INR ≥ 2 for 2 consecutive days)

Prophylaxis of DVT in orthopedic procedures (unlabeled)

- **Adult:** 75 anti-Xa units/kg/day started 12-24 hr after surgery

Prophylaxis of dvt/thromboembolism/pe (unlabeled)

- **Adult:** 3500 anti-Xa units (50 anti-Xa units/kg) daily beginning 1-2 hr prior to surgery and continued for 5-10 days

Available forms: Inj 20,000 international units/1 ml

Administer:

- Only after screening patient for bleeding disorders
- For 6 days, until warfarin has been given to result in adequate coagulation
- SUBCUT only; do not give IM
- To recumbent patient; give SUBCUT; rotate inj sites (left/right anterolateral, left/right posterolateral abdominal wall) • Insert whole length of needle into skin fold held with thumb and forefinger

 **Only this product when ordered; not interchangeable with heparin (unfractionated) or LMWHs • At same time each day to maintain steady blood levels**

- Do not massage area or aspirate when giving SUBCUT inj
- Do not mix with other products or inf fluids
- Alternate inj sites
- For excessive bruising at inj site, may use ice before SUBCUT inj

SIDE EFFECTS

CNS: Fever, confusion, dizziness, insomnia

CV: Angina, dysrhythmias, peripheral edema, tachycardia, hypo/hypertension

GI: Nausea, constipation, flatulence, dyspepsia, **hepatitis**

GU: UTI, hematuria, urinary retention, dysuria

HEMA: Hemorrhage, **anemia, thrombocytopenia**, bleeding

INTEG: Ecchymosis, inj site reaction

MISC: Headache, chest/back pain, hypersensitivity

SYST: **Stevens-Johnson syndrome**

PHARMACOKINETICS

Onset 2-3 hr, max antithrombin activity (3-5 hr), elimination half-life 4.5 hr

INTERACTIONS

Increase: action of tinzaparin—oral anticoagulants, salicylates, thrombolytics,

NSAIDs, platelet inhibitors, ticlopidine, clopidogrel

NURSING CONSIDERATIONS

Assess:

Black Box Warning:

Spinal/epidermal anesthesia, lumbar puncture: monitor neurological impairment; if impairment occurs, urgent treatment needed

- Blood studies (Hct, platelets, occult blood in stools), anti-Xa; thrombocytopenia may occur
- **Bleeding:** gums, petechiae, ecchymosis, black tarry stools, hematuria, decreased Hct, Hgb • Hypersensitivity (fever, urticaria, chills); report to prescriber
- Inj site reactions; do not use IM inj

Perform/provide:

- Storage at 77° F (25° C); do not freeze

Evaluate:

- Therapeutic response: resolution of DVT

Teach patient/family:

- To report any signs of bleeding: gums, under skin, urine, stools

TREATMENT OF OVERDOSE:

Protamine 1 mg/100 anti-Xa international units of tinzaparin

☼ Canada only Side effects: *italics* = common; **bold** = life-threatening ⚠
Nurse Alert

tioconazole vaginal antifungal

See [Appendix B](#)

tiotropium (Rx)

(ty-oh'tro-pee-um)

[Spiriva HandiHaler](#)

Func. class.: Anticholinergic, bronchodilator

Chem. class.: Synthetic quaternary ammonium compound

Do not confuse: [Spiriva](#)/Inspira

ACTION:

Inhibits interaction of acetylcholine at receptor sites on the bronchial smooth muscle, thereby resulting in decreased cGMP and bronchodilation

USES:

COPD; for the long-term treatment and once-daily maintenance of bronchospasm associated with COPD, including chronic bronchitis and emphysema

CONTRAINDICATIONS:

Hypersensitivity to this product, atropine or its derivatives

Precautions: Pregnancy (C), breastfeeding, children, geriatric patients, closed-angle glaucoma, prostatic hypertrophy, bladder neck obstruction, renal disease

DOSAGE AND ROUTES

Calculator

• **Adult: INH** content of 1 cap/day (18 mcg) using HandiHaler inhalation device

Available forms: Powder for INH 18 mcg in blister packs containing 6 caps with inhaler; 30 caps with inhaler

Administer:

Inhalation route

- Caps are for INH only; do not swallow
- Immediately before administration, peel back foil until cap is visible and to

“stop” line; remove cap from blister cavity; open dust cap of HandiHaler by pulling upward, then open mouthpiece; place cap in center chamber; firmly close mouthpiece until it clicks, leaving dust cap open • When finished taking dose, remove used capsule and dispose of it; close mouthpiece and dust cap; store

- Rinse mouth after use

SIDE EFFECTS

CNS: Depression, paresthesia

CV: Chest pain, increased heart rate

EENT: Dry mouth, blurred vision, glaucoma

GI: Vomiting, abdominal pain, constipation, dyspepsia

GU: Urinary difficulty, urinary retention, UTI

INTEG: Rash, **angioedema**

MISC: Candidiasis, flulike syndrome, herpes zoster, infections, angina pectoris

MS: Arthritis myalgic leg/skeletal pain

RESP: *Cough, sinusitis, upper respiratory tract infection*, epistaxis, pharyngitis

PHARMACOKINETICS

Half-life 5-6 days in animals, does not cross blood-brain barrier, very little metabolized in the liver, excreted in urine, 72% protein binding

INTERACTIONS

- Anticholinergics: avoid use with other anticholinergics

Drug/Lab Test

Increase: cholesterol, glucose

NURSING CONSIDERATIONS

Assess:

- **Respiratory status:** dyspnea, rate, breath sounds before and during treatment; pulmonary function tests at baseline and periodically; upper respiratory infections, cough, sinusitis • Tolerance over long-term therapy; dose may have to be increased or changed

- Patient’s ability to use HandiHaler

Evaluate:

- Therapeutic response: ability to breathe easier

Teach patient/family:

- Signs of closed-angle glaucoma (eye pain, blurred vision, visual halos)
 - That product is used for long-term maintenance, not for immediate relief of breathing problems; that effect takes 20 min, lasts 24 hr • To avoid getting the powder in the eyes; may cause blurred vision and pupil dilation
 - To hold HandiHaler with mouthpiece upward; to press button in once, completely, and release; this allows for medication to be released • To breathe out completely; not to breathe into mouthpiece at any time
 - To raise device to mouth and close lips tightly around mouthpiece
 - With head upright, to breathe in slowly and deeply, but allow the cap to vibrate; to breathe until the lungs fill; to hold breath and remove mouthpiece; to resume normal breathing • To rinse mouth after use; to use hard candy or regular oral hygiene to reduce dry mouth
 - To report immediately blurred vision, eye pain, halos
 - To keep caps in sealed blisters before use, store at room temperature
-

🍁 Canada only Side effects: *italics* = common; **bold** = life-threatening ⚠️
Nurse Alert

tipranavir (Rx)

(ti-pran'a-veer)

Aptivus

Func. class.: Antiretroviral

Chem. class.: Protease inhibitor

ACTION:

Inhibits human immunodeficiency virus (HIV) protease, thereby preventing the maturation of the virus

USES:

HIV in combination with other antiretrovirals

CONTRAINDICATIONS:

Hypersensitivity

Black Box Warning:

Hepatic disease (Child-Pugh B, C)

Precautions: Pregnancy (C), breastfeeding, children, renal disease, history of renal stones, sulfa allergy, hemophilia, diabetes mellitus, pancreatitis, alcoholism, immune reconstitution syndrome, surgery, trauma, infection

Black Box Warning:

Intracranial bleeding, hepatitis

DOSAGE AND ROUTES

Calculator

Reduce dose with mild to moderate hepatic impairment and ketoconazole coadministration

- **Adult: PO** 500 mg coadministered with ritonavir 200 mg bid with food
- **Adolescent and child ≥ 2 yr: PO** 14 mg/kg given with ritonavir 6 mg/kg bid or 375 mg/m² given with ritonavir 150 mg/m² bid, max 500 mg with ritonavir 200 mg bid

Available forms: Caps 250 mg; oral sol 100 mg/ml

Administer:

- Swallow cap whole; do not break, crush, chew
- After meals

- In equal intervals around the clock to maintain blood levels
- Give oral sol using calibrated dosing syringe or 5-ml oral syringe provided

SIDE EFFECTS

CNS: *Headache, insomnia, dizziness, somnolence, fatigue, fever, intracranial bleeding*

GI: *Diarrhea, abdominal pain, nausea, vomiting, anorexia, dry mouth, hepatitis B or C, fatalities when given with ritonavir, pancreatitis*

GU: Nephrolithiasis

INTEG: *Rash, urticaria, lipodystrophy, serious rash*

MS: Pain

OTHER: *Asthenia, insulin-resistant hyperglycemia, hyperlipidemia, ketoacidosis*

PHARMACOKINETICS

Terminal half-life 6 hr, peak 3 hr, plasma protein binding 99.9%, steady state 7-10 days, metabolism CYP3A4, 80% fecal excretion

INTERACTIONS

⚠ Life-threatening dysrhythmias: *amiodarone, astemizole, cisapride, ergots, flecainide, midazolam, pimozide, propafenone, quinidine, rifabutin, rifampin, terfenadine, triazolam*

Increase: myopathy, rhabdomyolysis—HMG-CoA reductase inhibitors (lovastatin, simvastatin)

Increase: tipranavir levels—ketoconazole, delavirdine, itraconazole

Increase: levels of both products—clarithromycin, zidovudine

Increase: levels of tipranavir—oral contraception

Decrease: tipranavir levels—rifamycins, fluconazole, nevirapine, efavirenz

Drug/Herb

Decrease: tipranavir levels—St. John's wort; avoid concurrent use

Drug/Food

Decrease: tipranavir absorption—grapefruit juice; high-fat, high-protein foods

Drug/Lab Test

Increase: AST/ALT, cholesterol, blood glucose, amylase, lipase, triglycerides

NURSING CONSIDERATIONS

Assess:

- Signs of infection, anemia; presence of other sexually transmitted diseases

Black Box Warning:

Hepatic studies: ALT, AST; total bilirubin, amylase; all may be elevated, discontinue in those with hepatic insufficiency or hepatitis or AST/ALT $10 \times$ upper limit or AST/ALT $5-10 \times$ ULN and total bilirubin $2.5 \times$ ULN

- **HIV:** Viral load, CD4, plasma HIV RNA, serum cholesterol profile, serum triglycerides during treatment
- Bowel pattern before, during treatment; if severe abdominal pain with bleeding occurs, product should be discontinued; monitor hydration
- **Serious rash:** if serious rash occurs, product should be discontinued
- Immune reconstitution syndrome: has been reported with combination antiretroviral therapy, patients may develop pain (MAC, CMV, PCP, TB) and autoimmune disease months after treatment
- Intracranial bleeding: more common in those with trauma, surgery, or those taking antiplatelets or anticoagulants
- Cushingoid symptoms: buffalo hump, facial/peripheral wasting, breast enlargement, central obesity

Perform/provide:

- Storage for caps in refrigerator before use; after opening, store at room temp; use within 60 days
- Storage for oral sol at room temp; use within 60 days after opening bottle

Evaluate:

- Therapeutic response: improving CD4 counts, viral load

Teach patient/family:

- To take as prescribed; if dose is missed, to take as soon as remembered up to 1 hr before next dose; not to double dose
- That product must be taken in equal intervals around the clock to maintain blood levels for duration of therapy ⚠
- That hyperglycemia may occur; to watch for increased thirst, weight loss, hunger, dry, itchy skin; to notify prescriber
- That product does not cure AIDS, only controls symptoms; not to donate blood

☛ Canada only Side effects: *italics* = common; **bold** = life-threatening ⚠

Nurse Alert

HIGH ALERT

tirofiban (Rx)

(tie-roh-fee'ban)

Aggrastat

Func. class.: Antiplatelet

Chem. class.: Glycoprotein IIb/IIIa inhibitor

ACTION:

Antagonist of platelet glycoprotein (GP) IIb/IIIa receptor that prevents binding of fibrinogen and von Willebrand's factor, which inhibits platelet aggregation

USES:

Acute coronary syndrome in combination with heparin

CONTRAINDICATIONS:

Hypersensitivity, active internal bleeding, stroke, major surgery, severe trauma within 30 days, intracranial neoplasm, aneurysm, hemorrhage, acute pericarditis, platelets $<100,000/\text{mm}^3$, history of thrombocytopenia, coagulopathy, systolic B/P >180 mm Hg or diastolic B/P >110 mm Hg

Precautions: Pregnancy (B), breastfeeding, children, geriatric patients, renal disease, bleeding tendencies, hypertension, platelets $<150,000/\text{mm}^3$

DOSAGE AND ROUTES

Calculator

• **Adult:** IV 0.4 mcg/kg/min $\times$ 30 min then 0.1 mcg/kg/min for 12-24 hr after angioplasty or atherectomy

Renal dose

• **Adult:** IV CCr <30 ml/min, 0.2 mcg/kg/min $\times$ 30 min then 0.05 mcg/kg/min during angiography and for ≤ 24 hr after angioplasty

Available forms: Inj 50 ml vials; inj premixed bag 50 mcg/ml in 100, 250 ml

Administer:

Intermittent IV INF route

- Dilute inj: withdraw and discard 100 ml from 500-ml bag of sterile 0.9% NaCl or D₅W and replace this vol with 100 ml of tirofiban inj from 2 vials

- Tirofiban inj for sol is premixed in containers of 500-ml 0.9% NaCl (50 mg/ml), infuse over 30 min
- Minimize other arterial/venous punctures; IM inj, catheter use, intubation, to reduce bleeding risk

Y-site compatibilities: Acyclovir, alfentanil, allopurinol, amifostine, amikacin, aminocaproic acid, aminophylline, amiodarone, ampicillin, ampicillin/sulbactam, anidulafungin, argatroban, arsenic trioxide, atracurium, atropine, azithromycin, aztreonam, bivalirudin, bleomycin, bumetanide, buprenorphine, butorphanol, calcium chloride/gluconate, capreomycin, CARBOplatin, carmustine, caspofungin, ceFAZolin, cefepime, cefotaxime, cefoTEtan, cefOXitin, cefTAZidime, ceftizoxime, cefTRIAxone, cefuroxime, chloramphenicol, chlorproMAZINE, cimetidine, ciprofloxacin, cisatracurium, CISplatin, clindamycin, cyclophosphamide, cycloSPORINE, cytarabine, DACTINomycin, DAPTOmycin, dexamethasone, dexmedetomidine, dexrazoxane, digoxin, diltiazem, diphenhydrAMINE, DOBUTamine, DOCEtaxel, dolasetron, DOPamine, doxacurium, DOXOrubicin, DOXOrubicin liposome, doxycycline, droperidol, enalaprilat, ePHEDrine, EPINEPHrine, epirubicin, eptifibatide, ertapenem, erythromycin, esmolol, etoposide, etoposide phosphate, famotidine, fenoldopam, fentaNYL, fluconazole, fludarabine, fluorouracil, foscarnet, fosphenytoin, furosemide, ganciclovir, gemcitabine, gentamicin, glycopyrrolate, granisetron, haloperidol, heparin, hydrALAZINE, hydrocortisone, HYDROmorphone, IDArubicin, ifosfamide, imipenem/cilastatin, insulin, irinotecan, isoproterenol, ketorolac, labetalol, leucovorin, lidocaine, linezolid, LORazepam, magnesium sulfate, mannitol, mechlorethamine, melphalan, meperidine, meropenem, mesna, methylhexital, methotrexate, methyl dopate, methylPREDNISolone, metoclopramide, metoprolol, metroNIDAZOLE, midazolam, milrinone, mitoXANtrone, morphine, mycophenolate, nafcillin, nalbuphine, naloxone, nesiritide, niCARdipine, nitroglycerin, nitroprusside, norepinephrine, octreotide, ondansetron, oxaliplatin, oxytocin, PACLitaxel, palonosetron, pamidronate, pancuronium, pantoprazole, PEMEtrexed, PENTobarbital, PHENobarbital, phentolamine, phenylephrine, piperacillin/tazobactam, potassium acetate, potassium chloride/phosphates, procainamide, prochlorperazine, promethazine, propranolol, quinupristin/dalfopristin, ranitidine, remifentanil, rocuronium, sodium acetate/bicarbonate, streptozocin, succinylcholine, SUFentanil,

tacrolimus, teniposide, theophylline, thiopental, thiotepa, ticarcillin/clavulanate, tigecycline, tobramycin, topotecan, vancomycin, vasopressin, vecuronium, verapamil, vinBLAStine, vinCRISStine, vinorelbine, voriconazole, zidovudine, zoledronic acid

SIDE EFFECTS

CNS: Dizziness, headache

CV: Bradycardia, hypotension

GI: Nausea, vomiting

HEMA: Bleeding, thrombocytopenia

INTEG: Rash

MISC: Dissection, edema, pain in legs/pelvis, sweating

SYST: Anaphylaxis

PHARMOCOKINETICS

Half-life 2 hr; excretion via urine, feces; plasma clearance 20%-25% lower in geriatric patients with CAD; renal insufficiency decreases plasma clearance

INTERACTIONS

Increase: bleeding—aspirin, heparin, NSAIDs, abciximab, eptifibatide, clopidogrel, ticlopidine, dipyridamole, cefamandole, cefoTEtan, cefoperazone, valproic acid, heparins, thrombin inhibitors, SSRIs, SNRIs

NURSING CONSIDERATIONS

Assess:

- **Multiple sclerosis, spinal cord injury:** muscle spasms, dizziness, drowsiness, difficulty moving, coordination, balance ⚠️ **Bleeding:** platelet counts, Hct, Hgb before treatment, within 6 hr of loading dose, and at least daily thereafter; watch for bleeding from puncture sites, catheters or in stools, urine; discontinue if platelets $<100,000/\text{mm}^3$

Evaluate:

- Therapeutic response: treatment of acute coronary syndrome

Teach patient/family:

- That it is necessary to quit smoking to prevent excessive vasoconstriction
- About signs, symptoms of bleeding and low platelets

- That there are many product and herbal interactions

✳ Canada only Side effects: *italics* = common; **bold** = life-threatening ⚠
Nurse Alert

tiZANidine (Rx)

(ti-za'nih-deen)

Zanaflex

Func. class.: Skeletal muscle relaxant, α_2 -adrenergic agonist *Chem. class.:* Imidazoline

Do not confuse: tiZANidine/tiaGABine

ACTION:

Increases presynaptic inhibition of motor neurons and reduces spasticity by α_2 -adrenergic agonism

USES:

Acute/intermittent management of increased muscle tone associated with spasticity, symptoms of MS

Unlabeled uses: Tension headache, low back pain, trigeminal neuralgia

CONTRAINDICATIONS:

Hypersensitivity

Precautions: Pregnancy (C), breastfeeding, children, geriatric patients, hypotension, renal/hepatic disease

DOSAGE AND ROUTES

Calculator

• **Adult: PO** 8 mg q6-8hr, max 36 mg/24 hr

Renal dose

• **Adult: PO** CCr <25 ml/min, start with lower dose

Available forms: Tabs 2, 4 mg; caps 2, 4, 6 mg

Administer

- Consistently either with/without food; food may affect absorption
- Titrate doses carefully
- Avoid use with other CNS depressants

SIDE EFFECTS

CNS: Somnolence, dizziness, speech disorder, dyskinesia, nervousness, hallucination, psychosis

CV: Hypotension, bradycardia

GI: Dry mouth, vomiting, increased ALT, abnormal LFTs, constipation

OTHER: Blurred vision, urinary frequency, pharyngitis, rhinitis, tremor, rash, muscle weakness

PHARMACOKINETICS

Completely absorbed, widely distributed, peak 1-2 hr, duration 3-6 hr, half-life 2.5 hr, protein binding 30%, metabolized by liver; excreted in urine, feces

INTERACTIONS

Increase: CNS depression—alcohol, other CNS depressants

Increase: tiZANidine levels—other CYP1A2 inhibitors (acyclovir, amiodarone, famotidine, mexiletine, enoxacin, norfloxacin, propafenone, tacrine, verapamil, zileuton, oral contraceptives ciprofloxacin), fluvoxamine; avoid concurrent use

Increase: hypotension—antihypertensives

Increase: effect of rasagiline

Drug/Herb

Increase: CNS depression—kava, St. John's wort

Drug/Lab Test

Increase: alk phos, AST, ALT, serum glucose

NURSING CONSIDERATIONS

Assess:

- **Muscle spasticity** at baseline and throughout treatment
- **Hypotension;** gradual dosage increase should lessen hypotensive effects; have patient rise slowly from supine to upright; watch those patients receiving antihypertensives for increased effects
- Increased sedation, dizziness, hallucinations, psychosis; product may need to be discontinued
- Vision by ophthalmic exam; corneal opacities may occur
- Hepatic studies: 1, 3, 6 mo during treatment and periodically thereafter

Evaluate:

- Therapeutic response: decreased muscle spasticity

Teach patient/family:

- To rise slowly from lying or sitting to upright position to prevent orthostatic hypotension

- To ask for assistance if dizziness, sedation occur; to avoid drinking alcohol; to avoid operating machinery, driving until effects known
 - To discontinue gradually
-

🍁 Canada only Side effects: *italics* = common; **bold** = life-threatening ⚠️
Nurse Alert

tobramycin (Rx)

(toe-bra-mye'sin)

BETHKIS

Func. class.: Antiinfective

Chem. class.: Aminoglycoside

ACTION:

Interferes with protein synthesis in bacterial cell by binding to ribosomal subunits, thereby causing inaccurate peptide sequences to form in protein chain causing bacterial death

USES:

Severe systemic infections of CNS, respiratory, GI, urinary tract, bone, skin, soft tissues caused by *Pseudomonas aeruginosa*, *Escherichia coli*, *Enterobacter*, *Providencia*, *Citrobacter*, *Staphylococcus*, *Proteus*, *Klebsiella*, *Serratia*; cystic fibrosis (nebulizer) for *Pseudomonas aeruginosa*

CONTRAINDICATIONS:

Hypersensitivity to aminoglycosides

Black Box Warning:

Pregnancy (D), severe renal disease

Precautions: Breastfeeding, geriatric patients, neonates, mild renal disease, myasthenia gravis, Parkinson's disease

Black Box Warning:

Hearing deficits, neuromuscular disease

DOSAGE AND ROUTES

Calculator

- **Adult:** IM/IV 3 mg/kg/day in divided doses q8hr; may give up to 6 mg/kg/day in divided doses q8-12hr; once-daily dosing (pulse dosing) (unlabeled) IV 5-7 mg/kg, dosing intervals determined using nomogram, based on random levels drawn 8-12 hr after 1st dose
- **Child:** IM/IV 6-7.5 mg/kg/day in 3-4 equal divided doses
- **Child ≥6 yr:** NEB 300 mg bid in repeating cycles of 28 days on/28 days off of product; give INH over 10-15 min using a handheld PARI LC PLUS reusable

nebulizer with DeVilbiss Pulmo-Aid compressor

- **Neonate <1 wk: IM/IV** ≤ 4 mg/kg/day divided q12hr

Cystic fibrosis with *pseudomonas aeruginosa*

- **Adult/adolescent/child: IV** 2.5-3.3 mg/kg q8hr, **neb** 300 mg via inhalation bid $\times 28$ days, then 28 days after

Renal dose

- **Adult: IM/IV** 1 mg/kg then dose determined by blood levels, may be removed by dialysis

Available forms: Inj 10, 40 mg/ml; powder for inj 1.2 g; neb sol 300 mg/5 ml

Administer:

- After obtaining specimen for C&S; begin treatment before results
- Product in evenly spaced doses to maintain blood level; separate aminoglycosides and penicillins by ≥ 1 hr • Use only on susceptible organisms to prevent development of product-resistant bacteria

IM route

- IM inj in large muscle mass; rotate inj sites, aspirate
- Draw peak 1 hr after dose, trough right before next dose; absorption erratic

Nebulizer route

- Give as close to q12hr apart as possible; do not use < 6 hr apart
- **Do not mix with dornase alfa in nebulizer**
- Have patient inhale while sitting or standing, breathe normally through mouthpiece; may use noseclips; use over 10-15 min • The sol for nebulization is for inhalation only

Intermittent IV INF route

- Visually inspect sol, do not use if discolored or particulate is present
- **Vantage vials are for IV only and only for exactly 60 or 80 mg**
- Diluted in 50-100 ml 0.9% NaCl D₅W (D₁₀W, Ringer's, LR), infuse over 20-60 min, volume for pediatric patients needs and should be sufficient to allow for 20-60 min infusion

Y-site compatibilities: Acyclovir, aldesleukin, alfentanil, alprostadil, amifostine, aminophylline, amiodarone, amsacrine, anidulafungin, ascorbic acid, atracurium, atropine, aztreonam, bivalirudin, bretylium, bumetanide, buprenorphine, butorphanol, calcium chloride/gluconate, CARBOplatin, caspofungin, chloramphenicol, cimetidine, ciprofloxacin, cisatracurium, CISplatin, clindamycin, cyanocobalamin, cyclophosphamide, cycloSPORINE, cytarabine,

DACTINomycin, DAPTOmycin, dexmedetomidine, digoxin, diltiazem, diphenhydrAMINE, DOBUTamine, DOCEtaxel, DOPamine, doripenem, doxacurium, DOXOrubicin hydrochloride, DOXOrubicin liposome, doxycycline, enalaprilat, ePHEDrine, EPINEPHrine, epirubicin, epoetin alfa, ertapenem, esmolol, etoposide, etoposide phosphate, famotidine, fenoldopam, fentaNYL, filgrastim, fluconazole, fludarabine, fluorouracil, foscarnet, furosemide, gemcitabine, gentamicin, glycopyrrolate, granisetron, HYDROmorphine, ifosfamide, imipenem/cilastatin, isoproterenol, ketorolac, labetalol, levofloxacin, lidocaine, linezolid, LORazepam, magnesium sulfate, mannitol, mechlorethamine, melphalan, meperidine, metaraminol, methicillin, methotrexate, methoxamine, methyldopate, methylPREDNISolone, metoclopramide, metoprolol, metroNIDAZOLE, miconazole, midazolam, milrinone, minocycline, mitoXANtrone, morphine, moxalactam, multiple vitamins, nafcillin, nalbuphine, naloxone, niCARdipine, nitroglycerin, nitroprusside, norepinephrine, octreotide, ondansetron, oxaliplatin, oxytocin, PACLitaxel, palonosetron, pantoprazole, papaverine, penicillin G, pentazocine, perphenazine, PHENobarbital, phentolamine, phenylephrine, phytonadione, potassium chloride, procainamide, prochlorperazine, promethazine, propranolol, protamine, pyridoxime, quinupristin/dalfopristin, ranitidine, remifentanyl, riTUXimab, rocuronium, sodium acetate/bicarbonate, succinylcholine, SUFentanyl, tacrolimus, teniposide, theophylline, thiamine, thiotepa, ticarcillin/clavulanate, tigecycline, tirofiban, tolazoline, trastuzumab, trimethaphan, urokinase, vancomycin, vasopressin, vecuronium, verapamil, vinCRISTine, vinorelbine, voriconazole, zidovudine

SIDE EFFECTS

CNS: Confusion, depression, numbness, tremors, **seizures**, muscle twitching, **neurotoxicity**, dizziness, vertigo

CV: Hypo/hypertension, palpitation

EENT: **Ototoxicity**, deafness, visual disturbances, tinnitus

GI: *Nausea, vomiting, anorexia*; increased ALT, AST, bilirubin, hepatomegaly, **hepatic necrosis**, splenomegaly

GU: **Oliguria, hematuria, renal damage, azotemia, renal failure, nephrotoxicity**

HEMA: **Agranulocytosis, thrombocytopenia, leukopenia, eosinophilia, anemia**

INTEG: *Rash*, burning, urticaria, dermatitis, alopecia

PHARMACOKINETICS

Plasma half-life 2-3 hr, prolonged in neonates; not metabolized; excreted unchanged in urine; crosses placental barrier; poor penetration into CSF

IM: Onset rapid, peak 1 hr, duration 8 hr

IV: Onset immediate, peak 30 min, duration 8 hr

INTERACTIONS

Increase: ototoxicity, neurotoxicity, nephrotoxicity—other aminoglycosides, amphotericin B, polymyxin, vancomycin, ethacrynic acid, furosemide, mannitol, methoxyflurane, CISplatin, cephalosporins, bacitracin, acyclovir, penicillins, cidofovir

Drug/Lab Test

Increase: eosinophils, BUN, creatinine, AST, ALT, LDH, alk phos

Decrease: potassium, calcium, sodium, magnesium, WBC, granulocytes, platelets

NURSING CONSIDERATIONS

Assess:

- Weight before treatment; dosage is usually based on ideal body weight but may be calculated on actual body weight
- I&O ratio, urinalysis daily for proteinuria, cells, casts; report sudden change in urine output
- VS during inf; watch for hypotension, change in pulse
- IV site for thrombophlebitis, including pain, redness, swelling q30min; change site if needed; apply warm compresses to discontinued site
- Serum aminoglycoside conc; serum peak drawn at 30-60 min after IV inf or 60 min after IM inj, trough drawn just before next dose, peak 4-10 mcg/ml, trough 0.5-2 mcg/ml

Black Box Warning:

Renal impairment: CCr, BUN, serum creatinine; lower dosage should be given in renal impairment (CCr <80 ml/min); monitor electrolytes: potassium, sodium, chloride, magnesium monthly if patient receiving long-term therapy

Black Box Warning:

Deafness by audiometric testing; ringing, roaring in ears; vertigo; assess hearing before, during, after treatment

• **Overgrowth of infection:** fever, malaise, redness, pain, swelling, perineal itching, diarrhea, stomatitis, change in cough, sputum • **Vestibular dysfunction:** nausea, vomiting, dizziness, headache; product should be discontinued if severe

Perform/provide:

- Adequate fluids of 2-3 L/day unless contraindicated to prevent irritation of tubules
- Flush of IV line with NS or D₅W after inf
- Supervised ambulation, other safety measures with vestibular dysfunction

Evaluate:

- Therapeutic response: absence of fever, draining wounds, negative C&S after treatment

Teach patient/family:

- To report headache, dizziness, symptoms of overgrowth of infection, renal impairment

Black Box Warning:

To report loss of hearing; ringing, roaring in ears; feeling of fullness in head

Black Box Warning:

To notify prescriber if pregnancy is planned or suspected; pregnancy (D)

Nebulizer

- To use other therapies first, then tobramycin

TREATMENT OF OVERDOSE:

Hemodialysis; monitor serum levels of product

☼ Canada only Side effects: *italics* = common; **bold** = life-threatening ⚠
Nurse Alert

tobramycin ophthalmic

See [Appendix B](#)

tocilizumab (Rx)

(toe'si-liz'oo-mab)

[Actemra](#)

Func. class.: DMARDs (disease-modifying antirheumatoid drugs)/tumor necrosis factor (TNF) modifier

ACTION:

Interleukin-6 (IL-6) receptor inhibiting monoclonal antibody

USES:

Rheumatoid arthritis, active systemic juvenile idiopathic arthritis

CONTRAINDICATIONS:

Hypersensitivity

Precautions: Breastfeeding, pregnancy (C); risk for GI perforation, active hepatic disease, severe neutropenia/ thrombocytopenia, demyelinating disorders

Black Box Warning:

Invasive fungal infection, active TB

DOSAGE AND ROUTES

Calculator

• **Adult: IV** 4 mg/kg over 1 hr q4wk, may increase to 8 mg/kg q4wk based on clinical response, max dose 800 mg/inf; do not initiate if ANC >2000, platelets <100,000

Juvenile idiopathic arthritis

• **Child ≥2 yr/adolescent ≥30 kg: IV** 8 mg/kg over 1 hr q2wk

• **Child ≥2 yr/adolescent <30 kg: IV** 12 mg/kg over 1 hr

Available forms: Sol for inj 80 mg/4 ml, 200 mg/10 ml, 400 mg/20 ml

Administer:

Intermittent IV INF route

- Visually inspect for particulate matter, discoloration before administration whenever sol and container permit; colorless to pale yellow liquid
- From

100-ml inf bag or bottle, withdraw vol of 0.9% sodium chloride inj equal to vol of tocilizumab sol required for patient's dose • Slowly add tocilizumab from each vial into inf bag or bottle; gently invert bag to avoid foaming; fully diluted sols are compatible with polypropylene, polyethylene, polyvinyl chloride inf bags and polypropylene, polyethylene, glass inf bottles • Fully diluted sol for infusion may be stored refrigerated or at room temp for ≤24 hr and should be protected from light; do not use unused product remaining in vials; no preservatives • Allow the fully diluted sol to reach room temp before inf

- Give over 60 minutes with inf set; do not administer as IV push or bolus
- Do not infuse concomitantly in same IV line with other drugs

SIDE EFFECTS

CNS: Headache, dizziness

CV: Hypertension

GI: **Perforation**, abdominal pain, gastritis, mouth ulcerations

HEMA: **Neutropenia, thrombocytopenia**

INTEG: Rash, inf reactions

RESP: Upper respiratory infections, nasopharyngitis, bronchitis

SYST: **Serious infections, anaphylaxis**, infusion-related reactions, antitocilizumab antibody formation

INTERACTIONS

Decrease: product level—cycloSPORINE, theophylline warfarin

Decreased: level of CYP3A4 substrates (hormonal contraceptives, omeprazole, atorvastatin, simvastatin)

- Do not give with live virus vaccines • Avoid use with TNF modifiers, DMARDs, immunosuppressives due to increased risk of infection

PHARMACOKINETICS

Half-life approx 6 days with single dose, approx 11 days with multiple (steady-state) doses

NURSING CONSIDERATIONS

Assess:

- **Rheumatoid arthritis:** ROM, pain, stiffness at baseline q1-2wk
- Blood studies: CBC with differential, LFTs, platelet count, serum lipid profile at baseline and periodically
- **Infection** before treatment and periodically; obtain TB screening before beginning treatment, invasive fungal infections, discontinue if infection occurs during administration, may use antituberculosis therapy before tocilizumab in past history of latent or active TB when adequate course of treatment cannot be confirmed and those with a negative TB with risk factors for infections

Evaluate:

- Therapeutic response: ability to move more easily with less pain

Teach patient/family:

- That this treatment must continue unless safety or effectiveness is an issue
- About reason for use and expected results
- To avoid live vaccines, bring immunizations up to date before treatment

Black Box Warning:

To report signs, symptoms of infection, including TB and hepatitis B

- To notify prescriber if pregnancy or suspected pregnancy (C), do not use if breastfeeding

☼ Canada only Side effects: *italics* = common; **bold** = life-threatening ⚠
Nurse Alert

tolcapone (Rx)

(toll'cah'pone)

Tasmar

Func. class.: Antiparkinson agent

Chem. class.: COMT inhibitor

ACTION:

Inhibits COMT; used as adjunct to levodopa/carbidopa therapy

USES:

Parkinson's disease

CONTRAINDICATIONS:

Hypersensitivity, rhabdomyolysis

Black Box Warning:

Hepatic disease

Precautions: Pregnancy (C), breastfeeding, cardiac/renal disease, hypertension, asthma, history of rhabdomyolysis

DOSAGE AND ROUTES

Calculator

• **Adult: PO** 100-200 mg tid with levodopa/carbidopa therapy; max 600 mg/day, discontinue if no benefit after 3 wk

Available forms: Tabs 100, 200 mg

Administer:

- Only to be used if levodopa/carbidopa does not provide satisfactory results
- Give without regard to food

SIDE EFFECTS

CNS: Dystonia, dyskinesia, dreaming, *fatigue, headache, confusion*, psychosis, hallucination, dizziness, sleep disorders

CV: *Orthostatic hypotension*, chest pain, hypotension

EENT: Cataract, eye inflammation

GI: *Nausea, vomiting, anorexia, abdominal distress*, diarrhea, constipation, **fatal hepatic failure**, increased LFTs

GU: UTI, urine discoloration, uterine tumor, micturition disorder, hematuria

HEMA: Hemolytic anemia, leukopenia, agranulocytosis

INTEG: Sweating, alopecia

MS: Rhabdomyolysis

PHARMACOKINETICS

Rapidly absorbed, peak 2 hr, protein binding 99%, extensively metabolized, half-life 2-3 hr, excreted in urine (60%)/feces (40%)

INTERACTIONS

Increase: CNS depression—CNS depressants

- May influence pharmacokinetics of α -methyldopa, DOBUTamine, apomorphine, isoproterenol
- Inhibition of normal catecholamine metabolism: MAOIs, MAO-B inhibitor may be used

NURSING CONSIDERATIONS

Assess:

Black Box Warning:

Hepatic disease: AST, ALT, alk phos, LDH, bilirubin, CBC; monitor ALT, AST q2wk $\times$ 1 yr, then q4wk $\times$ 6 mo, then q8wk thereafter; if LFTs elevated, product should not be used

- Involuntary movements of parkinsonism: akinesia, tremors, staggering gait, muscle rigidity, drooling
- B/P, respiration during initial treatment; hypo/hypertension should be reported
- Mental status: affect, mood, behavioral changes

Evaluate:

- Therapeutic response: decrease in akathisia, increased mood

Teach patient/family:

- To change positions slowly to prevent orthostatic hypotension
- That urine, sweat may change color
- That food taken within 1 hr before meals or 2 hr after meals decreases action of product by 20%, may be taken without regard to food
- To notify prescriber if pregnancy is planned or suspected, pregnancy (C)
- That CNS changes may occur, hallucinations, involuntary movement
- To avoid hazardous activities until reaction is known, dizziness may occur
- That nausea and diarrhea are common

Black Box Warning:

To report signs of hepatic injury: clay-colored stools, jaundice, fatigue, appetite loss, lethargy, fatigue, itching, right upper abdominal pain

- To report nausea, vomiting, anorexia; that nausea may occur at beginning of treatment

🍁 Canada only Side effects: *italics* = common; **bold** = life-threatening ⚠️
Nurse Alert

tolnaftate topical

See [Appendix B](#)

tolterodine (Rx)

(toll-tehr'oh-deen)

Detrol, Detrol LA

Func. class.: Overactive bladder product

Chem. class.: Muscarinic receptor antagonist

ACTION:

Relaxes smooth muscles in urinary tract by inhibiting acetylcholine at postganglionic sites

USES:

Overactive bladder (urinary frequency, urgency), urinary incontinence

CONTRAINDICATIONS:

Hypersensitivity, uncontrolled closed-angle glaucoma, urinary retention, gastric retention

Precautions: Pregnancy (C), breastfeeding, children, renal/hepatic disease, controlled closed-angle glaucoma, bladder obstruction, QT prolongation, decreased GI motility

DOSAGE AND ROUTES

Calculator

• **Adult and geriatric:** PO 2 mg bid; may decrease to 1 mg bid; **EXT REL** 4 mg/day, may decrease to 2 mg/day if needed, max 4 mg/day

Hepatic/renal dose

• **Adult:** PO 1 mg bid (50% dose) or **EXT REL** 2 mg/day; $CCr \leq 30$ ml/min, reduce by 50%

Available forms: Tabs 1, 2 mg; ext rel caps 2, 4 mg

Administer:

• Whole; take with liquids; do not crush, chew or break ext rel product; without regard to meals

SIDE EFFECTS

CNS: Anxiety, paresthesia, fatigue, *dizziness, headache*; increasing dementia, memory impairment

CV: Chest pain, hypertension, **QT prolongation**

EENT: Vision abnormalities, xerophthalmia

GI: *Nausea, vomiting, anorexia*, abdominal pain, constipation, dry mouth, dyspepsia

GU: Dysuria, urinary retention, frequency, UTI

INTEG: Rash, pruritus

RESP: Bronchitis, cough, pharyngitis, upper respiratory tract infection

SYST: **Angioedema, Stevens-Johnson syndrome**

PHARMACOKINETICS

Rapidly absorbed; highly protein bound; extensively metabolized by CYP2D6; a portion of the population may be poor metabolizers; excreted in urine, feces

INTERACTIONS

- Do not use in those with known hypersensitivity-festerodine

⚠ Increase: QT prolongation—class IA/III antidysrhythmics, some phenothiazines, β -agonists, local anesthetics, tricyclics, haloperidol, methadone, chloroquine, clarithromycin, droperidol, erythromycin, pentamidine

Increase: action of tolterodine—antiretroviral protease inhibitors, macrolide antiinfectives, azole antifungals

Increase: anticholinergic effect—antimuscarinics

Increase: urinary frequency—diuretics

Drug/Food

- Food increases bioavailability of tolterodine

NURSING CONSIDERATIONS

Assess:

- **Urinary patterns:** distention, nocturia, frequency, urgency, incontinence **⚠**

Serious skin disorders: angioedema, Stevens-Johnson syndrome; allergic reactions: rash; if this occurs, product should be discontinued • LFTs at baseline, periodically

⚠ QT prolongation: ECG, ejection fraction; assess for chest pain, palpitations,

dyspnea

Evaluate:

- Decreasing dysuria, frequency, nocturia, incontinence

Teach patient/family:

- To avoid hazardous activities; dizziness may occur
- Not to drink liquids before bedtime
- About the importance of bladder maintenance
- **Not to breastfeed**
- To report signs of infection, skin effects

🍁 Canada only Side effects: *italics* = common; **bold** = life-threatening ⚠️

Nurse Alert

tolvaptan (Rx)

(tole-vap'tan)

Samsca

Func. class.: Antihypertensive

Chem. class.: Vasopressin receptor antagonist, V2

ACTION:

Arginine vasopressin (AVP) antagonist with affinity for V2 receptors; level of circulating AVP in circulating blood is critical for the regulation of water and the electrolyte balance, and it is usually elevated with euvolemic/hypervolemic hyponatremia

USES:

Hypervolemic/euvolemic hyponatremia with heart failure, cirrhosis, SIADH

CONTRAINDICATIONS:

Hypersensitivity, hypovolemia, anuria

Precautions: Pregnancy (C), breastfeeding, children, dehydration, geriatric, hepatic disease, hyperkalemia

Black Box Warning:

Alcoholism, malnutrition

DOSAGE AND ROUTES

Calculator

• **Adult: PO** 15 mg daily; after 24 hr, may increase to 30 mg daily; max 60 mg/day

Available forms: Tab 15, 30 mg

Administer:

- PO with/without food
- Avoid fluid restriction for first 24 hr
- Initiate in hospital setting

SIDE EFFECTS

CNS: Fever

CV: Ventricular fibrillation, DIC, stroke, thrombosis

GI: Nausea, vomiting, constipation, colitis

GU: Polyuria

HEMA: Bleeding

META: Dehydration, hyperglycemia, hyperkalemia, hyponatremia

MS: Rhabdomyolysis

RESP: Respiratory depression, pulmonary embolism

PHARMACOKINETICS

Peak 2-4 hr, protein binding 99%, metabolized by CYP3A4, terminal half-life 12 hr

INTERACTIONS

Increase: concentrations of tolvaptan—CYP3A4 inhibitors (efavirenz, fosamprenavir, quinidine); P-gp inhibitors (cyclosporine, azithromycin, mefloquine, paliperidone, propafenone, quinidine, testosterone)

Decrease: conc of tolvaptan—CYP3A4 inducers (carbamazepine, dexamethasone, etravirine, flutamide, griseofulvin, metyraprone, modafinil, nafcillin, nevirapine, oxcarbazepine, phenytoin, rifampin, rifabutin, rifapentine, topiramate)

Drug/Herb

Decreased: tolvaptan effect: CYP3A4 inducer (St. John's wort)

Drug/Food

- Grapefruit juice: do not use together

NURSING CONSIDERATIONS

Assess:

- Renal, hepatic function
- Frequent sodium vol status; overly rapid correction of sodium conc (12 mEq/L per 24 hr), may result in osmotic demyelination syndrome, may occur in alcoholism, severe malnutrition, advanced liver disease, syndrome of inappropriate antidiuretic hormone
- CV status: ventricular fibrillation, hypertension; monitor B/P, pulse
- Monitor electrolytes (sodium, potassium)

Evaluate:

- Therapeutic response: correction of serum sodium levels

Teach patient/family:

- To avoid pregnancy, breastfeeding while taking this product

- About administration procedure and expected results
 - To report difficulty swallowing, speaking, seizures, dizziness, drowsiness; embolism may be the cause
-

🌿 Canada only Side effects: *italics* = common; **bold** = life-threatening ⚠️
Nurse Alert

topiramate (Rx)

(toh-pire'ah-mate)

Topamax, Topamax Sprinkle, Topiragen

Func. class.: Anticonvulsant—miscellaneous

Chem. class.: Monosaccharide derivative

ACTION:

May prevent seizure spread as opposed to an elevation of seizure threshold, increases GABA activity

USES:

Partial seizures in adults and children 2-16 yr old; tonic-clonic seizures; seizures with Lennox-Gastaut syndrome; migraine prophylaxis

Unlabeled uses: Infantile spasms, bipolar disorder, alcohol dependence, absence seizures, neuropathic pain, cluster headaches, mania

CONTRAINDICATIONS:

Hypersensitivity, metabolic acidosis, pregnancy (D)

Precautions: Breastfeeding, children, renal/hepatic disease, acute myopia, secondary closed-angle glaucoma, behavioral disorders, COPD, dialysis, encephalopathy, status asthmaticus, status epilepticus, surgery, paresthesias, maculopathy

DOSAGE AND ROUTES

Calculator

Adjunctive therapy for seizures

- **Adult/adolescent/child ≥ 10 yr:** PO 25-50 mg/day initially, titrate by 25-50 mg/wk, up to 200-400 mg/day in 2 divided doses
- **Child 2-9 yr:** PO week 1: 25 mg in PM, then 25 mg bid if tolerated (week 2), then increase by 25-50 mg/day each week as tolerated over 5 to 7-wk titration period, maintenance given in 2 divided doses; <11 kg, minimum 150 mg/day, max 250 mg/day; 12-22 kg, minimum 200 mg/day, max 300 mg/day; 23-31 kg, minimum 200 mg/day, max 350 mg/day; 32-38 kg, minimum 250 mg/day, max 350 mg/day; >38 kg, minimum 250 mg/day, max 400 mg/day

Migraine prophylaxis

- **Adult: PO** 25 mg/day initially, increase by 25 mg/day/wk up to 100 mg/day in 2 divided doses

Renal dose

- **Adult: PO** CCr <70 ml/min, give 1/2 dose

Atonic/atypical absence/myoclonic seizures (unlabeled)

- **Adult/adolescent >16 yr: PO** 50 mg/day, titrate slowly by 50 mg/wk to 100-300 mg tid
- **Child 2-16 yr: PO** 0.5-1 mg/kg, max 25 mg, initially daily × 7 days then increase by 0.5-1 mg/kg/day weekly up to 3-6 mg/kg/day in divided doses

Refractory infantile spasms (unlabeled)

- **Child: PO** 25 mg/day, may increase by 25 mg q2-3days until spasms controlled, max 24 mg/kg/day

Alcoholism (unlabeled)

- **Adult: PO** 25 mg/day, titrated to max 300 mg/day in divided doses

Neuropathic pain (unlabeled)

- **Adult: PO** 12.5-25 mg q day or bid × 4 wk then double dose q4wk to max 100-200 mg/day in divided doses

Bipolar disorder (unlabeled)

- **Adult: PO** 25 mg/day then increase by 25-mg increments to 200 mg/day

Available forms: Tabs 25, 50, 100, 200 mg; sprinkle caps 15, 25 mg

Administer:

- Swallow tabs whole; do not break, crush, or chew tabs; very bitter
- May take without regard to meals
- Sprinkle cap can be given whole or opened and sprinkled on soft food; do not chew, drink water after sprinkle

SIDE EFFECTS

CNS: *Dizziness, fatigue, cognitive disorders, insomnia, anxiety, depression, paresthesia, memory loss, tremor, motor retardation, suicidal ideation*

EENT: *Diplopia, vision abnormality*

GI: *Diarrhea, anorexia, nausea, dyspepsia, abdominal pain, constipation, dry mouth, pancreatitis*

GU: *Breast pain, dysmenorrhea, menstrual disorder*

INTEG: *Rash*

MISC: Weight loss, leukopenia, metabolic acidosis, increased body temperature; **unexplained death (epilepsy)**

RESP: Upper respiratory tract infection, pharyngitis, sinusitis

PHARMACOKINETICS

Well absorbed, peak 2 hr, terminal half-life 19-25 hr, excreted in urine (55%-97% unchanged), crosses placenta, excreted in breast milk, protein binding (9%-17%), steady state 4 days

INTERACTIONS

Increase: renal stones—carbonic anhydrase inhibitors

Increase: effect of amitriptyline

Increase: CNS depression—alcohol, CNS depressants

Increase: topiramate levels—metformin, hydrochlorothiazide, lamotrigine

Decrease: levels of oral contraceptives, estrogen, digoxin, valproic acid, lithium, risperidone

Decrease: topiramate levels—phenytoin, carbamazepine, valproic acid, probenecid

NURSING CONSIDERATIONS

Assess:

- **Seizures:** location, type, duration, aura
- **Bipolar disorder:** mood, behavior
- Renal studies: urinalysis, BUN, urine creatinine q3mo; symptoms of renal colic
- Hepatic studies: ALT, AST, bilirubin if patient receiving long-term treatment
- CBC during long-term therapy (anemia); serum bicarbonate (metabolic acidosis)
- Migraines: pain location, duration; alleviating factors

⚠ Mental status: mood, sensorium, affect, behavioral changes, **suicidal thoughts/behaviors**; if mental status changes, notify prescriber • **Body weight, evidence of cognitive disorder**

Perform/provide:

- Storage at room temp away from heat, light
- Assistance with ambulation during early part of treatment; dizziness occurs
- Seizure precautions: padded side rails, move objects that may harm patient

Evaluate:

- Therapeutic response: decreased seizure activity

Teach patient/family:

- To carry emergency ID stating patient's name, products taken, condition, prescriber's name and phone number
 - To avoid driving, other activities that require alertness
 - Not to discontinue medication quickly after long-term use
 - To notify prescriber immediately of blurred vision, periorbital pain
 - To maintain adequate fluid intake
 - About administration procedure and expected results
 - To use nonhormonal contraceptive; that effect of oral contraceptives is decreased, pregnancy (D)
 - To drink plenty of fluids to prevent kidney stones
 - May need to increase amount of food consumed, weight loss may occur
-

🍁 Canada only Side effects: *italics* = common; **bold** = life-threatening ⚠️
Nurse Alert

HIGH ALERT

topotecan (Rx)

(toh-poh-tee'kan)

Hycamtin

Func. class.: Antineoplastic, natural; topoisomerase inhibitor *Chem. class.:* Camptothecin analog

ACTION:

Antitumor product with topoisomerase-I-inhibitory activity; topoisomerase I relieves torsional strain in DNA by causing single-strand breaks; also causes double-strand DNA damage

USES:

Metastatic ovarian cancer after failure of traditional chemotherapy; relapsed small-cell lung cancer; cervical cancer

Unlabeled uses: Non-small-cell lung cancer (NSCLC), rhabdomyosarcoma

CONTRAINDICATIONS:

Pregnancy (D), breastfeeding, hypersensitivity, severe bone marrow depression

Black Box Warning:

Neutropenia

Precautions: Children, renal disease, gelatin hypersensitivity

DOSAGE AND ROUTES

Calculator

Metastatic carcinoma of the ovary after failure of first or subsequent chemotherapy; SCLC-sensitive disease after failure of first-line therapy

• **Adult:** IV INF 1.5 mg/m² over 30 min daily × 5 days starting on day 1 of 21-day course × 4 courses; may be reduced to 0.25 mg/m² for subsequent courses if severe neutropenia occurs; relapsed small-cell lung cancer (SCLC) in those with a prior complete or partial response, ≥45 days from end of first-line treatment.

PO 2.3 mg/m²/day on days 1-5 of 21-day course

Renal dose

• **Adult:** IV CCr 20-39 ml/min, 0.75 mg/m²/day × 5 days starting on day 1 of

21-day course

Available forms: Lyophilized powder for inj 4 mg; caps 0.25, 1 mg

Administer:

PO route

- Do not break, crush, chew, or open caps; protect from light
- Take without regard to food

Intermittent IV infusion route

- Visually inspect for particulate matter and discoloration prior to use
- Reconstitute each 4 mg-vial with 4 ml sterile water for injection; use immediately, no preservative
- Withdraw the appropriate volume of the reconstituted solution; dilute further, dilute in 0.9% NaCl or D5W prior to administration
- The reconstituted solution is yellow or yellow-green
- Topotecan injection diluted for infusion is stable at room temperature with normal light for 24 hr
- Infuse over 30 min

SIDE EFFECTS

CNS: Arthralgia, *asthenia*, *headache*, myalgia, *pain*, weakness

GI: *Abdominal pain*, *constipation*, diarrhea, obstruction, *nausea*, stomatitis, *vomiting*; increased ALT, AST; anorexia

HEMA: *Neutropenia*, *leukopenia*, *thrombocytopenia*, *anemia*, *sepsis*

INTEG: *Total alopecia*

RESP: Dyspnea, cough, *interstitial lung disease*

PHARMACOKINETICS

Rapidly and completely absorbed, excreted in urine and feces as metabolites, half-life 2.8 hr, 7%-35% bound to plasma proteins

INTERACTIONS

- Avoid use with P-glycoprotein, breast cancer resistance protein inhibitors (amiodarone, clarithromycin, diltiazem, erythromycin, indinavir), quinine, testosterone, verapamil, tamoxifen, itraconazole, mefloquine, RU-486, nifedipine, vaccines, toxoids

Increase: myelosuppression when used with cisplatin

Increase: bleeding risk—NSAIDs, anticoagulants, thrombolytics, platelet inhibitors

Drug/Food

- Avoid use with grapefruit juice

NURSING CONSIDERATIONS

Assess:

- Hepatic studies: AST, ALT, alk phos, which may be elevated; creatinine, BUN

Black Box Warning:

CBC, differential, platelet count weekly; withhold product if WBC is $<3500/\text{mm}^3$ or platelet count is $<100,000/\text{mm}^3$; notify prescriber of results; product should be discontinued

- Buccal cavity for dryness, sores or ulcerations, white patches, oral pain, bleeding, dysphagia • **Interstitial lung disease (ILD):** fever, cough, dyspnea, hypoxia, may be fatal

Perform/provide:

- Storage of caps in refrigerator; IV INF unopened at room temp; protect both from light • Increased fluid intake to 2-3 L/day to prevent dehydration unless contraindicated • Rinsing of mouth tid-qid with water, club soda; brushing of teeth bid-tid with soft brush or cotton-tipped applicator for stomatitis; use unwaxed dental floss

Evaluate:

- Therapeutic response: decreased tumor size, spread of malignancy

Teach patient/family:

- That total alopecia may occur; that hair grows back but is different in color and texture • To avoid foods with citric acid or hot or rough texture if stomatitis is present; to drink adequate fluids • To report stomatitis and any bleeding, white spots, ulcerations in mouth; to examine mouth daily; to report symptoms

Black Box Warning:

To report signs of anemia: fatigue, headache, faintness, SOB, irritability

- To use effective contraception during treatment and for ≤ 6 mo after, pregnancy (D); to avoid breastfeeding • To avoid OTC products without approval of prescriber
- To avoid driving or other activities requiring alertness
- To avoid vaccines, toxoids

☼ Canada only Side effects: *italics* = common; **bold** = life-threatening 
Nurse Alert

toremifene (Rx)

(tor-em'ih-feen)

Fareston

Func. class.: Antineoplastic

Chem. class.: Antiestrogen hormone

ACTION:

Inhibits cell division by binding to cytoplasmic estrogen receptors; resembles normal cell complex but inhibits DNA synthesis and estrogen response of target tissue

USES:

Advanced breast carcinoma not responsive to other therapy in estrogen-receptor–positive patients (usually postmenopausal)

Unlabeled uses: Prostate cancer prophylaxis

CONTRAINDICATIONS:

Pregnancy (D), hypersensitivity, history of thromboembolism

Black Box Warning:

QT prolongation

Precautions: Breastfeeding, children, leukopenia, thrombocytopenia, cataracts, hypercalcemia, hepatic disease, endometrial hyperplasia

DOSAGE AND ROUTES

Calculator

• **Adult: PO** 60 mg/day

Available forms: Tabs 60 mg

Administer:

- Antacid before oral agent; give product after evening meal, before bedtime
- Antiemetic 30-60 min before product to prevent vomiting

SIDE EFFECTS

CNS: Hot flashes, headache, lightheadedness, depression

CV: CHF, MI, PE, chest pain, angina

EENT: Ocular lesions, retinopathy, corneal opacity, blurred vision (high doses)

GI: Nausea, vomiting, altered taste (anorexia)

GU: Vaginal bleeding, pruritus vulvae

HEMA: Thrombocytopenia, leukopenia, thrombosis

INTEG: Rash, alopecia, sweating

META: Hypercalcemia

RESP: Pulmonary embolism

PHARMACOKINETICS

Peak 3 hr, excreted primarily in feces, 99.5% protein binding, terminal half-life 5-6 days, metabolized by liver

INTERACTIONS

- May increase effect of warfarin

⚠ Increase: QT prolongation—class IA/III antidysrhythmics, some phenothiazines, β agonists, local anesthetics, tricyclics, haloperidol, chloroquine, droperidol, pentamidine; CYP3A4 inhibitors (amiodarone, clarithromycin, erythromycin, telithromycin, troleandomycin), arsenic trioxide, levomethadyl; CYP3A4 substrates (methadone, pimozide, QUETIA-pine, quINIDine, risperiDONE, ziprasidone) **⚠ Increase:** toxicity—CYP3A4 inhibitors (aprepitant, antiretroviral protease inhibitors, clarithromycin, danazol, delavirdine, diltiazem, erythromycin, fluconazole, FLUoxetine, fluvoxamine, imatinib, ketoconazole, mibefradil, nefazodone, telithromycin, voriconazole)

Decrease: toremifene effect—CYP3A4 inducers (barbiturates, bosentan, carbamazepine, efavirenz, phenytoins, nevirapine, rifabutin, rifampin)

Drug/Herb

- Avoid use with St. John's wort

Drug/Lab Test

Increase: serum calcium

NURSING CONSIDERATIONS

Assess:

- CBC, differential, platelet count weekly; withhold product if WBC is $<3500/\text{mm}^3$ or platelet count is $<100,000/\text{mm}^3$; notify prescriber; LFTs, serum calcium
- **Bleeding:** hematuria, guaiac, bruising, petechiae, mucosa or orifices q8hr
- Effects of alopecia on body image; discuss feelings about body changes

⚠ Severe allergic reactions: rash, pruritus, urticaria, purpuric skin lesions,

itching, flushing

Black Box Warning:

QT prolongation: ECG, ejection fraction; assess for chest pain, palpitations, dyspnea

Perform/provide:

- Increase fluid intake to 2-3 L/day to prevent dehydration
- Storage in light-resistant container at room temp

Evaluate:

- Therapeutic response: decreased tumor size, spread of malignancy

Teach patient/family:

- That vaginal bleeding, pruritus, hot flashes are reversible after discontinuing treatment
- To report immediately decreased visual acuity, which may be irreversible; about need for routine eye exams; that health care providers should be told about tamoxifen therapy
- To report vaginal bleeding immediately
- **That tumor flare**—increase in size of tumor, increased bone pain—may occur and will subside rapidly; to take analgesics for pain
- That premenopausal women must use mechanical birth control because ovulation may be induced, pregnancy (D)
- That hair may be lost during treatment; that a wig or hairpiece may make patient feel better; that new hair may be different in color, texture

☼ Canada only Side effects: *italics* = common; **bold** = life-threatening ⚠
Nurse Alert

torsemide (Rx)

(tor'suh-mide)

Demadex

Func. class.: Loop diuretic

Chem. class.: Sulfonamide derivative

ACTION:

Acts on loop of Henle by inhibiting absorption of chloride, sodium, water

USES:

Treatment of hypertension and edema with CHF, ascites

CONTRAINDICATIONS:

Infants, hypersensitivity to sulfonamides, anuria

Precautions: Pregnancy (B), breastfeeding, diabetes mellitus, dehydration, severe renal disease, electrolyte depletion, hypovolemia, syncope, ventricular dysrhythmias

DOSAGE AND ROUTES

Calculator

CHF

- **Adult: PO/IV** 10-20 mg/day, may increase as needed, max 200 mg/day

Edema in chronic renal failure

- **Adult: PO/IV** 20 mg/day, may increase to 200 mg/day

Hepatic cirrhosis in combination with aldosterone antagonist/potassium-sparing diuretic

- **Adult: PO/IV** 5-10 mg/day, may increase as needed, max 40 mg/day

Hypertension

- **Adult: PO** 5 mg/day, may increase to 10 mg/day

Available forms: Tabs 5, 10, 20, 100 mg; inj 10 mg/ml

Administer:

PO route

- In AM to avoid interference with sleep if using product as diuretic • With food or milk if nausea occurs; absorption may be decreased slightly

IV route

- Visually inspect for particulate matter and discoloration before use
- Give either slowly as an IV bolus or as a continuous IV infusion
- Ampules are single-use containers; discard any unused portion after opening

IV bolus

- No dilution is necessary if given as a slow IV injection; give over 2 min
- If administered through an IV line, flush the line with 0.9% sodium chloride for injection before and after administration

Continuous IV infusion

- If administered through an IV line, flush the line with 0.9% sodium chloride for injection before and after use • Stable for 24 hr at room temperature

SIDE EFFECTS

CNS: *Headache, dizziness, asthenia, insomnia, nervousness*

CV: Orthostatic hypotension, chest pain, ECG changes, **circulatory collapse**, ventricular tachycardia, edema

EENT: *Loss of hearing, ear pain, tinnitus, blurred vision*

ELECT: *Hypokalemia, hypochloremic alkalosis, hyponatremia, metabolic alkalosis*

ENDO: *Hyperglycemia, hyperuricemia*

GI: *Nausea, diarrhea, dyspepsia, cramps, constipation*

GU: *Polyuria, **renal failure**, glycosuria*

INTEG: *Rash, photosensitivity, pruritus*

MS: Cramps, stiffness

RESP: Rhinitis, cough increase

PHARMACOKINETICS

PO: Rapidly absorbed; duration 6 hr; breast milk; crosses placenta; half-life 3.5 hr; protein binding 97%-99%, cleared through hepatic metabolism

INTERACTIONS

Increase: toxicity—lithium, nondepolarizing skeletal muscle relaxants, digoxin

Increase: action of antihypertensives, oral anticoagulants, nitrates

Increase: ototoxicity—aminoglycosides, CISplatin, vancomycin

Decrease: antihypertensive effect of torsemide—indomethacin, carBAMazepine, PHENobarbital, phenytoin, rifampin, NSAIDs

Drug/Herb

- Severe photosensitivity: St. John's wort

Drug/Lab Test

Increase: BUN, creatinine, uric acid, blood glucose, cholesterol

Decrease: potassium, magnesium, chloride sodium

NURSING CONSIDERATIONS

Assess:

- Hearing when giving high doses
- Weight, I&O daily to determine fluid loss; effect of product may be decreased if used daily
- B/P lying, standing; postural hypotension may occur
- Electrolytes: potassium, sodium, chlorine; include BUN, blood glucose, CBC, serum creatinine, blood pH, ABGs, uric acid, Ca, Mg • Glucose in urine of diabetic patients
- **Signs and symptoms of metabolic alkalosis:** drowsiness, restlessness • **Signs and symptoms of hypokalemia:** postural hypotension, malaise, fatigue, tachycardia, leg cramps, weakness • Rashes, temp elevation daily
- Confusion, especially in geriatric patients; take safety precautions if needed

Evaluate:

- Therapeutic response: improvement in edema of feet, legs, sacral area daily if medication is being used with CHF

Teach patient/family:

- To rise slowly from lying, sitting position
- To recognize adverse reactions: muscle cramps, weakness, nausea, dizziness, tinnitus • To take with food or milk for GI symptoms; to limit alcohol use
- To take early during the day to prevent nocturia
- To use sunscreen, protective clothing to prevent sunburn

TREATMENT OF OVERDOSE:

Lavage if taken orally; monitor electrolytes, administer dextrose in saline; monitor hydration, CV, renal status

☛ Canada only Side effects: *italics* = common; **bold** = life-threatening ⚠
Nurse Alert

traMADol (Rx)

(tram'a-dole)

Conzip, Rybix, Ryzolt, Ultram, Ultram ER, Zytram 

Func. class.: Analgesic—miscellaneous

Do not confuse: traMADol/Toradol

ACTION:

Binds to μ -opioid receptors, inhibits reuptake of norepinephrine, serotonin

USES:

Management of moderate to severe pain, chronic pain

Unlabeled uses: Restless leg syndrome (RLS), postoperative shivering, arthralgia/myalgia, bone/dental/neuropathic pain

CONTRAINDICATIONS:

Hypersensitivity, acute intoxication with any CNS depressant, alcohol, asthma, respiratory depression

Precautions: Pregnancy (C), breastfeeding, children, geriatric patients, seizure disorder, renal/hepatic disease, respiratory depression, head trauma, increased intracranial pressure, acute abdominal condition, drug abuse, depression, suicidal ideation

DOSAGE AND ROUTES

Calculator

Mild to moderate pain

- **Adult: PO** 25 mg daily, titrate by 25 mg ≥ 3 days to 100 mg/day (25 mg qid), then may increase by 50 mg ≥ 3 days to 200 mg (50 mg qid), then 50-100 mg q4-6hr, max 400 mg/day, use caution in geriatric patients; orally disintegrating tab 50 mg/day, titrate by 50 mg q3day, separate doses to 200 mg/day (50 mg qid)
- **Geriatric >75 years: PO** <300 mg/day in divided doses

Moderate to severe chronic pain

- **Adult: PO-ER** (Ultram ER) 100 mg daily, titrate upward q5days in 100-mg increments, max 300 mg/day; (Ryzolt) 100 mg, titrate upward q2-3days in 100-mg increments, max 300 mg/day; products are not interchangeable

Renal dose

- **Adult: PO** CCr <30 ml/min, give q12hr, max 200 mg/day; do not use ext rel tab

Hepatic dose

- **Adult (child-pugh c): PO** 50 mg q12hr, do not use ext rel tab

Restless leg syndrome (RLS) (unlabeled)

- **Adult: PO** 50-150 mg/day × 15-24 mo

Available forms: Tabs 50 mg; ext rel tab 100, 200, 300 mg; orally disintegrating tab 50 mg; ext rel caps 100, 200, 300 mg

Administer:

- **Ext rel products** (Ryzolt/Utram ER) are not interchangeable
- Do not break, crush, or chew ext rel product
- With antiemetic for nausea, vomiting
- When pain is beginning to return; determine dosage interval by patient response
- With or without food; ER: always give with food, or always give on empty stomach

SIDE EFFECTS

CNS: Dizziness, CNS stimulation, somnolence, headache, anxiety, confusion, euphoria, **seizures**, hallucinations, sedation, **neuroleptic-malignant-syndrome-like reactions**

CV: Vasodilation, orthostatic hypotension, tachycardia, hypertension, abnormal ECG

EENT: Visual disturbances

GI: Nausea, constipation, vomiting, dry mouth, diarrhea, abdominal pain, anorexia, flatulence, *GI bleeding*

GU: Urinary retention/frequency, menopausal symptoms, dysuria, menstrual disorder

INTEG: Pruritus, rash, urticaria, vesicles, flushing

SYST: **Anaphylaxis, Stevens-Johnson syndrome, toxic epidermal necrolysis, serotonin syndrome**

PHARMACOKINETICS

Rapidly and almost completely absorbed, steady state 2 days, peak 1.5 hr, duration 6 hr, terminal half-life 7.9-8.8 hr, may cross blood-brain barrier,

extensively metabolized, 30% excreted in urine as unchanged product, protein binding 20%

INTERACTIONS

- Inhibition of norepinephrine and serotonin reuptake: MAOIs; use together with caution

Increase: CNS depression—alcohol, sedatives, hypnotics, opiates

⚠ Increase: serotonin syndrome—SSRIs, SNRIs, serotonin-receptor agonists

Increase: traMADol levels—CYP3A4 inhibitors (aprepitant, antiretroviral protease inhibitors, clarithromycin, danazol, delavirdine, diltiazem, erythromycin, fluconazole, FLUoxetine, fluvoxamine, imatinib, ketoconazole, mibefradil, nefazodone, telithromycin, voriconazole)

Decrease: traMADol effects—CYP3A4 inducers (barbiturates, bosentan, carbamazepine, efavirenz, phenytoins, nevirapine, rifabutin, rifampin)

Decrease: levels of traMADol—carbamazepine

Drug/Herb

- Avoid use with St. John's wort

Increase: CNS depression—chamomile, hops, kava, skullcap, valerian

Drug/Lab Test

Increase: creatinine, hepatic enzymes

Decrease: Hgb

NURSING CONSIDERATIONS

Assess:

- **Pain:** location, type, character, give before pain becomes extreme
- **Respiratory depression:** withhold if respirations <12/min
- I&O ratio: check for decreasing output; may indicate urinary retention
- Need for product; dependency
- Bowel pattern; for constipation, increase fluids, bulk in diet
- CNS changes: dizziness, drowsiness, hallucinations, euphoria, LOC, pupil reaction
- **Hypersensitivity:** usually after beginning treatment
- Increased side effects in renal/hepatic disease

⚠ Serotonin syndrome, neuroleptic malignant syndrome: increased heart rate, shivering, sweating, dilated pupils, tremors, high B/P, hyperthermia, headache, confusion; if these occur, stop product, administer serotonin

antagonist if needed

Perform/provide:

- Storage in cool environment, protected from sunlight
- Assistance with ambulation
- Safety measures: side rails, night-light, call bell within easy reach

Evaluate:

- Therapeutic response: decrease in pain

Teach patient/family:

- To report any symptoms of CNS changes, allergic reactions, serotonin syndrome, seizures
- That drowsiness, dizziness, and confusion may occur; to avoid hazardous activities
- To make position changes slowly because orthostatic hypotension may occur
- To avoid OTC medications, herbs, supplements, CNS depressants and alcohol unless approved by prescriber
- Not to discontinue abruptly, taper

☼ Canada only Side effects: *italics* = common; **bold** = life-threatening ⚠
Nurse Alert

trandolapril (Rx)

(tran-doe'la-prill)

Mavik

Func. class.: Antihypertensive

Chem. class.: Angiotension-converting enzyme inhibitor

ACTION:

Selectively suppresses renin-angiotensin-aldosterone system; inhibits ACE; prevents conversion of angiotensin I to angiotensin II, dilates arterial and venous vessels, lowers B/P

USES:

Hypertension, heart failure, left ventricular dysfunction post MI

CONTRAINDICATIONS:

Breastfeeding, hypersensitivity, history of angioedema

Black Box Warning:

Pregnancy (D) 2nd/3rd trimester

Precautions: Geriatric patients, hyperkalemia, hepatic disease, bilateral renal stenosis, after kidney transplant, aorta/mitral valve stenosis, cirrhosis, severe renal disease, untreated CHF, autoimmune disease, cough, pregnancy (C) 1st trimester

DOSAGE AND ROUTES

Calculator

Hypertension

- **Adult: PO** 1 mg/day; 2 mg/day in African-Americans; make dosage adjustment ≥ 1 wk; max 8 mg/day

Heart failure, left ventricular dysfunction post MI

- **Adult: PO** 1 mg/day, titrate upward to 4 mg/day if tolerated

Renal/hepatic dose

- **Adult: PO** CCr < 30 ml/min or hepatic disease, 0.5 mg/day

Available forms: Tabs 1, 2, 4 mg

Administer:

- Discontinue diuretic 2-3 days before starting this product; if not possible, decrease initial dose to 0.5 ml • Make dosage changes ≥ 1 wk
- Give without regard to food
- Space antacids by 2 hr after dose

SIDE EFFECTS

CNS: *Dizziness, syncope, paresthesias, headache, fatigue, drowsiness, depression, sleep disturbances, anxiety*

CV: *Hypotension, MI, palpitations, angina, TIAs, stroke, bradycardia, dysrhythmias*

GI: *Nausea, vomiting, cramps, diarrhea, constipation, pancreatitis, dyspepsia*

GU: *Proteinuria, renal failure*

HEMA: *Agranulocytosis, neutropenia, leukopenia, anemia*

INTEG: *Rash, purpura, pruritus*

MISC: *Hyperkalemia, hyponatremia, impotence, myalgia, angioedema, muscle cramps, asthenia, hypocalcemia, gout*

RESP: *Dyspnea, cough*

PHARMACOKINETICS

Peak 4-10 hr, duration 24 hr, half-life 6-10 hr, metabolized by liver (active metabolitetrandolaprilat), excreted in urine, protein binding 65%-94%

INTERACTIONS

Increase: effects—phenothiazines, diuretics

Increase: severe hypotension—diuretics, other antihypertensives, NSAIDs

Increase: potassium levels—salt substitutes, potassium-sparing diuretics, potassium supplements

Increase: effects of ergots, neuromuscular blocking agents, antihypertensives, hypoglycemics, barbiturates, reserpine, levodopa, lithium

Decrease: effects oftrandolapril—antacids, NSAIDs, salicylates

Drug/Lab Test

Increase: potassium, LFTs, BUN, creatinine

Decrease: sodium, WBC

NURSING CONSIDERATIONS

Assess:

• **Hepatotoxicity (rare):** increased LFTs, jaundice, fulfillment hepatic necrosis; if jaundice occurs, discontinue product • **Angioedema** of the face, edema of the extremities, mucus membranes, may need to discontinue • **Hyperkalemia:** monitor electrolytes, check potassium

- B/P, pulse q4hr; note rate, rhythm, quality
- Baselines of renal, hepatic studies before therapy begins
- Edema in feet, legs daily
- **Symptoms of CHF:** edema, dyspnea, wet crackles

Evaluate:

- Therapeutic response: decreased B/P

Teach patient/family:

- Not to use OTC (cough, cold, or allergy) products unless directed by prescriber, to separate antacids by 2 hr; to avoid salt substitutes • To comply with dosage schedule even if feeling better
- To notify prescriber of mouth sores, sore throat, fever, swelling of hands/feet, irregular heartbeat, chest pain, signs of angioedema • That excessive perspiration, dehydration, vomiting, diarrhea may lead to fall in B/P; to consult prescriber if these occur • That product may cause dizziness, fainting; lightheadedness may occur during 1st few days of therapy • That product may cause skin rash or impaired perspiration
- Not to discontinue product abruptly, taper
- To rise slowly to sitting or standing position to minimize orthostatic hypotension

Black Box Warning:

To notify prescriber if pregnancy is planned or suspected; pregnancy (D)

☼ Canada only Side effects: *italics* = common; **bold** = life-threatening ⚠
Nurse Alert

HIGH ALERT

trastuzumab (Rx)

(trastuz'uh-mab)

Herceptin

Func. class.: Antineoplastic—miscellaneous

Chem. class.: Humanized monoclonal antibody

ACTION:

DNA-derived monoclonal antibody selectively binds to extracellular portion of human epidermal growth factor receptor 2; it inhibits the proliferation of cancer cells

USES:

Breast cancer; metastatic with overexpression of HER2, early breast cancer (adjuvant, neoadjuvant), gastric cancer; previously untreated HER2 overexpressing metastatic gastric or gastroesophageal junction adenocarcinoma with CISplatin, 5-fluorouracil or capecitabine

CONTRAINDICATIONS:

Pregnancy (D); hypersensitivity to this product, Chinese hamster ovary cell protein

Precautions: Breastfeeding, children, geriatric patients, pulmonary disease, anemia, leukopenia

Black Box Warning:

Cardiac disease, respiratory distress syndrome, respiratory insufficiency, infusion-related reactions, cardiomyopathy

DOSAGE AND ROUTES

Calculator

Breast cancer

- Several regimens may be used
- **Adult:** **IV** 4 mg/kg given over 90 min then maintenance 2 mg/kg given over 30 min; do not give as IV push or bol; may be given in combination with other antineoplastics

Gastric cancer

- **Adult:** IV 8 mg/kg over 90 min on day 1 then 6 mg/kg over 30-90 min q21days from day 22, give with CISplatin 80 mg/m² on day 1 plus 5-fluorouracil 800 mg/m² **CONT INF** on days 1-5 or capecitabine 1000 mg/m² bid on days 1-14, repeat cycle q3wk

Available forms: Lyophilized powder 440 mg

Administer:

- Acetaminophen as ordered to alleviate fever and headache

Intermittent IV INF route

- After reconstituting vial with 20 ml bacteriostatic water for inj, 1.1% benzyl alcohol preserved (supplied) to yield 21 mg/ml, mark date on vial 28 days from reconstitution date; if patient is allergic to benzyl alcohol, reconstitute with sterile water for inj; use immediately, infuse over 90 min; q3wk give 8 mg/kg loading dose over 90 min, subsequent 6 mg/kg dose may be given over 30-60 min • Do not mix or dilute with other products or dextrose sol

SIDE EFFECTS

CNS: *Dizziness, numbness, paresthesias, depression, insomnia, neuropathy, peripheral neuritis*

CV: *Tachycardia, CHF*

GI: *Nausea, vomiting, anorexia, diarrhea, abdominal pain, hepatotoxicity, dysgeusia*

HEMA: *Anemia, leukopenia*

INTEG: *Rash, acne, herpes simplex*

META: *Edema, peripheral edema*

MISC: *Flulike symptoms; fever, headache, chills*

MS: *Arthralgia, bone pain*

RESP: *Cough, dyspnea, pharyngitis, rhinitis, sinusitis, pneumonia, pulmonary edema/fibrosis, acute respiratory distress syndrome (ARDS)*

SYST: *Anaphylaxis, angioedema*

PHARMACOKINETICS

Half-life 1-32 days

INTERACTIONS

Increase: bleeding risk—warfarin

Increase: cardiomyopathy—anthracyclines, cyclophosphamide; avoid use

Decrease: immune response—vaccines, toxoids

NURSING CONSIDERATIONS

Assess:

- CBC, HER2 overexpression

Black Box Warning:

CHF, other cardiac symptoms: dyspnea, coughing; gallop; obtain full cardiac workup including ECG, echo, multigated acquisition scan

- Symptoms of infection; may be masked by product
- CNS reaction: LOC, mental status, dizziness, confusion

Hypersensitive reactions, anaphylaxis

Black Box Warning:

Inf reactions that may be fatal: fever, chills, nausea, vomiting, pain, headache, dizziness, hypotension; discontinue product

- **Pulmonary toxicity:** dyspnea, interstitial pneumonitis, pulmonary hypertension, ARDs; can occur after infusion reaction, those with lung disease may have more severe toxicity

Perform/provide:

- Increased fluid intake to 2-3 L/day

Evaluate:

- Therapeutic response: decrease in size of tumors

Teach patient/family:

- To take acetaminophen for fever
- To avoid hazardous tasks because confusion, dizziness may occur
- To report signs of infection: sore throat, fever, diarrhea, vomiting
- That emotional lability is common; to notify prescriber if severe or incapacitating
- To use contraception while taking this product; pregnancy (D); to avoid breastfeeding

Black Box Warning:

To report pain at infusion site

☼ Canada only Side effects: *italics* = common; **bold** = life-threatening 
Nurse Alert

travoprost ophthalmic

See [Appendix B](#)

traZODone (Rx)

(tray'zoe-done)

[Oleptro](#)

Func. class.: Antidepressant—miscellaneous

Chem. class.: Triazolopyridine

Do not confuse: [traZODone](#)/traMADol

ACTION:

Selectively inhibits serotonin uptake by brain; potentiates behavioral changes

USES:

Depression

Unlabeled uses: Alcoholism, anxiety, panic disorder, insomnia

CONTRAINDICATIONS:

Hypersensitivity to tricyclics, recovery phase of MI, seizure disorders, prostatic hypertrophy

Precautions: Pregnancy (C), suicidal patients, severe depression, increased intraocular pressure, closed-angle glaucoma, urinary retention, cardiac/hepatic disease, hyperthyroidism, electroshock therapy, elective surgery, bleeding, abrupt discontinuation, bipolar disorder, breastfeeding, dehydration, hyponatremic, hypovolemia

Black Box Warning:

Suicidal ideation in children/adolescents

DOSAGE AND ROUTES

Calculator

Depression

- **Adult: PO** 150 mg/day in divided doses, may increase by 50 mg/day q3-4days, max 400 mg/day (outpatient), 600 mg/day (inpatients); **EXT REL** 150 mg in PM, may increase gradually by 75 mg/day q3days, max 375 mg/day
- **Child 6-18 yr (unlabeled): PO** 1.5-2 mg/kg/day in divided doses, may

increase q3-4days up to 6 mg/kg/day or 400 mg/day, whichever is less

- **Geriatric: PO** 25-50 mg at bedtime, increase by 25-50 mg q3-7days to desired dose, usually 75-150 mg/day

Alcoholism (unlabeled)

- **Adult: PO** 50-100 mg/day

Panic disorder (unlabeled)

- **Adult: PO** 150 mg in divided doses, may increase by 50 mg/day q3-4days

Insomnia (unlabeled)

- **Adult: PO** 50 mg at bedtime

Available forms: Tabs 50, 100, 150, 300 mg; ext rel tabs 150, 300 mg

Administer:

- Increased fluids, bulk in diet if constipation occurs, especially in geriatric patients
- With food, milk for GI symptoms
- Dosage at bedtime for oversedation during day; may take entire dose at bedtime; geriatric patients may not tolerate daily dosing
- Avoid use of CNS depressants
- Do not crush, break, chew ext rel product

SIDE EFFECTS

CNS: *Dizziness, drowsiness, confusion, headache, anxiety, tremors, stimulation, weakness, insomnia, nightmares, EPS (geriatric patients), increase in psychiatric symptoms, **suicide in children/adolescents***

CV: *Orthostatic hypotension, ECG changes, tachycardia, **hypertension**, palpitations*

EENT: *Blurred vision, tinnitus, mydriasis*

GI: *Diarrhea, dry mouth, nausea, vomiting, **paralytic ileus**, increased appetite, cramps, epigastric distress, jaundice, **hepatitis**, stomatitis, constipation*

GU: *Urinary retention, **acute renal failure**, priapism*

HEMA: ***Agranulocytosis, thrombocytopenia, eosinophilia, leukopenia***

INTEG: *Rash, urticaria, sweating, pruritus, photosensitivity*

PHARMACOKINETICS

Peak 1 hr without food, 2 hr with food; metabolized by liver (CYP3A4); excreted by kidneys, in feces; half-life 4.4-7.5 hr

INTERACTIONS

 Hyperpyretic crisis, seizures, hypertensive episode: MAOIs; do not use within 14 days of traZODone

Increase: toxicity, serotonin syndrome—FLUoxetine, nefazodone, other SSRIs, SNRIs, linezolid; methylene blue (IV)

Increase: effects of direct-acting sympathomimetics (EPINEPHrine), alcohol, barbiturates, benzodiazepines, CNS depressants, digoxin, phenytoin, carbamazepine

Increase: effects of traZODone—CYP3A4, 2D6 inhibitors (phenothiazines, protease inhibitors, azole antifungals)

Increase or decrease: effects of warfarin

Decrease: effects of guanethidine, clonidine, indirect-acting sympathomimetics (ephedrine)

Drug/Herb

Increase: serotonin syndrome—SAM-e, St. John's wort

Increase: CNS depression—hops, kava, lavender, valerian

Drug/Lab Test

Increase: LFTs

Decrease: Hgb

NURSING CONSIDERATIONS

Assess:

- B/P lying, standing; pulse q4hr; if systolic B/P drops 20 mm Hg, hold product, notify prescriber; take vital signs q4hr in patients with CV disease
- Blood studies: CBC, leukocytes, differential, cardiac enzymes if patient is receiving long-term therapy
- Hepatic studies: AST, ALT, bilirubin
- Weight weekly; appetite may increase with product
- ECG for flattening of T wave, bundle branch block, AV block, dysrhythmias in cardiac patients
- EPS, primarily in geriatric patients: rigidity, dystonia, akathisia

Black Box Warning:

Mental status changes: mood, sensorium, affect, suicidal tendencies, increase in psychiatric symptoms, depression, panic; observe for suicidal behaviors in children/adolescents, not approved for children

- Urinary retention, constipation; constipation most likely in children
- **Withdrawal symptoms:** headache, nausea, vomiting, muscle pain, weakness; not usual unless product discontinued abruptly
- Alcohol consumption; hold

dose until morning

⚠ Serotonin syndrome, neuroleptic malignant syndrome: increased heart rate, shivering, sweating, dilated pupils, tremors, high B/P, hyperthermia, headache, confusion; if these occur, stop product, administer serotonin antagonist if needed

Perform/provide:

- Storage in tight, light-resistant container at room temp
- Assistance with ambulation during beginning therapy for drowsiness, dizziness

Evaluate:

- Therapeutic response: decreased depression

Teach patient/family:

- That therapeutic effects may take 2-3 wk; to take product before bedtime, not to crush, chew ext rel product
- To use caution when driving, performing other activities requiring alertness because of drowsiness, dizziness, blurred vision
- To avoid alcohol ingestion
- Not to discontinue medication quickly after long-term use; may cause nausea, headache, malaise
- To report urinary retention, priapism >4 hr immediately
- To wear sunscreen or large hat because photosensitivity occurs

Black Box Warning:

That suicidal thoughts/behaviors may occur (adolescents/children)

- To notify prescriber if pregnancy is planned or suspected, pregnancy (C), avoid breastfeeding

TREATMENT OF OVERDOSE:

ECG monitoring; lavage, activated charcoal; administer anticonvulsant, atropine for bradycardia

✳ Canada only Side effects: *italics* = common; **bold** = life-threatening ⚠
Nurse Alert

treprostinil (Rx)

(treh-prah'stin-ill)

Remodulin, Tyvaso

Func. class.: Antiplatelet agent

Chem. class.: Tricyclic benzidine prostacyclin analog

ACTION:

Direct vasodilation of pulmonary, systemic arterial vascular beds; inhibition of platelet aggregation

USES:

Pulmonary arterial hypertension (PAH) NYHA class II through IV

Unlabeled uses: Pulmonary arterial hypertension in children/adolescents, pediatric patients transitioning from epoprostenol to treprostinil, claudication

CONTRAINDICATIONS:

Hypersensitivity to this product, other prostacyclin analogs

Precautions: Pregnancy (B), breastfeeding, children, geriatric patients, past renal/hepatic disease, thromboembolic disease, abrupt discontinuation, IV administration

DOSAGE AND ROUTES

Calculator

Pulmonary arterial hypertension (who group 1)

• **Adult:** **SUBCUT INF** 1.25 ng/kg/min by **CONT INF**, may reduce to 0.625 ng/kg/min if not tolerated; may increase by 1.25 ng/kg/min q wk for first 4 wk then 2.5 ng/kg/min/wk for remainder of inf; **ORAL INH** 3 breaths via Tyvaso inh system qid

Hepatic dose

• **Adult:** **SUBCUT INF** 0.625 ng/kg ideal body weight/min; increase cautiously

Available forms: Inj 1, 2.5, 5, 10 mg/ml; neb sol 1.74 mg/2.9 ml

Administer:

• Sudden decreased doses, abrupt withdrawal may worsen pulmonary arterial hypertension symptoms

SUBCUT route

- By continuous inf
- No dilution required

Oral INH route

- Avoid skin, eyes; do not take orally; use Tyvaso Inhalation System only
- Patient should have backup Optineb-ir device to avoid interruptions
- Follow instructions for use, cleaning
- Do not mix with other medications in Optineb-ir device
- Twist off cap, squeeze total contents into medicine cup; vol is sufficient for 4 treatments

Continuous IV INF route

- By surgically placed CV catheter using ambulatory inf pump
- IV pump, product, patient education can be obtained from Priority Healthcare in United States • Must be diluted with sterile water for inj or 0.9% NaCl
- Conc should be calculated using this formula: $\text{diluted conc} = [\text{dose (ng/kg/min)} \times \text{weight (kg)} \times 0.00006] \text{ inf rate (ml/hr)}$

SIDE EFFECTS

CNS: Dizziness, headache, syncope

CV: Vasodilation, hypotension, edema, right ventricular heart failure

GI: Nausea, *diarrhea*

INTEG: *Rash*, pruritus

OTHER: Jaw pain, cough, throat irritation

SYST: Inf site reactions, pain; increased risk for infection

PHARMACOKINETICS

Metabolized by liver; excreted in urine, feces; terminal half-life 2-4 hr; 90% protein binding

INTERACTIONS

- Excessive hypotension: diuretics, antihypertensives, vasodilators, MAOIs, β -blockers, calcium channel blockers

Increase: bleeding tendencies—anticoagulants, aspirin, NSAIDs, thrombin inhibitors, SSRIs

NURSING CONSIDERATIONS

Assess:

- **Hypertension:** monitor B/P, baseline and periodically
- Hepatic studies: AST, ALT, bilirubin, creatinine with long-term therapy
- ⚠ Blood studies: CBC; CBC q2wk × 3 mo, Hct, Hgb, PT with long-term therapy, ABGs ⚠ Bleeding time at baseline, throughout treatment; levels may be 2-5× normal limit

Evaluate:

- Avoid abrupt discontinuation
- Therapeutic response: decreased pulmonary arterial hypertension (PAH)

Teach patient/family:

- That blood work will be necessary during treatment, that treatment may last for years
- To report side effects such as diarrhea, skin rashes
- That therapy will be needed for prolonged periods of time, sometimes years
- To prevent infection, aseptic technique must be used for preparation, administration of treprostinil
- That there are many product, herbal interactions
- About signs, symptoms of bleeding; blood in urine, stools
- How to use inhaled solution, how to care for equipment

🌿 Canada only Side effects: *italics* = common; **bold** = life-threatening ⚠
Nurse Alert

tretinoin (vit A acid, retinoic acid) (Rx)

(tret'i-noyn)

Avita, Renova, Retin-A, Retin-A Micro, Stieva-A 

Func. class.: Vit A acid, acne product; antineoplastic (miscellaneous) *Chem. class.:* Tretinoin derivative

ACTION:

(Topical) Decreases cohesiveness of follicular epithelium, decreases microcomedone formation; (PO) induces maturation of acute promyelocytic leukemia, exact action is unknown

USES:

(Topical) Acne vulgaris (grades 1-3); (PO) acute promyelocytic leukemia, facial wrinkles, photoaging

Unlabeled uses: Acne rosacea, actinic keratosis, ichthyosis, Kaposi's sarcoma, keloids, keratosis follicularis, melasma

CONTRAINDICATIONS:

Hypersensitivity to retinoids or sensitivity to parabens

Black Box Warning:

Pregnancy (D) (PO)

Precautions: Pregnancy (C) (topical), breastfeeding, eczema, sunburn, sun exposure

Black Box Warning:

Rapid-evolving leukocytosis, respiratory compromise, acute promyelocytic leukemia differentiation syndrome

DOSAGE AND ROUTES

Calculator

• **Adult and child: TOP** cleanse area, apply 0.025%-0.1% cream or 0.05% liquid gel at bedtime, cover lightly

Promyelocytic leukemia

• **Adult: PO** 45 mg/m²/day given as 2 evenly divided doses until remission, discontinue treatment 30 days after remission or 90 days of treatment, whichever is first

Available forms: Cream 0.01%, 0.02%, 0.025%, 0.05%, 0.1%; gel 0.01%,

0.025%, 0.04%, 0.05%, 0.1%; liquid 0.05%; caps 10 mg

Administer:

Topical route

- Once daily before bedtime; cover area lightly using gauze; use gloves to apply

SIDE EFFECTS

Oral

CNS: Headache, fever, sweating, fatigue

CV: Cardiac dysrhythmias, pericardial effusion

GI: Nausea, vomiting, hemorrhage, abdominal pain, diarrhea, constipation, dyspepsia, distention, hepatitis

Topical

INTEG: Rash, stinging, warmth, redness, erythema, blistering, crusting, peeling, contact dermatitis, hypo/hyperpigmentation, dry skin, pruritus, scaly skin, retinoic acid syndrome (RAS)

META: Hypercholesterolemia, hypertriglyceridemia

RESP: Pneumonia, upper respiratory tract disease

PHARMACOKINETICS

PO: Terminal half-life 0.5-2 hr

TOPICAL: Poor systemic absorption

INTERACTIONS

- Use with caution: medicated, abrasive soaps; cleansers that have a drying effect; products with high conc of alcohol astringents (topical)

Increase: peeling—medication containing agents such as sulfur, benzoyl peroxide, resorcinol, salicylic acid (topical)

Increase: plasma concentrations of tretinoin—ketoconazole (PO)

 **Increase:** ICP, risk of pseudotumor cerebri—tetracyclines; do not use together

Increase: photosensitivity—retinoids, quinolones, phenothiazines, sulfonamides, sulfonylureas, thiazide diuretics

Increase: thrombotic complications—aminocaproic acid, aprotinin, tranexamic acid

Drug/Lab Test

Increase: AST, ALT

NURSING CONSIDERATIONS

Assess:

Topical route

- Area of body involved, what helps or aggravates condition; cysts, dryness, itching; lesions may worsen at beginning of treatment

PO route

- Hepatic function, coagulation, hematologic parameters; also cholesterol, triglycerides

Perform/provide:

Topical route

- Storage at room temp
- Handwashing after application

Evaluate:

- Therapeutic response: decrease in size, number of lesions

Teach patient/family:

Topical route

- To avoid application on normal skin; to avoid getting cream in eyes, nose, other mucous membranes; not to use product on areas with cuts, scrapes • To use cream/gel by applying a thin layer to affected skin; to rub gently; to use liquid; to apply with fingertip or cotton swab • To avoid sunlight, sunlamps; to use protective clothing, sunscreen
- That treatment may cause warmth, stinging; that dryness, peeling will occur
- That cosmetics may be used over product; not to use shaving lotions
- That rash may occur during first 1-3 wk of therapy
- That product does not cure condition, only relieves symptoms
- That therapeutic results may be seen in 2-3 wk but may not be optimal until after 6 wk

PO route

Black Box Warning:

To notify prescriber if pregnancy is planned or suspected; pregnancy (D) PO

☛ Canada only Side effects: *italics* = common; **bold** = life-threatening 
Nurse Alert

tretinoin topical

See [Appendix B](#)

triamcinolone (Rx)

(trye-am-sin'oh-lone)

Aristospan, Kenalog-10, Tac-3, Triesence

Func. class.: Corticosteroid, synthetic

Chem. class.: Glucocorticoid, intermediate acting

See ophthalmic in [Appendix B](#)

ACTION:

Decreases inflammation by suppression of migration of polymorphonuclear leukocytes, fibroblasts; reversal of increased capillary permeability and lysosomal stabilization

USES:

Severe inflammation, immunosuppression, neoplasms, asthma (steroid dependent); collagen, respiratory, dermatologic/rheumatic disorders

CONTRAINDICATIONS:

Hypersensitivity, neonatal prematurity; epidural/intrathecal administration (Triamcinolone acetonide injections [Kenalog])

Precautions: Pregnancy (C), breastfeeding, diabetes mellitus, glaucoma, osteoporosis, seizure disorders, ulcerative colitis, CHF, myasthenia gravis, renal disease, esophagitis, peptic ulcer, acne, cataracts, coagulopathy, head trauma, children <2 yr, psychosis, idiopathic thrombocytopenia, acute glomerulonephritis, amebiasis, fungal infections, nonasthmatic bronchial disease, AIDS, TB, adrenal insufficiency, acute bronchospasm

DOSAGE AND ROUTES

Calculator

- **Adult: IM** (acetonide, diacetate) 40 mg/wk; (diacetate, acetonide) 5-48 mg into neoplasms; (diacetate, acetonide) 2-40 mg into joint or soft tissue; (hexacetonide) 0.5 mg/in² of affected intralesional skin; (hexacetonide) 2-20 mg

into joint or soft tissue

Severe/incapacitating allergic conditions such as asthma

- **Adult: IM** (Trivaris) 60 mg, titrate, usual range 40-80 mg
- **Child: IM** (Trivaris) 0.11-1.6 mg/kg/day (3.2-48 mg/m²/day) in 3-4 divided doses

Available forms: Inj 25, 40 mg/ml diacetate; inj 3, 10, 40 mg/ml acetate; inj 20, 5 mg/ml hexacetate

Administer:

IM route

- After shaking susp (parenteral)
- Titrated dose; use lowest effective dose
- IM inj deep in large muscle mass; rotate sites; avoid deltoid; use 21G needle
- In 1 dose in AM to prevent adrenal suppression; avoid SUBCUT administration, may damage tissue

SIDE EFFECTS

CNS: *Depression, flushing, sweating, headache, mood changes*

CV: *Hypertension, circulatory collapse, thrombophlebitis, embolism, tachycardia, edema*

EENT: *Fungal infections, increased intraocular pressure, blurred vision*

GI: *Diarrhea, nausea, abdominal distention, GI hemorrhage, increased appetite, pancreatitis*

HEMA: *Thrombocytopenia*

INTEG: *Acne, poor wound healing, ecchymosis, petechiae*

MS: *Fractures, osteoporosis, weakness*

PHARMACOKINETICS

PO/IM: Peak 1-2 hr, half-life 2-5 hr

INTERACTIONS

Increase: side effects—alcohol, salicylates, indomethacin, amphotericin B, digoxin, cycloSPORINE, diuretics

Increase: action of triamcinolone—salicylates, estrogens, indomethacin, oral contraceptives, ketoconazole, macrolide antiinfectives

Decrease: action of triamcinolone—cholestyramine, colestipol, barbiturates,

rifampin, ePHEDrine, phenytoin, theophylline

Decrease: effects of anticoagulants, anticonvulsants, antidiabetics, ambenonium, neostigmine, isoniazid, toxoids, vaccines, anticholinesterases, salicylates, somatrem

Drug/Herb

- Hypokalemia: aloe, cascara, senna

Drug/Lab Test

Increase: cholesterol, sodium, blood glucose, uric acid, calcium, urine glucose

Decrease: Ca, K, T₄, T₃, thyroid ¹³¹I uptake test, urine 17-OHCS, 17-KS, PBI

False negative: skin allergy tests

NURSING CONSIDERATIONS

Assess:

- Potassium, blood glucose, urine glucose while patient receiving long-term therapy; hypokalemia and hyperglycemia • Weight daily; notify prescriber if weekly gain of >5 lb
- B/P, pulse; notify prescriber if chest pain occurs
- I&O ratio; be alert for decreasing urinary output, increasing edema
- Plasma cortisol levels during long-term therapy (normal level: 138-635 nmol/L SI units when drawn at 8 AM) • **Infection:** increased temp, WBC even after withdrawal of medication; product masks infection • Potassium depletion: paresthesias, fatigue, nausea, vomiting, depression, polyuria, dysrhythmias, weakness • Edema, hypertension, cardiac symptoms
- Mental status: affect, mood, behavioral changes, aggression

Perform/provide:

- Assistance with ambulation for patient with bone-tissue disease to prevent fractures • Use of spacer device for geriatric patients with inhaler

Evaluate:

- Therapeutic response: ease of respirations, decreased inflammation

Teach patient/family:

- That emergency ID as corticosteroid user should be carried
- To notify prescriber if therapeutic response decreases; that dosage adjustment may be needed • To avoid OTC products: salicylates, alcohol in cough products, cold preparations unless directed by prescriber • About cushingoid symptoms
- About the symptoms of adrenal insufficiency: nausea, anorexia, fatigue,

dizziness, dyspnea, weakness, joint pain

✳ Canada only Side effects: *italics* = common; **bold** = life-threatening ⚠

Nurse Alert

triamcinolone nasal agent

See [Appendix B](#)

triamcinolone ophthalmic

See [Appendix B](#)

triamcinolone (topical)

(try-am-sin'oh-lone)

Kenalog, Triacet, Triderm

Func. class.: Corticosteroid, topical

ACTION:

Crosses cell membrane to attach to receptors to decrease inflammation, itching; inhibits multiple inflammatory cytokines

USES:

Inflammation/itching in corticosteroid-responsive dermatoses on the skin or inflammation in the mouth

CONTRAINDICATIONS:

Hypersensitivity, use on face, ear canal, infections

Precautions: Pregnancy (C), breastfeeding, children

DOSAGE AND ROUTES

Calculator

- Apply to the affected areas bid-qid

Available forms: Aerosol 0.2 mg; paste (dental) 0.1%; lotion, cream, ointment 0.025%; ointment 0.05%; lotion, cream, ointment 0.1%; ointment, cream 0.5%

Administer:

Topical route

- May be used with occlusive dressings

• **Cream/Ointment/Lotion:** apply sparingly in a thin film and rub gently into the cleansed, slightly moist affected area • **Paste:** apply without rubbing, press into lesion until film develops • **Spray:** spray a small amount of preparation onto the lesion

SIDE EFFECTS

ENDO: HPA axis suppression, Cushing syndrome

INTEG: Burning, folliculitis, pruritus, dermatitis, maceration, hypopigmentation

META: Hyperglycemia; glycosuria

PHARMACOKINETICS

Onset 8-12 hr

INTERACTIONS

Increase: blood glucose

NURSING CONSIDERATIONS

Assess:

• Skin reactions: burning pruritus, folliculitis, mouth lesions

Evaluate:

• Decreasing itching, inflammation on the skin, decreasing mouth lesions

Teach patient/family:

• How to use each product

☼ Canada only Side effects: *italics* = common; **bold** = life-threatening ⚠
Nurse Alert

triamcinolone (topical-oral) (OTC)

(trye-am-sin'oh-lone)

Kenalog in Orabase, Oralone Dental

Func. class.: Topical anesthetic

Chem. class.: Synthetic fluorinated adrenal corticosteroid

ACTION:

Binds with steroid receptors, decreases inflammation

USES:

Oral pain

CONTRAINDICATIONS:

Infants <1 yr, hypersensitivity, application to large areas; presence of fungal, viral, or bacterial infections of mouth or throat

Precautions: Pregnancy (C), children <6 yr, sepsis, denuded skin

DOSAGE AND ROUTES

Calculator

• **Adult and child: TOP** Press 1/4 inch into affected area until film appears, repeat bid-tid

Available forms: Paste 0.1%

Administer:

- After cleansing oral cavity after meals

SIDE EFFECTS

INTEG: Rash, irritation, sensitization

NURSING CONSIDERATIONS

Assess:

- Allergy: rash, irritation, reddening, swelling
- Infection: if affected area is infected, do not apply

Evaluate:

- Therapeutic response: absence of pain in affected area

Teach patient/family:

- To report rash, irritation, redness, swelling
- How to apply paste

🍁 Canada only Side effects: *italics* = common; **bold** = life-threatening ⚠️
Nurse Alert

triazolam (Rx)

(trye-ay'zoe-lam)

Apo-Triazo , Halcion

Func. class.: Sedative-hypnotic, antianxiety

Chem. class.: Benzodiazepine, short acting

Controlled Substance Schedule IV (USA), Targeted (CDSA IV) (Canada)

Do not confuse: **Halcion**/Haldol/halcinonide

ACTION:

Produces CNS depression at limbic, thalamic, hypothalamic levels of CNS; may be mediated by neurotransmitter γ -aminobutyric acid (GABA); results are sedation, hypnosis, skeletal muscle relaxation, anticonvulsant activity, anxiolytic action

USES:

Insomnia, sedative/hypnotic

CONTRAINDICATIONS:

Pregnancy (X), breastfeeding, hypersensitivity to benzodiazepines, intermittent porphyria

Precautions: Children <15 yr, geriatric patients, anemia, renal/hepatic disease, suicidal individuals, drug abuse, psychosis, acute closed-angle glaucoma, seizure disorders, angioedema, respiratory disease, depression, sleep-related behaviors (sleep walking)

DOSAGE AND ROUTES

Calculator

- **Adult: PO** 0.125-0.5 mg at bedtime, max 0.5 mg/day
- **Geriatric: PO** 0.0625-0.125 mg at bedtime, max 0.25 mg/day

Available forms: Tabs 0.125, 0.25 mg

Administer:

- After trying conservative measures for insomnia

- 1/2 hr before bedtime for sleeplessness
- On empty stomach for fast onset; may be taken with food if GI symptoms occur
- Avoid use with CNS depressants; serious CNS depression may result

SIDE EFFECTS

CNS: *Headache, lethargy, drowsiness, daytime sedation*, dizziness, confusion, lightheadedness, anxiety, irritability, amnesia, poor coordination, **complex sleep-related reactions: sleep driving, sleep eating**

CV: Chest pain, pulse changes

GI: Nausea, vomiting, diarrhea, heartburn, abdominal pain, constipation, **hepatic injury**

SYST: **Severe allergic reactions**

PHARMACOKINETICS

Onset 30-45 min, duration 6-8 hr, metabolized by liver, excreted by kidneys (inactive metabolites), crosses placenta, excreted in breast milk, half-life 2-3 hr

INTERACTIONS

- Smoking may decrease hypnotic effect

Increase: triazolam levels—CYP3A4 inhibitors, protease inhibitors

⚠ Increase: effects of cimetidine, disulfiram, erythromycin, clarithromycin, probenecid, isoniazid, oral contraceptives; do not use concurrently

Increase: action of both products—alcohol, CNS depressants

Decrease: effect of antacids, theophylline, rifampin, smoking

Drug/Herb

Increase: CNS depression—chamomile, hops, kava, lavender, valerian

Drug/Food

- Grapefruit may increase action, avoid concurrent use

Drug/Lab Test

Increase: ALT, AST, serum bilirubin

Decrease: RAI uptake

False increase: urinary 17-OHCS

NURSING CONSIDERATIONS

Assess:

- Blood studies: Hct, Hgb, RBC if blood dyscrasias suspected (rare)
- Hepatic studies: AST, ALT, bilirubin if hepatic damage has occurred
- Mental status: mood, sensorium, affect, memory (long, short term), insomnia, withdrawal symptoms, excessive sedation, impaired coordination
- Blood dyscrasias: fever, sore throat, bruising, rash, jaundice, epistaxis (rare)
- Type of sleep problem: falling asleep, staying asleep

Perform/provide:

- Assistance with ambulation after receiving dose
- Cool storage in tight container

Evaluate:

- Therapeutic response: ability to sleep at night, decreased amount of early morning awakening if taking product for insomnia

Teach patient/family:

- **To use reliable contraception; pregnancy category (X)**
- That dependence is possible after long-term use
- To avoid driving, other activities requiring alertness until product is stabilized
- To avoid alcohol ingestion
- That effects may take 2 nights for benefits to be noticed; that product is for short-term use only; to use for 7-10 continuous nights
- About alternative measures to improve sleep: reading, exercise several hours before bedtime, warm bath, warm milk, TV, self-hypnosis, deep breathing
- That complex sleep-related behaviors (sleep eating/driving) may occur
- That hangover common in geriatric patients but less common than with barbiturates; that rebound insomnia may occur for 1-2 nights after discontinuing product; to discontinue by decreasing dose by 50% q2 nights until 0.125 mg for 2 nights, then stop

TREATMENT OF OVERDOSE:

Lavage, activated charcoal; monitor electrolytes, VS

☛ Canada only Side effects: *italics* = common; **bold** = life-threatening ⚠️
Nurse Alert

trifluridine ophthalmic

See [Appendix B](#)

trimethobenzamide (Rx)

(trye-meth-oh-ben'za-mide)

[Tigan](#)

Func. class.: Antiemetic, anticholinergic

Chem. class.: Ethanolamine derivative

ACTION:

Acts centrally by blocking chemoreceptor trigger zone, which in turn acts on vomiting center

USES:

Nausea, vomiting

CONTRAINDICATIONS:

Children (parenterally), hypersensitivity to opioids, shock

Precautions: Pregnancy (C), children, geriatric patients, cardiac dysrhythmias, acute febrile illness, encephalitis, gastroenteritis, dehydration, electrolyte imbalances, Reye's syndrome

DOSAGE AND ROUTES

Calculator

Nausea/vomiting

- **Adult:** IM 200 mg 3-4×/day; PO 300 mg 3-4×/day

Postoperative

- **Adult:** IM 200 mg followed by 2nd dose 1 hr later

Renal dose

- **Adult:** IM CCr 15-30 ml/min, give 50% of dose

Available forms: Caps 300 mg; inj 100 mg/ml

Administer:

PO route

- Capsules may be swallowed whole, chewed, allowed to dissolve

IM route

- Inj in large muscle mass; aspirate to avoid IV administration; inj not to be used in children or infants

Syringe compatibilities: Butorphanol, glycopyrrolate, HYDROMorphone, midazolam, nalbuphine

SIDE EFFECTS

CNS: *Drowsiness*, headache, dizziness, confusion, disorientation, **coma**, **seizures**, depression, *vertigo*, EPS

CV: Hypo/hypertension, palpitation, **cardiac dysrhythmias**

EENT: Dry mouth, blurred vision, photosensitivity

GI: Nausea, diarrhea, vomiting, difficulty swallowing

INTEG: Rash, urticaria, fever, chills, flushing, hyperpyrexia

PHARMACOKINETICS

Metabolized by liver, excreted by kidneys

PO: Onset 20-40 min, duration 3-4 hr

IM: Onset 15-35 min, duration 2-3 hr

INTERACTIONS

Increase: effect—CNS depressants, alcohol

NURSING CONSIDERATIONS

Assess:

- Nausea, vomiting before, after treatment
- VS, B/P; check patients with cardiac disease more often
- **Signs of toxicity of other products or masking of symptoms of disease: brain tumor, intestinal obstruction • Observe for drowsiness, dizziness**

Evaluate:

- Therapeutic response: decreased nausea, vomiting

Teach patient/family:

- To avoid hazardous activities, activities requiring alertness because dizziness may occur; to request assistance with ambulation • To avoid alcohol, other depressants
 - To keep out of children's reach
-

🍁 Canada only Side effects: *italics* = common; **bold** = life-threatening ⚠️
Nurse Alert

trimethoprim-sulfamethoxazole (Rx)

(trye-meth'oh-prim-sul-fa-meth-ox'a-zole)

Bacter-Aid DS, Bactrim DS, Novo-Trimel , Nu-Cotrimox , Septra, Septra DS, Sultrex, SMZ/TMP

Func. class.: Antiinfective

Chem. class.: Sulfonamide—miscellaneous

ACTION:

Sulfamethoxazole (SMZ) interferes with the bacterial biosynthesis of proteins by competitive antagonism of PABA when adequate levels are maintained; trimethoprim (TMP) blocks the synthesis of tetrahydrofolic acid; the combination blocks 2 consecutive steps in the bacterial synthesis of essential nucleic acids and protein

USES:

UTI, otitis media, acute and chronic prostatitis, shigellosis, *Pneumocystis jiroveci* pneumonitis, chronic bronchitis, chancroid, traveler's diarrhea

CONTRAINDICATIONS:

Breastfeeding, infants <2 mo; hypersensitivity to trimethoprim or sulfonamides; pregnancy at term, megaloblastic anemia, CCr <15 ml/min, porphyria, hyperkalemia

Precautions: Pregnancy (C), geriatric patients, infants, renal disease, G6PD deficiency, impaired hepatic/renal function, possible folate deficiency, severe allergy, bronchial asthma, UV exposure

DOSAGE AND ROUTES

Calculator

Based on TMP content

UTI

- **Adult: PO** 160 mg TMP q12hr × 10-14 days
- **Child: PO** 8 mg/kg TMP/day in 2 divided doses q12hr (Treatment): 2 mg/kg/day (prophylaxis)

Otitis media

- **Child: PO** 8 mg/kg TMP/day in 2 divided doses q12hr × 10 days

Chronic bronchitis

- **Adult: PO** 160 mg TMP q12hr × 10-14 days

***Pneumocystis jiroveci* pneumonitis**

- **Adult and child: PO** 15-20 mg/kg TMP daily in 4 divided doses q6hr × 14-21 days; **IV** 15-20 mg/kg/day (based on TMP) in 3-4 divided doses for ≤14 days
- Dosage reduction necessary in moderate to severe renal impairment (CCr <30 ml/min)

Available forms: Tabs 80 mg trimethoprim/400 mg sulfamethoxazole, 160 mg trimethoprim/800 mg sulfamethoxazole; susp 40 mg/200 mg/5 ml; IV 16 mg/80 mg/ml

Administer:

PO route

- Medication after C&S; repeat C&S after full course of medication
- With resuscitative equipment, EPINEPHrine available; severe allergic reactions may occur
- On an empty stomach 1 hr before or 2 hr after meals
- With full glass of water to maintain adequate hydration; increase fluids to 2 L/day to decrease crystallization in kidneys

Intermittent IV INF route

- After diluting 5 ml of product/125 ml D₅W, run over 1-1½ hr

Y-site compatibilities: Acyclovir, aldesleukin, allopurinol, amifostine, amphotericin B cholesteryl, atracurium, aztreonam, cefepime, cyclophosphamide, diltiazem, DOXOrubicin liposome, enalaprilat, esmolol, filgrastim, fludarabine, gallium, granisetron, HYDROmorphine, labetalol, LORazepam, magnesium sulfate, melphalan, meperidine, morphine, pancuronium, perphenazine, piperacillin/tazobactam, remifentanyl, sargramostim, tacrolimus, teniposide, thiotepa, vecuronium, zidovudine

SIDE EFFECTS

CNS: Headache, insomnia, hallucinations, depression, vertigo, fatigue, anxiety, seizures, product fever, chills, aseptic meningitis

CV: Allergic myocarditis

EENT: Tinnitus

GI: Nausea, vomiting, abdominal pain, stomatitis, hepatitis, glossitis, pancreatitis, diarrhea, enterocolitis, anorexia, pseudomembranous colitis

GU: Renal failure, toxic nephrosis; increased BUN, creatinine; crystalluria

HEMA: Leukopenia, neutropenia, thrombocytopenia, agranulocytosis, hemolytic anemia, hypoprothrombinemia, Henoch-Schönlein purpura, methemoglobinemia, eosinophilia I

INTEG: Rash, dermatitis, urticaria, Stevens-Johnson syndrome, erythema, photosensitivity, pain, inflammation at inj site, toxic epidermal necrolysis, erythema multiforme

RESP: Cough, SOB

SYST: Anaphylaxis, SLE

PHARMACOKINETICS

PO: Rapidly absorbed; peak 1-4 hr; half-life 8-13 hr; excreted in urine (metabolites and unchanged), breast milk; crosses placenta; 68% bound to plasma proteins; TMP achieves high levels in prostatic tissue and fluid

INTERACTIONS

Increase: thrombocytopenia—thiazide diuretics

Increase: potassium levels—potassium-sparing diuretics, potassium supplements

Increase: hypoglycemic response—sulfonylurea agents

Increase: anticoagulant effects—oral anticoagulants

Increase: levels of dofetilide

Increase: crystalluria—methenamine

Increase: bone marrow depressant effects—methotrexate

Decrease: hepatic clearance of phenytoin, CYP2C9, CYP3A4 inducers

Decrease: response—cycloSPORINE

Drug/Lab Test

Increase: alk phos, creatinine, bilirubin, AST, ALT

NURSING CONSIDERATIONS

Assess:

- I&O ratio; note color, character, pH of urine if product administered for UTI; output should be 800 ml less than intake; if urine is highly acidic, alkalization may be needed
- Renal studies: BUN, creatinine, urinalysis with long-term therapy

- Type of infection; obtain C&S before starting therapy
- Blood dyscrasias, skin rash, fever, sore throat, bruising, bleeding, fatigue, joint pain • **Allergic reaction:** rash, dermatitis, urticaria, pruritus, dyspnea, bronchospasm; product should be discontinued at 1st sign of rash; AIDS patients more susceptible

Perform/provide:

- Storage in tight, light-resistant container at room temp

Evaluate:

- Therapeutic response: absence of pain, fever; C&S negative

Teach patient/family:

- To take each oral dose with full glass of water to prevent crystalluria; to drink 8-10 glasses of water/day; to take product on an empty stomach 1 hr before meals, 2 hr after meals • To complete full course of treatment to prevent superinfection
- To avoid sunlight; to use sunscreen to prevent burns
- To avoid OTC medications (aspirin, vit C) unless directed by prescriber
- To use alternative contraceptive measures; that decreased effectiveness of oral contraceptives may occur • To notify prescriber if skin rash, sore throat, fever, mouth sores, unusual bruising, bleeding occur; to notify prescriber of CNS effects: anxiety, depression, hallucinations, seizures

🍁 Canada only Side effects: *italics* = common; **bold** = life-threatening ⚠️
Nurse Alert

tropicamide ophthalmic

See [Appendix B](#)

trospium (Rx)

(trose'pee-um)

Sanctura, Sanctura XR

Func. class.: Anticholinergic, urinary antispasmodic *Chem. class.:* Muscarinic receptor antagonist

ACTION:

Relaxes smooth muscles in bladder by inhibiting acetylcholine effect on muscarinic receptors

USES:

Overactive bladder (urinary frequency, urgency)

CONTRAINDICATIONS:

Hypersensitivity, uncontrolled closed-angle glaucoma, urinary retention, gastric retention, myasthenia gravis

Precautions: Pregnancy (C), breastfeeding, children, geriatric patients, renal/hepatic disease, controlled closed-angle glaucoma, ulcerative colitis, intestinal atony, bladder outflow obstruction

DOSAGE AND ROUTES

Calculator

- **Adult <75 yr:** **PO** 20 mg bid 1 hr before meals or on empty stomach; **ER** 60 mg in AM
- **Geriatric ≥75 yr:** **PO** titrate down to 20 mg/day based on response and tolerance

Renal dose

- **Adult:** **PO** CCr <30 ml/min, 20 mg/day at bedtime, ext rel product not recommended

Available forms: Tabs 20 mg; caps ext rel 60 mg

Administer:

- 1 hr before meals or on empty stomach (reg rel); in AM (ext rel) ≥1 hr before

meal

SIDE EFFECTS

CNS: Fatigue, dizziness, headache

CV: Tachycardia

EENT: Dry eyes, vision abnormalities

GI: Flatulence, abdominal pain, *constipation*, *dry mouth*, dyspepsia

GU: Urinary retention, UTI

INTEG: Dry skin, **angioedema**

MISC: Heat stroke, fever

PHARMACOKINETICS

Rapidly absorbed (10%); peak 5-6 hr; protein bound (50%-85%); extensively metabolized; excreted in urine, feces; excreted in urine by active tubular secretion; half-life 20 hr

INTERACTIONS

Increase: drowsiness—CNS depressants, alcohol

Increase or decrease: trospium effect—products excreted by active renal secretion (aMILoride, digoxin, morphine), metformin, quiNIDine, procainamide, ranitidine, tenofovir, triamterene, vancomycin

Drug/Food

Decrease: absorption—high-fat meal

NURSING CONSIDERATIONS

Assess:

- **Urinary patterns:** distention, nocturia, frequency, urgency, incontinence, voiding patterns

Evaluate:

- Therapeutic response: correction of urinary status: absence of dysuria, frequency, nocturia, incontinence

Teach patient/family:

- To avoid hazardous activities because dizziness may occur
- That alcohol may increase drowsiness
- About anticholinergic effects that may occur

- That overheating may occur with strenuous exercise
 - To avoid all other products unless approved by prescriber
-

Nurse Alert

undecylenic acid topical

See [Appendix B](#)

unoprostone ophthalmic

See [Appendix B](#)

ustekinumab (Rx)

(us'te-kin'ue-mab)

[Stelara](#)

Func. class.: Antipsoriatic agent

ACTION:

Interleukin (IL)-12, IL-23 Antagonist

USES:

Plaque psoriasis

CONTRAINDICATIONS:

Hypersensitivity, sepsis, active infections

Precautions: Pregnancy (B), breast-feeding, children ≤ 18 yr, geriatric patients, surgery, TB, diabetes mellitus, immunosuppression

DOSAGE AND ROUTES

Calculator

• **Adult ≥ 100 kg:** SUBCUT 90 mg, repeat in 4 wk, then 90 mg q12wk starting wk 16

• **Adult ≤ 100 kg:** SUBCUT 45 mg, repeat in 4 wk, then 45 mg q12wk starting wk 16

Available forms: Solutions for inj 45 mg/0.5 mc

Administer:

• Visually inspect for particulate matter or discoloration; solution should be slightly yellow and may contain a few small translucent or white particles; do not use if discolored, cloudy or if foreign particulate matter is present; do not

shake

- Use at 27 G, 0.5 inch needle
- May be administered subcut into upper arm, abdomen, or thigh; rotate inj sites

SIDE EFFECTS

CNS: Headache, leukoencephalopathy

HEMA: Bleeding

INTEG: *Inj site reaction*, pruritus, skin irritation, erythema

SYST: **Serious infections, malignancies**

PHARMACOKINETICS

Maximum serum concentration: 13.5 days after a single 45 mg subcut dose, 7 days after a single 90 mg subcut dose; half-life 14.9-45.6 days

INTERACTIONS

- Do not give concurrently with vaccines; immunizations should be brought up to date before treatment
- Avoid use with immunosuppressives

NURSING CONSIDERATIONS

Assess:

- For inj site pain, swelling

Evaluate:

- Therapeutic response: decreased plaque psoriasis

Teach patient/family:

- That product must be continued for prescribed time to be effective
- Not to receive live vaccinations during treatment
- To notify prescriber of possible infection (upper respiratory or other)

☼ Canada only Side effects: *italics* = common; **bold** = life-threatening ⚠

Nurse Alert

valACYclovir (Rx)

(val-a-sye'kloh-vir)

Valtrex

Func. class.: Antiviral

Chem. class.: Synthetic purine nucleoside analog

Do not confuse: valACYclovir/valGANciclovir

Valtrex/Valcyte

ACTION:

Interferes with DNA synthesis by conversion to acyclovir, thereby causing decreased viral replication, time of lesional healing

USES:

Treatment or suppression of herpes zoster (shingles), genital herpes, herpes labialis (cold sores), varicella, varicella-zoster

Unlabeled uses: CMV with advanced HIV, posttransplant patients, Bell's palsy, herpes simplex virus prophylaxis, acute retinal necrosis (ARN), encephalitis

CONTRAINDICATIONS:

Hypersensitivity to this product or acyclovir, valGANciclovir

Precautions: Pregnancy (B), breastfeeding, geriatric patients, hepatic/renal disease, electrolyte imbalance, dehydration, penciclovir, famciclovir, ganciclovir, hypersensitivity, varicella

DOSAGE AND ROUTES

Calculator

Herpes zoster (shingles)

- **Adult:** PO 1 g tid $\times$ 1 wk

Genital herpes (suppressive, initial)

- **Adult:** PO 1 g bid $\times$ 10 days initially

Genital herpes (recurrent episodes)

- **Adult:** PO 500 mg bid $\times$ 3 days

Genital herpes (suppressive therapy)

- **Adult:** PO 1 g/day with normal immune function; 500 mg/day for those with

≤9 recurrences/yr; 500 mg bid for HIV-infected patients with CD4 count ≥100

Reduction of transmission

- **Adult: PO** 500 mg/day for source partner

Herpes labialis

- **Adult: PO** 2 g bid × 1 day at 1st sign of lesions

Varicella (chickenpox) in immunocompetent patients

- **Adolescent and child ≥2 yr: PO** 20 mg/kg/dose tid × 5 days, max 3 g/day; start at 1st sign, preferably within 24 hr of rash

Renal dose

- **Adult: PO** CCr 30-49 ml/min, 1 g q12hr (for regimens 1 g q8hr); 1 g q12hr × 1 day (herpes labialis); CCr 10-29 ml/min, 1 g q24hr (genital herpes/herpes zoster); 500 mg q24hr (recurrent genital herpes); CCr <10 ml/min, 500 mg q24hr (genital herpes/herpes zoster), 500 mg q24hr (recurrent genital herpes)

Available forms: Tabs 500 mg, 1 g

Administer:

- As soon as possible (herpes labialis, genital herpes); within 24 hr of rash (varicella)
- Within 72 hr of outbreak (herpes zoster)
- Without regard to food
- Caps may be made into susp by pharmacy

SIDE EFFECTS

CNS: Tremors, lethargy, *dizziness*, *headache*, weakness, depression

ENDO: *Dysmenorrhea*

GI: *Nausea*, vomiting, diarrhea, abdominal pain, constipation, *increased AST*

HEMA: *Thrombocytopenic purpura*, *hemolytic uremic syndrome*

INTEG: *Rash*

PHARMACOKINETICS

Onset unknown; terminal half-life 2½-3½ hr; converted to acyclovir that crosses placenta, enters breast milk; excreted in urine primarily as acyclovir; protein binding 13.5%-17.9%

INTERACTIONS

Increase: blood levels of valACYclovir—cimetidine, probenecid; only significant with renal disease

Drug/Lab Test

Increase: LFTs, creatinine

Decrease: WBC, platelets

NURSING CONSIDERATIONS

Assess:

- **Infection;** characteristics of lesions; therapy should be started at 1st sign or symptom of herpes; most effective within 72 hr of outbreak ⚠
- Thrombocytopenic purpura, hemolytic uremic syndrome; may be fatal • C&S before product therapy; product may be taken as soon as culture is taken; repeat C&S after treatment; determine presence of other sexually transmitted diseases
- Bowel pattern before, during treatment
- Skin eruptions: rash
- Allergies before treatment, reaction of each medication

Perform/provide:

- Storage at room temp; protect from light, moisture

Evaluate:

- Therapeutic response: absence of itching, painful lesions; crusting and healed lesions

Teach patient/family:

- To take as prescribed; if dose is missed, to take as soon as remembered up to 2 hr before next dose; not to double dose • That product may be taken orally before infection occurs; that product should be taken when itching or pain occurs, usually before eruptions • That partners need to be told that patient has herpes because they can become infected; that condoms must be worn to prevent reinfections • That product does not cure infection, just controls symptoms; that product does not prevent infection of others

☼ Canada only Side effects: *italics* = common; **bold** = life-threatening ⚠
Nurse Alert

valGANciclovir (Rx)

(val-gan-sy'kloh-veer)

Valcyte

Func. class.: Antiviral

Chem. class.: Synthetic nucleoside

Do not confuse: valGANciclovir/valACYclovir

Valcyte/Valtrex

ACTION:

Metabolized to ganciclovir; inhibits replication of human cytomegalovirus in vivo and in vitro by selective inhibition of viral DNA synthesis

USES:

Cytomegalovirus (CMV) retinitis in immunocompromised persons, including those with AIDS, after indirect ophthalmoscopy confirms diagnosis; prevention of CMV with transplantation; prevention of CMV in at-risk patient going through transplant (kidney, heart, pancreas)

Unlabeled uses: Colitis, Epstein-Barr virus, esophagitis, herpes simplex type 1, 2; human herpesvirus 6, 8; multicentric Castleman's disease, varicella-zoster virus

CONTRAINDICATIONS:

Breastfeeding, hypersensitivity to ganciclovir, valACYclovir; absolute neutrophil count $<500/\text{mm}^3$; platelet count $<25,000/\text{mm}^3$; hemodialysis; liver transplantation

Precautions: Pregnancy (C), children, geriatric patients, renal function impairment; hypersensitivity to acyclovir, penciclovir, famciclovir

Black Box Warning:

Preexisting cytopenias, secondary malignancy, infertility, anemia

DOSAGE AND ROUTES

Calculator

Treatment of CMV

- **Adult and adolescent (unlabeled):** PO induction 900 mg bid $\times$ 21 days with food; maintenance 900 mg/day with food

Transplant (CMV prophylaxis)

- **Adult/adolescent >16 yr: PO** 900 mg/day with food starting 10 days prior to transplantation until day 100 after transplantation
- **Infant ≥4 mo/child/adolescent ≤16 yr: PO** give within 10 days of heart/kidney transplant; calculate dose as $7 \times \text{BSA} \times \text{CCr}$, give as single daily dose

Renal dose

- **Adult: PO** CCr ≥60 ml/min, same as above; CCr 40-59 ml/min, 450 mg bid for 21 days then 450 mg/day; CCr 25-39 ml/min, 450 mg/day then 450 mg q2days; CCr 10-24 ml/min, 450 mg q2days then 450 mg 2×/week

Available form: Tabs 450 mg, powder for oral sol 50 mg/ml

Administer:

PO tab

- With food for better absorption; avoid getting product on skin; do not break

Oral sol

- Measure 9 ml purified water in graduated cylinder, shake bottle to loosen powder, add 1/2 liquid, shake well, add remaining water, shake; remove child-resistant cap and push bottle adapter into neck of bottle, close with cap, give using dispenser provided • Store liquid in refrigerator; do not freeze; throw away any unused after 49 days

SIDE EFFECTS

CNS: *Fever, chills, coma, confusion, abnormal thoughts, dizziness, bizarre dreams, headache, insomnia, psychosis, tremors, somnolence, paresthesia, weakness, seizures*

EENT: Retinal detachment with CMV retinitis

GI: Abnormal LFTs, *nausea, vomiting, anorexia, diarrhea, abdominal pain, hemorrhage*

GU: *Hematuria*, increased creatinine, BUN

HEMA: *Granulocytopenia, thrombocytopenia, irreversible neutropenia, anemia, eosinophilia*

INTEG: *Rash, alopecia, pruritus, urticaria, pain at site, phlebitis, Stevens-Johnson syndrome*

MISC: Local and systemic infections, *sepsis*

PHARMACOKINETICS

Metabolized to ganciclovir, which has a half-life of 3-4½ hr; excreted by kidneys (unchanged); crosses blood-brain barrier, CSF

INTERACTIONS

Increase: Severe granulocytopenia: immunosuppressants, zidovudine, antineoplastics, radiation; do not use together

Increase: toxicity—dapson, pentamidine, flucytosine, vinCRISTine, vinBLASTine, adriamycin, DOXOrubicin, amphotericin B, trimethoprim-sulfamethoxazole combinations or other nucleoside analogs, cycloSPORINE

Increase: effect of both drugs—mycophenolate

Increase: seizures—imipenem-cilastatin

Increase: effect of didanosine; monitor for adverse effects, toxicity

Decrease: renal clearance of valganciclovir—probenecid

Drug/Food

Increase: absorption, high-fat meal

Drug/Lab Test

Increase: creatinine

Decrease: RBC/WBC, Hct/Hgb

NURSING CONSIDERATIONS

Assess:

- CMV retinitis by ophthalmoscopy before beginning treatment, q2wk; culture for CMV retinitis

Black Box Warning:

Leukopenia/neutropenia/thrombocytopenia: WBCs, platelets q2days during 2×/day dosing then q1wk; leukopenia with daily WBC count in patients with prior leukopenia with other nucleoside analogs or for whom leukopenia counts are <1000 cells/mm³ at start of treatment

- Serum creatinine or CCr ≥q2wk

Evaluate:

- Therapeutic response: decreased symptoms of CMV

Teach patient/family:

- That product does not cure condition; that regular ophthalmologic and blood tests necessary
- That major toxicities may necessitate discontinuing product
- To use contraception during treatment; that infertility may occur; that men

should use barrier contraception for 90 days after treatment • To take with food
⚠ Blood dyscrasias: bruising, bleeding, petechiae; seizures, dizziness; to avoid hazardous activities • To use sunscreen to prevent burns

🌿 Canada only Side effects: *italics* = common; **bold** = life-threatening ⚠
Nurse Alert

valproate (Rx)

(val'proh-ate)

Depacon

valproic acid (Rx)

(val'proh-ik)

Depakene, Stavzor

divalproex sodium (Rx)

(dye-val'proh-ex)

Depakote, Depakote ER, Epival 

Func. class.: Anticonvulsant, vascular headache suppressant *Chem. class.:* Carboxylic acid derivative

ACTION:

Increases levels of γ -aminobutyric acid (GABA) in the brain, which decreases seizure activity

USES:

Simple (petit mal), complex (petit mal), absence, mixed, seizures; manic episodes associated with bipolar disorder, prophylaxis of migraine, adjunct for schizophrenia, tardive dyskinesia, aggression in children with ADHD, organic brain syndrome, mania, migraines; tonic-clonic (grand mal), myoclonic seizures

Unlabeled uses: Rectal for seizures (valproic acid)

CONTRAINDICATIONS:

Hypersensitivity, urea cycle disorders

Black Box Warning:

Pregnancy (D), hepatic disease, pancreatitis

Precautions: Breastfeeding, geriatric patients

Black Box Warning:

Children <2 yr

DOSAGE AND ROUTES

Calculator

Epilepsy

- **Adult and child:** PO 10-15 mg/kg/day in 2-3 divided doses, may increase by

5-10 mg/kg/day weekly, max 60 mg/kg/day in 2-3 divided doses; **IV** ≤20 mg/min over 1 hr

Status epilepticus refractory to diazepam IV (unlabeled)

- **Adult: RECT** 400-600 mg PR as enema or wax-based suppository (not commercially available)

- **Child: RECT** 20 mg/kg/dose

Mania (divalproex sodium)

- **Adult: PO** 750 mg/day in divided doses, max 60 mg/kg/day or 3000 mg/day

Mania (valproic acid: Stavzor)

- **Adult: DEL REL CAP** 750 mg/day in divided doses

Migraine (divalproex sodium)

- **Adult: PO** 250 mg bid, may increase to 1000 mg/day if needed or 500 mg (Depakote ER) daily × 7 days, then 1000 mg/day

Available forms: *Valproate*: inj 100 mg/ml; *valproic acid*: caps 250 mg; oral solution 250 mg/5 ml; del rel cap (Stavzor) 125, 250, 500 mg; *divalproex*: gastro-resistant tabs 125, 250, 500 mg; ext rel tabs 250, 500 mg cap gastro-resistant; sprinkle cap 125 mg

Administer:

PO route

- Swallow tabs or caps whole; do not break, crush, or chew ext rel tabs
- Sprinkle cap contents on food
- Oral solution alone; do not dilute with carbonated beverage; do not give oral solution to patients with sodium restrictions • Give with food or milk to decrease GI symptoms

SIDE EFFECTS

CNS: *Sedation, drowsiness, dizziness, headache, incoordination, depression, hallucinations, behavioral changes, tremors, aggression, weakness, coma, suicidal ideation, hypothermia*

EENT: Visual disturbances, taste perversion

GI: *Nausea, vomiting, constipation, diarrhea, dyspepsia, anorexia, cramps, hepatic failure, pancreatitis, toxic hepatitis, stomatitis, weight gain*

GU: Enuresis, irregular menses

HEMA: *Thrombocytopenia, leukopenia, lymphocytosis, increased PT, bruising, epistaxis*

INTEG: *Rash*, alopecia, photosensitivity, dry skin

META: Hyperammonemia

PHARMACOKINETICS

Metabolized by liver; excreted by kidneys, in breast milk; crosses placenta; half-life 6-16 hr; 90% protein binding

PO: Peak 4 hr (regular rel); 4-17 hr (ext rel)

INTERACTIONS

Increase: valproic acid toxicity level—erythromycin, felbamate, salicylates, NSAIDs, rifampin

Increase: CNS depression—alcohol, opioids, barbiturates, antihistamines, MAOIs, sedative/hypnotics, tricyclics

Increase: action of, possible toxicity phenytoin, carbamazepine, ethosuximide, barbiturates, zidovudine, lorazepam, rufinamide, lamotrigine

Increase: bleeding—warfarin

Decrease: seizure threshold—tricyclics

Drug/Lab Test

False positive: ketones, urine

Interference: thyroid function tests

Increase: LFTs, bleeding time, ammonia

NURSING CONSIDERATIONS

Assess:

- **Seizure disorder:** location, aura, activity, duration; seizure precautions should be in place  Mental status: bipolar disorder: mood, activity, sleeping/eating, behavior; suicidal thoughts/behaviors
- **Migraines:** frequency, intensity, alleviating factors
- Blood studies: Hct, Hgb, RBC, serum folate, PT/PTT, serum ammonia, platelets, vit D if patient receiving long-term therapy

Black Box Warning:

Hepatic studies: AST, ALT, bilirubin; hepatic failure has occurred

- **Hyperammonemic encephalopathy:** can be fatal in those with urea cycle disorders (UCD); lethargy, confusion, coma, CV, respiratory changes; discontinue
- **Blood levels:** therapeutic level 50-100 mcg/ml, during seizures

Black Box Warning:

Pancreatitis; may be fatal, report immediately nausea, vomiting, anorexia, abdominal pain

Evaluate:

- Therapeutic response: decreased seizures

Teach patient/family:

- That physical dependency may result from extended use
- To avoid driving, other activities that require alertness
- To drink plenty of fluids
- Not to discontinue medication quickly after long-term use because seizures may result
- To report visual disturbances, rash, diarrhea, abdominal pain, light-colored stools, jaundice, protracted vomiting, weakness to prescriber
- To use contraception while taking this product; pregnancy category (D)
- Overdose symptoms: heart block, coma

🍁 Canada only Side effects: *italics* = common; **bold** = life-threatening ⚠️
Nurse Alert

valsartan (Rx)

(val'sahr-tan)

Diovan

Func. class.: Antihypertensive

Chem. class.: Angiotensin II receptor antagonist (Type AT₁)

Do not confuse: Diovan/Dioval

ACTION:

Blocks the vasoconstrictor and aldosterone-secreting effects of angiotensin II; selectively blocks the binding of angiotensin II to the AT₁ receptor found in tissues

USES:

Hypertension, alone or in combination in patients >6 yr, CHF, post MI with left ventricular dysfunction/failure in stable patients

CONTRAINDICATIONS:

Hypersensitivity, severe hepatic disease, bilateral renal artery stenosis

Black Box Warning:

Pregnancy (D) 2nd/3rd trimester

Precautions: Breastfeeding, children, geriatric patients, hypersensitivity to ACE inhibitors; CHF, hypertrophic cardiomyopathy aortic/mitral valve stenosis, CAD, angioedema, renal/hepatic disease, hyperkalemia, hypovolemia

DOSAGE AND ROUTES

Calculator

Hypertension

- **Adult:** PO 80 or 160 mg/day alone or in combination with other antihypertensives, may increase to 320 mg/day
- **Geriatric:** PO adjust on clinical response, may start with lower dose
- **Child and adolescent 6-16 yr:** PO 1.3 mg/kg/day, max 40 mg/day

CHF

- **Adult:** PO 40 mg bid, up to 160 mg bid

Post MI

- **Adult:** PO 20 mg bid as early as 12 hr post MI, may be titrated within 7 days to 40 mg bid, then titrate to maintenance of 160 mg bid

Available forms: Tabs 40, 80, 160, 320 mg

Administer:

- Without regard to meals

SIDE EFFECTS

CNS: *Dizziness, insomnia, drowsiness, vertigo, headache, fatigue*

CV: Angina pectoris, 2nd-degree AV block, cerebrovascular accident, hypotension, MI, dysrhythmias

EENT: Conjunctivitis

GI: *Diarrhea, abdominal pain, nausea, hepatotoxicity*

GU: Impotence, nephrotoxicity

HEMA: *Anemia, neutropenia*

META: Hyperkalemia

MISC: Vasculitis, angioedema

MS: Cramps, myalgia, pain, stiffness

RESP: *Cough*

PHARMACOKINETICS

Onset up to 2 hr; peak 4-6 hr; duration 24 hr; extensively metabolized; protein binding 95%; half-life 6 hr; excreted in feces, urine, breast milk

INTERACTIONS

- Do not use with aliskiren

Increase: effects of lithium, antidiabetics

Increase: hyperkalemia—potassium-sparing diuretics, potassium supplements, ACE inhibitors, cycloSPORINE

Increase: Valsartan level—rifampin, ritonavir, gemfibrozil, telithromycin

Decrease: antihypertensive effects—NSAIDs, salicylates

Drug/Herb

Increase: antihypertensive effect—hawthorn

Decrease: antihypertensive effect—ephedra, ma huang

Drug/Food

Increase: hyperkalemia—salt substitutes with potassium

Decrease: AUC by 40%

NURSING CONSIDERATIONS

Assess:

- B/P, pulse q4hr lying, sitting, standing; note rate, rhythm, quality periodically
- Blood studies; BUN, creatinine, LFTs, potassium total/direct bilirubin before treatment
- **Angioedema:** facial swelling; SOB; edema in feet, legs daily
- Skin turgor, dryness of mucous membranes for hydration status; correct volume depletion before initiating therapy

Evaluate:

- Therapeutic response: decreased B/P

Teach patient/family:

- To comply with dosage schedule, even if feeling better; that, if dose is missed, to take it as soon as possible unless it is within 1 hr of next dose
- To notify prescriber of fever, swelling of hands or feet, irregular heartbeat, chest pain, dizziness, persistent cough
- That excessive perspiration, dehydration, diarrhea may lead to fall in blood pressure; to consult prescriber if these occur
- That product may cause dizziness, fainting, lightheadedness; to rise slowly to sitting or standing position to minimize orthostatic hypotension; to take B/P readings

Black Box Warning:

Not to take product if pregnant (D) or breastfeeding

- **Overdose symptoms:** bradycardia or tachycardia, circulatory collapse

☼ Canada only Side effects: *italics* = common; **bold** = life-threatening ⚠
Nurse Alert

vancomycin (Rx)

(van-koe-mye'sin)

Vancocin

Func. class.: Antiinfective—miscellaneous

Chem. class.: Tricyclic glycopeptide

ACTION:

Inhibits bacterial cell wall synthesis, blocks glycopeptides

USES:

Resistant staphylococcal infections, pseudomembranous colitis, staphylococcal enterocolitis, endocarditis prophylaxis for dental procedures, diphtheroid endocarditis

CONTRAINDICATIONS:

Hypersensitivity to this product or corn

Precautions: Pregnancy (B) PO, (C) IV; breastfeeding, neonates, geriatric patients, renal disease, hearing loss

DOSAGE AND ROUTES

Calculator

Serious staphylococcal infections

- **Adult:** IV 500 mg q6-8hr or 1 g q12hr
- **Child:** IV 40-60 mg/kg/day divided q6-8hr
- **Neonate:** IV 15 mg/kg initially, then 10 mg/kg q8-24hr

Pseudomembranous/staphylococcal enterocolitis

- **Adult:** PO 125 mg qid × 10-14 days
- **Child:** PO (unlabeled) 40 mg/kg/day divided q6hr × 7-10 days, max 2 g/day

Endocarditis prophylaxis

- **Adult:** IV 1 g over 1 hr given 1 hr before procedure
- **Child:** IV 20 mg/kg over 1 hr given 1 hr prior to procedure

Renal dose

- **Adult:** IV CCr >70 ml/min, no dosage adjustment; CCr 50-70 ml/min, loading dose of 15 mg/kg, reduce dose to 750 mg-1 g q18-24 hr; CCr <49 ml/min, initial loading dose of 15 mg/kg, with subsequent dosing based on concentration, may

be q24-72hr or longer

Available forms: Cap 125, 250 mg; powder for inj 500 mg, 1, 5, 10 g

Administer:

- Use only for susceptible organisms to prevent product-resistant bacteria
- Antihistamine if red-man syndrome occurs: decreased B/P, flushing of neck, face
- Dose based on serum concentration

IT route

- Use preservative-free 0.9% NaCl (2-5 mg/ml final conc), instill into ventricular cerebrospinal fluid

Intermittent IV INF route

- After reconstitution with 10 ml sterile water for inj (500 mg/10 ml); further dilution is needed for IV, 500 mg/100 ml 0.9% NaCl, D₅W given as intermittent inf over 1 hr; decrease rate of inf if red-man syndrome occurs

Continuous IV INF route

- May infuse 1-2 g in volume to give over 24 hr if intermittent IV route cannot be used

Y-site compatibilities: Acyclovir, allopurinol, amifostine, amiodarone, amsacrine, atracurium, cisatracurium, cyclophosphamide, diltiazem, DOXOrubicin liposome, enalaprilat, esmolol, filgrastim, fluconazole, fludarabine, gallium, granisetron, HYDROmorphone, insulin (regular), labetalol, LORazepam, magnesium sulfate, melphalan, meperidine, meropenem, midazolam, morphine, ondansetron, PACLitaxel, pancuronium, perphenazine, propofol, remifentanyl, sodium bicarbonate, tacrolimus, teniposide, theophylline, thiotepa, tolazoline, vecuronium, vinorelbine, warfarin, zidovudine

SIDE EFFECTS

CV: Cardiac arrest, vascular collapse (rare), hypotension

EENT: Ototoxicity, permanent deafness, tinnitus, nystagmus

GI: Nausea, pseudomembranous colitis

GU: Nephrotoxicity, increased BUN, creatinine, albumin, fatal uremia

HEMA: Leukopenia, eosinophilia, neutropenia

INTEG: Chills, fever, rash, thrombophlebitis at inj site, urticaria, pruritus, necrosis (red-man syndrome), skin/subcutaneous tissue disorders

RESP: Wheezing, dyspnea

SYST: Anaphylaxis, superinfection

PHARMACOKINETICS

PO: Absorption poor

IV: Onset rapid, peak 1 hr, half-life 4-8 hr, excreted in urine (active form)

INTERACTIONS

Increase: ototoxicity or nephrotoxicity—aminoglycosides, cephalosporins, colistin, polymyxin, bacitracin, CISplatin, amphotericin B, cidofovir

Increase: neuromuscular effects—nondepolarizing muscle relaxants

Drug/Lab Test

Increase: BUN/creatinine, eosinophils

Decrease: WBC

NURSING CONSIDERATIONS

Assess:

- **Infection:** WBC, urine, stools, sputum, characteristics of wound throughout treatment • I&O ratio; report hematuria, oliguria; nephrotoxicity may occur, BUN, creatinine
- Serum levels: peak 1 hr after 1-hr inf 25-40 mg/L, trough before next dose 5-10 mg/L, especially in renal disease • C&S
- Auditory function during, after treatment; hearing loss, ringing, roaring in ears; product should be discontinued • B/P during administration; sudden drop may indicate red-man syndrome
- Skin eruptions
- **Red man syndrome:** flushing of neck, face, upper body, arms, back, may lead to anaphylaxis; slow IV infusion to >1 hr

Perform/provide:

- Storage at room temp for ≤ 2 wk after reconstitution
- EPINEPHrine, suction, tracheostomy set, endotracheal intubation equipment on unit; anaphylaxis may occur • Adequate intake of fluids (2 L/day) to prevent nephrotoxicity

Evaluate:

- Therapeutic response: absence of fever, sore throat; negative culture

Teach patient/family:

- About all aspects of product therapy; about the need to complete entire course of medication to ensure organism death (7-10 days); that culture may be taken after completed course of medication • To report sore throat, fever, fatigue; could indicate superinfection
 - That product must be taken in equal intervals around the clock to maintain blood levels
-

🍁 Canada only Side effects: *italics* = common; **bold** = life-threatening ⚠️
Nurse Alert

varденаfil (Rx)

(var-den'a-fil)

Levitra, Staxyn

Func. class.: Erectile dysfunction agent

Chem. class.: Phosphodiesterase type 5 inhibitor

ACTION:

Inhibits phosphodiesterase type 5 (PDE5), enhances erectile function by increasing the amount of cGMP, which in turn causes smooth muscle relaxation and increased blood flow into the corpus cavernosum

USES:

Treatment of erectile dysfunction

CONTRAINDICATIONS:

Hypersensitivity, coadministration of α -blockers or nitrates, renal failure, congenital or acquired QT prolongation

Precautions: Pregnancy (B); not indicated for women, children, or newborns; hepatic impairment, retinitis pigmentosa, anatomical penile deformities, sickle cell anemia, leukemia, multiple myeloma, bleeding disorders, active peptic ulceration, CV/renal disease

DOSAGE AND ROUTES

Calculator

- **Adult: PO** 10 mg taken 1 hr before sexual activity; dose may be reduced to 5 mg or increased to max 20 mg; max dosing frequency once daily; orally disintegrating tab 10 mg 60 min before sexual activity; do not use with potent CYP3A4 inhibitors

- **Geriatric >65 yr: PO** 5 mg initially, titrated as needed/tolerated

Hepatic dose

- **Adult: PO (Child-Pugh B)** 5 mg, max 10 mg/day

Concomitant medications

- Ritonavir, max 2.5 mg q72hr; for indinavir, ketoconazole 400 mg/day and itraconazole 400 mg/day, max 2.5 mg/day; for ketoconazole 200 mg/day, itraconazole 200 mg/day and erythromycin max 5 mg/day

Available forms: Tabs 2.5, 5, 10, 20 mg; orally disintegrating tab 10 mg

Administer:

- Approximately 1 hr before sexual activity; do not use more than once daily; orally disintegrating tabs are not interchangeable with film-coated tabs
- Without regard to food; avoid taking with high-fat meal
- **Oral disintegrating tab:** place on tongue, allow to dissolve, do not use water

SIDE EFFECTS

CNS: Headache, flushing, dizziness, insomnia, seizures, transient global amnesia

CV: Hypertension, MI, CV collapse, chest pain

EENT: Conjunctivitis, tinnitus, photophobia, diminished vision, glaucoma, hearing loss

GU: Abnormal ejaculation, priapism

MISC: Rash, GERD, GGTP increased, NAION (nonarteritic ischemic optic neuropathy), dyspepsia

MS: Myalgia, arthralgia, neck pain

RESP: Rhinitis, sinusitis, dyspnea, pharyngitis, epistaxis

PHARMACOKINETICS

Rapidly absorbed, bioavailability 15%, protein binding 95%, metabolized by liver, terminal half-life 4-5 hr, onset 20 min, peak 1/2-1½ hr, duration <5 hr, reduced absorption with high-fat meal, primarily excreted in feces (91%-95%)

INTERACTIONS

⚠ Do not use with nitrates because of unsafe decrease in B/P, which could result in MI or stroke ⚠ Serious dysrhythmias: class IA/III antiarrhythmics, clarithromycin, droperidol, procainamide, quinidine, quinolones; do not use concurrently

Increase: hypotension—α-blockers, protease inhibitors, metoprolol, nifedipine, alcohol, amlodipine, angiotensin II receptor blockers; do not use concurrently

Increase: vardenafil levels—erythromycin, azole antifungals (ketoconazole, itraconazole), cimetidine, antiretroviral protease inhibitors

Drug/Food

Decrease: absorption—high-fat meal

Drug/Lab Test

Increase: CK

NURSING CONSIDERATIONS

Assess:

- Erectile dysfunction and cause before treatment

⚠️ Any severe loss of vision while taking this or similar products; products should not be used ⚠️ Use of organic nitrates that should not be used with this product

Teach patient/family:

- That product does not protect against STDs, including HIV
- That product absorption is reduced with high-fat meal
- That product should not be used with nitrates in any form; to inform physician of all medications being taken
- That product has no effect in the absence of sexual stimulation; that patient should seek immediate medical attention if erections last >4 hr ⚠️ To notify prescriber immediately and stop taking product if vision loss occurs

🌿 Canada only Side effects: *italics* = common; **bold** = life-threatening ⚠️

Nurse Alert

varenicline (Rx)

(var-e-ni'kleen)

Champix , Chantix

Func. class.: Smoking cessation agent

Chem. class.: Nicotine receptor agonist

ACTION:

Partial agonist for nicotine receptors; partially activates receptors to help curb cravings; occupies receptors to prevent nicotine binding

USES:

Smoking deterrent

CONTRAINDICATIONS:

Hypersensitivity, eating disorders

Precautions: Pregnancy (C), breastfeeding, children <18 yr, geriatric patients, renal disease, recent MI, angioedema

Black Box Warning:

Bipolar disorder, depression, schizophrenia, suicidal ideation

DOSAGE AND ROUTES

Calculator

Smoking cessation

- **Adult: PO** therapy should begin 1 wk prior to smoking stop date (i.e., take product plus tobacco for 7 days); titrate for 1 wk; days 1 through 3, 0.5 mg/day; days 4 through 7, 0.5 mg bid; day 8 through end of treatment, 1 mg bid; treatment is for 12 wk and may be repeated for another 12 wk

Renal dose

- **Adult: PO** $\text{CCr} \leq 50 \text{ ml/min}$, titrate to max 0.5 mg bid

Available forms: Tabs 0.5, 1 mg; Chantix continuing month PAK; Chantix starting month PAK

Administer:

- Do not break, crush, or chew tabs
- Increased fluids, bulk in diet if constipation occurs
- After eating with a full glass of water

- Sugarless gum, hard candy, or frequent sips of water for dry mouth

SIDE EFFECTS

CNS: Headache, agitation, dizziness, insomnia, abnormal dreams, fatigue, malaise, behavior changes, depression, suicidal ideation, **suicide**, amnesia, hallucinations, hostility, mania, psychosis, tremor

CV: Dysrhythmias, hypo/hypertension, palpitations, tachycardia, angina, **MI**

EENT: *Blurred vision*, tinnitus

GI: *Nausea, vomiting*, anorexia, *dry mouth*, increased/decreased appetite, *constipation*, flatulence, GERD

GU: Erectile dysfunction, urinary frequency, menstrual irregularities

INTEG: Rash, pruritus, **angioedema**, **Stevens-Johnson syndrome**

MISC: Weight loss or gain

RESP: Dyspnea, rhinorrhea

PHARMACOKINETICS

Elimination half-life 24 hr; metabolism minimal; 93% excreted unchanged in urine; steady state 4 days

NURSING CONSIDERATIONS

Assess:

- **Smoking history:** motivation for smoking cessation, years used, amount each day
- Renal function in geriatric patients; cardiac status in cardiac disease
- Smoking cessation after 12 wk; if progress not made, product may be used for additional 12 wk

Black Box Warning:

Neuropsychiatric symptoms: mood, sensorium, affect; behavior changes, agitation, depression, suicidal ideation; suicide has occurred; possible worsening of depression, schizophrenia, bipolar disorder

Evaluate:

- Therapeutic response: smoking cessation

Teach patient/family:

- That treatment for smoking cessation lasts 12 wk and that another 12 wk may be required
- To use caution when driving, performing other activities requiring alertness; blurred vision may occur
- To set a date to quit smoking and to initiate treatment

1 wk before that date

- How to titrate product
- Not to use with nicotine patches unless directed by prescriber; may increase B/P
- To notify prescriber if pregnancy planned or suspected
- About common side effects to be expected

Black Box Warning:

To notify prescriber immediately of change in thought/behavior (suicidal ideation, hostility, depression), stop product

🍁 Canada only Side effects: *italics* = common; **bold** = life-threatening ⚠️
Nurse Alert

vasopressin (Rx)

(vay-soe-press'in)

Pitressin, Pressyn 

Func. class.: Pituitary hormone

Chem. class.: Lysine vasopressin

ACTION:

Promotes the reabsorption of water via action on the renal tubular epithelium; causes vasoconstriction

USES:

Diabetes insipidus (nephrogenic/nonpsychogenic), abdominal distention postoperatively, bleeding esophageal varices

CONTRAINDICATIONS:

Hypersensitivity, chronic nephritis

Precautions: Pregnancy (C), breastfeeding, CAD, asthma, vascular/renal disease, migraines, seizures

DOSAGE AND ROUTES

Calculator

Diabetes insipidus

- **Adult:** IM/SUBCUT 5-10 units bid-qid as needed; **CONT IV INF** 0.0005 units/kg/hr (0.05 milliunit/kg/hr), double dose q30min as needed
- **Child:** IM/SUBCUT 2.5-10 units bid-qid as needed; **IM/SUBCUT** 1.25-2.5 units q2-3days (Pitressin Tannate) for chronic therapy

Abdominal distention

- **Adult:** **IM** 5 units then q3-4hr, increasing to 10 units if needed (aqueous)

Available forms: sol for inj 20 units/ml; 10 units/0.5 ml

SIDE EFFECTS

CNS: Drowsiness, headache, lethargy, flushing, vertigo

CV: Increased B/P, dysrhythmias, **cardiac arrest, shock**, chest pain, **MI**

EENT: Nasal irritation, congestion, rhinitis

GI: Nausea, heartburn, cramps, vomiting, flatus

GU: Vulval pain, uterine cramping

MISC: Tremor, sweating, vertigo, urticaria, bronchial constriction

PHARMACOKINETICS

Nasal: Onset 1 hr; duration 3-8 hr; half-life 15 min; metabolized in liver, kidneys; excreted in urine

INTERACTIONS

Increase: antidiuretic effect—tricyclics, carbamazepine, chlorpromide, fludrocortisone, clofibrate, urea

Decrease: antidiuretic effect—lithium, demeclocycline

NURSING CONSIDERATIONS

Assess:

- Pulse, B/P when giving product IV or IM
- I&O ratio, weight daily; fluid/electrolyte balance; check for edema in extremities; if water retention is severe, diuretic may be prescribed
- **Water intoxication:** lethargy, behavioral changes, disorientation, neuromuscular excitability
- Small doses may precipitate coronary adverse effects; keep emergency equipment nearby

Evaluate:

- Therapeutic response: absence of severe thirst, decreased urine output, osmolality

Teach patient/family:

- To measure and record I&O
- To avoid alcohol, all OTC medications unless approved by prescriber

☼ Canada only Side effects: *italics* = common; **bold** = life-threatening ⚠
Nurse Alert

vemurafenib

Zelboraf

Func. class.: Biologic response modifiers; signal transduction inhibitors (STIs)

ACTION:

Inhibitor of some mutated forms of BRAF serine threonine kinase, thereby blocking cellular proliferation in melanoma cells with the mutation; inhibits other kinases including CRAF, ARAF, wild-type BRAF, SRMA, ACK1, MAP4H5, and FGR; potent adenosine triphosphate-competitive inhibitor of RAFs, with a modest preference for mutant BRAF and CRAF compared with wild-type BRAF

USES:

Unresectable or metastatic malignant melanoma with V600E mutation of the BRAF gene

Precautions: Pregnancy (D), breastfeeding, children, infants, neonates, hepatic disease, QT prolongation, secondary malignancy, torsades de pointes, hypokalemia, hypomagnesia, sunlight exposure

DOSAGE AND ROUTES

Calculator

• **Adult:** PO 960 mg (4 tabs) bid about q12hr

Dose adjustments for toxicity due to symptomatic adverse reactions or QTC prolongation

Grade 1 or tolerable grade 2 adverse events: no dosage change; **intolerable grade 2 or grade 3 adverse events (1st episode):** interrupt treatment until toxicity resolves to grade ≤ 1 , when resuming, reduce dosage to 720 mg (3 tabs) bid; **intolerable grade 2 or grade 3 adverse events (2nd episode):** interrupt treatment until toxicity resolves to grade ≤ 1 , when resuming, reduce dose to 480 mg (2 tabs) bid; **intolerable grade 2 or grade 3 adverse events (3rd episode):** discontinue treatment permanently; **grade 4 adverse events (1st episode):** discontinue permanently or interrupt until toxicity resolves to grade ≤ 1 , when resuming, reduce dose to 480 mg (2 tabs) bid; **grade 4 adverse events (2nd episode):** discontinue permanently

Available forms: Tabs 240 mg

Administer:

- Continue until disease progresses or unacceptable toxicity occurs
- Missed doses can be taken up to 4 hr before the next dose is due, take about 12 hr apart, take without regard to meals
- Swallow whole with a full glass of water, do not crush or chew

SIDE EFFECTS

CNS: Fatigue, fever, asthenia, headache, dizziness, peripheral neuropathy, muscle paralysis

CV: QT prolongation, atrial fibrillation, peripheral edema, hypotension

EENT: Uveitis, blurred vision, iritis, photophobia

GI: Nausea, diarrhea, vomiting, constipation, dysgeusia, decreased appetite, weight loss

INTEG: Alopecia, pruritus, hyperkeratosis, maculopapular rash, actinic keratosis, xerosis/dry skin, papular rash, palmar-plantar erythrodysesthesia (hand and foot syndrome), photosensitivity

MS: Arthralgia, myalgias, extremity pain, musculoskeletal pain, back pain, arthritis

RESP: Cough

SYST: Secondary malignancy, anaphylaxis

PHARMACOKINETICS

>99% protein binding (albumin and alpha-1 acid glycoprotein) an inhibitor of CYP1A2, 2A6, 2C9, 2C19, 2D6, 3A4/5 CYP1A2 inhibitor, a weak CYP2D6 inhibitor, and a CYP3A4 inducer; elimination 94% in feces, 1% in urine, half-life 57 hr

INTERACTIONS

Increase: vemurafenib effect—CYP3A4/CYP1A2 inhibitors (enoxacin, cimetidine, delavirdine, indinavir, isoniazid, itraconazole, dalfopristin, quinupristin, tipranavir)

⚠ Increase: QT prolongation, torsades de pointes—arsenic trioxide, certain phenothiazines (chlorpromazine, mesoridazine, thioridazine), grepafloxacin, levomethadyl, pentamidine, probucol, sparfloxacin, troleandomycin, class IA antiarrhythmics (disopyramide, procainamide, quinidine), class III antiarrhythmics (amiodarone, dofetilide, ibutilide, sotalol), clarithromycin,

ziprasidone, pimozide, haloperidol, halofantrine, quinine, chloroquine, dronedarone, droperidol, erythromycin, methadone, posaconazole, propafenone, saquinavir, abarelix, amoxapine, apomorphine, asenapine, β -agonists, ofloxacin, eribulin, ezogabine, flecainide, gatifloxacin, gemifloxacin, halogenated anesthetics, iloperidone, levofloxacin, local anesthetics, magnesium sulfate, potassium sulfate, sodium, maprotiline, moxifloxacin, nilotinib, norfloxacin, ciprofloxacin, OLANzapine, paliperidone, some phenothiazines (fluphenazine, perphenazine, prochlorperazine, trifluoperazine), telavancin, tetrabenazine, tricyclic antidepressants, venlafaxine, vorinostat, citalopram, alfuzosin, clozapine, cyclobenzaprine, dolasetron, palonosetron, quetiapine, rilpivirine, sunitinib, tacrolimus, vardenafil, indacaterol, dasatinib, fluconazole, lapatinib, lopinavir/ritonavir, mefloquine, octreotide, ondansetron, ranolazine, risperidone, telithromycin, vemurafenib

Decrease: vemurafenib effect—CYP3A4 inducers (rifampin, barbiturates, carbamazepine, phenytoin, erythromycin, ketoconazole, fluvoxamine, alcohol, etravirine, ritonavir, bexarotene, rifabutin, oxcarbazepine, nevirapine, modafinil, metyrapone)

Drug/Lab Test:

Increase: serum creatinine, LFTs, alkaline phosphatase, bilirubin

NURSING CONSIDERATIONS

Assess:

- **Hepatic Disease:** Liver function test (LFT) abnormalities, altered bilirubin levels, may occur; monitor LFTs and bilirubin levels before treatment, then monthly; more frequent testing is needed in those with grade 2 or greater toxicities; laboratory alterations should be managed with dose reduction, treatment interruption, or discontinuation
- **QT prolongation:** has been reported with the use of this product; therefore, should be avoided in patients with QT prolongation; monitor ECG and electrolytes in those with congestive heart failure, bradycardia, electrolyte imbalance (hypokalemia, hypomagnesemia), or those who are taking concomitant medications known to prolong the QT interval; treatment interruption, dosage adjustment, treatment discontinuation may be needed in those who develop QT prolongation

Pregnancy/breastfeeding: Identify if pregnancy is planned or suspected, pregnancy category D, avoid breastfeeding • Serum electrolytes

Perform/provide:

- Storage at room temperature, in original container

Evaluate:

- Decreased spread of malignancy

Teach patient/family:

- Teach patient missed doses can be taken up to 4 hr before the next dose is due to maintain the twice-daily regimen ⚠️ Teach patient to use reliable contraception; both women and men of childbearing age should use adequate contraceptive methods during therapy and for at least 90 days after completing treatment, pregnancy category D

🍁 Canada only Side effects: *italics* = common; **bold** = life-threatening ⚠️
Nurse Alert

venlafaxine (Rx)

(ven-la-fax'een)

Effexor , Effexor XR

Func. class.: Antidepressant—SNRI

Chem. class.: SNRI

ACTION:

Potent inhibitor of neuronal serotonin and norepinephrine uptake, weak inhibitor of dopamine; no muscarinic, histaminergic, or α -adrenergic receptors in vitro

USES:

Prevention/treatment of major depression; depression at the end of life; long-term treatment of general anxiety disorder, panic disorder, social anxiety disorder (Effexor XR only)

Unlabeled uses: Hot flashes, premenstrual dysphoric disorder (PMDD), headache, neuropathic pain, fibromyalgia, diabetic neuropathy

CONTRAINDICATIONS:

Hypersensitivity, bipolar disorder, interstitial lung disease

Precautions: Pregnancy (C), breastfeeding, geriatric patients, mania, hypertension, seizure disorder, recent MI, cardiac/renal/hepatic disease, eosinophilic pneumonia, desvenlafaxine hypersensitivity

Black Box Warning:

Children, suicidal ideation

DOSAGE AND ROUTES

Calculator

Depression

• **Adult: PO** 75 mg/day in 2-3 divided doses; taken with food, may be increased to 150 mg/day; if needed, may be further increased to 225 mg/day; increments of 75 mg/day at intervals of ≥ 4 days; some hospitalized patients may require up to 375 mg/day in 3 divided doses; **EXT REL** 37.5-75 mg PO daily, max 225 mg/day; give XR daily

Anxiety disorders

• **Adult: PO** 75 mg/day or 37.5 mg/day $\times$ 4-7 days initially, max 225 mg/day

Renal dose

- **Adult: PO** CCr 10-70 ml/min, reduce dose by 25%-50%; CCr <10 ml/min, reduce dose by 50%

Hepatic dose

- **Adult: PO** Moderate impairment, 50% of dose

Hot flashes (unlabeled)

- **Adult (male, prostate cancer): PO** 12.5 mg bid × 4 wk; females 37.5-75 mg/day

Neuropathic pain, diabetic neuropathy, headache, fibromyalgia (unlabeled)

- **Adult: PO** 37.5-75 mg/day, max 75 mg bid (regular rel) or 150 mg/day (ext rel)

Premenstrual dysphoric disorder (PMDD) (unlabeled)

- **Adult female: PO** 50-200 mg/day, start at 50 mg/day for 1st cycle, titrate upward

Available forms: Tabs scored 25, 37.5, 50, 75, 100 mg; ext rel cap (Effexor XR) 37.5, 75, 150 mg; ext rel tab 37.5, 75, 150, 225 mg

Administer:

- With food, milk for GI symptoms; do not crush, chew caps; caps can be opened and contents sprinkled on applesauce, given with full glass of water
- Sugarless gum, hard candy, frequent sips of water for dry mouth
- Avoid use with CNS depressants
- In small amounts because of suicide potential, especially at beginning of therapy

SIDE EFFECTS

CNS: Emotional lability, *vertigo*, *dizziness*, *weakness*, apathy, ataxia, CNS stimulation, euphoria, hallucinations, hostility, increased libido, hypertonia, hypotonia, psychosis, insomnia, anxiety, **suicidal ideation in children/adolescents, seizures, neuroleptic-malignant-syndrome-like reaction**

CV: *Migraine*, angina pectoris, hypertension, **sustained hypertension, change in QTc interval**, increased pulse, increased cholesterol, extrasystoles, postural hypotension, syncope, thrombophlebitis

EENT: *Abnormal vision*, taste, *ear pain*, cataract, conjunctivitis, corneal lesions, dry eyes, otitis media, photophobia

GI: *Dysphagia*, *eructation*, nausea, anorexia, dry mouth, colitis, gastritis,

gingivitis, **rectal hemorrhage**, stomatitis, stomach and mouth ulceration

GU: *Anorgasmia*, abnormal ejaculation, *dysuria*, *hematuria*, *metrorrhagia*, *vaginitis*, *impaired urination*, albuminuria, amenorrhea, kidney calculus, cystitis, nocturia, breast and bladder pain, polyuria, **uterine hemorrhage**, **vaginal hemorrhage**, moniliasis

HEMA: **Agranulocytosis**, **aplastic anemia**, **neutropenia**, **pancytopenia**, **abnormal bleeding**

INTEG: Ecchymosis, acne, alopecia, brittle nails, dry skin, photosensitivity, sweating, **angioedema (ext rel)**

META: *Peripheral edema*, *weight loss or gain*, diabetes mellitus, edema, glycosuria, hyperlipemia, hypokalemia

MS: Arthritis, bone pain, bursitis, myasthenia, tenosynovitis, arthralgia

RESP: *Bronchitis*, *dyspnea*, asthma, chest congestion, epistaxis, hyperventilation, laryngitis

SYST: *Malaise*, *neck pain*, enlarged abdomen, cyst, facial edema, hangover, hernia

PHARMACOKINETICS

Well absorbed; extensively metabolized in liver by CYP2D6 to active metabolite; 87% of product recovered in urine; 27% protein binding; half-life 5, 11 hr (active metabolite), respectively

INTERACTIONS

⚠️ Hyperthermia, rigidity, rapid fluctuations of vital signs, mental status changes, neuroleptic malignant syndrome: MAOIs

Increase: bleeding risk—salicylates, NSAIDs, platelet inhibitors, anticoagulants

Increase: venlafaxine effect—cimetidine

Increase: CNS depression—alcohol, opioids, antihistamines, sedative/hypnotics

Increase: levels of cloZAPine, desipramine, haloperidol, warfarin

Increase: serotonin syndrome—sibutramine, SUMAtriptan, traZODone, traMADol, SSRIs, serotonin receptor agonist, linezolid, methylene blue, tryptophan

Decrease: effect of indinavir

Decrease: venlafaxine effect—cyproheptadine

Drug/Herb

- Serotonin syndrome: St. John's wort, tryptophan

Increase: CNS depression—kava, valerian

Drug/Lab Test

Increase: alk phos, bilirubin, AST, ALT, BUN, creatinine, serum cholesterol, CPK, LDH

False positive: amphetamines, phencyclidine

NURSING CONSIDERATIONS

Assess:

Black Box Warning:

Mental status: mood, sensorium, affect, increase in psychiatric symptoms; depression, panic; assess for suicidal ideation in children/adolescents

- B/P lying, standing; pulse q4hr; if systolic B/P drops 20 mm Hg, hold product, notify prescriber; take VS q4hr in patients with CV disease ⚠️ **Bleeding:** GI, ecchymosis, epistaxis, hematomas, petechiae, hemorrhage • Blood studies: CBC, differential, leukocytes, cardiac enzymes if patient is receiving long-term therapy
- Hepatic studies: AST, ALT, bilirubin
- Weight weekly; weight loss or gain; appetite may increase; peripheral edema may occur; monitor cholesterol • **Withdrawal symptoms:** flulike symptoms, headache, nervousness, agitation, nausea, vomiting, muscle pain, weakness; not usual unless product is discontinued abruptly ⚠️ **Serotonin syndrome, neuroleptic malignant syndrome:** increased heart rate, shivering, sweating, dilated pupils, tremors, high B/P, hyperthermia, headache, confusion; if these occur, stop product, administer serotonin antagonist if needed, usually worse if given with linezolid, methylene blue, tryptophan

Perform/provide:

- Storage in tight container at room temp; do not freeze
- Assistance with ambulation during beginning therapy because drowsiness, dizziness occur

Evaluate:

- Therapeutic response: decreased depression, anxiety; increased well-being

Teach patient/family:

- To notify prescriber of rash, hives, allergic reactions, bleeding
- To use with caution when driving, performing other activities requiring alertness because of drowsiness, dizziness, blurred vision

Black Box Warning:

That worsening of symptoms, suicidal thoughts/behaviors may occur in children/young adults

- To avoid alcohol ingestion
- Not to discontinue medication abruptly after long-term use; may cause nausea, headache, malaise
- To wear sunscreen or large hat because photosensitivity occurs
- To avoid pregnancy or breastfeeding while taking this product, birth defects have occurred when used in the 3rd trimester
- To monitor B/P with hypertension

TREATMENT OF OVERDOSE:

ECG monitoring; lavage, activated charcoal; administer anticonvulsant; may require whole-bowel irrigation for ext rel product

☼ Canada only Side effects: *italics* = common; **bold** = life-threatening ⚠
Nurse Alert

verapamil (Rx)

(ver-ap'a-mill)

Apo-Verap , Calan, Calan SR, Covera-HS , Isoptin SR, Nu-Verap , Verelan, Verelan PM

Func. class.: Calcium channel blocker; antihypertensive; antianginal, antidysrhythmic (class IV) *Chem. class.:* Diphenylalkylamine

ACTION:

Inhibits calcium ion influx across cell membrane during cardiac depolarization; produces relaxation of coronary vascular smooth muscle; dilates coronary arteries; decreases SA/AV node conduction; dilates peripheral arteries

USES:

Chronic stable, vasospastic, unstable angina; dysrhythmias, hypertension, supraventricular tachycardia, atrial flutter or fibrillation

Unlabeled uses: Prevention of migraine headaches, claudication, mania

CONTRAINDICATIONS:

Sick sinus syndrome, 2nd-/3rd-degree heart block, hypotension <90 mm Hg systolic, cardiogenic shock, severe CHF, Lown-Ganong-Levine syndrome, Wolff-Parkinson-White syndrome

Precautions: Pregnancy (C), breastfeeding, children, geriatric patients, CHF, hypotension, hepatic injury, renal disease, concomitant β -blocker therapy

DOSAGE AND ROUTES

Calculator

Angina

- **Adult: PO** 80-120 mg tid, increase weekly, max 480 mg/day

Dysrhythmias

- **Adult: PO** 240-480 mg/day in 3-4 divided doses in digitalized patients
- **Adult: IV BOL** 5-10 mg (0.075-0.15 mg/kg) over 2 min, may repeat 10 mg (0.15 mg/kg) 1/2 hr after 1st dose
- **Child 1-15 yr: IV BOL** 0.1-0.3 mg/kg over ≥ 2 min, repeat in 30 min, max 5 mg in single dose
- **Child 0-1 yr: IV BOL** 0.1-0.2 mg/kg over ≥ 2 min, may repeat after 30 min

Hypertension

- **Adult: PO** 80 mg tid, may titrate upward; **EXT REL** 120-240 mg/day as single dose, may increase to 240-480 mg/day

Hepatic disease/geriatric patients/ compromised ventricular function

- **Adult: PO** 40 mg tid initially, increase as tolerated

Claudication due to PVD (unlabeled)

- **Adult: PO** 120-480 mg/day in divided doses

Mania (unlabeled)

- **Adult: PO** 160-320 mg/day in divided doses, may be given with lithium

Migraine prophylaxis (unlabeled)

- **Adult: PO** 80 mg tid

Available forms: Tabs 40, 80, 120 mg; ext rel tabs 120, 180, 240 mg; inj 2.5 mg/ml in ampules, syringes, vials; ext rel caps 100, 200, 240, 300 mg

Administer:

PO route

- **Reg rel:** Give without regard to food

Ext rel route

- Do not crush or chew ext rel products; caps may be opened and contents sprinkled on food; do not dissolve chew cap contents • Before meals, at bedtime; give ext rel product with food

Direct IV route

- Undiluted through Y-tube or 3-way stopcock of compatible sol; give over 2 min or 3 min for geriatric patients, with continuous ECG and B/P monitoring, discard unused solution • Do not use IV with IV β -blockers, may cause AV nodal blockade

Y-site compatibilities: Alfentanil, amikacin, argatroban, ascorbic acid, atracurium, atropine, aztreonam, bivalirudin, bumetanide, buprenorphine, butorphanol, calcium chloride/gluconate, CARBOplatin, caspofungin, ceFAZolin, cefonicid, cefotaxime, cefoTEtan, cefOXitin, ceftizoxime, cefTRIAxone, cefuroxime, chlorproMAZINE, cimetidine, ciprofloxacin, clindamycin, cyanocobalamin, cyclophosphamide, cycloSPORINE, cytarabine, DACTINomycin, DAPTOmycin, dexamethasone, dexmedetomidine, digoxin, diltiazem, diphenhydrAMINE, DOBUTamine, DOCEtaxel, DOPamine, doxacurium, DOXOrubicin hydrochloride, doxycycline, enalaprilat, ePHEDrine,

EPINEPHrine, epirubicin, epoetin alfa, eptifibatide, erythromycin, esmolol, etoposide, etoposide phosphate, famotidine, fenoldopam, fentaNYL, fluconazole, fludarabine, gemcitabine, gentamicin, glycopyrrolate, granisetron, heparin, hydrALAZINE, hydrocortisone, HYDROmorphine, ifosfamide, imipenem/cilastatin, inamrinone, insulin, isoproterenol, ketorolac, labetalol, levofloxacin, lidocaine, linezolid, LORazepam, magnesium sulfate, mannitol, mechlorethamine, meperidine, metaraminol, methotrexate, methoxamine, methyldopate, methylPREDNISolone, metoclopramide, metoprolol, metroNIDAZOLE, miconazole, midazolam, milrinone, mitoXANtrone, morphine, multivitamins, nalbuphine, naloxone, nesiritide, nitroglycerin, nitroprusside, norepinephrine, octreotide, ondansetron, oxaliplatin, oxytocin, PACLitaxel, palonosetron, papaverine, PEMEtrexed, penicillin G, pentamidine, pentazocine, phentolamine, phenylephrine, phytonadione, piperacillin/tazobactam, potassium chloride, procainamide, prochlorperazine, promethazine, propranolol, protamine, pyridoxime, quinupristin/dalfopristin, ranitidine, rocuronium, sodium acetate, succinylcholine, SUFentanil, tacrolimus, teniposide, theophylline, thiamine, ticarcillin/clavulanate, tirofiban, tobramycin, tolazoline, trimethaphan, urokinase, vancomycin, vasopressin, vecuronium, vinCRISTine, vinorelbine, voriconazole

SIDE EFFECTS

CNS: *Headache, drowsiness, dizziness, anxiety, depression, weakness, insomnia, confusion, lightheadedness, asthenia, fatigue*

CV: *Edema, CHF, bradycardia, hypotension, palpitations, AV block, dysrhythmias*

GI: *Nausea, diarrhea, gastric upset, constipation, increased LFTs*

GU: *Impotence, gynecomastia, nocturia, polyuria*

HEMA: *Bruising, petechiae, bleeding*

INTEG: *Rash, bruising*

MISC: *Gingival hyperplasia*

SYST: *Stevens-Johnson syndrome*

PHARMACOKINETICS

Metabolized by liver, excreted in urine (70% as metabolites)

PO: Onset variable; peak 3-4 hr; duration 17-24 hr; half-life (biphasic) 4 min, 3-

7 hr (terminal)

IV: Onset 3 min, peak 3-5 min, duration 10-20 min

INTERACTIONS

Increase: hypotension—prazosin, quinidine, fentanyl, other antihypertensives, nitrates

Increase: effects of verapamil— β -blockers, cimetidine, clarithromycin, erythromycin, monitor for CV effects

Increase: levels of digoxin, theophylline, cyclosporine, carbamazepine, nondepolarizing muscle relaxants

Decrease: effects of lithium

Decrease: antihypertensive effects—NSAIDs

Drug/Food

Increase: hypotensive effects—grapefruit juice

Drug/Herb

Increase: verapamil effect—ginseng, ginkgo

Increase: hypertension ephedra (ma huang)

Decrease: verapamil effect—St. John's wort

Drug/Lab Test

Increase: AST, ALT, alk phos, BUN, creatinine, serum cholesterol

NURSING CONSIDERATIONS

Assess:

• **Cardiac status:** B/P, pulse, respiration, ECG intervals (PR, QRS, QT); notify prescriber if pulse <50 bpm, systolic B/P <90 mm Hg ⚠️ **CHF:** I&O ratios, weight daily; crackles, weight gain, dyspnea, jugular venous distention • Renal, hepatic studies during long-term treatment, serum potassium periodically

Evaluate:

• Therapeutic response: decreased anginal pain, decreased B/P, dysrhythmias

Teach patient/family:

- To increase fluids, fiber to counteract constipation
- How to take pulse, B/P before taking product; to keep record or graph
- To avoid hazardous activities until stabilized on product, dizziness no longer a problem
- To limit caffeine consumption; to avoid alcohol products
- To avoid OTC or grapefruit products unless directed by prescriber

- To comply with all areas of medical regimen: diet, exercise, stress reduction, product therapy • To change positions slowly to prevent syncope
- Not to discontinue abruptly, chest pain may occur

⚠ To report chest pain, palpitations, irregular heart beats, swelling of extremities, skin irritation, rash, tremors, weakness • To notify prescriber if pregnancy is planned; may breastfeed (American Academy of Pediatrics) • That cap (Covera-HS) ⌘ may appear in stool

TREATMENT OF OVERDOSE:

Defibrillation, atropine for AV block, vasopressor for hypotension, IV calcium

⌘ Canada only Side effects: *italics* = common; **bold** = life-threatening ⚠
Nurse Alert

vidarabine ophthalmic

See [Appendix B](#)

vigabatrin (Rx)

(vye-ga'ba-trin)

Sabril

Func. class.: Anticonvulsant

Chem. class.: GABA transaminase inhibitor

ACTION:

May inhibit reuptake and metabolism of GABA, may increase seizure threshold; structurally similar to GABA

USES:

Adjunct treatment of partial seizures in adults and children ≥ 12 yr, infantile spasm

CONTRAINDICATIONS:

Hypersensitivity to this product

Precautions: Pregnancy (C), breastfeeding, children < 2 yr, geriatric patients, renal/hepatic disease, suicidal thoughts/behaviors, abrupt discontinuation

Black Box Warning:

Visual disturbance

DOSAGE AND ROUTES

Calculator

Partial seizures

- **Adult: PO** 500 mg bid, titrate in 500-mg increments at weekly intervals up to 1.5 g bid

Infantile spasm

- **Infant > 1 mo, child ≤ 2 yr: PO** 50 mg/kg/day in 2 divided doses, titrate in 25 to 50-mg/kg/day increments q3days, max 150 mg/kg/day

Renal dose

- **Adult: PO** CCr 50-80 ml/min, reduce dose by 25%; CCr 30-50 ml/min, reduce dose by 50%; CCr 10-30 ml/min, reduce dose by 75%

Available forms: Tabs 500 mg; powder for oral solution 500 mg

Administer:**PO route (tab)**

- Give without regard to meals

PO route (oral sol)

- Reconstitute immediately before using
- Empty contents of appropriate number of packets into clean cup
- For each packet, dissolve 10 ml water, conc 50 mg/ml; do not use other liquids
- Stir until dissolved, sol should be clear
- Use calibrated oral syringe to measure correct dosage
- Discard any unused sol

SIDE EFFECTS

CNS: *Dizziness*, irritability, lethargy, **malignant hyperthermia**, insomnia

CV: Edema

EENT: **Visual impairment**

GI: Nausea, vomiting, diarrhea, increased appetite, abdominal pain, GI bleeding, hemorrhoids, weight gain, constipation

HEMA: Anemia

INTEG: Pruritus, rash

RESP: Coughing, **respiratory depression**, **pulmonary embolism**

PHARMACOKINETICS

Absorption >95%, no protein binding, widely distributed, not metabolized, excretion in urine 80% parent drug, excretion slowed in renal disease, peak 2 hr, half-life 7.5 hr

INTERACTIONS

Increase: CNS depression—CNS depressants

Increase: Serious ophthalmic effects (glaucoma, retinopathy): azaTHIOprine, chloroquine, corticosteroids, deferoxamine, ethambutol, hydroxychloroquine, interferons, loxapine, mecasermin, rh-IGF-1, pentostatin, phenothiazine, phosphodiesterase inhibitors, tamoxifen, thiothixene; avoid concurrent use

NURSING CONSIDERATIONS**Assess:**

- Renal studies: urinalysis, BUN, urine creatinine q3mo

- Hepatic studies: ALT, AST, bilirubin
- Description of seizures: location, duration, presence of aura
- Mental status: mood, sensorium, affect, behavioral changes; if mental status changes, notify prescriber

Perform/provide:

- Storage at room temp
- Assistance with ambulation during early part of treatment; dizziness occurs
- Seizure precautions: padded side rails; move objects that may harm patient

Evaluate:

- Therapeutic response: decreased seizure activity; document on patient's chart

Teach patient/family:

- To carry emergency ID stating patient's name, products taken, condition, prescriber's name and phone number
- To avoid driving, other activities that require alertness
- Not to discontinue medication quickly after long-term use
- To notify prescriber if pregnancy is planned or suspected

🍁 Canada only Side effects: *italics* = common; **bold** = life-threatening ⚠️
Nurse Alert

vilazodone (Rx)

(vil-az'oh-done)

Viibryd

Func. class.: Antidepressant, miscellaneous

ACTION:

Novel antidepressant unrelated to other antidepressants, enhances serotonergic action by a dual mechanism

USES:

Major depression

CONTRAINDICATIONS:

Concomitant use of MOA inhibitors or within 14 days after discontinuing MOA inhibitor or within 14 days after discontinuing vilazodone

Precautions: Pregnancy (C), labor, infants, geriatric patients, abrupt discontinuation, bipolar disorder, bleeding, operating machinery, ECT, hepatic disease, hyponatremia, hypovolemia, substance abuse, history of seizures, serotonin syndrome, neuroleptic malignant syndrome; use with serotonin precursors (e.g., tryptophan) or serotonergic drugs; suicidal ideation, worsening depression or behavior

Black Box Warning:

Children, suicidal ideation

DOSAGE AND ROUTES

Calculator

• **Adult: PO** 10 mg $\times$ 7 days, then 20 mg $\times$ 7 days, then 40 mg/day; if taking potent CYP3A4 inhibitor, max 20 mg/day

Available forms: Tabs 10, 20, 40 mg

Administer:

- With food to increase absorption
- Do not use within 2 wk of MAOIs

SIDE EFFECTS

CNS: Restlessness, dizziness, drowsiness, fatigue, mania, insomnia, migraine,

neuroleptic-malignant-like syndrome,x paresthesias, seizures, suicidal ideation, tremor, night sweats, dream disorders

EENT: Cataracts, blurred vision

GI: Nausea, vomiting, flatulence, diarrhea, xerostomia, altered taste, gastroenteritis

GU: Decreased libido, ejaculation disorder, increased frequency of urination, sexual dysfunction

HEMA: Bleeding, decreased platelets

MS: Arthralgia

SYST: Neonatal abstinence syndrome, withdrawal, serotonin syndrome

INTERACTIONS

⚠ Do not use within 2 wk of MAO inhibitors ⚠ **Increased:** serotonin syndrome—SSRIs, SNRIs, serotonin receptor agonists, selegiline, busPIRone, dextromethorphan, ergots, fenfluramine, dexfluramine, lithium, meperidine, fentaNYL, methylphenidate, dexmethylphenidate, metoclopramide, mirtazapine, nefazodone, pentazocine, phenothiazines, haloperidol, loxapine, thiothixene, molindone, amphetamines

Increased: bleeding—anticoagulants, thrombolytics, platelet inhibitors, salicylates, NSAIDs

Increased: vilazodone levels—CYP3A4 inhibitors (ketoconazole, erythromycin, efavirenz, dronedarone, clarithromycin and others)

Decrease: vilazodone effect—CYP3A4 inducers

Drug/Food

- Avoid use with grapefruit juice

Drug/Herb

Increased: serotonin syndrome—St. John's wort

PHARMACOKINETICS

Protein binding 96%-99%, metabolized by liver by CYP3A4 (major) and CYP2C19 and CYP2D (minor) and non-CYP pathways, peak 4-5 hr, half-life 25 hr

NURSING CONSIDERATIONS

Assess:

Black Box Warning:

Mental status: orientation, mood behavior initially and periodically; initiate suicide precautions if indicated; history of seizures, mania

- Renal/hepatic status: hyponatremia
- **Abrupt discontinuation:** Do not discontinue abruptly, taper, monitor for symptoms of withdrawal; if intolerable, resume previous dose and decrease more slowly
- Serotonin syndrome/neuroleptic malignant syndrome: nausea, vomiting, sedation, sweating, facial flushing, high B/P; discontinue product

Perform/provide:

- Storage at room temp, away from moisture, heat

Evaluate:

- Therapeutic response: remission of depressive symptoms

Teach patient/family:

- To take as directed; not to double dose
- To avoid abrupt discontinuation unless approved by prescriber
- Not to drive or operate machinery until effects are known
- Not to use other products unless approved by prescribed

⚠ To contact prescriber regarding the following: allergic reactions; personality changes (aggression, anxiety, anger, hostility); extreme sleepiness or drowsiness; feeling confused, nervous, restless or clumsy; numbness, tingling, or burning pain in hands, arms, legs, or feet; tremors; unusual behavior or thoughts about hurting oneself

- To notify prescriber if pregnancy is planned or suspected; avoid breastfeeding

🇨🇦 Canada only Side effects: *italics* = common; **bold** = life-threatening ⚠

Nurse Alert

HIGH ALERT

vinBLAStine (VLB) (Rx)

(vin-blast'een)

Func. class.: Antineoplastic

Chem. class.: Vinca alkaloid

Do not confuse: **vinBLAStine**/vinCRISStine/vinorelbine

ACTION:

Inhibits mitotic activity, arrests cell cycle at metaphase; inhibits RNA synthesis, blocks cellular use of glutamic acid needed for purine synthesis; vesicant

USES:

Breast, testicular cancer, lymphomas, neuroblastoma; Hodgkin's/non-Hodgkin's lymphoma; mycosis fungoides, histiocytosis, Kaposi's sarcoma, Langerhans cell histiocytosis

Unlabeled uses: Lung, bladder, prostate cancer; desmoid tumor, malignant melanoma

CONTRAINDICATIONS:

Pregnancy (D), breastfeeding, infants, hypersensitivity, leukopenia, granulocytopenia, bone marrow suppression, infection

Black Box Warning:

Intrathecal use

Precautions: Renal/hepatic disease, tumor lysis syndrome

Black Box Warning:

Extravasation

DOSAGE AND ROUTES

Calculator

Breast cancer

• **Adult:** IV 4.5 mg/m² on day 1 of every 21 days in combination with DOXOrubicin and thiotepa

Hodgkins disease

- **Adult: IV** 6 mg/m² on days 1 and 15 of every 28 days with DOXOrubicin, bleomycin, dacarbazine (ABVD regimen)
- **Child: IV** 2.5-6 mg/m²/day once q1-2wk × 3-6 wk, max weekly dose 12.5 mg/m²

Available forms: Inj, powder 10 mg for 10 ml IV; sol for inj 1 mg/ml

Administer:

- Antiemetic 30-60 min before product and prn to prevent vomiting

Black Box Warning:

Hyaluronidase 150 units/ml in 1 ml NaCl, warm compress for extravasation for vesicant activity treatment

Black Box Warning:

Do not administer intrathecally; fatal

IV inj route

- After diluting 10 mg/10 ml NaCl; give through **Y**-tube or 3-way stopcock or directly over 1 min

Intermittent IV INF route

- Further dilute in 50-100 ml of NS, infuse over 15-30 min

Additive compatibilities: Bleomycin

Syringe compatibilities: Bleomycin, CISplatin, cyclophosphamide, droperidol, fluorouracil, leucovorin, methotrexate, metoclopramide, mitoMYcin, vinCRISTine

Y-site compatibilities: Allopurinol, amifostine, amphotericin B cholesteryl, aztreonam, bleomycin, CISplatin, cyclophosphamide, DOXOrubicin, DOXOrubicin liposome, droperidol, filgrastim, fludarabine, fluorouracil, granisetron, heparin, leucovorin, melphalan, methotrexate, metoclopramide, mitoMYcin, ondansetron, PACLitaxel, piperacillin/tazobactam, sargramostim, teniposide, thiotepa, vinCRISTine, vinorelbine

SIDE EFFECTS

CNS: Paresthesias, peripheral neuropathy, depression, headache, **seizures**, malaise

CV: Tachycardia, orthostatic hypo/hypertension

GI: *Nausea, vomiting, ileus, anorexia, stomatitis, constipation*, abdominal pain, **GI/rectal bleeding, hepatotoxicity**, pharyngitis

GU: Urinary retention, **renal failure**, hyperuricemia

HEMA: Thrombocytopenia, leukopenia, myelosuppression, agranulocytosis, granulocytosis, aplastic anemia, neutropenia, pancytopenia

INTEG: Rash, alopecia, photosensitivity, extravasation, tissue necrosis

META: SIADH

RESP: Fibrosis, pulmonary infiltrate, bronchospasm

SYST: Tumor lysis syndrome (TLS)

PHARMACOKINETICS

Half-life (triphasic) <5 min, 50-155 min, 23-85 hr; metabolized in liver; excreted in urine, feces; crosses blood-brain barrier

INTERACTIONS

Increase:

Synergism: bleomycin

Increase:

Bronchospasm: mitomycin

- Do not use with radiation

Increase: bleeding risk—NSAIDs, anticoagulants, thrombolytics, antiplatelets

Increase: toxicity, bone marrow suppression—antineoplastics

Increase: action of methotrexate

Increase: adverse reactions—live virus vaccines

 **Increase:** toxicity—CYP3A4 inhibitors (aprepitant, antiretroviral protease inhibitors, clarithromycin, danazol, delavirdine, diltiazem, erythromycin, fluconazole, fluoxetine, fluvoxamine, imatinib, ketoconazole, mibefradil, nefazodone, telithromycin, voriconazole)

Decrease: vinblastine effect—CYP3A4 inducers (barbiturates, bosentan, carbamazepine, efavirenz, phenytoins, nevirapine, rifabutin, rifampin)

Drug/Herb

- Avoid use with St. John's wort

Drug/Lab Test

Increase: uric acid, bilirubin

Decrease: Hgb, platelets, WBC

NURSING CONSIDERATIONS

Assess:

 CBC, differential, platelet count weekly; withhold product if WBC is

<2000/mm³ or platelet count is <75,000/mm³; notify prescriber; RBC, Hct, Hgb may be decreased, nadir occurs on days 4-10 and continues for another 1-2 wk

• **Tumor lysis syndrome:** monitor for hyperkalemia, hyperphosphatemia, hyperuricemia; usually occurs with leukemia, lymphoma; alkalization of the urine, allopurinol should be used to prevent urate nephropathy; monitor electrolytes and renal function (BUN, uric acid, urine CCR) • Hepatitis: transient hepatitis may occur with continuous IV

• Bleeding: hematuria, guaiac, bruising, petechiae, mucosa or orifices

• **Bronchospasm:** can be life-threatening; usually occurs when giving mitoMYcin • Effects of alopecia on body image; discuss feelings about body changes

• Sensitivity of feet/hands, which precedes neuropathy

• Jaundiced skin, sclera; dark urine, clay-colored stools, itchy skin, abdominal pain, fever, diarrhea • Buccal cavity q8hr for dryness, sores, ulcerations, white patches, oral pain, bleeding, dysphagia

Black Box Warning:

Local irritation, pain, burning, discoloration at inj site, extravasation

• Symptoms indicating severe allergic reaction: rash, pruritus, urticaria, purpuric skin lesions, itching, flushing

Perform/provide:

• Increased fluid intake to 2-3 L/day to prevent urate deposits, calculi formation

• Brushing of teeth bid-tid with soft brush or cotton-tipped applicator for stomatitis; use unwaxed dental floss

Evaluate:

• Therapeutic response: decreased tumor size, spread of malignancy

Teach patient/family:

• To report any complaints or side effects to nurse or prescriber

• To report any changes in breathing or coughing; to avoid exposure to persons with infection • That hair may be lost during treatment, that a wig or hairpiece may make patient feel better; that new hair may be different in color, texture • To report change in gait or numbness in extremities; may indicate neuropathy

• To avoid foods with citric acid, hot or rough texture

• To report any bleeding, white spots, ulcerations in mouth to prescriber; to examine mouth daily • To wear sunscreen, protective clothing, sunglasses

• To avoid receiving vaccinations

⚠ **Pregnancy:** pregnancy (D); to avoid breastfeeding; that product may cause

male infertility • To notify prescriber if pregnancy is planned or suspected; avoid persons with known infections • **Infection:** to report sore throat, flulike symptoms

🍁 Canada only Side effects: *italics* = common; **bold** = life-threatening ⚠️
Nurse Alert

HIGH ALERT

vinCRISStine (VCR) (Rx)

(vin-kris'teen)

Vincasar PFS

Func. class.: Antineoplastic—miscellaneous

Chem. class.: Vinca alkaloid

Do not confuse: **vinCRISStine**/vinBLASStine/vinorelbine

ACTION:

Inhibits mitotic activity, arrests cell cycle at metaphase; inhibits RNA synthesis, blocks cellular use of glutamic acid needed for purine synthesis; vesicant

USES:

Lymphomas, neuroblastoma, Hodgkin's disease, acute lymphoblastic and other leukemias, rhabdomyosarcoma, Wilms' tumor, non-Hodgkin's lymphoma, malignant glioma, soft-tissue sarcoma

Unlabeled uses: Lung, breast, colorectal, head/neck, osteogenic sarcomas; small-cell lung cancer, trophoblastic disease

CONTRAINDICATIONS:

Pregnancy (D), breastfeeding, infants, hypersensitivity, radiation therapy

Black Box Warning:

Intrathecal use

Precautions: Renal/hepatic disease, hypertension, neuromuscular disease

Black Box Warning:

Extravasation

DOSAGE AND ROUTES

Calculator

- **Adult:** IV 0.4-1.4 mg/m²/wk, max 2 mg
- **Child:** IV 1-2 mg/m²/wk, max 2 mg

Available forms: Inj 1 mg/ml; powder for inj 5 mg/vial

Administer:

- Antiemetic 30-60 min before product and prn

- Antispasmodic for GI symptoms

Black Box Warning:

Do not give intrathecally; fatal

IV route

- After diluting with diluent provided or 1 mg/10 ml sterile water or NaCl; give through Y-tube or 3-way stopcock or directly over 1 min; do not use 5-mg vial for single doses

Black Box Warning:

Hyaluronidase 150 units/ml in 1 ml NaCl; apply warm compress for extravasation

Additive compatibilities: Bleomycin, cytarabine, fluorouracil, methotrexate

Syringe compatibilities: Bleomycin, CISplatin, cyclophosphamide, doxapram, DOXOrubicin, droperidol, fluorouracil, heparin, leucovorin, methotrexate, metoclopramide, mitomycin, vinBLAStine

Y-site compatibilities: Allopurinol, amifostine, amphotericin B cholesteryl, aztreonam, bleomycin, CISplatin, cladribine, cyclophosphamide, DOXOrubicin, DOXOrubicin liposome, droperidol, filgrastim, fludarabine, fluorouracil, granisetron, heparin, leucovorin, melphalan, methotrexate, metoclopramide, mitoMYcin, ondansetron, PACLitaxel, piperacillin/tazobactam, sargramostim, teniposide, thiotepe, vinBLAStine, vinorelbine

SIDE EFFECTS

CNS: *Decreased reflexes, numbness, weakness, motor difficulties*, CNS depression, cranial nerve paralysis, **seizures**, peripheral neuropathy

CV: Orthostatic hypotension

EENT: *Diplopia*

GI: *Nausea, vomiting, anorexia, stomatitis, constipation*, **paralytic ileus**, abdominal pain, **hepatotoxicity**

GU: **Renal tubular obstruction**

HEMA: **Thrombocytopenia, leukopenia, myelosuppression, anemia**

INTEG: *Alopecia*, extravasation

SYST: **Tumor lysis syndrome (TLS)**

PHARMACOKINETICS

Half-life (triphasic) <5 min, 50-155 min, 23-85 hr; metabolized in liver; excreted in bile, feces; crosses placental, blood-brain barrier

INTERACTIONS

Decrease: immune response—vaccines, toxoids

Decrease: digoxin level—digoxin

Decrease: vinCRISTine effect—CYP3A4 inducers (barbiturates, bosentan, carbamazepine, efavirenz, phenytoins, nevirapine, rifabutin, rifampin)

Increase: Neurotoxicity: peripheral nervous system products

- Do not use with radiation

- **Acute pulmonary reactions:** mitomycin c

⚠ Increase: toxicity—CYP3A4 inhibitors (aprepitant, antiretroviral protease inhibitors, clarithromycin, danazol, delavirdine, diltiazem, erythromycin, fluconazole, flucloxacillin, fluvoxamine, imatinib, ketoconazole, mibefradil, nefazodone, telithromycin, voriconazole)

Drug/Herb

- Avoid use with St. John's wort

Drug/Lab Test

Increase: uric acid

Decrease: Hgb, WBC, platelets, sodium

NURSING CONSIDERATIONS

Assess:

- CBC, differential, platelet count before each dose; withhold product if WBC is $<4000/\text{mm}^3$ or platelet count is $<75,000/\text{mm}^3$; notify prescriber; RBC, Hct, Hgb; may be decreased • **Bronchospasm:** more common with mitomycin

- Hepatic studies before, during therapy (bilirubin, AST, ALT, LDH) as needed or monthly

- Sensitivity of feet/hands, which precedes neuropathy

- **Tumor lysis syndrome:** hyperkalemia, hyperphosphatemia, hyperuricemia, hypocalcemia; more common in leukemia, lymphoma; use alkalinization of urine with allopurinol, monitor electrolytes, renal function (BUN, urine, CCR, uric acid)

Black Box Warning:

Extravasation: pain, swelling, poor blood return; if extravasation occurs, local inj of hyaluronidase and moderate heat to area may help disperse product

Intrathecal administration

- **Bleeding:** hematuria, guaiac, bruising, petechiae, mucosa or orifices q8hr

- Effects of alopecia on body image; discuss feelings about body changes
- Buccal cavity q8hr for dryness, sores, ulcerations, white patches, oral pain, bleeding, dysphagia • Symptoms indicating severe allergic reaction: rash, pruritus, urticaria, purpuric skin lesions, itching, flushing

Perform/provide:

- Brushing of teeth bid-tid with soft brush or cotton-tipped applicator for stomatitis; use unwaxed dental floss

Evaluate:

- Therapeutic response: decreased tumor size, spread of malignancy

Teach patient/family:

- To report change in gait or numbness in extremities; may indicate neuropathy
- To report any bleeding, white spots or ulcerations in mouth to prescriber; to examine mouth daily • To increase bulk, fluids, exercise to prevent constipation
- **Infection:** to report sore throat, fever, flulike symptoms; avoid persons with known infection • To avoid vaccinations
- That hair may be lost; that hair will grow back but with different texture, color
- **Pregnancy (D):** to notify prescriber if pregnancy is planned or suspected ⚠️ To use effective contraception during and for 2 mo after therapy, pregnancy (D), to avoid breastfeeding

🍁 Canada only Side effects: *italics* = common; **bold** = life-threatening ⚠️
Nurse Alert

HIGH ALERT

vinorelbine (Rx)

(vi-nor'el-bine)

Navelbine

Func. class.: Antineoplastic—miscellaneous

Chem. class.: Semisynthetic vinca alkaloid

ACTION:

Inhibits mitotic spindle activity, arrests cell cycle at metaphase; inhibits RNA synthesis, blocks cellular use of glutamic acid needed for purine synthesis; vesicant

USES:

Unresectable advanced non–small-cell lung cancer (NSCLC) stage IV; may be used alone or in combination with CISplatin for stage III or IV NSCLC

Unlabeled uses: Hodgkin's disease, breast/ovarian/head/neck cancer, desmoid tumor

CONTRAINDICATIONS:

Pregnancy (D), breastfeeding, infants, hypersensitivity, granulocyte count <1000 cells/mm³ pretreatment

Black Box Warning:

Severe neutropenia, intrathecal administration

Precautions: Children, geriatric patients, renal/hepatic/pulmonary/neurologic disease, anemia, bone marrow suppression

Black Box Warning:

Extravasation

DOSAGE AND ROUTES

Calculator

• **Adult: IV** 30 mg/m²/wk

• **Anc 1000-1499:**

Give 50% of dose; <1000 , hold dose; $<1000 \times 3$ wk, discontinue

Hepatic dose

• **Adult: IV** total bilirubin 2.1-3 mg/dl 15 mg/m²/wk; total bilirubin ≥ 3 mg/dl 7.5

mg/m²/day

Available forms: Inj 10 mg/ml

Administer:

Black Box Warning:

Do not give intrathecally; fatal

- Antiemetic 30-60 min before product and prn to prevent vomiting

Intermittent IV INF route

- Dilute to 0.5-2 mg/ml with 0.9% NaCl, 0.45% NaCl, D₅W, D₅/0.45% NaCl, L.R. Ringer's sol, give over 6-10 min into **Y-site** or central line, flush line

Black Box Warning:

Hyaluronidase 150 units/ml in 1 ml NaCl, warm compress for extravasation for vesicant activity treatment

Continuous IV INF route

- 40 mg/m² q3wk after IV bol of 8 mg/m²; may be given in combination with DOXOrubicin, fluorouracil, CISplatin

Y-site compatibilities: Amikacin, aztreonam, bleomycin, bumetanide, buprenorphine, butorphanol, calcium gluconate, CARBOplatin, carmustine, cefotaxime, cefTAZidime, ceftizoxime, chlorproMAZINE, cimetidine, CISplatin, clindamycin, cyclophosphamide, cytarabine, dacarbazine, DACTINomycin, DAUNOrubicin, dexamethasone, diphenhydrAMINE, DOXOrubicin, DOXOrubicin liposome, doxycycline, droperidol, enalaprilat, etoposide, famotidine, filgrastim, floxuridine, fluconazole, fludarabine, gallium, gentamicin, granisetron, haloperidol, heparin, hydrocortisone, HYDROmorphine, hydrOXYzine, IDArubicin, ifosfamide, imipenem-cilastatin, LORazepam, mannitol, mechlorethamine, melphalan, meperidine, mesna, methotrexate, metoclopramide, metroNIDAZOLE, minocycline, mitoXANtrone, morphine, nalbuphine, netilmicin, ondansetron, plicamycin, streptozocin, teniposide, ticarcillin, ticarcillin-clavulanate, tobramycin, vancomycin, vinBLASline, vinCRISline, zidovudine

SIDE EFFECTS

CNS: Paresthesias, peripheral neuropathy, depression, headache, seizures, weakness, jaw pain, asthenia

CV: Chest pain

GI: Nausea, vomiting, ileus, anorexia, stomatitis, constipation, abdominal pain,

diarrhea, hepatotoxicity, GI obstruction/perforation

HEMA: *Neutropenia, anemia, thrombocytopenia, granulocytopenia*

INTEG: *Rash, alopecia, photosensitivity, inj site reaction, necrosis*

META: SIADH

MS: Myalgia

RESP: SOB, *dyspnea, pulmonary edema, acute bronchospasm, acute respiratory distress syndrome (ARDS)*

PHARMACOKINETICS

Half-life 27-43 hr; peak 1-2 hr; highly bound to platelets, lymphocytes; metabolized in liver; excreted in feces; small amount unchanged in kidneys

INTERACTIONS

Increase: bleeding risk—NSAIDs, anticoagulants

⚠ Increase: toxicity—CYP3A4 inhibitors (aprepitant, antiretroviral protease inhibitors, clarithromycin, danazol, delavirdine, diltiazem, erythromycin, fluconazole, FLUoxetine, fluvoxamine, imatinib, ketoconazole, mibefradil, nefazodone, telithromycin, voriconazole)

Decrease: vinorelbine effect—CYP3A4 inducers (barbiturates, bosentan, carbamazepine, efavirenz, phenytoins, nevirapine, rifabutin, rifampin)

Drug/Herb

- Avoid use with St. John's wort

Drug/Lab Test

Increase: LFTs, bilirubin

Decrease: Hgb, WBC, platelets

NURSING CONSIDERATIONS

Assess:

- B/P (baseline, q15min) during administration

Black Box Warning:

CBC, differential, platelet count before each dose; withhold product if WBC is $<4000/\text{mm}^3$ or platelet count is $<75,000/\text{mm}^3$; notify prescriber of results; recovery will take 3 wk

• **Bronchospasm:** more common with mitoMYcin; also dyspnea, wheezing; may be treated with oxygen, bronchodilators, corticosteroids, especially if there is underlying pulmonary disease • **Respiratory status:** dyspnea, crackles, unproductive cough, chest pain, tachypnea

- Renal studies: BUN, serum uric acid, urine CCr before, during therapy; I&O ratio; report fall in urine output to <30 ml/hr; decreased hyperuricemia
- **Infection**, cold, fever, sore throat; notify prescriber if these occur; effects of alopecia on body image • **Bleeding**: hematuria, guaiac, bruising, petechiae, mucosa or orifices, no rectal temps; avoid IM inj; apply pressure to venipuncture sites • Hepatic function tests: AST, ALT, bilirubin, LDH

 **Severe allergic reactions**: rash, pruritus, urticaria, itching, flushing, bronchospasm, hypotension; EPINEPHrine and crash cart should be nearby

- Neurologic status: numbness, pain, tingling, loss of Achilles reflex, weakness, palsies

Perform/provide:

- Brushing of teeth bid-tid with soft brush or cotton-tipped applicator for stomatitis; unwaxed dental floss

Evaluate:

- Therapeutic response: decreased tumor size, spread of malignancy

Teach patient/family:

- To report change in gait or numbness in extremities, continuing constipation; may indicate neurotoxicity • To examine mouth daily for bleeding, white spots, ulcerations; to notify prescriber
- **Infection**: report sore throat, fever, flulike symptoms
- To avoid crowds, people with infections, vaccinations, OTC products

 **Pregnancy**: notify prescriber if pregnancy is planned or suspected; to use effective contraception during treatment and for ≥2 mo after product is discontinued, pregnancy (D); to avoid breastfeeding • That hair may be lost; that hair will grow back but with different texture, color

☼ Canada only Side effects: *italics* = common; **bold** = life-threatening 
Nurse Alert

vitamin A (Rx, PO-OTC, Rx-IM)

Aquasol A, Vitamin A

Func. class.: Vitamin, fat soluble

Chem. class.: Retinol

ACTION:

Needed for normal bone, tooth development; visual dark adaptation; skin disease; mucosa tissue repair; assists with production of adrenal steroids, cholesterol, RNA

USES:

Vit A deficiency

CONTRAINDICATIONS:

Pregnancy (X) (IM), hypersensitivity to vit A, malabsorption syndrome, hypervitaminosis A, IV administration

Precautions: Pregnancy (C) (PO), breastfeeding, impaired renal function, children, hepatic disease, infants, alcoholism, hepatitis

DOSAGE AND ROUTES

Calculator

- **Adult and child >8 yr: PO** 100,000-500,000 international units/day $\times$ 3 days then 50,000/day $\times$ 2 wk; dose based on severity of deficiency; maintenance 10,000-20,000 international units for 2 mo
- **Child 1-8 yr: IM** 5000-15,000 international units/day $\times$ 10 days
- **Infant <1 yr: IM** 5000-15,000 international units $\times$ 10 days

Maintenance

- **Child 4-8 yr: IM** 15,000 international units/day $\times$ 2 mo
- **Child <4 yr: IM** 10,000 international units/day $\times$ 2 mo

Available forms: Caps 10,000, 25,000, 50,000 international units; drops 5000 international units; inj 50,000 international units/ml; tabs 10,000, 25,000, 50,000 international units

Administer:

PO route

- With food (PO) for better absorption
- Do not administer IV because of risk of anaphylactic shock; IM only
- Oral preparations not indicated for vit A deficiency in those with malabsorption syndrome

IM route

- Give deep in large muscle mass; do not use deltoid muscle for administration of >1 ml

SIDE EFFECTS

CNS: Headache, increased intracranial pressure, intracranial hypertension, lethargy, malaise

EENT: Gingivitis, papilledema, exophthalmos, inflammation of tongue and lips

GI: Nausea, vomiting, anorexia, abdominal pain, jaundice

INTEG: Drying of skin, pruritus, increased pigmentation, night sweats, alopecia

META: Hypomenorrhea, hypercalcemia

MS: Arthralgia, retarded growth, hard areas on bone

PHARMACOKINETICS

Stored in liver, kidneys, fat; excreted (metabolites) in urine, feces

INTERACTIONS

Increase: levels of vit A—corticosteroids, oral contraceptives

Decrease: absorption of vit A—mineral oil, cholestyramine, colestipol

Drug/Lab Test

False increase: bilirubin, serum cholesterol

NURSING CONSIDERATIONS

Assess:

- Nutritional status: yellow and dark green vegetables, yellow/orange fruits, vit-A-fortified foods, liver, egg yolks
- **Vit A deficiency:** decreased growth; night blindness; dry, brittle nails; hair loss; urinary stones; increased infection; hyperkeratosis of skin; drying of cornea

Perform/provide:

- Storage in tight, light-resistant container

Evaluate:

- Therapeutic response: increased growth rate, weight; absence of dry skin and mucous membranes, night blindness

Teach patient/family:

- That, if dose is missed, it should be omitted
- That ophthalmic exams may be required periodically throughout therapy
- Not to use mineral oil while taking this product
- To notify prescriber of nausea, vomiting, lip cracking, loss of hair, headache
- Not to take more than prescribed amount

TREATMENT OF OVERDOSE:

Discontinue product

vitamin E (OTC)

Aquasol E

Func. class.: Vit E

Chem. class.: Fat soluble

ACTION:

Needed for digestion and metabolism of polyunsaturated fats; decreases platelet aggregation, blood clot formation; promotes normal growth and development of muscle tissue, prostaglandin synthesis

USES:

Vit E deficiency, impaired fat absorption, hemolytic anemia in premature neonates, prevention of retrolental fibroplasia, sickle cell anemia, supplement for malabsorption syndrome

CONTRAINDICATIONS:

IV use in infants

Precautions: Pregnancy (A), anemia, breastfeeding, hypoprothrombinemia

DOSAGE AND ROUTES

Calculator

Deficiency

- **Adult: PO** 60-75 international units/day
- **Child: PO** 1 international units/kg (malabsorption)

Prevention of deficiency

- **Adult: PO** 30 international units/day; **TOP** apply to affected areas
- **Infant: PO** 5 international units/day

Available forms: Caps 100, 200, 400, 500, 600, 1000 international units; tabs 100, 200, 400 international units; drops 50 mg/ml; chew tabs 400 units; ointment; cream; lotion; oil

Administer:

PO route

- Administer with or after meals
- Chew chewable tabs well

- Sol may be dropped in mouth or mixed with food

Topical route

- To moisturize dry skin

SIDE EFFECTS

CNS: Headache, fatigue

CV: Increased risk for thrombophlebitis

EENT: Blurred vision

GI: Nausea, cramps, diarrhea

GU: Gonadal dysfunction

INTEG: Sterile abscess, contact dermatitis

META: Altered metabolism of hormones (thyroid, pituitary, adrenal), altered immunity

MS: Weakness

PHARMACOKINETICS

PO: Metabolized in liver, excreted in bile

INTERACTIONS

Increase: action of oral anticoagulants

Decrease: absorption—cholestyramine, colestipol, mineral oil, sucralfate

NURSING CONSIDERATIONS

Assess:

- Nutritional status: wheat germ; dark green, leafy vegetables; nuts; eggs; liver; vegetable oils; dairy products; cereals

Perform/provide:

- Storage in tight, light-resistant container

Evaluate:

- Therapeutic response: absence of hemolytic anemia, adequate vit E levels, improvement in skin lesions, decreased edema

Teach patient/family:

- About the necessary foods for diet
 - To omit dose if missed
 - To avoid vitamin supplements unless directed by prescriber
-

🍁 Canada only Side effects: *italics* = common; **bold** = life-threatening ⚠️
Nurse Alert

voriconazole (Rx)

(vohr-i-kahn'a-zol)

Vfend

Func. class.: Antifungal, systemic

Chem. class.: Triazole derivative

ACTION:

Inhibits fungal CYP 450-mediation demethylation; needed for biosynthesis; causes leakage from cell membrane

USES:

Invasive aspergillosis, serious fungal infections (*Candida* sp., *Scedosporium apiospermum*, *Fusarium* sp., *Monosporium*, *Apiospermum*)

Unlabeled uses: *Acremonium* sp., *Blastomyces dermatitidis*, *Coccidioides immitis*, *Cryptococcus neoformans*, febrile neutropenia, fungal keratitis, *Histoplasma capsulatum*, oropharyngeal candidiasis, *Rhodotorula* sp., *Scedosporium* sp., cutaneous aspergillosis, candidemia (premature neonates), fungal infections in children ≥ 12 yr

CONTRAINDICATIONS:

Pregnancy (D), breastfeeding, children, hypersensitivity, severe bone marrow depression, severe hepatic disease

Precautions: Renal disease (IV); patients of Asian/African descent; cardiomyopathy, cholestasis, chemotherapy, lactase deficiency, visual disturbances, renal failure, pancreatitis, QT prolongation, hypokalemia; ventricular dysrhythmias, torsades de pointes

DOSAGE AND ROUTES

Calculator

Esophageal candidiasis

- **Adult/geriatric/child ≥ 12 yr and ≥ 40 kg:** PO 200 mg q12hr; < 40 kg, 100 mg q12hr
- **Adult/geriatric/child ≥ 12 yr:** IV INF Loading dose 6 mg/kg q12hr $\times$ 2 dose then 4 mg/kg q12hr; may switch to oral dosing

Candidemia of the skin, kidney, bladder wall, abdomen (nonneutropenic

patients)

- **Adult/child ≥ 12 yr:** **IV** loading dose 6 mg/kg q12hr $\times$ 24 hr then 3-4 mg/kg q12hr $\times$ ≥ 14 days and ≥ 7 days after resolution of symptoms; **PO** after loading dose **>40 kg** 200 mg q12hr $\times$ ≥ 14 days and ≥ 7 days after resolution of symptoms; **<40 kg** 100 mg q12hr $\times$ ≥ 14 days and ≥ 7 days after resolution of symptoms

Invasive aspergillosis

- **Adults/adolescents:** **IV** 6 mg/kg q12hr (loading dose) then 4 mg/kg q12hr, may reduce to 3 mg/kg q12hr if intolerable
- **Child ≥ 12 yr:** **IV** 6 mg/kg q12hr, then 4 mg/kg q12hr

CNS blastomycosis/blastomycosis meningitis (unlabeled)

- **Adult:** **PO** 200-400 mg bid $\times$ at least 12 mo and until resolution of CSF abnormalities

Renal dose

- **Adult:** **PO** CCr <50 ml/min, use orally only

Hepatic dose

- **Adult:** **PO** 6 mg/kg q12hr $\times$ 2 doses then 2 mg/kg q12hr or 100 mg q12hr if >40 kg; 50 mg q12hr if <40 kg

Available forms: Tabs 50, 200 mg; powder for inj, lyophilized 200 mg voriconazole, powder for oral susp 45 g (40 mg/ml after reconstitution)

Administer:

PO route

- Oral susp: tap bottle; add 46 ml of water to bottle; shake well; remove cap; push bottle adaptor into neck of bottle; replace cap; write expiration date (14 days); shake well before each use; administer using only oral dispenser supplied, 1 hr before or after meals; tabs and susp may be interchanged

Intermittent IV INF route

- Product only after C&S confirms organism, product needed to treat condition; make sure product used in life-threatening infections • Reconstitute powder with 19 ml water for inj to 10 mg/ml, shake until dissolved; infuse over 1-2 hr at conc of ≤ 5 mg/ml; do not admix with other products, 4.2% sodium bicarbonate inf • Store at room temp (powder, tabs)

Y-site compatibilities: Acyclovir, alfentanil, allopurinol, amifostine, amikacin, aminocaproic acid, aminophylline, amiodarone, amphotericin B liposome, ampicillin, ampicillin/sulbactam, anidulafungin, azithromycin, aztreonam,

bivalirudin, bleomycin, bumetanide, buprenorphine, butorphanol, calcium acetate/chloride/gluconate, CARBOplatin, carmustine, caspofungin, ceFAZolin, cefotaxime, cefoTEtan, cefOXitin, cefTAZidime, ceftizoxime, cefTRIAxone, chloramphenicol, chlorproMAZINE, cimetidine, ciprofloxacin, cisatracurium, CISplatin, clindamycin, cyclophosphamide, cytarabine, dacarbazine, DACTINomycin, DAPTOmycin, DAUNOrubicin, dexamethasone, dexmedetomidine, dexrazoxane, digoxin, diltiazem, diphenhydrAMINE, DOBUTamine, DOCEtaxel, dolasetron, DOPamine, doripenem, doxacurium, doxycycline, droperidol, enalaprilat, ePHEDrine, EPINEPHrine, epirubicin, ertapenem, erythromycin, esmolol, etoposide, etoposide phosphate, famotidine, fenoldopam, fentaNYL, fluconazole, fludarabine, fluorouracil, foscarnet, fosphenytoin, furosemide, ganciclovir, gemcitabine, gentamicin, glycopyrrolate, granisetron, haloperidol, heparin, hydrALAZINE, hydrocortisone, ifosfamide, imipenem/cilastatin, inamrinone, insulin, irinotecan, isoproterenol, ketorolac, labetalol, leucovorin, levofloxacin, lidocaine, linezolid, LORazepam, magnesium sulfate, mannitol, mechlorethamine, melphalan, meperidine, meropenem, mesna, metaraminol, methohexital, methotrexate, methyldopate, methylPREDNISolone, metoclopramide, metoprolol, metroNIDAZOLE, midazolam, milrinone, mitoMYcin, morphine, nafcillin, nalbuphine, naloxone, niCARDipine, nitroglycerin, norepinephrine, octreotide, ondansetron, oxaliplatin, oxytocin, PACLitaxel, pamidronate, pancuronium, pentamidine, pentazocine, PENTobarbital, PHENobarbital, phentolamine, phenylephrine, piperacillin/tazobactam, potassium chloride/phosphates, procainamide, promethazine, propranolol, quinupristin/dalfopristin, remifentanyl, rocuronium, sodium acetate/bicarbonate/phosphates, streptozocin, succinylcholine, SUFentanyl, tacrolimus, teniposide, theophylline, thiotepa, ticarcillin/clavulanate, tirofiban, tobramycin, topotecan, trimethobenzamide, trimethoprim/sulfamethoxazole, vancomycin, vasopressin, vecuronium, verapamil, vinBLASTine, vinCRISTine, vinorelbine, zidovudine

SIDE EFFECTS

CNS: *Headache*, paresthesias, peripheral neuropathy, hallucinations, psychosis, EPS, depression, Guillain-Barré syndrome, insomnia, suicidal ideation, dizziness
CV: **Tachycardia**, hypo/hypertension, vasodilation, **atrial arrhythmias**, **atrial**

fibrillation, AV block, bradycardia, CHF, MI, QT prolongation, torsades de pointes

EENT: Blurred vision, eye hemorrhage

GI: *Nausea, vomiting, anorexia*, diarrhea, cramps, hemorrhagic gastroenteritis, acute hepatic failure, hepatitis, intestinal perforation, pancreatitis

GU: *Hypokalemia*, azotemia, renal tubular necrosis, permanent renal impairment, anuria, oliguria

HEMA: Anemia, eosinophilia, hypomagnesemia, thrombocytopenia, leukopenia, pancytopenia

INTEG: *Burning, irritation*, pain, necrosis at inj site with extravasation, dermatitis, rash, photosensitivity

MISC: Respiratory disorder

SYST: *Stevens-Johnson syndrome, toxic epidermal necrolysis, sepsis*; melanoma (photosensitivity reactions)

PHARMACOKINETICS

By CYP3A4, CYP2C9 enzymes; max serum conc 1-2 hr after dosing; eliminated via hepatic metabolism; protein binding 58%; elimination half-life 6 hr (dose dependent)

INTERACTIONS

Increase: effects of benzodiazepines, calcium channel blockers, cycloSPORINE, ergots, HMG-CoA reductase inhibitors, pimozide, quiNIDine, prednisoLONE, sirolimus, sulfonylureas, tacrolimus, vinca alkaloids, warfarin, rifabutin, proton pump inhibitors, NNRTIs, protease inhibitors, phenytoin

Increase: nephrotoxicity—other nephrotoxic antibiotics (aminoglycosides, CISplatin, vancomycin, cycloSPORINE, polymyxin B)

Increase: hypokalemia—corticosteroids, digoxin, skeletal muscle relaxants, thiazides

⚠ Increase: QT prolongation—class IA/III antidysrhythmics, some phenothiazines, β agonists, local anesthetics, tricyclics, haloperidol, chloroquine, droperidol, pentamidine; CYP3A4 inhibitors (amiodarone, clarithromycin, erythromycin, telithromycin, troleandomycin), arsenic trioxide, levomethadyl; CYP3A4 substrates (methadone, pimozide, QUETiapine, quiNIDine, risperiDONE, ziprasidone)

Drug/Herb

- Do not use with St. John's wort

Drug/Food

- Avoid use with high-fat meals, take 1 hr before or after meal

Drug/Lab Test

Increase: AST/ALT, alk phos, creatinine, bilirubin

Decrease: Hgb/Hct, platelets, WBC

NURSING CONSIDERATIONS**Assess:**

- VS q15-30min during first inf; note changes in pulse, B/P
- I&O ratio; watch for decreasing urinary output, change in specific gravity; discontinue product to prevent permanent damage to renal tubules
- Blood studies: CBC, K, Na, Ca, Mg q2wk; BUN, creatinine weekly
- Weight weekly; if weight increases >2 lb/wk, edema is present; renal damage should be considered ⚠️ **Renal toxicity:** increasing BUN, serum creatinine; if BUN is >40 mg/dl or if serum creatinine >3 mg/dl, product may be discontinued or dosage reduced ⚠️ **Hepatotoxicity:** increasing AST, ALT, alk phos, bilirubin, baseline and periodically
- **Allergic reaction:** dermatitis, rash; product should be discontinued, antihistamines (mild reaction) or epinephrine (severe reaction) administered
- **Hypokalemia:** anorexia, drowsiness, weakness, decreased reflexes, dizziness, increased urinary output, increased thirst, paresthesias
- **Ototoxicity:** tinnitus (ringing, roaring in ears), vertigo, loss of hearing (rare); visual disturbance
- **QT prolongation:** ECG, ejection fraction; assess for chest pain, palpitations, dyspnea

Evaluate:

- Therapeutic response: decreased fever, malaise, rash, negative C&S for infecting organism

Teach patient/family:

- That long-term therapy may be needed to clear infection (2 wk-3 mo, depending on type of infection)
- To notify prescriber of bleeding, bruising, soft-tissue swelling, dark urine, persistent nausea or diarrhea, headache, rash, yellow skin/eyes
- Take 1 hr before or after meal (PO)
- Do not drive at night because of vision changes
- Avoid strong, direct sunlight

- Women of childbearing age should use effective contraceptive, pregnancy (D)
-

✳ Canada only Side effects: *italics* = common; **bold** = life-threatening ⚠

Nurse Alert

HIGH ALERT

warfarin (Rx)

(war'far-in)

Coumadin, Jantoven

Func. class.: Anticoagulant

Chem. class.: Coumarin derivative

Do not confuse: **Coumadin**/Cardura/Compazine

ACTION:

Interferes with blood clotting by indirect means; depresses hepatic synthesis of vit-K–dependent coagulation factors (II, VII, IX, X)

USES:

Antiphospholipid antibody syndrome, arterial thromboembolism prophylaxis, DVT, MI prophylaxis, after MI, stroke prophylaxis, thrombosis prophylaxis

Unlabeled uses: Angina, unstable angina

CONTRAINDICATIONS:

Pregnancy (X), breastfeeding, hypersensitivity, hemophilia, leukemia with bleeding, peptic ulcer disease, thrombocytopenic purpura, hepatic disease (severe), malignant hypertension, subacute bacterial endocarditis, acute nephritis, blood dyscrasias, eclampsia, preeclampsia, hemorrhagic tendencies; surgery of CNS, eye; traumatic surgery with large open surface, bleeding tendencies of GI/GU/respiratory tract, stroke, aneurysms, pericardial effusion, spinal puncture, major regional/lumbar block anesthesia

Black Box Warning:

Bleeding

Precautions: Geriatric patients, alcoholism, CHF, debilitated patients, trauma, indwelling catheters, severe hypertension, active infections, protein C deficiency, polycythemia vera, vasculitis, severe diabetes, Asian patients (CYP2C9), protein C, S deficiency

DOSAGE AND ROUTES

Calculator

- **Adult: PO/IV** 2.5-10 mg/day × 2-4 days then titrated to INR/PT
- **Adolescent/child/infant: PO/IV** 0.2 mg/kg/day × 2 days titrated to INR

Available forms: Tabs 1, 2, 2.5, 3, 4, 5, 6, 7.5, 10 mg; inj 5 mg powder for inj

Administer:

PO route

- At same time each day to maintain steady blood levels without regard to food; food decreases rate but not extent of absorption; do not change brands
- Tabs whole or crushed
- Avoiding all IM inj that may cause bleeding

Direct IV route

- Reconstitute with 2.7 ml sterile water for inj (2 mg/ml); do not use sol that is discolored or that has particulates
- Give over 1-2 min into peripheral vein

Y-site compatibilities: Amikacin, ascorbic acid, bivalirudin, ceFAZolin, cefTRIAxone, DOPamine, EPINEPHrine, heparin, lidocaine, metaraminol, morphine, nitroglycerin, oxytocin, potassium chloride, ranitidine

SIDE EFFECTS

CNS: *Fever*, dizziness, fatigue, headache, lethargy

CV: Angina, chest pain, edema, hypotension, syncope

GI: *Diarrhea*, nausea, vomiting, anorexia, stomatitis, cramps, **hepatitis**, cholestatic jaundice

GU: **Hematuria**

HEMA: **Hemorrhage**, **agranulocytosis**, **leukopenia**, **eosinophilia**, anemia, ecchymosis, petechiae

INTEG: *Rash*, dermatitis, urticaria, alopecia, pruritus

MISC: Epistaxis, hemoptysis, mouth ulcers, taste disturbances, priapism, dyspnea

MS: Bone fractures

SYST: **Anaphylaxis**, coma, cholesterol, microembolism, **exfoliative dermatitis**, **purple toe syndrome**

PHARMACOKINETICS

PO: Onset 12-24 hr, peak 1½-4 days, duration 3-5 days, effective half-life 20-60 hr; metabolized in liver; excreted in urine, feces (active/inactive metabolites);

crosses placenta, 99% bound to plasma proteins

INTERACTIONS

Increase: warfarin action—allopurinol, amiodarone, chloral hydrate, chloramphenicol, cimetidine, clofibrate, cotrimoxazole, COX-2 selective inhibitors, dextrothyroxine, diflunisal, disulfiram, erythromycin, ethacrynic acids, furosemide, glucagon, heparin, HMG-CoA reductase inhibitors, indomethacin, isoniazid, mefenamic acid, metroNIDAZOLE, mifepristone, NSAIDs, oxyphenbutazones, penicillins, phenylbutazone, quinIDine, quinolone antiinfectives, RU-486, salicylates, sulfapyrazone, sulfonamides, sulindac, SSRIs, steroids, thrombolytics, thyroid, tricyclics

Increase: toxicity—oral sulfonylureas, phenytoin

Decrease: warfarin action—aprepitant, azaTHIOprine, barbiturates, bile acid sequestrants, bosentan, carBAMazepine, dicloxacillin, estrogens, ethchlorvynol, factor IX/VIIa, griseofulvin, nafcillin, oral contraceptives, phenytoin, rifampin, sucralfate, sulfaSALazine, thyroid, vit K, vit K foods

Drug/Herb

Increase: risk for bleeding—angelica, anise, basil, chamomile, chondroitin, dong quai, evening primrose, feverfew, garlic, ginger, ginkgo, ginseng, horse chestnut, kava, licorice, melatonin, red yeast rice, saw palmetto

Decrease: anticoagulant effect—coenzyme Q10, St. John's wort

Drug/Lab Test

Increase: T₃ uptake, LFTs

Decrease: uric acid

NURSING CONSIDERATIONS

Assess:

Black Box Warning:

Blood studies (Hct, PT, platelets, occult blood in stools) q3mo; INR: in hospital daily after 2nd or 3rd dose; when in therapeutic range for 2 consecutive days, monitor 2-3× wk for 1-2 wk then less frequently, depending on stability of INR results; *Outpatient:* monitor every few days until stable dose then periodically thereafter, depending on stability of INR results, usually at least monthly

Black Box Warning:

Bleeding gums, petechiae, ecchymosis, black tarry stools, hematuria; fatal hemorrhage can occur

 **Fever, skin rash, urticaria**

Perform/provide:

- Storage in tight container

Evaluate:

- Therapeutic response: decrease in deep venous thrombosis

Teach patient/family:

- To avoid OTC preparations that may cause serious product interactions unless directed by prescriber
- To carry emergency ID identifying product taken
- About the importance of compliance
- To report any signs of bleeding: gums, under skin, urine, stools; to use soft-bristle toothbrush to avoid bleeding gums; to use electric razor
- To avoid hazardous activities (eg, football, hockey, skiing), dangerous work
- About the importance of avoiding unusual changes in vitamin intake, diet, or lifestyle
- To inform all health care providers of anticoagulant intake

TREATMENT OF OVERDOSE:

Administer vit K

☼ Canada only Side effects: *italics* = common; **bold** = life-threatening ⚠

Nurse Alert

xylometazoline nasal agent

See [Appendix B](#)

🍁 Canada only Side effects: *italics* = common; **bold** = life-threatening ⚠️
Nurse Alert

zafirlukast (Rx)

(za-feer'loo-cast)

Accolate

Func. class.: Bronchodilator

Chem. class.: Leukotriene receptor antagonist

ACTION:

Antagonizes the contractile action of leukotrienes (LTD₄, LTE₄) in airway smooth muscle; inhibits bronchoconstriction caused by antigens

USES:

Prophylaxis and chronic treatment of asthma in adults/children >5 yr

Unlabeled uses: Allergic rhinitis

CONTRAINDICATIONS:

Hypersensitivity, hepatic encephalopathy

Precautions: Pregnancy (B), breastfeeding, children, geriatric patients, hepatic disease, Churg-Strauss syndrome, acute bronchospasm

DOSAGE AND ROUTES

Calculator

- **Adult and child ≥12 yr: PO** 20 mg bid
- **Child 5-11 yr: PO** 10 mg bid

Available forms: Tabs 10, 20 mg

Administer:

- 1 hr before or 2 hr after meals; absorption may be decreased if given with food

SIDE EFFECTS

CNS: Headache, dizziness, **suicidal ideation**, insomnia, fever

GI: Nausea, diarrhea, abdominal pain, vomiting, dyspepsia, **hepatic failure**, **hepatitis**

HEMA: **Agranulocytosis**

OTHER: Infections, pain, asthenia, myalgia, fever, increased ALT, urticaria, rash, **angioedema**

PHARMACOKINETICS

Rapidly absorbed, peak 3 hr, 99% protein binding (albumin), extensively metabolized, inhibits CYP2C9 and 3A4 enzyme systems, excreted in feces, clearance reduced in geriatric patients, hepatic impairment, half-life 10 hr

INTERACTIONS

Increase: plasma levels of zafirlukast—aspirin

Increase: PT—warfarin

Decrease: plasma levels of zafirlukast—erythromycin, theophylline

Drug/Food

Decrease: bioavailability

NURSING CONSIDERATIONS

Assess:

 **Adult patients carefully for symptoms of Churg-Strauss syndrome** (rare), including eosinophilia, vasculitic rash, worsening pulmonary symptoms, cardiac complications, neuropathy, may be caused by reducing oral corticosteroids

• Respiratory rate, rhythm, depth; auscultate lung fields bilaterally; notify prescriber of abnormalities, not to be used for acute bronchospasm in acute asthma • **Hepatic disease:** monitor liver function tests

Evaluate:

• Therapeutic response: ability to breathe more easily

Teach patient/family:

• To check OTC medications, current prescription medications that may increase stimulation • To avoid hazardous activities because dizziness may occur

• That, if GI upset occurs, to take product with 8 oz water; to avoid taking with food if possible because absorption may be decreased • To notify prescriber of nausea, vomiting, diarrhea, abdominal pain, fatigue, jaundice, anorexia, flulike symptoms (hepatic dysfunction) • Not to use for acute asthma episodes

• **Not to take if breastfeeding**

• To take even if symptom free

✳ Canada only Side effects: *italics* = common; **bold** = life-threatening 

Nurse Alert

zaleplon (Rx)

(zal'eh-plon)

Sonata

Func. class.: Hypnotic, nonbarbiturate *Chem. class.:* Pyrazolopyrimidine

Controlled Substance Schedule IV

ACTION:

Binds selectively to omega-1 receptor of the GABA_A receptor complex; results are sedation, hypnosis, skeletal muscle relaxation, anticonvulsant activity, anxiolytic action

USES:

Insomnia (short-term treatment)

CONTRAINDICATIONS:

Hypersensitivity, severe hepatic disease

Precautions: Pregnancy (C), breastfeeding, children <15 yr, geriatric patients, respiratory/renal/hepatic disease, psychosis, angioedema, depression, sleep-related behaviors (sleep walking)

DOSAGE AND ROUTES

Calculator

- **Adult: PO** 10 mg at bedtime; may increase dose to 20 mg at bedtime if needed; 5 mg may be used in low-weight persons
- **Geriatric: PO** 5 mg at bedtime; may increase if needed

Available forms: Caps 5, 10 mg

Administer:

- Immediately before bedtime for sleeplessness
- On empty stomach for fast onset

SIDE EFFECTS

CNS: *Lethargy, drowsiness, daytime sedation, dizziness, confusion, anxiety, amnesia, depersonalization, hallucinations, hyperesthesia, paresthesia, somnolence, tremor, vertigo, complex sleep related reactions: sleep driving,*

sleep eating

CV: Chest pain, peripheral edema

EENT: Vision change, ear/eye pain, hyperacusis, parosmia

GI: Nausea, abdominal pain, constipation, anorexia, colitis, dyspepsia, dry mouth

MISC: Asthenia, fever, headache, myalgia, dysmenorrhea

MS: Myalgia, back pain, arthritis

RESP: Bronchitis

SYST: Severe allergic reactions

PHARMACOKINETICS

Rapid onset, metabolized by liver extensively, excreted by kidneys (inactive metabolites), half-life 1 hr, onset, peak 1 hr, duration 3-4 hr

INTERACTIONS

Increase: effect of zaleplon—cimetidine

Decrease: zaleplon bioavailability—CYP3A4 inducers

Drug/Food

- Prolonged absorption, sleep onset reduced: high-fat/heavy meal

NURSING CONSIDERATIONS

Assess:

- Mental status: mood, sensorium, affect, memory (long, short term), excessive sedation, impaired coordination
- **Sleep disorder:** type of sleep problem: falling asleep, staying asleep; monitor for complex sleep disorders

Perform/provide:

- Storage in tight container in cool environment

Evaluate:

- Therapeutic response: ability to sleep at night, decreased amount of early morning awakening

Teach patient/family:

- To avoid driving or other activities requiring alertness until product is stabilized
- To avoid alcohol ingestion
- That product may cause memory problems, dependence (if used for longer periods of time), changes in behavior/thinking, complex sleep-related behaviors

(sleep eating/driving) • That product is for short-term use only

- To take immediately before going to bed
- Not to ingest a high-fat/heavy meal before taking

✳ Canada only Side effects: *italics* = common; **bold** = life-threatening ⚠
Nurse Alert

zanamivir (Rx)

(zan'ah-mih-veer)

Relenza

Func. class.: Antiviral

Chem. class.: Neuramidase inhibitor

ACTION:

Inhibits neuramidase enzyme needed for influenza virus replication

USES:

Treatment of influenza types A and B for patients who have been symptomatic for ≤ 2 days

Unlabeled uses: Prophylaxis against influenza; swine flu (H1N1)

CONTRAINDICATIONS:

Hypersensitivity

Precautions: Pregnancy (C), breastfeeding, children < 7 yr, geriatric patients, respiratory disease, angioedema, milk protein hypersensitivity, Reye's syndrome

DOSAGE AND ROUTES

Calculator

• **Adult/child > 7 yr:** INH 2 inhalations (two 5-mg blisters) q12hr $\times$ 5 days; on the 1st day, 2 doses should be taken with at least 2 hr between doses

H1N1 (swine flu) (unlabeled)

• **Adult/adolescent/child ≥ 7 yr:** INH 2 bid $\times$ 5 days

Available forms: Blisters of powder for inhalation: 5 mg

Administer:

- Within 2 days of symptoms of influenza; continue for 5 days
- Give patient "Patient's Instructions for Use," review all points before using delivery system
- Do not use as nebulized sol or in mechanical ventilation

SIDE EFFECTS

CNS: Headache, dizziness, seizures, fatigue; self-injury, delirium (child)

EENT: Ear, nose, throat infections

GI: Nausea, vomiting, diarrhea

RESP: Nasal symptoms, cough, sinusitis, bronchitis, **bronchospasm**

SYST: **Angioedema**

PHARMACOKINETICS

Half-life 2½-5 hr, not metabolized, excreted in urine unchanged

INTERACTIONS

- May decrease intranasal influenzae vaccine; separate by ≥48 hr, do not restart antiviral products for ≥2 wk

NURSING CONSIDERATIONS

Assess:

- Skin eruptions, photosensitivity after administration of product
- Respiratory status: rate, character, wheezing, tightness in chest
- Allergies before initiation of treatment, reaction of each medication
- Signs of infection

Perform/provide:

- Storage in tight, dry container

Evaluate:

- Therapeutic response: absence of fever, malaise, cough, dyspnea with infection

Teach patient/family:

- That product does not reduce transmission risk of influenza to others
- That patients with asthma or COPD should carry a fast-acting inhaled bronchodilator because bronchospasm may occur; to use scheduled inhaled bronchodilators before using product
- To avoid hazardous activities if dizziness occurs

☼ Canada only Side effects: *italics* = common; **bold** = life-threatening ⚠

Nurse Alert

zidovudine (Rx)

(zye-doe'-vue-deen)

Novo-AZT , Retrovir

Func. class.: Antiretroviral

Chem. class.: Nucleoside reverse transcriptase inhibitor (NRTI)

Do not confuse: **Retrovir**/ritonavir

ACTION:

Inhibits replication of HIV-1 virus by incorporating into cellular DNA by viral reverse transcriptase, thereby terminating the cellular DNA chain

USES:

Used in combination with at least 2 other antiretrovirals for HIV-1 infection

Unlabeled uses: Epstein-Barr virus, hepatitis B, human T-lymphotropic virus type I (HTLV-I), thrombocytopenia

CONTRAINDICATIONS:

Hypersensitivity

Precautions: Pregnancy (C), breastfeeding, children, granulocyte count $<1000/\text{mm}^3$ or Hgb <9.5 g/dl, severe renal disease, obesity

Black Box Warning:

Impaired hepatic function, anemia, lactic acidosis, myopathy, neutropenia

DOSAGE AND ROUTES

Calculator

HIV infections with other antiretrovirals

- **Adult: PO (tabs, caps, syrup)** 600 mg/day in divided doses, either 200 mg tid or 300 mg bid in combination with other antiretrovirals; **IV** 1 mg/kg q4hr, initiate **PO** as soon as possible up to 1000 mg
- **Child 25 kg to <30 kg: PO (tabs/caps)** 500 mg/day divided bid
- **Child 19 kg to <25 kg: PO (tabs/caps)** 400 mg/day divided bid
- **Infant/child ≥ 4 wk and 13 to <19 kg: PO (tabs/caps)** 300 mg/day divided bid
- **Infant/child ≥ 4 wk and 7 to <13 kg: PO (tabs/caps)** 200 mg/day divided bid
- **Infant/child ≥ 4 wk and 5 to <7 kg: PO (tabs/caps)** 150 mg/day divided bid

- **Adolescent/child ≥ 30 kg: PO (tabs/caps/syrup)** 300 mg bid or 200 mg tid
- **Infant ≥ 4 wk, child/adolescent ≥ 9 to < 30 kg: PO (syrup)** 18 mg/kg/day divided bid or tid
- **Infant ≥ 4 wk and 4 to < 9 kg: PO (syrup)** 24 mg/kg/day divided bid or tid
- **Neonate (unlabeled): PO (syrup)** 2 mg/kg q6hr
- **Premature neonate (unlabeled): PO (syrup)** 2 mg/kg q12hr, increase to 2 mg/kg q8hr at 2 wk for neonates ≥ 30 wk gestation or at 4 wk for neonates < 30 wk gestation

Prevention of maternal–fetal HIV transmission

- **Neonates ≥ 34 wk: PO** 2 mg/kg/dose q6hr $\times$ 6 wk beginning 8-12 hr after birth; **IV** 1.5 mg/kg/dose over 30 min q6hr until able to take **PO**
- **Maternal (> 14 wk gestation): PO** 100 mg 5 $\times$ /day until start of labor then during labor/delivery **IV** 2 mg/kg over 1 hr followed by **IV INF** 1 mg/kg/hr until umbilical cord clamped

Prevention of HIV after needlestick

- **Adult: PO** 200 mg tid plus lamivudine 150 mg bid plus a protease inhibitor for high-risk exposure; begin within 2 hr of exposure

Available forms: Caps 100; tabs 300 mg; inj 10 mg/ml; oral syr 50 mg/5 ml

Administer:

- By mouth; capsules should be swallowed whole
- Trimethoprim-sulfamethoxazole, pyrimethamine, or acyclovir as ordered to prevent opportunistic infections; if these products are given, watch for neurotoxicity

Intermittent IV INF route

- After diluting each 1 mg/0.25 ml or more D₅W to ≤ 4 mg/ml; give over 1 hr
- Protect unopened product from light, use diluted sol within 24 hr room temperature, 48 hr refrigerated

Y-site compatibilities: Acyclovir, allopurinol, amifostine, amikacin, amphotericin B, amphotericin B cholesteryl, aztreonam, cefepime, ceftazidime, ceftriaxone, cimetidine, cisatracurium, clindamycin, dexamethasone, DOBUTamine, DOPamine, DOXOrubicin liposome, erythromycin, filgrastim, fluconazole, fludarabine, gentamicin, granisetron, heparin, imipenem-cilastatin, LORazepam, melphalan, metoclopramide, morphine, nafcillin, ondansetron, oxacillin, PACLitaxel, pentamidine, phenylephrine, piperacillin, piperacillin-

tazobactam, potassium chloride, ranitidine, remifentanyl, sargramostim, teniposide, thiopental, tobramycin, trimethoprim-sulfamethoxazole, trimetrexate, vancomycin, vinorelbine

SIDE EFFECTS

CNS: *Fever, headache, malaise, diaphoresis, dizziness, insomnia, paresthesia, somnolence, chills, tremor, twitching, anxiety, confusion, depression, lability, vertigo, loss of mental acuity, seizures, malaise*

EENT: Taste change, hearing loss, photophobia

GI: *Nausea, vomiting, diarrhea, anorexia, cramps, dyspepsia, constipation, dysphagia, flatulence, rectal bleeding, mouth ulcer, abdominal pain, hepatomegaly*

GU: Dysuria, polyuria, urinary frequency, hesitancy

HEMA: *Granulocytopenia, anemia*

INTEG: *Rash, acne, pruritus, urticaria*

MS: Myalgia, arthralgia, muscle spasm

RESP: Dyspnea

SYST: *Lactic acidosis*

PHARMACOKINETICS

PO: Rapidly absorbed from GI tract, peak ½-1½ hr, metabolized in liver (inactive metabolites), excreted by kidneys, protein binding 38%, terminal half-life ½-3 hr

INTERACTIONS

Increase: bone marrow depression—antineoplastics, radiation, ganciclovir, valganciclovir, trimethoprim-sulfamethoxazole

Increase: zidovudine level—methadone, atovaquone, fluconazole, probenecid, trimethoprim, valproic acid; may need to reduce zidovudine dose

Decrease: zidovudine levels—interferons, NRTIs, DOXOrubicin, ribavirin, stavudine; avoid concurrent use

Drug/Lab Test

Decrease: platelets

Increase: LFTs

NURSING CONSIDERATIONS

Assess:

- Blood dyscrasias (anemia, granulocytopenia): bruising, fatigue, bleeding, poor healing

Black Box Warning:

Blood counts q2wk; watch for decreasing granulocytes, Hgb; if low, therapy may have to be discontinued and restarted after hematologic recovery; blood transfusions may be required; viral load, CD4 counts, LFTs, plasma HIV RNA, serum creatinine/BUN at baseline and throughout treatment

Black Box Warning:

Lactic acidosis, severe hepatomegaly with steatosis: Obtain baseline liver function tests, if elevated, discontinue treatment; discontinue even if liver function tests are normal but lactic acidosis, hepatomegaly are present; may be fatal

Perform/provide:

- Storage in cool environment; protect from light

Evaluate:

- Therapeutic response: decreased viral load, increased CD4 counts, decreased symptoms of HIV

Teach patient/family:

- That GI complaints and insomnia resolve after 3-4 wk of treatment
- That product not cure for AIDS but will control symptoms
- To notify prescriber of sore throat, swollen lymph nodes, malaise, fever because other infections may occur
- That patient is still infective, may pass AIDS virus on to others
- That follow-up visits must be continued because serious toxicity may occur; that blood counts must be done q2wk; that blood transfusions may be needed for severe anemia
- That product must be taken bid or tid
- That serious product interactions may occur if OTC products are ingested; to check with prescriber before taking aspirin, acetaminophen, indomethacin
- That other products may be necessary to prevent other infections
- That product may cause fainting or dizziness

☼ Canada only Side effects: *italics* = common; **bold** = life-threatening ⚠
Nurse Alert

zinc (Rx, otc)

Galzin

Func. class.: Trace element; nutritional supplement

ACTION:

Needed for adequate healing, bone and joint development (23% zinc)

USES:

Prevention of zinc deficiency, adjunct to vit A therapy

Unlabeled uses: Wound healing

Precautions: Pregnancy (C) parenteral; breastfeeding, neonates, hypocupremia, neonatal prematurity, renal disease

DOSAGE AND ROUTES

Calculator

Dietary supplement (elemental zinc)

- **Adult/adolescent/pregnant female: PO** 11-13 mg/day
- **Adult/lactating female: PO** 12-14 mg/day × 12 mo
- **Adult/adolescent male ≥14 yr: PO** 11 mg/day
- **Adult female ≥19 yr: PO** 8 mg/day
- **Adolescent female ≥14 yr: PO** 9 mg/day
- **Child 9-13 yr: PO** 8 mg/day
- **Child 4-8 yr: PO** 5 mg/day
- **Child 1-3 yr: PO** 3 mg/day
- **Infant 7-12 mo: PO** 3 mg/day
- **Infant birth to 6 mo: PO** 2 mg/day (adequate intake)

Nutritional supplement (IV)

- **Adult: IV** 2.5-4 mg/day; may increase by 2 mg/day if needed
- **Child 1-5 yr: IV** 50 mcg/kg/day

Wound healing

- **Adult: PO** 50 mg tid until healed (elemental zinc)

Available forms: Tabs 66, 110 mg; caps 220 mg; inj 1 mg, 5 mg/ml

Administer:

- With meals to decrease gastric upset; avoid dairy products

SIDE EFFECTS

GI: Nausea, vomiting, cramps, heartburn, ulcer formation

OVERDOSE: Diarrhea, rash, dehydration, restlessness

INTERACTIONS

Decrease: absorption of fluoroquinolones—tetracyclines

Drug/Food

Decrease: absorption of PO zinc—dairy products, caffeine

NURSING CONSIDERATIONS

Assess:

- **Zinc deficiency:** poor wound healing, absence of taste, smell, slowing growth
- Alkaline phosphatase, HDL monthly in long term therapy
- Zinc levels during treatment

Evaluate:

- Therapeutic response: absence of zinc deficiency

Teach patient/family:

- That element must be taken for 2-3 mo to be effective
- **To immediately report nausea, diarrhea, rash, severe vomiting, restlessness, abdominal pain, tarry stools**

🍁 Canada only Side effects: *italics* = common; **bold** = life-threatening ⚠️

Nurse Alert

ziprasidone (Rx)

(zi-praz'ih-dohn)

Geodon, Zeldox 

Func. class.: Antipsychotic/neuroleptic *Chem. class.:* Benzisoxazole derivative

ACTION:

Unknown; may be mediated through both dopamine type 2 (D₂) and serotonin type 2 (5-HT₂) antagonism

USES:

Schizophrenia, acute agitation, acute psychosis, bipolar disorder, mania, psychotic depression

Unlabeled uses: Tourette's syndrome

CONTRAINDICATIONS:

Breastfeeding, hypersensitivity, acute MI, heart failure, QT prolongation

Precautions: Pregnancy (C), children, geriatric patients, cardiac/renal/hepatic disease, breast cancer, diabetes, seizure disorders, AV block, CNS depression

Black Box Warning:

Increased mortality in geriatric patients with dementia-related psychosis

DOSAGE AND ROUTES

Calculator

Schizophrenia

- **Adult: PO** 20 mg bid with food, adjust dosage every 2 days upward to max of 80 mg bid; **IM** 10-20 mg; may give 10 mg q2hr; doses of 20 mg may be given q4hr; max 40 mg/day (acute episodes); switch to PO as soon as possible

Bipolar disorder

- **Adult: PO** 40 mg bid with food; on day 2 increase to 60 or 80 mg bid, then adjust to response; maintenance as adjunct to lithium/valproate 40-80 mg bid

Tourette's syndrome (unlabeled)

- **Adolescent and child ≥7 yr: PO** 5 mg/day, may increase in divided doses to 20 mg bid

Available forms: Caps 20, 40, 60, 80 mg; inj 20 mg/ml single-dose vials

Administer:

PO route

- Reduced dose in geriatric patients
- Anticholinergic agent on order from prescriber to be used for EPS

IM route

- Add 1.2 ml sterile water for inj to vial; shake vigorously until dissolved; do not admix; give only IM

SIDE EFFECTS

CNS: *EPS, pseudoparkinsonism, akathisia, dystonia, tardive dyskinesia; drowsiness, insomnia, agitation, anxiety, headache, seizures, neuroleptic malignant syndrome*, dizziness, tremor, facial droop

CV: Orthostatic hypotension, *tachycardia, prolonged QT/QTc*, hypertension; *sudden death, heart failure (geriatric patients), torsades de pointes*

EENT: Blurred vision, diplopia

ENDO: Metabolic changes

GI: *Nausea*, vomiting, *anorexia, constipation*, jaundice, weight gain, diarrhea, dry mouth, abdominal pain

GU: Enuresis, urinary incontinence, gynecomastia, impotence, priapism

RESP: Rhinitis, dyspnea, infection, cough

PHARMACOKINETICS

PO: Extensively metabolized by liver to major active metabolite, plasma protein binding 90%, peak 6-8 hr, terminal half-life 7 hr

INTERACTIONS

 **Increase:** QT prolongation—class IA/III antidysrhythmics, some phenothiazines, β -agonists, local anesthetics, tricyclics, haloperidol, methadone, chloroquine, clarithromycin, droperidol, erythromycin, pentamidine, moxifloxacin

Increase: sedation—other CNS depressants, alcohol

Increase: EPS, possible neurotoxicity—other antipsychotics, lithium

Increase: ziprasidone excretion—carbamazepine

Increase: ziprasidone level—ketoconazole

Increase: hypotension—antihypertensives

Increase: serotonin syndrome, neuroleptic malignant syndrome—SSRIs, SNRIs

NURSING CONSIDERATIONS

Assess:

- Mental status before initial administration

Black Box Warning:

Geriatric patient with dementia closely; heart failure, sudden death have occurred

- Bilirubin, CBC, LFTs, fasting blood glucose monthly
- Urinalysis before, during prolonged therapy
- B/P standing and lying; also pulse, respirations; take these q4hr during initial treatment; establish baseline before starting treatment; report drops of 30 mm Hg; watch for ECG changes; QT prolongation may occur • Dizziness, faintness, palpitations, tachycardia on rising; metabolic changes, weight gain • **EPS**, including akathisia (inability to sit still, no pattern to movements), tardive dyskinesia (bizarre movements of the jaw, mouth, tongue, extremities), pseudoparkinsonism (rigidity, tremors, pill rolling, shuffling gait) ⚠️ **Neuroleptic malignant syndrome, serotonin syndrome:** hyperthermia, increased CPK, altered mental status, muscle rigidity • Constipation, urinary retention daily; if these occur, increase bulk and water in diet

Perform/provide:

- Supervised ambulation until patient is stabilized on medication; do not involve patient in strenuous exercise program because fainting is possible; patient should not stand still for a long time • Increased fluids to prevent constipation
- Storage in tight, light-resistant container

Evaluate:

- Therapeutic response: decrease in emotional excitement, hallucinations, delusions, paranoia; reorganization of patterns of thought, speech

Teach patient/family:

- That orthostatic hypotension may occur; to rise from sitting or lying position gradually • To avoid hot tubs, hot showers, tub baths because hypotension may occur • To avoid abrupt withdrawal of product because EPS may result; that product should be withdrawn slowly • To avoid OTC preparations (cough, hay fever, cold) unless approved by prescriber because serious product interactions may occur; to avoid use with alcohol because increased drowsiness may occur
- To avoid hazardous activities if drowsy or dizzy
- To report impaired vision, tremors, muscle twitching

- In hot weather, that heat stroke may occur; to take extra precautions to stay cool

TREATMENT OF OVERDOSE:

Lavage if orally ingested; provide airway; *do not induce vomiting*

☼ Canada only Side effects: *italics* = common; **bold** = life-threatening ⚠

Nurse Alert

zoledronic acid (Rx)

(zoh'leh-drah'nick ass'id)

Reclast, Zometa

Func. class.: Bone-resorption inhibitor *Chem. class.:* Bisphosphonate

ACTION:

Potent inhibitor of osteoclastic bone resorption; inhibits osteoclastic activity, skeletal calcium release caused by stimulating factors released by tumors; reduction of abnormal bone resorption is responsible for therapeutic effect with hypercalcemia; may directly block dissolution of hydroxyapatite bone crystals

USES:

Moderate to severe hypercalcemia associated with malignancy; multiple myeloma; bone metastases from solid tumors (used with antineoplastics); active Paget's disease; osteoporosis, glucocorticoid-induced osteoporosis, osteoporosis prophylaxis in postmenopausal women

CONTRAINDICATIONS:

Pregnancy (D), breastfeeding; hypersensitivity to this product or bisphosphonates; hypocalcemia

Precautions: Children, geriatric patients, renal dysfunction, asthmatic patients, acute bronchospasm, anemia, chemotherapy, coagulopathy, dehydration, dental disease, diabetes mellitus, renal disease, electrolyte imbalance, hypertension, hypovolemia, infection, multiple myeloma, phosphate hypersensitivity

DOSAGE AND ROUTES

Calculator

Hypercalcemia of malignancy

- **Adult:** IV INF 4 mg, given as single inf over ≥ 15 min; may re-treat with 4 mg if serum calcium does not return to normal within 1 wk

Multiple myeloma/metastatic bone lesions

- **Adult:** IV INF 4 mg, give over 15 min q3-4wk

Osteoporosis

- **Adult:** IV INF 5 mg over ≥ 15 min q12mo

Active Paget's disease

- **Adult: IV INF** 5 mg over ≥ 15 min

Osteoporosis prophylaxis (reclast), postmenopausal women

- **Adult: IV INF** 5 mg every other year

Osteoporosis prophylaxis (reclast) when taking systemic glucocorticoids

- **Adult: IV** 5 mg every yr

Early breast cancer (unlabeled)

- **Adult: IV** 4 mg q6mo with goserelin 3.6 mg SUBCUT monthly and tamoxifen 20 mg daily or anastrozole 1 mg daily for 3 yr

Available forms: (Zometa) sol for inj 4 mg/5 ml; (Reclast) inj 5 mg/100 ml

Administer:

- Saline hydration must be performed before administration; urine output should be 2 L/day during treatment; do not overhydrate patient

IV route**Zometa**

- Administer after reconstituting by adding 5 ml of sterile water for inj to each vial then add to ≥ 100 ml of sterile 0.9% NaCl, D₅W; run over ≥ 15 min
- Administer in separate IV line from all other products

Reclast

- No further dilution required
- Infuse over ≥ 15 min at constant rate; max 5 mg

SIDE EFFECTS

CNS: Dizziness, headache, anxiety, confusion, insomnia, agitation

CV: Hypotension, leg edema, **atrial fibrillation**, chest pain

GI: Abdominal pain, anorexia, constipation, nausea, diarrhea, vomiting, taste change

GU: UTI, possible reduced renal function, **renal damage**

META: Anemia, hypokalemia, hypomagnesemia, hypophosphatemia, hypocalcemia, increased serum creatinine

MISC: *Fever, chills, flulike symptoms*

MS: Severe bone pain, *arthralgias, myalgias*, **osteonecrosis of jaw**

PHARMACOKINETICS

Rapidly cleared from circulation, taken up mainly by bones, not metabolized,

eliminated primarily by kidneys, approximately 50% eliminated in urine within 24 hr, max effect 7 days; terminal half-life 167 hr, protein binding 22%

INTERACTIONS

- Hypomagnesemia, hypokalemia: digoxin

Decrease: effect of zoledronic acid—calcium, vit D

Decrease: serum calcium, aminoglycosides, loop diuretics

- **Do not mix with calcium-containing infusion sol such as lactated Ringer's sol**

Increase: nephrotoxicity—aminoglycosides, NSAIDs, radiopaque contrast agents

Drug/Lab Test

Increase: creatinine

Decrease: calcium, phosphorous, magnesium, potassium, Hct/Hgb, RBC, platelets, WBC

NURSING CONSIDERATIONS

Assess:

- Renal tests, calcium, phosphate, magnesium, potassium; creatinine, BUN; if creatinine elevated, hold treatment
- **Hypocalcemia:** paresthesia, twitching, laryngospasm; Chvostek's/Trousseau's signs
- Dental status; cover with antiinfectives for dental extraction

- Atrial fibrillation

Perform/provide:

- Sol reconstituted with sterile water may be stored under refrigeration for up to 24 hr
- Acetaminophen before and for 72 hr after to decrease pain

Evaluate:

- Therapeutic response: decreased calcium levels, increased bone density

Teach patient/family:

- To report hypercalcemic relapse: nausea, vomiting, bone pain, thirst
- To continue with dietary recommendations, including calcium and vit D; to take a multiple vitamin daily as well as 500 mg of calcium, 400 international units vit D with multiple myeloma
- If nausea or vomiting occurs, to eat small, frequent meals, to use lozenges or chewing gum
- If bone pain occurs, to notify prescriber to obtain analgesics
- **To avoid use during pregnancy (D)**

- To continue good oral hygiene

🍁 Canada only Side effects: *italics* = common; **bold** = life-threatening ⚠️
Nurse Alert

ZOLMitriptan (Rx)

(zole-mih-trip'tan)

Zomig, Zomig-ZMT

Func. class.: Migraine agent, abortive Chem. class.: 5-HT_{1B}/5HT_{1D} receptor agonist (triptan)

ACTION:

Binds selectively to the vascular 5-HT_{1B}/5HT_{1D} receptor subtype, exerts antimigraine effect; causes vasoconstriction in cranial arteries

USES:

Acute treatment of migraine with/without aura

CONTRAINDICATIONS:

Angina pectoris, history of MI, documented silent ischemia, ischemic heart disease, uncontrolled hypertension, hypersensitivity, basilar or hemiplegic migraine, risk of CV events

Precautions: Pregnancy (C), breastfeeding, children, postmenopausal women, men >40 yr, geriatric patients, risk factors for CAD, hypercholesterolemia, obesity, diabetes, impaired renal/hepatic function

DOSAGE AND ROUTES

Calculator

• **Adult: PO** start at ≤2.5 mg (tab may be broken), may repeat after 2 hr, max 10 mg/24 hr; **NASAL** 1 spray in 1 nostril at onset of migraine, repeat in 2 hr if no relief

Available forms: Tabs 2.5, 5 mg; orally disintegrating tabs 2.5, 5 mg; nasal spray 5 mg

Administer:

- Take with fluids as soon as symptoms of migraine occur
- **Orally disintegrating tab:** do not crush or chew, allow to dissolve on tongue

SIDE EFFECTS

CNS: Tingling, hot sensation, burning, feeling of pressure, tightness, numbness, dizziness, sedation

CV: Palpitations, chest pain

GI: Abdominal discomfort, nausea, dry mouth, dyspepsia, dysphagia

MISC: Odd taste (spray)

MS: *Weakness, neck stiffness, myalgia*

RESP: Chest tightness, pressure

PHARMACOKINETICS

Duration 2-3½ hr; 25% plasma protein binding; half-life 3-3½ hr; metabolized in liver (metabolite); excreted in urine (60-80%), feces (20-40%)

INTERACTIONS

⚠️ Extended vasospastic effects: ergot, ergot derivatives ⚠️ Do not use within 2 wk of MAOIs ⚠️ Weakness, hyperreflexia, incoordination: SSRIs (FLUoxetine, fluvoxamine, PARoxetine, sertraline)

Increase: half-life of ZOLmitriptan—cimetidine, oral contraceptives

Increase: ZOLmitriptan levels—sibutramine

Drug/Herb

- Serotonin syndrome: SAM-e, St. John's wort

Drug/Lab Test

Increase: alk phos

NURSING CONSIDERATIONS

Assess:

- Tingling, hot sensation, burning, feeling of pressure, numbness, flushing
- Neurologic status: LOC, blurring vision, nausea, vomiting, tingling in extremities preceding headache
- Ingestion of tyramine foods (pickled products, beer, wine, aged cheese), food additives, preservatives, colorings, artificial sweeteners, chocolate, caffeine, which may precipitate these types of headaches
- Serotonin syndrome if also taking SSRI

Evaluate:

- Therapeutic response: decrease in frequency, severity of headache

Teach patient/family:

- To report any side effects to prescriber
- To use contraception while taking product
- That product does not prevent or reduce number of migraines

- To report chest pain, rash, swelling of face
 - Not to double doses, if second dose is needed, wait at least 2 hr
-

🍁 Canada only Side effects: *italics* = common; **bold** = life-threatening ⚠️
Nurse Alert

zolpidem (Rx)

(zole'pih-dem)

Ambien, Ambien CR, Edluar, Zolpimist

Func. class.: Sedative/hypnotic

Chem. class.: Imidazopyridine

Controlled Substance Schedule IV

ACTION:

Produces CNS depression at limbic, thalamic, hypothalamic levels of CNS; may be mediated by neurotransmitter γ -aminobutyric acid (GABA); results are sedation, hypnosis, skeletal muscle relaxation, anticonvulsant activity, anxiolytic action

USES:

Insomnia, short-term treatment; insomnia with difficulty of sleep onset/maintenance (ext rel)

CONTRAINDICATIONS:

Hypersensitivity to benzodiazepines

Precautions: Pregnancy (C), breastfeeding, children <18 yr, geriatric patients, anemia, renal/hepatic disease, suicidal individuals, drug abuse, psychosis, seizure disorders, angioedema, depression, respiratory disease, sleep apnea, sleep-related behaviors (sleepwalking), myasthenia gravis

DOSAGE AND ROUTES

Calculator

- **Adult:** **PO** 5 mg (women), 5-10 mg (men) at bedtime $\times$ 7-10 days only; total max dose 10 mg; **EXT REL** 6.25 (women), 6.25-12.5 mg (men) immediately before bedtime, may be useful for ≤ 24 wk in people 18-64 yr with primary insomnia; **oral spray** (Zolpimist) 5 mg (women), 5-10 mg (men) immediately before bedtime, max 10 mg/day; **SL** (Edluar) 5 mg (women), 5-10 mg (men) just before bedtime

- **Geriatric:** **PO** 5 mg at bedtime; **EXT REL** 6.25 mg; **SL:** 5 mg at bedtime

Available forms: Tabs 5, 10 mg; ext rel tabs 6.25, 12.5 mg; SL: 5, 10 mg; oral

spray 5 mg/spray

Administer:

PO route

- Do not break, crush, or chew ext rel
- Take with full glass of water
- ½-1 hr before bedtime (PO); right before retiring (ext rel)
- On empty stomach for fast onset; may be taken with food if GI symptoms occur

Spray route

- Prime before first use or if pump is not used for ≥14 days
- Do not use spray with or after a meal

Sublingual route

- Separate blister pack at perforation, peel paper and push product through, place product under tongue, allow to dissolve before swallowing; do not take with water

SIDE EFFECTS

CNS: Headache, lethargy, drowsiness, daytime sedation, dizziness, confusion, lightheadedness, anxiety, irritability, amnesia, poor coordination, complex sleep-related reactions (sleep driving, sleep eating), depression, somnolence, **suicidal ideation**, abnormal thinking/behavioral changes

CV: Chest pain, palpitations

GI: Nausea, vomiting, diarrhea, heartburn, abdominal pain, constipation

HEMA: **Leukopenia, granulocytopenia (rare)**

MISC: Myalgia

SYST: **Severe allergic reactions, angioedema, anaphylaxis**

PHARMACOKINETICS

PO: Onset up to 1.5 hr, metabolized by liver, excreted by kidneys (inactive metabolites), crosses placenta, excreted in breast milk, half-life 2-3 hr

INTERACTIONS

Increase: action of both products—alcohol, CNS depressants

Increase or decrease: zolpidem levels—CYP3A4 inhibitors/inducers

Decrease: zolpidem effect—rifamycins

NURSING CONSIDERATIONS

Assess:

⚠️ Mental status: mood, sensorium, affect, memory (long, short term), excessive sedation, impaired coordination, **suicidal thoughts/behaviors**

- Blood dyscrasias: fever, sore throat, bruising, rash, jaundice, epistaxis (rare)
- Type of sleep problem: falling asleep, staying asleep

Perform/provide:

- Storage in tight container in cool environment

Evaluate:

- Therapeutic response: ability to sleep at night, decreased amount of early morning awakening if taking product for insomnia

Teach patient/family:

- That dependence is possible after long-term use

⚠️ That complex sleep-related behaviors may occur (sleep driving/eating) • To avoid driving or other activities requiring alertness until dosage is stabilized • To avoid alcohol ingestion

- That effects may take 2 nights for benefits to be noticed
- Not to use during pregnancy, breastfeeding
- That hangover is common in geriatric patients but less common than with barbiturates; that rebound insomnia may occur for 1-2 nights after discontinuing product; not to discontinue abruptly; to taper • Not to crush, chew, break ext rel tabs
- To prime spray pump before using

TREATMENT OF OVERDOSE:

Lavage, activated charcoal; monitor electrolytes, VS

🇨🇦 Canada only Side effects: *italics* = common; **bold** = life-threatening ⚠️
Nurse Alert

zonisamide (Rx)

(zone-is'a-mide)

Zonegran

Func. class.: Anticonvulsant

Chem. class.: Sulfonamides

ACTION:

May act through action at sodium and calcium channels, but exact action is unknown; serotonergic action

USES:

Epilepsy, adjunctive therapy for partial seizures

Unlabeled uses: Bipolar disorder (mania)

CONTRAINDICATIONS:

Hypersensitivity to this product or sulfonamides; psychiatric condition, hepatic failure

Precautions: Pregnancy (C), breastfeeding, children <16 yr, geriatric patients, allergies, renal/hepatic disease

DOSAGE AND ROUTES

Calculator

• **Adult and child >16 yr:** 100 mg/day, may increase after 2 wk to 200 mg/day, may increase q2wk, max dose 600 mg/day

Available forms: Caps 25, 50, 100 mg

SIDE EFFECTS

CNS: Dizziness, insomnia, paresthesias, depression, fatigue, headache, confusion, somnolence, agitation, irritability, speech disturbance, **suicidal ideation, seizures, status epilepticus**

EENT: Diplopia, verbal difficulty, speech abnormalities, taste perversion, amblyopia, pharyngitis, rhinitis, tinnitus, nystagmus

GI: Nausea, constipation, anorexia, weight loss, diarrhea, dyspepsia, dry mouth, abdominal pain

GU: Kidney stones

HEMA: Aplastic anemia, granulocytopenia (rare); ecchymosis

INTEG: Rash, pruritus

MISC: Flulike symptoms

SYST: Stevens-Johnson syndrome, metabolic acidosis

PHARMACOKINETICS

Peak 2-6 hr, half-life in RBCs 105 hr, metabolized by liver, excreted by kidneys, protein binding 40%

INTERACTIONS

Decrease: half-life of zonisamide—carbamazepine, phenytoin, phenobarbital

Altered product levels: CYP3A4 inhibitors/inducers

Increase: CNS depression—alcohol

Drug/Herb

Increase: effect of this product—St. John's wort

Drug/Food

- Do not use with grapefruit

Drug/Lab Test

Increase: BUN, creatinine

NURSING CONSIDERATIONS

Assess:

- **Seizures:** duration, type, intensity, precipitating factors
- Renal function: albumin conc, BUN, creatinine, serum bicarbonate at baseline and periodically ⚠

Mental status: mood, sensorium, affect, memory (long, short term), **suicidal thoughts/behaviors**

- Stevens-Johnson syndrome, aplastic anemia, fulminant hepatic necrosis; may cause death; monitor for rashes and hypersensitive reactions
- Rash, hypersensitivity reactions

- Obtain bicarbonate before treatment/periodically; metabolic acidosis may occur in child

Evaluate:

- Therapeutic response: decrease in severity of seizures

Teach patient/family:

- Not to discontinue product abruptly because seizures may occur
- To avoid hazardous activities until stabilized on product

- To carry emergency ID stating product use
 - To notify prescriber of rash immediately; to notify prescriber of back pain, abdominal pain, blood in urine; to increase fluid intake to reduce risk of kidney stones
 - To notify prescriber if pregnancy planned, suspected
 - To avoid grapefruit
 - To notify prescriber of sore throat, fever, easy bruising
-

🍁 Canada only Side effects: *italics* = common; **bold** = life-threatening ⚠️

Recent FDA drug approvals

Generic	Trade	Use
alogliptin	Nesina	Diabetes Mellitus II
bedaquiline	Sirturo	Tuberculosis
crofelemer	Fulyzaq	Non-infectious diarrhea
lomitapide	Juxtapid	Hypercholestrolemia
pomalidomide	Pomalyst	Multiple Myeloma
raxibacumab	n/a	Anthrax
teduglutide	Gattex	Intestinal failure

Appendix A

Selected new drugs

alogliptin

(al'oh-glip'tin)

Nesina

Func. class.: Antidiabetic

Chem. class.: Dipeptidyl peptidase-4 (DPP-4) inhibitor

ACTION:

A dipeptidyl-peptidase-IV (DDP-IV) inhibitor for the treatment of type 2 diabetes mellitus (monotherapy or in combination with other antidiabetic agents), potentiates the effects of the incretin hormones by inhibiting their breakdown by DDP-IV

USES:

Type 2 diabetes mellitus (T2DM)

CONTRAINDICATIONS:

Hypersensitivity

Precautions: Pregnancy (B), breastfeeding, hepatic disease, burns, ketoacidosis, diarrhea, fever, GI obstruction, hyper/hypoglycemia, hyper/hypothyroidism, type 1 diabetes, hypercortisolism, children, ileus, malnutrition, pancreatitis, surgery, trauma, vomiting, kidney disease, adrenal insufficiency

Black Box Warning:

Angioedema

DOSAGE AND ROUTES

Calculator

- **Adult: PO** 25 mg/day; when used in combination, a lower dose of the other antidiabetic may be needed

Renal dose

- **Adult: PO** CCr 30–59 ml/min: 12.5 mg q day; CCr <30 ml/min: 6.25 mg q day; intermittent hemodialysis: 6.25 mg q day; give without regard to the timing of hemodialysis

Available forms: Tab 6.25, 12.5, 25

Administer:

- Without regard to food

SIDE EFFECTS

CNS: Headache

GI: Pancreatitis

META: Hypoglycemia

RESP: Upper respiratory infection, nasopharyngitis

SYST: Rash, hypersensitivity, angioedema, Stevens–Johnson syndrome

PHARMACOKINETICS

20% protein binding, excreted unchanged (urine), peak 1-2 hr, effect decreased in liver disease and increased in kidney disease

INTERACTIONS

Drug/Lab Test

Increase: LFTs

NURSING CONSIDERATIONS

Assess:

- **Diabetes:** monitor blood glucose, glycosylated hemoglobin A1c (A1c), LFTs, serum creatinine/BUN

⚠ **Pancreatitis:** Can occur during use

⚠ **Hypersensitivity reactions:** angioedema, Stevens–Johnson syndrome;

product should be discontinued

Evaluate:

- Positive therapeutic response: Decrease in polyuria, polydipsia, polyphagia, clear sensorium, absence of dizziness, improvement in A1c, daily blood glucose monitoring

Teach patient/family:

- That diabetes is a life-long condition, product does not cure disease
- That all food in diet plan must be eaten to prevent hypoglycemia; to continue with weight control, dietary medical nutrition therapy, physical activity, hygiene
- To carry emergency ID with prescriber, medications, and condition listed
- To test blood glucose using a blood glucose meter

🍁 Canada only Side effects: *italics* = common; **bold** = life-threatening ⚠️
Nurse Alert

bosutinib

(boe-sue'ti-nib)

Bosulif

Func. class.: Antineoplastic biologic response modifiers

Chem. class.: Signal transduction inhibitors (STIs), tyrosine kinase inhibitor

ACTION:

Inhibits bcr-abl tyrosine kinase created in patients with chronic myeloid leukemia (CML)

USES:

Treatment of CML; Philadelphia-chromosome–positive patients in blast-cell crisis

CONTRAINDICATIONS:

Pregnancy (D), hypersensitivity

Precautions: Breastfeeding, children, diarrhea, geriatric patients, hepatic disease, bone marrow suppression, infection, thrombocytopenia, neutropenia, immunosuppression

DOSAGE AND ROUTES

Calculator

- **Adult: PO** 500 mg daily with food, may increase to 600 mg/day in those who have not developed grade 3 toxicity or in patients who do not reach complete hematological response by wk 8 or complete cytogenetic response (CCyR) by wk 12

Hepatic dosage

- **Adult: PO** Any baseline hepatic impairment: Start at 200 mg/day; liver transaminase $>5 \times \text{ULN}$, hold dose until levels are $\leq 2.5 \times \text{ULN}$, then resume at 400 mg/day; liver transaminase level $\geq 3 \times \text{ULN}$ and bilirubin $>2 \times \text{ULN}$ and alk

phos $<2 \times \text{ULN}$, discontinue

Dosage adjustments for treatment-related toxicity

Hematologic toxicity:

⚠️ ANC $<1000 \times 10^6/\text{L}$ or platelet count $<50,000 \times 10^6/\text{L}$: hold dose until ANC is $\geq 1000 \times 10^6/\text{L}$ and platelets are $\geq 50,000 \times 10^6/\text{L}$; if recovery within 2 wk, resume therapy at the same dosage; if blood counts remain low after 2 wk, upon recovery, resume at 100 mg/day less than the previous dosage

Diarrhea:

⚠️ Grade 3 or 4 diarrhea (≥ 7 stools/day compared with baseline): hold therapy until recovery to grade 1 toxicity or lower; resume therapy at 400 mg/day

Other nonhematologic toxicity:

⚠️ Significant or moderate or severe toxicity: hold therapy until toxicity resolves; resume therapy at 400 mg/day

Available forms: Tabs 100, 500 mg

Administer:

PO route

- Give with food; swallow whole
- If dose is missed, take within 12 hr of missed dose; if >12 hr have passed, skip dose
- Follow cytotoxic handling procedures

SIDE EFFECTS

CNS: Headache, dizziness

GI: Nausea, vomiting, anorexia, abdominal pain, diarrhea

HEMA: Neutropenia, thrombocytopenia, bleeding

INTEG: Rash, pruritus

MS: Arthralgia, myalgia

RESP: Cough, dyspnea, pleural effusion, edema

OTHER: Elevated LFTs

PHARMACOKINETICS

Protein binding 96%; metabolized by CYP3A4; half-life 22.5 hr

INTERACTIONS

Increase: bosutinib concentrations—CYP3A4 inhibitors (ketoconazole, itraconazole, erythromycin, clarithromycin)

Increase: plasma concentrations of simvastatin, calcium channel blockers, ergots

Decrease: bosutinib concentrations—CYP3A4 inducers (dexamethasone, phenytoin, carbamazepine, rifampin, phenobarbital), antacids, proton-pump inhibitors

Drug/Food

Increase: increase bosutinib effect—grapefruit juice; avoid use while taking product

Drug/Herb

Decrease: bosutinib concentration—St. John's wort

Nursing considerations

Assess:

 **Myelosuppression: anemia, thrombocytopenia, neutropenia; obtain a CBC weekly × 1 mo, then monthly as needed**

- LFTs every mo × 3 mo, then as clinically indicated

Evaluate:

- Therapeutic response: decrease in leukemic cells or size of tumor

Teach patient/family:

- To report adverse reactions immediately, bleeding
- About reason for treatment, expected results
- To use effective contraception during treatment and up to 30 days after discontinuing treatment

 Canada only Side effects: *italics* = common; **bold** = life-threatening 
Nurse Alert

cabozantinib

(ka'boe-zan'ti-nib)

Cometriq

Func. class.: Antineoplastic biologic response modifiers

Chem. class.: Signal transduction inhibitor (STI)

ACTION:

Inhibits abnormal tyrosine kinase associated with growth and development of metastatic medullary thyroid cancer

USES:

Treatment of progressive metastatic medullary thyroid cancer

CONTRAINDICATIONS:

Pregnancy (D), hypersensitivity

Precautions: Breastfeeding, children, geriatric patients, cardiac/renal/hepatic/dental disease, bone marrow suppression, wound dehiscence, skin disease MI, hypertension, proteinuria, infertility, surgery, thrombocytopenia, neutropenia, immunosuppression

Black Box Warning:

Bleeding, fistula, GI bleeding/perforations

DOSAGE AND ROUTES

Calculator

- **Adult: PO** 140 mg/day until disease progression or unacceptable toxicity
- Avoid the concomitant use of strong 3A4 inhibitors or inducers if possible; temporary interruption of therapy and a dosage reduction may be necessary in patients who develop toxicity or intolerable side effects

Available forms: Tabs 60, 100, 140 mg

Administer:

- Take on an empty stomach; do not eat for ≥ 2 hr before and ≥ 1 hr after use; swallow whole; do not open or crush caps
- Do not take with grapefruit juice
- Do not take a missed dose within 12 hr of the next dose; if the next dose is in 12 hr or more, take the missed dose; if the next dose is in less than 12 hr, skip the

missed dose and take the next dose at the scheduled time

- Store at room temperature

Dosage adjustments for treatment-related toxicity:

⚠️ *Grade 4 hematologic toxicity, grade 3 or higher nonhematologic toxicity, or intolerable grade 2 toxicity:* Hold until resolution/improvement, then reduce the daily dosage by 40 mg (eg, 140 mg/day to 100 mg/day or 100 mg/day to 60 mg/day)

Dosage guidance in patients on strong CYP3A4 inducers/inhibitors:

⚠️ *Strong CYP3A4 inhibitors:* Avoid use if possible; if a strong CYP3A4 inhibitor is used, reduce the daily cabozantinib dosage by 40 mg; resume the prior dosage after 2 or 3 days if the strong CYP3A4 inhibitor is discontinued

⚠️ *Strong CYP3A4 inducers:* Avoid chronic concomitant use if possible; if a strong CYP3A4 inducer is required, increase the daily cabozantinib dosage by 40 mg, max 180 mg/day; resume the prior dosage after 2 or 3 days if the strong CYP3A4 inducer is discontinued

SIDE EFFECTS

CNS: Headache, dizziness

GI: Nausea, vomiting, dyspepsia, anorexia, abdominal pain, diarrhea, GI bleeding/fistula/perforation

HEMA: Neutropenia, thrombocytopenia, bleeding

INTEG: Rash

META: Hypokalemia

MISC: Fatigue, hypothyroidism, elevated liver enzymes

MS: Arthralgia, myalgia

PHARMACOKINETICS

Protein binding 99%, metabolized by CYP3A4

INTERACTIONS

Increase: cabozantinib concentrations—CYP3A4 inhibitors (ketoconazole, itraconazole, erythromycin, clarithromycin)

Increase: plasma concentrations of simvastatin, calcium channel blockers, ergots

Decrease: cabozantinib concentrations—CYP3A4 inducers (dexamethasone, phenytoin, carbamazepine, rifampin, phenobarbital)

Drug/Food

Increase: cabozantinib effect—grapefruit juice; avoid use while taking product

Drug/Herb

Cabozantinib concentration—St. John's wort

Nursing considerations

Assess:

⚠ **Proteinuria:** monitor urine protein regularly; discontinue if nephritic syndrome occurs

⚠ **GI bleeding/fistula/perforation:** can be fatal

⚠ **Wound dehiscence:** discontinue product ≥ 20 days before surgery

Evaluate:

- Therapeutic response: decrease in size, spread of tumor

Teach patient/family:

- To report adverse reactions immediately: bleeding
- About reason for treatment, expected results
- That effect on male infertility is unknown

🍁 Canada only Side effects: *italics* = common; **bold** = life-threatening ⚠

Nurse Alert

carfilzomib

(car-fil'zoe-mib)

Kyprolis

Func. class.: Antineoplastic biologic response modifiers

Chem. class.: Signal transduction inhibitors (STIs)

ACTION:

Antiproliferative and proapoptotic activity

USES:

Multiple myeloma in those who have received ≥ 2 therapies (including bortezomib and immunomodulatory agents)

CONTRAINDICATIONS:

Pregnancy (D), hypersensitivity

Precautions: Breastfeeding, children, cardiac disease, cardiac arrest, dysrhythmias, MI, infusion-related reactions, pulmonary/hepatic disease, edema, thrombocytopenia, neutropenia, tumor lysis syndrome

DOSAGE AND ROUTES

Calculator

- **Adult: IV** 20 mg/m² over 2-10 min on days 1, 2, 8, 9, 15, 16, then 12 day rest (days 17-28), then may increase to 27 mg/m² on days 1, 2, 8, 9, 15, 16 repeated every 28 days

 Refer to package insert for dosage adjustments for treatment-related toxicity

Available forms: Powder for injection 60 mg

Administer:

- Premedicate with dexamethasone 4 mg PO/IV before all carfilzomib 20-mg/m² doses during cycle 1 and before all carfilzomib 27-mg/m² doses in cycle 2; dexamethasone may be given in subsequent cycles if infusion-related reactions occur
- Hydration with 250–500 ml of NS or other IV fluids before each dose in cycle 1; additional hydration with 250–500 ml may be given after the carfilzomib infusion in cycle 1, continue hydration as needed

- Do not mix with other products
- Flush IV line with NS or D₅ for injection, before and after use

Reconstitution:

- Add 29 ml of sterile water for injection to the inside wall of the vial to minimize foaming (2 mg/mL); to mix, gently swirl and/or invert the vial slowly for about 1 min or until the cake or powder completely dissolves; do not shake; if foaming occurs, allow the solution to rest for 2 to 5 min or until foaming subsides; visually inspect for particulate and discoloration before use

IV injection route

- Give over 2-10 min; do not give as an IV bolus; the reconstituted sol may be stored in the vial/syringe at room temperature × 4 hr or ≤24 hr refrigerated

IV infusion route

- May further dilute in D₅W; measure and inject the correct dose from the reconstituted vial into 50 ml D₅W
- Administer IV over 2-10 min
- The diluted solution may be stored at room temperature × 4 hr or ≤24 hr refrigerated

SIDE EFFECTS

CNS: Headache, dizziness, insomnia

CV: Heart failure

GI: Nausea, vomiting, dyspepsia, anorexia, diarrhea

HEMA: Neutropenia, thrombocytopenia

META: Hyperglycemia, hypercalcemia, hypomagnesemia, hyponatremia, hypophosphatemia

MISC: Fatigue

MS: Arthralgia, myalgia

PHARMACOKINETICS

Protein binding 97%

NURSING CONSIDERATIONS

Assess:

 **Tumor lysis syndrome (TLS):** hydrate well; assess for hyperuricemia, hyperkalemia, hyperphosphatemia, hypocalcemia, uremia

⚠ **Hematologic toxicity** grade 3 and 4 neutropenia and thrombocytopenia; platelet nadirs occur day 8 of each 28-day cycle; counts return to baseline before the start of the next cycle; monitor blood and platelet counts frequently; hold dose for grade 3 or 4 neutropenia or grade 4 thrombocytopenia, may require dosage reduction

⚠ **Serious liver toxicity:** AST/ALT and bilirubin elevations and rare cases of fatal hepatic failure have occurred; monitor hepatic enzymes frequently; withhold doses until resolution or return to baseline in grade 3 or 4 AST/ALT or bilirubin elevations

⚠ **Serious cardiac toxicity:** fatal cardiac arrest, CHF with decreased left ventricular function/ejection fraction, myocardial ischemia, and pulmonary edema; those with NYHA class III/ IV CHF, MI within 6 mo, cardiac arrhythmias (conduction abnormalities) may be at increased risk; monitor for cardiac complications; withhold doses until resolution or return to baseline for grade 3 or 4 cardiac toxicity

⚠ **Infusion-related reactions:** may occur ≤24 hr after dose; premedication with dexamethasone is recommended; assess for fever, chills, arthralgia, myalgia, facial flushing, facial edema, vomiting, weakness, shortness of breath, hypotension, syncope, chest tightness, angina

Evaluate:

- Decreased spread of multiple myeloma

Teach patient/family:

- To promptly report infusion-related symptoms (fever, chills, arthralgia, myalgia, facial flushing, facial edema, vomiting, weakness, shortness of breath, hypotension, syncope, chest tightness, angina)

🇨🇦 Canada only Side effects: *italics* = common; **bold** = life-threatening ⚠
Nurse Alert

enzalutamide

(en-zal-u'ta-mide)

Xtandi

Func. class.: Antineoplastic hormone

Chem. class.: Nonsteroidal antiandrogen

ACTION:

Binds to cytosolic androgen receptors in target tissue, which competitively inhibits the action to androgens

USES:

Metastatic castration-resistant prostate cancer in those who have received docetaxel

CONTRAINDICATIONS:

Pregnancy (X), women, hypersensitivity

Precautions: Breastfeeding, brain tumor, head trauma, infertility, seizures, stroke, male-mediated teratogenicity

DOSAGE AND ROUTES

Calculator

- **Adult: PO** 160 mg (4×40 -mg caps) daily
- If a patient experiences a grade 3 or higher toxicity or an intolerable adverse effect, withhold dosing for 1 wk or until symptoms improve to grade 2 or less, then resume at the same or a reduced dosage (120 or 80 mg), if warranted
- The concomitant use of strong cytochrome P450 (CYP-450) 2C8 inhibitors should be avoided if possible; if a strong CYP2C8 inhibitor must be coadministered, reduce the enzalutamide dosage to 80 mg once daily

Available forms: Tabs 40 mg

Administer:

- At same time each day, without regard to food
- Swallow whole

SIDE EFFECTS

CNS: Dizziness, paresthesias, insomnia, anxiety, headache

CV: Hot flashes, hypertension

GU: Urinary frequency

INTEG: Dry skin, pruritus

MISC: Infection, asthenia

PHARMACOKINETICS

Terminal half-life 2.8 to 10.2 days, 97% to 98% protein binding

INTERACTIONS

Increase: anticoagulation—anticoagulants

Increase: enzalutamide effects—CYP3A4 inhibitors (amiodarone, antiretrovirals, protease inhibitors, clarithromycin, dalfopristin, quinupristin, delavirdine, efavirenz, erythromycin, FLUoxetine, fluvoxamine, imatinib, mifepristone, RU-486, nefazodone, some azole antifungals)

Decrease: enzalutamide effects—CYP3A4 inducers (barbiturates, bosentan, carbamazepine, dexamethasone, nevirapine, oxcarbazepine, phenytoin, rifabutin, rifampin, rifapentine)

Drug/Lab Test

Might require dosage change when used with St. John's wort

NURSING CONSIDERATIONS

Assess:

⚠️ **Male-mediated teratogenicity:** a condom and another effective birth control method should be used if patient is having sex with a woman of childbearing potential during and 3 mo after end of therapy

⚠️ **Seizures:** those with a history of seizures, underlying head trauma with loss of consciousness, TIA within 12 mo, stroke, brain tumor, or drugs lowering seizure threshold, should be told about danger of loss of consciousness when engaging in activities

⚠️ For hot flashes, assure patient that these are common side effects

Evaluate:

- Therapeutic response: decreased tumor size, decreased spread of malignancy

Teach patient/family:

- That infertility can occur

⚠️ To use a condom and another form of birth control during and for 3 mo after end of therapy if female sex partner is of child bearing potential

⚠️ That those with seizure disorders might experience seizures because seizure threshold is decreased

- Not to use other products unless approved by prescriber

🍁 Canada only Side effects: *italics* = common; **bold** = life-threatening ⚠️

Nurse Alert

icosapent

(eye-koe'sa-pent)

Vascepa

Func. class.: Antilipidemic

Chem. class.: Omega-3 fatty acid ethylester

ACTION:

Inhibits hepatic very low density lipoprotein (VLDL) and triglyceride synthesis; enhances clearance of triglycerides from circulating VLDL particles

USES:

As adjunct to diet in adults with severe hypertriglyceridemia (≥ 500 mg/dl)

CONTRAINDICATIONS:

Hypersensitivity to icosapent ethyl

Precautions: Hepatic disease, bleeding, breastfeeding, children, fish/shellfish hypersensitivity, thrombolytic/anticoagulation therapy, pregnancy C

DOSAGE AND ROUTES

Calculator

• **Adult: PO** 2 g bid

Available forms: Soft gel cap 1 g

Administer:

- Give with food, swallow whole
- Store at room temperature

SIDE EFFECTS

HEMA: Ecchymosis, epistaxis

MS: Arthralgia

PHARMACOKINETICS

Peak 5 hr, protein binding 99%, half-life 89 hr

INTERACTIONS

Increase: effects of anticoagulants, platelet inhibitors, thrombolytics

Drug/Lab Test

Increase: bleeding time

NURSING CONSIDERATIONS

Assess:

Hypertriglyceridemia:

- Obtain diet history including fat, cholesterol in diet; cholesterol, triglyceride levels periodically during treatment

Liver disease:

- Monitor LFTs baseline, periodically in those with liver disease

Bleeding:

- Monitor ecchymosis, epistaxis, bleeding time; use cautiously in anticoagulant/thrombolytic therapy

Fish/shellfish hypersensitivity:

- Identify fish hypersensitivity, use cautiously

Evaluate:

- Therapeutic response: decrease in triglycerides

Teach patient/family:

- That blood work may be necessary during treatment
- To report bleeding if anticoagulants or thrombolytics are used
- Not to break, crush, open, or dissolve caps
- That previously prescribed regimen will continue: low-cholesterol diet, exercise program, smoking cessation

🍁 Canada only Side effects: *italics* = common; **bold** = life-threatening ⚠️

Nurse Alert

linaclotide

(lin'a-kloe'tide)

Linzess

Func. class.: Functional GI disorder agent

Chem. class.: Selective guanylate cyclase C agonist

ACTION:

Acts locally on the luminal surface of the intestinal epithelium; stimulates secretion of chloride and bicarbonate into the intestinal lumen; this action results in increased intestinal fluid and accelerated GI transit

USES:

Irritable bowel syndrome (IBS) with constipation, chronic constipation not associated with IBS

CONTRAINDICATIONS:

Hypersensitivity, urticaria, infection, sinusitis, GI obstruction

Black Box Warning:

Children <6 yr, infants, neonates

Precautions: Pregnancy C, breastfeeding, diarrhea, abdominal pain, cholelithiasis, Crohn's disease, diverticulitis, fecal impaction, gastric cancer, GI disease, IBS

DOSAGE AND ROUTES

Calculator

Constipation

- **Adult: PO** 145 mcg/day on empty stomach, AM

Irritable bowel syndrome

- **Adult: PO** 290 mcg/day on empty stomach, AM

Available forms: Caps 145, 290 mcg

Administer:

- Give on empty stomach, ≥ 30 min before first meal of day, swallow whole
- Store at room temperature

SIDE EFFECTS

CNS: Headache, fatigue

GI: Nausea, abdominal pain, diarrhea, flatulence, fecal incontinence, vomiting, GERD, **GI bleeding**

PHARMACOKINETICS

Minimally absorbed, metabolized within the GI tract

INTERACTIONS

Do not use with antidiarrheals

Decrease: linaclotide effect—antimuscarinics

NURSING CONSIDERATIONS

Assess:

Black Box Warning:

Neonates/infants/children <6 yr: Can cause serious effects, including death

- GI symptoms: nausea, abdominal pain, evidence of mechanical GI obstruction; check for other sources of constipation, determine stool quality and frequency

Evaluate:

- Decreased constipation in IBS

Teach patient/family:

- To notify prescriber of GI symptoms, avoid antidiarrheals, if severe diarrhea occurs, stop product
- Do not crush, break, chew
- Pregnancy C: Avoid use in pregnancy, breastfeeding

☼ Canada only Side effects: *italics* = common; **bold** = life-threatening ⚠

Nurse Alert

lorcaserin

(lor-ca-ser'in)

Belviq

Func. class.: Weight-control agent (anorexiant)

Chem. class.: Serotonin 2C (5-HT_{2C}) receptor agonist

ACTION:

Decreases food consumption and decreases hunger by selectively activating 5-HT_{2C} receptors

USES:

Obesity management

CONTRAINDICATIONS:

Pregnancy (X), breastfeeding, hypersensitivity, severe renal impairment

Precautions: Children, other organic causes of obesity, anemia, AV block, bradycardia, bundle branch block, depression, dialysis, liver/kidney disease, multiple myeloma, neutropenia, suicidal ideation, Peyronie's disease, pulmonary hypertension, sick sinus syndrome

DOSAGE AND ROUTES

Calculator

Adult:

- **PO** 10 mg bid; do not exceed recommended dosage

Available forms: Tabs, film-coated 10 mg

Administer:

- For obesity if patient is on weight reduction program that includes dietary changes, exercise
- May give without regard to food

SIDE EFFECTS

CNS: Insomnia, depression, serotonin syndrome, anxiety, **suicidal ideation**, dizziness, headache, fatigue

CV: Bradycardia, hypertension

GI: Diarrhea, constipation, nausea

HEMA: Neutropenia, leukopenia, lymphopenia

INTEG: Rash

MS: Back pain

PHARMACOKINETICS

70% protein binding, half-life 11 hr

INTERACTIONS

Increase: life-threatening serotonin syndrome or NMS—SSRIs, SNRIs, serotonin-receptor agonists, sibutramine, MAOIs, linezolid, tricyclic antidepressants, buPROPion, lithium, DOPamine antagonist, traMADol

Increase: risk of hypoglycemia with sulfonylureas and insulin

Drug/Herb

Increase: Serotonin syndrome—St. John's wort

NURSING CONSIDERATIONS

Assess:

- Weight weekly; oral hypoglycemic dosage might need to be reduced in diabetic patients
- Monitor blood glucose, CBC with differential, Hct/Hgb, serum prolactin

 **Pregnancy (X):** do not use in pregnancy

Suicidal ideation:

 Use caution in psychiatric disorders with emotional lability; assess for depression, suicidal thoughts/behaviors

Evaluate:

- Therapeutic response: decrease in weight

Teach patient/family:

- To avoid hazardous activities until stabilized on medication
- To discuss unpleasant side effects

 To notify prescriber if pregnancy is planned or suspected, pregnancy X

mirabegron

(mir'a-beg'ron)

Myrbetriq

Func. class.: Bladder antispasmodic

Chem. class.: β_3 Adrenergic receptor agonist

ACTION:

Relaxes smooth muscles in urinary tract

USES:

Overactive bladder (urinary frequency, urgency), urinary incontinence

CONTRAINDICATIONS:

Hypersensitivity

Precautions: Pregnancy (C), breastfeeding, children, kidney/liver disease, bladder obstruction, dialysis, hypertension

DOSAGE AND ROUTES

Calculator

- **Adult: PO** 25 mg/day, may increase to 50 mg/day if needed

Hepatic/renal dose

 **PO** Child–Pugh B or (CCr 15-29 ml/min, max 25 mg/day; Child–Pugh C or CCr <15 ml/min, not recommended

Available forms: Tabs ext rel 25, 50 mg

Administer:

- Give whole; take with liquids; do not crush, chew, or break ext rel product; use without regard to meals

SIDE EFFECTS

CNS: Fatigue, dizziness, headache

CV: Hypertension

EENT: Xerophthalmia, blurred vision

GI: Nausea, vomiting, anorexia, abdominal pain, constipation, diarrhea, dyspepsia

GU: Dysuria, urinary retention, frequency, UTI, bladder discomfort

INTEG: Rash, pruritus

MISC: Arthralgia, back pain

RESP: Pharyngitis

SYST: Stevens–Johnson syndrome

PHARMACOKINETICS

71% protein binding, excretion 25% unchanged in urine, terminal half-life 50 hr, peak 3.5 hr

INTERACTIONS

Increase: Effect of digoxin, warfarin, desipramine, thioridazine, flecainide, propafenone

Increase: risk of urinary retention with antimuscarinic agents (eg, atropine, scopolamine)

NURSING CONSIDERATIONS

Assess:

- Urinary patterns: distention, nocturia, frequency, urgency, incontinence
- LFTs at baseline, periodically
- Monitor B/P

Evaluate:

- Decreasing dysuria, frequency, nocturia, incontinence

Teach patient/family:

- To avoid hazardous activities; dizziness can occur
- Not to drink liquids before bedtime
- About the importance of bladder maintenance

omacetaxine

(oh'ma-set-ax'een)

Synribo

Func. class.: Antineoplastic-miscellaneous

Chem. class.: Cephalotaxine ester (derived from the Evergreen tree: *Cephalotaxus harringtonia*)

ACTION:

Inhibits protein synthesis by binding to site of large ribosome subunit, it reduces Bcr-Abl and Mcl-1 independent of direct Bcr-Abl binding, inducing apoptosis

USES:

Chronic or accelerated phase chronic myelogenous leukemia (CML) with resistance or/and intolerance to 2 or more tyrosine kinase inhibitors

CONTRAINDICATIONS:

Pregnancy (D), breastfeeding, hypersensitivity

Precautions: Children, bleeding, diabetes mellitus, female patients, geriatric patients, hyperglycemia, hyperosmolar hyperglycemic state (HHS), infection, anemia, neutropenia, thrombocytopenia

DOSAGE AND ROUTES

Calculator

- **Adult:** SUBCUT 1.25 mg/m² bid × 14 days every 28 days

 **Grade 4 neutropenia (absolute neutrophil count [ANC] <0.5 × 10⁹/L) or grade 3 thrombocytopenia (platelet count <50 × 10⁹/L):** Do not start the next cycle until the ANC is ≥1 × 10⁹/L and platelets are ≥50 × 10⁹/L; when therapy is resumed, reduce the number of dosing days by 2 days/cycle (initial cycles, from 14 to 12 days; maintenance cycles, from 7 to 5 days)

Available forms: Powder for injection 3.5 mg

Administer:

SUBCUT route

- **Reconstitution:** Add 1 ml of 0.9% saline for injection/vial to 3.5 mg/ml, gently swirl until the solution is clear and completely dissolved, visually inspect for particulate matter and discoloration before use, protect from light

- **Administration:** Calculate dose, withdraw into a syringe, and give as a

SUBCUT injection; discard unused portion, use ≤ 12 hr at room temperature, ≤ 24 hr when refrigerated

SIDE EFFECTS

CNS: Seizures, weakness, agitation, anxiety, chills, fever, confusion, depression, dizziness, fatigue, headache, insomnia, lethargy, night sweats, tremor

CV: Hypotension, peripheral edema, sinus tachycardia

EENT: Blurred vision, change in taste (dysgeusia)

GI: Nausea, vomiting, diarrhea, abdominal pain, stomatitis

HEMA: Neutropenia, leukopenia, thrombocytopenia, anemia, bleeding

INTEG: Alopecia, rash, skin hyperpigmentation, stomatitis, skin ulcer, purpura, petechiae, pruritus

MISC: Fever

MS: Arthralgia, gout, myalgia, back pain

RESP: Dyspnea, cough, rales, sinus congestion

SYST: Infections

PHARMACOKINETICS

Protein binding $\leq 50\%$, half-life 6 hr, peak 30 min

INTERACTIONS

Increase: Bleeding risk—anticoagulants, salicylates, NSAIDs, avoid use when platelets are $< 50,000$ cells/mL

NURSING CONSIDERATIONS

Assess:

Black Box Warning:

CBC, differential, platelet count before treatment and weekly, during induction/maintenance, then every 2 wk as needed

 **Pregnancy D:** assess for pregnancy before starting treatment

 **Infection:** monitor temp every 4 hr; fever might indicate beginning of infection

- CV status: B/P, edema, flushing

- CNS changes: confusion, paresthesias, dysesthesia, pain, weakness

 **Hypersensitive reactions, anaphylaxis:** hypotension, dyspnea, angioedema, generalized urticaria; discontinue infusion immediately

⚠️ **Bone marrow depression/bleeding:** hematuria, guaiac, bruising or petechiae, mucosa or orifices every 8 hr; obtain prescription for viscous lidocaine (Xylocaine); avoid invasive procedures

- Effects of alopecia on body image; discuss feelings about body changes
- **Diabetes mellitus:** avoid in poorly controlled disease, monitor blood glucose levels frequently

Evaluate:

- Therapeutic response: decreased CML, positive hematologic response

Teach patient/family:

- To report signs of infection: fever, sore throat, flulike symptoms
- To report signs of anemia: fatigue, headache, faintness, SOB, irritability
- To report bleeding; to avoid use of razors, commercial mouthwash
- To avoid use of aspirin, ibuprofen
- That hair may be lost during treatment; that a wig or hairpiece might make patient feel better; that new hair may be different in color and texture
- That pain in muscles and joints 2-5 days after infusion is common

⚠️ To use barrier contraception during and for several mo after treatment, pregnancy (D); to avoid breastfeeding

- To avoid receiving vaccinations while taking product

🇨🇦 Canada only Side effects: *italics* = common; **bold** = life-threatening ⚠️

pazopanib

(paz-oh'pa-nib)

Votrient

Func. class.: Antineoplastic biologic response modifiers/multikinase angiogenesis inhibitor

Chem. class.: Signal transduction inhibitor (STI)

ACTION:

Targets vascular endothelial growth factor receptors; a multikinase angiogenesis inhibitor

USES:

Advanced renal cell carcinoma; soft-tissue sarcoma patients who have received prior chemotherapy

Unlabeled uses: Breast, ovarian cancer

CONTRAINDICATIONS:

Pregnancy (D), hypothyroidism, QT prolongation, MI, wound dehiscence, hypertension

Precautions: Breastfeeding, children, cardiac/renal/hepatic/dental disease, GI bleeding

Black Box Warning:

Hepatic disease

DOSAGE AND ROUTES

Calculator

• **Adult: PO** 800 mg/day without food (1 hr before, 2 hr after a meal), may decrease to 400 mg/day if not tolerated (renal cell cancer); or adjust in 200-mg increments based on toxicity (soft-tissue sarcoma)

Available forms: Tabs 200 mg

Administer:

- Give on an empty stomach (1 hr before or 2 hr after a meal); separate doses by ~24 hr
- Do not crush tablets owing to the potential for an increased rate of absorption, which can affect systemic exposure; only intact, whole tablets should be used
- If a dose is missed, it should not be taken if it is <12 hr until the next dose

- Store at 77°F (25°C)

SIDE EFFECTS

CNS: Intracranial bleeding, headache

CV: Heart failure, hypertension, hypertensive crisis, chest pain, MI, QT prolongation, torsades de pointes

GI: Nausea, hepatotoxicity, vomiting, dyspepsia, GI hemorrhage, anorexia, abdominal pain, GI perforation, pancreatitis, diarrhea

HEMA: Neutropenia, thrombocytopenia, bleeding

INTEG: Rash, alopecia

MISC: Fatigue, epistaxis, pyrexia, hot sweats, increased weight, flulike symptoms, hypothyroidism, hand–foot syndrome

PHARMACOKINETICS

Protein binding 99%

INTERACTIONS

Increase: QT prolongation—class IA/III antidysrhythmics, some phenothiazines, β -agonists, local anesthetics, tricyclics, haloperidol, chloroquine, droperidol, pentamidine; CYP3A4 inhibitors (amiodarone, clarithromycin, erythromycin, telithromycin, troleandomycin), arsenic trioxide, levomethadyl; CYP3A4 substrates (methadone, pimozide, QUetiapine, quiNIDine, risperiDONE, ziprasidone)

Increase: pazopanib concentrations—CYP3A4 inhibitors (ketoconazole, itraconazole, erythromycin, clarithromycin)

Increase: plasma concentrations of simvastatin, calcium-channel blockers, ergots

Increase: plasma concentration of warfarin; avoid use with warfarin; use low-molecular-weight anticoagulants instead

Decrease: pazopanib concentrations—CYP3A4 inducers (dexamethasone, phenytoin, carbamazepine, rifampin, PHENobarbital)

Drug/Food

Increase: pazopanib effect—grapefruit juice; avoid use while taking product

Drug/Herb

Decrease: pazopanib concentration—St. John's wort

NURSING CONSIDERATIONS

Assess:

Black Box Warning:

Hepatic disease: fatal hepatotoxicity can occur; obtain LFTs baseline and at least every 2 wk × 2 mo, then monthly

⚠ **Fatal Bleeding:** from GI, respiratory, GU tracts, permanently discontinue in those with severe bleeding

⚠ **Palmar-plantar erythrodysesthesia (hand-foot syndrome):** more common in those previously treated; reddening swelling, numbness, desquamation on palms and soles

⚠ **GI perforation/fistula:** discontinue if this occurs, assess for pain in epigastric area, dyspepsia, flatulence, fever, chills

⚠ **Hypertension/hypertensive crisis:** hypertension usually occurs in the first cycle; in those with preexisting hypertension, do not start treatment until B/P is controlled; monitor B/P every wk × 6 wk, then at start of each cycle or more often if needed, temporarily or permanently discontinue for severe uncontrolled hypertension

Evaluate:

- Therapeutic response: decreased in size, spread of tumor

Teach patient/family:

- To report adverse reactions immediately: bleeding
- About reason for treatment, expected results
- That effect on male fertility is unknown

🌿 Canada only Side effects: *italics* = common; **bold** = life-threatening ⚠
Nurse Alert

peginesatide

(peg'in-es'a-tide)

Omontys

Func. class.: Erythropoiesis-stimulating agent (ESA)

Chem. class.: Colony-stimulating factor/synthetic pegylated dimeric peptide

ACTION:

Stimulates erythropoiesis by binding to human erythropoietin receptors, thereby increasing reticulocyte count and Hgb

USES:

Anemia associated with chronic kidney disease (CKD) in patients on dialysis

CONTRAINDICATIONS:

Hypersensitivity, uncontrolled hypertension

Precautions: Pregnancy (C), breastfeeding, children, seizure disorder, hypertension, chronic kidney failure, dialysis, CABG, angina, heart failure, stroke, thromboembolic disease

Black Box Warning:

Hgb >11 g/dl, surgery, neoplastic disease

DOSAGE AND ROUTES

Calculator

Anemia due to chronic kidney disease in patients on dialysis

- **Adult: SUBCUT/IV** 0.04 mg/kg monthly for those not receiving erythropoiesis-stimulating agent (ESA)

Anemia due to CKD in patients on dialysis and currently receiving epoetin alfa or darbepoetin alfa

- **Adult: SUBCUT/IV** 2 mg/mo for epoetin <2500 units/wk or darbepoetin <12 mcg/wk; 3 mg/mo for epoetin 2500 to <4300 units/wk or darbepoetin 12 to <18 mcg/wk; 4 mg/mo for epoetin 4300 to <6500 units/wk or darbepoetin 12 to <25 mcg/wk; 5 mg/mo for epoetin 6500 to <8900 units/wk or darbepoetin 25 to <35 mcg/wk; 6 mg/mo for epoetin 8900 to <13,000 units/wk or darbepoetin 35 to <45 mcg/wk; 8 mg/mo for epoetin 13,000 to <19,000 units/wk or darbepoetin 45 to <60 mcg/wk; 10 mg/mo for epoetin 19,000 to <33,000 units/wk or

darbepoetin 60 to <95 mcg/wk; 15 mg/mo for epoetin 33,000 to <68,000 units/wk or darbepoetin 95 to <175 mcg/wk; 20 mg/mo for epoetin ≥68,000 units/wk or darbepoetin ≥175 mcg/wk

Available forms: Sol for inj 10 mg/ml, 20 mg/2 ml

Administer:

- Administer IV or SUBCUT
- Single-use vials and single-use prefilled syringes do not contain preservatives; use only one time and discard unused portion
- Do not dilute and do not administer with other drugs
- Adjustments in dialysis prescriptions and anticoagulation regimens may be required after initiation
- Visually inspect for particulate matter and discoloration before use; solution should be colorless to slightly yellow

IV direct route

- Inject directly into a vein

SIDE EFFECTS

CNS: Seizures, sweating, headache, stroke

CV: Hypo/hypertension, cardiac arrest, thrombosis, CHF, acute MI

GI: Diarrhea, vomiting, nausea

INTEG: Infusion-related reactions, angioedema, pruritus

MISC: Infection, fever, hyperkalemia

MS: Muscle cramps, back pain

RESP: Dyspnea, cough, bronchospasm

SYST: Allergic reactions, anaphylaxis

PHARMACOKINETICS

Mean half-life approximately 25 hr (IV), 53 hr (SUBCUT), 47.9 hr (dialysis, IV use)

INTERACTIONS

- Do not use epoetin alfa, darbepoetin alpha with product or concurrently

Drug/Lab Test

Increase: WBC, platelets

Decrease: bleeding time

NURSING CONSIDERATIONS

Assess:

- **Anemia:** fatigue, dyspnea, pallor
- ⚠ **Serious allergic reactions:** rash, urticaria; if anaphylaxis occurs, stop product, administer emergency treatment
- Renal studies: urinalysis, protein, blood, BUN, creatinine; monitor dialysis shunts; during dialysis, heparin may need to be increased

Black Box Warning:

HGB $\geq$ 11 g/dl B/P: check for rising B/P as Hgb rises; antihypertensives may be needed

- ⚠ **CV status:** hypertension can occur rapidly, leading to hypertensive encephalopathy; Hgb 12 g/dl can lead to death, do not administer
- I&O; report drop in output to 50 ml/hr
- **Seizures:** Monitor B/P; neurologic symptoms should be closely monitored
- Dialysis patients: thrill, bruit of shunts, monitor for circulation impairment
- ⚠ Before and during therapy, monitor iron status (transferrin saturation and serum ferritin); most patients require supplemental iron during therapy; monitor Hgb up to every 2 wk until stable, then at least monthly thereafter; consider rate of Hgb rise and fall, responsiveness to therapy, and Hgb variability when adjusting the peginesatide dose; a single Hgb concentration outside of the therapeutic range might not necessitate a dosage change
- ⚠ Do not initiate therapy until Hgb is <10 g/dl
- ⚠ Do not increase the dosage more than q4wk
- ⚠ If Hgb rises rapidly (eg, >1 g/dl in the 2 wk before the dose or >2 g/dl in 4 wk), reduce the dosage by 25% or more as needed to reduce rapid responses
- ⚠ If Hgb approaches or exceeds 11 g/dl, reduce or interrupt the dose. After a dose has been withheld and the Hgb begins to decrease, product may be restarted at a dosage 25% less than previous dosage
- ⚠ For those whose response is inadequate, if Hgb has not increased >1 g/dl after 4 wk of therapy, increase the dosage by 25%
- ⚠ For those who do not respond adequately over a 12-wk escalation period, increasing the dosage further is unlikely to improve response and can increase risks

Evaluate:

- Therapeutic response: increase in reticulocyte count, Hgb/Hct; increased appetite, enhanced sense of well-being

Teach patient/family:

- To avoid driving or hazardous activity, to report changes that can indicate seizures during beginning of treatment
 - That lab testing (Hgb) and blood pressure monitoring are required
-

🍁 Canada only Side effects: *italics* = common; **bold** = life-threatening ⚠️
Nurse Alert

perampanel

(per-am'pa-nel)

Fycompa

Func. class.: Anticonvulsant

ACTION:

A noncompetitive AMPA-selective receptor antagonist; inhibits calcium influx

USES:

Partial onset-seizures with/without secondary generalization

CONTRAINDICATIONS:

Hypersensitivity

Precautions: Pregnancy (C), breastfeeding, children <12 yr, geriatric patients, abrupt discontinuation, depression, liver disease, kidney disease, substance abuse, suicidal ideation, driving or operating machinery

Black Box Warning:

Bipolar disorder, psychosis, schizophrenia

DOSAGE AND ROUTES

Calculator

- **Adult/adolescent/child ≥ 12 yr receiving enzyme-inducing aeds:** PO 4 mg/day at bedtime, increase dosage every wk by 2 mg/day to 4-12 mg/day at bedtime
- **Adult/adolescent/child ≥ 12 yr not receiving aeds:** PO 2 mg/day at bedtime, increase dosage every wk by 2 mg/day up to 4-8 mg/day at bedtime

Available forms: Tabs 2, 4, 6, 8, 10, 12 mg

Administer:

- Store at room temperature away from light

SIDE EFFECTS

CNS: Drowsiness, confusion, memory impairment, dizziness, fatigue, anxiety, ataxia, agitation, emotional lability, euphoria, hostility, lethargy, memory impairment, paranoia, paresthesias, **suicidal ideation**, vertigo, depression

CV: Peripheral edema

EENT: Blurred vision, diplopia

GI: Constipation, nausea, vomiting, weight gain

MS: Myalgia, arthralgia

SYST: Infection

PHARMACOKINETICS

Protein binding 95%-96%, half-life 105 hr, antagonist of the AMPA receptor

INTERACTIONS

Increase: perampanel effect—CYP3A4 inducers

Increase: depression—benzodiazepines

Increase: CNS depression—alcohol, sedatives, antihistamines, all other CNS depressants

Decrease: contraception—oral/implant contraceptives with levonorgestrel/estrogen

Decrease: perampanel effect—CYP3A4 inhibitors

Drug/Herb

Decrease: perampanel effect—St. John's wort

NURSING CONSIDERATIONS

Assess:

⚠ **Seizures:** aura, location, duration, activity at onset; institute seizure precautions: padded side rails; move objects that might harm patient

Black Box Warning:

Bipolar disorder, psychosis, schizophrenia: Hostility, aggression, anger, homicidal ideation can occur

⚠ **Suicidal ideation:** assess for suicidal thoughts/behaviors as early as 1 wk and any time during treatment

- Mental status: mood, sensorium, affect, behavioral changes, suicidal thoughts/behaviors; if mental status changes: notify prescriber

⚠ **Abrupt discontinuation:** can increase seizures

Evaluate:

- Therapeutic response: decreased seizure activity

Teach patient/family:

- To avoid driving, other activities that require alertness because dizziness, drowsiness can occur

⚠ **Not to discontinue medication quickly after long-term use; to taper over ≥ 1**

wk because withdrawal-precipitated seizures can occur

⚠ To notify prescriber if pregnancy is planned or suspected; to avoid breastfeeding

- Take once daily at bedtime

🍁 Canada only Side effects: *italics* = common; **bold** = life-threatening ⚠
Nurse Alert

pertuzumab

(per-too'zoo-mab)

Perjeta

Func. class.: Antineoplastic biologic-response modifier

Chem. class.: Monoclonal antibody, antineoplastic

ACTION:

Blocks liquid-dependent action of human epidermal growth factor-2 (HER2), inhibiting signal pathways

USES:

First-line treatment of (HER2) positive metastatic breast cancer with trastuzumab and DOCEtaxel

CONTRAINDICATIONS:

Black Box Warning:

pregnancy (category D)

Precautions: Breastfeeding, children, infants, neonates, cardiac arrhythmias, MI, cardiac disease, heart failure, hypertension, infusion-related reactions

DOSAGE AND ROUTES

Calculator

• **Adult:** IV 840 mg over 60 min, then after 3 wk 420 mg over 30-60 min every 3 wk; give with trastuzumab 8 mg/kg IV over 90 min, then after 3 wk 6 mg/kg over 30-90 min every 3 wk and DOCEtaxel 75 mg/m² IV every 3 wk; dosage may be escalated to 100 mg/m²

Available forms: Solution for inj 420 mg/14 ml

Administer:

• Visually inspect for particulate matter and discoloration

Dilution and preparation

• Withdraw the calculated dose from the vial and add to 250 ml 0.9% sodium chloride to PVC or non-PVC polyolefin infusion bag; do not dilute with dextrose 5% solution

• Dilute in normal saline only; do not mix or dilute with other drugs or dextrose

solutions

- Mix the diluted solution by gentle inversion; do not shake

IV infusion

- Administer the diluted solution immediately
- Do not administer as an IV push or bolus
- Give the first dose of 840 mg over 60 min and subsequent 420 mg doses over 30–60 min
- If the diluted solution is not used immediately, store at 2°-8° C for up to 24 hr

Delayed or missed doses

- If time since previous dose is <6 wk, give 420 mg IV (do not wait for next scheduled dose)
- If time since previous dose is ≥6 wk, give 840 mg IV over 60 min, followed 3 wk later by 420 mg IV over 30–60 min repeated every 3 wk
- If DOCEtaxel is discontinued, this product and trastuzumab may continue

SIDE EFFECTS

CNS: Headache, fever, *peripheral neuropathy*, chills, *fatigue*, asthenia

CV: **Heart failure**

EENT: Lacrimation, stomatitis

GI: *Nausea*, vomiting, diarrhea, dysgeusia

HEMA: Anemia, **neutropenia**

MS: Myalgia

RESP: Upper respiratory infection

SYST: **Anaphylaxis**, infection, antibody formation

PHARMACOKINETICS

Median half-life 18 days

NURSING CONSIDERATIONS

Assess:

HER2 overexpression:

- Testing should be done to identify HER2 overexpression before using this product

Decreased left ventricular ejection fraction (LVEF):

⚠ Can occur and is increased in those with a history of prior anthracycline use or radiotherapy to the chest; evaluate LVEF at baseline and every 3 mo; withhold therapy ×3 wk if LVEF is <40% or LVEF is 40%-45% with a 10% or greater absolute decrease from baseline; resume therapy if the LVEF is recovered to >45% or to 40%-45% with <10% absolute decrease at reassessment; if the LVEF has not improved or has declined further, consider permanently discontinuing pertuzumab and trastuzumab after a risk/benefit assessment

Infusion-related reactions/hypersensitivity:

⚠ Assess anaphylactoid reaction, acute infusion reaction, cytokine-release syndrome 60 min after the first infusion, 30 min after other infusions; monitor for pyrexia, chills, fatigue, headache, asthenia, hypersensitivity, and vomiting; if a significant reaction occurs, slow or interrupt the infusion; permanent discontinuation may be needed in severe reactions

Black Box Warning:

Pregnancy: Determine if pregnancy is planned or suspected; patients who become pregnant during therapy should report exposure to the Genentech Adverse Event line at 1-888-835-2555 and enroll in the MOTHER pregnancy registry at 1-800-690-6720

Neutropenia:

⚠ Can occur, but occurs more commonly when trastuzumab is also used

Upper respiratory infection:

- Monitor for dyspnea, shortness of breath, fever

Evaluate:

- Decreased size, spread of tumor

Teach patient/family:

Black Box Warning:

Counsel women of childbearing age on the need for contraception during and for 6 mo after therapy; advise patients who suspect pregnancy to contact their health care provider immediately; discontinue breastfeeding

🍁 Canada only Side effects: *italics* = common; **bold** = life-threatening ⚠

Nurse Alert

regorafenib

(re'goe-raf'e-nib)

Stivarga

Func. class.: Antineoplastic biologic-response modifier; multikinase inhibitor

Chem. class.: Signal transduction inhibitor (STI)

ACTION:

Inhibits tyrosine kinase in patients with colorectal cancer

USES:

Metastatic colorectal cancer in those who have received fluoropyrimidine, oxaliplatin, irinotecan-based chemotherapy, an anti-VEGF therapy; and an anti-EGFR therapy if *KRAS* wild type

CONTRAINDICATIONS:

Pregnancy (D)

Precautions: Breastfeeding, children, geriatric patients, cardiac/renal/hepatic/dental disease, fistula, GI bleeding or perforation, bone marrow suppression, infection, wound dehiscence, thrombocytopenia, neutropenia, immunosuppression

Black Box Warning:

Hepatic disease

DOSAGE AND ROUTES

Calculator

• **Adult: PO** 160 mg/day with a low-fat breakfast × 21 days of a 28-day cycle, cycles may be repeated

Available forms: Tabs 40 mg

Administer:

- Store at 77°F (25°C)
- Give at the same time each day with a low-fat breakfast that contains less than 30% fat such as 2 slices of white toast with 1 TBSP of low-fat margarine and 1 TBSP of jelly, and 8 oz of skim milk; or 1 cup of cereal, 8 oz of skim milk, 1 slice of toast with jam, apple juice, and 1 cup of coffee or tea
- Swallow tablets whole

- If a dose is missed, take as soon as possible that day; do not take 2 doses on the same day

Hand–foot skin reaction

⚠️ Reduce to 120 mg (grade 2 palmar–plantar erythrodysesthesia); hold if grade 2 toxicity does not improve in ≤ 7 days or recurs; hold for ≥ 7 days in grade 3 toxicity; reduce to 80 mg for recurrent grade 2 toxicity; discontinue if 80 mg is not tolerated

Hypertension

⚠️ Hold in grade 2 hypertension

Other severe toxicity (except hepatotoxicity)

⚠️ Hold until toxicity resolves in grade 3 or 4 toxicity; consider the risk/benefits of continuing therapy in grade 4 toxicity, reduce dosage to 120 mg; if grade 3 or 4 toxicity recurs, hold until toxicity resolves, then reduce to 80 mg; discontinue in those who do not tolerate 80-mg dose

Hepatic dose

⚠️ Baseline mild (Child-Pugh class A) or moderate (Child-Pugh class B): no change; baseline severe hepatic impairment (Child-Pugh class C): use not recommended; AST/ALT elevations during therapy: For grade 3 AST/ALT level elevations, hold dose; if therapy is continued, reduce to 120 mg after levels recover; discontinue in those with AST/ALT $> 20 \times$ ULN; AST/ALT $> 3 \times$ ULN and bilirubin $> 2 \times$ ULN; recurrence of AST/ALT $> 5 \times$ ULN despite a reduction to 120 mg

SIDE EFFECTS

CNS: Headache, tremor

CV: Hypertensive crisis, MI

EENT: Blurred vision, conjunctivitis

GI: Hepatotoxicity, GI hemorrhage, diarrhea, GI perforation, xerostomia

HEMA: Neutropenia, thrombocytopenia, bleeding

INTEG: Rash, alopecia

META: Hypokalemia

MISC: Fatigue, decreased weight, hand–foot syndrome, hypothyroidism

PHARMACOKINETICS

Protein binding 99%, metabolized by CYP3A4, UGT1A0, half-life 14-58 hr

INTERACTIONS

Increase: regorafenib concentrations—CYP3A4 inhibitors (ketoconazole, itraconazole, erythromycin, clarithromycin)

Increase: plasma concentrations of simvastatin, calcium-channel blockers, ergots

Increase: plasma concentration of warfarin; avoid use with warfarin; use low-molecular-weight anticoagulants instead

Decrease: regorafenib concentrations—CYP3A4 inducers (dexamethasone, phenytoin, carbamazepine, rifampin, phenobarbital)

Drug/Food

Increase: regorafenib effect—grapefruit juice; avoid use while taking product

Drug/Herb

Decrease: imatinib concentration—St. John's wort

NURSING CONSIDERATIONS

Assess:

Black Box Warning:

Hepatic disease: fatal hepatotoxicity can occur; obtain LFTs baseline and at least every 2 wk × 2 mo, then monthly

Fatal bleeding:

⚠ From GI, respiratory, GU tracts; permanently discontinue in those with severe bleeding

Palmar–plantar erythrodysesthesia (hand–foot syndrome):

⚠ More common in those previously treated; reddening swelling, numbness, desquamation on palms, soles

GI perforation/fistula:

⚠ Discontinue if this occurs, assess for pain in epigastric area, dyspepsia, flatulence, fever, chills

Hypertension/hypertensive crisis:

⚠ Hypertension usually occurs in the first cycle in those with preexisting hypertension, do not start treatment until B/P is controlled; monitor B/P every wk × 6 wk, then at start of each cycle or more often if needed, temporarily or permanently discontinue for severe uncontrolled hypertension

Evaluate:

- Therapeutic response: decrease in spread or size of tumor

Teach patient/family:

- To report adverse reactions immediately: bleeding, rash

- About reason for treatment, expected results
- That effect on male fertility is unknown

🍁 Canada only Side effects: *italics* = common; **bold** = life-threatening ⚠️
Nurse Alert

tbo-filgrastim

(filgras'tim)

Neutrophil

Func. class.: Biologic modifier

Chem. class.: Short-acting granulocyte colony-stimulating factor (G-CSF)

ACTION:

Stimulates proliferation and differentiation of neutrophils by binding to G-CSF receptors

USES:

Chemotherapy-induced neutropenia prophylaxis to reduce the duration of severe neutropenia in nonmyeloid malignancies

CONTRAINDICATIONS:

Hypersensitivity

Precautions: pregnancy (C), breastfeeding, children, sickle cell disease, chemotherapy, neoplastic disease

DOSAGE AND ROUTES

Calculator

• **Adult: SUBCUT** 5 mcg/kg/day

Available forms: Solution for injection 300 mcg/0.5 ml, 480 mcg/0.8 ml

Administer:

SUBCUT route

- Visually inspect for particulate matter and discoloration before use, the solution should be clear; do not shake
- Injection sites include the front of the middle thighs, the upper outer areas of the buttocks, the upper back portion of the upper arms, or the abdomen except for the 2 inches around the navel; vary sites daily
- After removing the needle shield, expel unneeded volume based on the needed dose, discard unused portions
- Inject SUBCUT, avoiding any area that is tender, red, bruised, or hard or that has stretch marks or scars; push the plunger as far as it will go, because injection

of the entire contents is necessary to activate the needle guard

- Remove needle from skin while keeping plunger depressed; slowly let the plunger go to allow the empty syringe to move inside the device and guard the needle

SIDE EFFECTS

CNS: Fever, headache

GI: Nausea, vomiting, diarrhea, anorexia, abdominal pain

HEMA: Excessive leukocytosis

INTEG: Alopecia

RESP: Acute respiratory distress syndrome (ARDS)

SYST: Anaphylaxis, angioedema, sickle-cell crisis, splenic rupture

PHARMACOKINETICS

Half-life 3.2-3.8 hr

INTERACTIONS

Increase: adverse reactions—do not use this product concomitantly with antineoplastics, lithium

NURSING CONSIDERATIONS

Assess:

- Blood studies: CBC, platelet count before treatment and twice weekly; neutrophil counts may be increased for 2 days after therapy
- B/P, respirations, pulse before and during therapy
- Bone pain; give mild analgesics

Evaluate:

- Absence of severe neutropenia in cancer chemotherapy

Teach patient/family:

- About the technique for self-administration: dose, side effects, disposal of containers and needles; provide instruction sheet

☛ Canada only Side effects: *italics* = common; **bold** = life-threatening ⚠
Nurse Alert

teriflunomide

(ter'i-floo'noe-mide)

Aubagio

Func. class.: Multiple sclerosis agent

Chem. class.: Pyrimidine synthesis inhibitor

ACTION:

Antiproliferative effects including peripheral T-and B-lymphocytes, might reduce inflammatory demyelination

USES:

Reduction of the frequency of relapses or remitting MS

CONTRAINDICATIONS:

Hypersensitivity

Black Box Warning:

Pregnancy: X

Precautions: Breastfeeding, alcoholism, diabetes mellitus, eosinophilic pneumonia, hepatitis, jaundice, male-mediated teratogenicity, pneumonitis, pulmonary disease/fibrosis, sarcoidosis, TB, vaccination

Black Box Warning:

Hepatic disease

DOSAGE AND ROUTES

Calculator

• **Adult: PO** 7 or 14 mg/day

Available forms: Tabs 7, 14 mg

Administer:

PO route

• May be taken without regard to food

SIDE EFFECTS

CNS: Anxiety, headache

CV: Palpitations, hypertension, **MI**

EENT: Blurred vision, conjunctivitis, sinusitis

GI: Nausea, vomiting, diarrhea, cystitis

HEMA: **Leukopenia, lymphopenia, neutropenia**

INTEG: Acne vulgaris, alopecia, pruritus

META: Weight loss

MISC: Infection, cystitis

PHARMACOKINETICS

Protein binding >99%, median half-life 18-19 days, peak 1-4 hr

INTERACTIONS

- Do not use with leflunomide, live virus vaccines

Increase: teriflunomide effect—cycloSPORINE, eltrombopag, gefitinib

Increase: hepatotoxicity—methotrexate, HMG-CoA reductase inhibitors

Increase: hematologic toxicity—zidovudine

Increase: effect of—oral contraceptives, repaglinide, pioglitazone, rosiglitazone, PACLitaxel, naproxen, topotecan, bosentan, furosemide

Decrease: effect of—warfarin, alosetron, DULoxetine, theophylline, tiZANidine, quiNINE, tamoxifen, bendamustine, rasagiline, rOPINIRole, selegiline, propafenone, mexiletine, lidocaine, anagrelide, cloZAPine, cinacalcet, caffeine, monitor closely

Decrease: effect of teriflunomide—cholestyramine, activated charcoal

NURSING CONSIDERATIONS

Assess:

- CNS symptoms: anxiety, confusion, vertigo
- GI status: diarrhea, vomiting, abdominal pain
- Cardiac status: tachycardia, palpitations, vasodilation, chest pain

Evaluate:

- Therapeutic response: decreased symptoms of MS

Teach patient/family:

- That blurred vision can occur
- To notify prescriber if pregnancy is planned or suspected
- Not to change dosing or stop taking without advice of prescriber

Nurse Alert

tofacitinib

(toe'fa-sye'ti-nib)

Xeljanz

Func. class.: Antirheumatic agent (disease modifying), immunomodulator/biologic DMARD

Chem. class.: Janus kinase inhibitor

ACTION:

Affects the signaling pathway of Janus kinase

USES:

Rheumatoid arthritis (moderately to severely active) in those who have taken methotrexate with inadequate response or intolerance

CONTRAINDICATIONS:

Hypersensitivity

Precautions: Pregnancy (C), breastfeeding, neonates, infants, children, geriatric patients, neoplastic disease, ulcerative colitis, neutropenia, peptic ulcer disease
Active infections, risk of lymphomas/leukemias, TB, posttransplant lymphoproliferative disorder (PTLD), kidney disease, diabetes mellitus, HIV, hypercholesterolemia

Black Box Warning:

Infection, secondary malignancy

DOSAGE AND ROUTES

Calculator

• **Adult: PO** 5 mg/day with or without methotrexate or other nonbiologic DMARDs

Available forms: Tabs 5 mg

Administer:

PO route

• Without regard to food

SIDE EFFECTS

CNS: Headache, paresthesias, insomnia, fatigue

CV: Hypertension

GI: Abdominal pain, nausea, liver damage, dyspepsia, vomiting, diarrhea, gastritis, GI perforation, steatosis

HEMA: Anemia, lymphocytosis, lymphopenia, neutropenia

INTEG: Rash, pruritus

MISC: Increased cancer risk, risk of infection (TB, invasive fungal infections, other opportunistic infections), may be fatal, posttransplant lymphoproliferative disorder (PTLD)

PHARMACOKINETICS

Bioavailability 70%, protein binding 40% (albumin), metabolism mediated by CYP3A4, half-life 3 hr, peak 0.5-1 hr

INTERACTIONS

- Do not use with TNF modifiers, vaccines, potent immunosuppressants, other biologic DMARDS

Increase: tofacinib effect—CYP3A4 inhibitors (amprenavir, boceprevir, delavirdine, ketoconazole, indinavir, itraconazole, dalfopristin/quinupristin, ritonavir, tipranavir, fluconazole, isoniazid, miconazole)

Decrease: tofacinib effect—CYP3A4 inducers (rifampin, rifapentine, rifabutin, primidone, phenytoin, PHENobarbital, nevirapine, nafcillin, modafinil, griseofulvin, etravirine, efavirenz, barbiturates, bexarotene, bosentan, carbamazepine, enzalutamide, dexamethasone)

Drug/Lab Test

Increase: LFTs, cholesterol

Decrease: neutrophils, lymphocytes, Hct, Hgb

NURSING CONSIDERATIONS

Assess:

- Monitor lipid profile, Hct/Hgb WBC, LFTs
- **RA:** Pain, stiffness, ROM, swelling of joints before, during treatment

Black Box Warning:

Active infection, including localized infection: evaluate and test patients for latent or active TB before use; treat with antimycobacterials before use of product; this product increases the risk of serious including fatal infections (pulmonary or extrapulmonary TB; invasive fungal infections; and bacterial, viral, and opportunistic infections); during and after use, monitor for infection including TB in those who tested negative for latent TB before use; if a serious infection develops, interrupt receipt until the infection is controlled

Black Box Warning:

Secondary malignancy: lymphoma and other malignancies have been noted with product use

⚠️ Epstein–Barr virus–associated posttransplant lymphoproliferative disorder (PTLD): in kidney transplant patients when used with this product and immunosuppressives

- **Liver disease:** not recommended in severe liver disease, impairment; dose modification is needed with moderate liver impairment, monitor LFTs

⚠️ GI perforation: assess in those with diverticulitis, peptic ulcer disease, or ulcerative colitis

⚠️ Immunosuppression: obtain neutrophil and lymphocyte counts before use, do not start the product in lymphocyte count <500 cells/mm³ or ANC <1000 cells/mm³; for ANC >1000 cells/mm³, monitor neutrophil counts after 4–8 wk and every 3 mo thereafter; lymphocyte count >500 cells/mm³, monitor lymphocyte counts every 3 mo

⚠️ Anemia: determine Hgb, do not start in Hgb <9 g/dl; in Hgb ≥ 9 g/dl, monitor Hgb after 4–8 wk and every 3 mo thereafter

⚠️ Pregnancy (C)/breastfeeding: use during pregnancy only if the potential benefit justifies the potential risk to the fetus; if pregnancy occurs, enrollment in the pregnancy registry is encouraged by calling 1–877–311–8972; discontinue product or breastfeeding, serious adverse reactions can occur in nursing infants

Black Box Warning:

Neoplastic disease (lymphomas/leukemias)

Evaluate:

- Therapeutic response: decreased inflammation, pain in joints, decreased joint destruction

Teach patient/family:

- Not to have vaccines while taking this product
- Not to take any live virus vaccines during treatment
- To report signs of infection, allergic reaction

⚠️ Pregnancy C: teach patient to report if pregnancy is planned or suspected, do not breastfeed

☼ Canada only Side effects: *italics* = common; **bold** = life-threatening ⚠️
Nurse Alert

vismodegib

(vis'moe-deg'ib)

Erivedge

Func. class.: Antineoplastic biologic response modifier

Chem. class.: Signal transduction inhibitor (STI)

ACTION:

A hedgehog (Hh) signaling pathway inhibitor

USES:

Patients who have metastatic basal cell carcinoma, locally advanced, that has recurred after surgery and who are not candidates for surgery/radiation

CONTRAINDICATIONS:

Hypersensitivity, breastfeeding

Black Box Warning:

Intrauterine fetal death, male-mediated teratogenicity, Pregnancy (D)

Precautions: Children, blood donation

DOSAGE AND ROUTES

Calculator

• **Adult: PO** 150 mg/day

Available forms: Cap 150 mg

Administer:

- Give without regard to food
- Swallow whole, do not open or crush caps
- If a dose is missed, do not take additional dose, take at usual time
- Store at 77°F (25°C)

SIDE EFFECTS

GI: Nausea, vomiting, dysgeusia

GU: Amenorrhea, azotemia

INTEG: Alopecia

META: Hyponatremia

MISC: Fatigue, decreased weight

MS: Arthralgia

PHARMACOKINETICS

Protein binding >99%, elimination half-life 4 days

INTERACTIONS

Increase: effect of each product—Pgp inhibitors (amiodarone, clarithromycin, cycloSPORINE, diltiazem, erythromycin, indinavir, itraconazole, ketoconazole, nelfinavir, niCARDipine, propafenone, quiNIDine, ritonavir, saquinavir, tacrolimus, tamoxifen, verapamil); CYP2C19 substrates (amitriptyline, clomiPRAMINE, imipramine, citalopram, diazepam, phenytoin, PHENobarbital, lansoprazole, omeprazole, pantoprazole, RABEprazole, esomeprazole, clopidogrel, proguanil, propranolol, carisoprodol, chloramphenicol, cyclophosphamide, indomethacin, nelfinavir, nilutamide, progesterone, teniposide, warfarin)

NURSING CONSIDERATIONS

Assess:

Black Box Warning:

Pregnancy D: Verify pregnancy status of all women within 7 days before starting therapy; effective contraception is needed during and for 7 mo after treatment; men receiving this product should use condoms with spermicide (even after vasectomy) during sexual intercourse with female partners and for 2 mo after the last dose; report exposure during pregnancy to the Genentech Adverse Event Line

Evaluate:

- Therapeutic response: decreased spread of tumor

Teach patient/family:

Black Box Warning:

Pregnancy D: Teach patient to notify their provider immediately if pregnancy is suspected (or in a female partner for male patients); effective contraception is needed during and for 7 mo after treatment; men receiving this product should use condoms with spermicide (even after vasectomy) during sexual intercourse with female partners and for 2 mo after the last dose; if product is used during pregnancy or if the patient becomes pregnant during use, the woman (or female partner for male patients) should be apprised of the potential hazard to the fetus; encourage exposed women (either directly or through seminal fluid) to participate in the ERIVEDGE pregnancy pharmacovigilance program

- About reason for treatment, expected results

🇨🇦 Canada only Side effects: *italics* = common; **bold** = life-threatening ⚠️

Nurse Alert

ziv-aflibercept

(ziv-a-flih'ber-sept)

Zaltrap

Func. class.: Antineoplastic biologic response modifier

Chem. class.: Signal transduction inhibitor (STI)

ACTION:

An angiogenesis inhibitor, a fusion protein that binds to vascular endothelial growth factors (VEGF-A, VEGF-B) and placental growth factor 1 and 2

USES:

Metastatic colorectal cancer that is resistant or has progressed after an Oxaliplatin-containing regimen in combination with 5-fluorouracil, leucovorin, irinotecan (FOLFIRI)

CONTRAINDICATIONS:

Hypersensitivity

Precautions: infertility, male-mediated teratogenicity, encephalopathy, hypertension, dental work, breastfeeding, children, neonates, geriatric patients, infection, neutropenia, pregnancy C

Black Box Warning:

Bleeding, GI bleeding/perforation, intracranial bleeding, surgery

DOSAGE AND ROUTES

Calculator

• **Adult:** IV 4 mg/kg over 1 hr on day 1 every 2 wk in combination with the FOLFIRI regimen (irinotecan 180 mg/m² over 90 min on day 1 with dl-racemic leucovorin 400 mg/m² over 2 hr) (infused at the same time, in same Y-line; then on day 1 by 5-fluorouracil 400 mg/m² as a bolus, then 2400 mg/m² as a 46-hr cont IV inf)

Available forms: Solution for injection 100 mg/4 ml; 200 mg/8 ml

Administer:

• Give before FOLFIRI chemotherapy; visually inspect for particulate matter and discoloration before use

Dilution and preparation

- Withdraw the calculated dose, add to 0.9% sodium chloride or dextrose 5% solution to 0.6–8 mg/mL; use polyvinyl chloride (PVC) infusion bags containing bis (2-ethylhexyl) phthalate (DHEP) or polyolefin infusion bags; do not re-enter the vial after first puncture; discard any unused portion; do not mix or combine with other drugs in the same infusion bag; the diluted solution may be stored refrigerated for ≤ 4 hr; discard any unused portion in the infusion bag

IV infusion

- Give diluted solution over 1 hr using a 0.2 micron polyethersulfone filter; do not use nylon or polyvinylidene fluoride (PVDF) filters; do not give IV push or bolus; do not mix or combine with other drugs in the same IV line; give using an infusion set made of one of the following: PVC containing DEHP, DEHP-free PVC containing trioctyl-trimellitate (TOTM), polypropylene, polyethylene-lined PVC, or polyurethane

Dosage adjustments for recurrent or severe hypertension

⚠ Hold until B/P is controlled and then permanently reduce dose to 2 mg/kg; discontinue in hypertensive crisis or hypertensive encephalopathy

Dosage adjustments for proteinuria (2 g/24 hr)

⚠ Hold until proteinuria is < 2 g/24 hr; if proteinuria recurs, hold therapy until proteinuria is < 2 g/24 hr, then reduce to 2 mg/kg; discontinue in nephrotic syndrome or thrombotic microangiopathy

SIDE EFFECTS

CNS: Intracranial bleeding, headache, dizziness

CV: Hypertensive crisis, hypertension, stroke

GI: Nausea, hepatotoxicity, dyspepsia, GI hemorrhage, abdominal pain, GI perforation

GU: Proteinuria, hematuria

HEMA: Neutropenia, leukopenia

INTEG: Rash, pruritus, alopecia, hypersensitivity

MISC: Fatigue, epistaxis, night sweats, decreased weight, flulike symptoms, infection

RESP: Dyspnea, pulmonary embolism

PHARMACOKINETICS

Elimination half-life 6 days

NURSING CONSIDERATIONS

Assess:

⚠ **Severe bleeding:** GI bleeding, intracranial bleeding, and pulmonary hemorrhage/hemoptysis may be fatal; monitor patients for signs and symptoms of bleeding

⚠ **GI perforation:** some cases are fatal; monitor patients for signs and symptoms of GI perforation; discontinue therapy if GI perforation develops

• **Poor wound healing:** hold ≥ 4 wk before elective surgery; after major surgery, do not restart for ≥ 4 wk and until the surgical wound is entirely healed

⚠ **Severe hypertension/hypertensive crisis:** usually occurs within the first 2 cycles (grade 3 or 4 hypertension); monitor B/P every 2 wk or more often if needed; treatment with antihypertensives may be needed; product may need to be discontinued

⚠ **Severe proteinuria/nephrotic syndrome/thrombotic microangiopathy (TMA):** monitor urine protein by dipstick analysis and urinary protein-to-creatinine ratio (UPCR); obtain a 24-hr urine collection for a UPCR >1 ; for proteinuria of 2 g/24 hr, temporarily hold doses until proteinuria is <2 g/24 hr; if proteinuria recurs, hold doses until proteinuria is <2 g/24 hr, then permanently reduce; discontinue in nephrotic syndrome or TMA

⚠ **Febrile neutropenia, neutropenic infection/sepsis:** monitor CBC with differential at baseline and before each cycle, hold FOLFIRI until the neutrophil count is $\geq 1.5 \times 10^9/L$

⚠ **Geriatric toxicity:** assess for diarrhea, dizziness, asthenia, weight loss, and dehydration that can indicate toxicity

⚠ **Pregnancy C/Breastfeeding:** highly effective contraception during and up to 3 mo after the last dose is needed for all patients of reproductive potential because infertility and male-mediated teratogenicity can occur; infertility can occur but is reversible within 18 wk after stopping product: do not breastfeed

Evaluate:

• Therapeutic response: decrease in spread of size of tumor

Teach patient/family:

Pregnancy c/breastfeeding:

⚠ That highly effective contraception should be used during and up to 3 mo after the last dose in all patients of reproductive potential, infertility and male-mediated teratogenicity can occur; infertility is reversible within 18 wk after stopping product; do not breastfeed

- About reason for treatment, expected results

 Notify prescriber immediately of bleeding, severe abdominal pain, poor wound healing

🌿 Canada only Side effects: *italics* = common; **bold** = life-threatening

travoprost (Rx)

(tra'voh-prost)

Travatan Z

unoprostone (Rx)

(un-oh-proe'stone)

Rescula

β-Adrenergic blockers

ACTION:

Reduces production of aqueous humor by unknown mechanism

USES:

Ocular hypertension, chronic open-angle glaucoma

Anesthetics

ACTION:

Decreases ion permeability by stabilizing neuronal membrane

USES:

Cataract extraction, tonometry, gonioscopy, removal of foreign objects, corneal suture removal, glaucoma surgery (ophthalmic); pruritus, sunburn, toothache, sore throat, cold sores, oral pain, rectal pain and irritation, control of gagging (topical)

Antiinfectives

ACTION:

Inhibits folic acid synthesis by preventing PABA use, which is necessary for bacterial growth

Uses: Conjunctivitis, superficial eye infections, corneal ulcers, prophylaxis against infection after removal of foreign matter from the eye

Antiinflammatories

ACTION:

Decreases inflammation, resulting in decreased pain, photophobia, hyperemia, cellular infiltration

USES:

Inflammation of eye, eyelids, conjunctiva, cornea; uveitis, iridocyclitis, allergic conditions, burns, foreign bodies, postoperatively in cataract

Carbonic anhydrase inhibitor

ACTION:

Converted to EPINEPHrine, which decreases aqueous production and increases outflow

Uses: Open-angle glaucoma, ocular hypertension

Direct-acting miotic

ACTION:

Acts directly on cholinergic receptor sites; induces miosis, spasm of accommodation, fall in intraocular pressure, caused by stimulation of ciliary, pupillary sphincter muscles, which leads to pulling away of iris from filtration angle, resulting in increased outflow of aqueous humor

Uses: Primary glaucoma, early stages of wide-angle glaucoma (less useful in advanced stages), chronic open-angle glaucoma, acute closed-angle glaucoma before emergency surgery; also neutralizes mydriatics used during eye exam; may be used alternately with mydriatics to break adhesions between iris and lens

CONTRAINDICATIONS:

Hypersensitivity

Precautions: Pregnancy, breastfeeding, children, aphakia, hypersensitivity to carbonic anhydrase inhibitors, sulfonamides, thiazide diuretics, ocular inhibitors, hepatic/renal insufficiency

SIDE EFFECTS

CNS: Headache

CV: Hypertension, tachycardia, dysrhythmias

EENT: Burning, stinging

GI: Bitter taste

NURSING CONSIDERATIONS

Assess:

- Ophth exams and intraocular pressure readings
- Blood counts; hepatic, renal function tests and serum electrolytes during long-term treatment

Perform/provide:

- Storage at room temperature away from light

Evaluate:

- Positive therapeutic response
- Absence of increased intraocular pressure

Teach patient/family:

- How to instill drops
- That product may cause burning, itching, blurring, dryness of eye area

🍁 Canada only Side effects: *italics* = common; **bold** = life-threatening ⚠️

(trye-am-sin'oh-lone)

Nasacort AQ

NONSTEROIDAL ANTIINFLAMMATORY

ketorolac (Rx)

(kee'toe-role'ak)

Sprix

ACTION:

Produces vasoconstriction (rapid, long acting) of arterioles, thereby decreasing fluid exudation, mucosal engorgement by stimulation of α -adrenergic receptors in vascular smooth muscle

USES:

Nasal congestion

CONTRAINDICATIONS:

Hypersensitivity to sympathomimetic amines

Precautions: Pregnancy (C), children <6 yr, geriatric, diabetes, CV disease, hypertension, hyperthyroidism, increased intracranial pressure, prostatic hypertrophy, glaucoma

DOSAGE AND ROUTES

Calculator

Desoxyephedrine

- **Adult and child >6 yr:** 1-2 INH in each nostril q2hr or less

EPINEPHrine

- **Adult and child >6 yr:** Apply with swab, drops, spray prn

Oxymetazoline

- **Adult and child >6 yr:** INSTILL 2-3 gtt or sprays to each nostril bid
- **Child 2-6 yr:** INSTILL 2-3 gtt or sprays 0.025 sol bid, max 3 days

Phenylephrine

- **Adult and child >12 yr:** 2-3 drops/spray (0.25-0.5) in each nostril q3-4hr or less; or 2-3 drops/spray (1%) in each nostril q4hr or less
- **Child 6-12 yr:** 2-3 drops/spray (0.25%) in each nostril q3-4hr
- **Infant >6 mo:** 1-2 drops (0.16%) in each nostril q3hr

Tetrahydrozoline

- **Adult and child >6 yr:** 2-4 drops (0.1%) q3-4hr prn or 3-4 sprays in each nostril q4hr prn
- **Child 2-6 yr:** 2-3 drops (0.05%) in each nostril q4-6hr prn

Available forms: Nasal sol

Administer:

- Having patient tilt head back, squeeze bulb to create a vacuum, and draw correct amount of sol into dropper; insert 2 gtt of sol into nostril; repeat in other nostril
- Store in light-resistant container; do not expose to high temperature or let sol come into contact with aluminum
- For <4 consecutive days
- Environmental humidification to decrease nasal congestion, dryness

SIDE EFFECTS

CNS: Anxiety, restlessness, tremors, weakness, insomnia, dizziness, fever, headache

EENT: Irritation, burning, sneezing, stinging, dryness, rebound congestion

GI: Nausea, vomiting, anorexia

INTEG: Contact dermatitis

NURSING CONSIDERATIONS

Assess:

- For redness, swelling, pain in nasal passages before and during treatment • For systemic absorption; hypertension, tachycardia; notify prescriber; systemic absorption occurs at high doses or after prolonged use

Evaluate:

- Therapeutic response: decreased nasal congestion

Teach patient/family:

- That stinging may occur for several applications; drying of mucosa may be decreased by environmental humidification • To notify prescriber if irregular pulse, insomnia, dizziness, or tremors occur • Proper administration to avoid systemic absorption • To rinse dropper with very hot water to prevent contamination

☼ Canada only Side effects: *italics* = common; **bold** = life-threatening ⚠

TOPICAL GLUCOCORTICOIDS

betamethasone (augmented) (Rx)

(bay-ta-meth'a-sone)

Diprolene

desonide (Rx)

(dess'oh-nide)

LoKara, Verdeso Foam

fluocinolone (Rx)

(floo-oh-sin'oh-lone)

Derma-Smoothe/F, Synalar

flurandrenolide (Rx)

(flure-an-dren'oh-lide)

Cordran, Cordran SP, Drenison 1/4 , Drenison Tape 

halcinonide (Rx)

(hal-sin'oh-nide)

Halog

ACTION:

Antipruritic, antiinflammatory

USES:

Psoriasis, eczema, contact dermatitis, pruritus; usually reserved for severe dermatoses that have not responded to less potent formulation

CONTRAINDICATIONS:

Hypersensitivity, viral infections, fungal infections

Precautions: Pregnancy (C)

DOSAGE AND ROUTES

Calculator

- **Adult and child:** Apply to affected area

Administer:

- Only to affected areas; do not get in eyes
- Leaving site uncovered or lightly covered; occlusive dressing is not recommended—systemic absorption may occur
- Use only on dermatoses; do not use on weeping, denuded, or infected area
- Cleansing before application of product
- Continuing treatment for a few days after area has cleared
- Store at room temperature

SIDE EFFECTS

INTEG: *Acne, atrophy, epidermal thinning, purpura, striae*

NURSING CONSIDERATIONS

Assess:

- Temp; if fever develops, product should be discontinued
- For systemic absorption, increased temp, inflammation, irritation

Evaluate:

- Therapeutic response: absence of severe itching, patches on skin, flaking

Teach patient/family:

- To avoid sunlight on affected area, burns may occur
- To limit treatment to 14 days

🍁 Canada only Side effects: *italics* = common; **bold** = life-threatening ⚠️
Nurse Alert

TOPICAL ANTIFUNGALS

nystatin (OTC)

(nye-stat'in)

Nyamyc, Nystop, Pediaderm, Pedia-dri

selenium (OTC)

(see-leen'ee-um)

Dandrex, Selsun, Selsun Blue

terbinafine (OTC)

(ter-bin'a-feen)

Lamisil

tolnaftate (OTC)

(tole-naf'tate)

Absorbine Athlete's Foot Cream, Fungi-Guard, Tinactin

undecylenic acid (OTC)

(un-deh-sih-len'ik)

ACTION:

Interferes with fungal cell membrane permeability

USES:

Tinea cruris, tinea pedis, diaper rash, minor skin irritations; amphotericin B is used for candida infections

CONTRAINDICATIONS:

Hypersensitivity

Precautions: Pregnancy (B), breastfeeding, children

DOSAGE AND ROUTES

Calculator

- Massage into affected area, surrounding area daily or bid, continue for 7-14 days, not to exceed 4 wk

Administer:

Topical route

- To affected area, surrounding area; do not cover with occlusive dressings
- Store below 86° F (30° C)

SIDE EFFECTS

INTEG: Burning, stinging, dryness, itching, local irritation

NURSING CONSIDERATIONS

Assess:

- Skin for fungal infections; peeling, dryness, itching before and throughout treatment
- For continuing infection; increased size, number of lesions

Evaluate:

- Therapeutic response: decrease in size, number of lesions

Teach patient/family:

- To apply with glove to prevent further infection; not to cover with occlusive dressings
- That long-term therapy may be needed to clear infection (2 wk-6 mo depending on organism); compliance is needed even after feeling better
- Proper hygiene; hand-washing technique, nail care, use of concomitant top agents if prescribed
- To avoid use of OTC creams, ointments, lotions unless directed by prescriber
- To use medical asepsis (hand washing) before, after each application; to change socks and shoes once a day during treatment of tinea pedis
- To report to health care prescriber if infection persists or recurs; if blisters, burning, oozing, swelling occur
- To avoid alcohol because nausea, vomiting, hypertension may occur
- To use sunscreen or avoid direct sunlight to prevent photosensitivity
- To notify health care provider of sore throat, fever, skin rash, which may indicate overgrowth of organisms

☼ Canada only Side effects: *italics* = common; **bold** = life-threatening ⚠

Flamazine , Silvadene, SSD, SSD AF, Thermazene

tretinoin (Rx)

(treh'tih-noyn)

Atralin, Avita, Retin-A, Renova

ACTION:

Interferes with bacterial protein synthesis

USES:

Skin infections, minor burns, wounds, skin grafts, primary pyodermas, otitis externa

CONTRAINDICATIONS:

Hypersensitivity, large areas, burns, ulcerations

Precautions: Pregnancy (C), breastfeeding, impaired renal function, external ear or perforated eardrum

Administer:

- Enough medication to cover lesions completely
- After cleansing with soap, water before each application; dry well
- To less than 20% of body surface area when patient has impaired renal function

SIDE EFFECTS

INTEG: Rash, urticaria, scaling, redness

NURSING CONSIDERATIONS

Assess:

- Allergic reaction: burning, stinging, swelling, redness
- For signs of

nephrotoxicity or ototoxicity

Perform/provide:

- Storage at room temperature in dry place

Evaluate:

- Therapeutic response: decrease in size, number of lesions

🍁 Canada only Side effects: *italics* = common; **bold** = life-threatening ⚠️

TOPICAL ANTIVIRALS

acyclovir (Rx)

(ay-sye'kloe-ver)

Zovirax

penciclovir (Rx)

(pen-sye'kloe-ver)

Denavir

ACTION:

Interferes with viral DNA replication

USES:

Simple mucocutaneous herpes simplex, in immunocompromised clients with initial herpes genitalis

CONTRAINDICATIONS:

Hypersensitivity

Precautions: Pregnancy (C), breastfeeding

Administer:

- Using finger cot or rubber glove to prevent further infection
- Enough medication to cover lesions completely
- After cleansing with soap, water before each application; dry well

SIDE EFFECTS

INTEG: Rash, urticaria, stinging, burning, pruritus, vulvitis

NURSING CONSIDERATIONS

Assess:

- Allergic reaction: burning, stinging, swelling, redness, rash, vulvitis, pruritus

Perform/provide:

- Storage at room temperature in dry place

Evaluate:

- Therapeutic response: decrease in size, number of lesions

Teach patient/family:

- Not to use in eyes or when there is no evidence of infection
- To apply with

glove to prevent further infection • To avoid use of OTC creams, ointments, lotions unless directed by prescriber • To use medical asepsis (hand washing) before, after each application and avoid contact with eyes • To adhere strictly to prescribed regimen to maximize successful treatment outcome • To begin taking product when symptoms arise

TOPICAL MISCELLANEOUS

docosanol (OTC)

(doe-koe'san-ole)

Abreva

pimecrolimus (Rx)

(pim-eh-croh'lim-us)

Elidel

ACTION:

Docosanol unknown; pimecrolimus may bind with macrophilin and inhibit calcium-dependent phosphatase

USES:

Docosanol applied to fever blisters to promote more rapid healing; pimecrolimus used to treat mild to moderate atopic dermatitis in nonimmunocompromised patients ≥ 2 yr who are unresponsive to other treatment

CONTRAINDICATIONS:

Hypersensitivity

Precautions: Pregnancy (C), breastfeeding, dermal infections

DOSAGE AND ROUTES

Calculator

Docosanol

- **Adult: TOP** Rub into blisters 5×/day until healing occurs

Pimecrolimus

- **Adult and child ≥ 2 yr: TOP** Apply thin layer 2×/day and rub in, use as long as needed

Administer:

- To skin, rub in gently

SIDE EFFECTS

Pimecrolimus

INTEG: Burning

NURSING CONSIDERATIONS

Assess:

- Skin condition (color, pain, inflammation) before and after administration • For signs and symptoms of skin infections (redness, draining lesions); if present, avoid use of product (pimecrolimus)

Evaluate:

- Therapeutic response: decreased inflammation, redness

Teach patient/family:

- To avoid contact between medication and eyes • To discontinue use of product when condition clears

☼ Canada only Side effects: *italics* = common; **bold** = life-threatening ⚠

VAGINAL ANTIFUNGALS

butoconazole (OTC)

(byoo-toh-kone'ah-zole)

Gynazol-1

miconazole (OTC)

(mye-kon'a-zole)

Monistat, Monistat 3, Monistat 7, Monistat Dual Pak

terconazole (OTC)

(ter-kone'ah-zole)

Terazol 7, Terazol 3, Zazole

tioconazole (OTC)

(tye-oh-kone'ah-zole)

Gyne-Trosyd , Vagistat-1

ACTION:

Interferes with fungal DNA replication; binds sterols in fungal cell membranes, which increases permeability, leaking of nutrients

USES:

Vaginal, vulval, vulvovaginal candidiasis (moniliasis)

CONTRAINDICATIONS:

Hypersensitivity

Precautions: Pregnancy, breastfeeding, children <2 yr

DOSAGE AND ROUTES

Calculator

Butoconazole

- **Adult: VAG** 5 g (1 applicator) at bedtime × 3-6 days

Miconazole

- **Adult:** 200 mg supp at bedtime × 3 days or 100 mg supp × 1 wk

Terconazole

- **Adult:** VAG 5 g (1 applicator) at bedtime

Tioconazole

- **Adult:** 1 applicator at bedtime

Administer:

Topical route

- One full applicator every night high into the vagina
- Store at room temperature in dry place

SIDE EFFECTS

GU: Vulvovaginal burning, itching, pelvic cramps

INTEG: Rash, urticaria, stinging, burning

MISC: Headache, body pain

NURSING CONSIDERATIONS

Assess:

- For allergic reaction: burning, stinging, itching, discharge, soreness

Evaluate:

- Therapeutic outcome: decrease in itching or white discharge (vaginal)

Teach patient/family:

- About asepsis (hand washing) before, after each application
- To apply with applicator only; to avoid use of any other vaginal product unless directed by prescriber; sanitary napkin may prevent soiling of undergarments
- To abstain from sexual intercourse until treatment is completed; reinfection and irritation may occur
- To notify prescriber if symptoms persist

🍁 Canada only Side effects: *italics* = common; **bold** = life-threatening ⚠️

Nurse Alert

OTIC ANTIINFECTIVES

ciprofloxacin (Rx)
Cetraxel

ACTION:

Inhibits protein synthesis in susceptible microorganisms

USES:

Ear infection (external), short-term use

CONTRAINDICATIONS:

Hypersensitivity, perforated eardrum

Precautions: Pregnancy (C)

Administer:

- After removing impacted cerumen by irrigation • After cleaning stopper with alcohol
- After restraining child if necessary
- After warming sol to body temp

SIDE EFFECTS

EENT: Itching, irritation in ear

INTEG: Rash, urticaria

NURSING CONSIDERATIONS

Assess:

- For redness, swelling, fever, pain in ear, which indicates superinfection

Evaluate:

- Therapeutic response: decreased ear pain

Teach patient/family:

- The correct method of instillation using aseptic technique, including not touching dropper to ear • That dizziness may occur after instillation

☛ Canada only Side effects: *italics* = common; **bold** = life-threatening ⚠

Nurse Alert

Appendix C

Vaccines and toxoids

GENERIC NAME	TRADE NAME	USES	DOSAGE AND ROUTES	CONTRAINDICATIONS
adenovirus vaccine		Prevention of adenovirus types 4/7	Adult ≤ 50 yr/adolescent ≥ 17 yr in the military PO 1 tab of each 4/7 or a single dose	Pregnancy
avian influenza A (H5N1) virus vaccine		Prophylaxis	Adult: IM 1 ml (90 mcg) 2 doses, 28 days apart	IV
anthrax vaccine	BioThrax	Pre-/postexposure prophylaxis	Preexposure Adult: SUBCUT 0.5 ml at 0, 2, 4 wk, then 0.5 ml at 6, 12, 18 mo Postexposure Adult: SUBCUT 0.5 ml 0, 2, 4 wk, with antibiotics	Hypersensitivity
BCG vaccine	TICE BCG	TB exposure	Adult and child >1 mo: 0.2-0.3 ml Child <1 mo: Reduce dose by 50% using 2 ml of sterile water after reconstituting	Hypersensitivity, hypogammaglobulinaemia, positive TB test, burns
cholera vaccine	No trade name	Immunization for cholera outside the United States	Adult and child >10 yr: IM/SUBCUT $2 \times$ of 0.5 ml, 7-30 days before traveling to cholera areas Booster is used q6mo 0.5 ml pm	Hypersensitivity, acute febrile illness
diphtheria and tetanus toxoids, adsorbed	No trade name	Induces antitoxins to provide immunity to diphtheria and tetanus	Adult and child ≥ 7 yr: IM (adult strength) 0.5 ml q4-8wk $\times 2$ doses, then 3rd dose 6-12 mo after 2nd dose, booster IM 0.5 ml q10yr Child 1-6 yr: IM (pediatric strength) 0.5 ml q4wk $\times 2$ doses, booster 6-12 mo after 2nd dose Infant 6 wk-1 yr: IM (pediatric strength) 0.5 ml q4wk $\times 3$ doses, booster 6-12 mo after 3rd dose	Hypersensitivity to mercury, thimerosal; immunocompromised patients; radiation; corticosteroids; acute illness
diphtheria and tetanus toxoids and whole-cell pertussis vaccine (DPT, DTP)	DTwP, Tri-Immunol	Prevention of diphtheria, tetanus, pertussis	Doses vary Check product information	Hypersensitivity, active infection, poliomyelitis outbreak, immunosuppression, febrile illness
diphtheria and tetanus toxoids and acellular pertussis vaccine	Adacel, Boostrix, Daptacel, Infanrix, Tripedia			
diphtheria, tetanus, pertussis, haemophilus, polio IPV	Pentacel	Immunity to diphtheria, tetanus, pertussis, haemophilus, polio IPV	Infant >6 wk and child ≤ 5 yr: IM 0.5 ml at 2, 4, 6, and 15-18 mo	Hypersensitivity, polio outbreak, acute infection, immunosuppression
diphtheria, tetanus, pertussis, polio vaccine IPV	Kinrix	Immunity to diphtheria, tetanus, pertussis, polio vaccine IPV	Child: IM 0.5 ml	Hypersensitivity, polio outbreak, acute infection, immunosuppression
H1N1 influenza A (swine flu) virus vaccine	Influenza A (H1N1)	Immunity to H1N1	Adult <50 yr, adolescent, child ≥ 2 yr: Intranasal 1 dose (roughly 0.1 ml) into each nostril; child 2-9 repeat dose ≈ 4 wk later Adult, adolescent, child ≥ 3 yr: IM 0.5 ml as a single dose; child 3-9 yr repeat dose ≈ 4 wk later (Sanofi) (CSL); child 4-9 yr repeat dose ≈ 4 wk later (Novartis); infants ≥ 6 mo-child <36 mo: IM 0.25 ml, repeat in 4 wk (Sanofi) Adult: IM 0.5 ml as a single dose (GSK)	
haemophilus b conjugate vaccine, diphtheria CRM ₁₉₇ protein conjugate (HbOC)	HibTITER	Polysaccharide immunization of children 2-6 yr against <i>H. influenzae</i> b, conjugate	HibTITER (IM only) Child: IM 0.5 ml Child 2-6 mo: 0.5 ml q2mo $\times 3$ inj	Hypersensitivity, febrile illness, active infection
haemophilus b conjugate vaccine, meningococcal protein conjugate (PRP-OMP)	PedvaxHIB	Immunization of child 2, 4, 6 mo	Child 7-11 mo: Previously unvaccinated 0.5 ml q2mo inj Child 12-14 mo: Previously unvaccinated 0.5 ml $\times 1$ inj PedvaxHIB (IM only) Child 2-14 mo: 0.5 ml $\times 2$ inj at 2, 4 mo of age (6 mo dose not needed), then booster at 12-18 mo against invasive disease Child ≥ 15 mo: Previously unvaccinated 0.5 ml inj	
hepatitis A vaccine, inactivated	Havrix, VQTA	Active immunization against hepatitis A virus	Adult: IM 1440 EL units (Havrix) or 50 units (VQTA) as a single dose; booster dose is the same given at 6, 12 mo Child 2-18 yr: IM 720 EL units (Havrix) or 25 units (VQTA) as a single dose, booster dose is the same given at 6, 12 mo	Hypersensitivity
hepatitis B vaccine, recombinant	Egertix-B, Recombivax HB	Immunization against all subtypes of hepatitis B virus	Varies widely	Hypersensitivity to this vaccine or yeast
herpes zoster virus vaccine	Zostavax	Prevention of herpes zoster	Adult ≥ 60 yr: SUBCUT 0.65 ml	<60 yr, child, infant, AIDS, DM/T, leukemia, lymphoma, pregnancy
human papillomavirus recombinant vaccine, quadrivalent	Gardasil	Prevention of HPV types 6, 11, 16, 18, cervical cancer, genital warts, precancerous dysplastic lesions, anal cancer/anal intraepithelial neoplasia	Adult up to 26 yr and child >9 yr to 26 yr: IM give as 3 separate doses; 1st dose as elected; 2nd dose 2 mo after 1st dose; 3rd dose 6 mo after 1st dose	Child <9 yr, pregnancy, breastfeeding, geriatric, active disease, hypersensitivity
influenza virus vaccine	Afluria, FluMist, Fluogen, Flu-Shield, Fluvirin [®] , Fluvirin, Fluzone, influenza virus vaccine, trivalent	Prevention of Russian, Chilean, Philippine influenza	Adult and child >12 yr: IM 0.5 ml in 1 dose Adult 18-64 yr: ID 0.1 ml as a single dose Child 3-12 yr: IM 0.5 ml, repeat in 1 mo (split) unless 1978-1985 vaccine was given; also given nasal Child 6 mo to 3 yr: IM 0.25 ml, repeat in 1 mo (split) unless 1978-1985 vaccine was given; also given nasal child ≤ 2 yr	Hypersensitivity, active infection, chicken egg allergy, Guillain-Barré syndrome, active neurologic disorders
Japanese encephalitis virus vaccine, inactivated	JE-VAX	Active immunity against Japanese encephalitis (JE)	Adult and child ≥ 3 yr: SUBCUT 1 ml, days 0, 7, 30; booster SUBCUT 1 ml 2 yr after last dose Child 1-3 yr: SUBCUT 0.5 ml, days 0, 7, 30; booster SUBCUT 0.5 ml 2 yr after last dose	Hypersensitivity to murine, thimerosal; allergic reactions to previous dose

lyme disease vaccine (recombinant OspA)	LYMERix	Immunization against lyme disease	Adult and adolescent 15-70 yr: IM 30 mcg in deltoid, repeat at 1, 12 mo after first dose	Hypersensitivity, antibiotic refractory lyme arthritis
measles and rubella virus vaccine, live attenuated	M-R-Vax II	Immunity to measles and rubella by antibody production	Adult and child ≥ 15 mo: SUBCUT 0.5 ml (1000 units)	Hypersensitivity, immunocompromised patients, active untreated TB, cancer, blood dyscrasias, radiation, corticosteroids, pregnancy; allergic reactions to neomycin, eggs
measles, mumps, and rubella vaccine, live	M-M-R-II	Prevention of measles, mumps, rubella	Adult: SUBCUT 1 vial; 2 vials separated by 1 mo, in person born after 1957 Child > 15 mo and adult: SUBCUT 0.5 ml	Hypersensitivity, blood dyscrasias, anemia, active infection, immunosuppression, egg, chicken allergy, pregnancy, febrile illness, neomycin allergy, neoplasms
measles, mumps, rubella, varicella	ProQuad	Immunity to measles, mumps, rubella, varicella	Child: SUBCUT 0.5 ml	Hypersensitivity to eggs, acromycin, cancer, radiation, corticosteroids, blood dyscrasias, active untreated TB
measles virus vaccine, live attenuated	Attenuvax	Immunity to measles by antibody production	Adult and child ≥ 15 mo: SUBCUT 0.5 ml (1000 units), 1 dose 15 mo, 2nd dose age 4-6 or 11, or 12	Hypersensitivity to eggs, acromycin, cancer, radiation, corticosteroids, pregnancy, immunocompromised patients, blood dyscrasias, active untreated TB
meningococcal diphtheria toxoid conjugate vaccine	Menomune, Menactra, Menveo	Prophylaxis to meningococcal meningitis/diphtheria	All doses are different; check product information	Latex hypersensitivity
meningococcal polysaccharide vaccine	Menomune-AC/W-135, Menactra	Prophylaxis to meningococcal meningitis	Adult and child > 2 yr: SUBCUT 0.5 ml	Hypersensitivity to thimerosal, pregnancy, acute illness
mumps virus vaccine, live	Mumpsavax	Active immunity to mumps	Adult and child ≥ 1 yr: SUBCUT 0.5 ml (20,000 units)	Hypersensitivity to eggs, acromycin, cancer, radiation, corticosteroids, pregnancy, immunocompromised patients, blood dyscrasias, active untreated TB
plague vaccine	No trade name	Active immunity to <i>Yersinia pestis</i> plague	Adult: IM 1 ml, then 0.2 ml in 4-12 wk, then 0.2 ml 5-6 mo after 2nd dose; booster 0.1-0.2 ml q6mo when in plague area	Hypersensitivity to phenol, stiftles, formaldehyde, beef, soy, casein; pregnancy; coagulation disorders
pneumococcal 7-valent conjugate vaccine	Prevnar	Immunity against <i>Streptococcus pneumoniae</i>	Child: IM 0.5 ml $\times$ 3 doses (7-11 mo); $\times$ 2 doses (12-23 mo); $\times$ 1 dose > 2 -9 yr	Hypersensitivity to diphtheria toxoid or this product
pneumococcal vaccine, polyvalent	Pneumovax 23, Pneumune 23	Pneumococcal immunization	Adult and child > 2 yr: IM/SUBCUT 0.5 ml	Hypersensitivity, Hodgkin's disease, ARDS
poliovirus vaccine, live, oral, trivalent (TOPV) poliovirus vaccine (IPV)	Orimune, IPOL	Prevention of polio	Adult and child > 2 yr: PO 0.5 ml, given q8wk $\times$ 2 doses, then 0.5 ml $\frac{1}{2}$ -1 yr after dose 2 Infant: PO 0.5 ml at 2, 4, 18 mo, booster at 4-6 yr; may also be given: IPV at 2, 4 mo, then TOPV at 12-18 mo, booster at 4-6 yr	Hypersensitivity, active infection, allergy to neomycin/streptomycin, immunosuppression, vomiting, diarrhea
rabies vaccine, adsorbed	No trade name	Active immunity to rabies	Preexposure Adult and child: IM 1 ml day 0, 7, 21, or 28 days (total 3 doses); booster IM 1 ml prn q2-5yr Postexposure Adult and child not vaccinated: IM 20 international units/kg of human rabies immune globulin (HRIG), give 5 total doses of 1-ml inj of rabies vaccine on days 0, 3, 7, 14, 28	Severe hypersensitivity to previous inj of vaccine, thimerosal
rabies vaccine, human diploid cell (HDCV)	Inovax Rabies, Inovax Rabies I.D.	Active immunity to rabies	Preexposure Adult and child: IM 1 ml day 0, 7, 21, or 28 (total 4 doses) Postexposure Adult and child: IM 1 ml on day 0, 3, 7, 14, 28 (total 5 doses)	No contraindications
rotavirus	RotaTeq, Rotarix	Prevents rotavirus	Infant: PO 3 doses given between 6 and 32 wk of age; 1st dose between 6-12 wk of age; 2nd and 3rd doses q4-10wk	Hypersensitivity to this product or latex, immunocompromised, blood products given within 6 wk, lymphatic disorders
rubella and mumps virus vaccine, live	Bivax II	Immunity to rubella and mumps by antibody production	Adult and child ≥ 1 yr: SUBCUT 0.5 ml	Hypersensitivity to eggs, acromycin, cancer, radiation, corticosteroids, pregnancy, immunocompromised patients, blood dyscrasias, active untreated TB
rubella virus vaccine, live attenuated (RA 27/3)	Menavax II	Immunity to rubella by antibody production	Adult and child ≥ 1 yr: SUBCUT 0.5 ml (1000 units)	Hypersensitivity to eggs, acromycin, cancer, radiation, corticosteroids
smallpox vaccine	ACAM 2000, Dry Vax	Prevention of smallpox	See package insert	No contraindications
tetanus toxoid, adsorbed/tetanus toxoid	No trade name	Tetanus toxoid: Used for prophylactic treatment of wounds	Adult and child: IM 0.5 ml q4-6wk $\times$ 2 doses, then 0.5 ml 1 yr after dose 2 (adsorbed); SUBCUT/IM 0.5 ml q4-8wk $\times$ 3 doses, then 0.5 ml $\frac{1}{2}$ -1 yr after dose 3, booster dose 0.5 ml q10yr	Hypersensitivity, active infection, poliomyelitis outbreak, immunosuppression
typhoid vaccine, parenteral typhoid vaccine, oral	No trade name Vivofit Berna Vaccine	Active immunity to typhoid fever	Adult: PO 1 cap 1 hr before meals $\times$ 4 doses, booster q5yr Adult and child > 10 yr: SUBCUT 0.5 ml, repeat in 4 wk, booster q3yr Child 6 mo-10 yr: SUBCUT 0.25 ml, repeat in 4 wk, booster q3yr	Parenteral: Systemic or allergic reaction, acute respiratory or other acute infection, intensive physical exercise in high temperatures Oral: Hypersensitivity, acute febrile illness, suppressive or antibiotic products
typhoid Vi polysaccharide vaccine	Typhim Vi	Active immunity to typhoid fever	Adult and child ≥ 2 yr: IM 0.5 ml as a single dose, reinimmunize q2yr 0.5 ml IM, if needed	Hypersensitivity, chronic typhoid carriers
varicella virus vaccine	Varivax	Prevention of varicella-zoster (chickenpox)	Adult and child ≥ 13 yr: SUBCUT 0.5 ml, 2nd dose SUBCUT 0.5 ml 4-8 wk later	Hypersensitivity to neomycin; blood dyscrasias, immunosuppression, active untreated TB, acute illness, pregnancy, diseases of lymphatic system
yellow fever vaccine	YF-Vax	Active immunity to yellow fever	Adult and child ≥ 9 mo: SUBCUT 0.5 ml deeply, booster q10yr Child 6-9 mo: same as above if exposed	Hypersensitivity to egg or chicken embryo protein, pregnancy; child < 6 mo, immunodeficiency
zoster vaccine, live	Zostavax	Herpes zoster prevention	Reconstitute immediately after removing from freezer; give SUBCUT as a single dose; inject total amount of single-dose vial	Immunosuppression; neomycin, gelatin allergy; children, TB, pregnancy (C)

Entries can be identified as follows: DISEASES/DISORDERS, *DRUG CATEGORIES*, generic names, Trade Names.

Formulas

Surface area rule:

$$\text{Child dose} = \frac{\text{Surface area (m}^2\text{)}}{1.73 \text{ m}^2} \times \text{Adult dose}$$

Calculating strength of a solution:

$$\begin{array}{l} \text{Solution Strength:} \quad \text{Desired Solution:} \\ \frac{x}{100} = \frac{\text{Amount of drug desired}}{\text{Amount of finished solution}} \end{array}$$

Calculating flow rate for IV:

$$\begin{array}{l} \text{Rate of flow} = \frac{\text{Amount of fluid} \times \text{Administration set calibration}}{\text{Running time}} \\ \frac{x}{1} = \frac{(\text{ml}) (\text{gtt/min})}{\text{min}} \end{array}$$

Calculation of medication dosages:

Formula method:

$$\frac{\text{Amount ordered}}{\text{Amount on hand}} \times \text{Vehicle} = \text{Number of tablets, capsules, or amount of liquid}$$

Vehicle is the drug form or amount of liquid containing the dosage. Amounts used in calculation by formula must be in same system.

Ratio–proportion method:

1 tablet:tablet in mg on hand::x tablet order in mg Know or have::Want to know or order Multiply means and extremes, divide both sides by known amount to get x. Amounts used in equation must be in same system.

Dimensional analysis method:

$$\text{Order in mg} \times \frac{1 \text{ tablet or capsule}}{\text{What 1 tablet or capsule is in mg}} = \text{Tablets or capsules to be given}$$

If amounts are in different systems:

$$\text{Order in mg} \times \frac{1 \text{ tablet or capsule}}{\text{What 1 tablet or capsule is in g}} \times \frac{1}{1000 \text{ mg}} = \text{Tablets or capsules to be given}$$

Temperature conversion:

$$F = C \times \frac{9}{5} + 32$$

$$C = \frac{5}{9} (F - 32)$$

Nomogram for calculation of body surface area

Place a straight edge from the patient's height in the left column to the patient's weight in the right column. The point of intersection on the body surface area column indicates the body surface area (BSA). (Reproduced in Behrman RE, Kliegman RM, Jenson HB: *Nelson textbook of pediatrics*, ed 18, Philadelphia, 2011, WB Saunders; Nomogram modified from data of E. Boyd by CD West.)

Alternative (Mosteller's formula):

$$\text{Surface area (m}^2\text{)} = \sqrt{\frac{\text{Height (cm)} \times \text{Weight (kg)}}{3600}}$$

Antitoxins and antivenins

GENERIC NAME	TRADE NAME	USES	DOSAGE AND ROUTES	CONTRAINDICATIONS
Black widow spider antivenin (<i>Lactrodectus mactans</i>)	No trade name	Black widow spider bite	Adult and child: IM 2.5 ml, 2nd dose may be given if severe; give in anterolateral thigh, obtain test for sensitivity before inj	Hypersensitivity to this product or horse serum
Crotalidae antivenom, polyvalent	No trade name	Rattlesnake bite	Adult and child: IV 20-150 ml depending on seriousness of bite, may give additional doses based on response	Hypersensitivity
Diphtheria antitoxin, equine	No trade name	Diphtheria	Adult and child: IM/slow IV 20,000-120,000 units, may give additional doses after 24 hr	Hypersensitivity
<i>Microtus fulvus</i> antivenin	No trade name	East/Texas coral snake bite	Adult and child: IV 30-50 ml, give through running IV line of normal saline, give 1st 1-2 ml over 4-5 min, watch for allergic reaction	Hypersensitivity
Scorpion antivenin (centruroides sculpturatus equine)	Anascorp	Scorpion stings	Adult and child: IV 3 vial/50 ml NS given over 10 min, may give other doses 1 vial/50 ml NS over 10 min q30-60min	N/A

Abbreviations

ABG	arterial blood gas
ADA	American Diabetes Association
ADH	antidiuretic hormone
ALT	alanine aminotransferase
ANA	antinuclear antibody
APLA	antiphospholipid antibody syndrome
APTT	activated partial thromboplastin time
ASA	acetylsalicylic acid, aspirin
AST	aspartate aminotransferase (SGOT)
AV	atrioventricular
bid	twice a day
BPH	benign prostatic hypertrophy
BPM	beats per minute
BUN	blood urea nitrogen
CAD	coronary artery disease
CBC	complete blood cell count
CCr	creatinine clearance
CHF	congestive heart failure
CNS	central nervous system
CONT	continuous

COPD	chronic obstructive pulmonary disease
CPAP	continuous positive airway pressure
CPK	creatine phosphokinase
CPS	carbamoyl phosphate synthetase
C&S	culture and sensitivity
CSF	cerebrospinal fluid
CTCL	cutaneous T-cell lymphoma
CV	cardiovascular
CVA	cerebrovascular accident
CVP	central venous pressure
D&C	dilatation and curettage
DIC	diffuse intravascular coagulation
DIR INF	direct infusion
D₅W	5% glucose in distilled water
DVT	deep vein thrombosis
ECG	electrocardiogram (EKG)
EDTA	ethylenediamine tetraacetic acid
EEG	electroencephalogram
EPS	extrapyramidal symptom
ESR	erythrocyte sedimentation rate
EXT REL	extended release
FBS	fasting blood sugar
FHT	fetal heart tones
FSH	follicle-stimulating hormone

GABA	γ-aminobutyric acid
GPC	giant papillary conjunctivitis
gr	grain
GT	glucose tolerance
GTT	glucose tolerance test
GU	genitourinary
GVHD	graft-versus-host disease
H₂	histamine ₂
hCG	human chorionic gonadotropin
Hct	hematocrit
HDCV	human diploid cell rabies vaccine
Hgb	hemoglobin
H & H	hematocrit and hemoglobin
5-HIAA	5-hydroxyindoleacetic acid
HIV	human immunodeficiency virus (AIDS)
HR	heart rate
IBD	inflammatory bowel disease
IC	intracardiac
ICP	intracranial pressure
ID	intradermal
IgG	immunoglobulin G
IM	intramuscular
INF	infusion

INH	inhalation
inj	injection
I&O	intake and output
INT	intermittent
IPPB	intermittent positive-pressure breathing
IT	intrathecal
ITP	idiopathic thrombocytopenic purpura
IUD	intrauterine device
IV	intravenous
IVP	intravenous pyelogram
K	potassium
LDH	lactic dehydrogenase
LE	lupus erythematosus
LFT	liver function test
LH	luteinizing hormone
LOC	level of consciousness
LR	lactated Ringer's solution
LT	leukotriene
m	minim
m²	square meter
MAC	monitored anesthesia care
MAOI	monoamine oxidase inhibitor
mcg	microgram
mEq	milliequivalent

mg	milligram
MI	myocardial infarction
ml	milliliter
mm	millimeter
mo	month
Na	sodium
ng	nanogram
NGU	non-gonococcal urethritis
NHL	non-Hodgkin's lymphoma
NPO	nothing by mouth (Lat. nulla per os)
NS	normal saline
OBS	organic brain syndrome
OTC	over-the-counter
P56	plasma-lyte 56
PaCO₂	arterial carbon dioxide tension (pressure)
PaO₂	arterial oxygen tension (pressure)
PAT	paroxysmal atrial tachycardia
PBI	protein-bound iodine
PCI	percutaneous coronary intervention
PCWP	pulmonary capillary wedge pressure
PEEP	positive end-expiratory pressure
pH	hydrogen ion concentration
PO	by mouth
PP	postprandial

PPHN	persistent pulmonary hypertension of the newborn
prn	as required
PT	prothrombin time
PTT	partial thromboplastin time
PVC	premature ventricular contraction
pwd	powder
qAM	every morning
qhr	every hour
q2hr	every 2 hours
q3hr	every 3 hours
q4hr	every 4 hours
q6hr	every 6 hours
q12hr	every 12 hours
qid	four times daily
qPM	every night
RAIU	radioactive iodine uptake
RBC	red blood cell count or red blood cell
RECT	rectal
ROM	range of motion
SARS	severe acute respiratory syndrome
SCr	serum creatinine
SIMV	synchronous intermittent mandatory ventilation
SL	sublingual
SLE	systemic lupus erythematosus

sol	solution
STD	sexually transmitted disease
SUBCUT	subcutaneous
supp	suppository
SUS REL	sustained release
syr	syrup
TD	transdermal
tid	three times daily
tinc	tincture
TPN	total parenteral nutrition
TSH	thyroid-stimulating hormone
TT	thrombin time
UA	urinalysis
UTI	urinary tract infection
UV	ultraviolet
VMA	vanillylmandelic acid
VS	vital sign
WBC	white blood cell count
