How to Use

Easily confused drug names located beneath the header

Common unlabeled uses and doses clearly indicated

Life-threatening side effects are emphasized

Pregnancy categories appear under Contraindications (D or X) or Precautions (A, B, or C)

Subheads indicate specific administration for dosing and routes of administration

Nursing considerations provide guidance throughout the nursing process

abacavir (Rx)
(ah-bak'ah-veer)
Ziagen
Func. class.: Antiretroviral
Chem. class.: Nucleoside reverse transcriptase inhibitor (NRTI)

Do not confuse:
abacavir/tenofovir

ACTION: Inhibitory action against HIV-1; inhibits replication of the virus by incorporating into cellular DNA by viral reverse transcriptase, thereby terminating the cellular DNA chain

USES: In combination with other antiretroviral agents for HIV-1 infection (not to be used with lamivudine or zalcitabine)

Unlabeled uses: HIV prophylaxis following occupational exposure

CONTRAINDICATIONS
Black Box Warning: Hypersensitivity; moderate/severe hepatic disease

Precautions: Pregnancy (C), breast-feeding, children <3 mo, granulocyte count <1000/mm³ or Hgb <9.5 g/dL, severe renal disease, impaired hepatic function, HLA B5701

Black Box Warning: Lactic acidosis

DOSAGE AND ROUTES
• **Adult and adolescent ≥18 yr:** PO 300 mg bid or 600 mg/day with other antiretrovirals
• **Adolescent <18 yr and child ≥3 mo:** PO 8 mg/kg bid, max 300 mg bid with other antiretrovirals
• **Hepatic dose:** • **Adult:** PO (Child-Pugh 5-6) (oral sol) 200 mg bid; severe hepatic disease, do not use
• **HIV prophylaxis (unlabeled):** • **Adult:** PO 300 mg bid to be added to the basic 2-drug regimen ×4 wk

ADMINISTRATION
• Give in combination with other antiretrovirals with or without first-triple therapy as a regimen; resistance may occur
• Reduce dose in hepatic impairment

SIDE EFFECTS
CNS: Fever, headache, malaise, myalgia, paresthesia
GI: Nausea, vomiting, diarrhea, anorexia, cramps, abdominal pain, increased AST, ALT, hepatotoxicity, hepatomegaly with steatosis
HEMA: Granulocytopenia, anemia, lymphopenia
IMTID: Rash, urticaria, hypersensitivity reactions
META: Lactic acidosis
OTHER: Fatal hypersensitivity reactions, MI
RESP: Dyspnea

PHARMACOKINETICS
Rapid/extended absorption; 50% plasma protein binding; metabolized to inactive metabolite 1 1/2 hr; excreted in urine, changed

INTERACTIONS
• Do not coadminister with containing products
• **Increases:** possible lactic acidosis
• **Increases:** abacavir levels—alcohol
• **Decreases:** abacavir levels—dopa
• **Decreases:** levels of—methadone
Drug/Lab Test
Increase: glucose, triglycerides, GOT

NURSING CONSIDERATIONS
Assess:
• Symptoms of HIV and possible infections; increased temp
• **Lactic acidosis** (elevated lactate, anion gap, increased LFTs), severe hepatomegaly with steatosis, discontinue treatment

Black Box Warnings identify serious and life-threatening adverse effects

2 abacavir

2 **abacavir**
and do not restart; may have large liver,
elevated AST, ALT, lactate levels, women
are at greater chance of lactic acidosis
Warning: Fetal hypersensitivity
rash, nausea, vomit

Black Box Warning: Fetal hypersensitivity reactions: fever, rash, nausea, vomiting, fatigue, cough, dyspnea, diarrhea, abdominal discomfort; treatment should be discontinued and not restarted; those with HLA B*57:01 are at great risk for hypersensitivity; obtain genetic testing prior to starting treatment.

▲ **Blood dyscrasias** (anemia, granulocytopenia): bruising, fatigue, bleeding, poor healing

- Renal studies: BUN, serum uric acid, Cr before, during therapy; these may be elevated

Black Box Warning: Hepatic studies before and monthly every 2 wk during therapy. Bilirubin, AST, ALT, amylase, alkaline phosphatase, creatine phosphokinase, creatinine

- Blood counts; monitor viral load and CD4 counts during treatment; watch for decreasing granulocytes. If low, therapy may have to be discontinued and restarted after hematologic recovery; transfusions may be required

Perform/provide:

- Storage in cool environment, protect from light; oral sol stored at room temperature; do not freeze

Evaluate:
 Immune response: increased CD4

- Therapeutic response: in count, decrease viral load

- This product is not a cure but will control symptoms; patient is still infective, may pass AIDS virus on to others, to carry emergency ID with condition products taken

④ To notify prescriber of some trouble, swollen lymph nodes, malaise, fever, other infections may occur; to stop product if skin rash, fever, cough, shortness of breath; ⑤ symptoms, and to notify prescriber immediately; advise all health care providers that allergic reaction has occurred with abacavir

- That follow-up visits must be continued because serious toxicity may occur;
- To use contraception during treatment, if patient is pregnant, register with the Antiretroviral Pregnancy Registry at 1-800-258-4265.

- Give patient Medication Guide and Warning Card, discuss points on guide
- That other products may be necessary to prevent other infections and that drug is taken with other antiretrovirals
- Not to drink alcohol while taking the product

Alert icon highlights high-alert drugs and clinical considerations

Notices

Knowledge and best practice in this field are constantly changing. As new research and experience broaden our understanding, changes in research methods, professional practices, or medical treatment may become necessary.

Practitioners and researchers must always rely on their own experience and knowledge in evaluating and using any information, methods, compounds, or experiments described herein. In using such information or methods they should be mindful of their own safety and the safety of others, including parties for whom they have a professional responsibility.

With respect to any drug or pharmaceutical products identified, readers are advised to check the most current information provided (i) on procedures featured or (ii) by the manufacturer of each product to be administered, to verify the recommended dose or formula, the method and duration of administration, and contraindications. It is the responsibility of practitioners, relying on their own experience and knowledge of their patients, to make diagnoses, to determine dosages and the best treatment for each individual patient, and to take all appropriate safety precautions.

To the fullest extent of the law, neither the Publisher nor the authors, contributors, or editors, assume any liability for any injury and/or damage to persons or property as a matter of products liability, negligence or otherwise, or from any use or operation of any methods, products, instructions, or ideas contained in the material herein.

Preface

Increasingly, patients are relying on nurses to know every detail of health care. More important, nurses are expected to have these answers, especially when it comes to medication. Let *Mosby's 2014 Nursing Drug Reference* be your answer. Our indispensable, yet compact, resource contains hundreds of monographs with several easy-to-use features.

NEW FEATURES

This edition features:

- A beautiful, full-color design to spotlight critical and safety-related information
- More than 20 recent FDA-approved drugs located throughout the book and in **Appendix A** (see Contents for a complete list). Included are monographs for:
 - ivacaftor (Kalydeco)—for cystic fibrosis
 - lucinactant (Surfaxin)—for newborn respiratory distress
 - pertuzumab (Perjeta)—for breast cancer
- Newly added complete monographs for select ophthalmic, otic, nasal, and topical products
- A new ebook with easy-to-use navigation for quick access to drug monographs of your choice

NEW FACTS

This edition features more than 2000 new drug facts, including:

- New drugs and dosage information

- Newly researched side effects and adverse reactions
- New and revised Black Box Warnings
- The latest precautions, interactions, and contraindications
- IV therapy updates
- Revised nursing considerations
- Updated patient/family teaching guidelines

ORGANIZATION

This reference is organized into three main sections:

- Drug categories
- Individual drug monographs (in alphabetical order by generic name)
- Appendixes (identified by the wide, blue thumb tabs on the edge)

The guiding principle behind this book is to provide fast, easy access to drug information and nursing considerations. Every detail—the paper, typeface, cover, binding, use of color, and appendixes—has been carefully chosen with the user in mind.

INDIVIDUAL DRUG MONOGRAPHS

This book contains monographs for more than 1300 generic and 4500 trade medications. Common trade names are given for all drugs regularly used in the United States and Canada, with drugs available only in Canada identified by a maple leaf 🍁.

The following information is provided, whenever possible, for safe, effective administration of each drug:

Highalert status: Identifies highalert drugs with a label and icon. Visit the Institute for Safe Medication Practices (ISMP) at <http://www.ismp.org/tools/highalertmedications.pdf> for a list of medications and drug classes with the greatest potential for patient harm if they are used in error.

Tall man lettering: Uses the capitalization of distinguishing letters to avoid

medication errors and is required by the FDA for drug manufacturers.

Pronunciation: Helps the nurse master complex generic names.

Rx/OTC: Identifies prescription or over-the-counter drugs.

Functional and chemical classifications: Allow the nurse to see similarities and dissimilarities among drugs in the same functional but different chemical classes.

Do not confuse: Present drug names that might easily be confused within each appropriate monograph.

Action: Describes pharmacologic properties concisely.

Uses: List the conditions the drug is used to treat.

Unlabeled uses: Describe drug uses that may be encountered in practice but are not yet FDA approved.

Dosages and routes: List all available and approved dosages and routes for adult, pediatric, and geriatric patients.

Available forms: Include tablets, capsules, extended-release, injectables (IV, IM, SUBCUT), solutions, creams, ointments, lotions, gels, shampoos, elixirs, suspensions, suppositories, sprays, aerosols, and lozenges.

Side effects: Groups these reactions by body system, with common side effects *italicized* and life-threatening reactions (those that are potentially fatal and/or permanently disabling) in **bold, red type** for emphasis.

Contraindications: List conditions under which the drug absolutely should not be given, including FDA pregnancy safety categories D or X.

Precautions: List conditions that require special consideration when the drug is prescribed, including FDA pregnancy safety categories A, B, or C.

Black Box Warnings: Identify FDA warnings that highlight serious and life-threatening adverse effects.

Pharmacokinetics: Outlines metabolism, distribution, and elimination.

Interactions: Include confirmed drug interactions, followed by the drug or nutrient causing that interaction, when applicable.

Drug/herb: Highlight potential interactions between herbal products and

prescription or OTC drugs.

Drug/food: Identifies many common drug interactions with foods.

Drug/lab test: Identifies how the drug may affect lab test results.

Nursing considerations: Identify key nursing considerations for each step of the nursing process: Assess, Administer, Perform/Provide, Evaluate, and Teach Patient/Family. Instructions for giving drugs by various routes (e.g., PO, IM, IV) are included, with route subheadings in bold.

Compatibilities: List syringe, Y-site, and additive compatibilities and incompatibilities. If no compatibilities are listed for a drug, the necessary compatibility testing has not been done and that compatibility information is unknown. To ensure safety, assume that the drug may not be mixed with other drugs unless specifically stated.

“Nursing Alert” icon : Highlights a critical consideration.

Treatment of overdose: Provides drugs and treatment for overdoses where appropriate.

APPENDIXES

Selected new drugs: Includes comprehensive information on 23 key drugs approved by the FDA during the past 12 months.

Ophthalmic, otic, nasal, and topical products: Provides essential information for more than 80 ophthalmic, otic, nasal, and topical products commonly used today, grouped by chemical drug class.

Vaccines and toxoids: Features an easy-to-use table with generic and trade names, uses, dosages and routes, and contraindications for 43 key vaccines and toxoids.

I am indebted to the nursing and pharmacology consultants who reviewed the manuscript and thank them for their criticism and encouragement. I would also like to thank Robin Carter and Shephali Graf, my editors, whose active encouragement and enthusiasm have made this book better than it might otherwise have been. I am likewise grateful to Joy Moore and Graphic World

Inc. for the coordination of the production process and assistance with the development of the new edition.

Linda Skidmore-Roth

FDA pregnancy categories

- A** No risk demonstrated to the fetus in any trimester
- B** No adverse effects in animals; no human studies available
- C** Only given after risks to the fetus are considered; animal studies have shown adverse reactions; no human studies available
- D** Definite fetal risks, may be given in spite of risks if needed in life-threatening conditions
- X** Absolute fetal abnormalities; not to be used at any time during pregnancy

Note: **UK** = Unknown fetal risk (used in this text but not an official FDA pregnancy category)

Drug categories

α -ADRENERGIC BLOCKERS

ACTION:

α -Adrenergic blockers act by binding to α -adrenergic receptors, causing dilation of peripheral blood vessels. Lowers peripheral resistance, resulting in decreased B/P.

USES:

α -adrenergic blockers are used for benign prostatic hyperplasia, pheochromocytoma, prevention of tissue necrosis and sloughing associated with extravasation of IV vasopressors.

CONTRAINDICATIONS:

Hypersensitive reactions may occur, and allergies should be identified before these products are given. Patients with MI, coronary insufficiency, angina, or other evidence of CAD should not use these products.

Administer:

- Starting with low dose, gradually increasing to prevent side effects
- With food or milk for GI symptoms

SIDE EFFECTS:

The most common side effects are hypotension, tachycardia, nasal stuffiness, nausea, vomiting, and diarrhea.

PHARMACOKINETICS:

Onset, peak, and duration vary among products.

INTERACTIONS:

Vasoconstrictive and hypertensive effects of EPINEPHrine are antagonized by α -

adrenergic blockers.

POSSIBLE NURSING DIAGNOSES:

- Risk for injury [*adverse reactions*]
- Insomnia [*adverse reactions*]
- Impaired urinary elimination [*uses*]

NURSING CONSIDERATIONS

Assess:

- Electrolytes: K, Na, Cl, CO₂
- Weight daily, I&O
- B/P lying, standing before starting treatment, q4hr thereafter
- Nausea, vomiting, diarrhea
- Skin turgor, dryness of mucous membranes for hydration status

Evaluate:

- Therapeutic response: decreased B/P, increased peripheral pulses

Teach patient/family:

- To avoid alcoholic beverages
- To report dizziness, palpitations, fainting
- To change position slowly or fainting may occur
- To take product exactly as prescribed
- To avoid all OTC products (cough, cold, allergy) unless directed by prescriber

SELECTED GENERIC NAMES

α 1 blockers

silodosin

tamsulosin

ANESTHETICS—GENERAL/LOCAL

ACTION:

Anesthetics (general) act on the CNS to produce tranquilization and sleep before invasive procedures. Anesthetics (local) inhibit conduction of nerve impulses from sensory nerves.

USES:

General anesthetics are used to premedicate for surgery, induction and maintenance in general anesthesia. For local anesthetics, refer to individual product listing for indications.

CONTRAINDICATIONS:

Persons with cerebrovascular accident, increased intracranial pressure, severe hypertension, cardiac decompensation should not use these products since severe adverse reactions can occur.

Precautions: Anesthetics (general) should be used with caution in the geriatric, CVD (hypotension, bradydysrhythmias), renal/hepatic disease, Parkinson's disease, children <2 yr. The precaution for anesthetics (local) is pregnancy.

Administer:

- Anticholinergic preoperatively to decrease secretions
- Only with crash cart, resuscitative equipment nearby

SIDE EFFECTS:

The most common side effects are dystonia, akathisia, flexion of arms, fine tremors, drowsiness, restlessness, and hypotension. Also common are chills, respiratory depression, and laryngospasm.

PHARMACOKINETICS:

Onset, peak, and duration vary widely among products. Most products are metabolized in the liver and excreted in urine.

INTERACTIONS:

MAOIs, tricyclics, phenothiazines may cause severe hypotension or hypertension when used with local anesthetics. CNS depressants will potentiate general and local anesthetics.

POSSIBLE NURSING DIAGNOSES:

General:

- Risk for injury [*adverse reactions*]
- Deficient knowledge [*teaching*]

Local:

- Deficient knowledge [*teaching*]
- Acute pain [*uses*]

NURSING CONSIDERATIONS**Assess:**

- VS q10min during IV administration, q30min after IM dose

Perform/provide:

- Quiet environment for recovery to decrease psychotic symptoms

Evaluate:

- Therapeutic response: maintenance of anesthesia, decreased pain

ANTACIDS**ACTION:**

Antacids are basic compounds that neutralize gastric acidity and decrease the

rate of gastric emptying. Products are divided into those containing aluminum, magnesium, calcium, or a combination of these.

USES:

Antacids decrease hyperacidity in conditions such as peptic ulcer disease, reflux esophagitis, gastritis, and hiatal hernia.

CONTRAINDICATIONS:

Sensitivity to aluminum or magnesium products may cause hypersensitive reactions. Aluminum products should not be used by persons sensitive to aluminum; magnesium products should not be used by persons sensitive to magnesium. Check for sensitivity before administering.

Precautions: Magnesium products should be given cautiously to patients with renal insufficiency and during pregnancy and breastfeeding. Sodium content of antacids may be significant; use with caution for patients with hypertension, congestive heart failure or for those on a low-sodium diet.

Administer:

- Not to take other products within 1-2 hr of antacid administration because antacids may impair absorption of other products
- All products with an 8-oz glass of water to ensure absorption in the stomach
- Another antacid if constipation occurs with aluminum products

SIDE EFFECTS:

The most common side effect caused by aluminum-containing antacids is constipation, which may lead to fecal impaction and bowel obstruction. Diarrhea occurs often when magnesium products are given. Alkalosis may occur when systemic products are used. Constipation occurs more frequently than laxation with calcium carbonate. The release of CO₂ from carbonate-containing antacids causes belching, abdominal distention, and flatulence. Sodium bicarbonate may act as a systemic antacid and produce systemic electrolyte disturbances and alkalosis. Calcium carbonate and sodium bicarbonate may cause rebound hyperacidity and milk-alkali syndrome. Alkaluria may occur when products are used on a long-term basis, particularly in persons with abnormal renal function.

PHARMACOKINETICS:

Duration is 20-40 min. If ingested 1 hr after meals, acidity is reduced for at least 3 hr.

INTERACTIONS:

Effects of the following products may be increased by some antacids:

quinidine, amphetamines, pseudoephedrine, levodopa, valproic acid, dicumarol.

Effects of the following products may be decreased by some antacids:

cimetidine, corticosteroids, ranitidine, iron salts, phenothiazines, phenytoin, digoxin, tetracyclines, ketoconazole, salicylates, isoniazid.

POSSIBLE NURSING DIAGNOSES:

- Constipation [*adverse reactions*]
- Diarrhea [*adverse reactions*]
- Chronic pain [*uses*]

NURSING CONSIDERATIONS

Assess:

- Aggravating and alleviating factors of epigastric pain or hyperacidity; identify the location, duration, and characteristics of epigastric pain
- GI symptoms, including constipation, diarrhea, abdominal pain; if severe abdominal pain with fever occurs, these products should not be given
- Renal symptoms, including increasing urinary pH, electrolytes

Evaluate:

- Therapeutic response: absence of epigastric pain, and decreased acidity

SELECTED GENERIC NAMES

aluminum hydroxide

bismuth subsalicylate

calcium carbonate

magnesium oxide

sodium bicarbonate

ANTI-ALZHEIMER AGENTS

ACTION:

Anti-Alzheimer agents improve cognitive functioning by increasing acetylcholine and inhibiting cholinesterase in the CNS. Do not cure condition, but improve symptoms.

USES:

Anti-Alzheimer agents are used for the treatment of Alzheimer's symptoms.

CONTRAINDICATIONS:

Persons with hypersensitivity reactions should not use these products.

Precautions: Anti-Alzheimer agents should be used cautiously in pregnancy (C), breastfeeding, sick sinus syndrome, GI bleeding, bladder obstruction, and seizures.

Administer:

- Lowest possible dose for therapeutic result; adjust dose to response

SIDE EFFECTS:

The most common side effects are nausea, vomiting, diarrhea, dry mouth, insomnia, dizziness, as well as urinary frequency, incontinence, and rash. The most serious side effects are seizures and dysrhythmias.

PHARMACOKINETICS:

Onset, peak, and duration vary widely among products. Most products are metabolized in the liver and excreted by the kidneys.

INTERACTIONS:

Increased synergistic reactions may occur with succinylcholine, cholinesterase inhibitors, and cholinergic agonists. There may be a decrease in the action of anticholinergics, and there may be additive effects when used with cholinergic agents.

POSSIBLE NURSING DIAGNOSES:

- Chronic confusion [*uses*]
- Deficient knowledge [*teaching*]
- Noncompliance [*teaching*]

NURSING CONSIDERATIONS

Assess:

- B/P, hypotension, hypertension
- Mental status: affect, mood, behavioral changes, depression, confusion
- GI status: nausea, vomiting, anorexia, diarrhea
- GU status: urinary frequency, incontinence

Perform/provide:

- Assistance with ambulation during beginning therapy if dizziness, ataxia occur

Evaluate:

- Therapeutic response: decrease in confusion, improved mood

Teach patient/family:

- To report side effects, adverse reactions to health care provider
- To use exactly as prescribed, at regular intervals
- Not to increase or abruptly decrease dose; serious consequences may result
- That product is not a cure but relieves symptoms

SELECTED GENERIC NAMES

donepezil

galantamine

memantine

rivastigmine

ANTIANGINALS

ACTION:

Antianginals are divided into the nitrates, calcium channel blockers, and β -adrenergic blockers. The nitrates dilate coronary arteries, causing decreased preload, and dilate systemic arteries, causing decreased afterload. Calcium channel blockers dilate coronary arteries and decrease SA/AV node conduction. β -Adrenergic blockers decrease heart rate so that myocardial O_2 use is decreased. Dipyridamole selectively dilates coronary arteries to increase coronary blood flow.

USES:

Antianginals are used in chronic stable angina pectoris, unstable angina, vasospastic angina. Some (i.e., calcium channel blockers and β -blockers) may be used for dysrhythmias and in hypertension.

CONTRAINDICATIONS:

Persons with known hypersensitivity, increased intracranial pressure, or cerebral hemorrhage should not use some of these products.

Precautions: Antianginals should be used with caution in postural hypotension, pregnancy, breastfeeding, children, renal disease, and hepatic injury.

SIDE EFFECTS:

The most common side effects are postural hypotension, headache, flushing, dizziness, nausea, edema, and drowsiness. Also common are rash, dysrhythmias, and fatigue.

PHARMACOKINETICS:

Onset, peak, and duration vary widely among coronary products. Most products are metabolized in the liver and excreted in urine.

INTERACTIONS:

Interactions vary widely among products. Check individual monographs for specific information.

POSSIBLE NURSING DIAGNOSES:

- Decreased cardiac output [*adverse reactions*]
- Risk for injury [*uses*]
- Deficient knowledge [*teaching*]
- Acute pain [*uses*]
- Ineffective cardiac tissue perfusion [*uses*]

NURSING CONSIDERATIONS

Assess:

- Orthostatic B/P, pulse
- Pain: duration, time started, activity being performed, character
- Tolerance if taken over long period

- Headache, light-headedness, decreased B/P; may indicate a need for decreased dosage

Perform/provide:

- Storage protected from light, moisture; place in cool environment

Evaluate:

- Therapeutic response: decrease, prevention of anginal pain

Teach patient/family:

- To keep tabs in original container
- Not to use OTC products unless directed by prescriber
- To report bradycardia, dizziness, confusion, depression, fever
- To take pulse at home, advise when to notify prescriber
- To avoid alcohol, smoking, sodium intake
- To comply with weight control, dietary adjustments, modified exercise program
- To carry emergency ID to identify product that you are taking, allergies
- To make position changes slowly to prevent fainting

ANTIANXIETY AGENTS

ACTION:

Benzodiazepines potentiate the action of GABA, including any other inhibitory transmitters in the CNS resulting in decreased anxiety. Most agents cause a decrease in CNS excitability.

USES:

Anxiety is relieved in conditions such as generalized anxiety disorder and phobic disorders. Benzodiazepines are also used for acute alcohol withdrawal to prevent delirium tremens, and some products are used for relaxation before surgery.

CONTRAINDICATIONS:

These products are contraindicated in hypersensitivity, acute closed-angle glaucoma, children <6 mo, hepatic disease (clonazepam), and breastfeeding (diazepam).

Precautions: Antianxiety agents should be used cautiously in geriatric or debilitated patients. Usually smaller doses are needed because metabolism is slowed. Persons with renal/hepatic disease may show delayed excretion. Clonazepam may increase the incidence of seizures.

Administer:

- With food or milk for GI symptoms; may give crushed if patient is unable to swallow whole (tabs only, no controlled-or sustained-release products)

SIDE EFFECTS:

The most common side effects are dizziness, drowsiness, blurred vision, and orthostatic hypotension. Most adverse reactions are mediated through the CNS. There is the potential for abuse and physical dependence with some products.

PHARMACOKINETICS:

Most of these agents are metabolized by the liver and excreted via the kidneys.

INTERACTIONS:

Increased CNS depression may occur when given with other CNS depressants. These products should be used together cautiously. Alcohol should not be used, as fatal reactions have occurred. The serum concentration and toxicity may be increased when used with benzodiazepines.

POSSIBLE NURSING DIAGNOSES:

- Anxiety [*uses*]
- Risk for injury [*adverse reactions*]
- Deficient knowledge [*teaching*]

NURSING CONSIDERATIONS

Assess:

- B/P (lying and standing), pulse; if systolic B/P drops 20 mm Hg, hold product and notify prescriber; orthostatic hypotension can be severe
- Hepatic/renal studies: AST, ALT, bilirubin, creatinine, LDH, alk phos
- Physical dependency and withdrawal with some products, including headache, nausea, vomiting, muscle pain, and weakness after long-term use

Evaluate:

- Therapeutic response: decreased anxiety, increased relaxation

Teach patient/family:

- That product should not be used for everyday stress or long-term use; not to take more than prescribed amount because product is habit forming
- To avoid driving and activities that require alertness because drowsiness and dizziness may occur
- To abstain from alcohol, other psychotropic medications unless directed by prescriber
- Not to discontinue abruptly; after extended periods, withdrawal symptoms may occur

ANTIASTHMATICS

ACTION:

Bronchodilators are divided into anticholinergics, α/β -adrenergic agonists, β -adrenergic agonists, and phosphodiesterase inhibitors. Also included in antiasthmatic agents are corticosteroids, leukotriene antagonists, mast cell stabilizers, and monoclonal antibodies. Anticholinergics act by inhibiting interaction of acetylcholine at receptor sites on bronchial smooth muscle. α/β -Adrenergic agonists act by relaxing bronchial smooth muscle and increasing diameter of nasal passages. β -Adrenergic agonists act by action on β_2 -receptors, which relaxes bronchial smooth muscle. Phosphodiesterase inhibitors act by blocking phosphodiesterase and increasing cAMP, which mediates smooth muscle relaxation in the respiratory system. Corticosteroids act by decreasing inflammation in the bronchial system. Leukotriene receptor antagonists decrease leukotrienes, and mast cell stabilizers decrease histamine; both act to decrease bronchospasm.

USES:

Antiasthmatics are used for bronchial asthma; bronchospasm associated with bronchitis, emphysema, or other obstructive pulmonary diseases; Cheyne-Stokes respirations; and prevention of exercise-induced asthma. Some products are used

for rhinitis and other allergic reactions.

CONTRAINDICATIONS:

Persons with hypersensitivity, closed-angle glaucoma, tachydysrhythmias, and severe cardiac disease should not use some of these products.

Precautions: Antiasthmatics should be used with caution in breastfeeding, pregnancy, hyperthyroidism, hypertension, prostatic hypertrophy, and seizure disorders.

Administer:

- Inhaled product after shaking; exhale, place mouthpiece in mouth, inhale slowly, hold breath, remove, exhale slowly
- PO product with meals to decrease gastric irritation

SIDE EFFECTS:

The most common side effects are tremors, anxiety, nausea, vomiting, and irritation in the throat. The most serious adverse reactions are bronchospasm and dyspnea.

PHARMACOKINETICS:

Onset, peak, and duration vary widely among products. Most products are metabolized by the liver and excreted in urine.

INTERACTIONS:

Interactions vary widely among products. Check individual monographs for specific information.

POSSIBLE NURSING DIAGNOSES:

- Activity intolerance [*uses*]
- Ineffective airway clearance [*uses*]
- Risk for injury [*adverse reactions*]
- Deficient knowledge [*teaching*]
- Noncompliance [*teaching*]

NURSING CONSIDERATIONS

Assess:

- Respiratory function: vital capacity, forced expiratory volume, ABGs, lung sounds, heart rate and rhythm, aggravating and alleviating factors

Perform/provide:

- Storage of inhaled product in light-resistant container; do not expose to temps over 86° F (30° C) • Gum, small sips of water for dry mouth

Evaluate:

- Therapeutic response: decrease severity and number of asthma attacks; absence of dyspnea, wheezing

Teach patient/family:

- To avoid hazardous activities; drowsiness or dizziness may occur with some products • To obtain blood work as required; some products require blood levels to be drawn • Avoid all OTC medications unless approved by provider
- To report side effects, including insomnia, heart palpitations, light-headedness; these side effects may occur with some products

ANTICHOLINERGICS

ACTION:

Anticholinergics inhibit the muscarinic actions of acetylcholine at receptor sites in the autonomic nervous system. Anticholinergics are also known as antimuscarinic products.

USES:

Anticholinergics are used for a variety of conditions: decreasing involuntary movements in parkinsonism (benztropine, trihexyphenidyl); bradydysrhythmias (atropine); nausea and vomiting (scopolamine); and as cycloplegic mydriatics (atropine, homatropine, scopolamine, cyclopentolate, tropicamide).

Gastrointestinal anticholinergics are used to decrease motility (smooth muscle tone) in the GI, biliary, and urinary tracts and for their ability to decrease gastric secretions (propantheline, glycopyrrolate).

CONTRAINDICATIONS:

Persons with closed-angle glaucoma, myasthenia gravis, or GI/GU obstruction should not use some of these products.

Precautions: Anticholinergics should be used with caution in patients who are

geriatric, pregnant, or breastfeeding or in those with prostatic hypertrophy, congestive heart failure, or hypertension; use with caution in presence of high environmental temperature.

Administer:

- Parenteral dose with patient recumbent to prevent postural hypotension
- With or after meals to prevent GI upset; may give with fluids other than water
- Parenteral dose slowly; keep in bed for at least 1 hr after dose; monitor vital signs
- After checking dose carefully; even slight overdose can lead to toxicity

SIDE EFFECTS:

The most common side effects are dry mouth, constipation, urinary retention, urinary hesitancy, headache, and dizziness. Also common is paralytic ileus.

PHARMACOKINETICS:

Onset, peak, and duration vary widely among products. Most products are metabolized in the liver and excreted in urine.

INTERACTIONS:

Increased anticholinergic effects may occur when used with MAOIs and tricyclics and amantadine. Anticholinergics may cause a decreased effect of phenothiazines and levodopa.

POSSIBLE NURSING DIAGNOSES:

- Decreased cardiac output [*uses*]
- Constipation [*adverse reactions*]
- Deficient knowledge [*teaching*]

NURSING CONSIDERATIONS

Assess:

- I&O ratio; retention commonly causes decreased urinary output
- Urinary hesitancy, retention; palpate bladder if retention occurs
- Constipation; increase fluids, bulk, exercise if this occurs
- For tolerance over long-term therapy, dose may need to be increased or changed
- Mental status: affect, mood, CNS depression, worsening of mental

symptoms during early therapy

Perform/provide:

- Storage at room temperature
- Hard candy, frequent drinks, sugarless gum to relieve dry mouth

Evaluate:

- Therapeutic response: decreased secretions, absence of nausea and vomiting

Teach patient/family:

- To avoid driving or other hazardous activities; drowsiness may occur
- To avoid OTC medication: cough, cold preparations with alcohol, antihistamines unless directed by prescriber

SELECTED GENERIC NAMES

atropine

benztropine

glycopyrrolate

hyoscyamine

scopolamine (transdermal)

solifenacin

ANTICOAGULANTS

ACTION:

Anticoagulants interfere with blood clotting by preventing clot formation.

USES:

Anticoagulants are used for deep venous thrombosis, PE, MI, open-heart surgery, disseminated intravascular clotting syndrome; atrial fibrillation with embolization, transfusion, and dialysis.

CONTRAINDICATIONS:

Persons with hemophilia and related disorders, leukemia with bleeding, peptic ulcer disease, thrombocytopenic purpura, blood dyscrasias, acute nephritis, and subacute bacterial endocarditis should not use these products.

Precautions: Anticoagulants should be used with caution in alcoholism,

geriatric patients, and pregnancy.

Administer:

- At same time each day to maintain steady blood levels
- In abdomen between pelvic bone, rotate sites; do not massage area or aspirate when giving SUBCUT injection; do not pull back on plunger, leave in for 10 sec, apply gentle pressure for 1 min
- Without changing needles
- Avoiding all IM inj that may cause bleeding

SIDE EFFECTS:

The most serious adverse reactions are hemorrhage, agranulocytosis, leukopenia, eosinophilia, and thrombocytopenia, depending on the specific product. The most common side effects are diarrhea, rash, and fever.

PHARMACOKINETICS:

Onset, peak, and duration vary widely among products. Most products are metabolized in the liver and excreted in urine.

INTERACTIONS:

Salicylates, corticosteroids, and nonsteroidal antiinflammatories will potentiate the action of anticoagulants. Anticoagulants may cause serious effects; check individual monographs.

POSSIBLE NURSING DIAGNOSES:

- Risk for injury [*side effects*]
- Deficient knowledge [*teaching*]
- Ineffective cardiac tissue perfusion [*uses*]

NURSING CONSIDERATIONS

Assess:

- Blood studies (Hct, platelets, occult blood in stools) q3mo
- Partial PT, which should be $1\frac{1}{2}$ -2 × control PPT daily, also APTT, ACT
- B/P; watch for increasing signs of hypertension
- Bleeding gums, petechiae, ecchymosis; black, tarry stools; hematuria
- Fever, skin rash, urticaria

- Needed dosage change q1-2wk

Perform/provide:

- Storage in tight container

Evaluate:

- Therapeutic response: decrease of DVT

Teach patient/family:

- To avoid OTC preparations that may cause serious product interactions unless directed by prescriber • That product may be held during active bleeding (menstruation), depending on condition • To use soft-bristle toothbrush to avoid bleeding gums; to avoid contact sports, use electric razor • To carry emergency ID identifying product taken
- To report any signs of bleeding: gums, under skin, urine, stools

ANTICONVULSANTS

ACTION:

Anticonvulsants are divided into the barbiturates, benzodiazepines, hydantoins, succinimides, and miscellaneous products. Barbiturates and benzodiazepines are discussed in separate sections. Hydantoins act by inhibiting the spread of seizure activity in the motor cortex. Succinimides act by inhibiting spike and wave formation; they also decrease amplitude, frequency, duration, and spread of discharge in seizures.

USES:

Hydantoins are used in generalized tonic-clonic seizures, status epilepticus, and psychomotor seizures. Succinimides are used for absence (petit mal) seizures. Barbiturates are used in generalized tonic-clonic and cortical focal seizures.

CONTRAINDICATIONS:

Hypersensitive reactions may occur, and allergies should be identified before these products are given.

Precautions: Persons with renal/hepatic disease should be watched closely.

Administer:

- With food, milk to decrease GI symptoms

SIDE EFFECTS:

Bone marrow depression is the most life-threatening adverse reaction associated with hydantoins or succinimides. The most common side effects are GI symptoms. Other common side effects for hydantoins are gingival hyperplasia and CNS effects such as nystagmus, ataxia, slurred speech, and mental confusion.

PHARMACOKINETICS:

Onset, peak, and duration vary widely among products. Most products are metabolized in the liver and excreted in urine, bile, and feces.

INTERACTIONS:

Decreased effects of estrogens, oral contraceptives (hydantoins).

POSSIBLE NURSING DIAGNOSES:

- Injury, risk for *[uses]*
- Noncompliance *[teaching]*

NURSING CONSIDERATIONS

Assess:

- Renal studies, including BUN, creatinine, serum uric acid, urine creatinine clearance before and during therapy
- Blood studies: RBC, Hct, Hgb,

reticulocyte counts weekly for 4 wk then monthly • Hepatic studies: AST, ALT, bilirubin, creatinine

- Mental status, including mood, sensorium, affect, behavioral changes; if mental status changes, notify prescriber
- Eye problems, including need for ophthalmic exam before, during, and after treatment (slit lamp, funduscopy, tonometry)
- Allergic reactions, including red, raised rash; if this occurs, product should be discontinued
- Blood dyscrasia, including fever, sore throat, bruising, rash, jaundice
- Toxicity, including bone marrow depression, nausea, vomiting, ataxia, diplopia, CV collapse, Stevens-Johnson syndrome

Perform/provide:

- Good oral hygiene as it is important for hydantoins

Evaluate:

- Therapeutic response: decreased seizure activity; document on patient's chart

Teach patient/family:

- To carry emergency ID stating products taken, condition, prescriber's name, phone number
- To avoid driving, other activities that require alertness

ANTIDEPRESSANTS

ACTION:

Antidepressants are divided into the tricyclics, MAOIs, and miscellaneous antidepressants (SSRIs). The tricyclics work by blocking reuptake of norepinephrine and serotonin into nerve endings and increasing action of norepinephrine and serotonin in nerve cells. MAOIs act by increasing concentrations of endogenous EPINEPHrine, norepinephrine, serotonin, and DOPamine in storage sites in CNS by inhibition of MAO; increased concentration reduces depression.

USES:

Antidepressants are used for depression and, in some cases, enuresis in children.

CONTRAINDICATIONS:

The contraindications to antidepressants are seizure disorders, prostatic hypertrophy and severe renal/hepatic/cardiac disease depending on the type of medication.

Precautions: Antidepressants should be used cautiously in suicidal patients, severe depression, schizophrenia, hyperactivity, diabetes mellitus, pregnancy, and geriatric patients.

Administer:

- Increased fluids if urinary retention occurs, bulk in diet, if constipation occurs
- With food or milk for GI symptoms

SIDE EFFECTS:

The most serious adverse reactions are paralytic ileus, acute renal failure, hypertension, and hypertensive crisis, depending on the specific product. Common side effects are dizziness, drowsiness, diarrhea, dry mouth, urinary retention, and orthostatic hypotension.

PHARMACOKINETICS:

Onset, peak, and duration vary widely among products. Most products are metabolized in the liver and excreted in urine.

INTERACTIONS:

Interactions vary widely among products. Check individual monographs for specific information.

POSSIBLE NURSING DIAGNOSES:

- Ineffective coping [*uses*]
- Risk for injury [*uses/adverse reactions*]
- Deficient knowledge [*teaching*]

NURSING CONSIDERATIONS

Assess:

- B/P (lying, standing), pulse q4hr; if systolic B/P drops 20 mm Hg, hold product, notify prescriber; take VS q4hr in patients with cardiovascular disease
- Blood studies: CBC, leukocytes, differential, cardiac enzymes if patient is receiving long-term therapy • Hepatic studies: AST, ALT, bilirubin, creatinine
- Weight every wk; appetite may increase with product
- EPS, primarily in geriatric patients: rigidity, dystonia, akathisia
- Mental status: mood, sensorium, affect, suicidal tendencies, increase in psychiatric symptoms: depression, panic • Urinary retention, constipation; constipation is more likely to occur in children, geriatric patients • Withdrawal symptoms: headache, nausea, vomiting, muscle pain, weakness; do not usually occur unless product was discontinued abruptly • Alcohol consumption; if alcohol is consumed, hold dose until morning

Perform/provide:

- Storage in tight container at room temperature; do not freeze
- Assistance with ambulation during beginning therapy because drowsiness, dizziness occur
- Safety measures including side rails primarily in geriatric patients
- Checking to see PO medication swallowed
- Gum, hard candy, or frequent sips of water for dry mouth

Evaluate:

- Therapeutic response: decreased depression

Teach patient/family:

- That therapeutic effects may take 2-3 wk
- To use caution in driving, other activities requiring alertness because of drowsiness, dizziness, blurred vision
- To avoid alcohol ingestion, other CNS depressants
- Not to discontinue medication quickly after long-term use; may cause nausea, headache, malaise
- To wear sunscreen or wide-brimmed hat; photosensitivity may occur

ANTIDIABETICS

ACTION:

Antidiabetics are divided into the insulins that decrease blood glucose, phosphate, and potassium and increase blood pyruvate and lactate; and oral antidiabetics that cause functioning β -cells in the pancreas to release insulin and improve the effect of endogenous and exogenous insulin.

USES:

Insulins are used for ketoacidosis and diabetes mellitus types 1 and 2; oral antidiabetics are used for stable adult-onset diabetes mellitus type 2.

CONTRAINDICATIONS:

Hypersensitive reactions may occur, and allergies should be identified before these products are given. Oral antidiabetics should not be used in juvenile or brittle diabetes, diabetic ketoacidosis, or severe renal/hepatic disease.

Precautions: Oral antidiabetics should be used with caution in the geriatric patient, in cardiac disease, pregnancy, breastfeeding, and in the presence of alcohol.

Administer:

- Insulin after warming to room temperature by rotating in palms to prevent lipodystrophy from injecting cold insulin
- Human insulin to those allergic to beef or pork
- Oral antidiabetic 30 min before meals

SIDE EFFECTS:

The most common side effect of insulin and oral antidiabetics is hypoglycemia. Other adverse reactions to oral antidiabetics include blood dyscrasias;

hepatotoxicity; and, rarely, cholestatic jaundice. Adverse reactions to insulin products include allergic responses and, more rarely, anaphylaxis.

PHARMACOKINETICS:

Onset, peak, and duration vary widely among products. Oral antidiabetics are metabolized in the liver, with metabolites excreted in urine, bile, and feces.

INTERACTIONS:

Interactions vary widely among products. Check individual monographs for specific information.

POSSIBLE NURSING DIAGNOSES:

- Imbalanced nutrition: more than body requirements [*uses*]

NURSING CONSIDERATIONS

Assess:

- Blood, urine glucose levels during treatment to determine diabetes control (oral products)
- Fasting blood glucose, 2 hr PP (60-100 mg/dl normal fasting level) (70-130 mg/dl normal 2-hr level)
- Hypoglycemic reaction that can occur during peak time

Perform/provide:

- Rotation of inj sites when giving insulin; use abdomen, upper back, thighs, upper arm, buttocks; rotate sites within one of these regions; keep a record of sites

Evaluate:

- Therapeutic response: decrease in polyuria, polydipsia, polyphagia, clear sensorium; absence of dizziness; stable gait

Teach patient/family:

- To avoid alcohol and salicylates except on advice of prescriber
- Symptoms of ketoacidosis: nausea, thirst, polyuria, dry mouth, decreased B/P; dry, flushed skin; acetone breath, drowsiness, Kussmaul respiration
- Symptoms of hypoglycemia: headache, tremors, fatigue, weakness; that candy or sugar should be carried to treat hypoglycemia
- To test urine for glucose/ketones tid if this product is replacing insulin

- To continue weight control, dietary restrictions, exercise, hygiene
- To obtain yearly eye exams

ANTIDIARRHEALS

ACTION:

Antidiarrheals work by various actions, including direct action on intestinal muscles to decrease GI peristalsis; by inhibiting prostaglandin synthesis responsible for GI hypermotility; by acting on mucosal receptors responsible for peristalsis; or by decreasing water content of stools.

USES:

Antidiarrheals are used for diarrhea of undetermined causes.

CONTRAINDICATIONS:

Persons with severe ulcerative colitis, pseudomembranous colitis with some products.

Precautions: Antidiarrheals should be used with caution in the geriatric patient, pregnancy, breastfeeding, children, dehydration.

Administer:

- For 48 hr only

SIDE EFFECTS:

The most serious adverse reactions of some products are paralytic ileus, toxic megacolon, and angioneurotic edema. The most common side effects are constipation, nausea, dry mouth, and abdominal pain.

PHARMACOKINETICS:

Onset, peak, and duration vary widely among products. Most products are metabolized in the liver and excreted in urine.

INTERACTIONS:

Interactions vary widely among products. Check individual monographs for specific information.

POSSIBLE NURSING DIAGNOSES:

- Constipation [*adverse reactions*]
- Diarrhea [*uses*]
- Deficient fluid volume [*adverse reactions*]
- Deficient knowledge [*teaching*]

NURSING CONSIDERATIONS

Assess:

- Electrolytes (K, Na, Cl) if on long-term therapy
- Bowel pattern before; for rebound constipation after termination of medication
- Response after 48 hr; if no response, product should be discontinued
- Dehydration in children

Evaluate:

- Therapeutic response: decreased diarrhea

Teach patient/family:

- To avoid OTC products
- Not to exceed recommended dose

SELECTED GENERIC NAMES

bismuth subsalicylate

loperamide

ANTIDYSRHYTHMICS**ACTION:**

Antidysrhythmics are divided into four classes and miscellaneous antidysrhythmics:

- Class I increases the duration of action potential and effective refractory period and reduces disparity in the refractory period between a normal and infarcted myocardium; further subclasses include Ia, Ib, Ic
- Class II decreases the rate of SA node discharge, increases recovery time, slows conduction through the AV node, and decreases heart rate, which decreases O₂ consumption in the myocardium
- Class III increases the duration of action potential and the effective refractory period
- Class IV inhibits calcium ion influx across the cell membrane during cardiac depolarization; decreases SA node discharge; decreases conduction velocity through the AV node
- Miscellaneous antidysrhythmics include those such as adenosine, which slows conduction through the AV node, and digoxin, which decreases conduction velocity and prolongs the effective refractory period in the AV node

USES:

Antidysrhythmics are used for PVCs, tachycardia, hypertension, atrial fibrillation, angina pectoris.

CONTRAINDICATIONS:

Contraindications vary widely among products.

Precautions: Precautions vary widely among products.

SIDE EFFECTS:

Side effects and adverse reactions vary widely among products.

PHARMACOKINETICS:

Onset, peak, and duration vary widely among products.

INTERACTIONS:

Interactions vary widely among products. Check individual monographs for specific information.

POSSIBLE NURSING DIAGNOSES:

- Decreased cardiac output [*uses*]
- Diarrhea [*adverse reactions*]
- Impaired gas exchange [*adverse reactions*]
- Ineffective cardiac tissue perfusion [*uses*]

NURSING CONSIDERATIONS

Assess:

- ECG continuously to determine product effectiveness, premature ventricular contractions, or other dysrhythmias
- IV inf rate to avoid causing nausea, vomiting
- For dehydration or hypovolemia
- B/P continuously for hypotension, hypertension
- I&O ratio
- Serum potassium
- Edema in feet and legs daily

Evaluate:

- Therapeutic response: decrease in B/P in hypertension; decreased B/P, edema, moist crackles in congestive heart failure

Teach patient/family:

- To comply with dosage schedule, even if patient is feeling better
- To report bradycardia, dizziness, confusion, depression, fever

ANTIEMETICS

ACTION:

The antiemetics are divided into the 5-HT₃ receptor antagonists, the phenothiazines, and the miscellaneous products. The 5HT₃ receptor antagonists work by blocking serotonin peripherally, centrally, and in the small intestine.

The phenothiazines act by blocking the chemoreceptor trigger zone in the brain. The miscellaneous products work by either decreasing motion sickness or delaying gastric emptying.

USES:

Antiemetics are used to prevent nausea and vomiting due to cancer chemotherapy, radiotherapy, and surgery (5-HT₃ receptor antagonists); some of the miscellaneous products (antihistamines) work by decreasing motion sickness. Most other products are used for many types of nausea and vomiting.

CONTRAINDICATIONS:

Persons developing hypersensitive reactions should not use these products.

Precautions: Antiemetics should be used cautiously in pregnancy, breastfeeding, hepatic disease, and some GI disorders.

Administer:

- Prophylactically, before nausea and vomiting occur, in cancer chemotherapy

SIDE EFFECTS:

The most common side effects are headache, dizziness, fatigue, and diarrhea.

PHARMACOKINETICS:

Onset, peak, and duration vary widely among products. Most products are metabolized by the liver and excreted by the kidneys.

INTERACTIONS:

Interactions vary widely among products. Check individual monographs for specific information. Other CNS depressants increase CNS depression.

POSSIBLE NURSING DIAGNOSES:

- Deficient fluid volume [*uses*]
- Risk for injury [*uses, adverse reactions*]
- Deficient knowledge [*teaching*]
- Imbalanced nutrition: less than body requirements [*uses*]

NURSING CONSIDERATIONS

Assess:

- For reason for nausea, vomiting; absence of nausea and vomiting after giving product
- For hypersensitivity reactions: rash, bronchospasm with some products

Perform/provide:

- Storage at room temperature vial/ampules, oral products

Evaluate:

- Therapeutic response: absence or decreasing nausea and vomiting after use

Teach patient/family:

- To avoid hazardous activities if dizziness occurs; ask for assistance if hospitalized
- To rise slowly to prevent orthostatic hypotension
- To teach all aspects of product usage
- Conservative methods to control nausea and vomiting such as sips of water or other fluids and dry crackers

ANTIFUNGALS (SYSTEMIC)

ACTION:

Antifungals act by increasing cell membrane permeability in susceptible organisms by binding sterols and decreasing potassium, sodium, and nutrients in the cell.

USES:

Antifungals are used for infections of histoplasmosis, blastomycosis, coccidioidomycosis, cryptococcosis, aspergillosis, phycomycosis, candidiasis, sporotrichosis causing severe meningitis, septicemia, and skin infections.

CONTRAINDICATIONS:

Persons with severe bone depression or hypersensitivity should not use these products.

Precautions: Antifungals should be used with caution in renal/hepatic disease and pregnancy.

Administer:

- IV using in-line filter (mean pore diameter $>1\ \mu\text{m}$) using distal veins; check for extravasation, necrosis q8hr
- Product only after C&S confirms organism; make sure product is used in life-threatening infections

SIDE EFFECTS:

The most serious adverse reactions include renal tubular acidosis, permanent renal impairment, anuria, oliguria, hemorrhagic gastroenteritis, acute hepatic failure, and blood dyscrasias. Some common side effects include hypokalemia, nausea, vomiting, anorexia, headache, fever, and chills.

PHARMACOKINETICS:

Onset, peak, and duration vary widely among products. Most products are metabolized in the liver and excreted in urine.

INTERACTIONS:

Interactions vary widely among products. Check individual monographs for specific information.

POSSIBLE NURSING DIAGNOSES:

- Risk for infection [*uses*]
- Risk for injury [*adverse reactions*]
- Deficient knowledge [*teaching*]

NURSING CONSIDERATIONS

Assess:

- VS q15-30min during first infusion; note changes in pulse, B/P
- I&O ratio; watch for decreasing urinary output, change in specific gravity; discontinue product to prevent permanent damage to renal tubules
- Blood studies: CBC, K, Na, Ca, Mg q2wk
- Weight weekly; if weight increases over 2 lb/wk, edema is present; renal damage should be considered • For renal toxicity: increasing BUN, if >40 mg/dl or if serum creatinine >3 mg/dl; product may be discontinued or dosage reduced
- For hepatotoxicity: increasing AST, ALT, alk phos, bilirubin
- For allergic reaction: dermatitis, rash; product should be discontinued, antihistamines (mild reaction) or EPINEPHrine (severe reaction) administered
- For hypokalemia: anorexia, drowsiness, weakness, decreased reflexes, dizziness, increased urinary output, increased thirst, paresthesias • For ototoxicity: tinnitus (ringing, roaring in ears), vertigo, loss of hearing (rare)

Perform/provide:

- Protection from light during inf, cover with foil
- Symptomatic treatment as ordered for adverse reactions: aspirin, antihistamines, antiemetics, antispasmodics • Storage protected from moisture and light; diluted sol is stable for 24 hr

Evaluate:

- Therapeutic response: decreased fever, malaise, rash, negative C&S for infecting organism

Teach patient/family:

- That long-term therapy may be needed to clear infection (2 wk-3 mo depending on type of infection)

SELECTED GENERIC NAMES

posaconazole
voriconazole

ANTIHISTAMINES

ACTION:

Antihistamines compete with histamines for H_1 -receptor sites. They antagonize in varying degrees most of the pharmacologic effects of histamines.

USES:

Antihistamines are used to control the symptoms of allergies, rhinitis, and pruritus.

CONTRAINDICATIONS:

Hypersensitivity to H_1 -receptor antagonists occurs rarely. Patients with acute asthma and lower respiratory tract disease should not use these products since thick secretions may result. Other contraindications include closed-angle glaucoma, bladder neck obstruction, stenosing peptic ulcer, symptomatic prostatic hypertrophy, newborns, and breastfeeding.

Precautions: Antihistamines must be used cautiously in conjunction with intraocular pressure since they increase intraocular pressure. Caution should also be used in geriatric patients, those with renal/cardiac disease, hypertension, seizure disorders, pregnancy, and those breastfeeding.

Administer:

- With food or milk to decrease GI symptoms; absorption may be decreased slightly
- Whole (sustained-release tabs)

SIDE EFFECTS:

Most products cause drowsiness; however, fexofenadine and loratadine produce little, if any, drowsiness. Other common side effects are headache and thickening

of bronchial secretions. Serious blood dyscrasias may occur but are rare. Urinary retention, GI effects occur with many of these products.

PHARMACOKINETICS:

Onset varies from 20-60 min, with duration lasting 4-24 hr. In general, pharmacokinetics vary widely among products.

INTERACTIONS:

Barbiturates, opioids, hypnotics, tricyclics, or alcohol can increase CNS depression when taken with antihistamines.

POSSIBLE NURSING DIAGNOSES:

- Ineffective airway clearance [*uses*]

NURSING CONSIDERATIONS

Assess:

- I&O ratio; be alert for urinary retention, frequency, dysuria; product should be discontinued if these occur
- CBC during long-term therapy since hemolytic anemia, although rare, may occur
- Blood dyscrasias: thrombocytopenia, agranulocytosis (rare)
- Respiratory status: rate, rhythm, increase in bronchial secretions, wheezing, chest tightness
- Cardiac status: palpitations, increased pulse, hypotension

Perform/provide:

- Hard candy, gum; frequent rinsing of mouth for dryness

Evaluate:

- Therapeutic response: absence of allergy symptoms, itching

Teach patient/family:

- To notify prescriber if confusion, sedation, hypotension occur
- To avoid driving, other hazardous activity if drowsiness occurs
- To avoid concurrent use of alcohol, other CNS depressants
- To discontinue a few days before skin testing

ANTIHYPERTENSIVES

ACTION:

Antihypertensives are divided into angiotensin-converting enzyme (ACE) inhibitors, β -adrenergic blockers, calcium channel blockers, centrally acting adrenergics, diuretics, peripherally acting antiadrenergics, and vasodilators. β -Blockers, calcium channel blockers, and diuretics are discussed in separate sections. Angiotensin-converting enzyme inhibitors act by selectively suppressing renin-angiotensin I to angiotensin II; dilation of arterial and venous vessels occurs. Centrally acting adrenergics act by inhibiting the sympathetic vasomotor center in the CNS that reduces impulses in the sympathetic nervous system; B/P, pulse rate, and cardiac output decrease. Peripherally acting antiadrenergics inhibit sympathetic vasoconstriction by inhibiting release of norepinephrine and/or depleting norepinephrine stores in adrenergic nerve endings. Vasodilators act on arteriolar smooth muscle by producing direct relaxation or vasodilation; a reduction in B/P, with concomitant increases in heart rate and cardiac output, occurs.

USES:

Antihypertensives are used for hypertension. Some products are used for heart failure not responsive to conventional therapy. Some products are used in hypertensive crisis, angina, and for some cardiac dysrhythmias.

CONTRAINDICATIONS:

Hypersensitive reactions may occur, and allergies should be identified before these products are given. Antihypertensives should not be used in children or in patients with heart block.

Precautions: Antihypertensives should be used with caution in geriatric and dialysis patients and in the presence of hypovolemia, leukemia, and electrolyte imbalances.

SIDE EFFECTS:

The most common side effects are hypotension, bradycardia, tachycardia, headache, nausea, and vomiting. Side effects and adverse reactions may vary widely between classes and specific products.

PHARMACOKINETICS:

Onset, peak, and duration vary widely among products. Most products are metabolized in the liver, with metabolites excreted in urine, bile, and feces.

INTERACTIONS:

Interactions vary widely among products. Check individual monographs for specific information.

POSSIBLE NURSING DIAGNOSES:

- Decreased cardiac output [*uses*]
- Diarrhea [*adverse reactions*]
- Impaired gas exchange [*adverse reactions*]
- Ineffective cardiac tissue perfusion [*uses*]

NURSING CONSIDERATIONS

Assess:

- Blood studies: neutrophil; decreased platelets occur with many of the products
- Renal studies: protein, BUN, creatinine; watch for increased levels that may indicate nephrotic syndrome; obtain baselines in renal and hepatic function studies before beginning treatment
- Edema in feet and legs daily
- Allergic reaction, including rash, fever, pruritus, urticaria: product should be discontinued if antihistamines fail to help
- Symptoms of congestive heart failure: edema, dyspnea, wet crackles, B/P
- Renal symptoms: polyuria, oliguria, frequency

Perform/provide:

- Supine or Trendelenburg position for severe hypotension

Evaluate:

- Therapeutic response: decrease in B/P in hypotension; decreased B/P, edema, moist crackles in congestive heart failure

Teach patient/family:

- To comply with dosage schedule, even if feeling better
- To rise slowly to sitting or standing position to minimize orthostatic hypotension

ANTIINFECTIVES

ACTION:

Antiinfectives are divided into several groups, which include but are not limited to penicillins, cephalosporins, aminoglycosides, sulfonamides, tetracyclines, monobactam, erythromycins, and quinolones. These products act by inhibiting the growth and replication of susceptible bacterial organisms.

USES:

Antiinfectives are used for infections of susceptible organisms. These products are effective against bacterial, rickettsial, and spirochetal infections.

CONTRAINDICATIONS:

Hypersensitivity reactions may occur. Allergies should be identified before these products are given. Cross-sensitivity can occur between products of different classes (penicillins and cephalosporins). Many persons allergic to penicillins are also allergic to cephalosporins.

Precautions: Antiinfectives should be used with caution in persons with renal/hepatic disease.

Administer:

- For 10-14 days to ensure organism death, prevention of superinfection
- Product after C&S completed; product may be taken as soon as C&S is drawn

SIDE EFFECTS:

The most common side effects are nausea, vomiting, and diarrhea. Adverse reactions include bone marrow depression and anaphylaxis.

PHARMACOKINETICS:

Onset, peak, and duration vary widely among products. Most products are metabolized in the liver. Metabolites are excreted in urine, bile, and feces.

INTERACTIONS:

Interactions vary widely among products. Check individual monographs for specific information.

POSSIBLE NURSING DIAGNOSES:

- Diarrhea [*adverse reactions*]
- Risk for infection [*uses*]

NURSING CONSIDERATIONS

Assess:

- Nephrotoxicity: increased BUN, creatinine
- Blood studies: AST, ALT, CBC, Hct, bilirubin; test monthly if patient is on long-term therapy
- Bowel pattern daily; if severe diarrhea occurs, product should be discontinued
- Urine output; if decreasing, notify prescriber; may indicate nephrotoxicity
- Allergic reaction: rash, fever, pruritus, urticaria; product should be discontinued
- Bleeding: ecchymosis, bleeding gums, hematuria, stool guaiac daily
- Overgrowth of infection: perineal itching, fever, malaise, redness, pain, swelling, drainage, rash, diarrhea, change in cough, sputum

Evaluate:

- Therapeutic response, including absence of fever, fatigue, malaise, draining wounds

Teach patient/family:

- To comply with dosage schedule, even if feeling better
- To report sore throat, bruising, bleeding, joint pain; may indicate blood dyscrasias (rare)

ANTILIPIDEMICS

ACTION:

Antilipidemics are divided into three categories or subclassifications; HMG-CoA reductase inhibitors (statins), bile acid sequestrants, and miscellaneous products. The HMG-CoA reductase inhibitors work by reduction of an enzyme that is responsible for the beginning step in cholesterol production. Bile acid sequestrants work by binding cholesterol in the GI system. The miscellaneous products work by various actions.

USES:

Primary hypercholesterolemia in individuals as an adjunct with other lifestyle

changes.

CONTRAINDICATIONS:

Persons breastfeeding (some products) or those with hypersensitivity to any product or severe hepatic disease should not take these products. Antilipidemics are identified as pregnancy category X on some products.

Precautions: Some products are identified as pregnancy category C.

Administer:

- As directed by health care provider; times will vary with medication used

SIDE EFFECTS:

The most common side effects are headache, dizziness, fatigue, insomnia, peripheral edema, dysrhythmias, sinusitis, pharyngitis, abdominal pain, diarrhea, constipation, flatulence, and back pain.

PHARMACOKINETICS:

Pharmacokinetics and pharmacodynamics vary with each product.

INTERACTIONS:

Interactions vary widely among products. Check individual monographs for specific information.

POSSIBLE NURSING DIAGNOSES:

- Constipation [*adverse reactions*]
- Diarrhea [*adverse reactions*]
- Deficient knowledge [*teaching*]
- Noncompliance [*teaching*]

NURSING CONSIDERATIONS

Assess:

- Obtain a diet and lifestyle history, including exercise, smoking, alcohol, and stress-related activities

Perform/provide:

- Protection from sunlight and heat

Evaluate:

- Therapeutic response: decrease in triglycerides and LDL cholesterol levels

Teach patient/family:

- All aspects of medication use
- To combine medication with lifestyle changes, including low-cholesterol diet, decreasing LDL in diet; avoid smoking, alcohol, and sedentary daily routine

niacinamide

ANTINEOPLASTICS**ACTION:**

Antineoplastics are divided into alkylating agents, antimetabolites, antibiotic agents, hormonal agents, and miscellaneous agents. Alkylating agents act by cross-linking strands of DNA. Antimetabolites act by inhibiting DNA synthesis. Antibiotic agents act by inhibiting RNA synthesis and by delaying or inhibiting mitosis. Hormones alter the effects of androgens, luteinizing hormone, follicle-stimulating hormone, and estrogen by changing the hormonal environment.

USES:

Antineoplastics uses vary widely among products and classes of products. They are used to treat leukemia, Hodgkin's disease, lymphomas, and other tumors throughout the body.

CONTRAINDICATIONS:

Hypersensitive reactions may occur, and allergies should be identified before these products are given. Also, persons with severe hepatic/renal disease should not use these products unless the benefits outweigh the risks.

Precautions: Persons with bleeding, severe bone marrow depression, or renal/hepatic disease should be watched closely.

Administer:

- Checking IV site for irritation; phlebitis
- EPINEPHrine for hypersensitivity reaction
- Antibiotics for prophylaxis of infection

SIDE EFFECTS:

Most products cause thrombocytopenia, leukopenia, and anemia. If these reactions occur, the product may have to be stopped until the problem is corrected. Other side effects include nausea, vomiting, glossitis, and hair loss. Some products also cause hepatotoxicity, nephrotoxicity, and cardiotoxicity.

PHARMACOKINETICS:

Onset, peak, and duration vary widely among products. Most products cross the placenta and are excreted in breast milk and in urine.

INTERACTIONS:

Toxicity may occur when used with other antineoplastics or radiation.

POSSIBLE NURSING DIAGNOSES:

- Risk for infection [*adverse reactions*]
- Imbalanced nutrition: less than body requirements [*adverse reactions*]
- Impaired oral mucous membrane [*adverse reactions*]

NURSING CONSIDERATIONS

Assess:

- CBC, differential, platelet count weekly; withhold product if WBC is

<4000/mm³ or platelet count is <75,000/mm³; notify prescriber of results • Renal function studies: BUN, creatinine, serum uric acid, and urine CCr before and during therapy • I&O ratio; report fall in urine output of 30 ml/hr

- Monitor temp q4hr (may indicate beginning infection)
- LFTs before and during therapy (bilirubin, AST, ALT, LDH), monthly, or as needed • Bleeding, including hematuria, guaiac, bruising or petechiae, mucosa, or orifices q8hr; obtain prescription for viscous Xylocaine (lidocaine)
- Yellowing of skin, sclera, dark urine, clay-colored stools, itchy skin, abdominal pain, fever, diarrhea • Edema in feet, joint pain, stomach pain, shaking
- Inflammation of mucosa, breaks in skin

Perform/provide:

- Strict asepsis, protective isolation if WBC levels are low
- Comprehensive oral hygiene, using careful technique and soft-bristle brush

Evaluate:

- Therapeutic response: decreased tumor size

Teach patient/family:

- To report signs of infection, including increased temp, sore throat, malaise
- To report signs of anemia, including fatigue, headache, faintness, SOB, irritability • To report bleeding; to avoid use of razors or commercial mouthwash

ANTIPARKINSON AGENTS

ACTION:

Antiparkinson agents are divided into cholinergics, DOPamine, and monoamine oxidase type B agonists. Cholinergics work by blocking or competing at central acetylcholine receptors. DOPamine agonists work by decarboxylation to DOPamine or by activation of dopamine receptors. Monoamine oxidase type B inhibitors work by increasing dopamine activity by inhibiting MAO type B activity.

USES:

Antiparkinson agents are used alone or in combination for patients with Parkinson's disease.

CONTRAINDICATIONS:

Persons with hypersensitivity, closed-angle glaucoma, and undiagnosed skin lesions should not use these products.

Precautions: Antiparkinson agents should be used with caution in pregnancy, breastfeeding, children, renal/cardiac/hepatic disease, and affective disorder.

Administer:

- Product up until NPO before surgery
- Dosage adjustment depending on patient response
- With meals; limit protein taken with drug
- Only after MAOIs have been discontinued for 2 wk

SIDE EFFECTS:

Side effects and adverse reactions vary widely among products. The most common side effects include involuntary movements, headache, numbness, insomnia, nightmares, nausea, vomiting, dry mouth, and orthostatic hypotension.

PHARMACOKINETICS:

Onset, peak, and duration vary widely among products. Most products are metabolized in the liver and excreted in urine.

INTERACTIONS:

Interactions vary widely among products. Check individual monographs for specific information.

POSSIBLE NURSING DIAGNOSES:

- Risk for injury [*uses*]
- Deficient knowledge [*teaching*]
- Impaired physical mobility [*uses*]

NURSING CONSIDERATIONS

Assess:

- B/P, respiration
- Mental status: affect, mood, behavioral changes, depression, complete suicide

assessment

Perform/provide:

- Assistance with ambulation, during beginning therapy
- Testing for diabetes mellitus, acromegaly if on long-term therapy

Evaluate:

- Therapeutic response: decrease in akathisia, increased mood

Teach patient/family:

- To change positions slowly to prevent orthostatic hypotension
- To report side effects: twitching, eye spasm; indicate overdose
- To use product exactly as prescribed; if product is discontinued abruptly, parkinsonian crisis may occur

SELECTED GENERIC NAMES

amantadine

benztropine

bromocriptine

carbidopa-levodopa

pramipexole

rasagiline

selegiline

tolcapone

ANTIPLATELETS

ACTION:

The antiplatelets are divided into the platelet aggregation inhibitors, platelet adhesion inhibitors, and the glycoprotein IIb, IIIa inhibitors. The platelet aggregation inhibitors work by action on thrombin; the platelet adhesion inhibitors work by inhibition of phosphodiesterase; and the glycoprotein IIb, IIIa inhibitors work by preventing fibrin from binding to glycoprotein IIb, IIIa receptors.

USES:

Antiplatelets are used to prevent MI and stroke; other products are used for coronary syndromes.

CONTRAINDICATIONS:

Persons developing hypersensitive reactions should not use these products.

Precautions: Antiplatelets should be used cautiously in pregnancy, breastfeeding, and bleeding disorders.

Administer:

- With heparin or other aspirin (some products)

SIDE EFFECTS:

The most common side effects are headache, dizziness, bleeding, and diarrhea.

PHARMACOKINETICS:

Onset, peak, and duration vary widely among products. Most products are metabolized by the liver and excreted by the kidneys.

INTERACTIONS:

Interactions vary widely among products. Check individual monographs for specific information.

POSSIBLE NURSING DIAGNOSES:

- Risk for injury [*uses, adverse reactions*]
- Deficient knowledge [*teaching*]

NURSING CONSIDERATIONS

Assess:

- Reason for use of these products
- For hypersensitivity reactions with some products
- For bleeding from orifices, in stool, urine
- Blood studies: platelets, Hgb, Hct, PT/APTT, and INR

Perform/provide:

- Storage at room temperature vial/ampules, oral products

Evaluate:

- Therapeutic response: absence of MI, stroke or other coronary syndromes

Teach patient/family:

- To avoid hazardous activities if drowsiness, dizziness occurs; to ask for assistance if hospitalized
- About all aspects of product usage

SELECTED GENERIC NAMES

Platelet aggregation inhibitors

cilostazol

clopidogrel

ticlopidine

Platelet adhesion inhibitors

dipyridamole

Glycoprotein IIb, IIIa inhibitors

eptifibatide

tirofiban

ANTIPSYCHOTICS

ACTION:

Antipsychotics/neuroleptics are divided into several subgroups: phenothiazines, thioxanthenes, butyrophenones, dibenzoxazepines, dibenzodiazepines, and indolones and other heterocyclic compounds. Although chemically different, these subgroups share many pharmacologic and clinical properties. All antipsychotics work to block postsynaptic dopamine receptors in the brain that are responsible for psychotic behavior, including hallucinations, delusions, and paranoia.

USES:

Antipsychotic behavior is decreased in conditions such as schizophrenia, paranoia, and mania. These agents are also effective for severe anxiety, intractable hiccups, nausea, vomiting, behavioral problems in children, and relaxation before surgery.

CONTRAINDICATIONS:

Persons with hepatic damage, severe hypertension or coronary disease, cerebral arteriosclerosis, blood dyscrasias, bone marrow depression, parkinsonism, severe depression, closed-angle glaucoma, children <12 yr, or persons withdrawing from alcohol or barbiturates should not use antipsychotics until these conditions are corrected.

Precautions: Caution must be used when antipsychotics are given to geriatric

patients because metabolism is slowed, and adverse reactions can occur rapidly. Hepatic/renal disease may cause poor metabolism and excretion of the product. Seizure threshold is decreased with these products; increases in the dose of anticonvulsants may be required. Persons with diabetes mellitus, prostatic hypertrophy, chronic respiratory disease, and peptic ulcer disease should be monitored closely.

Administer:

- Antiparkinson agent if EPS occur
- Liquid concentrates mixed in glass of juice or cola because taste is unpleasant; avoid contact with skin when preparing liquid concentrate or parenteral medications
- Patient should remain lying down for at least 30 min after IM inj

SIDE EFFECTS:

The most common side effects include EPS such as pseudoparkinsonism, akathisia, dystonia, and tardive dyskinesia, which may be controlled by use of antiparkinson agents. Serious adverse reactions such as hypotension, agranulocytosis, cardiac arrest, and laryngospasm have occurred. Other common side effects include dry mouth and photosensitivity.

PHARMACOKINETICS:

Onset, peak, and duration vary widely with different products and routes. Products are metabolized by the liver, are excreted in urine as metabolites, are highly bound to plasma proteins, cross the placenta, and enter breast milk. Half-life can be extended over 3 days.

INTERACTIONS:

Because other CNS depressants can cause oversedation, these combinations should be used carefully. Anticholinergics may decrease the therapeutic actions of phenothiazines and also cause increased anticholinergic effects.

POSSIBLE NURSING DIAGNOSES:

- Chronic confusion [*uses*]

NURSING CONSIDERATIONS

Assess:

- Bilirubin, CBC, hepatic studies monthly because these products are

metabolized in the liver and excreted in urine • I&O ratio: palpate bladder if low urinary output occurs; urinary retention occurs with many of these products

- Affect, orientation, LOC, reflexes, gait, coordination, sleep pattern disturbances
- Dizziness, faintness, palpitations, tachycardia on rising
- B/P (lying and standing); wide fluctuations between lying and standing B/P may require dosage or product change because orthostatic hypotension is occurring
- EPS, including akathisia, tardive dyskinesia, pseudoparkinsonism

Perform/provide:

- Supervised ambulation until stabilized on medication; do not involve in strenuous exercise program because fainting is possible; patient should not stand still for long periods
- Increased fluids to prevent constipation
- Sips of water, candy, gum for dry mouth

Evaluate:

- Therapeutic response: decrease in excitement, hallucinations, delusions, paranoia; reorganization of thought patterns, speech

Teach patient/family:

- To rise from sitting or lying position gradually; fainting may occur
- To avoid hot tubs, hot showers, or tub baths; hypotension may occur
- To wear a sunscreen or protective clothing to prevent burns
- To take extra precautions during hot weather to stay cool; heat stroke can occur
- To avoid driving, other activities requiring alertness until response to medication is known
- That drowsiness or impaired mental/motor activity is evident the first 2 wk, but tends to decrease over time

ANTIPYRETICS

ACTION:

Antipyretics act on the CNS to control fever and also inhibit prostaglandin production.

USES:

Antipyretics are used to decrease fever.

CONTRAINDICATIONS:

Persons developing hypersensitive reactions should not use these products.

Precautions: Antipyretics should be used cautiously in pregnancy, breastfeeding, hepatic disease, geriatric patients, and those with certain GI

disorders.

Administer:

- Around the clock to keep fever reduced

SIDE EFFECTS:

The most common side effects are nausea, vomiting, and rash.

PHARMACOKINETICS:

Onset, peak, and duration vary widely among products. Most products are metabolized by the liver and excreted by the kidneys.

INTERACTIONS:

Interactions vary widely among products. Check individual monographs for specific information.

POSSIBLE NURSING DIAGNOSES:

- Risk for injury [*uses, adverse reactions*]
- Deficient knowledge [*teaching*]

NURSING CONSIDERATIONS

Assess:

- Temperature frequently
- For reason for use and expected outcome
- For hypersensitivity reactions: rash, bronchospasm with some products

Perform/provide:

- Storage at room temperature

Evaluate:

- Therapeutic response: absence or decreasing fever after use

Teach patient/family:

- All aspects of product usage

SELECTED GENERIC NAMES

aspirin

choline/magnesium salicylates

choline salicylate

ibuprofen
ketoprofen
magnesium salicylate
naproxen
salsalate

ANTIRETROVIRALS

ACTION:

Antiretrovirals act by blocking DNA synthesis.

USES:

Antiretrovirals are used for HIV infections and chronic hepatitis C to slow the progression of the disease.

CONTRAINDICATIONS:

Persons with hypersensitivity should not use these products.

Precautions: Antiretrovirals should be used cautiously in renal/hepatic disease, pregnancy, and breastfeeding. Protease inhibitors should be used cautiously in diabetes.

Administer:

- In equal intervals around the clock

SIDE EFFECTS:

The most common side effects are nausea, vomiting, anorexia, headache, and diarrhea. The most serious adverse reactions are nephrotoxicity and blood dyscrasias.

PHARMACOKINETICS:

Onset, peak, and duration vary widely among products. Most products are metabolized by the liver and excreted by the kidneys.

INTERACTIONS:

Interactions vary widely among products. Check individual monographs for specific information.

POSSIBLE NURSING DIAGNOSES:

- Risk for infection [*uses*]
- Risk for injury [*adverse reactions*]
- Deficient knowledge [*teaching*]
- Noncompliance [*teaching*]

NURSING CONSIDERATIONS

Assess:

- For signs of HIV infection; increased CD4 counts, decreased viral load; signs of chronic hepatitis C
- Patients with compromised renal system; because product is excreted slowly in poor renal system function, toxicity may occur rapidly

Perform/provide:

- Storage at room temperature

Evaluate:

- Therapeutic response: decreased viral load, increased CD4 count, improvement in the symptoms of HIV/AIDS

Teach patient/family:

- To report sore throat, fever, fatigue; may indicate superinfection
- That medication does not cure condition or prevent infecting others but controls symptoms
- That product must be taken around the clock, in equal intervals, to maintain blood levels for duration of therapy
- To notify prescriber of side effects such as bruising, bleeding, fatigue, malaise; may indicate blood dyscrasias

ANTITUBERCULARS

ACTION:

Antituberculars act by inhibiting RNA or DNA or by interfering with lipid and protein synthesis, thereby decreasing tubercle bacilli replication.

USES:

Antituberculars are used for pulmonary tuberculosis.

CONTRAINDICATIONS:

Persons with severe renal disease or hypersensitivity should not use these products.

Precautions: Antituberculars should be used with caution with pregnancy, breastfeeding, and hepatic disease.

Administer:

- For some of these agents: on empty stomach, 1 hr before meals (only for isoniazid and rifampin) or 2 hr after meals

- Antiemetic if vomiting occurs
- After C&S is completed; monthly to detect resistance

SIDE EFFECTS:

They vary widely among products. Most products can cause nausea, vomiting, anorexia, and rash. Serious adverse reactions include renal failure, nephrotoxicity, ototoxicity, and hepatic necrosis.

PHARMACOKINETICS:

Onset, peak, and duration vary widely among products. Most products are metabolized in the liver and excreted in urine.

INTERACTIONS:

Interactions vary widely among products. Check individual monographs for specific information.

POSSIBLE NURSING DIAGNOSES:

- Risk for infection [*uses*]
- Risk for injury [*adverse reactions*]
- Deficient knowledge [*teaching*]
- Noncompliance [*teaching*]

NURSING CONSIDERATIONS

Assess:

- Signs of anemia: Hct, Hgb, fatigue
- Hepatic studies weekly: ALT, AST, bilirubin
- Renal status before, monthly: BUN, creatinine, output, specific gravity, urinalysis
- Hepatic status: decreased appetite, jaundice, dark urine, fatigue

Evaluate:

- Therapeutic response: decreased symptoms of TB, culture negative

Teach patient/family:

- That compliance with dosage schedule and duration is necessary
- That scheduled appointments must be kept; relapse may occur
- To avoid alcohol while taking product
- To report flulike symptoms: excessive fatigue, anorexia, vomiting, sore throat;

unusual bleeding, yellowish discoloration of skin/eyes

SELECTED GENERIC NAMES

ethambutol

isoniazid

pyrazinamide

rifabutin

rifampin

streptomycin

ANTITUSSIVES/EXPECTORANTS

ACTION:

Antitussives act by suppressing the cough reflex by direct action on the cough center in the medulla. Expectorants act by liquefying and reducing the viscosity of thick, tenacious secretions.

USES:

Antitussives/expectorants are used to treat cough occurring in pneumonia, bronchitis, TB, cystic fibrosis, and emphysema; as an adjunct in atelectasis (expectorants); and nonproductive cough (antitussives).

CONTRAINDICATIONS:

Some products are contraindicated in hypothyroidism, pregnancy, and breastfeeding.

Precautions: Some products should be used cautiously in asthmatic, geriatric, and debilitated patients.

Administer:

- Decreased dose to geriatric patients; their metabolism may be slowed

SIDE EFFECTS:

The most common side effects are drowsiness, dizziness, and nausea.

PHARMACOKINETICS:

Onset, peak, and duration vary widely among products. Some products are metabolized in the liver and excreted in urine.

INTERACTIONS:

Interactions vary widely among products. Check individual monographs for specific information.

POSSIBLE NURSING DIAGNOSES:

- Ineffective airway clearance [*uses*]
- Deficient knowledge [*teaching*]

NURSING CONSIDERATIONS

Assess:

- Cough: type, frequency, character (including sputum)

Perform/provide:

- Increased fluids to liquefy secretions
- Humidification of patient's room

Evaluate:

- Therapeutic response: absence of cough

Teach patient/family:

- To avoid driving, other hazardous activities until patient is stabilized on this medication
- To avoid smoking, smoke-filled rooms, perfumes, dust, environmental pollutants, cleaners that increase cough

SELECTED GENERIC NAMES

acetylcysteine

benzonatate

codeine

dextromethorphan

diphenhydrAMINE

guaiFENesin

HYDROcodone

ANTIVIRALS

ACTION:

Antivirals act by interfering with DNA synthesis that is needed for viral replication.

USES:

Antivirals are used for mucocutaneous herpes simplex virus, herpes genitalis (HSV-1, HSV-2), varicella infections, herpes zoster, and herpes simplex encephalitis.

CONTRAINDICATIONS:

Persons with hypersensitivity or immunosuppressed individuals should not use these products.

Precautions: Antivirals should be used cautiously in renal/hepatic disease, pregnancy, and breastfeeding.

Administer:

- Increased fluids to 3 L/day to decrease crystalluria when given IV

SIDE EFFECTS:

The most common side effects are nausea, vomiting, anorexia, headache, and diarrhea. The most serious adverse reactions are nephrotoxicity and blood dyscrasias.

PHARMACOKINETICS:

Onset, peak, and duration vary widely among products. Most products are metabolized by the liver and excreted by the kidneys.

INTERACTIONS:

Interactions vary widely among products. Check individual monographs for specific information.

POSSIBLE NURSING DIAGNOSES:

- Risk for infection [*uses*]
- Risk for injury [*adverse reactions*]
- Deficient knowledge [*teaching*]

NURSING CONSIDERATIONS

Assess:

- For signs of infection, anemia
- Patients with a compromised renal system; because product is excreted slowly in poor renal system function, toxicity may occur rapidly

- Renal studies: urinalysis, BUN, serum creatinine or decreased CCr may indicate nephrotoxicity; I&O ratio; report hematuria, oliguria, fatigue, weakness; check for protein in the urine during treatment
- C&S before treatment, agent may be taken as soon as culture is taken; repeat C&S after treatment
- Bowel pattern before, during treatment; if severe abdominal pain with bleeding occurs, agent should be discontinued
- Skin reactions: rash, urticaria, itching
- Hepatic studies: AST, ALT
- Blood studies: WBC, RBC, Hct, Hgb, bleeding time; blood dyscrasias

Perform/provide:

- Storage at room temperature for up to 12 hr after reconstitution

Evaluate:

- Therapeutic response: absence or control of infection

Teach patient/family:

- To report sore throat, fever, fatigue; may indicate superinfection
- That medication does not prevent infecting others or cure condition but controls symptoms
- That product must be taken around the clock in equal intervals to maintain blood levels for duration of therapy
- To notify prescriber of side effects such as bruising, bleeding, fatigue, malaise; may indicate blood dyscrasias

β-ADRENERGIC BLOCKERS

ACTION:

β-Blockers are divided into selective and nonselective blockers. Selective β-blockers competitively block stimulation of β₁-receptors in cardiac smooth muscle; these products produce chronotropic and inotropic effects. Nonselective blockers produce a fall in blood pressure without reflex tachycardia or reduction in heart rate through a mixture of β-blocking effects; elevated plasma renins are reduced.

USES:

β-Blockers are used for hypertension, ventricular dysrhythmias, and prophylaxis of angina pectoris.

CONTRAINDICATIONS:

Hypersensitive reactions may occur, and allergies should be identified before these products are given. β-Adrenergic blockers should not be used in heart block, congestive heart failure, or cardiogenic shock.

Precautions: β-Blockers should be used with caution in geriatric patients, or in renal/thyroid disease, COPD, coronary artery disease, diabetes mellitus, pregnancy, and asthma.

Administer:

- PO before meals and at bedtime; tabs may be crushed or swallowed whole
- Reduced dosage in renal dysfunction

SIDE EFFECTS:

The most common side effects are orthostatic hypotension, bradycardia, diarrhea, nausea, and vomiting. Serious adverse reactions include blood dyscrasias, bronchospasm, and congestive heart failure.

PHARMACOKINETICS:

Onset, peak, and duration vary widely among products. Most products are metabolized in the liver, with metabolites excreted in urine, bile, and feces.

INTERACTIONS:

Interactions vary widely among products. Check individual monographs for specific information.

POSSIBLE NURSING DIAGNOSES:

- Decreased cardiac output [*uses*]
- Diarrhea [*adverse reactions*]
- Impaired gas exchange [*adverse reactions*]
- Ineffective cardiac tissue perfusion [*uses*]

NURSING CONSIDERATIONS

Assess:

- Renal studies: protein, BUN, creatinine; watch for increased levels that may indicate nephrotic syndrome; obtain baselines in renal/hepatic function studies before beginning treatment
- I&O, weight daily
- B/P during beginning treatment and periodically thereafter; pulse q4hr, note rate, rhythm, quality
- Apical/radial pulse before administration; notify prescriber of significant changes
- Edema in feet and legs daily

Evaluate:

- Therapeutic response: decrease in B/P in hypertension; decreased B/P, edema, moist crackles in congestive heart failure

Teach patient/family:

- To comply with dosage schedule even if feeling better
- To rise slowly to sitting or standing position to minimize orthostatic hypotension
- To report bradycardia, dizziness, confusion, depression, and fever
- To take pulse at home; advise when to notify prescriber
- To comply with weight control, dietary adjustment, modified exercise program
- To wear support hose to minimize effects of orthostatic hypotension

- Not to discontinue product abruptly; taper over 2 wk; may precipitate angina

BONE RESORPTION INHIBITORS

ACTION:

Bone resorption inhibitors are divided into bisphosphonates and selective estrogen receptor modulators. Bisphosphonates act by absorbing calcium phosphate crystals in bone and may directly block dissolution of hydroxyapatite crystals of bone, inhibiting normal and abnormal bone resorption and mineralization. Selective estrogen receptor modulators act by reducing resorption of bone and decreasing bone turnover; mediated through estrogen receptor binding.

USES:

Bone resorption inhibitors are used for prevention and treatment of osteoporosis in postmenopausal women, treatment of Paget's disease, and treatment of osteoporosis in men.

CONTRAINDICATIONS:

Persons developing hypersensitive reactions or those with hypocalcemia should not use these products.

Precautions: Bone resorption inhibitors should be used cautiously in pregnancy, breastfeeding, hepatic/renal disease, geriatric patients, and some GI disorders.

Administer:

- For 6 months or more in Paget's disease

SIDE EFFECTS:

The most common side effects are nausea, vomiting, headache, bone pain, and rash.

PHARMACOKINETICS:

Onset, peak, and duration vary widely among products. Most products are taken up by the bones and excreted by the kidneys.

INTERACTIONS:

Interactions vary widely among products. Check individual monographs for specific information.

POSSIBLE NURSING DIAGNOSES:

- Risk for injury [*uses, adverse reactions*]
- Deficient knowledge [*teaching*]

NURSING CONSIDERATIONS

Assess:

- For reason for use and expected outcome
- For bone density test; hormonal status (women) before starting treatment and thereafter
- For hypercalcemia: paresthesia, twitching, laryngospasm; Chvostek's, Trousseau's signs

Perform/provide:

- Storage at room temperature

Evaluate:

- Therapeutic response: increase in bone mass, absence of fractures

Teach patient/family:

- To remain upright for at least 30 min after taking, to prevent esophageal

irritation

- To teach all aspects of product usage
- To use weight-bearing exercise to increase bone density

SELECTED GENERIC NAMES

Bisphosphonates

pamidronate

risedronate

Selective estrogen receptor modulators

raloxifene

Monoclonal antibody

denosumab

CALCIUM CHANNEL BLOCKERS

ACTION:

Calcium channel blockers act by inhibiting calcium ion influx across the cell membrane in cardiac and vascular smooth muscle. This action produces relaxation of coronary vascular smooth muscle, dilates coronary arteries, slows SA/AV node conduction, and dilates peripheral arteries.

USES:

Calcium channel blockers are used for chronic stable angina pectoris, vasospastic angina, dysrhythmias, hypertension, and unstable angina.

CONTRAINDICATIONS:

Persons with 2nd-/3rd-degree heart block, sick sinus syndrome, hypotension of <90 mm Hg systolic, Wolff-Parkinson-White syndrome, or cardiogenic shock should not use these products; worsening of those conditions may occur.

Precautions: Congestive heart failure because edema may be increased.

Hypotension may worsen because B/P is decreased. Patients with renal/hepatic disease should use these products cautiously because they are metabolized in the liver and excreted by the kidneys.

Administer:

- PO before meals and at bedtime

SIDE EFFECTS:

The most common side effects are dysrhythmias and edema. Also common are headache, fatigue, drowsiness, and flushing.

PHARMACOKINETICS:

Onset, peak, and duration vary widely with route of administration. Products are metabolized by the liver and excreted in the urine primarily as metabolites.

INTERACTIONS:

Increased levels of digoxin and theophylline may occur when used with these products. Increased effects of β -blockers and antihypertensives may occur with calcium channel blockers.

POSSIBLE NURSING DIAGNOSES:

- Decreased cardiac output [*adverse reactions*]
- Ineffective cardiac tissue perfusion [*uses*]

NURSING CONSIDERATIONS**Assess:**

- Cardiac system: B/P, pulse, respirations, ECG intervals (PR, QRS, QT)

Evaluate:

- Therapeutic response: decreased anginal pain; decreased B/P, dysrhythmias

Teach patient/family:

- How to take pulse before taking product; patient should record or graph pulses to identify changes
- To avoid hazardous activities until stabilized on this product because dizziness commonly occurs
- The need for compliance in all areas of medical regimen, including diet, exercise, stress reduction, and product therapy

SELECTED GENERIC NAMES

verapamil

CARDIAC GLYCOSIDES

ACTION:

Cardiac glycosides act by inhibiting sodium and potassium ATPase and then making more calcium available to activate contracted proteins. Cardiac contractility and cardiac output are increased.

USES:

Cardiac glycosides are used for congestive heart failure, atrial fibrillation, atrial flutter, atrial tachycardia, and rapid digitalization in these disorders.

CONTRAINDICATIONS:

Hypersensitive reactions may occur, and allergies should be identified before these products are given. Also, persons with ventricular tachycardia, ventricular fibrillation, and carotid sinus syndrome should not use these products.

Precautions: Persons with acute MI and those who have or may develop serum potassium, calcium, or magnesium imbalances should use these products cautiously. Also, geriatric patients and those with AV block, severe respiratory disease, hypothyroidism, or renal/hepatic disease should exercise caution when these products are prescribed.

Administer:

- Potassium supplements if ordered for potassium levels <3 mg/dl

SIDE EFFECTS:

The most common side effects are cardiac disturbances, headache, hypotension, and GI symptoms. Also common are blurred vision and yellow-green halos.

PHARMACOKINETICS:

Onset, peak, and duration vary widely with the route of administration. Digitoxin

is inactivated by the liver, and inactive metabolites are excreted in urine. Digoxin is excreted in urine mainly as the parent product and metabolites.

INTERACTIONS:

Toxicity may occur when used with diuretics, succinylcholine, quinine, and thioamines. Increased blood levels may occur with propantheline bromide, spironolactone, quinine, verapamil, aminoglycosides (PO), amiodarone, anticholinergics, and quinine. Diuretics may increase toxicity.

POSSIBLE NURSING DIAGNOSES:

- Decreased cardiac output [*adverse reactions*]
- Ineffective cardiac tissue perfusion [*uses*]

NURSING CONSIDERATIONS

Assess:

- Cardiac system: B/P, pulse, respirations, and increased urine output
- Apical pulse for 1 min before giving product; if pulse <60 bpm, take again in 1 hr; if still <60 bpm, notify prescriber
- Electrolytes: K, Na, Cl, Mg; renal function studies, including BUN and creatinine; and blood studies, including AST, ALT, bilirubin
- I&O ratio, daily weights
- Monitor therapeutic product levels

Evaluate:

- Therapeutic response: decreased weight, edema, pulse, respiration; increased urine output

Teach patient/family:

- How to take pulse before taking product; patient should record or graph pulse to identify changes
- To avoid hazardous activities until stabilized on this product; dizziness commonly occurs
- About the need for compliance in all areas of medical regimen, including diet, exercise, stress reduction, product therapy

SELECTED GENERIC NAME

digoxin

CHOLINERGICS

ACTION:

Cholinergics act by preventing destruction of acetylcholine, which increases concentration at sites where acetylcholine is released. This exaggerates the effects of acetylcholine and facilitates transmission of impulses across the myoneural junction. Cholinergics may also act by stimulating receptors for acetylcholine.

USES:

Cholinergics are used for myasthenia gravis, as antagonists of nondepolarizing neuromuscular blockade, postoperative bladder distention and urinary distention, and postoperative ileus.

CONTRAINDICATIONS:

Persons with obstruction of the intestine or renal system should not use these products.

Precautions: Caution should be used in patients with bradycardia, hypotension, seizure disorders, bronchial asthma, coronary occlusion, hyperthyroidism, breastfeeding, and in children.

Administer:

- Only with atropine sulfate available for cholinergic crisis
- Only after all other cholinergics have been discontinued
- Increased doses if tolerance occurs
- Larger doses after exercise or fatigue
- On empty stomach for better absorption

SIDE EFFECTS:

The most serious adverse reactions are respiratory depression, bronchospasm, constriction, laryngospasm, respiratory arrest, seizures, and paralysis. The most common side effects are nausea, diarrhea, and vomiting.

PHARMACOKINETICS:

Onset, peak, and duration vary widely among products. Most products are metabolized in the liver and excreted in urine.

INTERACTIONS:

Interactions vary widely among products. Check individual monographs for specific information.

POSSIBLE NURSING DIAGNOSES:

- Deficient knowledge [*teaching*]
- Noncompliance [*teaching*]
- Impaired urinary elimination [*uses*]

NURSING CONSIDERATIONS

Assess:

- VS, respiration q8hr
- I&O ratio; check for urinary retention or incontinence
- Bradycardia, hypotension, bronchospasm, headache, dizziness, seizures, respiratory depression; product should be discontinued if toxicity occurs

Perform/provide:

- Storage at room temperature

Evaluate:

- Therapeutic response: increased muscle strength, hand grasp; improved muscle gait; absence of labored breathing (if severe)

Teach patient/family:

- That product is not a cure; it only relieves symptoms (myasthenia gravis)
- To carry emergency ID specifying myasthenia gravis, products taken

SELECTED GENERIC NAMES

bethanechol

neostigmine

physostigmine

pyridostigmine

CHOLINERGIC BLOCKERS

ACTION:

Cholinergic blockers inhibit or block acetylcholine at receptor sites in the autonomic nervous system.

USES:

Many cholinergic blockers are used to decrease secretions before surgery, to reverse neuromuscular blockade, and to decrease motility of GI, biliary, urinary tracts. Other products are used for parkinsonian symptoms, including dystonia associated with neuroleptic products.

CONTRAINDICATIONS:

Hypersensitivity can occur, and allergies should be identified before administering these products. Persons with GI and GU obstruction should not use these products since constipation and urinary retention may occur. They are also contraindicated in closed-angle glaucoma and myasthenia gravis.

Precautions: Caution must be used when these products are given to geriatric patients since metabolism is slowed. Also, persons with tachycardia or prostatic hypertrophy should use these products with caution.

Administer:

- With food or milk to decrease GI symptoms
- Parenteral dose with patient recumbent to prevent postural hypotension; give parenteral dose slowly, monitoring vital signs

SIDE EFFECTS:

The most common side effects are dryness of the mouth and constipation, which can be prevented by frequent rinsing of the mouth and by increasing water and bulk in the diet.

PHARMACOKINETICS:

Onset, peak, and duration vary with route.

INTERACTIONS:

Increase in anticholinergic effect occurs when used with opioids, barbiturates, antihistamines, MAOIs, phenothiazines, and amantadine.

POSSIBLE NURSING DIAGNOSES:

- Impaired physical mobility *[uses]*
- Chronic pain *[uses]*

NURSING CONSIDERATIONS

Assess:

- I&O ratio; be alert for urinary retention, frequency, dysuria; product should be discontinued if these occur
- Urinary hesitancy, retention; palpate bladder if retention occurs
- Constipation; increase fluids, bulk, exercise
- For tolerance over long-term therapy; dose may have to be increased or changed
- Mental status: affect, mood, CNS depression, worsening of mental symptoms during early therapy

Perform/provide:

- Hard candy, gum, frequent rinsing of mouth for dryness

Evaluate:

- Therapeutic response: absence of cramps and EPS

Teach patient/family:

- To avoid driving, other hazardous activities if drowsiness occurs
- To avoid concurrent use of cough, cold preparations with alcohol, antihistamines unless directed by prescriber
- To use with caution in hot weather because medication may increase susceptibility to heat stroke

SELECTED GENERIC NAMES

atropine

benztropine

glycopyrrolate

scopolamine

CORTICOSTEROIDS

ACTION:

Corticosteroids are divided into glucocorticoids and mineralocorticoids. Glucocorticoids decrease inflammation by the suppression of migration of polymorphonuclear leukocytes, fibroblasts, increased capillary permeability, and lysosomal stabilization. They also have varied metabolic effects and modify the body's immune responses to many stimuli. Mineralocorticoids act by increasing resorption of sodium by increasing hydrogen and potassium excretion in the

distal tubule.

USES:

Glucocorticoids are used to decrease inflammation and for immunosuppression. In addition, some products may be given for allergy, adrenal insufficiency, or cerebral edema. Mineralocorticoids are given for adrenal insufficiency or adrenogenital syndrome.

CONTRAINDICATIONS:

Hypersensitivity may occur and should be identified before administering. Because these products mask infection, they should not be used in systemic fungal infections or amebiasis. Mothers taking pharmacologic doses of corticosteroids should not breastfeed.

Precautions: Caution must be used when these products are prescribed for diabetic patients because hyperglycemia may occur. Also, patients with glaucoma, seizure disorders, peptic ulcer, impaired renal function, congestive heart failure, hypertension, ulcerative colitis, or myasthenia gravis should be monitored closely if corticosteroids are given. Use with caution in children, the geriatric patients, and during pregnancy.

Administer:

- With food or milk to decrease GI symptoms
- Take single daily or alternate-day doses in the morning before 9 AM (for replacement therapy)

SIDE EFFECTS:

The most common side effects include change in behavior, including insomnia and euphoria; GI irritation, including peptic ulcer; metabolic reactions, including hypokalemia, hyperglycemia, and carbohydrate intolerance; and sodium and fluid retention. Most adverse reactions are dose-dependent.

PHARMACOKINETICS:

For oral preparations, the onset of action occurs between 1 and 2 hr, and duration can be up to 2 days, with a half-life of 2-4 days. Pharmacokinetics vary widely among products. These products cross the placenta and appear in breast milk.

INTERACTIONS:

Decreased corticosteroid effect may occur with barbiturates, rifampin, and phenytoin; corticosteroid dose may have to be increased. There is a possibility of GI bleeding when used with salicylates and indomethacin. Corticosteroids may reduce salicylate levels. When using with digoxin, glycosides, potassium-depleting diuretics, and amphotericin, serum potassium levels should be monitored.

POSSIBLE NURSING DIAGNOSES:

- Disturbed body image [*adverse reactions*]
- Risk for infection [*adverse reactions*]
- Risk for suicide [*adverse reactions*]

NURSING CONSIDERATIONS

Assess:

- Potassium, blood glucose, urine glucose while on long-term therapy; hypokalemia and hyperglycemia are common
- Weight daily; notify prescriber of weekly gain >5 lb because these products alter fluid and electrolyte balance
- I&O ratio; be alert for decreasing urinary output and increasing edema
- Plasma cortisol levels during long-term therapy (normal level is 138-635 nmol/L SI units when drawn at 8 AM)
- Infection: increased temp, WBC, even after withdrawal of medication; product masks symptoms of infection
- Adrenal insufficiency: nausea, anorexia, fatigue, dizziness, dyspnea, weakness, joint pain
- Potassium depletion: paresthesias, fatigue, nausea, vomiting, depression, polyuria, dysrhythmias, weakness
- Mental status: affect, mood, behavioral changes, aggression; if severe personality changes occur, including depression, product may have to be tapered and then discontinued

Evaluate:

- Therapeutic response: decreased inflammation

Teach patient/family:

- That emergency ID as steroid user should be carried
- Not to discontinue this medication abruptly; adrenal crisis can result

- All aspects of product use, including cushingoid symptoms
- To take with meals or a snack
- To avoid exposure to chickenpox or measles if taking immunosuppressives

hydrocortisone

methylPREDNISolone

prednisoLONE

predniSONE

triamcinolone

DIURETICS

ACTION:

Diuretics are divided into subgroups: thiazides and thiazide-like diuretics, loop diuretics, carbonic anhydrase inhibitors, osmotic diuretics, and potassium-sparing diuretics. Each one of these subgroups has its own mechanism of action. Thiazides and thiazide-like diuretics increase excretion of water and sodium by inhibiting resorption in the early distal tubule. Loop diuretics inhibit resorption of sodium and chloride in the thick ascending limb of the loop of Henle. Carbonic anhydrase inhibitors increase sodium excretion by decreasing sodium-hydrogen ion exchange throughout the renal tubule. Carbonic anhydrase inhibitors also decrease secretion of aqueous humor in the eye and thus decrease intraocular pressure. Osmotic diuretics increase the osmotic pressure of glomerular filtrate, thus decreasing net absorption of sodium. The potassium-sparing diuretics interfere with sodium resorption at the distal tubule, thus decreasing potassium excretion.

USES:

B/P is reduced in hypertension; edema is reduced in congestive heart failure; intraocular pressure is decreased in glaucoma.

CONTRAINDICATIONS:

Persons with electrolyte imbalances (Na, Cl, K), dehydration, or anuria should not be given these products until the problem is corrected.

Precautions: Caution must be used when diuretics are given to geriatric patients; electrolyte disturbances and dehydration can occur rapidly. Hepatic/renal disease may cause poor metabolism and excretion of the product.

Administer:

- In AM to avoid interference with sleep if using product as a diuretic
- Potassium replacement if potassium is <3 mg/dl

SIDE EFFECTS:

Hypokalemia, hyperuricemia, and hyperglycemia occur most frequently with thiazide diuretics. Aplastic anemia, blood dyscrasias, volume depletion, and dehydration may occur when thiazide-like diuretics, loop diuretics, or carbonic anhydrase inhibitors are given. Side effects and adverse reactions vary widely for the miscellaneous products.

PHARMACOKINETICS:

Onset, peak, and duration vary widely among the different subgroups of these products.

INTERACTIONS:

Cholestyramine and colestipol will decrease the absorption of thiazide diuretics. Concurrent use of thiazides with diazoxide may increase hyperuricemia, hyperglycemia, and antihypertensive effects of thiazides. Ototoxicity may occur when loop diuretics are used with aminoglycosides. Thiazide and loop diuretics may increase therapeutic and toxic effects of lithium.

POSSIBLE NURSING DIAGNOSES:

- Decreased cardiac output [*adverse reactions*]
- Excess fluid volume [*uses*]

NURSING CONSIDERATIONS

Assess:

- Weight, I&O daily to determine fluid loss; check skin turgor for dehydration

- Electrolytes: K, Na, Cl; include BUN, blood glucose, CBC, serum creatinine, blood pH, ABGs, uric acid, Ca; electrolyte imbalances may occur quickly
- B/P (lying and standing); postural hypotension may occur because fluid loss occurs first from intravascular spaces
- Signs of metabolic alkalosis, including drowsiness and restlessness
- Signs of hypokalemia with some products: postural hypotension, malaise, fatigue, tachycardia, leg cramps, weakness

Evaluate:

- Therapeutic response: improvement in edema of feet, legs, sacral area daily if medication is being used in congestive heart failure; improvement in B/P if medication is being used as a diuretic; improvement in intraocular pressure if medication is being used to decrease aqueous humor in the eye

Teach patient/family:

- To take product early in the day (diuretic) to prevent nocturia

HISTAMINE H₂ ANTAGONISTS

ACTION:

Histamine H₂ antagonists act by inhibiting histamine at the H₂-receptor site in parietal cells, which inhibits gastric acid secretion.

USES:

Histamine H₂ antagonists are used for short-term treatment of duodenal and gastric ulcers and maintenance therapy for duodenal ulcer; gastroesophageal reflux disease.

CONTRAINDICATIONS:

Persons with hypersensitivity should not use these products.

Precautions: Caution should be used in pregnancy, breastfeeding, child <16 yr, organic brain syndrome, hepatic/renal disease.

Administer:

- With meals for prolonged product effect
- Antacids 1 hr before or 1 hr after cimetidine
- IV slowly; bradycardia may occur; give over 30 min

SIDE EFFECTS:

The most serious adverse reactions are agranulocytosis, thrombocytopenia, neutropenia, aplastic anemia, and exfoliative dermatitis. The most common side effects are confusion (not with ranitidine), headache, and diarrhea.

PHARMACOKINETICS:

Onset, peak, and duration vary widely among products. Most products are metabolized in the liver and excreted in urine.

INTERACTIONS:

Antacids interfere with absorption of histamine H₂ antagonists. Check individual monographs for specific information.

POSSIBLE NURSING DIAGNOSES:

- Risk for injury [*bleeding*]
- Deficient knowledge [*teaching*]

- Chronic pain [*uses*]

NURSING CONSIDERATIONS

Assess:

- Gastric pH (>5 should be maintained)
- I&O ratio, BUN, creatinine

Perform/provide:

- Storage of diluted sol at room temperature for up to 48 hr

Evaluate:

- Therapeutic response: decreased pain in abdomen

Teach patient/family:

- That gynecomastia, impotence may occur but are reversible
- To avoid driving, other hazardous activities until patient is stabilized on this medication
- To avoid black pepper, caffeine, alcohol, harsh spices, extremes in temperature of food
- To avoid OTC preparations: aspirin, cough, cold preparations
- That product must be continued for prescribed time to be effective
- To report bruising, fatigue, malaise; blood dyscrasias may occur

SELECTED GENERIC NAMES

cimetidine

famotidine

ranitidine

IMMUNOSUPPRESSANTS

ACTION:

Immunosuppressants act by inhibiting lymphocytes (T).

USES:

Most immunosuppressants are used for organ transplants to prevent rejection.

CONTRAINDICATIONS:

Products are contraindicated in hypersensitivity.

Precautions: Caution should be used in severe renal/hepatic disease and

pregnancy.

Administer:

- For several days before transplant surgery
- With meals for GI upset or product mixed with chocolate milk
- With oral antifungal for *Candida* infections

SIDE EFFECTS:

The most serious adverse reactions are albuminuria, hematuria, proteinuria, renal failure, and hepatotoxicity. The most common side effects are overgrowth of oral *Candida*, gum hyperplasia, tremors, and headache. The most serious adverse reactions for azathioprine are hematologic (leukopenia and thrombocytopenia) and GI (nausea and vomiting). There is a risk of secondary infection.

PHARMACOKINETICS:

Onset, peak, and duration vary widely among products. Most products are metabolized in the liver and excreted in urine.

INTERACTIONS:

Interactions vary widely among products. Check individual monographs for specific information.

POSSIBLE NURSING DIAGNOSES:

- Risk for infection [*adverse reactions*]
- Risk for injury [*uses*]
- Deficient knowledge [*teaching*]

NURSING CONSIDERATIONS

Assess:

- Renal studies: BUN, creatinine at least monthly during treatment, 3 mo after treatment
- Hepatic studies: alk phos, AST (SGOT), ALT (SGPT), bilirubin
- Product blood levels during treatment
- Hepatotoxicity: dark urine, jaundice, itching, light-colored stools; product should be discontinued

Evaluate:

- Therapeutic response: absence of rejection

Teach patient/family:

- To report fever, chills, sore throat, fatigue; serious infections may occur
- To use contraceptive measures during treatment and for 12 wk after ending therapy

SELECTED GENERIC NAMES

azaTHIOprine

basiliximab

cycloSPORINE

everolimus

muromonab-CD3

sirolimus

tacrolimus

LAXATIVES**ACTION:**

Laxatives are divided into bulk products, lubricants, osmotics, saline laxative stimulants, and stool softeners. Bulk laxatives work by absorbing water and expanding to increase moisture content and bulk in the stool. Lubricants increase water retention in the stool, causing reabsorption of water in the bowel.

Osmotics increase distention and promote peristalsis. Saline draws water into the intestinal lumen. Stimulants act by increasing peristalsis by direct effect on the intestine. Stool softeners reduce surface tension of liquids of the bowel.

USES:

Laxatives are used as a preparation for bowel and rectal exam, constipation, and stool softener.

CONTRAINDICATIONS:

Persons with GI obstruction, perforation, gastric retention, toxic colitis, megacolon, abdominal pain, nausea, vomiting, or fecal impaction should not use these products.

Precautions: Caution should be used in rectal bleeding, large hemorrhoids, and anal excoriation.

Administer:

- Swallow tabs whole; do not break, crush, or chew
- Alone only with water for better absorption; do not take within 1 hr of antacids, milk, or cimetidine

SIDE EFFECTS:

The most common side effects are nausea, abdominal cramps, and diarrhea.

PHARMACOKINETICS:

Onset, peak, and duration vary among products.

INTERACTIONS:

Interactions vary widely among products. Check individual monographs for specific information.

POSSIBLE NURSING DIAGNOSES:

- Constipation [*uses*]
- Diarrhea [*adverse reactions*]
- Deficient knowledge [*teaching*]

NURSING CONSIDERATIONS

Assess:

- Blood, urine electrolytes if product is used often by patient
- I&O ratio to identify fluid loss
- Cause of constipation: identify whether fluids, bulk, or exercise missing from lifestyle
- Cramping, rectal bleeding, nausea, vomiting; if these symptoms occur, product should be discontinued

Evaluate:

- Therapeutic response: decrease in constipation

Teach patient/family:

- Not to use laxatives for long-term therapy; bowel tone will be lost
- That normal bowel movements do not always occur daily
- Not to use in presence of abdominal pain, nausea, vomiting
- To notify prescriber of abdominal pain, nausea, vomiting
- To notify prescriber if constipation is unrelieved or if symptoms of electrolyte imbalance: muscle cramps, pain, weakness, dizziness

NEUROMUSCULAR BLOCKING AGENTS

ACTION:

Neuromuscular blocking agents are divided into depolarizing and nondepolarizing blockers. They act by inhibiting transmission of nerve impulses by binding with cholinergic receptor sites.

USES:

Neuromuscular blocking agents are used to facilitate endotracheal intubation and skeletal muscle relaxation during mechanical ventilation, surgery, or general anesthesia.

CONTRAINDICATIONS:

Persons who are hypersensitive should not be given this product.

Precautions: Caution should be used in pregnancy, thyroid disease, collagen disease, cardiac disease, breastfeeding, children <2 yr, electrolyte imbalances, dehydration, neuromuscular disease (myasthenia gravis), and respiratory disease.

Administer:

- Using nerve stimulator by anesthesia provider to determine neuromuscular blockade
- Anticholinesterase to reverse neuromuscular blockade
- IV undiluted over 1-2 min (only by qualified person, usually an

anesthesiologist)

SIDE EFFECTS:

The most serious adverse reactions are prolonged apnea, bronchospasm, cyanosis, respiratory depression, and malignant hyperthermia. The most common side effects are bradycardia and decreased motility.

PHARMACOKINETICS:

Onset, peak, and duration vary widely among products. Most products are metabolized in the liver and excreted in urine.

INTERACTIONS:

Aminoglycosides potentiate neuromuscular blockade. Check individual monographs for specific information.

POSSIBLE NURSING DIAGNOSES:

- Risk for injury [*adverse reactions*]
- Deficient knowledge [*teaching*]

NURSING CONSIDERATIONS

Assess:

- For electrolyte imbalances (K, Mg); may lead to increased action of this product
- VS (B/P, pulse, respirations, airway) q15min until fully recovered; rate, depth, pattern of respirations, strength of hand grip
- I&O ratio; check for urinary retention, frequency, hesitancy
- Recovery: decreased paralysis of face, diaphragm, leg, arm, rest of body
- Allergic reactions: rash, fever, respiratory distress, pruritus; product should be discontinued

Perform/provide:

- Storage in light-resistant container, cool area
- Reassurance if communication is difficult during recovery from neuromuscular blockade

Evaluate:

- Therapeutic response: paralysis of jaw, eyelid, head, neck, rest of body

SELECTED GENERIC NAMES

atracurium

pancuronium

rocuronium

succinylcholine

vecuronium

NONSTEROIDAL ANTIINFLAMMATORIES

ACTION:

Nonsteroidal antiinflammatories decrease prostaglandin synthesis by inhibiting an enzyme needed for biosynthesis.

USES:

Nonsteroidal antiinflammatories are used to treat mild to moderate pain, osteoarthritis, rheumatoid arthritis, and dysmenorrhea.

CONTRAINDICATIONS:

Persons with hypersensitivity, asthma, or severe renal/hepatic disease should not use these products.

Precautions: Caution should be used in pregnancy, breastfeeding, children, geriatric patients, bleeding/GI/cardiac disorders, and hypersensitivity to other antiinflammatory agents.

Administer:

- With food to decrease GI symptoms; however, best to take on empty stomach to facilitate absorption

SIDE EFFECTS:

The most serious adverse reactions are nephrotoxicity (dysuria, hematuria, oliguria, azotemia), blood dyscrasias, and cholestatic hepatitis. The most common side effects are nausea, abdominal pain, anorexia, dizziness, and drowsiness.

PHARMACOKINETICS:

Onset, peak, and duration vary widely among products. Most products are metabolized in the liver and excreted in urine.

INTERACTIONS:

Interactions vary widely among products. Check individual monographs for specific information.

POSSIBLE NURSING DIAGNOSES:

- Deficient knowledge [*teaching*]
- Impaired physical mobility [*uses*]
- Noncompliance [*teaching*]
- Chronic pain [*uses*]

NURSING CONSIDERATIONS

Assess:

- Renal, hepatic, blood studies: BUN, creatinine, AST, ALT, Hgb, before treatment, periodically thereafter
- Audiometric, ophthalmic examination before, during, and after treatment
- For eye, ear problems: blurred vision, tinnitus; may indicate toxicity

Perform/provide:

- Storage at room temperature

Evaluate:

- Therapeutic response: decreased pain, stiffness in joints; decreased swelling in joints; ability to move more easily

Teach patient/family:

- To report blurred vision, ringing, roaring in ears; may indicate toxicity
- To avoid driving, other hazardous activities if dizziness, drowsiness occur, especially in geriatric patients
- To report change in urine pattern, increased weight, edema, increased pain in joints, fever, blood in urine; indicate nephrotoxicity
- That therapeutic effects may take up to 1 mo

SELECTED GENERIC NAMES

OPIOID ANALGESICS

ACTION:

Opioid analgesics act by depressing pain impulse transmission at the spinal cord level by interacting with opioid receptors. Products are divided into opiates and nonopiates.

USES:

Most opioid analgesics are used to control moderate to severe pain and are used before and after surgery.

CONTRAINDICATIONS:

Hypersensitive reactions occur frequently. Check for sensitivity before administering. These products should be used cautiously if opiate addiction is suspected.

Precautions: Caution must be used when these products are given to a person with an addictive personality because the possibility of addiction is so great. Also, they may worsen intracranial pressure. Persons with severe heart disease, hepatic/renal disease, respiratory conditions, or seizure disorders should be monitored closely for worsening condition.

Administer:

- With antiemetic if nausea or vomiting occurs
- When pain is beginning to return; determine dosage interval by response

SIDE EFFECTS:

GI symptoms, including nausea, vomiting, anorexia, constipation, and cramps, are the most common side effects. Other common side effects include light-headedness, dizziness, and sedation. Serious adverse reactions such as respiratory depression, respiratory arrest, circulatory depression, and increased intracranial pressure may result but are less common and usually dose

dependent.

PHARMACOKINETICS:

Onset of action is immediate by IV route and rapid by IM and PO routes. Peak occurs from 1-2 hr, depending on route, with a duration of 2-8 hr. These agents cross the placenta and appear in breast milk.

INTERACTIONS:

Barbiturates, other opioids, hypnotics, antipsychotics, or alcohol can increase CNS depression when taken with opioids.

POSSIBLE NURSING DIAGNOSES:

- Impaired gas exchange [*adverse reactions*]
- Acute pain [*uses*]

NURSING CONSIDERATIONS

Assess:

- I&O ratio; be alert for urinary retention, frequency, and dysuria; product should be discontinued if these occur
- Respiratory dysfunction: respiratory depression, rate, rhythm, character; notify prescriber if respirations are <12/min
- CNS changes: dizziness, drowsiness, hallucinations, euphoria, LOC, pupil reaction
- Allergic reactions: rash, urticaria
- Need for pain medication; use pain scoring

Perform/provide:

- Assistance with ambulation; patient should not be ambulating during product peak

Evaluate:

- Therapeutic response: decrease in pain

Teach patient/family:

- To report any symptoms of CNS changes, allergic reactions, or SOB
- That physical dependency may result when used for extended periods
- That withdrawal symptoms may occur, including nausea, vomiting, cramps, fever, faintness, anorexia

- To avoid alcohol and other CNS depressants

SALICYLATES

ACTION:

Salicylates have analgesic, antipyretic, and antiinflammatory effects. The analgesic and antiinflammatory activities may be mediated through the inhibition of prostaglandin synthesis. Antipyretic action results from inhibition of the hypothalamic heat-regulating center.

USES:

The primary uses of salicylates are relief of mild to moderate pain and fever and in inflammatory conditions such as arthritis, thromboembolic disorders, and rheumatic fever.

CONTRAINDICATIONS:

Hypersensitivity to salicylates is common. Check for sensitivity before administering. Persons with bleeding disorders, GI bleeding, and vit K deficiency should not use these products; salicylates increase PT. Children should not use these products; salicylates have been associated with Reye's

syndrome.

Precautions: Caution is needed when salicylates are given to patients with anemia, hepatic/renal disease, and Hodgkin's disease. Caution should also be exercised in pregnancy and breastfeeding.

Administer:

- With food or milk to decrease gastric irritation; give 30 min before or 1 hr after meals with a full glass of water

SIDE EFFECTS:

The most common side effects are GI symptoms and rash. Serious blood dyscrasias and hepatotoxicity may result when used for long periods at high doses. Tinnitus or impaired hearing may indicate that blood salicylate levels are reaching or exceeding the upper limit of the therapeutic range.

PHARMACOKINETICS:

Onset of action occurs in 15-30 min, with a peak of 1-2 hr and a duration up to 6 hr. These products are metabolized by the liver and excreted by the kidneys.

INTERACTIONS:

Increased effects of anticoagulants, insulin, methotrexate, heparin, valproic acid, and oral sulfonylureas may occur when used with salicylates. Aspirin may decrease serum concentrations of nonsteroidal antiinflammatory agents.

POSSIBLE NURSING DIAGNOSES:

- Activity intolerance [*uses*]
- Impaired physical mobility [*uses*]
- Acute pain [*uses*]
- Chronic pain [*uses*]
- Ineffective thermoregulation [*uses*]

NURSING CONSIDERATIONS

Assess:

- Hepatic/renal studies: AST, ALT, bilirubin, creatinine, LDH, alk phos, BUN if patient is on long-term therapy since these products are metabolized and excreted by the liver and kidneys
- Blood studies: CBC, hematocrit, hemoglobin, and PT if patient is on long-term

therapy because these products increase the possibility of bleeding and blood dyscrasias

- Hepatotoxicity: dark urine, clay-colored stools; yellowing of skin, sclera; itching, abdominal pain, fever, diarrhea, which may occur with long-term use
- Ototoxicity: tinnitus; ringing, roaring in ears; audiometric testing is needed before and after long-term therapy

Evaluate:

- Therapeutic response: decreased pain, fever

Teach patient/family:

- That blood glucose levels should be monitored closely if patient is diabetic
- Not to exceed recommended dosage; acute poisoning may result
- That therapeutic response takes 2 wk in arthritis
- To avoid use of alcohol; GI bleeding may result
- To notify prescriber of ringing in the ears or persistent GI pain
- To take with full glass of water to reduce risk of lodging in esophagus

SELECTED GENERIC NAMES

aspirin

choline salicylate

magnesium salicylate

salsalate

SEDATIVES/HYPNOTICS

ACTION:

Sedatives/hypnotics depress the CNS; some products act at the cerebral cortex, others inhibit transmitters in the CNS.

USES:

Sedatives/hypnotics are used for the treatment of sleep disorders, seizures, muscle spasms, and alcohol withdrawal.

CONTRAINDICATIONS:

Persons with hypersensitivity reactions should not use these products.

Precautions: Sedatives/hypnotics should be used cautiously in pregnancy (C) and breastfeeding.

Administer:

- Lowest possible dose for therapeutic result; adjust dose to response

SIDE EFFECTS:

The most common side effects are nausea and drowsiness. The most serious side effects are Stevens-Johnson syndrome, blood dyscrasias, and risk of dependency.

PHARMACOKINETICS:

Onset, peak, and duration vary widely among products. Most products are metabolized in the liver and excreted by the kidneys.

INTERACTIONS:

Increased CNS depression may occur with other CNS depressants such as alcohol, opiates, antipsychotics, and antidepressants.

POSSIBLE NURSING DIAGNOSES:

- Deficient knowledge [*teaching*]
- Noncompliance [*teaching*]
- Insomnia [*uses*]

NURSING CONSIDERATIONS**Assess:**

- Mental status: affect, mood, behavioral changes, depression, confusion; seizure activity

Perform/provide:

- Assistance with ambulation during beginning therapy if dizziness, ataxia occur

Evaluate:

- Therapeutic response: ability to sleep throughout the night; absence or decreasing seizure activity

Teach patient/family:

- That these products should only be used for short-term insomnia
- Not to drive or engage in other hazardous activities while taking these products
- To avoid breastfeeding while taking these products
- To avoid alcohol or other CNS depressants because drowsiness will increase
- That some of the products take 2 nights to be effective
- To report side effects, adverse reactions to health care provider

- To use exactly as prescribed, at regular intervals

SKELETAL MUSCLE RELAXANTS

ACTION:

Most skeletal muscle relaxants inhibit synaptic responses in the CNS by stimulating receptors and decreasing neurotransmission, decreasing pain and spasticity.

USES:

Skeletal muscle relaxants are used for musculoskeletal disorders with pain or spasticity related to spinal cord injuries.

CONTRAINDICATIONS:

Persons with hypersensitivity should not use these products.

Precautions: Skeletal muscle relaxants should be used cautiously in pregnancy (C), peptic ulcer, renal/hepatic disease, stroke, seizure disorder, diabetes, breastfeeding, and geriatric patients.

Administer:

- When pain is beginning to return, not after pain is severe

SIDE EFFECTS:

The most common side effects are dizziness, weakness, fatigue, drowsiness, and headache. Some products can cause seizures, CV collapse, and severe CNS depression.

PHARMACOKINETICS:

Pharmacokinetics vary widely among products. Check individual monographs for specific information.

INTERACTIONS:

CNS depressants used with skeletal muscle relaxants may lead to increased CNS depression.

POSSIBLE NURSING DIAGNOSES:

- Risk for injury [*adverse reactions*]
- Deficient knowledge [*teaching*]
- Impaired physical mobility [*uses*]
- Acute pain [*uses*]
- Chronic pain [*uses*]

NURSING CONSIDERATIONS

Assess:

- Pain: character, location, duration, alleviating/aggravating factors

Perform/provide:

- Storage in dry area, away from heat and sunlight

Evaluate:

- Therapeutic response: decreased pain or spasticity

Teach patient/family:

- Not to use with other CNS depressant unless prescriber approved
- That many products require 1-2 mo of treatment for full effect
- To avoid hazardous activities until response to medication is known
- That most products should not be discontinued quickly but tapered over 1-2 wk

SELECTED GENERIC NAMES**Centrally acting**

baclofen

carisoprodol

cyclobenzaprine

diazepam

methocarbamol

Direct-acting

dantrolene

THROMBOLYTICS**ACTION:**

Thrombolytics act by activating conversion of plasminogen to plasmin (fibrinolysin). Plasmin is able to break down clots (fibrin).

USES:

Thrombolytics are used to treat DVT, pulmonary embolism, arterial thrombosis, arterial embolism, arteriovenous cannula occlusion, lysis of coronary artery thrombi after MI, and acute, evolving transmural MI.

CONTRAINDICATIONS:

Persons with hypersensitivity, active bleeding, intraspinal surgery, neoplasms of the CNS, ulcerative colitis/enteritis, severe hypertension, renal/hepatic disease, hypocoagulation, COPD, subacute bacterial endocarditis, rheumatic valvular disease, cerebral embolism/thrombosis/hemorrhage, recent intraarterial diagnostic procedure or surgery (10 days), and recent major surgery should not use these products.

Precautions: Caution should be used in arterial emboli from left side of heart and pregnancy.

Administer:

- As soon as thrombi identified; not useful for thrombi over 1 wk old
- Cryoprecipitate or fresh, frozen plasma if bleeding occurs
- Loading dose at beginning of therapy; may require increased loading doses
- Heparin after fibrinogen level is >100 mg/dl; heparin inf to increase PTT to $1.5-2 \times$ baseline for 3-7 days
- About 10% of patients have high streptococcal antibody titers requiring increased loading doses
- IV therapy using $0.8 \mu\text{m}$ filter

SIDE EFFECTS:

Serious adverse reactions include GI, GU, intracranial retroperitoneal bleeding, and anaphylaxis. The most common side effects are decreased Hct, urticaria, headache, and nausea.

PHARMACOKINETICS:

Onset, peak, and duration vary widely among products. Most products are metabolized in the liver and excreted in urine.

INTERACTIONS:

Interactions vary widely among products. Check individual monographs for specific information.

POSSIBLE NURSING DIAGNOSES:

- Risk for injury [*uses*]

NURSING CONSIDERATIONS**Assess:**

- VS, B/P, pulse, resp, neurologic signs, temp at least q4hr; temp $>104^{\circ}$ F (40° C) indicator of internal bleeding; cardiac rhythm following intracoronary administration; systolic pressure increase of >25 mm Hg should be reported to prescriber
- For neurologic changes that may indicate intracranial bleeding
- Retroperitoneal bleeding: back pain, leg weakness, diminished pulses
- Allergy: fever, rash, itching, chill; mild reaction may be treated with antihistamines

- For bleeding during 1st hr of treatment: hematuria, hematemesis, bleeding from mucous membranes, epistaxis, ecchymosis
- Blood studies (Hct, platelets, PTT, PT, TT, aPTT) before starting therapy; PT or APTT must be $<2\times$ control before starting therapy or PT q3-4hr during treatment

Perform/provide:

- Storage of reconstituted product in refrigerator; discard after 24 hr
- Bed rest during entire course of treatment

Evaluate:

- Therapeutic response: resolution of thrombosis, embolism

Teach patient/family:

- To avoid venous or arterial puncture, inj, rectal temp
- To treat fever with acetaminophen or aspirin
- To apply pressure for 30 sec to minor bleeding sites; to inform prescriber if this does not attain hemostasis; to apply pressure dressing

SELECTED GENERIC NAMES

alteplase

tenecteplase

urokinase

THYROID HORMONES

ACTION:

Thyroid hormones act by increasing metabolic rates resulting in increased cardiac output, O_2 consumption, body temp, blood volume, growth, development at cellular level, respiratory rate, and enzyme system activity.

USES:

Thyroid hormones are used for thyroid replacement.

CONTRAINDICATIONS:

Persons with adrenal insufficiency, MI, or thyrotoxicosis should not use these products.

Precautions: Geriatric patients and those with angina pectoris, hypertension, ischemia, cardiac disease, diabetes mellitus or insipidus should be watched closely when using these products. Caution should be used in pregnancy (A) and

breastfeeding.

Administer:

- At same time each day to maintain product level
- Only for hormone imbalances; not to be used for obesity, male infertility, menstrual conditions, lethargy

SIDE EFFECTS:

The most common side effects include insomnia, tremors, tachycardia, palpitations, angina, dysrhythmias, weight loss, and changes in appetite. Serious adverse reactions include thyroid storm.

PHARMACOKINETICS:

Pharmacokinetics vary widely among products. Check individual monographs for specific information.

INTERACTIONS:

- Impaired absorption of thyroid products may occur when administered with cholestyramine, iron products (separate by 4-5 hr)
- Increased effects of anticoagulants, sympathomimetics, tricyclics, catecholamines may occur
- Decreased effects of digoxin, glycosides, insulin, hypoglycemics may occur
- Decreased effects of thyroid products may occur with estrogens

POSSIBLE NURSING DIAGNOSES:

- Disturbed body image [*adverse reactions*]
- Deficient knowledge [*teaching*]
- Noncompliance [*teaching*]

NURSING CONSIDERATIONS

Assess:

- B/P, pulse before each dose
- I&O ratio
- Weight daily in same clothing, using same scale, at same time of day
- PT should be closely monitored, and dosage of anticoagulant therapy may need adjustment
- Height, growth rate if given to a child

- T₃, T₄, which are decreased; radioimmunoassay of TSH, which is increased; ratio uptake, which is decreased if patient is on too low a dosage of medication
- Increased nervousness, excitability, irritability; may indicate overdosage, usually after 1-3 wk of treatment
- Cardiac status: angina, palpitation, chest pain, change in VS

Perform/provide:

- Removal of medication 4 wk before RAIU test

Evaluate:

- Therapeutic response: absence of depression; increased weight loss; diuresis; pulse; appetite; absence of constipation; peripheral edema; cold intolerance; pale, cool, dry skin; brittle nails; alopecia; coarse hair; menorrhagia; night blindness; paresthesias; syncope; stupor; coma; rosy cheeks

Teach patient/family:

- That hair loss will occur in children and is temporary
- To report excitability, irritability, anxiety, chest pain, palpitations, increased pulse, excessive sweating, heat intolerance; indicates overdose
- Not to switch brands unless directed by prescriber
- That hypothyroid children will show almost immediate behavior/personality change
- That treatment product is not to be taken to reduce weight
- To avoid OTC preparations with iodine; read labels
- To avoid iodine in food: iodized salt, soybeans, tofu, turnips, some seafood, some bread

SELECTED GENERIC NAMES

levothyroxine (T₄)

liothyronine (T₃)

liotrix

thyroid USP

VASODILATORS

ACTION:

Vasodilators have various modes of action. Check individual monographs for specific action.

USES:

Vasodilators are used to treat intermittent claudication, arteriosclerosis obliterans, vasospasm and muscular ischemia, ischemic cerebrovascular disease, hypertension, and angina.

CONTRAINDICATIONS:

Some products are contraindicated in acute MI, paroxysmal tachycardia, and thyrotoxicosis.

Precautions: Caution should be used in uncompensated heart disease or peptic ulcer disease.

Administer:

- With meals to reduce GI symptoms

SIDE EFFECTS:

The most common side effects are headache, nausea, hypotension, hypertension, and ECG changes.

PHARMACOKINETICS:

Onset, peak, and duration vary widely among products. Most products are metabolized in the liver and excreted in urine.

INTERACTIONS:

Interactions vary widely among products. Check individual monographs for specific information.

POSSIBLE NURSING DIAGNOSES:

- Decreased cardiac output [*uses*]
- Deficient knowledge [*teaching*]
- Ineffective cardiac tissue perfusion [*uses*]

NURSING CONSIDERATIONS

Assess:

- Bleeding time in individuals with bleeding disorders
- Cardiac status: B/P, pulse, rate, rhythm, character; watch for increasing pulse

Perform/provide:

- Storage in tight container at room temperature

Evaluate:

- Therapeutic response: ability to walk without pain, increased temp in extremities, increased pulse volume

Teach patient/family:

- That medication is not a cure; may need to be taken continuously
- That it is necessary to quit smoking to prevent excessive vasoconstriction
- That improvement may be sudden, but usually occurs gradually over several weeks
- To report headache, weakness, increased pulse, as product may have to be decreased or discontinued
- To avoid hazardous activities until stabilized on medication; dizziness may occur

SELECTED GENERIC NAMES

bosentan

dipyridamole

hydrALAZINE

isoxsuprine

minoxidil

nesiritide

VITAMINS**ACTION:**

The action of vitamins varies widely among products and classes. Check individual monographs for specific information.

USES:

Vitamins are used to correct and prevent vitamin deficiencies.

CONTRAINDICATIONS:

Hypersensitive reactions may occur, and allergies should be identified before these products are given.

Administer:

- PO with food for better absorption

SIDE EFFECTS:

There are no side effects or adverse reactions with the water-soluble vitamins (C, B). However, fat-soluble vitamins (A, D, E, K) may accumulate in the body and cause adverse reactions (see individual monographs).

PHARMACOKINETICS:

Onset, peak, and duration vary widely among products. Check individual monographs for specific information.

POSSIBLE NURSING DIAGNOSES:

- Imbalanced nutrition: less than body requirements[uses]

NURSING CONSIDERATIONS

Perform/provide:

- Storage in tight, light-resistant container

Evaluate:

- Therapeutic response: no vitamin deficiency

Teach patient/family:

- Not to take more than prescribed amount

Nurse Alert

abacavir (Rx)

(ah-bak'ah-veer)

Ziagen

Func. class.: Antiretroviral

Chem. class.: Nucleoside reverse transcriptase inhibitor (NRTI)

Do not confuse: abacavir/amprenavir

ACTION:

Inhibitory action against HIV-1; inhibits replication of the virus by incorporating into cellular DNA by viral reverse transcriptase, thereby terminating the cellular DNA chain

USES:

In combination with other antiretroviral agents for HIV-1 infection (not to be used with lamivudine or tenofovir)

Unlabeled uses: HIV prophylaxis following occupational exposure

CONTRAINDICATIONS

Black Box Warning:

Hypersensitivity, moderate severe hepatic disease

Precautions: Pregnancy (C), breastfeeding, children <3 mo, granulocyte count <1000/mm³ or Hgb <9.5 g/dl, severe renal disease, impaired hepatic function, HLA B5701

Black Box Warning:

Lactic acidosis

DOSAGE AND ROUTES

Calculator

- **Adult and adolescent ≥16 yr:** PO 300 mg bid or 600 mg/day with other antiretrovirals
- **Adolescent <16 yr and child ≥3 mo:** PO 8 mg/kg bid, max 300 mg bid with other antiretrovirals

Hepatic dose

- **Adult:** PO (Child-Pugh 5-6) (oral sol) 200 mg bid; severe hepatic disease, do

not use

HIV prophylaxis (unlabeled)

- **Adult: PO** 300 mg bid to be added to the basic 2-drug regimen ×4 wk

Available forms: Tabs 300 mg; oral sol 20 mg/ml

Administer:

- Give in combination with other antiretrovirals with or without food; do not use triple therapy as a beginning treatment, resistance may occur • Reduce dose in hepatic disease, use oral sol

SIDE EFFECTS

CNS: *Fever, headache, malaise, insomnia, paresthesia*

GI: *Nausea, vomiting, diarrhea, anorexia, cramps, abdominal pain, increased AST, ALT, hepatotoxicity, hepatomegaly with steatosis*

HEMA: *Granulocytopenia, anemia, lymphopenia*

INTEG: *Rash, urticaria, hypersensitivity reactions*

META: *Lactic acidosis*

OTHER: *Fatal hypersensitivity reactions, MI*

RESP: *Dyspnea*

PHARMACOKINETICS

Rapid/extensive absorption, distributed to extravascular space then erythrocytes; 50% plasma protein binding; extensively metabolized to inactive metabolites; half-life 1½ hr; excreted in urine, feces (unchanged)

INTERACTIONS

- Do not coadminister with abacavir-containing products

 **Increase:** possible lactic acidosis—ribavirin

Increase: abacavir levels—alcohol

Decrease: abacavir levels—tipranavir

Decrease: levels of—methadone

Drug/Lab Test

Increase: glucose, triglycerides, GGT

NURSING CONSIDERATIONS

Assess:

- Symptoms of HIV and possible infections; increased temp

⚠️ **Lactic acidosis** (elevated lactate levels, increased LFTs), severe hepatomegaly with steatosis, discontinue treatment and do not restart; may have large liver, elevated AST, ALT, lactate levels, women are at greater chance of lactic acidosis

Black Box Warning:

Fatal hypersensitivity reactions: fever, rash, nausea, vomiting, fatigue, cough, dyspnea, diarrhea, abdominal discomfort; treatment should be discontinued and not restarted; those with HLA B5701 are at great risk for hypersensitivity; obtain genetic testing for HLA B5701 before starting treatment

⚠️ **Blood dyscrasias** (anemia, granulocytopenia): bruising, fatigue, bleeding, poor healing • **Renal studies:** BUN, serum uric acid, CCr before, during therapy; these may be elevated

Black Box Warning:

Hepatic studies before and monthly every 2 wk during therapy: bilirubin, AST, ALT, amylase, alk phos, creatine phosphokinase, creatinine

- Blood counts; monitor viral load and CD4 counts during treatment; watch for decreasing granulocytes, Hgb; if low, therapy may have to be discontinued and restarted after hematologic recovery; blood transfusions may be required

Perform/provide:

- Storage in cool environment; protect from light; oral sol stored at room temperature; do not freeze

Evaluate:

- Therapeutic response: increased CD4 count, decrease viral load

Teach patient/family:

- That product is not a cure but will control symptoms; patient is still infective, may pass AIDS virus on to others, to carry emergency ID with condition, products taken ⚠️ To notify prescriber of sore throat, swollen lymph nodes, malaise, fever; other infections may occur; to stop product if skin rash, fever, cough, shortness of breath, GI symptoms, and to notify prescriber immediately; advise all health care providers that allergic reaction has occurred with abacavir
- That follow-up visits must be continued because serious toxicity may occur; blood counts must be done
- To use contraception during treatment; if patient is pregnant, register with the Antiretroviral Pregnancy Registry at 1-800-258-4263
- Give patient Medication Guide and Warning Card, discuss points on guide
- That other products may be necessary to prevent other infections and that drug is taken with other antiretrovirals
- Not to drink alcohol while taking this product

🍁 Canada only Side effects: *italics* = common; **bold** = life-threatening ⚠️
Nurse Alert

abatacept (Rx)

(ab-a-ta'sept)

Orencia

Func. class.: Antirheumatic agent (disease modifying); immunomodulator

ACTION:

A selective costimulation modulator, inhibits T-lymphocytes, inhibits production of tumor necrosis factor (TNF- α), interferon- γ , interleukin-2, which are involved in immune and inflammatory reactions

USES:

Polyarticular juvenile rheumatoid arthritis; moderate to severe rheumatoid arthritis; acute, chronic rheumatoid arthritis that has not responded to other disease-modifying agents, may use in combination with DMARDs; do not use with TNF antagonists (adalimumab, etanercept, infliximab), anakinra

CONTRAINDICATIONS:

Hypersensitivity, TB, viral hepatitis

Precautions: Pregnancy (C), breastfeeding, children, geriatric patients, recurrent infections, COPD

DOSAGE AND ROUTES

Calculator

Rheumatoid arthritis

- **Adult:** Subcut 125 mg within 1 day after single IV loading dose, then 125 mg weekly; weekly subcut dose may be initiated without an IV loading dose for those unable to receive an infusion
- **Adult >100 kg (220 lb):** IV INF 1 g over 30 min, give at 2, 4 wk after first inf, then q4wk
- **Adult 60-100 kg (132-220 lb):** IV INF 750 mg over 30 min, give at 2, 4 wk after first inf, then q4wk
- **Adult <60 kg (132 lb):** IV INF 500 mg over 30 min, give at 2, 4 wk after first inf, then q4wk

Juvenile rheumatoid arthritis (JRA)/juvenile idiopathic arthritis (JIA)

- **Adolescent and child ≥ 6 yr and >100 kg: IV INF** 1 g over 30 min q2wk $\times$ 3 doses, then 1 g over 30 min q4wk starting at wk 8
- **Adolescent and child ≥ 6 yr and 75-100 kg: IV INF** 750 mg over 30 min q2wk $\times$ 2 doses, then 750 mg over 30 min q4wk starting at wk 8
- **Adolescent and child ≥ 6 yr and <75 kg: IV INF** 10 mg/kg over 30 min q2wk $\times$ 3 doses then 10 mg/kg q4wk starting at wk 8

Available forms: Lyophilized powder, single-use vials 250 mg; sol for subcut inj 125 mg/ml

Administer:

Intermittent IV INF route

- To reconstitute, remove plastic flip top from vial and wipe the top with alcohol wipe; insert syringe needle into vial and direct stream of sterile water for inj on the wall of vial; rotate vial until mixed; vent with needle to rid foam after reconstitution (25 mg/ml); further dilute in 100 ml NS from a 100-ml inf bag/bottle; withdraw the needed volume (2 vials remove 20 ml; 3 vials remove 30 ml, 4 vials remove 40 ml); slowly add the reconstituted Orencia sol from each vial into the inf bag/bottle using the same disposable syringe supplied; mix gently, discard unused portions of vials; do not use if particulate is present or discolored; give over 30 min; use non-protein-binding filter (0.2-1.2 microns), protect from light • Do not admix with other sol or medications

SUBCUT route

- Use prefilled syringe for subcut only (do not use for IV); only those trained should use this system; allow syringe to warm to room temp (30-60 min), do not speed up warming process in any way; the amount of liquid should be between the 2 lines on the barrel, do not use the syringe if there is more or less liquid; inject into fronts of thighs, outer area of upper arm, or abdomen except for 2-inch area around the navel; do not inject into tender, bruised area • Gently pinch skin and hold firmly, insert needle at 45-degree angle, inject full amount in 125-mg syringe • Rotate injection sites

SIDE EFFECTS

CNS: Headache, asthenia, dizziness

CV: *Hypo/hypertension*

GI: Abdominal pain, dyspepsia, nausea

INTEG: Rash, *inj site reaction*, flushing, urticaria, pruritus

RESP: *Pharyngitis, cough, URI, non-URI, rhinitis*, wheezing

SYST: Anaphylaxis, malignancies, angioedema, serious infections

PHARMACOKINETICS

Terminal half-life IV 13 days, subcut 14.3 days, steady state 60 days; subcut half-life 85 days, clearance increases with increased body weight

INTERACTIONS

- Do not give concurrently with vaccines; immunizations should be brought up to date before treatment
- Do not use with TNF antagonists: adalimumab, etanercept, infliximab; anakinra
- Avoid use with corticosteroids, immunosuppressives, atropine, scopolamine, halothane

NURSING CONSIDERATIONS

Assess:

- **RA:** pain, stiffness, ROM, swelling of joints during treatment
- For latent/active TB, viral hepatitis before beginning treatment
- For inj site pain, swelling
- Patient's overall health at each visit; product should not be given with active infections; parenteral product contains maltose, glucose monitoring must be done with glucose-specific testing
- **Infection:** sinusitis, urinary tract infection, influenza, bronchitis; serious infections have occurred

Perform/provide:

- Storage in refrigerator; do not use expired vials, protect from light, do not freeze

Evaluate:

- Therapeutic response: decreased inflammation, pain in joints

Teach patient/family:

- That product must be continued for prescribed time to be effective
 - To use caution when driving; dizziness may occur
 - Not to have vaccinations while taking this product
 - About patient information included in packaging
-

🍁 Canada only Side effects: *italics* = common; **bold** = life-threatening ⚠️
Nurse Alert

RARELY USED

HIGH ALERT

abciximab (Rx)

(ab-six'i-mab)

ReoPro

Func. class.: Platelet aggregation inhibitor

USES:

Used with heparin and aspirin to prevent acute cardiac ischemia after percutaneous transluminal coronary angioplasty in patients with NSTEMI or UA when percutaneous coronary intervention (PCI) is planned within 24 hr

Unlabeled uses: Acute MI, Kawasaki disease (child)

CONTRAINDICATIONS:

Hypersensitivity to this product or murine protein; GI, GU bleeding; CVA within 2 yr, bleeding disorders, intracranial neoplasm, intracranial arteriovenous malformations, intracranial aneurysm, platelet count $<100,000/\text{mm}^3$, recent surgery, aneurysm, uncontrolled severe hypertension, vasculitis, coagulopathy

DOSAGE AND ROUTES

Calculator

PCI

• **Adult:** **IV BOL** 250 mcg (0.25 mg)/kg 10-60 min before PCI followed by 0.125 mcg/kg/min **CONT INF** for 12 hr

MI (unlabeled)

• **Adult:** **IV BOL** 0.25 mg/kg over 5 min, then 0.125 mcg/kg/min (max 10 mcg/min); **IV INF** for 12 hr unless complications

☛ Canada only Side effects: *italics* = common; **bold** = life-threatening 
Nurse Alert

abiraterone

(a'bir-a'ter-one)

Zytiga

Func. class.: Androgen inhibitor

ACTION:

Converted to abiraterone which inhibits CYP17, the enzyme required for androgen biosynthesis; androgen-sensitive prostate cancer responds to treatment that decreases androgens

USES:

Metastatic castration-resistant prostate cancer in combination with predniSONE for patients who have received prior chemotherapy containing docetaxel

CONTRAINDICATIONS:

Pregnancy (X), women, children

Precautions: Adrenal insufficiency, cardiac disease, MI, heart failure, hepatic disease, hypertension, hypokalemia, infection, surgery, ventricular dysrhythmia

DOSAGE AND ROUTES

Calculator

- **Adult males: PO** 1000 mg/day with predniSONE 5 mg bid

Hepatic dose

- **Adult males (Child-pugh B, 7-9): PO** 250 mg/day with predniSONE; (Child-Pugh C, >10) do not use

Available forms:

Tab 250 mg

Administer:

PO route

- Give whole, on empty stomach 2 hr before or 1 hr after meals with full glass of water

⚠ Women who are pregnant or may become pregnant should not touch tabs without gloves

SIDE EFFECTS

CV: Angina, dysrhythmia exacerbation, atrial flutter/fibrillation/tachycardia, AV block, chest pain, edema, heart failure, MI, hypertension, QT prolongation, sinus tachycardia, supraventricular tachycardia, ventricular tachycardia

ENDO: Hot flashes

GI: Diarrhea, dyspepsia

GU: Increased urinary frequency, nocturia, urinary tract infection

META: Adrenocortical insufficiency, hyperbilirubinemia, hypertriglyceridemia, hypokalemia, hypophosphatemia

MS: Arthralgia, myalgia

RESP: Cough, upper respiratory infection

SYST: Infection

PHARMACOKINETICS

99% protein binding, converted to abiraterone (active metabolite), mean terminal half-life 7-17 hr; excreted 88% in feces, 5% in urine; high-fat food increases effect, give on empty stomach; increased effect in hepatic disease

INTERACTIONS

Avoid use with: CYP3A4 inhibitors (clarithromycin, atazanavir, nefazodone, saquinavir, telithromycin, ritonavir, indinavir, nelfinavir, voriconazole, ketoconazole, itraconazole); loperamide, guinine, naprosen, pioglitazone, pitavastatin, repaglinide, rosiglitazone
Avoid use with: CYP3A4 inducers (carbamazepine, phenytoin, rifampin, rifabutin, rifapentine, phenobarbital)
Increase action of CYP2D6 substrate—dextromethorphan, thioridazine; dose of these products should be reduced

Drug/Food

Increase: abiraterone action—must be taken on an empty stomach

NURSING CONSIDERATIONS

Assess:

- **Prostate cancer:** monitor prostate specific antigen (PSA), serum potassium ⚠

Hepatotoxicity: monitor liver function tests (AST/ALT) at baseline, every 2 wk for 3 mo, monthly thereafter in patients with no known hepatic disease; interrupt treatment in patients without known hepatic disease at baseline who develop ALT/AST $>5 \times$ ULN or total bilirubin $>3 \times$ ULN; patients with moderate hepatic

disease at baseline, measure ALT, AST, bilirubin before the start of treatment, every wk for 1 month, every 2 wk for the following 2 mo, monthly thereafter; if elevations in ALT and/or AST $>5 \times \text{ULN}$ or total bilirubin $>3 \times \text{ULN}$ occur in patients with moderate hepatic impairment at baseline, discontinue and do NOT restart; measure serum total bilirubin, AST/ALT if hepatotoxicity is suspected; elevations of AST, ALT, bilirubin from baseline should prompt more frequent monitoring.

- Musculoskeletal pain, joint swelling, discomfort: arthritis, arthralgia, joint swelling, and joint stiffness, some severe; muscle discomfort that included muscle spasms, musculoskeletal pain, myalgia, musculoskeletal discomfort, and musculoskeletal stiffness may be relieved with analgesics
- Signs, symptoms of adrenocorticoid insufficiency; monthly for hypertension, hypokalemia, fluid retention
- ⚠ **QT prolongation:** Monitor ECG for QT prolongation, ejection fraction in patients with cardiac disease, small increases in the QTc interval such as <10 ms have occurred; monitor for arrhythmia exacerbation such as sinus tachycardia, atrial fibrillation, supraventricular tachycardia (SVT), atrial tachycardia, ventricular tachycardia, atrial flutter, bradycardia, AV block complete, conduction disorder, bradyarrhythmia

Perform/provide:

- Storage of tabs at room temp

Teach patient/family:

⚠ That women must not come in contact with tabs; wear gloves if product needs to be handled, pregnancy (X) • To report chest pain, swelling of joints, burning/pain when urinating

🌿 Canada only Side effects: *italics* = common; **bold** = life-threatening ⚠
Nurse Alert

acamprosate

(a-kam-pro'sate)

Campral

Func. class.: Alcohol deterrent

Chem. class.: Synthetic amino acid neurotransmitter analog

ACTION:

Not completely understood; in vitro data suggest it has affinity for type A and type B GABA receptors, lowers neuronal excitability, centrally mediated

USES:

Alcohol abstinence management

CONTRAINDICATIONS:

Black Box Warning:

Hypersensitivity to this product or sulfites, creatinine clearance ≤ 30 ml/min

Precautions: Pregnancy (C), breastfeeding, infants, children, ethanol intoxication, renal impairment, depression, suicidal ideation, driving or operating machinery, geriatric patients

DOSAGE AND ROUTES

Calculator

• **Adult: PO** 666 mg tid

Renal dosage

• **Adult: PO** CCr 30-50 ml/min 333 mg tid; CCr < 30 ml/min do not use

Available forms: Del-rel tabs 333 mg

Administer

- Without regard to food; do not crush, chew, break delayed-release tab
- Use only after alcohol is stopped

SIDE EFFECTS

CNS: Anxiety, depression, dizziness, headache, insomnia, paresthesias, suicidal ideation, tremor, abnormal thoughts, chills, drowsiness

CV: Palpitations, hypertension, peripheral edema

EENT: Rhinitis, pharyngitis, abnormal vision

GI: Anorexia, constipation, diarrhea, dry mouth, abdominal pain, flatulence, nausea, vomiting, taste change, weight gain

GU: Impotence

INTEG: Rash, pruritus, increased sweating

MISC: Infection, flu-like syndrome

MS: Back pain, myalgias, arthralgia

RESP: Dyspnea, bronchitis

PHARMACOKINETICS

Peak 3-8 hr, half-life 20-33 hr

INTERACTIONS

Increase: LFTs, blood glucose, bilirubin, uric acid

Decrease: Hgb/Hct, platelets

NURSING CONSIDERATIONS

Assess:

- Mental status: depression, abnormal thinking, suicidal thoughts/behaviors, length of alcohol use, date of discontinuing alcohol use
- B/P baseline and periodically

Perform/provide:

- Storage at room temperature

Evaluate:

- Therapeutic response: Continued alcohol abstinence

Teach patient/family:

- To notify prescriber of depression, abnormal thoughts, suicidal thoughts/behaviors
- To take without regard to food; not to break, crush, chew delayed release tabs
- To notify prescriber if pregnancy is planned or suspected, to use effective contraception
- Not to engage in hazardous activities until effect is known

☛ Canada only Side effects: *italics* = common; **bold** = life-threatening ⚠

Nurse Alert

acarbose (Rx)

(ay-car'bose)

Precose

Func. class.: Oral antidiabetic

Chem. class.: α -Glucosidase inhibitor

Do not confuse: Precose/preCare

ACTION:

Delays digestion/absorption of ingested carbohydrates by inhibiting α -glucosidase, results in smaller rise in postprandial blood glucose after meals; does not increase insulin production

USES:

Type 2 diabetes mellitus, alone or in combination with a sulfonylurea, metformin

Unlabeled uses: Adjunct in type 1 diabetes mellitus

CONTRAINDICATIONS:

Breastfeeding, hypersensitivity, diabetic ketoacidosis, cirrhosis, inflammatory bowel disease, ileus, colonic ulceration, partial intestinal obstruction, chronic intestinal disease, serum creatinine >2 mg/dl, CCr <25 ml/min

Precautions: Pregnancy (B), children, renal/hepatic disease

DOSAGE AND ROUTES

Calculator

- **Adult >60 kg (132 lb): PO** 25 mg tid initially, with 1st bite of meal; maintenance dose may be increased to 50-100 mg tid; dosage adjustment at 4-8 wk intervals, individualized

- **Adult <60 kg (132 lb): PO** max 50 mg tid

Type 1 diabetes mellitus (unlabeled)

- **Adult: PO** 50 mg tid with meals $\times 2$ wk, then 100 mg tid with meals

Available forms: Tabs 25, 50, 100 mg

Administer:

PO route

- With 1st bite of each meal 3 $\times$ /day

SIDE EFFECTS

GI: *Abdominal pain, diarrhea, flatulence*

PHARMACOKINETICS

Poor systemic absorption, peak 1 hr, duration 2-4 hr, metabolized in GI tract, excreted as intact product in urine, half-life 2 hr

INTERACTIONS

Increase: acetaminophen toxicity—acetaminophen combined with alcohol

Increase or decrease: glycemic control—androgens, lithium, bortezomib, quinolones

Decrease: effect of digoxin

- Do not use with gatifloxacin

Increase: hypoglycemia—sulfonylureas, insulin, MAOIs, salicylates, fibric acid derivatives, bile acid sequestrants, ACE inhibitors, angiotensin II receptor antagonists, beta blockers

Decrease: effect, increase hyperglycemia—digestive enzymes, intestinal absorbents, thiazide diuretics, loop diuretics, corticosteroids, estrogen, progestins, oral contraceptives, sympathomimetics, isoniazid, phenothiazines; protease inhibitors, atypical antipsychotics, carbonic anhydrase inhibitors, cycloSPORINE, tacrolimus, baclofen

Drug/Herb

Increase: hypoglycemia—chromium, garlic, horse chestnut

Drug/Lab Test

Increase: ALT, AST

Decrease: calcium, vit B₆, Hgb, Hct

NURSING CONSIDERATIONS

Assess:

- **Hypoglycemia** (weakness, hunger, dizziness, tremors, anxiety, tachycardia, sweating), hyperglycemia; even though product does not cause hypoglycemia, if patient is on sulfonylureas or insulin, hypoglycemia may be additive; if hypoglycemia occurs, treat with dextrose, or, if severe, with IV glucose or glucagon
- For stress, surgery, or other trauma that may require change in dose
- Monitor AST, ALT q3mo × 1 yr and periodically thereafter; if elevated, dose

may need to be reduced or discontinued, usually increased with doses $\geq 300\text{mg/day}$; A1c q3mo, monitor serum glucose, 1 hr PP throughout treatment

- GI side effects for tolerability/compliance

Perform/provide:

- Storage in tight container in cool environment

Evaluate:

- Therapeutic response: improved signs/symptoms of diabetes mellitus (decreased polyuria, polydipsia, polyphagia; clear sensorium, absence of dizziness, stable gait)

Teach patient/family:

- The symptoms of hypo/hyperglycemia, what to do about each
- That medication must be taken as prescribed; explain consequences of discontinuing medication abruptly; that insulin may need to be used for stress, including trauma, surgery, fever
- To avoid OTC medications and herbal supplements unless approved by health care provider
- That diabetes is a lifelong illness; that the diet and exercise regimen must be followed; that this product is not a cure
- To carry emergency ID and a glucose source; to avoid sugar, because sugar is blocked by acarbose
- That blood glucose monitoring is required to assess product effect
- To avoid breastfeeding if using acarbose with other antidiabetics
- That GI side effects may occur

🍁 Canada only Side effects: *italics* = common; **bold** = life-threatening ⚠️
Nurse Alert

acetaminophen (OTC)

(a-seat-a-mee'noe-fen)

Acephen, Apacet, APAP, Apra, Children's Feverall, Equaline Children's Pain Relief, Equaline Infant's Pain Relief, Genapap, GoodSense Acetaminophen, GoodSense Children's Pain Relief, Infantaire, Leader Children's Pain Reliever, Mapap, Neopap, Ofirmev, Q-Pap, Q-Pap Children's, Redutemp, Ridenol, Silapap, Temptra, T-Painol, Tylenol, Walgreen's Non-Aspirin, XS pain reliever *Func. class.:* Nonopioid analgesic, antipyretic

Chem. class.: Nonsalicylate, paraaminophenol derivative

ACTION:

May block pain impulses peripherally that occur in response to inhibition of prostaglandin synthesis; does not possess antiinflammatory properties; antipyretic action results from inhibition of prostaglandins in the CNS (hypothalamic heat-regulating center)

USES:

Mild to moderate pain or fever, arthralgia, dental pain, dysmenorrhea, headache, myalgia, osteoarthritis

Unlabeled uses: Migraine

CONTRAINDICATIONS:

Hypersensitivity

Precautions: Pregnancy (B), (C) IV; breastfeeding, geriatric patients, anemia, renal/hepatic disease, chronic alcoholism

DOSAGE AND ROUTES

Calculator

- **Adult/child >12 yr: PO/RECT** 325-650 mg q4-6hr prn, max 4 g/day; weight ≥ 50 kg IV 1000 mg q6hr or 650 mg q4hr prn, max single dose 1000 mg, min dosing interval 4 hr; weight < 50 kg IV 15 mg/kg/dose q6hr or 12.5 mg/kg/dose q4hr, max single dose 15 mg/kg, min dosing interval 4 hr, max 75 mg/kg/day from all sources, ext rel 650-1300 mg q 8 hr as needed, max 4 g/day
- **Child ≥ 2 yr and < 50 kg: IV** 15 mg/kg/dose q6hr or 12.5 mg/kg/dose q4hr, max single dose 15 mg/kg, min dosing interval 4 hr, max 75 mg/kg/day from all sources

- **Child 1-12 yr: PO** 10-15 mg/kg q4-6hr, max 5 doses/24 hr
- **Child 1-12 yr: RECT** 10-20 mg/kg/dose q4-6hr
- **Neonate: RECT** 10-15 mg/kg/dose q6-8hr

Migraine (unlabeled)

- **Adult and adolescent: PO/RECT** 500-1000 mg, max 1 g/dose or max 4 g/day

Available forms: Rect supp 120, 325, 650 mg; soft chew tabs 80 mg; caps 500 mg; elix 120, 160, 325 mg/5 ml; oral disintegrating tab 80, 160 ml; oral drops 80 mg/0.8 ml, liquid 500 mg/5 ml, 160/5 ml, 1000/30 ml; ext rel 650 mg, 80 mg/ml; tabs 325, 500, 650 mg; sol for inj 1000 mg/100 ml

Administer:

PO route

- Crushed or whole, do not crush EXT REL product; chewable tabs may be chewed; give with full glass of water • With food or milk to decrease gastric symptoms if needed
- Susp after shaken well; check elixir, liquid, suspension concentration carefully, susp and cups are bioequivalent

Intermittent IV INF route

- No further dilution needed; do not add other medications to vial or inf device
- For doses equal to single vial, averted IV set may be used to deliver directly from vial; for doses less than a single vial, withdraw dose and place in an empty sterile syringe, plastic IV container, or glass bottle; infuse over 15 min
- Discard unused portion; if seal is broken, vial penetrated, or drug transferred to another container, give within 6 hr

SIDE EFFECTS

GI: Nausea, vomiting, abdominal pain; **hepatotoxicity, hepatic seizure (overdose), GI bleeding**

GU: **Renal failure (high, prolonged doses)**

HEMA: **Leukopenia, neutropenia, hemolytic anemia (long-term use), thrombocytopenia, pancytopenia**

INTEG: Rash, urticaria

SYST: Hypersensitivity

TOXICITY: **Cyanosis, anemia, neutropenia, jaundice, pancytopenia, CNS**

stimulation, delirium followed by vascular collapse, seizures, coma, death

PHARMACOKINETICS

85%-90% metabolized by liver, excreted by kidneys; metabolites may be toxic if overdose occurs; widely distributed; crosses placenta in low concentrations; excreted in breast milk; half-life 1-4 hr

PO: Onset 10-30 min, peak 1/2-2 hr, duration 4-6 hr, well absorbed

RECT: Onset slow, peak 1-2 hr, duration 4-6 hr, absorption varies

INTERACTIONS

- Avoid use with salicylates
- Renal adverse reactions: NSAIDs, salicylates

Increase: Hypoprothrombinemia: warfarin, long-term use, high doses of acetaminophen

Increase: hepatotoxicity—barbiturates, alcohol, carbamazepine, hydantoins, rifampin, rifabutin, isoniazid, diflunisal, zidovudine, lamotrigine, imatinib

Decrease: absorption—colestipol, cholestyramine

Drug/Herb

Increase: hepatotoxicity—St. John's wort, due to acetaminophen metabolism

Increase: hepatotoxicity—echinacea (rare)

Drug/Lab Test

Interference: 5-HIAA

Increase: LFTs, potassium, bilirubin, LDH, pro-time

Decrease: Hgb/Hct, WBC, RBC, platelets; albumin, magnesium, phosphate (pediatrics)

NURSING CONSIDERATIONS

Assess:

- Hepatic studies: AST, ALT, bilirubin, creatinine before therapy if long-term therapy is anticipated; may cause hepatic toxicity at doses >4 g/day with chronic use
- Renal studies: BUN, urine creatinine, occult blood, albumin, if patient is on long-term therapy; presence of blood or albumin indicates nephritis
- Blood studies: CBC, PT if patient is on long-term therapy
- I&O ratio; decreasing output may indicate renal failure (long-term therapy)
- For fever and pain: type of pain, location, intensity, duration

• **Chronic poisoning:** rapid, weak pulse; dyspnea; cold, clammy extremities; report immediately to prescriber • **Hepatotoxicity:** dark urine; clay-colored stools; yellowing of skin, sclera; itching; abdominal pain; fever; diarrhea if patient is on long-term therapy • **Allergic reactions:** rash, urticaria; if these occur, product may have to be discontinued

Perform/provide:

- Storage of suppositories <80° F (27° C)

Evaluate:

- Therapeutic response: absence of pain using pain scoring; fever

Teach patient/family:

 Not to exceed recommended dosage; the elixir, liquid, suspension come in several concentrations, read label carefully; acute poisoning with liver damage may result; tell parents of children to check products carefully; that acute toxicity includes symptoms of nausea, vomiting, abdominal pain and that prescriber should be notified immediately; that toxicity may occur when used with other combination products • Not to use with alcohol, herbals, OTC products without approval of prescriber

- May be used when breastfeeding, short-term
- To recognize signs of chronic overdose: bleeding, bruising, malaise, fever, sore throat
- That those with diabetes may notice blood glucose monitoring changes
- To notify prescriber of pain or fever lasting more than 3 days, not to be used in patients <2 yr unless approved by prescriber

TREATMENT OF OVERDOSE:

Product level, gastric lavage, activated charcoal; administer oral acetylcysteine to prevent hepatic damage ([see acetylcysteine monograph](#)); monitor for bleeding

☼ Canada only Side effects: *italics* = common; **bold** = life-threatening 
Nurse Alert

acetaZOLAMIDE (Rx)

(a-set-a-zole'a-mide)

Diamox Sequels

Func. class.: Diuretic, carbonic anhydrase inhibitor, antiglaucoma agent, antiepileptic *Chem. class.:* Sulfonamide derivative

Do not confuse: acetaZOLAMIDE/acetoHEXAMIDE

Diamox/Trimox/Dobutrex

ACTION:

Inhibits carbonic anhydrase activity in proximal renal tubules to decrease reabsorption of water, sodium, potassium, bicarbonate resulting in increased urine volume and alkalization of urine; decreases carbonic anhydrase in CNS, increasing seizure threshold; able to decrease secretion of aqueous humor in eye, which lowers intraocular pressure

USES:

Open-angle glaucoma, angle-closure glaucoma (preoperatively, if surgery delayed), seizures (petit mal, grand mal, mixed, absence), edema in CHF, product-induced edema, acute altitude sickness

Unlabeled uses: Urine alkalization, metabolic alkalosis in mechanical ventilation, decrease CSF production in infants with hydrocephalus, familial periodic paralysis, nystagmus

CONTRAINDICATIONS:

Hypersensitivity to sulfonamides, severe renal/hepatic disease, electrolyte imbalances (hyponatremia, hypokalemia), hyperchloremic acidosis, Addison's disease, long-term use for closed-angle glaucoma, adrenocortical insufficiency

Precautions: Pregnancy (C), breastfeeding, hypercalciuria, respiratory acidosis, pulmonary obstruction/emphysema, COPD

DOSAGE AND ROUTES

Calculator

Angle-closure glaucoma

- **Adult:** PO/IV 250 mg q4hr or 250 mg bid for short-term therapy

Open-angle glaucoma

- **Adult: PO/IV** 250 mg/day in divided doses for amounts of more than 250 mg or 500 mg **EXT REL** bid, max 1 g/day

Edema in CHF

- **Adult: PO/IV** 250-375 mg/day or 5 mg/kg in AM, give for 2 days, then 1-2 days drug free
- **Child: PO/IV** 5 mg/kg/day or 150 mg/m² in AM

Seizures

- **Adult: PO/IV** 8-30 mg/kg/day, in 1-4 divided doses, usual range 375-1000 mg/day; **ER** not recommended with seizures
- **Child: PO/IV** 8-30 mg/kg/day in divided doses tid or qid, or 300-900 mg/m²/day, not to exceed 1 g/day

Altitude sickness

- **Adult: PO** 250 mg q6-12hr; **EXT REL** 500 mg q12-24hr, start therapy 24-48 hr before ascent and give for ≥48 hr after arrival at high altitude
- **Geriatric: PO** 250 mg bid, use lowest effective dose

Renal dose

- **Adult: PO/IV** CCr 50-80 ml/min give dose ≥6 hr reg rel of IV; CCr 10-50 ml/min give dose q12hr; CCr <10 ml/min, avoid use

Infants with hydrocephalus (unlabeled)

- **Infant: PO/IV** 5 mg/kg q6hr, may increase by 25 mg/kg/day; max 100 mg/kg/day

Urine alkalinization (unlabeled)

- **Adult: IV** 5 mg/kg/dose, repeat 2-3× over 24 hr

Familial periodic paralysis (unlabeled)

- **Adult: PO** 250-375 mg/day in divided doses

Metabolic alkalosis in mechanical ventilation (unlabeled)

- **Adult: IV** 500 mg as a single dose or 250 mg q6hr × 4 doses

Vestibular nystagmus (unlabeled)

- **Adult: PO** 250 mg, increase by 250 mg q3days; max 3 g/day in divided doses

Available forms: Tabs 125, 250 mg; ext rel caps 500 mg; inj 500 mg

Administer:

- In AM to avoid interference with sleep if using product as diuretic • Potassium replacement if potassium level is <3 mg/dl

PO route

- Do not break, crush, or chew ext rel caps; this product should be used for altitude sickness, glaucoma • With food if nausea occurs; absorption may be decreased slightly

IV route

- After diluting 500 mg in ≥ 5 ml sterile water for inj; **direct IV:** give at 100-500 mg/min; **intermittent INF:** may be diluted further in LR, D₅W, D₁₀W, 0.45% NaCl, 0.9% NaCl, or Ringer's sol and infused over 15-30 min; use within 24 hr of dilution

Additive compatibilities: cimetidine, ranitidine

SIDE EFFECTS

CNS: Anxiety, confusion, seizures, depression, dizziness, drowsiness, fatigue, headache, paresthesia, stimulation

EENT: Myopia, tinnitus

ENDO: Hyperglycemia

GI: Nausea, vomiting, anorexia, diarrhea, melena, weight loss, hepatic insufficiency, cholestatic jaundice, fulminant hepatic necrosis, taste alterations, bleeding

GU: Frequency, polyuria, uremia, glucosuria, hematuria, dysuria, crystalluria, renal calculi

HEMA: Aplastic anemia, hemolytic anemia, leukopenia, thrombocytopenia, purpura, pancytopenia

INTEG: Rash, pruritus, urticaria, fever, Stevens-Johnson syndrome, photosensitivity, flushing, toxic epidermal necrolysis

META: Hypokalemia, hyperchloremic acidosis, hyponatremia, sulfonamide-like reactions, metabolic acidosis

PHARMACOKINETICS

65% absorbed if fasting (oral), 75% absorbed if given with food; half-life 2½-5½ hr; excreted unchanged by kidneys (80% within 24 hr), crosses placenta

PO: Onset 1-1½ hr, peak 2-4 hr, duration 8-12 hr

PO-EXT REL: Onset 2 hr, peak 8-12 hr, duration 18-24 hr

IV: Onset 2 min, peak 15 min, duration 4-5 hr

INTERACTIONS

Increase: action of—amphetamines, flecainide, memantine, phenytoin, procainamide, quinidine, anticholinergics, methenamine, mecamlamine, ePHEDrine, memantine, mexiletene, quINIDine, folic acid antagonists

Increase: excretion of lithium, primidone

Increase: osteomalacia—carBAMazepine, ethotoin

Increase: toxicity—salicylates, cycloSPORINE

Increase: hypokalemia—corticosteroids, amphotericin B, corticotropin, ACTH

Increase: cardiac toxicity if hypokalemia develops—arsenic trioxide, cardiac glycosides, levomethadyl

Increase: renal stone formation, heat stroke—topiramate (avoid concurrent use)

Decrease: primidone levels

Drug/Lab Test

Increase: glucose, bilirubin, calcium, uric acid

Decrease: thyroid iodine uptake

False positive: urinary protein, 17 hydroxysteroid

NURSING CONSIDERATIONS

Assess:

- Edema: weight daily, I&O daily to determine fluid loss; effect of product may be decreased if used daily; monitor geriatric patients for dehydration
- Ocular status: intraocular pressure, ophthalmologic examination
- For cross-sensitivity with other sulfonamides and this product
- B/P lying, standing; postural hypotension may occur
- Electrolytes: potassium, sodium, chloride; also BUN, blood glucose, CBC, serum creatinine, blood pH, ABGs, LFTs; I&O, platelet count, patient may need to be on a high-potassium diet; identify signs of hypokalemia (vomiting, fatigue, weakness)
- **Seizures:** neurologic status, provide seizure precaution

Perform/provide:

- Storage in dark, cool area; use reconstituted solution within 24 hr

Evaluate:

- Therapeutic response: improvement in edema of feet, legs, sacral area daily if medication is being used for CHF; decrease in aqueous humor if medication is being used for glaucoma; decreased frequency of seizures, prevention of altitude sickness

Teach patient/family:

- To take exactly as prescribed; if dose is missed, take as soon as remembered; do not double dose
- Altitude sickness: to avoid rapid ascent
- Diabetic: that drug may increase blood glucose and to monitor blood glucose
- To use sunscreen to prevent photosensitivity
- To avoid hazardous activities if drowsiness occurs
- To increase fluids to 2-3 L/day if not contraindicated

⚠ To report nausea, vertigo, rapid weight gain, change in stools, weakness, numbness, rash, sore throat, bleeding/bruising; Stevens-Johnson syndrome, toxic epidermal necrolysis (blistering, red rash that spreads)

TREATMENT OF OVERDOSE:

Lavage if taken orally; monitor electrolytes; administer dextrose in saline; monitor hydration, CV, renal status

🍁 Canada only Side effects: *italics* = common; **bold** = life-threatening ⚠
Nurse Alert

acetylcholine ophthalmic

See [Appendix B](#)

acetylcysteine (Rx)

(a-se-teel-sis'tay-een)

Acetadote, Mucomyst 

Func. class.: Mucolytic; antidote—acetaminophen

Chem. class.: Amino acid L-cysteine

Do not confuse: [acetylcysteine](#)/acetylcholine

[Mucomyst](#)/Mucinex

ACTION:

Decreases viscosity of secretions by breaking disulfide links of mucoproteins; serves as a substrate in place of glutathione, which is necessary to inactivate toxic metabolites with acetaminophen overdose

USES:

Acetaminophen toxicity; bronchitis; cystic fibrosis; COPD; atelectasis

Unlabeled uses: Prevention of contrast medium nephrotoxicity

CONTRAINDICATIONS:

Hypersensitivity, increased intracranial pressure, status asthmaticus

Precautions: Pregnancy (B), breastfeeding, hypothyroidism, Addison's disease, CNS depression, brain tumor, asthma, renal/hepatic disease, COPD, psychosis, alcoholism, seizure disorders, bronchospasms, asthma, anaphylactoid reactions, fluid restriction, weight <40 kg

DOSAGE AND ROUTES

Calculator

Acetaminophen toxicity

- **Adult and child:** **PO** 140 mg/kg, then 70 mg/kg q4hr × 17 doses to total of 1330 mg/kg; **IV** loading dose 150 mg/kg over 60 min (dilution 150 mg/kg in 200 ml of D₅); maintenance dose 1: 50 mg/kg over 4 hr (dilution 50 mg/kg in 500 ml

D₅): maintenance dose 2: 100 mg/kg over 16 hr (dilution 100 mg/kg in 1000 ml D₅)

Mucolytic

- **Adult and child: INSTILL** 1-20 ml (10%-20% sol) q6-8hr prn or 3-5 ml (20% sol) or 6-10 ml (10% sol) tid or qid; nebulization (face mask, mouthpiece, tracheostomy) 1-10 ml of a 20% sol, or 2-20 ml of a 10% sol, q6-8hr; nebulization (tent, croupette) may require large dose, up to 300 ml/treatment

Nephrotoxicity prophylaxis (unlabeled)

- **Adult: PO** 600 mg bid, given day before and day of administration of contrast media or **IV** 150 mg/kg in 500 ml NS over 30 min before contrast, then 50 mg/kg in 500 ml NS over the next 4 hr; **IV BOL** 1200 mg before contrast medium and 1200 mg **PO** bid for 48 hr (MI undergoing angioplasty)

Available forms: Oral sol 10%, 20%; inj 20% (200 mg/ml)

Administer:

PO route

- **Antidotal use:** give within 24 hr; dilute 10% or 20% sol to a 5% sol with diet soda, may use water if giving via gastric tube; dilution of 10% sol 1:1, 20% sol 1:3, store open undiluted solution refrigerated ≤96 hr

Direct intratracheal instill route

- By syringe: 1-2 ml of 10%-20% sol up to q1hr
- Decreased dose to geriatric patients; metabolism may be slowed
- Only if suction machine is available
- Before meals 1/2-1 hr for better absorption, to decrease nausea
- 20% sol diluted with NS or water for inj; may give 10% sol undiluted
- Only after patient clears airway by deep breathing, coughing

IV route

- **21-hr regimen:** loading dose: dilute 150 mg/kg in 200 ml D₅W; maintenance dose 1: dilute 50 mg/kg in 500 ml D₅W; maintenance dose 2: dilute 100 mg/kg in 1000 ml D₅W, give loading dose over 15 min, give maintenance dose 1 over 4 hr; give maintenance dose 2 over 16 hr, administer sequentially without time between doses

SIDE EFFECTS

CNS: *Dizziness, drowsiness, headache, fever, chills*

CV: Hypotension, flushing tachycardia

EENT: *Rhinorrhea*, tooth damage

GI: *Nausea*, stomatitis, constipation, vomiting, anorexia, **hepatotoxicity**, diarrhea

INTEG: Urticaria, rash, fever, clamminess, pruritus

RESP: **Bronchospasm**, burning, **hemoptysis**, chest tightness, cough, dyspnea

MISC: **Anaphylaxis**, **angioedema**

PHARMACOKINETICS

PO: (antidote), peak 1-2 hr, duration 4 hr

INH/INSTILL: Onset 5-10 min, peak 10 min, duration 1 hr

Excreted in urine, half-life 5.6 hr (adult), 11 hr (newborn)

IV: Protein binding 83%

INTERACTIONS

- Do not use with iron, copper, rubber, nickel, activated charcoal

Increase: effect—nitrates

NURSING CONSIDERATIONS

Assess:

- **Mucolytic use:** cough—type, frequency, character, including sputum
- Rate, rhythm of respirations, increased dyspnea; sputum; discontinue if bronchospasm occurs • VS, cardiac status including checking for dysrhythmias, increased rate, palpitations
- ABGs for increased CO₂ retention in asthma patients
- **Antidotal use:** LFTs, PT, BUN, creatinine, glucose, electrolytes, acetaminophen levels; inform prescriber if dose is vomited or vomiting is persistent • Nausea, vomiting, rash; notify prescriber if these occur

Perform/provide:

- Storage in refrigerator; use within 96 hr of opening
- Assistance with inhaled dose: bronchodilator if bronchospasm occurs; mechanical suction if cough insufficient to remove excess bronchial secretions

Evaluate:

- Therapeutic response: absence of purulent secretions when coughing, clear lung sounds (mucolytic use); absence of hepatic damage with acetaminophen toxicity

Teach patient/family:

- That foul odor and smell may be unpleasant
 - To clear airway for inhalation
 - That discoloration of sol after bottle is opened does not impair its effectiveness
 - To report vomiting because dose may need to be repeated
-

🍁 Canada only Side effects: *italics* = common; **bold** = life-threatening ⚠️

Nurse Alert

aclidinium

(a'kli-din'ee-um)

Tudorza Pressair

Func. class.: Anticholinergic, bronchodilator

Chem. class.: Synthetic quaternary ammonium compound

ACTION:

Inhibits interaction of acetylcholine at receptor sites on the bronchial smooth muscle, thereby resulting in decreased cGMP and bronchodilation

USES:

Long-term maintenance treatment of bronchospasm in COPD, emphysema, chronic bronchitis, not indicated for initial treatment of acute episodes

CONTRAINDICATIONS:

Hypersensitivity

Precautions: Pregnancy (C), breastfeeding, milk sensitivity, contact lenses, narrow-angle glaucoma, neonates, ocular exposure, prostatic hypertrophy, bladder obstruction

DOSAGE AND ROUTES

Calculator

• **Adults, including geriatric patients:** Oral inhalation 400 µg (1 actuation) bid; doses should be 12 hours apart

Available forms: Powder for inhalation 400 µg/actuation

Administer

Oral inhalation route

• Before initial use, remove inhaler from pouch; remove the cap by squeezing the arrows marked on each side and pulling outward; instruct the patient to hold the inhaler with the mouthpiece facing patient but not inside the mouth; the green button should be facing straight up • Before placing the inhaler into the mouth, the green button should be pushed all the way down and then released; patient should not continue to hold it down. Once the green button is pressed, the control window changes from red to green, indicating that the medication is

ready for inhalation. If the control window remains red, repeat the press-and-release actions until the control window is green • Before inhaling the dose, have patient breathe out completely away from the inhaler; patient should never breathe out into the inhaler • Instruct patient to put their lips tightly around the mouthpiece and to breathe in quickly and deeply through the mouth until a click sound is heard • The patient should remove the inhaler from the mouth and hold breath for as long as is comfortable, then breathe out slowly through the nose • The control window should turn red after the full dose has been inhaled. If it remains green after the dose is inhaled, the inhalation process should be repeated. If correct inhalation has not been achieved after several attempts, the doctor or health care professional should be contacted • Once the window has turned red, the protective cap should be placed back onto the inhaler by pressing it back onto the mouthpiece • The dose indicator displays how many doses are left. The first time the inhaler is used, the indicator displays the number 60. The indicator number counts down as the patient uses the inhaler • Discard inhaler when the marking “0” with red background shows in the middle of the dose indicator, the device locks out, after 45 days (whichever comes first); the inhaler does not need to be cleaned

SIDE EFFECTS

CNS: *Anxiety, dizziness, headache, nervousness*

CV: Palpitation

EENT: Dry mouth, blurred vision, nasopharyngitis congestion

GI: *Nausea, vomiting, diarrhea*

INTEG: Rash

RESP: *Cough, worsening of symptoms, bronchospasm*

PHARMACOKINETICS

Half-life 5-8 hr

INTERACTIONS

Increase: toxicity—other bronchodilators

NURSING CONSIDERATIONS

Assess:

- Tolerance over long-term therapy; dose might have to be increased or changed
- Respiratory status: rate, rhythm, auscultate breath sounds before and after administration, pulmonary function tests at baseline and periodically

Evaluate:

- Therapeutic response: Ability to breathe adequately

Teach patient/family:

- That compliance is necessary with number of inhalations/24 hr or overdose can occur; about spacer device for geriatric patients; that max therapeutic effects can take 2-3 mo • About the correct method of inhalation
- To report any visual effects or urinary retention

☼ Canada only Side effects: *italics* = common; **bold** = life-threatening ⚠
Nurse Alert

activated charcoal (OTC)

Actidose-Aqua, Actidose with Sorbitol, Charcoal Plus, Charcoal Plus DS, CharcoCaps, EZ Char
Func. class.: Antiflatulent; antidote

Do not confuse: **Actidose**/Actos

ACTION:

Binds poisons, toxins, irritants; increases adsorption in GI tract; inactivates toxins and binds until excreted

USES:

Poisoning, overdose

Unlabeled uses: Diarrhea, flatulence

CONTRAINDICATIONS:

Hypersensitivity to this product, unconsciousness, semiconsciousness, cyanide poisoning, mineral acids, alkalis, gag reflex depression, ethanol intoxication, intestinal obstruction, absent bowel sounds

Precautions: Pregnancy (C), hypersensitivity to quinidine, quinine

DOSAGE AND ROUTES

Calculator

Children should not get more than 1 dose of products that contain sorbitol

Poisoning

- Tabs/caps should not be used for poisonings
- **Adult/adolescents:** **PO** (activated charcoal aqueous susp) 5-10 × estimated weight of drug/chemical ingested or 50-100 g dose, may repeat q4-6hr as needed; (activated charcoal with sorbitol susp) 50 g as a single dose, do not use multiple dosing
- **Child:** **PO** (activated charcoal aqueous susp) 1-2 g/kg/dose or 25-50 g dose, may repeat as needed q4-6hr
- **Infant:** **PO** (activated charcoal aqueous susp) 1 g/kg/dose, may repeat as needed q4-6hr

Diarrhea/flatulence (unlabeled)

- **Adult:** **PO** (CharcoCaps) 520 mg (2 caps) after meals or prn, max 4.16 g (16

cap)/day

Available forms: Powder 15, 25 ✱, 30, 40, 120, 240 g/container; oral susp 12.5 g/60 ml, 15 g/72 ml, 15 g/120 ml, 25 g/120 ml, 30 g/120 ml, 50 g/240 ml; 15 g/120 ml ✱, 25 g/125 ml, 50 g/225 ml, 50 g/250 ml

Administer:

- Storage in tightly closed container to prevent absorption of gases
- Use stool softener or laxative to lessen constipation unless sorbitol has been given

PO route

- Give orally to those with intact gag reflexes, protected airways
- After inducing vomiting unless vomiting contraindicated (i.e., cyanide or alkalis)
- After mixing with water or fruit juice to form thick syrup; do not use dairy products, chocolate syrup to mix charcoal
- Repeat dose if vomiting occurs soon after dose; give with a laxative to promote elimination • After spacing at least 2 hr before or after other products or absorption will be decreased • Do not use tabs, caps to treat overdose

NG route

- Through nasogastric tube if patient unable to swallow

SIDE EFFECTS

GI: Nausea, black stools, vomiting, constipation, diarrhea, abdominal pain

OTHER: Pulmonary aspiration

PHARMACOKINETICS

PO: Excreted in feces, not absorbed, excreted unchanged in feces

INTERACTIONS

- Inactivation of acetylcysteine

Decrease: effects of acarbose, carbamazepine, digoxin, ipecac, phenytoin, acetaminophen, barbiturates, furosemide, methotrexate, phenothiazine, salicylates, tricyclics; use for overdose

NURSING CONSIDERATIONS

Assess:

- Respiration, pulse, B/P to determine charcoal effectiveness if taken for

barbiturate/opiate poisoning; intact gag reflex, serum • Not used for all types of overdose

Evaluate:

- Therapeutic response: LOC alert (poisoning)

Teach patient/family:

- That stools will be black
- How to prevent further poisonings
- To drink 8 glasses of water to prevent constipation

🍁 Canada only Side effects: *italics* = common; **bold** = life-threatening ⚠️
Nurse Alert

acyclovir (Rx)

(ay-sye'kloe-veer)

Zovirax

Func. class.: Antiviral

Chem. class.: Purine nucleoside analog

Do not confuse: Zovirax/Zyvox/Valtrex/Zostrix

ACTION:

Interferes with DNA synthesis by conversion to acyclovir triphosphate, thereby causing decreased viral replication

USES:

Mucocutaneous herpes simplex virus, herpes genitalis (HSV-1, HSV-2), varicella infections, herpes zoster, herpes simplex encephalitis

Unlabeled uses: Bell's palsy, prevention of CMV, Epstein-Barr virus, esophagitis, hairy leukoplakia, prevention of herpes labialis, herpes simplex, herpes simplex ocular prophylaxis, keratoconjunctivitis, pharyngitis, pneumonitis, prevention of postherpetic neuralgia, proctitis, stomatitis, tracheobronchitis, varicella prophylaxis

CONTRAINDICATIONS:

Hypersensitivity to this product, valacyclovir

Precautions: Pregnancy (B), breastfeeding, renal/hepatic/neurologic disease, electrolyte imbalance, dehydration, hypersensitivity to famciclovir, ganciclovir, penciclovir, valganciclovir

DOSAGE AND ROUTES

Calculator

Herpes simplex (recurrent)

- **Adult: PO** 400 mg 3 ×/day for 5 days or 200 mg 5 ×/day × 5 days
- **Adult and child >12 yr: IV INF** 5 mg/kg over 1 hr q8hr × 7 days, use ideal body weight for patients with obesity
- **Infant >3 mo/child <12 yr: IV INF** 10 mg/kg q8hr × 7 day; if HIV infected 5-10 mg/kg q8hr (moderate to severe)

- **Neonate:** IV INF 10 mg/kg q8hr × 10 days, may use higher dose

Genital herpes

- **Adult:** PO 200 mg q4hr (5 ×/day while awake) for 5 days to 6 mo depending on whether initial, recurrent, or chronic; IV 5 mg/kg q8hr × 5 days

Genital herpes, initial limited, mucocutaneous HSV in immunocompromised patients, non-life-threatening

- **Adult/child ≥12 yr:** top cover lesions q3hr 6 times/day

Herpes simplex encephalitis

- **Adult:** IV 10 mg/kg over 1 hr q8hr × 10 days
- **Child 3 mo-12 yr:** IV 20 mg/kg q8hr × 10 days
- **Child birth-3 mo:** IV 10 mg/kg q8hr × 10 days

Herpes labialis, recurrent

- **Adult/child ≥12 yr:** top apply cream 5 ×/day for 4 days, start as soon as symptoms appear

Herpes zoster

- **Adult:** PO 800 mg q4hr while awake × 7-10 days; IV 10 mg/kg q8hr × 7 days

Herpes zoster (shingles) immunocompromised patients

- **Adult/adolescent:** PO 800 mg q4hr 5×/day for 7-10 days; IV 10 mg/kg q8hr × 7 days
- **Child ≥12 yr:** IV 10 mg/kg/dose q8hr × 7 days
- **Infant/child <12 yr:** IV 20 mg/kg/dose q8hr × 7-10 days

Herpes zoster (shingles) immunocompetent

- **Adult:** PO 800 mg q4hr 5×/day × 7-10 days; start within 48-72 hr of rash onset

Varicella (chickenpox) immunocompetent

- **Adult/adolescent/child >40 kg:** PO 800 mg 4×/day × 5 days
- **Child ≥2 yr and ≤40 kg:** PO 20 mg/kg/dose (max 800 mg) 4×/day × 5 days

Mucosal/cutaneous herpes simplex infections in immunosuppressed patients

- **Adult and child >12 yr:** IV 5 mg/kg q8hr × 7 days
- **Infant >3 mo/child <12:** IV 10 mg/kg q8hr × 7 days

Renal dose

- **Adult and child:** PO/IV CCr >50 ml/min 100% dose q8hr, CCr 25-50 ml/min 100% dose q12hr, CCr 10-25 ml/min 100% dose q24hr, CCr 0-10 ml/min 50% dose q24hr

Recurrent ocular herpes, prevention (unlabeled)

- **Adult/child ≥12 yr:** PO 600-800 mg every day × 8-12 mo

CMV prophylaxis (unlabeled)

- **Adult:** IV 500 mg/m² q8hr

Herpes simplex in

pneumonitis/esophagitis/tracheobronchitis/proctitis/stomatitis/pharyngitis (unlabeled)

- **Adult and adolescent:** IV 5-10 mg/kg q8hr × 2-7 days or **PO** 200 mg q4hr 5×/day × 7-10 days or 400 mg 3-5 ×/day × ≥10 days
- **Child 6 mo-12 yr:** IV 1000 mg/day in 3-5 divided doses × 7-14 days

Herpes simplex prophylaxis for chronic suppression therapy (unlabeled)

- **Adult and adolescent:** **PO** 400 mg bid up to 12 mo
- **Child:** **PO** 800-1000 mg/day in 2-5 divided doses, max 80 mg/kg/day

Available forms: Caps 200 mg; tabs 400, 800 mg; powder for inj 500, 1000 mg; sol for inj 50 mg/ml; oral susp 200 mg/5 ml; ointment/cream 5%

Administer:

PO route

- Do not break, crush, or chew caps
- May give without regard to meals, with 8 oz of water
- Shake susp before use

Intermittent IV INF route

- Increase fluids to 3 L/day to decrease crystalluria; most critical during first 2 hr after IV
- Reconstitute with 10 ml compatible sol/500 mg or 20 mg/1 g of product, conc of 50 mg/ml, shake, further dilute in 50-125 ml compatible sol; use within 12 hr; give over at least 1 hr (constant rate) by inf pump to prevent nephrotoxicity; do not reconstitute with sol containing benzyl alcohol in neonates

Topical route

- Use finger cot or glove to cover all lesions completely, do not get in eye, wash hands after use

Solution compatibilities: D₅W, LR, or NaCl (D₅ 0.9% NaCl, 0.9% NaCl) sol

Y-site compatibilities: Alemtuzumab, alfentanil, allopurinol, amikacin, aminophylline, amphotericin B cholesteryl, amphotericin B liposome, ampicillin, anidulafungin, argatroban, atracurium, bivalirudin, buprenorphine, busulfan, butorphanol, calcium chloride/gluconate, CARBOplatin, cefazolin,

cefonicid, cefoperazone, cefotaxime, cefoxitin, ceftazidime, ceftizoxime, cefTRIAXone, cefuroxime, cephapirin, chloramphenicol, cholesteryl sulfate complex, cimetidine, clindamycin, dexamethasone sodium phosphate, dimenhyDRINATE, DOXOrubicin, doxycycline, erythromycin, famotidine, filgrastim, fluconazole, gallium, gentamicin, granisetron, heparin, hydrocortisone sodium succinate, hydromorphone, imipenem/cilastatin, LORazepam, magnesium sulfate, melphalan, methylPREDNISolone sodium succinate, metoclopramide, metroNIDAZOLE, multivitamin, nafcillin, oxacillin, paclitaxel, penicillin G potassium, PENTobarbital, perphenazine, piperacillin, potassium chloride, propofol, ranitidine, remifentanyl, sodium bicarbonate, tacrolimus, teniposide, theophylline, thiotepa, ticarcillin, tobramycin, trimethoprim-sulfamethoxazole, vancomycin, vasopressin, voriconazole, zidovudine

SIDE EFFECTS

CNS: Tremors, confusion, lethargy, hallucinations, **seizures**, dizziness, headache, encephalopathic changes

EENT: Gingival hyperplasia

GI: Nausea, vomiting, diarrhea, increased ALT/AST, abdominal pain, glossitis, colitis

GU: **Oliguria, proteinuria, hematuria**, vaginitis, moniliasis, **glomerulonephritis, acute renal failure**, changes in menses, polydipsia

HEMA: **Thrombotic thrombocytopenia purpura, hemolytic uremic syndrome** (immunocompromised patients)

INTEG: Rash, urticaria, pruritus, pain or phlebitis at IV site, unusual sweating, alopecia, **Stevens-Johnson syndrome**

MS: Joint pain, leg pain, muscle cramps

PHARMACOKINETICS

Distributed widely; crosses placenta; CSF concentrations are 50% plasma; protein binding 9%-33%

PO: Absorbed minimally, onset unknown, peak 1.5-2 hr, terminal half-life 2.5-3.3 hr

IV: Onset immediate, peak immediate, duration unknown, half-life 20 min-3 hr (terminal); metabolized by liver, excreted by kidneys as unchanged product

(95%)

INTERACTIONS

Increase: CNS side effects; zidovudine

Increase: levels, toxicity—probenecid

Increase: nephrotoxicity—aminoglycosides

Increase: concentrations of—entecavir, pemetrexed, tenofovir

Decrease: action of—hydantoins, valproic acid

Drug/Lab Test

Increase: BUN, creatinine

NURSING CONSIDERATIONS

Assess:

- Signs of infection, anemia
- **Toxicity:** any patient with compromised renal system because product is excreted slowly with poor renal system function; toxicity may occur rapidly
- Hepatic, renal studies: AST, ALT; urinalysis, protein, BUN, creatinine, CCr, watch for increasing BUN and serum creatinine or decreased CCr; I&O ratio; report hematuria, oliguria, fatigue, weakness; may indicate **nephrotoxicity**; check for protein in urine during treatment
- Bowel pattern before, during treatment; if severe abdominal pain with bleeding occurs, product should be discontinued
- Skin eruptions: rash, urticaria, itching
- Allergies before treatment, reaction of each medication; place allergies on chart in bright red letters
- Neurologic status with herpes encephalitis

Perform/provide:

- Storage at room temp for up to 12 hr after reconstitution; if refrigerated, sol may show a precipitate that clears at room temp; yellow discoloration does not affect potency
- Adequate intake of fluids (2 L) to prevent deposits in kidneys, more likely to occur with rapid administration or in dehydration

Evaluate:

- Therapeutic response: absence of itching, painful lesions; crusting and healed lesions; decreased symptoms of chickenpox; healing, decreased pain with herpes zoster

Teach patient/family:

- To take as prescribed; if dose is missed, take as soon as remembered up to 1 hr before next dose; do not double dose
- That product may be taken orally before

infection occurs; product should be taken when itching or pain occurs, usually before eruptions • That sexual partners need to be told that patient has herpes because they can become infected; condoms must be worn to prevent reinfections • Not to touch lesions to avoid spreading infection to new sites • That product does not cure infection, just controls symptoms and does not prevent infecting others • That product must be taken in equal intervals around the clock to maintain blood levels for duration of therapy • To seek dental care during treatment to prevent gingival hyperplasia • That women with genital herpes are more likely to develop cervical cancer; to keep all gynecologic appointments

TREATMENT OF OVERDOSE:

Discontinue product, hemodialysis, resuscitate if needed

🍁 Canada only Side effects: *italics* = common; **bold** = life-threatening ⚠️
Nurse Alert

adalimumab (Rx)

(add-a-lim'yu-mab)

Humira

Func. class.: Antirheumatic agent (disease modifying), immunomodulator, anti-TNF

Chem. class.: Recombinant human IgG1 monoclonal antibody, DMARD

Do not confuse: Humira/Humulin/Humalog

ACTION:

A form of human IgG1 monoclonal antibody specific for human tumor necrosis factor (TNF); elevated levels of TNF are found in patients with rheumatoid arthritis

USES:

Reduction of signs and symptoms and inhibition of progression of structural damage in patients with moderate to severe active rheumatoid arthritis who are ≥ 18 years of age and who have not responded to other disease-modifying agents, juvenile rheumatoid arthritis (JRA), psoriatic arthritis, Crohn's disease, moderate to severe plaque psoriasis, ankylosing spondylitis, ulcerative colitis

CONTRAINDICATIONS:

Hypersensitivity

Precautions: Pregnancy (B), breastfeeding, children, geriatric patients, CNS demyelinating disease, lymphoma, CHF, hepatitis B carriers, manitol hypersensitivity, latex allergy, neoplastic disease

Black Box Warning:

Active infections, risk of lymphomas/leukemias, TB

DOSAGE AND ROUTES

Calculator

Rheumatoid arthritis/ankylosing spondylitis/psoriatic arthritis

- **Adult:** SUBCUT 40 mg every other wk or every wk if not combined with methotrexate; IV (unlabeled) 0.25-3 mg/kg q2-4wk

Juvenile rheumatoid arthritis

- **Child ≥ 4 yr/adolescent ≥ 30 kg:** SUBCUT 40 mg every other wk
- **Child ≥ 4 yr/adolescent ≥ 15 kg to < 30 kg:** SUBCUT 20 mg every other wk

- **Child ≥ 4 yr/adolescent < 15 kg:** SUBCUT 24 mg/m² BSA (up to 40 mg total) every other wk, then 20 mg every other wk

Crohn's disease/ulcerative colitis

- **Adult:** SUBCUT 160 mg given as 4 inj on day 1 or 2 inj each on days 1 and 2, then 80 mg at wk 2 and 40 mg every other wk starting at wk 4

Plaque psoriasis

- **Adult:** SUBCUT 80 mg baseline as 2 inj then 40 mg every other wk starting 1 wk after initial dose $\times$ 16 wk

Available form: Inj 40 mg/0.8 ml; 20 mg/0.4 ml (pediatric)

Administer:

SUBCUT route

- Do not admix with other sol or medications; do not use filter; protect from light; give at 45-degree angle using abdomen, thighs; rotate inj sites; discard unused portions

SIDE EFFECTS

CNS: Headache

CV: Hypertension

EENT: Sinusitis

GI: Abdominal pain, nausea, hepatic damage

HEMA: Leukopenia pancytopenia, aplastic anemia, agranulocytopenia

INTEG: Rash, inj site reaction

MISC: Flulike symptoms, UTI, back pain, lupuslike syndrome, increased cancer risk, antibody development to this drug; risk of infection (TB, invasive fungal infections, other opportunistic infections), may be fatal, Stevens-Johnson syndrome, anaphylaxis

RESP: URI, pulmonary fibrosis, bronchitis

PHARMACOKINETICS

Absorption 65%, terminal half-life 2 wk, lower clearance with advancing age (40-75 yr), high RA factor

INTERACTIONS

Increase: serious infections—other TNF blockers, rilonacept

- Do not use with anakinra, serious infections may occur

- Do not give concurrently with vaccines; immunizations should be brought up to date before treatment

Drug/Lab Test

Increase: ALT, cholesterol

NURSING CONSIDERATIONS

Assess:

- **RA:** pain, stiffness, ROM, swelling of joints before, during treatment
- For inj site pain, swelling, redness; usually occur after 2 inj (4-5 days), use cold compress to relieve pain/swelling

Black Box Warning:

For infections (fever, flulike symptoms, dyspnea, change in urination, redness/swelling around any wounds), stop treatment if present; some serious infections including sepsis may occur, may be fatal; patients with active infections should not be started on this product

- May reactivate hepatitis B in chronic carriers, may be fatal

Black Box Warning:

Latent TB before therapy, treat before starting this product

- **Anaphylaxis, latex allergy:** stop therapy if lupuslike syndrome develops
- **Blood dyscrasias:** CBC, differential periodically

Black Box Warning:

For neoplastic disease (lymphomas/leukemia) in children, adolescents, hepatosplenic T-cell lymphoma is more likely in adolescent males with Crohn's disease or ulcerative colitis

Evaluate:

- Therapeutic response: decreased inflammation, pain in joints, decreased joint destruction

Teach patient/family:

- About self-administration if appropriate: inj should be made in thigh, abdomen, upper arm; rotate sites at least 1 inch from old site; do not inject in areas that are bruised, red, hard
- That if medication is not taken when due, inject next dose as soon as remembered and inject next dose as scheduled
- Not to take any live virus vaccines during treatment
- **To report signs of infection, allergic reaction, or lupuslike syndrome, immediately**

☼ Canada only Side effects: *italics* = common; **bold** = life-threatening ⚠

Nurse Alert

adefovir (Rx)

(add-ee-foh'veer)

Hepsera

Func. class.: Antiviral

Chem. class.: Adenosine monophosphate analog

ACTION:

Inhibits hepatitis B virus DNA polymerase by competing with natural substrates and by causing DNA termination after its incorporation into viral DNA; causes viral DNA death

USES:

Chronic hepatitis B

CONTRAINDICATIONS:

Hypersensitivity

Precautions: Pregnancy (C), labor, breastfeeding, children, geriatric patients, dialysis, females, obesity, organ transplant

Black Box Warning:

Severe renal disease, impaired hepatic function, lactic acidosis, HIV

DOSAGE AND ROUTES

Calculator

• **Adult/adolescent:** PO 10 mg/day, optimal duration unknown

Renal dose

• **Adult:** PO CCr ≥ 50 ml/min 10 mg q24hr; CCr 30-49 ml/min 10 mg q48hr; CCr 10-29 ml/min 10 mg q72hr; hemodialysis 10 mg q7days after dialysis

Available forms: Tabs 10 mg

Administer:

- By mouth without regard for food
- Take with full glass of water

SIDE EFFECTS

CNS: Headache

GI: Dyspepsia, abdominal pain, nausea, vomiting, diarrhea, hepatomegaly, flatulence, pancreatitis

GU: Hematuria, glycosuria, **nephrotoxicity**, **Fanconi syndrome**, renal failure

MISC: Fever, rash, weight loss, cough

PHARMACOKINETICS

PO: Rapidly absorbed from GI tract, peak $1\frac{3}{4}$ hr, excreted by kidneys 45%, terminal half-life 7.48 hr

INTERACTIONS

- Do not use in combination with emtricitabine/tenofovir, emtricitabine/rilpivirine, emtricitabine/efavirenz/tenofovir

Increase: serum conc and possible toxicity—aminoglycosides, memantine, emtricitabine, efavirenz, dofetilide, digoxin, cyclosporine, amiloride, quinine, quinidine, procainamide, pemetrexed, midodrine, metFORMIN, NSAIDs, vancomycin, trospium, triamterene, tenofovir, tacrolimus, ranitidine, cimetidine, morphine

Black Box Warning:

Increase: lactic acidosis, severe hepatomegaly, NNRTIs, NRTIs, antiretroviral protease inhibitors

Drug/Lab Test

Increase: ALT, AST, amylase, creatine kinase

NURSING CONSIDERATIONS

Assess:

Black Box Warning:

Nephrotoxicity: increasing CCr, BUN

Black Box Warning:

HIV antibody testing before beginning treatment, HIV resistance may occur in chronic hepatitis B patients

Black Box Warning:

For lactic acidosis, severe hepatomegaly with stenosis; for use of NNRTIs, NRTIs, antiretroviral protease inhibitors (PIs), lactic acidosis with severe hepatomegaly is more common in females, obese patients, and with prolonged nucleoside use

- Geriatric patients more carefully; may develop renal, cardiac symptoms more rapidly

Black Box Warning:

For exacerbations of hepatitis after discontinuing treatment, monitor LFTs, hepatitis B serology

- Pregnancy: If planned or suspected; if pregnant call the Pregnancy Registry 800-258-4263

Perform/provide:

- Storage in cool environment; protect from light

Evaluate:

- Therapeutic response: decreased symptoms of chronic hepatitis B, improving LFTs

Teach patient/family:

- That optimal duration of treatment is unknown, that product is not a cure, that transmission may still occur
- To avoid use with other medications unless approved by prescriber
- To notify prescriber of decreased urinary output
- Not to stop abruptly unless directed, worsening of hepatitis may occur
- To report immediately dyspnea, nausea, vomiting, abdominal pain, weakness, dizziness, cold extremities
- To notify prescriber if pregnancy is planned or suspected, avoid breastfeeding

🍁 Canada only Side effects: *italics* = common; **bold** = life-threatening ⚠️
Nurse Alert

HIGH ALERT

adenosine (Rx)

(a-den'oh-seen)

Func. class.: Antidysrhythmic

Chem. class.: Endogenous nucleoside

Do not confuse: **adenosine**/adeosine phosphate

ACTION:

Slows conduction through AV node, can interrupt reentry pathways through AV node, and can restore normal sinus rhythm in patients with paroxysmal supraventricular tachycardia

USES:

PSVT, as a diagnostic aid to assess myocardial perfusion defects in CAD, Wolff-Parkinson-White syndrome

Unlabeled uses: Wide-complex tachycardia diagnosis

CONTRAINDICATIONS:

Hypersensitivity, 2nd-or 3rd-degree AV block, sick sinus syndrome, atrial flutter, atrial fibrillation, ventricular tachycardia, bronchospastic lung disease, symptomatic bradycardia, bundle branch block, heart transplant, unstable angina

Precautions: Pregnancy (C), breastfeeding, children, geriatric patients, asthma

DOSAGE AND ROUTES

Calculator

Antidysrhythmic

- **Adult and child >50 kg: IV BOL** 6 mg; if conversion to normal sinus rhythm does not occur within 1-2 min, give 12 mg by rapid **IV BOL**; may repeat 12-mg dose again in 1-2 min
- **Infant and child <50 kg: IV BOL** 0.1 mg/kg; if not effective, increase dose by 0.05-0.1 mg/kg q2min to a max of 0.3 mg/kg/dose
- **Neonate: IV BOL** 0.05 mg/kg by rapid IV BOL, may increase by 0.05 mg/kg q2min, max 0.3 mg/kg/dose

Available forms: 3 mg/ml

Administer:

- Warm to room temp; crystals will dissolve

IV, direct route

- Undiluted; give 6 mg or less by rapid inj over 1-2 sec; if using an IV line, use port near insertion site, flush with NS (20 ml), then elevate arm

Y-site compatibilities: abciximab

Solution compatibilities: D₅LR, D₅W, LR, 0.9% NaCl

SIDE EFFECTS

CNS: Lightheadedness, dizziness, arm tingling, numbness, headache

CV: Chest pain, pressure, **atrial tachydysrhythmias**, sweating, palpitations, hypotension, *facial flushing*, **AV block**, **cardiac arrest**, **ventricular dysrhythmias**

GI: *Nausea*, metallic taste

RESP: *Dyspnea*, *chest pressure*, hyperventilation, **bronchospasm (asthmatics)**

PHARMACOKINETICS

Cleared from plasma in <30 sec, half-life 10 sec, converted to inosine/adenosine monophosphate

INTERACTIONS

Increase: risk for higher degree of heart block—carbamazepine

Increase: risk for ventricular fibrillation—digoxin, verapamil

- Smoking: increase tachycardia

Increase: effects of adenosine—dipyridamole

Decrease: activity of adenosine—theophylline or other methylxanthines (caffeine)

Drug/Herb

Increase: adenosine effect—ginger

Decrease: adenosine effect—guarana, green tea

NURSING CONSIDERATIONS

Assess:

- **Cardiopulmonary status:** B/P, pulse, respiration, rhythm, ECG intervals (PR, QRS, QT); check for transient dysrhythmias (PVCs, PACs, sinus tachycardia,

AV block) • Respiratory status: rate, rhythm, lung fields for crackles, watch for respiratory depression; bilateral crackles may occur in **CHF** patient; increased respiration, increased pulse, product should be discontinued • CNS effects: dizziness, confusion, psychosis, paresthesias, seizures; product should be discontinued

Perform/provide:

- Storage at room temperature; sol should be clear; discard unused product

Evaluate:

- Therapeutic response: normal sinus rhythm or diagnosis of perfusion defect

Teach patient/family:

- To report facial flushing, dizziness, sweating, palpitations, chest pain; usually transient

TREATMENT OF OVERDOSE:

Defibrillation, vasopressor for hypotension, theophylline

☼ Canada only Side effects: *italics* = common; **bold** = life-threatening ⚠

Nurse Alert

aflibercept

(a-fli-ber'sept)

EYLEA

Func. class.: Biologic response modifier; signal transduction inhibitor (STIs) (Ophthalmic)

ACTION:

A recombinant fusion protein consisting of portions of human VEGF receptors 1 and 2 extracellular domains fused to human IgG1; acts as a soluble decoy receptor that binds vascular endothelial growth factor-A (VEGF-A) and placental growth factor (PIGF); can act as mitogenic, chemotactic, vascular permeability factors for endothelial cells; VEGF-A interacts with VEGFR-1 and VEGFR-2 on the surface of endothelial cells; results in neovascularization and vascular permeability; binding of aflibercept to VEGF-A and PIGF prevents activation of these receptors

USES:

For treatment of neovascular (wet) age-related macular degeneration (AMD), macular edema after central retinal vein

CONTRAINDICATIONS:

Hypersensitivity, ocular/periocular infection, active intraocular inflammation

Precautions: Neonates, infants, children, adolescents, pregnancy (C), breastfeeding; history of glaucoma, ocular surgery; driving or operating machinery

DOSAGE AND ROUTES

Calculator

• **Adult: Intravitreal INJ** 2 mg (0.05 ml) into affected eye(s) q4wk × 12 wk, then 2 mg (0.05 ml) q8wk

Available forms: Solution for injection 2 mg/0.05 ml

Administer:

Intravitreal route

• Visually inspect for particulate matter, discoloration before use; do not use if particulates, cloudiness, discoloration are visible; only for use by physicians

trained in administration • Use controlled aseptic conditions (sterile gloves, sterile drape, sterile eyelid speculum); adequate anesthesia, topical broad-spectrum antiinfective should be given before use • Use each vial for treatment of single eye only; if other eye is being treated, use new vial and change the sterile field, syringe, gloves, drapes, eyelid speculum, filter, injection needles before administering to the other eye • Use aseptic technique, withdraw all of vial contents through a 5-micron 19-G filter needle attached to 1-ml syringe supplied by manufacturer; after vial contents are withdrawn, discard filter needle and replace with sterile 30-G × ½ inch needle for intravitreal injection; expel any air bubbles and contents of syringe until plunger tip is aligned with line that marks 0.05 ml • Immediately after the intravitreal injection, monitor patient for elevation in intraocular pressure (IOP); appropriate monitoring may consist of a check for perfusion of optic nerve head or tonometry; sterile paracentesis needle should be available if required

SIDE EFFECTS

CV: Thromboembolism, nonfatal stroke, nonfatal myocardial infarction, vascular death

EENT: Ocular hemorrhage, ocular pain, cataracts, vitreous detachment, vitreous floaters, conjunctival hyperemia, corneal erosion, detachment of retinal pigment epithelium, injection site pain, foreign body sensation, increased lacrimation, blurred vision, retinal pigment epithelium tear, injection site hemorrhage, blepharedema, corneal edema

SYST: Hypersensitivity

PHARMACOKINETICS

Absorbed into systemic circulation; present in its unbound form and stable inactive form bound with endogenous VEGF; elimination by binding to free endogenous VEGF; metabolism by proteolysis; terminal half-life in plasma 5-6 days

NURSING CONSIDERATIONS

Assess:

- **Infection:** monitor for infection during week after injection to permit early treatment of any ocular infection that may develop; proper aseptic injection

technique should be used to minimize infection • **Increased intraocular pressure:** monitor for acute increases in intraocular pressure within 60 min of injection; sustained increases in intraocular pressure have been reported after repeated intravitreal dosing; monitor intraocular pressure and optic nerve head perfusion, a sterile paracentesis needle should be available

Perform/provide:

- Storage: do not freeze, protect from light, refrigerate, store in original package until time of use

Evaluate:

- Prevention of further vision loss

Teach patient/family:

 To seek immediate care if symptoms of endophthalmitis or retinal detachment develop (ocular pain, hyperemia of the conjunctiva, photophobia, blurry vision)

🍁 Canada only Side effects: *italics* = common; **bold** = life-threatening 
Nurse Alert

albumin, human 5% (Rx)

(al-byoo'min)

Albumarc, Albuminar-5, Albutein 5%, Buminate 5%, Plasbumin-5

albumin, human 25%

Albuminar-25, Albutein 25%,

Buminate 25%, Plasbumin-25

Func. class.: Plasma volume expander

ACTION:

Exerts oncotic pressure, which expands volume of circulating blood and maintains cardiac output

USES:

Restores plasma volume after burns, hyperbilirubinemia, shock, hypoproteinemia, prevention of cerebral edema, cardiopulmonary bypass procedures, ARDS, nephrotic syndrome

CONTRAINDICATIONS:

Hypersensitivity, CHF, severe anemia, renal insufficiency, pulmonary edema

Precautions: Pregnancy (C), decreased salt intake, decreased cardiac reserve, lack of albumin deficiency, renal/hepatic disease, chronic anemia

DOSAGE AND ROUTES

Calculator

Burns

• **Adult:** IV dose to maintain plasma albumin at 3-4 mg/dl

Hypovolemic Shock

• **Adult:** IV rapidly give 5% sol, when close to normal inf at $\leq 2-4$ ml/min (25% sol ≤ 1 ml/min)

• **Child:** IV 0.5-1 g/kg/dose 5% sol, may repeat as needed, max 6 g/kg/day

Nephrotic Syndrome

• **Adult:** IV 100-200 ml of 25% and loop diuretic $\times$ 7-10 days

Hypoproteinemia

• **Adult:** IV 25 g, may repeat in 15-30 min, or 50-75 g of 25% albumin infused at

≤2 ml/min

- **Child and infant:** IV 0.5-1 g/kg/dose over 2-4 hr, may repeat q1-2days

Hyperbilirubinemia/erythroblastosis fetalis

- **Infant:** IV 1 g/kg 1-2 hr before transfusion

Available forms: Inj (5%) 50 mg/ml, (25%) 250 mg/ml

Administer:

IV route

- Slowly, to prevent fluid overload; dilute with NS for injection or D₅W; 5% is given undiluted; 25% may be given diluted or undiluted; give over 30-60 min, use inf pump, use large-gauge needle; inf must be completed within 4 hr
- 5% solution may be used with hypovolemic/intravascular depletion
- 25% solution may be used with sodium/fluid restrictions

Solution compatibilities: LR, NaCl, Ringer's, D₅W, D₁₀W, D_{21/2}W, NaCl 0.9%, dextrose/Ringer's, dextrose/LR

Y-site compatibilities: Diltiazem, LORazepam

SIDE EFFECTS

CNS: Fever, chills, flushing, headache

CV: Fluid overload, hypotension, erratic pulse, tachycardia

GI: Nausea, vomiting, increased salivation

INTEG: Rash, urticaria

RESP: Altered respirations, pulmonary edema

PHARMACOKINETICS

In hyponutrition states, metabolized as protein/energy source; terminal half-life 21 days

INTERACTIONS

Drug/Lab Test

Increase: serum albumin

NURSING CONSIDERATIONS

Assess:

- Blood studies Hct, Hgb; if serum protein declines, dyspnea, hypoxemia can result

- Decreased B/P, erratic pulse, respiration
- I&O ratio: urinary output may decrease

⚠ Circulatory/pulmonary overload: CVP, pulmonary wedge pressure distended neck veins indicate circulatory overload; shortness of breath, anxiety, insomnia, expiratory crackles, frothy blood-tinged cough, cyanosis indicate pulmonary overload • Allergy: fever, rash, itching, chills, flushing, urticaria, nausea, vomiting, hypotension, requires discontinuation of inf, use of new lot if therapy reinstituted; premedicate with diphenhydramine

Perform/provide:

- Adequate hydration before, during administration
- Check type of albumin; some stored at room temp, some need to be refrigerated, use within 4 hr of opening

Evaluate:

- Therapeutic response: increased B/P, decreased edema, increased serum albumin levels, increased plasma protein

Teach patient/family:

- Reason for product; to report hypersensitivity

🍁 Canada only Side effects: *italics* = common; **bold** = life-threatening ⚠
Nurse Alert

albuterol (Rx)

(al-byoo'ter-ole)

Accuneb, Airomir , Apo-Salvent, Gen-Salbutamol , Proair HFA, Proventil, Proventil HFA, ReliOn, Ventolin HFA, VoSpire ER

Func. class.: Adrenergic β_2 -agonist, sympathomimetic, bronchodilator

Do not confuse: **albuterol**/atenolol/Albutein

Ventolin/Vantin

Proventil/Prinivil

ACTION:

Causes bronchodilation by action on β_2 (pulmonary) receptors by increasing levels of cAMP, which relaxes smooth muscle; produces bronchodilation, CNS, cardiac stimulation as well as increased diuresis and gastric acid secretion; longer acting than isoproterenol

USES:

Prevention of exercise-induced asthma, acute bronchospasm, bronchitis, emphysema, bronchiectasis, or other reversible airway obstruction

Unlabeled uses: Hyperkalemia in dialysis patients

CONTRAINDICATIONS:

Hypersensitivity to sympathomimetics, tachydysrhythmias, severe cardiac disease, heart block

Precautions: Pregnancy (C), breastfeeding, cardiac/renal disease, hyperthyroidism, diabetes mellitus, hypertension, prostatic hypertrophy, angle-closure glaucoma, seizures, exercise-induced bronchospasm (aerosol) in children <12 yr, hypoglycemia

DOSAGE AND ROUTES

Calculator

Bronchospasm prophylaxis

- **Adult and child ≥ 4 yr:** INH (metered-dose inhaler) 2 puffs q4-6hr as needed

Other respiratory conditions

- **Adult and child ≥ 12 yr:** INH (metered-dose inhaler) 1 puff q4-6hr; **PO** 2-4

mg tid-qid, max 32 mg; **NEB/IPPB** 2.5 mg tid-qid

- **Geriatric: PO** 2 mg tid-qid, may increase gradually to 8 mg tid-qid
- **Child 2-12 yr: INH** (metered-dose inhaler) 0.1 mg/kg tid (max 2.5 mg tid-qid); **NEB/IPPB** 0.1-0.15 mg/kg/dose tid-qid or 1.25 mg tid-qid for child 10-15 kg or 2.5 mg tid-qid for child >15 kg

Hyperkalemia (unlabeled)

- **Adult: ORAL INH** (albuterol nebulizer sol) 10-20 mg

Available forms: Aerosol 90 mcg/actuation; oral syr 2 mg/5 ml; tabs 2, 4 mg; ext rel 4, 8 mg; INH sol 0.5, 0.83, 1, 2, 5 mg/ml; powder for INH (Ventodisk) 200, 400 mcg; INH cap 200 mcg; 100 mcg/spray, 80 INH/canister, 200 INH/canister

Administer:

PO route

- Do not break, crush, or chew ext rel tabs; give with meals to decrease gastric irritation
- **Oral sol** to children (no alcohol, sugar)

Inhalation route

- For geriatric patients and children, a spacing device is advised
- After shaking metered-dose inhaler, exhale, place mouthpiece in mouth, inhale slowly while depressing inhaler, hold breath, remove, exhale slowly; give INH at least 1 min apart • **NEB/IPPB** diluting 5 mg/ml sol/2.5 ml 0.9% NaCl for INH; other sol do not require dilution; for neb O₂ flow or compressed air 6-10 L/min

SIDE EFFECTS

CNS: *Tremors, anxiety, insomnia, headache, dizziness, stimulation, restlessness, hallucinations, flushing, irritability*

CV: Palpitations, tachycardia, angina, hypo/hypertension, dysrhythmias

EENT: Dry nose, irritation of nose and throat

GI: Heartburn, nausea, vomiting

MISC: Flushing, sweating, anorexia, bad taste/smell changes, hypokalemia, metabolic acidosis

MS: Muscle cramps

RESP: Cough, wheezing, dyspnea, **paradoxical bronchospasm**, dry throat

PHARMACOKINETICS

Extensively metabolized in the liver and tissues, crosses placenta, breast milk, blood-brain barrier

PO: Onset 1/2 hr, peak 2-3 hr, duration 4-6 hr, half-life 2.7-6 hr, well absorbed

PO-ER: Onset 1/2 hr; peak 2-3 hr; duration 8-12 hr

INH: Onset 5-15 min, peak 1-1½ hr, duration 3-6 hr, half-life 4 hr

INTERACTIONS

Increase: QTc prolongation—other drugs that increase QT prolongation

Increase: digoxin level—digoxin

Increase: CNS stimulation—CNS stimulants

Increase: ECG changes/hypokalemia—potassium-losing diuretics

Increase: severe hypotension—oxytocics

Increase: toxicity—theophylline

Increase: action of aerosol bronchodilators

Increase: action of albuterol—tricyclics, MAOIs, other adrenergics; do not use together

Increase: CV effects—atomoxetine, selegiline

Decrease: albuterol—other β-blockers

Drug/Herb

Increase: stimulation—caffeine (cola nut, green/black tea, guarana, yerba maté, coffee, chocolate)

Drug/Lab Test

Decrease: potassium

NURSING CONSIDERATIONS

Assess:

- **Respiratory function:** vital capacity, forced expiratory volume, ABGs; lung sounds, heart rate and rhythm, B/P, sputum (baseline and peak); whether patient has not received theophylline therapy before giving dose
- Patient's ability to self-medicate

- For evidence of allergic reactions

- **For paradoxical bronchospasm; hold medication, notify prescriber if bronchospasm occurs**

Perform/provide:

- Storage in light-resistant container; do not expose to temperatures of more than

86° F (30° C)

Evaluate:

- Therapeutic response: absence of dyspnea, wheezing after 1 hr, improved airway exchange, improved ABGs

Teach patient/family:

- To use exactly as prescribed; to take missed dose when remembered, alter dosing schedule; not to use OTC medications; that excess stimulation may occur
- About use of inhaler: review package insert with patient; use demonstration; return demonstration; shake, prime before 1st use and when not used for >2 wk; release 4 test sprays into air, away from the face
- To avoid getting aerosol in eyes (blurring of vision may result) or using near flames or sources of heat
- To wash inhaler in warm water daily and dry; to track number of inhalations used and to discard product when labeled inhalations have been used
- To avoid smoking, smoke-filled rooms, persons with respiratory infections

⚠ That **paradoxical bronchospasm** may occur; to stop product immediately, call prescriber

- To limit caffeine products such as chocolate, coffee, tea, colas

TREATMENT OF OVERDOSE:

Administer β_1 -adrenergic blocker, IV fluids

☼ Canada only Side effects: *italics* = common; **bold** = life-threatening ⚠
Nurse Alert

alendronate (Rx)

(al-en-drone'ate)

Binosto, Fosamax, Fosamax plus D

Func. class.: Bone-resorption inhibitor

Chem. class.: Bisphosphonate

Do not confuse: **Fosamax**/Flomax

ACTION:

Decreases rate of bone resorption and may directly block dissolution of hydroxyapatite crystals of bone, inhibits osteoclast activity

USES:

Treatment and prevention of osteoporosis in postmenopausal women, treatment of osteoporosis in men, Paget's disease, treatment of corticosteroid-induced osteoporosis in postmenopausal women not receiving estrogen and in men who are on continuing corticosteroid treatment with low bone mass

CONTRAINDICATIONS:

Hypersensitivity to bisphosphonates, delayed esophageal emptying, inability to sit or stand for 30 min, hypocalcemia

Precautions: Pregnancy (C), breastfeeding, children, CCr <35 ml/min, esophageal disease, ulcers, gastritis, poor dental health, increased esophageal cancer risk

DOSAGE AND ROUTES

Calculator

Osteoporosis in postmenopausal women

- **Adult and geriatric:** PO 10 mg/day or 70 mg/wk

Osteoporosis in men

- **Adult:** PO 10 mg/day or 70 mg/wk

Paget's disease

- **Adult and geriatric: PO** 40 mg/day × 6 mo, consider retreatment for relapse

Prevention of osteoporosis

- **Adult/postmenopausal female: PO** 5 mg/day or 35 mg/wk

Corticosteroid-induced osteoporosis in postmenopausal women (not receiving estrogen)

- **Adult: PO** 10 mg/day

Corticosteroid-induced osteoporosis in men or premenopausal women

- **Adult: PO** 5 mg/day

Renal dose

- **Adult: PO** CCr ≤35 ml/min, not recommended

Available forms: Tabs 5, 10, 35, 40, 70 mg; tabs 70 mg with 2800 IU vit D₃, 70 mg with 5600 IU Vit D₃; oral sol 70 mg/75 ml, effervescent tab 70 mg

Administer:

- For 6 months to be effective for Paget's disease
- **Tablet:** take with 8 oz of water 30 min before 1st food, beverage, or medication of the day • Do not lie down for ≥30 min after dose, do not take at bedtime or before rising
- **Liquid:** use oral syringe or calibrated device; give in AM with ≥2 oz of water ≥30 min before food, beverage, or medication

SIDE EFFECTS

CNS: Headache

GI: Abdominal pain, constipation, nausea, vomiting, esophageal ulceration, acid reflux, dyspepsia, **esophageal perforation**, diarrhea, **esophageal cancer**

META: Hypophosphatemia, hypocalcemia

MS: Bone pain, osteonecrosis of the jaw, bone fractures

SYST: **Angioedema, Stevens-Johnson syndrome, toxic epidermal necrolysis**

PHARMACOKINETICS

Bioavailability 60%, protein binding 78%, rapidly cleared from circulation, taken up mainly by bones, eliminated primarily through kidneys; bound to bone, half-life >10 yr

INTERACTIONS

Increase: GI adverse reactions—NSAIDs, salicylates, H₂ blockers, proton pump inhibitors, gastric mucosal agents

Decrease: absorption—antacids, calcium supplements, aminoglycosides

Drug/Food

Decrease: absorption when used with caffeine, orange juice, food

Drug/Lab Test

Decrease: calcium, phosphate

NURSING CONSIDERATIONS

Assess:

 **Serious reactions:** angioedema, Stevens-Johnson syndrome, toxic epidermal necrolysis, atrial fibrillation • **Hormonal status** if a woman, before treatment

- **For osteoporosis:** bone density test before and during treatment
- **For Paget's disease:** increased skull size, bone pain, headache; decreased vision, hearing • Electrolytes; BUN/creatinine; calcium, phosphorous, magnesium, potassium
- **For hypercalcemia:** paresthesia, twitching, laryngospasm; Chvostek's, Trousseau's signs • Alk phos levels, baseline and periodically, 2 × upper limit of normal is indicative of Paget's disease • **Dental status:** regular dental exams should be performed; dental extractions (cover with antiinfectives before procedure)

Perform/provide:

- Storage in cool environment, out of direct sunlight

Evaluate:

- Therapeutic response: increased bone mass, absence of fractures

Teach patient/family:

- To remain upright for 30 min after dose to prevent esophageal irritation; if dose is missed, skip dose, do not double doses or take later in day; to take in AM before food, other meds; to take with 6-8 oz of water only (no mineral water)
- To take calcium, vit D if instructed by health care provider
- To perform weight-bearing exercise to increase bone density

- To let health care provider know if pregnant or if pregnancy is planned or if breastfeeding; to inform dentist of the use of this product
 - To maintain good oral hygiene
-

🍁 Canada only Side effects: *italics* = common; **bold** = life-threatening ⚠️
Nurse Alert

alfuzosin (Rx)

(al-fyoo'zoe-sin)

Uroxatral

Func. class.: Urinary tract, antispasmodic, α_1 -agonist *Chem. class.:* Quinazolone

ACTION:

Binds to α_{1A} -adrenoceptor subtype located mainly in the prostate, relaxing smooth muscles

USES:

Symptoms of benign prostatic hyperplasia

Unlabeled uses: Lower urinary tract symptoms, erectile dysfunction with sildenafil

CONTRAINDICATIONS:

Hypersensitivity, moderate to severe hepatic impairment; not indicated for use in women or children, breastfeeding

Precautions: Pregnancy (B) but not used in females, geriatric patients; CAD, coronary insufficiency, mild hepatic disease, mild/moderate/severe renal disease, history of QT prolongation or coadministration with meds known to prolong QT interval, torsades de pointes, syncope, surgery, prostate cancer, orthostatic hypotension, ocular surgery, dysrhythmias, angina

DOSAGE AND ROUTES

Calculator

• **Adult: PO EXT REL** 10 mg/day, taken after same meal each day

Available forms: Ext rel tabs 10 mg

Administer:

PO route

• Do not break, crush, chew tabs; give with food; take at same time each day

SIDE EFFECTS

CNS: Dizziness, headache, fatigue, flushing

CV: Postural hypotension (dizziness, lightheadedness, fainting) within a few

hours of administration, chest pain, tachycardia, angina

GI: Nausea, abdominal pain, dyspepsia, constipation, diarrhea, liver injury, jaundice

INTEG: Rash, urticaria, **angioedema**, pruritus

GU: Impotence, priapism

MISC: Body pain in general, xerostomia, rhinitis

RESP: Upper respiratory infection, pharyngitis, bronchitis, sinusitis

PHARMACOKINETICS

Peak 8 hr, elimination half-life 10 hr, extensively metabolized in liver by CYP3A4 enzyme, excreted via urine (11% unchanged), moderately protein binding (82%-90%)

INTERACTIONS

- **Not to be taken with prazosin, terazosin, doxazosin**

Increase: QT prolongation (slight)—class IA/III antidysrhythmics

Increase: effects of alfuzosin—alcohol

Increase: effects—CYP3A4 inhibitors (ketoconazole, itraconazole, and ritonavir); do not use together

Increase: hypotension— β -blockers, phosphodiesterase 5 inhibitors, nitrates

NURSING CONSIDERATIONS

Assess:

- **Prostatic hyperplasia:** change in urinary patterns (hesitancy, dribbling, dysuria, urgency), baseline and throughout treatment
- **Serious skin reactions:** angioedema

Perform/provide:

- Storage in tight container in cool environment

Evaluate:

- Therapeutic response: decreased symptoms of benign prostatic hyperplasia

Teach patient/family:

- To take at same time each day with food; to not double doses
- Not to drive or operate machinery for 4 hr after 1st dose or after dosage increase, dizziness may occur
- About orthostatic hypotension; to rise slowly from sitting or lying

- To avoid all OTC products unless approved by prescriber
 - To notify prescriber of fainting, dizziness
 - That erectile dysfunction is a side effect and is temporary
-

🍁 Canada only Side effects: *italics* = common; **bold** = life-threatening ⚠️
Nurse Alert

aliskiren (Rx)

(a-lis'kir-en)

Tekturna

Func. class.: Antihypertensive

Chem. class.: Direct renin inhibitor

ACTION:

Renin inhibitor that acts on the renin-angiotensin system (RAS)

USES:

Hypertension, alone or in combination with other antihypertensives

CONTRAINDICATIONS:

Hypersensitivity

Black Box Warning:

Pregnancy (D) 2nd, 3rd trimester

Precautions: Pregnancy (C) 1st trimester, breastfeeding, children, geriatric patients, angioedema, aortic/renal artery stenosis, cirrhosis, CAD, dialysis, hyper/hypokalemia, hyponatremia, hypotension, hypovolemia, renal/hepatic disease, surgery, diabetes, seizures

DOSAGE AND ROUTES

Calculator

• **Adult: PO** 150 mg/day, may increase to 300 mg/day if needed, max 300 mg/day

Available forms: Tabs 150, 300 mg

Administer:

- Do not use with a high-fat meal
- Daily with a full glass of water, titrate up to achieve correct dose
- Do not discontinue abruptly, correct electrolyte/volume depletion before treatment

SIDE EFFECTS

CV: Orthostatic hypotension, hypotension

CNS: Headache, dizziness

GI: Diarrhea

GU: Renal stones, increased uric acid

INTEG: Rash

META: Hyperkalemia

MISC: Angioedema, cough

PHARMACOKINETICS

Poorly absorbed, bioavailability 2.3%, peak 1-3 hr, steady state 7-8 days, 91% excreted unchanged in the feces, half-life 24 hr

INTERACTIONS

- Do not use ACE inhibitors, angiotensin II receptor antagonists in diabetes mellitus

Increase: potassium levels—ACE inhibitors, angiotensin II receptor antagonists, potassium supplements, potassium-sparing diuretics

Increase: hypotension—other antihypertensives, diuretics

Increase: aliskiren levels—atorvastatin, itraconazole, ketoconazole, cyclosporine; concurrent use is not recommended

Decrease: levels of warfarin

Drug/Food

Decrease: absorption—high-fat meal

Drug/Lab Test

Increase: uric acid, CPK, BUN, serum creatinine, potassium

Decrease: Hct, Hgb

NURSING CONSIDERATIONS

Assess:

- Renal studies: uric acid, serum creatinine, BUN may be increased; potassium, hyperkalemia may occur

⚠ **Allergic reactions: angioedema** may occur (swelling of face; trouble breathing, swallowing) • Daily dependent edema in feet, legs; weight, B/P, orthostatic hypotension

- **Diabetes:** identify the use of ACE inhibitors, angiotensin II receptor antagonists, do not use aliskiren

Perform/provide:

- Storage in tight container at room temp

Evaluate:

- Therapeutic response: decrease in B/P

Teach patient/family:

- About the importance of complying with dosage schedule even if feeling better; that if dose is missed, take as soon as possible; that if it is almost time for the next dose, take only that dose; do not double dose

Black Box Warning:

To notify if pregnancy is planned or suspected; if pregnant, product will need to be discontinued, pregnancy (D) 2nd/3rd trimester, (C) 1st trimester

- How to take B/P and normal reading for age group
- Not to use OTC products including herbs, supplements unless approved by prescriber
- To report to prescriber immediately: dizziness, faintness, chest pain, palpitations, uneven or rapid heart beat, headache, severe diarrhea, swelling of tongue or lips, trouble breathing, difficulty swallowing, tightening of the throat
- Not to operate machinery or perform hazardous tasks if dizziness occurs
- To avoid faintness; to rise slowly

☼ Canada only Side effects: *italics* = common; **bold** = life-threatening ⚠
Nurse Alert

allopurinol (Rx)

(al-oh-pure'i-nole)

Aloprim, Zyloprim

Func. class.: Antigout drug, antihyperuricemic

Chem. class.: Xanthine oxidase inhibitor

Do not confuse: **Zyloprim**/Zovirax

ACTION:

Inhibits the enzyme xanthine oxidase, reducing uric acid synthesis

USES:

Chronic gout, hyperuricemia associated with malignancies, recurrent calcium oxalate calculi, uric acid calculi

CONTRAINDICATIONS:

Hypersensitivity

Precautions: Pregnancy (C), breastfeeding, children, renal/hepatic disease

DOSAGE AND ROUTES

Calculator

Increased uric acid levels in malignancies

- **Adult: PO** 600-800 mg/day in divided doses for 2-3 days; start up to 1-2 days before chemotherapy; **IV INF** 200-400 mg/m²/day, max 600 mg/day 24-48 hr before chemotherapy, may be divided at 6-, 8-, 12-hr intervals
- **Child 6-10 yr: PO** 300 mg/day, adjust dose after 48 hr
- **Child <6 yr: PO** 150 mg/day, adjust dose after 48 hr
- **Child: IV INF** 200 mg/m²/day, initially as a single dose or divided q6-12hr

Recurrent calculi

- **Adult: PO** 200-300 mg/day in a single dose or divided bid-tid, max 300 mg/dose, 800 mg/day

Uric acid nephropathy prevention

- **Adult and child >10 yr: PO** 600-800 mg/day × 2-3 days

Gout (mild)

- **Adult: PO** 100 mg/day, increase weekly based on uric acid levels, max 800

mg/day; maintenance dose 100-200 mg bid-tid

Gout (moderate-severe)

- **Adult: PO** 400-600 mg/day in a single dose or divided bid-tid, max 800 mg/day, doses >300 mg should be given in divided doses

Renal dose

- **Adult: PO/IV** CCr 81-100 ml/min 300 mg/day; CCr 61-80 ml/min 250 mg/day; CCr 41-60 ml/min 200 mg/day; 21-40 ml/min 150 mg/day; CCr 10-20 ml/min 100-200 mg/day; CCr 3-9 ml/min 100 mg/day or 100 mg every other day; CCr <3 ml/min 100 mg q24hr or longer or 100 mg every 3rd day

Available forms: Tabs, scored 100, 300 mg; powder for inj 500 mg/vial

Administer:

PO route

- With meals to prevent GI symptoms; may crush, add to foods or fluids
- 1-2 days before antineoplastic therapy

Intermittent IV INF route

- Reconstitute 30-ml vial with 25 ml of sterile water for inj; dilute to desired conc (≤ 6 mg/ml) with 0.9% NaCl for inj or D₅ for inj; begin inf within 10 hr

Y-site compatibilities: Acyclovir, aminophylline, amphotericin B lipid complex, anidulafungin, argatroban, atenolol, aztreonam, bivalirudin, bleomycin, bumetanide, buprenorphine, butorphanol, calcium gluconate, CARBOplatin, caspofungin, ceFAZolin, cefoperazone, cefotetan, cefTAZidime, ceftizoxime, cefTRIAxone, cefuroxime, CISplatin, cyclophosphamide, DACTINomycin, DAUNOrubicin citrate liposome, dexamethasone, dexmedetomidine, docetaxel, DOXOrubicin liposomal, enalaprilat, etoposide, famotidine, fenoldopam, filgrastim, fluconazole, fludarabine, fluorouracil, furosemide, gallium, ganciclovir, gatifloxacin, gemcitabine, gemtuzumab, granisetron hydrochloride, heparin, hydrocortisone phosphate, hydrocortisone succinate, HYDROmorphone, ifosfamide, linezolid injection, LORazepam, mannitol, mesna, methotrexate, metroNIDAZOLE, milrinone, mitoxantrone, morphine, nesiritide, octreotide, oxytocin, PACLitaxel, pamidronate, pantoprazole, pemetrexed, piperacillin, piperacillin-tazobactam, plicamycin, potassium chloride, ranitidine, sodium acetate, sulfamethoxazole-trimethoprim, teniposide, thiotepa, ticarcillin, ticarcillin-clavulanate, tigecycline, tirofiban, vancomycin, vasopressin, vinBLAS_tine, vinCRIS_tine, voriconazole, zidovudine, zoledronic

acid

SIDE EFFECTS

CNS: *Headache*, drowsiness, neuritis, paresthesia

GI: *Nausea, vomiting, anorexia, malaise*, metallic taste, cramps, peptic ulcer, diarrhea

HEMA: *Agranulocytosis, thrombocytopenia, aplastic anemia, pancytopenia, leukopenia, bone marrow suppression, eosinophilia*

INTEG: Dermatitis, pruritus, purpura, erythema, rash, *Stevens-Johnson syndrome*

MISC: Myopathy, arthralgia, hepatomegaly, *cholestatic jaundice, renal failure, exfoliative dermatitis*

PHARMACOKINETICS

Protein binding <1%, half-life 1-2 hr

PO: Peak 1.5 hr; excreted in feces, urine

IV: Peak up to 30 min

INTERACTIONS

Increase: kidney stone formation—ammonium chloride, vit C, potassium/sodium phosphate

Increase: rash—ampicillin, amoxicillin, avoid concurrent use

Increase: action of oral anticoagulants, oral antidiabetics, theophylline

Increase: hypersensitivity, toxicity—ACE inhibitors, thiazides

Increase: bone marrow depression—antineoplastics (mercaptopurine, azathioprine)

Increase: xanthine nephropathy, calculi—rasburicase

NURSING CONSIDERATIONS

Assess:

- **For gout:** joint pain, swelling; may use with NSAIDs for acute gouty attacks; uric acid levels q2wk; uric acid levels should be ≤ 6 mg/dl, effect may take several wk
- CBC, AST, BUN, creatinine before starting treatment, periodically
- I&O ratio; increase fluids to 2 L/day to prevent stone formation and toxicity
- For rash, hypersensitivity reactions, discontinue allopurinol

Evaluate:

- Therapeutic response: decreased pain in joints, decreased stone formation in kidneys, decreased uric acid levels

Teach patient/family:

- To take as prescribed; if dose is missed, take as soon as remembered; do not double dose; tabs may be crushed
- To increase fluid intake to 2 L/day
- To report skin rash, stomatitis, malaise, fever, aching; product should be discontinued
- To avoid hazardous activities if drowsiness or dizziness occurs
- To avoid alcohol, caffeine; will increase uric acid levels
- To avoid large doses of vit C; kidney stone formation may occur
- To reduce dairy products, refined sugars, sodium, meat if taking for calcium oxalate stones

🍁 Canada only Side effects: *italics* = common; **bold** = life-threatening ⚠️
Nurse Alert

almotriptan (Rx)

(al-moh-trip'tan)

Axert

Func. class.: Antimigraine agent, abortive

Chem. class.: 5-HT₁-receptor agonist, triptan

Do not confuse: Axert/Antivert

ACTION:

Binds selectively to the vascular 5-HT_{1B/1D/1F}-receptors, exerts antimigraine effect

USES:

Acute treatment of migraine with or without aura (adult/adolescent/child ≥12 yr)

CONTRAINDICATIONS:

Hypersensitivity, acute MI, angina, CV disease, CAD, stroke, vasospastic angina, ischemic heart disease or risk for, peripheral vascular syndrome, uncontrolled hypertension, basilar or hemiplegic migraine

Precautions: Pregnancy (C), postmenopausal women, men >40 yr, breastfeeding, children <18 yr, geriatric patients, risk factors for CAD, MI; hypercholesterolemia, obesity, diabetes, impaired renal/hepatic function, sulfonamide hypersensitivity, cardiac dysrhythmias, Raynaud's disease, tobacco smoking, Wolff-Parkinson-White syndrome

DOSAGE AND ROUTES

Calculator

• **Adult, adolescent, and child ≥12 yr: PO** 6.25-12.5 mg; may repeat dose after 2 hr; max 2 doses/24 hr, 25 mg/day or 4 treatment cycles within any 30-day period

Hepatic/renal dose CCr 10-30 ml/min

• **Adult: PO** 6.25 mg initially, max 12.5 mg

Available forms: Tabs 6.25, 12.5 mg

Administer:

• Avoid using more than 2 ×/wk; rebound headache may occur

- Swallow tabs whole; do not break, crush, chew, without regard to food

SIDE EFFECTS

CNS: *Tingling, hot sensation, burning, feeling of pressure, tightness, numbness, dizziness, sedation*, headache, anxiety, fatigue, cold sensation, **seizures**

CV: *Flushing*, palpitations, tachycardia, **coronary artery vasospasm, MI, ventricular fibrillation, ventricular tachycardia**

EENT: Throat, mouth, nasal discomfort; vision changes

GI: Nausea, xerostomia

INTEG: Sweating

MS: *Weakness, neck stiffness*, myalgia

RESP: Chest tightness, pressure

PHARMACOKINETICS

Onset of pain relief 2 hr; peak 1-3 hr; duration 3-4 hr; bioavailability 70%; protein binding 35%; metabolized in the liver (metabolite), metabolized by MAO-A, CYP2D6, CYP3A4; excreted in urine (40%), feces (13%); half-life 3-4 hr

INTERACTIONS

Increase: serotonin syndrome—SSRIs, SNRIs, serotonin-receptor agonists, **sibutramine**

Increase: vasospastic effects—ergot, ergot derivatives, other 5-HT₁ agonists; avoid concurrent use

⚠ Increase: almotriptan effect—MAOIs, **do not use together**

Increase: plasma concentration of almotriptan—(CYP3A4 inhibitors) itraconazole, ritonavir, erythromycin, ketoconazole, avoid concurrent use in renal/hepatic disease

Drug/Herb

- Avoid use with feverfew

Increase: serotonin syndrome—St. John's wort

NURSING CONSIDERATIONS

Assess:

- **Migraine:** pain location, aura, duration, intensity, nausea, vomiting
- **Serotonin syndrome:** occurs in those taking SSRIs, SNRIs; agitation,

confusion, hallucinations, diaphoresis, hypertension, diarrhea, fever, tremor, usually occurs when dose is increased • B/P; signs/symptoms of coronary vasospasms

- For stress level, activity, recreation, coping mechanisms
- Neurologic status: LOC, blurring vision, nausea, vomiting, tingling, hot sensation, burning, feeling of pressure, numbness, flushing preceding headache
- **Tyramine foods** (pickled products, beer, wine, aged cheese), food additives, preservatives, colorings, artificial sweeteners, chocolate, caffeine, which may precipitate these types of headaches

Perform/provide:

- Quiet, calm environment with decreased stimulation from noise, bright light, excessive talking

Evaluate:

- Therapeutic response: decrease in severity of migraine

Teach patient/family:

- To report chest pain, drowsiness, dizziness, tingling, flushing
- To use contraception while taking product, to notify prescriber if pregnancy is planned or suspected, to avoid breastfeeding • That if one dose does not relieve migraine to take another after 2 hr
- That product does not prevent or reduce number of migraine attacks; use to relieve attack only

☼ Canada only Side effects: *italics* = common; **bold** = life-threatening ⚠
Nurse Alert

alosetron

(ah-loss'a-tron)

Lotronex

Func. class.: Antidiarrheal, anti-IBS agent

Chem. class.: Serotonin receptor antagonist

ACTION:

A potent and selective antagonist at serotonin 5-HT₃ receptors, which are extensively distributed on enteric neurons in GI tract. Antagonism at these receptors in the GI tract modulates the regulation of visceral pain, colonic transit, and GI secretions

USES:

Severe, chronic, diarrhea-predominant irritable bowel syndrome (IBS) in women who have failed conventional therapy

CONTRAINDICATIONS:

Crohn's disease, severe hepatic disease, diverticulitis, toxic megacolon, GI adhesions/strictures/obstruction/perforation, thrombophlebitis, ulcerative colitis

Black Box Warning:

Ischemic colitis, severe constipation

Precautions: Breastfeeding, pregnancy (B), child <18 yr

DOSAGE AND ROUTES

Calculator

- **Adult woman:** PO 0.5 mg bid, may increase to 1 mg bid after 4 wk if well tolerated, if symptoms are not controlled after 4 wks of treatment with 1 mg bid, discontinue

Available forms: Tab 0.5 mg, 1 mg

Administer

- Without regard to meals

Black Box Warning:

Only after "Physician–Patient Agreement Form" is signed and patient receives official Medication Guide

SIDE EFFECTS

CNS: Fatigue, headache

GI: Constipation, abdominal pain, distention, reflux, nausea, obstruction, impaction, ischemic colitis, ileus perforation, small-bowel mesenteric ischemia

GU: Urinary tract infection

MS: Muscle spasm

RESP: Cough, nasopharyngitis, upper respiratory tract infection

PHARMACOKINETICS

Peak 1 hr, half-life 1½ hr, metabolized extensively in the liver

INTERACTIONS

- Do not use with fluvoxamine

Increase: Alosetron metabolism—CYP3A4, 1A2, 2C9 inducers

Increase: serious adverse reactions, drugs that decrease GI motility—drugs with anticholinergic such as TCAs, H₁-blockers, orphenadrine, OLANzapine, maprotiline, disopyramide, cyclobenzaprine, clozapine, bupropion, amoxapine, amantadine

Decrease: Alosetron metabolism—CYP3A4, 1A2, 2C9 inhibitors, hydralazine, procainamide

Drug/Lab Test

Increase: ALT

NURSING CONSIDERATIONS

Assess:

Black Box Warning:

Irritable bowel syndrome—constipation, diarrhea, abdominal pain, fecal incontinence, discontinue immediately if bloody diarrhea, severe constipation, rectal bleeding, or severe abdominal pain occur

Black Box Warning:

Only clinicians enrolled in the Prometheus Prescribing Program for Lotronex should use this product

- Geriatric women can experience more severe side effects

Perform/provide:

- Storage at room temperature, protect from light and moisture

Evaluate:

- Therapeutic response: Decreasing symptoms of IBS

Teach patient/family:

Black Box Warning:

Immediately report severe constipation, bloody diarrhea, rectal bleeding, or worsening abdominal pain

- Not to double doses, if a dose is missed skip it
- That product may be taken without regard to food
- That product does not cure disorder, only controls symptoms
- Provide medication guide and clarify, if needed, that improvement in symptoms can take 1-4 wks
- That product is only used for women with IBS
- To report if pregnancy is planned or suspected, product should not be used during pregnancy, effects are unknown

🍁 Canada only Side effects: *italics* = common; **bold** = life-threatening ⚠️
Nurse Alert

ALPRAZolam (Rx)

(al-pray'zoe-lam)

Apo-Alpraz , Niravam, Xanax, Xanax XR

Func. class.: Antianxiety

Chem. class.: Benzodiazepine (short/intermediate acting)

Controlled Substance Schedule IV

Do not confuse: ALPRAZolam/LORazepam

Xanax/Lanoxin/Tylox/Zantac

ACTION:

Depresses subcortical levels of CNS, including limbic system, reticular formation

USES:

Anxiety, panic disorders with or without agoraphobia, anxiety with depressive symptoms

Unlabeled uses: Premenstrual dysphoric disorders, insomnia, PMS, alcohol withdrawal syndrome

CONTRAINDICATIONS:

Pregnancy (D), breastfeeding, hypersensitivity to benzodiazepines, closed-angle glaucoma, psychosis, addiction

Precautions: Geriatric patients, debilitated patients, hepatic disease, obesity, severe pulmonary disease

DOSAGE AND ROUTES

Calculator

Anxiety disorder

- **Adult: PO** 0.25-0.5 mg tid, may increase q3-4days if needed, max 4 mg/day in divided doses
- **Geriatric: PO** 0.125-0.25 mg bid; increase by 0.125 as needed

Panic disorder

- **Adult: PO** 0.5 mg tid, may increase up to 1 mg/day q3-4days, max 10 mg/day;

EXT REL (Xanax XR) give daily in AM, 0.5-1 mg initially, maintenance 3-6 mg/day

Hepatic dose

- Reduce dose

Premenstrual dysphoric disorders/PMS (unlabeled)

- **Adult: PO** 0.25 mg bid-qid starting on day 16-18 of menses, taper over 2-3 days when menses occurs, max 4 mg/day

Insomnia (unlabeled)

- **Adult: PO** 0.25-0.5 mg at bedtime

Available forms: Tabs 0.25, 0.5, 1, 2 mg; ext rel tabs (Xanax XR) 0.5, 1, 2, 3 mg; orally disintegrating tabs 0.25, 0.5, 1, 2 mg; oral sol 1 mg/ml

Administer:

- Tabs may be crushed, mixed with food, fluids if patient is unable to swallow medication whole; do not break, crush, chew ext rel (XR), give ext rel tab in AM
- With food or milk for GI symptoms; high-fat meal will decrease absorption
- To discontinue, decrease by 0.5 mg q3days
- May divide total daily doses into more times/day if anxiety occurs between doses
- Orally disintegrating tabs on tongue to dissolve and swallow, protect from moisture

SIDE EFFECTS

CNS: *Dizziness, drowsiness, confusion, headache, anxiety, tremors, stimulation, fatigue, depression, insomnia, hallucinations, memory impairment, poor coordination, suicide*

CV: *Orthostatic hypotension, ECG changes, tachycardia, hypotension*

EENT: *Blurred vision, tinnitus, mydriasis*

GI: *Constipation, dry mouth, nausea, vomiting, anorexia, diarrhea, weight gain/loss, increased appetite*

GU: *Decreased libido*

INTEG: *Rash, dermatitis, itching, angioedema*

PHARMACOKINETICS

PO: Well absorbed; widely distributed; onset 30 min; peak 1-2 hr; duration 4-6 hr; *oral disintegrating tab* peak 1.5-2 hr; therapeutic response 2-3 days;

metabolized by liver (CYP3A4), excreted by kidneys; crosses placenta, breast milk; half-life 12-15 hr, protein binding 80%

INTERACTIONS

Increase: ALPRAZolam action—CYP3A4 inhibitors (cimetidine, disulfiram, erythromycin, FLUoxetine, isoniazid, itraconazole, ketoconazole, metoprolol, propoxyphene, propranolol, valproic acid)

Increase: CNS depression—anticonvulsants, alcohol, antihistamines, sedative/hypnotics, opioids

Decrease: sedation—xanthines

Decrease: ALPRAZolam action—CYP3A4 inducers (barbiturates, rifampin)

Decrease: action of levodopa

Decrease: product level—cigarette smoking

Drug/Herb

Increase: CNS depression—kava, melatonin, St. John's wort, valerian

Drug/Food

Increase: product level—grapefruit juice, avoid concurrent use

Drug/Lab Test

Increase: AST/ALT, alk phos

NURSING CONSIDERATIONS

Assess:

- Mental status: anxiety, mood, sensorium, orientation, affect, sleeping pattern, drowsiness, dizziness, especially in geriatric patients both before and during treatment, **suicidal thoughts, behaviors**
- B/P lying, standing; pulse; if systolic B/P drops 20 mm Hg, hold product, notify prescriber
- Hepatic, blood studies: AST, ALT, bilirubin, creatinine, LDH, alk phos, CBC; may cause neutropenia, decreased Hct, increased LFTs  **Physical dependency, withdrawal**

symptoms: anxiety, panic attacks, agitation, seizures, headache, nausea, vomiting, muscle pain, weakness; withdrawal seizures may occur after rapid decrease in dose or abrupt discontinuation; because duration of action is short, considered to be the product of choice for geriatric patients

- Pregnancy: if planned or suspected, pregnancy (D), to avoid breastfeeding

Evaluate:

- Therapeutic response: decreased anxiety, restlessness, sleeplessness

Teach patient/family:

- Not to double doses; take exactly as prescribed; if dose is missed, take within 1 hr as scheduled; that product may be taken with food
- Not to use for everyday stress or for more than 4 mo unless directed by prescriber; not to take more than prescribed amount; that product may be habit forming; that memory impairment is a result of long-term use
- To avoid OTC preparations unless approved by prescriber
- Not to use during pregnancy (D), avoid breastfeeding
- Not to discontinue medication abruptly after long-term use
- To avoid driving, activities that require alertness because drowsiness may occur
- To avoid alcohol, other psychotropic medications unless directed by prescriber
- To rise slowly or fainting may occur, especially among geriatric patients
- That drowsiness may worsen at beginning of treatment

TREATMENT OF OVERDOSE:

Lavage, VS, supportive care, flumazenil

☼ Canada only Side effects: *italics* = common; **bold** = life-threatening ⚠
Nurse Alert

RARELY USED

alprostadil (Rx)

(al-pros'ta-dil)

Caverject, Caverject Impulse, Edex, Muse, Prostin VR Pediatric

Func. class.: Hormone

USES:

To maintain patent ductus arteriosus (temporary treatment), erectile dysfunction

CONTRAINDICATIONS:

Hypersensitivity, respiratory distress syndrome, those at risk for priapism

DOSAGE AND ROUTES

Calculator

Patent ductus arteriosus

- **Infant:** IV INF 0.05-0.1 mcg/kg/min until desired response, then reduce to lowest effective amount, max 0.4 mcg/kg/min

Erectile dysfunction of vasculogenic or mixed etiology, psychogenic

- **Men:** INTRACAVERNOSAL 2.5 mcg, may increase by 2.5 mcg, may then increase by 5-10 mcg until adequate response occurs (max 60 mcg/dose);
INTRAURETHRAL 125-250 mcg, max 2 doses/24 hr, max dose 1000 mcg;
administer as needed to achieve erection

☼ Canada only Side effects: *italics* = common; **bold** = life-threatening ⚠
Nurse Alert

⚠ HIGH ALERT

alteplase (tissue plasminogen activator, t-PA) (Rx)

(al-ti-plaze')

Activase, Cathflo

Func. class.: Thrombolytic enzyme

Chem. class.: Tissue plasminogen activator (TPA)

Do not confuse: alteplase/Altace

ACTION:

Produces fibrin conversion of plasminogen to plasmin; able to bind to fibrin, convert plasminogen in thrombus to plasmin, which leads to local fibrinolysis, limited systemic proteolysis

USES:

Lysis of obstructing thrombi associated with acute MI, ischemic conditions that require thrombolysis (i.e., PE, unclotting arteriovenous shunts, acute ischemic CVA), central venous catheter occlusion (Cathflo)

Unlabeled uses: Arterial thromboembolism, deep vein thrombosis (DVT), occlusion prophylaxis, percutaneous coronary intervention (PCI), subarachnoid hemorrhage

CONTRAINDICATIONS:

Active internal bleeding, history of CVA, severe uncontrolled hypertension, intracranial/intraspinal surgery/trauma (within 3 mo), aneurysm, brain tumor, platelets $<100,000 \text{ mm}^3$, bleeding diathesis including INR >1.7 or PR >15 sec, arteriovenous malformation, subarachnoid hemorrhage, intracranial hemorrhage, uncontrolled hypertension, seizure at onset of stroke

Precautions: Pregnancy (C), breastfeeding, children, geriatric patients, neurologic deficits, mitral stenosis, recent GI/GU bleeding, diabetic retinopathy, subacute bacterial endocarditis, arrhythmias, diabetic hemorrhage retinopathy, CVA, recent major surgery, hypertension, acute pericarditis, hemostatic defects, significant hepatic disease, septic thrombophlebitis, occluded AV cannula at seriously infected site

DOSAGE AND ROUTES

Calculator

MI (standard infusion)

- **Adult $>65 \text{ kg}$:** 100 mg total given over 3 hr as follows: 6-to 10-mg IV BOL over 1-2 min; remaining 50-54 mg given over the remainder of the hr; during 2nd, 3rd hr 20 mg given by **CONT IV INF** (20 mg/hr)
- **Adult $<65 \text{ kg}$:** 1.25 mg/kg over 3 hr: 60% during 1st hr (6%-10% as bolus);

remaining 50% given over remainder of hr; during 2nd hr, 20% of dose given by CONT IV INF; 20% given during 3rd hr by CONT IV INF

MI (accelerated infusion)

- **Adult >67 kg:** 100 mg total dose: give 15-mg IV bolus, then 50 mg over 30 min, then 35 mg over 60 min
- **Adult <67 kg:** 15-mg IV bolus, then 0.75 mg/kg (max 50 mg) over 30 min, then 0.5 mg/kg (max 35 mg) over next 60 min

Pulmonary embolism

- **Adult:** IV 100 mg over 2 hr, then heparin

Acute ischemic stroke

- **Adult:** IV 0.9 mg/kg, max 90 mg; give as **INF** over 1 hr, give 10% of dose **IV BOL** over 1st min

Occluded venous access devices

- **Adult/child ≥30 kg:** IV 2 mg/2 ml instilled in occluded catheter, may repeat if needed after 2 hr
- **Child 10-29 kg:** IV 110% of lumen volume, max 2 mg/2 ml instilled in occluded catheter, may repeat if needed after 2 hr

Arterial thromboembolism (unlabeled)

- **Adult:** IV 2 mg/hr for up to 5 hr

Deep venous thrombosis (DVT) (unlabeled)

- **Adult:** IV 4 mcg/kg/min as 2-hr inf, then 1 mcg/kg/min × 33 hr

Percutaneous coronary intervention (PCI) (unlabeled)

- **Adult:**INTRACARDIAC 20 mg over 5 min then 50 mg over the next 60 min

Occlusion prophylaxis (unlabeled)

- **Adult >30 kg:** Do not exceed 2 mg in 2 ml; may use up to 2 doses 120 min apart

Available forms: Powder for inj 50 mg (29 million international units/vial), 100 mg (58 million international units/vial); Cathflo Actinase: lyophilized powder for inj 2 mg

Administer:

Intermittent IV INF route

- After reconstituting with provided diluent, add appropriate amount of sterile water for inj (no preservatives) 20-mg vial/20 ml or 50-mg vial/50 ml to make 1 mg/ml, mix by slow inversion or dilute with NaCl, D₅W to a conc of 0.5

mg/ml; 1.5 to <0.5 mg/ml may result in precipitation of product; use 18G needle; flush line with NaCl after administration, give over 3 hr for MI, 2 hr for PE

- Heparin therapy after thrombolytic therapy is discontinued, TT, ACT, or APTT less than 2× control (about 3-4 hr); treatment can be initiated before coagulation study results obtained, inf should be discontinued if pretreatment INR >1.7, PT >15 sec, or elevated aPTT is identified • Use reconstituted IV solution within 8 hr or discard

Y-site compatibilities: Eptifibatide, lidocaine, metoprolol, propranolol

- **Cathflo Actinase:** reconstitute by using 2.2 ml of sterile water provided and injecting in vial, direct flow into powder (1 mg/ml), foam will disappear after standing; swirl, do not shake, sol will be pale yellow or clear, use within 8 hr, instill 2 ml of reconstituted sol into occluded catheter, try to aspirate after 1/2 hr; if unable to remove, allow 2 hr, a 2nd dose may be used; aspirate 5 ml of blood to remove clot and product, irrigate with normal saline

SIDE EFFECTS

CV: Sinus bradycardia, cholesterol microembolization, ventricular tachycardia, accelerated idioventricular rhythm, bradycardia, recurrent ischemic stroke, hypotension

EENT: Orolingual angioedema

INTEG: Urticaria, rash

SYST: GI, GU, intracranial, retroperitoneal bleeding, surface bleeding, anaphylaxis, fever

PHARMACOKINETICS

Cleared by liver, 80% cleared within 10 min of product termination, onset immediate, peak 45 min, duration 4 hr, half-life 35 min

INTERACTIONS

Increase: bleeding—anticoagulants, salicylates, dipyridamole, other NSAIDs, abciximab, eptifibatide, tirofiban, clopidogrel, ticlopidine, some cephalosporins, plicamycin, valproic acid

Increase: orolingual angioedema—ACE inhibitors

Decrease: effect—nitroglycerin

Drug/Herb

Increase: risk for bleeding—feverfew, garlic, ginger, ginkgo, ginseng, green tea

Drug/Lab Test

Increase: PT, APTT, TT

NURSING CONSIDERATIONS

Assess:

- Treatment is not recommended for patients with acute ischemic stroke >3 hr after symptom onset or with minor neurologic deficits or rapidly improving symptoms
- VS, B/P, pulse, respirations, neurologic signs, temp at least q4hr; temp >104° F (40° C) indicates internal bleeding; monitor rhythm closely; ventricular dysrhythmias may occur with hyperfusion; monitor heart, breath sounds, neurologic status, peripheral pulses; assess neurologic status, neurologic change may indicate intracranial bleeding; those with severe neurologic deficit (NIH SS >22) at presentation have increased risk of hemorrhage  **For bleeding** during 1st hour of treatment and 24 hr after procedure: hematuria, hematemesis, bleeding from mucous membranes, epistaxis, ecchymosis; guaiac all body fluids, stools; do not use 150 mg or more total dose because intracranial bleeding may occur  **Hypersensitivity:** fever, rash, itching, chills, facial swelling, dyspnea, notify prescriber immediately; stop product, keep resuscitative equipment nearby; mild reaction may be treated with antihistamines
- Previous allergic reactions or streptococcal infection; alteplase may be less effective
- Blood studies (Hct, platelets, PTT, PT, TT, APTT) before starting therapy; PT or APTT must be less than 2× control before starting therapy TT or PT q3-4hr during treatment
- **MI:** ECG continuously, cardiac enzymes, radionuclide myocardial scanning/coronary angiography; chest pain intensity, character; monitor those with major early infarct signs on CT scan with substantial edema, mass effect, midline shift
- **PE:** pulse, B/P, ABGs, rate/rhythm of respirations

- **Occlusion:** have patient exhale then hold breath when connecting/disconnecting syringe to prevent air embolism
- **Cholesterol embolism:** purple toe syndrome, acute renal failure, gangrenous digits, hypertension, livedo reticularis, pancreatitis, MI, cerebral infarction, spinal cord infarction, retinal artery occlusion, bowel infarction, rhabdomyolysis

Perform/provide:

- Avoidance of invasive procedures, inj, rectal temp

- Pressure for 30 sec to minor bleeding sites; 30 min to sites of atrial puncture followed by pressure dressing; inform prescriber if this does not attain hemostasis; apply pressure dressing
- Storage of powder at room temperature or refrigerate; protect from excessive light

Evaluate:

- Therapeutic response: lysis of thrombi

Teach patient/family:

- The purpose and expected results of the treatment; to report adverse reactions

☼ Canada only Side effects: *italics* = common; **bold** = life-threatening ⚠
Nurse Alert

aluminum hydroxide (OTC)

Func. class.: Antacid, hypophosphatemic

Chem. class.: Aluminum product, phosphate binder

ACTION:

Neutralizes gastric acidity; binds phosphates in GI tract, these phosphates are then excreted

USES:

Antacid, hyperphosphatemia in chronic renal failure; adjunct in gastric, peptic, duodenal ulcers; hyperacidity, reflux esophagitis, heartburn, stress ulcer prevention in critically ill, GERD

Unlabeled uses: GI bleeding

CONTRAINDICATIONS:

Hypersensitivity to product or aluminum products

Precautions: Pregnancy (C), breastfeeding, geriatric patients, fluid restriction, decreased GI motility, GI obstruction, dehydration, renal disease, sodium-restricted diets

DOSAGE AND ROUTES

Calculator

Antacid

- **Adult: PO** 600 mg 1 hr after meals, at bedtime, max 6 doses/day

Hyperphosphatemia

- **Adult: PO** 300-600 mg tid
- **Child: PO** 50-150 mg/kg/day in 4-6 divided doses

Available forms: Susp 320 mg/5 ml, 600 mg/5 ml

Administer:

- 2 tsp (10 ml) will neutralize 20 mEq of acid

PO route

- Hyperphosphatemia: give with 8 oz water, meals unless contraindicated
- Laxatives or stool softeners if constipation occurs, especially for geriatric patients

- After shaking susp

NG route

- By nasogastric tube if patient unable to swallow

SIDE EFFECTS

GI: *Constipation*, anorexia, **obstruction**, fecal impaction

META: *Hypophosphatemia*, hypercalciuria

PHARMACOKINETICS

PO: Onset 20-40 min, duration 1-3 hr, excreted in feces

INTERACTIONS

Decrease: effectiveness of—allopurinol, amprenavir, cephalosporins, corticosteroids, delavirdine, digoxin, gabapentin, gatifloxacin, H₂-antagonists, iron salts, isoniazid, ketoconazole, penicillamine, phenothiazines, phenytoin, quiniDine, quinolones, tetracyclines, thyroid hormones, ticlopidine, anticholinergics; separate by at least 4-6 hr

Drug/Food

Decrease: product effect—high-protein meal

Drug/Lab Test

Decrease: phosphate interference: Tc-99m

NURSING CONSIDERATIONS

Assess:

- **Pain:** location, intensity, duration, character, aggravating, alleviating factors
- Phosphate, calcium levels because product is bound in GI system
- Hypophosphatemia: anorexia, weakness, fatigue, bone pain, hyporeflexia
- Constipation; increase bulk in diet if needed, may use stool softeners or laxatives; record amount and consistency of stools
- **Aluminum toxicity:** severe renal disease, may also be used for hyperphosphatemia

Evaluate:

- Therapeutic response: absence of pain, decreased acidity, healed ulcers, decreased phosphate levels

Teach patient/family:

- Not to use for prolonged periods for patients with low serum phosphate or

patients on low-sodium diets, shake liquid well • That stools may appear white or speckled

- To check with prescriber after 2 wk of self-prescribed antacid use
 - To separate from other medications by 2 hr
 - **Hyperphosphatemia:** to avoid phosphate foods (most dairy products, eggs, fruits, carbonated beverages) during product therapy • To notify prescriber black tarry stools, that may indicate bleeding
-

🍁 Canada only Side effects: *italics* = common; **bold** = life-threatening ⚠️
Nurse Alert

alvimopan

(al-vim'oh-pan)

Entereg

Func. class.: Functional GI disorder agent

Chem. class.: Peripheral mu-opioid receptor antagonist

ACTION:

A peripherally selective mu-opioid receptor antagonist with activity restricted to the GI tract

USES:

Prevention of postoperative ileus

Unlabeled uses: Opiate-agonist–induced constipation

CONTRAINDICATIONS:

Those who have taken therapeutic doses of opioids for more than 7 consecutive days immediately before starting alvimopan, end-stage renal disease, Child–Pugh C

Precautions: Risk for MI, surgery for complete GI obstruction, hepatic disease, renal disease, pregnancy B, breastfeeding

DOSAGE AND ROUTES

Calculator

- **Adult/geriatric patient:** PO 12 mg 30 min–5 hr before surgery, then 12 mg bid beginning the day after surgery; max 7 days or hospital discharge; max 15 doses

Opiate agonist–induced constipation (unlabeled)

- **Adult:** PO 0.5 mg or 1 mg every day

Renal/hepatic dosage

- **Adult:** PO Do not use in end-stage renal disease or Child–Pugh Class C

Available forms: Cap 12 mg

Administer

- Without regard to food

Black Box Warning:

Only in a hospital setting approved for the ENTEREG Access Support and Education (E.A.S.E.) program

SIDE EFFECTS

GI: *Constipation, dyspepsia, flatulence, diarrhea, abdominal pain, cramping*

HEMA: *Anemia*

META: Hypokalemia

MISC: Back pain, urinary retention, **MI**

PHARMACOKINETICS

Half-life 10-17 hr, extended in hepatic/renal disease, protein binding 80%-94%

INTERACTIONS

Increase: Alvimopan concentrations, toxicity—amiodarone, bepridil, cycloSPORINE, diltiazem, itraconazole, quiniDine, quiniNE, spironolactone, verapamil

- Do not use if opiate agonists have been used for 7 consecutive days before alvimopan
- Do not use concurrently with other opiate antagonists

NURSING CONSIDERATIONS

Assess:

- Blood studies: Hgb/Hct, potassium; hyperkalemia occurs
- Recent opioid use, do not use within 7 consecutive days
- **Opioid use for chronic pain; MI is more common in this population**

Perform/provide:

- Storage at room temperature

Evaluate:

- Therapeutic response: Absence of postoperative ileus

Teach patient/family:

- To notify prescriber if pregnancy is planned or suspected, avoid breastfeeding
- That product is only used for a limited time in a hospital setting
- To report constipation, abdominal pain, cramping

☼ Canada only Side effects: *italics* = common; **bold** = life-threatening ⚠
Nurse Alert

amantadine (Rx)

(a-man'ta-deen)

Func. class.: Antiviral, antiparkinsonian agent

Chem. class.: Tricyclic amine

Do not confuse: amantadine/ranitidine/rimantidine

ACTION:

Prevents uncoating of nucleic acid in viral cell, thereby preventing penetration of virus to host; causes release of DOPamine from neurons

USES:

Prophylaxis or treatment of influenza type A, EPS, parkinsonism, Parkinson's disease

Unlabeled uses: Neuroleptic malignant syndrome, MS-associated fatigue

CONTRAINDICATIONS:

Hypersensitivity, breastfeeding, children <1 eczematic rash

Precautions: Pregnancy (C), geriatric patients, epilepsy, CHF, orthostatic hypotension, psychiatric disorders, renal/hepatic disease, peripheral edema

DOSAGE AND ROUTES

Calculator

Influenza type A

- **Adult and child >9 yr:** PO 200 mg/day in single dose or divided bid
- **Geriatric:** PO No more than 100 mg/day
- **Child 1-8 yr:** PO 4.4-8.8 mg/kg/day divided bid-tid, max 150 mg/day

Extrapyramidal reaction/parkinsonism

- **Adult:** PO 100 mg bid up to 400 mg/day in EPS; give for 1 wk then 100 mg as needed up to 400 mg for parkinsonism

Renal dose

- **Adult:** PO CCr 30-50 ml/min 200 mg 1st day then 100 mg/day; CCr 15-29 ml/min 100 mg 1st day then 100 mg on alternate days; CCr 15 ml/min reduce dose and interval to 200 mg q7days

MS-associated fatigue (unlabeled)

- **Adult: PO** 200 mg/day or 100 mg bid

Neuroleptic malignant syndrome (unlabeled)

- **Adult: PO** 100 mg bid × 3 wk

Available forms: Caps 100 mg; oral sol 50 mg/5 ml; tab 100 mg

Administer:

- **Prophylaxis:** before exposure to influenza; continue for 10 days after contact;
- treatment:** initiate within 24-48 hr of onset of symptoms, continue for 24-48 hr after symptoms disappear
- After meals for better absorption to decrease GI symptoms; at least 4 hr before bedtime to prevent insomnia
- In divided doses to prevent CNS disturbances: headache, dizziness, fatigue, drowsiness

SIDE EFFECTS

CNS: Headache, dizziness, drowsiness, fatigue, anxiety, psychosis, depression, hallucinations, tremors, seizures, confusion, insomnia

CV: Orthostatic hypotension, CHF

EENT: Blurred vision

GI: Nausea, vomiting, constipation, dry mouth, anorexia

GU: Frequency, retention

HEMA: Leukopenia, agranulocytosis

INTEG: Photosensitivity, dermatitis, livedo reticularis

PHARMACOKINETICS

PO: Onset 48 hr, peak 1-4 hr, half-life 24 hr, not metabolized, excreted in urine (90%) unchanged, crosses placenta, excreted in breast milk

INTERACTIONS

Increase: anticholinergic response—atropine, other anticholinergics

Increase: CNS stimulation—CNS stimulants

Decrease: amantadine effect—metoclopramide, phenothiazines

Decrease: renal excretion of amantadine—triamterene, hydrochlorothiazide

Decrease: effect—S/B H1N1 influenza A virus vaccine; avoid use 2 wk before or 48 hr after amantadine

Drug/Lab Test

Increase: BUN, creatinine, alk phos, CK, LDH, bilirubin, AST, ALT, GGT

NURSING CONSIDERATIONS

Assess:

- Mental status: may cause increased psychiatric disorders especially in the elderly
- **CHF** (weight gain, jugular venous distention, dyspnea, crackles)
- Skin eruptions, photosensitivity after administration of product
- Reaction to each medication
- Signs of infection
- **Livedo reticularis**: mottling of the skin, usually red; edema; itching in lower extremities • **Parkinson's disease**: gait, tremors, akinesia, rigidity, may be effective if anticholinergics have not been effective  **Toxicity**: confusion, behavioral changes, hypotension, seizures

Perform/provide:

- Storage in tight, dry container

Evaluate:

- Therapeutic response: absence of fever, malaise, cough, dyspnea with infection; tremors, shuffling gait with Parkinson's disease

Teach patient/family:

- To change body position slowly to prevent orthostatic hypotension
- About aspects of product therapy: to report dyspnea, weight gain, dizziness, poor concentration, dysuria, complex sleep behaviors • To avoid hazardous activities if dizziness, blurred vision occurs
- To take product exactly as prescribed; parkinsonian crisis may occur if product is discontinued abruptly; not to double dose; if a dose is missed, not to take within 4 hr of next dose; caps may be opened and mixed with food • To avoid alcohol

TREATMENT OF OVERDOSE:

Withdraw product, maintain airway, administer EPINEPHrine, aminophylline, O₂, IV corticosteroids, physostigmine

✳ Canada only Side effects: *italics* = common; **bold** = life-threatening 
Nurse Alert

ambrisentan (Rx)

(am-bri-sen'tan)

Letairis

Func. class.: Antihypertensive

Chem class.: Vasodilator/endothelin receptor antagonist

ACTION:

Endothelin-A receptor antagonist; endothelin-A is vasoconstrictor

USES:

Pulmonary arterial hypertension, alone or in combination with other antihypertensives

CONTRAINDICATIONS:

Breastfeeding, hypersensitivity, idiopathic pulmonary fibrosis (IPF)

Black Box Warning:

Pregnancy (X)

Precautions: Children, females, geriatric patients, hepatitis, anemia, heart failure, jaundice, peripheral edema, hepatic disease

DOSAGE AND ROUTES

Calculator

• **Adult: PO** 5 mg/day; may increase to 10 mg/day if needed

Hepatic dose

• **Adult: PO** Discontinue if AST/ALT $>5\times$ ULN, or if elevations are accompanied by bilirubin $>2\times$ ULN, or other signs of liver dysfunction

Available forms: Tabs 5, 10 mg

Administer:

- Do not break, crush, chew tabs
- Daily with a full glass of water without regard to food
- Do not discontinue abruptly
- Only those facilities enrolled in the LEAP program (866-664-5327) may administer this product

SIDE EFFECTS

CNS: *Headache*, fever, flushing, fatigue

CV: Orthostatic hypotension, hypotension, *peripheral edema*, palpitations

EENT: Sinusitis, rhinitis

GI: Abdominal pain, constipation, anorexia, *hepatotoxicity*

GU: Decreased sperm counts

HEMA: *Anemia*

INTEG: Rash, *angioedema*

RESP: Pharyngitis, dyspnea, *pulmonary edema, veno-occlusive disease (VOD)*

PHARMACOKINETICS

Rapidly absorbed, peak 2 hr, protein binding 99%, metabolized by CYP3A4, CYP2C19, terminal half-life 15 hr, effective half-life 9 hr

INTERACTIONS

- Possibly increase ambrisentan: cimetidine, clopidogrel, efavirenz, felbamate, fluoxetine, modafinil, oxcarbazepine, ticlopidine

Increase: hypotension—other antihypertensives, diuretics, MAOIs

Increase: ambrisentan—CYP3A4 inhibitors (amprenavir, aprepitant, atazanavir, clarithromycin, conivaptan, cycloSPORINE, dalfopristin, danazol, darunavir, erythromycin, estradiol, imatinib, itraconazole, ketoconazole, nefazodone, nelfinavir, propoxyphene, quinupristin, ritonavir, RU-486, saquinavir, tamoxifen, telithromycin, troleandomycin, zafirlukast); CYP2C19/CYP3A4 (chloramphenicol, delavirdine, fluconazole, fluvoxamine, isoniazid, voriconazole)

Decrease: ambrisentan—CYP3A4 inducers (carbamazepine, phenobarbital, phenytoin, rifampin)

Decrease: ambrisentan absorption—mefloquine, nifedipine, propafenone, quinidine, ranolazine, tacrolimus, testosterone

Drug/Herb

- Need for ambrisentan dosage change: St. John's wort, ephedra (ma huang)

Drug/Food

- Avoid use with grapefruit products

Drug/Lab Test

Increase: LFTs, bilirubin

Decrease: Hct, Hgb

NURSING CONSIDERATIONS

Assess:

- **Pulmonary status:** improvement in breathing, ability to exercise; pulmonary edema that may indicate veno-occlusive disease
- Blood studies: CBC with differential; Hct, Hgb may be decreased
- Liver function tests: AST, ALT, bilirubin

Black Box Warning:

Assess pregnancy status before giving this product; pregnancy category X

- **Hepatotoxicity:** nausea, vomiting, abdominal pain/cramping, jaundice, anorexia, itching

Perform/provide:

- Storage in tight container at room temp

Evaluate:

- Therapeutic response: decrease in B/P; decreased shortness of breath

Teach patient/family:

- The importance of complying with dosage schedule even if feeling better

Black Box Warning:

To notify if pregnancy is planned or suspected (if pregnant, product will need to be discontinued, pregnancy test done monthly); to use 2 contraception methods while taking this product

- Not to use OTC products including herbs, supplements unless approved by prescriber
- **To report to prescriber immediately:** dizziness, faintness, chest pain, palpitations, uneven or rapid heart rate, headache, edema, weight gain
- **To report hepatic dysfunction:** nausea/vomiting, anorexia, fatigue, jaundice, right upper quadrant abdominal pain, itching, fever, malaise

☼ Canada only Side effects: *italics* = common; **bold** = life-threatening ⚠
Nurse Alert

amifostine (Rx)

(a-mi-foss'teen)

Ethyol

Func. class.: Cytoprotective agent for cisplatin/radiation

ACTION:

Binds and detoxifies damaging metabolites of cisplatin, alkylating agents, DNA-reactive agents, ionizing radiation by converting this product by alk phos in tissue to an active free thiol compound

USES:

To reduce renal toxicity when cisplatin is given repeatedly for ovarian cancer; to reduce xerostomia (dry mouth) after radiation therapy for head, neck cancer

Unlabeled uses: To prevent or reduce cisplatin-induced neurotoxicity, cyclophosphamide-induced granulocytopenia; to prevent or reduce toxicity of radiation therapy; to reduce toxicity of paclitaxel, myelodysplastic syndrome (MDS)

CONTRAINDICATIONS:

Breastfeeding, hypersensitivity to mannitol, aminothiols; hypotension, dehydration

Precautions: Pregnancy (C), children, geriatric patients, CV disease, hypocalcemia, MI, radiation therapy, stroke, dehydration, hypotension, chemotherapy, exfoliative dermatitis

DOSAGE AND ROUTES

Calculator

Reduction of renal damage with cisplatin

•**Adult:** IV 910 mg/m²/day within 1/2 hr before chemotherapy, give over 15 min; may reduce dose to 740 mg/m² if higher dose is poorly tolerated

Xerostomia prophylaxis

•**Adult:** IV 200 mg/m²/day over 3 min as inf 15-30 min before radiation therapy

Bone marrow suppression/nephrotoxicity/neurotoxicity prophylaxis (unlabeled)

•**Adult: IV** 100-340 mg/m²/day over 15 min before each dose of chemotherapy/radiation

Myelodysplastic syndrome (MDS) (unlabeled)

•**Adult: IV** 100 mg/m² 3×/wk, max 300 mg/m² 3×/wk

Available forms: Powder for inj, lyophilized 500 mg/vial

Administer:

Intermittent IV INF route

- Intermittent inf after reconstituting 500 mg/9.7 ml of sterile 0.9% NaCl, further dilute with 0.9% NaCl to concentration of 5-40 mg/ml, give over 15 min within 1/2 hr of chemotherapy, place patient in supine position during inf
- **Xerostomia:** Give over 3 min 15-30 min before radiation

Y-site compatibilities: Amikacin, aminophylline, amphotericin B liposome, ampicillin, ampicillin/sulbactam, aztreonam, bivalirudin, bleomycin, bumetanide, buprenorphine, butorphanol, calcium gluconate, carboplatin, carmustine, caspofungin, ceFAZolin, cefotaxime, cefoTEtan, cefOXitin, cefTAZidime, ceftizoxime, cefTRIAxone, cefuroxime, cimetidine, ciprofloxacin, clindamycin, cyclophosphamide, cytarabine, dacarbazine, DACTINomycin, DAPTOmycin, DAUNOrubicin, dexamethasone, dexmedetomidine, diltiazem, diphenhydrAMINE, DOBUTamine, DOCEtaxel, DOPamine, DOXOrubicin, doxycycline, droperidol, enalaprilat, epirubicin, ertapenem, etoposide, famotidine, fenoldopam, floxuridine, fluconazole, fludarabine, fluorouracil, furosemide, gallium, gentamicin, granisetron, haloperidol, heparin, hydrocortisone, HYDROmorphine, IDArubicin, ifosfamide, imipenem-cilastatin, leucovorin, levofloxacin, linezolid, LORazepam, magnesium sulfate, mannitol, mechlorethamine, meperidine, mesna, methotrexate, methylPREDNISolone, metoclopramide, metroNIDAZOLE, mezlocillin, milrinone, mitoMYcin, morphine, nalbuphine, nesiritide, netilmicin, octreotide, ondansetron, oxaliplatin, PACLitaxel, palonosetron, pantoprazole, pemetrexed, piperacillin, plicamycin, potassium chloride, promethazine, ranitidine, sodium bicarbonate, streptozocin, tacrolimus, teniposide, thiotepa, ticarcillin, ticarcillin/clavulanate, tigecycline, tirofiban, tobramycin, trastuzumab, trimethoprim-sulfamethoxazole, trimetrexate, vancomycin, vinBLASline, vinCRISline, voriconazole, zidovudine

Solution compatibility: 0.9% NaCl

Additive incompatibilities: Do not mix with other products

SIDE EFFECTS

CNS: Dizziness, somnolence, loss of consciousness, **seizures**

CV: *Hypotension*

EENT: *Sneezing*

GI: *Nausea, vomiting, hiccups, diarrhea*

INTEG: Flushing, feeling of warmth

MISC: *Hypocalcemia, rash, chills, anaphylaxis, toxic epidermal necrolysis, toxicoderma, Stevens-Johnson syndrome, exfoliative dermatitis, erythema multiforme*

PHARMACOKINETICS

Metabolized to free thiol compound, half-life 8 min, onset 5-8 min

INTERACTIONS

Increase: hypotension—antihypertensives

Drug/Lab

Decrease: calcium

NURSING CONSIDERATIONS

Assess:

- B/P before and q5min during inf; antihypertensives should be discontinued 24 hr before inf if severe hypotension occurs, give IV 0.9% NaCl to expand fluid volume, place patient in modified Trendelenburg position
- Fluid status before administration; administer antiemetic before administration to prevent severe nausea and vomiting; may also give dexamethasone 20 mg IV and a serotonin antagonist such as ondansetron, dolasetron, granisetron
- Calcium levels before and during treatment; may cause hypocalcemia, calcium supplements may be needed
- **Xerostomia:** mouth lesions, dry mouth during therapy
- **Anaphylaxis:** Rash, pruritus, wheezing, laryngeal edema, discontinue; give antihistamines, EPINEPHrine depending on severity; reactions may be delayed, if severe product should be permanently discontinued; other serious skin disorders (Stevens-Johnson syndrome, toxic epidermal necrolysis, toxicoderma, erythema multiforme, exfoliative dermatitis)

Evaluate:

- Therapeutic response: prevention of renal toxicity associated with cisplatin therapy; decreased xerostomia associated with radiation therapy of head, neck cancer

Teach patient/family:

- To stay supine during inf, B/P will be monitored often
 - To drink fluids
 - To report signs, symptoms, severe reactions
 - The reason for the medication and expected results
 - That side effects may include severe nausea, vomiting, decreased B/P, chills, dizziness, somnolence, hiccups, sneezing, skin reactions • Not to breastfeed
-

🍁 Canada only Side effects: *italics* = common; **bold** = life-threatening ⚠️
Nurse Alert

amikacin (Rx)

(am-i-kay'sin)

Amikin

Func. class.: Antiinfective

Chem. class.: Aminoglycoside

Do not confuse: Amikin/Amicar

Amikacin/anakinra

ACTION:

Interferes with protein synthesis in bacterial cells by binding to ribosomal subunits, which causes misreading of genetic code; inaccurate peptide sequence forms in protein chain, thereby causing bacterial death

USES:

Severe systemic infections of CNS, respiratory tract, GI tract, urinary tract, bone, skin, soft tissues caused by *Staphylococcus aureus* (MSSA), *Pseudomonas aeruginosa*, *Escherichia coli*, *Enterobacter*, *Acinetobacter*, *Providencia*, *Citrobacter*, *Serratia*, *Proteus*, *Klebsiella pneumoniae*

Unlabeled uses: *Mycobacterium avium* complex (MAC) (intrathecal or intraventricular) in combination; aerosolization, actinomycotic mycetoma, febrile neutropenia

CONTRAINDICATIONS:

Pregnancy (D), mild to moderate infections, hypersensitivity to aminoglycosides, sulfites

Precautions: Breastfeeding, neonates, geriatric patients, myasthenia gravis, Parkinson's disease

Black Box Warning:

Hearing impairment, renal/neuromuscular disease

DOSAGE AND ROUTES

Calculator

Severe systemic infections

- **Adult and child:** IV INF 10-15 mg/kg/day in 2-3 divided doses q8-12hr in 100-200 ml D₅W over 30-60 min, max 1.5 g; use for 7-10 days; decreased doses

are needed with poor renal function as determined by blood levels, renal studies; **pulse dosing** (once-daily dosing) may be used with some infections; **IM** 10-15 mg/kg/day in divided doses q8-12hr; daily or extended-interval dosing as an alternative dosing regimen

- **Infant: IV/IM** 10 mg/kg initially then 7.5 mg/kg q12hr
- **Neonate: IV/IM** 10 mg/kg initially then 7.5 mg/kg q12hr
- **Premature neonate:** 10 mg/kg initially then 7.5 mg/kg q8-12hr

Severe urinary tract infections

- **Adult:IM** 10-15 mg/kg/day divided q8-12hr

Hemodialysis

- **Adult:IM/IV** 7.5 mg/kg followed by 5 mg/kg 3×/wk after each dialysis session (for TIW dialysis)

Renal dose (pulse dosing)

- **Adult: IV** CCr 40-59 ml/min 15 mg/kg q36hr; CCr 20-39 ml/min 15 mg/kg q48hr; <20 ml/min adjust based on serum concentrations and MIC

Mycobacterium avium complex (MAC) (unlabeled)

- **Adult and adolescent: IV** 7.5-15 mg/kg divided q12-24hr as part of multiple-drug regimen
- **Child: IV** 15-30 mg/kg/day divided q12-24hr as part of multiple-drug regimen, max 1.5 g/day

Actinomycotic mycetoma (unlabeled)

- **Adult:IM/IV** 15 mg/kg/day in 2 divided doses × 3 wk with co-trimoxazole for 5 wk; repeat cycle once, may be repeated 2×

Available forms: Inj 50, 250 mg/ml

Administer:

IM route

- Inj in large muscle mass; rotate inj sites
- Obtain C&S before administration, begin treatment before results
- Obtain peak 1 hr after IM, trough before next dose

Intermittent IV INF route

- Dilute 500 mg of product/100-200 ml of D₅W, 0.9% NaCl and give over 1/2-1 hr; dilute in sufficient volume to allow for inf over 1-2 hr (infants); flush after administration with D₅W or 0.9% NaCl; sol clear or pale yellow; discard if precipitate or dark color develops • In children, amount of fluid will

depend on ordered dose; in infants, infuse over 1-2 hr • In evenly spaced doses to maintain blood level, separate from penicillins by at least 1 hr

Y-site compatibilities: Acyclovir, aldesleukin, alfentanil, amifostine, aminophylline, amiodarone, amsacrine, anidulafungin, ascorbic acid, atracurium, atropine, aztreonam, benztropine, bivalirudin, bumetanide, buprenorphine, butorphanol, calcium chloride/gluconate, CARBOplatin, caspofungin, ceFAZolin, cefepime, cefonicid, cefotaxime, cefoTEtan, cefOXitin, cefTAZidime, ceftizoxime, cefTRIAxone, cefuroxime, chloramphenicol, chlorproMAZINE, cimetidine, cisatracurium, CISplatin, clindamycin, codeine, cyanocobalamin, cyclophosphamide, cycloSPORINE, cytarabine, DACTINomycin, DAPTOmycin, dexamethasone, dexmedetomidine, digoxin, diltiazem, diphenhydrAMINE, DOBUTamine, DOCEtaxel, DOPamine, doripenem, doxacurium, DOXOrubicin, doxycycline, eftifibatide, enalaprilat, ePHEDrine, EPINEPHrine, epirubicin, epoetin alfa, ertapenem, erythromycin, esmolol, etoposide, famotidine, fentaNYL, filgrastim, fluconazole, fludarabine, fluorouracil, foscarnet, furosemide, gemcitabine, gentamicin, glycopyrrolate, granisetron, hydrocortisone, HYDROmorphone, IDArubicin, ifosfamide, IL-2, imipenem/cilastin, isoproterenol, ketorolac, labetalol, levofloxacin, lidocaine, linezolid, LORazepam, magnesium sulfate, mannitol, mechlorethamine, melphalan, meperidine, metaraminol, methotrexate, methoxamine, methyl dopate, methylPREDNISolone, metoclopramide, metoprolol, metroNIDAZOLE, midazolam, milrinone, mitoXANtrone, morphine, multivitamins, nafcillin, nalbuphine, naloxone, niCARdipine, nitroglycerin, nitroprusside, norepinephrine, octreotide, ondansetron, oxaliplatin, oxytocin, PACLitaxel, palonosetron, pantoprazole, papaverine, PEMEtrexed, penicillin G, pentazocine, perphenazine, PHENobarbital, phenylephrine, phytonadione, piperacillin/tazobactam, potassium chloride, procainamide, prochlorperazine, promethazine, propranolol, protamine, pyridoxime, quinupristin/dalfopristin, rantidine, remifentanil, riTUXimab, rocuromium, sargramostim, sodium acetate, sodium bicarbonate, succinylcholine, SUFentanil, tacrolimus, teniposide, theophylline, thiamine, thiotepa, ticarcillin/clavulanate, tigecycline, tirofiban, tobramycin, tolazoline, trimethaphan, urokinase, vancomycin, vasopressin, vecuronium, verapamil, vinCRISTine, vinorelbine, voriconazole, warfarin, zidovudine

SIDE EFFECTS

CNS: Confusion, depression, numbness, tremors, **seizures**, muscle twitching, **neurotoxicity**, dizziness, vertigo, tinnitus, **neuromuscular blockade with respiratory paralysis**

CV: Hypo/hypertension, palpitations

EENT: *Ototoxicity*, deafness, visual disturbances

GI: *Nausea, vomiting, anorexia*; increased ALT, AST, bilirubin; hepatomegaly, **hepatic necrosis**, splenomegaly

GU: **Oliguria, hematuria, renal damage, azotemia, renal failure, nephrotoxicity**

HEMA: **Agranulocytosis, thrombocytopenia, leukopenia, eosinophilia, anemia**

INTEG: *Rash*, burning, urticaria, dermatitis, alopecia

PHARMACOKINETICS

IM: Onset rapid, peak 1-2 hr, leads to unpredictable concentrations, IV preferred

IV: Onset immediate, peak 15-30 min; half-life 2-3 hr, prolonged up to 7 hr in infants; not metabolized; excreted unchanged in urine; crosses placenta; removed by hemodialysis

INTERACTIONS

- Mask ototoxicity: dimenhydrinate, ethacrynic acid

Increase: serum trough and peak—NSAIDs

Increase: **nephrotoxicity—cephalosporins, acyclovir, vancomycin, amphotericin B, cyclosporine, loop diuretics, cidofovir**

Increase: neuromuscular blockade, respiratory depression—anesthetics, nondepolarizing neuromuscular blockers

Drug/Lab Test

Increase: BUN, creatinine

NURSING CONSIDERATIONS

Assess:

- Weight before treatment; calculation of dosage is usually based on ideal body weight but may be calculated on actual body weight
- I&O ratio; urinalysis daily for proteinuria, cells, casts; report sudden change in urine output
- VS during infusion; watch for hypotension, change in pulse
- IV site for thrombophlebitis including pain, redness, swelling q30min; change

site if needed; apply warm compresses to discontinued site

Black Box Warning:

Renal impairment by securing urine for CCr, BUN, serum creatinine; lower dosage should be given with renal impairment; nephrotoxicity may be reversible if product stopped at 1st sign

Black Box Warning:

Deafness: audiometric testing, ringing, roaring in ears, vertigo; assess hearing before, during, after treatment

- Dehydration: high specific gravity, decrease in skin turgor, dry mucous membranes, dark urine
- Overgrowth of infection: increased temp, malaise, redness, pain, swelling, perineal itching, diarrhea, stomatitis, change in cough, sputum
- Vestibular dysfunction: nausea, vomiting, dizziness, headache; product should be discontinued if severe

Black Box Warning:

Neuromuscular blockade; respiratory paralysis may occur

Perform/provide:

- Adequate fluids of 2-3 L/day, unless contraindicated, to prevent irritation of tubules

Evaluate:

- Therapeutic response: absence of fever, draining wounds, negative C&S after treatment

Teach patient/family:

- To report headache, dizziness, symptoms of overgrowth of infection, renal impairment; symptoms of neurotoxicity, hepatotoxicity ⚠️ To report loss of hearing; ringing, roaring in ears; feeling of fullness in head
- To report hypersensitivity: rash, itching, trouble breathing, facial edema; notify health care provider

TREATMENT OF HYPERSENSITIVITY:

Hemodialysis, exchange transfusion in the newborn, monitor serum levels of product, may give ticarcillin or carbenicillin

☼ Canada only Side effects: *italics* = common; **bold** = life-threatening ⚠️
Nurse Alert

aMILoride (Rx)

(a-mill'oh-ride)

Midamor

Func. class.: Potassium-sparing diuretic

Chem. class.: Pyrazine

Do not confuse: aMILoride/amLODIPine/amiodarone

ACTION:

Inhibits sodium, potassium ATPase in the distal tubule, cortical collecting duct resulting in inhibition of sodium reabsorption and decreasing potassium secretion

USES:

Edema in CHF in combination with other diuretics, for hypertension, adjunct with other diuretics to maintain potassium, polyuria due to lithium administration

Unlabeled uses: Ascites

CONTRAINDICATIONS:

Anuria, hypersensitivity, impaired renal function, diabetic nephropathy

Black Box Warning:

Hyperkalemia

Precautions: Pregnancy (B), breastfeeding, children, geriatric patients, dehydration, diabetes, respiratory acidosis, hyponatremia

DOSAGE AND ROUTES

Calculator

- **Adult: PO** 5-10 mg/day in 1-2 divided doses; may be increased to 10-20 mg/day if needed

- **Infant/child (6-20 kg): PO** 0.625 mg/kg/day

Renal dose

- **Adult: PO** CCr 10-50 ml/min reduce dose by 50%; however, avoid if possible; CCr <10 ml/min contraindicated

Ascites (unlabeled)

- **Adult: PO** 10 mg/day, max 40 mg

Available forms: Tabs 5 mg

Administer:

- In AM to avoid interference with sleep if using as diuretic; if 2nd daily dose is needed, give in late afternoon
- With food; if nausea occurs, absorption may be decreased slightly

SIDE EFFECTS

CNS: *Headache*, dizziness, fatigue, weakness, paresthesias, tremor, depression, anxiety, **encephalopathy**

CV: *Orthostatic hypotension*, dysrhythmias, chest pain

EENT: Blurred vision, increased intraocular pressure

ELECT: **Hyperkalemia**, dehydration, hyponatremia, hypochloremia

GI: *Nausea, diarrhea*, dry mouth, *vomiting, anorexia*, cramps, constipation, abdominal pain, jaundice

GU: *Polyuria*, dysuria, urinary frequency, impotence

HEMA: **Aplastic anemia, neutropenia**

INTEG: *Rash, pruritus*, alopecia, urticaria

MS: Cramps

RESP: Cough, dyspnea, shortness of breath

PHARMACOKINETICS

15%-25% absorbed from GI tract; widely distributed; onset 2 hr; peak 3-4 hr; duration 24 hr; excreted in urine, feces; half-life 6-9 hr

INTERACTIONS

Black Box Warning:

Hyperkalemia: other potassium-sparing diuretics, potassium products, ACE inhibitors, salt substitutes, cycloSPORINE, tacrolimus; avoid concurrent use, if using together monitor potassium level

Increase: lithium toxicity: lithium, monitor lithium levels

Increase: action of antihypertensives

Decrease: effect of amiloride—NSAIDs, avoid concurrent use

Drug/Herb

Increase: effect—hawthorn, horse chestnut

Drug/Food

- Possible hyperkalemia: foods high in potassium, potassium-based salt substitutes

Drug/Lab Test

Increase: LFTs, BUN, potassium, sodium

Interference: GTT

NURSING CONSIDERATIONS

Assess:

- Heart rate, B/P lying, standing; postural hypotension may occur
- Electrolytes: potassium, sodium, chloride; glucose (serum), BUN, CBC, serum creatinine, blood pH, ABGs, periodic ECG
- **Discontinue potassium-sparing diuretics 3 days before GTT, hyperkalemia may occur**
- **Hypokalemia:** weakness, polyuria, polydipsia, fatigue, ECG U wave

Black Box Warning:

Hyperkalemia: fatigue, weakness, paresthesia, confusion, dyspnea, dysrhythmias, ECG changes

Evaluate:

- Therapeutic response: improvement in edema of feet, legs, sacral area daily if medication is being used for CHF; decreased B/P; prevention of hypokalemia (diuretics)

Teach patient/family:

- To take as prescribed; if dose is missed, to take when remembered within 1 hr of next dose; to take with food or milk for GI symptoms; to take early in day to prevent nocturia • About adverse reactions: muscle cramps, weakness, nausea, dizziness, blurred vision
- To avoid potassium-rich foods: oranges, bananas, salt substitutes, dried fruits
- To rise slowly from sitting to standing to avoid orthostatic hypotension
- To avoid hazardous activities if dizziness occurs

TREATMENT OF OVERDOSE:

Lavage if taken orally, monitor electrolytes, administer sodium bicarbonate for potassium >6.5 mEq/L, IV glucose, kayoxalate as needed; monitor hydration, CV, renal status

Nurse Alert

amino acids

(a-mee'noe)

amino acid infusions (crystalline)

Aminosyn, Amynosyn II, Aminosyn-PF, Clinisol, FreAmine III, Premasol, Travasol, TrophAmine

amino acid infusions/dextrose

Aminosyn II with dextrose, Clinimix, Amino Acid Infusions/electrolytes

aminosyn with electrolytes

Aminosyn II with electrolytes, FreAmine III with electrolytes, ProcalAmine with electrolytes, Travasol with electrolytes

amino acid infusions/electrolytes/dextrose

Aminosyn II with electrolytes in dextrose

amino acid infusions (hepatic failure)

HepatAmine, Hepatasol

amino acid infusions (high metabolic stress)

Aminosyn-HBC, FreAmine HBC

amino acid infusions (renal failure)

Aminosyn-RF, NephroAmine

Func. class.: Nutritional supplement/protein

Chem. class.: n/a

ACTION:

Needed for anabolism to maintain structure, decrease catabolism, promote healing

Black Box Warning:

Central infusions: Administration by central venous catheter should be used only by those familiar with this technique and its complications

USES:

Hepatic encephalopathy, cirrhosis, hepatitis, nutritional support in cancer; burn or solid organ transplant patients; to prevent nitrogen loss when adequate nutrition by mouth, gastric, or duodenal tube cannot be obtained

CONTRAINDICATIONS:

Hypersensitivity, severe electrolyte imbalances, anuria, severe liver damage, maple syrup urine disease, PKU, azotemia, genetic disease of amino acid metabolism

Precautions: Pregnancy (C), breastfeeding, children, renal disease, diabetes mellitus, CHF, sulfite sensitivity

DOSAGE AND ROUTES

Calculator

Nutritional support (cirrhosis, hepatic encephalopathy, hepatitis)

• **Adult: IV** 80-120 g/day amino acids/12-18 g nitrogen of hepatic failure formula

TPN

• **Adult: IV** 1-1.5 g/kg/day

Metabolic stress (severe)

• **Adult: IV** 1.5 g/kg, use formula for high metabolic stress

Renal failure (nutritional support)

• **Adult: IV** Minosyn-RF 300-600 ml/70% dextrose/day; NephrAmine 250-500 ml/70% dextrose/day; the total daily dosage is calculated based on the daily protein requirements, as well as the patient's metabolic and clinical response. Check product instructions for specific directions

• **Child ≥ 10 kg (22 lb): IV** 20-25 g/day $\times$ first 10 kg, then 1-1.25 g/kg/day for each kg >10 kg

• **Child <10 kg (22 lb): IV** 2-4 kg/day

• **Child: IV** 1 g/kg/day max

• The dosage and constant infusion rate of IV dextrose must be selected with caution in children, particularly neonates and low birth weight infants, because of the increased risk of hyperglycemia/hypoglycemia. Owing to their concentration, these solutions are not recommended for use in children younger than 1 year • The total daily dosage is calculated based on the daily protein requirements, as well as the patient's metabolic and clinical response. Check each product's instructions for specific directions

Available forms:

Injection: 250, 500, 1000, 2000 ml, containing amino acids in various concentrations; amino acid infusions, crystalline: Aminosyn: 3.5%, 5%, 7%,

8.5%, 10%; AminosynII: 3.5%, 5%, 7%, 8.5%, 10%, 15%; Aminosyn-PF: 7%, 10%; Clinisol: 15%; FreAmine III: 8.5%, 10%; Premasol: 6%, 10%; Travasol: 10%; TrophAmine: 6%, 10%

Amino acid infusion/dextrose: Aminosyn II: 3.5% in 5% dextrose, 4.25% in 20% dextrose, 4.25% in 10% dextrose 4.25% in 25% dextrose; Clinimix: 2.75% in 5% dextrose, 4.25% in 5% dextrose, 4.25% in 10% dextrose 4.25% in 20% dextrose, 4.25% in 25% dextrose, 5% in 10% dextrose, 5% in 15% dextrose, 5% in 20% dextrose, 5% in 25% dextrose, 5 Amino acid infusions/electrolytes:

Aminosyn: 3.5%, 7%, 8.5%; Aminosyn II: 3.5%, 7%, 8.5%; FreAmine III: 3%, 8.5%; ProcalAmine: 3%; Travasol: 3.5%, 5.5%, 8.5%

Amino acid infusions/electrolytes/dextrose: Aminosyn II: 3.5% with electrolytes in 5% dextrose, 3.5% with electrolytes in 25% dextrose, 4.25% with electrolytes in 10% dextrose, 4.25% with electrolytes in 20% dextrose, 4.25% with electrolytes in 25% dextrose; Amino acid infusions (hepatic failure): HepatAmine: 8%; Hepatasol: 8%

Amino acid infusions (high metabolic stress): Aminosyn-HBC 7%; Freamine HBC: 6.9%; Amino acid (renal failure): Aminosyn-RF:5.2%; NephrAmine: 5.4%

Administer:

Continuous IV INF route

- Up to 40% protein and dextrose (up to 12.5%) via peripheral vein; stronger sol requires central IV administration • TPN only mixed with dextrose to promote protein synthesis
- Immediately after mixing under strict aseptic technique, use inf pump, in-line filter (0.22 µm) unless mixed with fat emulsion and dextrose (3 in 1). Using careful monitoring technique; do not speed up inf; pulmonary edema, glucose overload will result

SIDE EFFECTS

CNS: Dizziness, headache, confusion, loss of concentration, fever

CV: Hypertension, CHF/pulmonary edema, flushing, thrombosis

ENDO: Hyperglycemia, rebound hypoglycemia, electrolyte imbalances, hyperosmolar hyperglycemic nonketotic syndrome, alkalosis, hypophosphatemia, hyperammonemia, dehydration, hypocalcemia

GI: Nausea, abdominal pain

GU: Glycosuria osmotic diuresis

INTEG: Extravasation necrosis, phlebitis at inj site

INTERACTIONS

Individual Drugs

Decrease: Protein-sparing effects—tetracycline

Drug/Lab Test

Increase: LFTs, ammonia glucose

Decrease: Potassium, phosphate, glucose

NURSING CONSIDERATIONS

Assess:

- Electrolytes (potassium, sodium, phosphate, chloride, magnesium, bicarbonate, blood glucose, ammonia, ketones) • Renal/hepatic studies: BUN, creatinine, ALT, AST, bilirubin
- Weight changes, triglycerides before and after inf; vit A level with renal disease
- Inj site for extravasation: redness along vein, edema at site, necrosis, pain, hard tender area; site should be changed immediately • Discontinue inf, culture tubing and sol
- **Sepsis:** chills, fever, increased temperature, if sepsis is suspected • For impending hepatic coma: asterixis, confusion, uremic fetor, lethargy
- Hyperammonemia: nausea, vomiting, malaise, tremors, anorexia, seizures
- Change of dressing and IV tubing to prevent infection every 24-48 hr if chills, fever, other signs of infection occur

Evaluate:

- Therapeutic response: weight gain, decrease in jaundice with liver disorders, increased LOC

Teach patient/family:

- Reason for use of TPN
- If chills, sweating are experienced to report at once
- About infusion pump and blood glucose

☛ Canada only Side effects: *italics* = common; **bold** = life-threatening ⚠

Nurse Alert

HIGH ALERT

amiodarone (Rx)

(a-mee-oh'da-rone)

Cordarone, Nexterone, Pacerone

Func. class.: Antidysrhythmic (class III)

Chem. class.: Iodinated benzofuran derivative

Do not confuse: **amiodarone**/Inamrinone

Cordarone/Inocor

ACTION:

Prolongs duration of action potential and effective refractory period, noncompetitive α - and β -adrenergic inhibition; increases PR and QT intervals, decreases sinus rate, decreases peripheral vascular resistance

USES:

Hemodynamically unstable ventricular tachycardia, supraventricular tachycardia, ventricular fibrillation not controlled by 1st-line agents

Unlabeled uses: Atrial fibrillation treatment/prophylaxis, atrial flutter, cardiac arrest, cardiac surgery, CPR, heart failure, PSVT, Wolff-Parkinson-White (WPW) syndrome

CONTRAINDICATIONS:

Pregnancy (D), breastfeeding, neonates, infants, severe sinus node dysfunction, hypersensitivity, cardiogenic shock

Black Box Warning:

2nd-3rd degree AV block, bradycardia

Precautions: Children, goiter, Hashimoto's thyroiditis, electrolyte imbalances, CHF, respiratory disease

Black Box Warning:

Severe hepatic disease, cardiac arrhythmias, pneumonitis, pulmonary fibrosis

DOSAGE AND ROUTES

Calculator

Ventricular dysrhythmias

- **Adult: PO** Loading dose 800-1600 mg/day for 1-3 wk then 600-800 mg/day

for 1 mo, maintenance 400 mg/day; **IV** loading dose (1st rapid) 150 mg over the first 10 min then slow 360 mg over the next 6 hr, maintenance 540 mg given over the remaining 18 hr, decrease rate of the slow inf to 0.5 mg/min

- **Child (unlabeled): PO** Loading dose 10-15 mg/kg/day in 1-2 divided doses for 4-14 days then 5 mg/kg/day

- **Child and infant: IV/INTRAOSSEOUS** (during CPR) 5 mg/kg as a bolus (PALS guidelines)

Perfusion tachycardia

- **Adult: IV** 5 mg/kg loading dose given over 20-60 min

Supraventricular dysrhythmias (atrial fibrillation, atrial flutter, PSVT, WPW syndrome) (unlabeled)

- **Adult: PO** 1.2-1.8 g/day divided until a total of 10 g has been given, then 200-400 mg/day (class IIa recommendation); **IV** 5-7 mg/kg over 30-60 min, then 1.2-1.8 g as **CONT IV INF** or in divided PO doses until 10 g, then 200-400 mg/day (class IIa recommendation)

- **Child and infant: PO** 10-20 mg/kg/day in divided doses for 7-10 days, then 5-10 mg/kg/day once daily

Available forms: Tabs 100, 200, 400 mg; inj 50 mg/ml

Administer:

PO route

- May be used with/without food but be consistent

IV, direct route

- **Peripheral:** max 2 mg/ml for more than 1 hr; preferred through central venous line with in-line filter; concentrations of more than 2 mg/ml should be given by central line
- **Cardiac arrest:** give 300 bol; may repeat 150 mg after 3-5 min

Intermittent IV INF route

- **Rapid loading:** add 3 ml (150 mg), 100 ml D₅W (1.5 mg/ml), give over 10 min
- **Slow loading:** add 18 ml (900 mg), 500 ml D₅W (1.8 mg/ml), give over next 6 hr

Continuous IV INF route

- After 24 hr, dilute 50 ml to 1-6 mg/ml, give 1-6 mg/ml at 1 mg/min for the 1st 6 hr, then 0.5 mg/min

Y-site compatibilities: Amikacin, clindamycin, DOBUTamine, DOPamine,

doxycycline, erythromycin, esmolol, gentamicin, insulin, isoproterenol, labetalol, lidocaine, metaraminol, metroNIDAZOLE, midazolam, morphine, nitroglycerin, norepinephrine, penicillin G potassium, phenylephrine, potassium chloride, procainamide, tobramycin, vancomycin

Solution compatibility: D₅W, 0.9% NaCl

SIDE EFFECTS

CNS: Headache, dizziness, involuntary movement, tremors, peripheral neuropathy, malaise, fatigue, ataxia, paresthesias, insomnia

CV: Hypotension, bradycardia, sinus arrest, CHF, dysrhythmias, SA node dysfunction, AV block, increased defibrillation energy requirement

EENT: Blurred vision, halos, photophobia, corneal microdeposits, dry eyes

ENDO: Hypo/hyperthyroidism

GI: Nausea, vomiting, diarrhea, abdominal pain, anorexia, constipation, hepatotoxicity

GU: Epididymitis, ED

INTEG: Rash, photosensitivity, blue-gray skin discoloration, alopecia, spontaneous ecchymosis, toxic epidermal necrolysis, urticaria, pancreatitis, phlebitis (IV)

MISC: Flushing, abnormal taste or smell, edema, abnormal salivation, coagulation abnormalities

MS: Weakness, pain in extremities

RESP: Pulmonary fibrosis/toxicity, pulmonary inflammation, ARDS; gasping syndrome if used with neonates

PHARMACOKINETICS

PO: Onset 1-3 wk, peak 2-7 hr, half-life 26-107 days, metabolized by liver (CYP3A4, CYP2C8), excreted by kidneys, 99% protein binding

INTERACTIONS

Increase: QT prolongation—azoles, fluoroquinolones, macrolides

Increase: amiodarone concentrations, possible serious dysrhythmias—protease inhibitors, reduce dose

Increase: myopathy—HMG-CoA reductase inhibitors

Increase: bradycardia— β -blockers, calcium channel blockers

Increase: levels of cycloSPORINE, dextromethorphan, digoxin, disopyramide, flecainide, methotrexate, phenytoin, procainamide, quiniDine, theophylline, class I antidysrhythmics

Increase: anticoagulant effects—warfarin

Drug/Food

- **Toxicity:** grapefruit juice

Drug/Lab Test

Increase: T₄, ALT, AST, GGT alk phos, cholesterol, lipids, PT, INR

Decrease: T₃

NURSING CONSIDERATIONS

Assess:

Black Box Warning:

Pulmonary toxicity: dyspnea, fatigue, cough, fever, chest pain; product should be discontinued; for ARDS, pulmonary fibrosis, crackles, tachypnea, increased at higher doses, toxicity is common

Black Box Warning:

ECG continuously to determine product effectiveness; measure PR, QRS, QT intervals; check for PVCs, other dysrhythmias, B/P continuously for hypo/hypertension; report dysrhythmias, slowing heart rate; monitor amiodarone level: therapeutic 1-2.5 mcg/ml; toxic >2.5 mcg/ml

- Electrolytes (sodium, potassium, chloride); hepatic studies: AST, ALT, bilirubin, alk phos; for dehydration, hypovolemia, monitor PT, INR if using warfarin
- Chest x-ray, thyroid function tests
- CNS symptoms: confusion, psychosis, numbness, depression, involuntary movements; product should be discontinued
- **Hypothyroidism:** lethargy; dizziness; constipation; enlarged thyroid gland; edema of extremities; cool, pale skin
- **Hyperthyroidism:** restlessness; tachycardia; eyelid puffiness; weight loss; frequent urination; menstrual irregularities; dyspnea; warm, moist skin
- Ophthalmic exams at baseline and periodically (PO); to prevent corneal deposits, use methylcellulose
- Cardiac rate, respirations: rate, rhythm, character, chest pain; start with patient hospitalized and monitored up to 1 wk; for rebound hypertension after 1-2 hr

Evaluate:

- Therapeutic response: decrease in ventricular tachycardia, supraventricular tachycardia, fibrillation

Teach patient/family:

- To take this product as directed; to avoid missed doses; not to use with grapefruit juice; do not discontinue abruptly
- To use sunscreen or stay out of sun to prevent burns; that dark glasses may be needed for photophobia
- To report side effects immediately; more common at high dose
- That skin discoloration is usually reversible

TREATMENT OF OVERDOSE:

O₂, artificial ventilation, ECG, administer DOPamine for circulatory depression, administer diazepam, thiopental for seizures, isoproterenol

🍁 Canada only Side effects: *italics* = common; **bold** = life-threatening ⚠️
Nurse Alert

amitriptyline (Rx)

(a-mee-trip'ti-leen)

Func. class.: Antidepressant—tricyclic

Chem. class.: Tertiary amine

Do not confuse: amitriptyline/nortriptyline/aminophylline

ACTION:

Blocks reuptake of norepinephrine, serotonin into nerve endings, thereby increasing action of norepinephrine, serotonin in nerve cells

USES:

Major depression

Unlabeled uses: Neuropathic pain, prevention of cluster/migraine headaches, fibromyalgia, ADHD, bulimia nervosa, diabetic neuropathy, enuresis, insomnia, panic disorder, postherpetic neuralgia, hiccups, social phobia

CONTRAINDICATIONS:

Hypersensitivity to tricyclics, recovery phase of myocardial infarction

Precautions: Pregnancy (C), breastfeeding, geriatric patients, seizure disorders, prostatic hypertrophy, schizophrenia, psychosis, severe depression, increased intraocular pressure, closed-angle glaucoma, urinary retention, renal/hepatic/cardiac disease, hyperthyroidism, electroshock therapy, elective surgery

Black Box Warning:

Children <12 yr, suicidal patients

DOSAGE AND ROUTES

Calculator

Depression

- **Adult/adolescent:** PO 25-75 mg/day as single dose at bedtime or in divided

doses, may increase to 200 mg/day; max 300 mg/day (if hospitalized)

- **Geriatric: PO** 10-25 mg at bedtime, may be increased to 150 mg/day

Cluster/migraine headache (unlabeled)

- **Adult: PO** 10-300 mg/day

Pain (unlabeled)

- **Adult: PO** 75-300 mg/day

Fibromyalgia/insomnia (unlabeled)

- **Adult: PO** 10-50 mg nightly

Enuresis (unlabeled)

- **Child 11-14 yr: PO** 50 mg at bedtime
- **Child 6-10 yr: PO** 25 mg at bedtime

ADHD/bulimia nervosa (unlabeled)

- **Adult: PO** 25 mg tid, titrate to 200 mg/day by 25-50 mg at weekly intervals
- **Child 6-12 yr: PO** 10-30 mg/day or 1-5 mg/kg/day in divided doses

Available forms: Tabs 10, 25, 50, 75, 100, 150 mg

Administer:

- Increase fluids, bulk in diet if constipation, urinary retention occur, especially in geriatric patients • With food, milk for GI symptoms
- Crushed if patient unable to swallow medication whole
- Dosage at bedtime if oversedation occurs during day; may take entire dose at bedtime; geriatric patients may not tolerate once daily dosing

SIDE EFFECTS

CNS: *Dizziness, drowsiness, confusion, headache, anxiety, tremors, stimulation, weakness, insomnia, nightmares, EPS (geriatric patients), increased psychiatric symptoms, seizures, suicidal thoughts*

CV: *Orthostatic hypotension, ECG changes, tachycardia, hypertension, palpitations, dysrhythmias*

EENT: *Blurred vision, tinnitus, mydriasis, ophthalmoplegia*

GI: *Constipation, dry mouth, weight gain, nausea, vomiting, paralytic ileus, increased appetite, cramps, epigastric distress, jaundice, hepatitis, stomatitis*

GU: *Urinary retention*

HEMA: *Agranulocytosis, thrombocytopenia, eosinophilia, leukopenia, aplastic*

anemia

INTEG: Rash, urticaria, sweating, pruritus, photosensitivity

PHARMACOKINETICS

Onset 45 min; peak 2-12 hr; therapeutic response 4-10 days; metabolized by liver to nortriptyline; excreted in urine, feces; crosses placenta; excreted in breast milk; half-life 10-46 hr

INTERACTIONS

 Hyperpyretic crisis, seizures, hypertensive episode: MAOIs, do not use within 14 days of MAOIs

Increase: risk for agranulocytosis—antithyroid agents

Increase: QT prolongation—procainamide, quinidine, amiodarone, tricyclics, class IA, III antidysrhythmics

Increase: amitriptyline levels, toxicity—cimetidine, fluoxetine, phenothiazines, oral contraceptives, antidepressants, carbamazepine, class IC antidysrhythmics

Increase: effects of direct-acting sympathomimetics (epinephrine), alcohol, barbiturates, benzodiazepines, CNS depressants, opioids, sedative/hypnotics

Increase: serotonin syndrome, linezolid, methylene blue, use cautiously

Decrease: effects of guanethidine, clopidogrel, indirect-acting sympathomimetics (ephedrine)

Drug/Herb

Increase: serotonin syndrome—SAM-e, St. John's wort, yohimbe

Increase: CNS depression—kava, hops, chamomile, lavender, valerian

Drug/Lab Test

Increase: serum bilirubin, blood glucose, alk phos, LFTs

Decrease: WBCs, platelets, granulocytes

NURSING CONSIDERATIONS

Assess:

- B/P lying, standing; pulse q4hr; if systolic B/P drops 20 mm Hg, hold product, notify prescriber; take vital signs q4hr with CV disease; ECG for flattening of T

wave, prolongation of QTc interval, bundle branch block, AV block, dysrhythmias in cardiac patients, avoid use immediately after MI • Blood studies: CBC, leukocytes, differential, cardiac enzymes if patient is receiving long-term therapy • Hepatic studies: AST, ALT, bilirubin

- Weight every wk; appetite may increase with product
- EPS primarily in geriatric patients: rigidity, dystonia, akathisia

Black Box Warning:

Mental status: mood, sensorium, affect, suicidal tendencies; increase in psychiatric symptoms: depression, panic; suicidal tendencies are higher in those ≤ 24 yr, restrict amount of product available

- **Serotonin syndrome:** may occur with other serotonergic products (hyperthermia, hypertension, rigidity, delirium) • **Urinary retention, constipation;** constipation is most likely to occur in children and geriatric patients
- **Withdrawal symptoms:** headache, nausea, vomiting, muscle pain, weakness; do not usually occur unless product was discontinued abruptly • **Alcohol consumption:** if alcohol is consumed, hold dose until morning
- **Pain syndromes (unlabeled):** intensity, location, severity; use pain scale; product may be taken for 1-2 mo before effective • **Sexual dysfunction:** erectile dysfunction, decreased libido

Perform/provide:

- Storage at room temp; do not freeze

Evaluate:

- Therapeutic response: decrease in depression, absence of suicidal thoughts

Teach patient/family:

- To take medication as directed; not to double dose; that therapeutic effects may take 2-3 wk; not to discontinue medication quickly after long-term use: may cause nausea, headache, malaise • To use caution when driving, performing other activities that require alertness because of drowsiness, dizziness, blurred vision; to avoid rising quickly from sitting to standing (especially geriatric patients); how to manage anticholinergic effects • The symptoms of serotonin syndrome
- To avoid alcohol, other CNS depressants
- To wear sunscreen or large hat when outdoors, photosensitivity occurs
- **That contraception is recommended during treatment; to avoid breastfeeding**

- To watch for suicide

TREATMENT OF OVERDOSE:

ECG monitoring, lavage; administer anticonvulsant, sodium bicarbonate

🍁 Canada only Side effects: *italics* = common; **bold** = life-threatening ⚠️
Nurse Alert

amLODIPine (Rx)

(am-loe'di-peen)

Norvasc

Func. class.: Antianginal, antihypertensive, calcium channel blocker *Chem. class.:* Dihydropyridine

Do not confuse: amLODIPine/aMILoride

ACTION:

Inhibits calcium ion influx across cell membrane during cardiac depolarization; produces relaxation of coronary vascular smooth muscle, peripheral vascular smooth muscle; dilates coronary vascular arteries; increases myocardial O₂ delivery in patients with vasospastic angina

USES:

Chronic stable angina pectoris, hypertension, variant angina (Prinzmetal's angina); may coadminister with other antihypertensives, antianginals

Unlabeled uses: Hypertension (pediatric patients)

CONTRAINDICATIONS:

Hypersensitivity to this product, severe aortic stenosis, severe obstructive CAD

Black Box Warning:

Hypersensitivity to dihydropyridine

Precautions: Pregnancy (C), breastfeeding, children, geriatric patients, CHF, hypotension, hepatic injury

DOSAGE AND ROUTES

Calculator

Coronary artery disease

- **Adult: PO** 5-10 mg/day
- **Geriatric: PO** 5 mg/day, max 10 mg/day

Hypertension

- **Adult: PO** 2.5-5 mg/day initially, max 10 mg/day
- **Geriatric: PO** 2.5 mg/day, may increase to 5 mg/day, max 10 mg/day
- **Child 6-16 yr (unlabeled): PO** 2.5-5 mg/day
- **Child <6 yr (unlabeled): PO** 0.05-0.2 mg/kg/day in 1-2 divided doses

Hepatic dose

- **Adult: PO** 2.5 mg/day; may increase to 10 mg/day (antihypertensive); 5 mg/day, may increase to 10 mg/day (antianginal)

Available forms: Tabs 2.5, 5, 10 mg

Administer:

- Once a day without regard to meals

SIDE EFFECTS

CNS: *Headache*, fatigue, dizziness, asthenia, anxiety, depression, insomnia, paresthesia, somnolence

CV: *Peripheral edema*, bradycardia, hypotension, palpitations, syncope, chest pain

GI: Nausea, vomiting, diarrhea, gastric upset, constipation, flatulence, anorexia, gingival hyperplasia, dyspepsia

GU: Nocturia, polyuria, sexual difficulties

INTEG: Rash, pruritus, urticaria, alopecia

OTHER: Flushing, muscle cramps, cough, weight gain, tinnitus, epistaxis

PHARMACOKINETICS

Peak 6-12 hr; half-life 30-50 hr; increased in geriatric patients, hepatic disease; metabolized by liver (CYP3A4); excreted in urine (90% as metabolites); protein binding >93%

INTERACTIONS

Increase: neurotoxicity—lithium

Increase: hypotension—alcohol, antihypertensives, nitrates, fentanyl, quinidine

Increase: amlodipine level—diltiazem

Decrease: antihypertensive effect—NSAIDs

Drug/Herb

Decrease: effect—yohimbe

Drug/Food

Increase: hypotensive effect—grapefruit juice

NURSING CONSIDERATIONS

Assess:

- Cardiac status: B/P, pulse, respirations, ECG; some patients have developed severe angina, acute MI after calcium channel blockers if obstructive CAD is severe
- Peripheral edema, dyspnea, jugular vein distention, crackles
- **Angina:** intensity, location, duration of pain

Evaluate:

- Therapeutic response: decreased anginal pain, decreased B/P, increased exercise tolerance

Teach patient/family:

- To take product as prescribed, not to double or skip dose
- To avoid hazardous activities until stabilized on product, dizziness is no longer a problem
- To avoid OTC products unless directed by prescriber
- To comply in all areas of medical regimen: diet, exercise, stress reduction, product therapy, smoking cessation
- To notify prescriber of irregular heartbeat; shortness of breath; swelling of feet, face, hands; severe dizziness; constipation; nausea; hypotension; if chest pain does not improve, use nitroglycerin when angina is severe
- To use correct technique when monitoring pulse; to contact prescriber if pulse <50 bpm
- To avoid large amounts of grapefruit juice, alcohol
- To change positions slowly to prevent orthostatic hypotension
- To continue with good oral hygiene to prevent gingival disease
- To use sunscreen, protective clothing to prevent photosensitivity
- To notify all health care providers of use of this product

TREATMENT OF OVERDOSE:

Defibrillation, β -agonists, IV calcium inotropic agents, diuretics, atropine for AV block, vasopressor for hypotension

☼ Canada only Side effects: *italics* = common; **bold** = life-threatening ⚠
Nurse Alert

amoxicillin (Rx)

(a-mox-i-sill'in)

Moxatag

Func. class.: Antiinfective, antiulcer

Chem. class.: Aminopenicillin

Do not confuse: amoxicillin/amoxapine/Amoxil

Trimox/Diamox/Tylox

Wymox/Tylox

ACTION:

Interferes with cell wall replication of susceptible organisms; the cell wall, rendered osmotically unstable, swells and bursts from osmotic pressure; bactericidal: lysis mediated by bacterial cell wall autolysins

USES:

Treatment of skin, respiratory, GI, GU infections, otitis media, gonorrhea; for gram-positive cocci (*Staphylococcus aureus*, *Streptococcus pyogenes*, *Streptococcus faecalis*, *Streptococcus pneumoniae*), gram-negative cocci (*Neisseria gonorrhoeae*, *Neisseria meningitidis*), gram-positive bacilli (*Corynebacterium diphtheriae*, *Listeria monocytogenes*), gram-negative bacilli (*Haemophilus influenzae*, *Escherichia coli*, *Proteus mirabilis*, *Salmonella*); β -lactase-negative organisms; prophylaxis of bacterial endocarditis; in combination with other products for treatment of *Helicobacter pylori*

Unlabeled uses: Lyme disease, anthrax treatment and prophylaxis, cervicitis, *Chlamydia trachomatis*, dental abscess/infection, dyspepsia, gastric ulcer, non-gonococcal urethritis, periodontitis, typhoid fever

CONTRAINDICATIONS:

Hypersensitivity to penicillins

Precautions: Pregnancy (B), breastfeeding, neonates, hypersensitivity to cephalosporins, severe renal disease, acute lymphocytic leukemia, mononucleosis, phenylketonuria

DOSAGE AND ROUTES

Calculator

Systemic infections (severe)

- **Adult: PO** 750 mg-1.75 g/day in divided doses q8hr or q12hr
- **Child: PO** 20-50 mg/kg/day in divided doses q8hr or q12hr

***S. pyogenes* infection (pharyngitis/tonsillitis)**

- **Adult/child >12 yr: PO EXT REL** 775 mg every day with meal × 10 days

Gonorrhea

- **Adult: PO** 3 g given with 1 g probenecid as a single dose followed by tetracycline or erythromycin therapy

C. trachomatis

- **Adult: PO** 500 mg/tid × 1 wk

Bacterial endocarditis prophylaxis (unlabeled)

- **Adult: PO** 2 g 1 hr before procedure
- **Child: PO** 50 mg/kg 1 hr before procedure; max 2 g

Renal disease

- **Adult: PO** CCr 10-30 ml/min 250-500 mg q12hr; CCr <10 ml/min 250-500 mg q24hr; do not use 775, 875 mg strength if CCr <30 ml/min

Lyme disease (unlabeled)

- **Adult: PO** 250-500 mg tid × 10-30 days
- **Child: PO** 20-50 mg/kg/day in divided doses q8hr × 10-30 days

Duodenal/gastric ulcer/dyspepsia from *H. pylori* infection (unlabeled)

- **Adult: PO** 1000 mg bid with lansoprazole or clarithromycin/omeprazole

Anthrax treatment/prophylaxis (unlabeled)

- **Adult and child >20 kg: PO** 500 mg q8hr × 10-14 days (prophylaxis), 60 days (treatment)
- **Child <20 kg: PO** 80 mg/kg divided in 3 doses q8hr × 60 days (treatment)

Available forms: Caps 250, 500 mg; chew tabs 125, 200, 250, 400 mg; tabs 250, 500, 875 mg; ext rel tab (Moxatag) 775 mg; susp 125, 200, 250, 400 mg/5 ml

Administer:

PO route

- **Susp:** shake well before each dose; may be used alone, mixed in drinks; use immediately; discard unused portion after 14 days, store in refrigerator
- **Give** around the clock; caps may be emptied, mixed with liquids if needed without regard to food
- **Ext rel:** do not crush, chew, break, take with food

SIDE EFFECTS

CNS: Headache, **seizures**, agitation, confusion, dizziness, insomnia

GI: *Nausea, vomiting, diarrhea*, increased AST, ALT, abdominal pain, glossitis, colitis, **pseudomembranous colitis**, jaundice, cholestasis

HEMA: Anemia, increased bleeding time, **bone marrow depression**, **granulocytopenia**, **hemolytic anemia**

INTEG: *Urticaria, rash*

SYST: **Anaphylaxis**, respiratory distress, serum sickness, Stevens-Johnson syndrome, toxic epidermal necrolysis, exfoliative dermatitis

PHARMACOKINETICS

PO: Peak 2 hr, duration 6-8 hr, half-life 1-1½ hr, metabolized in liver, excreted in urine, crosses placenta, enters breast milk

INTERACTIONS

Increase: rash—allopurinol

Increase: amoxicillin level—probenecid

Increase: anticoagulant action—warfarin

Increase: methotrexate levels—methotrexate

Decrease: effectiveness of oral contraceptives

Drug/Lab Test

Increase: AST/ALT, alk phos, LDH

False positive: direct Coombs's test

NURSING CONSIDERATIONS

Assess:

- Report hematuria, oliguria, penicillin products, in high doses are nephrotoxic
- Hepatic studies: AST, ALT
- Blood studies: WBC, RBC, Hgb, Hct, bleeding time
- Renal studies: urinalysis, protein, blood, BUN, creatinine
- C&S before product therapy; product may be given as soon as culture is taken

⚠ **Pseudomembranous colitis:** bowel pattern before, during treatment; diarrhea, cramping, blood in stools; report to prescriber • Skin eruptions after administration of penicillin to 1 wk after discontinuing product, rash is more common if allopurinol is taken concurrently ⚠ **Anaphylaxis:** rash, itching, dyspnea, facial/laryngeal edema

Perform/provide:

- Scratch test to assess allergy after securing order from prescriber; usually done when penicillin is only product of choice

Evaluate:

- Therapeutic response: absence of infection; prevention of endocarditis, resolution of ulcer symptoms

Teach patient/family:

- That caps may be opened, contents taken with fluids; that chewable form is available; to take as prescribed, not to double dose
- All aspects of product therapy: to complete entire course of medication to ensure organism death (10-14 days); that culture may be taken after completed course of medication ⚠️ To report sore throat, fever, fatigue, diarrhea (**superinfection or agranulocytopenia**), blood in stool, abdominal pain (**pseudomembranous colitis**), decreased urinary output
- That product must be taken in equal intervals around the clock to maintain blood levels; to take without regard to food
- To wear or carry emergency ID if allergic to penicillins

TREATMENT OF ANAPHYLAXIS:

Withdraw product, maintain airway; administer EPINEPHrine, aminophylline, O₂, IV corticosteroids

🍁 Canada only Side effects: *italics* = common; **bold** = life-threatening ⚠️
Nurse Alert

amoxicillin/clavulanate (Rx)

(a-mox-i-sill'in)

Amoclan, Apo-Amoxi Clav , Augmentin, Augmentin XR, Clavulin 

Func. class.: Broad-spectrum antiinfective

Chem. class.: Aminopenicillin β -lactamase inhibitor

Do not confuse: **Augmentin**/amoxicillin

ACTION:

Bacteriocidal, interferes with cell wall replication of susceptible organisms; the cell wall, rendered osmotically unstable, swells and bursts from osmotic pressure; lysis mediated by bacterial cell wall autolytic enzymes, combination increases spectrum of activity against β -lactamase-resistant organisms

USES:

Lower respiratory tract infections, sinus infections, pneumonia, otitis media, skin infection, UTI; effective for strains of *Escherichia coli*, *Proteus mirabilis*, *Haemophilus influenzae*, *Streptococcus faecalis*, *Streptococcus pneumoniae*, and some β -lactamase-producing organisms

Unlabeled uses: Actinomycotic mycetoma, chancroid, dental infections, dentoalveolar infection, melioidosis, pericoronitis, SARS

CONTRAINDICATIONS:

Hypersensitivity to penicillins, severe renal disease, dialysis, jaundice

Precautions: Pregnancy (B), breastfeeding, neonates, children, hypersensitivity to cephalosporins; renal/GI disease, asthma, colitis, diabetes, eczema, leukemia, mononucleosis, viral infections, phenylketonuria

DOSAGE AND ROUTES

Calculator

- **Adult: PO** 250-500 mg q8hr or 500-875 mg q12hr, depending on severity of infection
- **Child ≤ 40 kg: PO** 20-90 mg/kg/day in divided doses q8-12hr

Renal disease

- **Adult: PO** CCr 10-30 ml/min dose q12hr; CCr <10 ml/min dose q24hr; do not

use 875-mg strength or ext rel if CCr <30 ml/min; Augmentin XR is contraindicated with renal disease

Available forms: Tabs 250, 500, 875 mg/125 mg clavulanate; chew tabs 200/28.5, 400/57 mg; powder for oral susp 250/28.5, 200/28.5, 400/57, 600/42.9 mg/5 ml; ext rel tabs (XR) 1000 mg amoxicillin, 62.5 mg clavulanate; powder for oral susp (ES) 600 mg amoxicillin, 42.9 mg clavulanate

Administer:

PO route

- Do not break, crush, chew XR (ext rel) product
- ⚠️ Only as directed; two 250-mg tabs not equivalent to one 500-mg tab due to strength of clavulanate • Shake susp well before each dose; may be used alone, mixed in drinks; use immediately, discard unused portion of susp after 14 days, store in refrigerator • Give around the clock
- Give with light meal for increased absorption

SIDE EFFECTS

CNS: Headache, fever, **seizures**, agitation, insomnia

GI: *Nausea, diarrhea, vomiting*, increased AST/ALT, abdominal pain, glossitis, colitis, black tongue, **pseudomembranous colitis**

GU: Oliguria, proteinuria, hematuria, *vaginitis, moniliasis*, **glomerulonephritis**

HEMA: Anemia, **bone marrow depression**, **granulocytopenia**, **leukopenia**, **eosinophilia**, thrombocytopenic purpura

INTEG: *Rash*, urticaria, dermatitis, **toxic epidermal necrolysis**

META: Hypo/hyperkalemia, alkalosis, hypernatremia

SYST: **Anaphylaxis**, **respiratory distress**, **serum sickness**, **superinfection**, **Stevens-Johnson syndrome**, candidiasis

PHARMACOKINETICS

PO: Peak 2 hr, duration 6-8 hr, half-life 1-1½ hr, metabolized in liver, excreted in urine, crosses placenta, excreted in breast milk, removed by hemodialysis

INTERACTIONS

Increase: amoxicillin levels—probenecid

Increase: anticoagulant effect—warfarin

Increase: skin rash—allopurinol

Decrease: action of oral contraceptives

Drug/Food

Decrease: absorption by a high-fat meal

Drug/Lab Test

Increase: AST/ALT, alk phos, LDH

False positive: direct Coombs's test

NURSING CONSIDERATIONS

Assess:

⚠️ **Nephrotoxicity** at high doses: I&O ratio; report hematuria, oliguria • **Hepatic studies:** AST, ALT

- Blood studies: WBC, RBC, Hgb, Hct, bleeding time
- Renal studies: urinalysis, protein, blood, BUN, creatinine; if urine output decreases, long-acting products should not be used • C&S before product therapy; product may be given as soon as culture is taken

⚠️ **Pseudomembranous colitis:** bowel pattern before, during treatment; diarrhea, cramping, blood in stools; report to prescriber ⚠️ **Anaphylaxis:** rash, itching, dyspnea, facial/laryngeal edema; skin eruptions after administration of penicillin to 1 wk after discontinuing product

Perform/provide:

- Adrenaline, suction, tracheostomy set, endotracheal intubation equipment on unit
- Adequate intake of fluids (2 L) during diarrhea episodes
- Scratch test to assess allergy after securing order from prescriber; usually done when penicillin is only product of choice • Storage in refrigerator for 10 days

Evaluate:

- Therapeutic response: absence of infection

Teach patient/family:

- To take as prescribed, not to double dose
- All aspects of product therapy: to complete entire course of medication to ensure organism death (10-14 days); that culture may be taken after completed course of medication ⚠️ To report sore throat, fever, fatigue (**superinfection or agranulocytosis**); diarrhea, cramping, blood in stools (**pseudomembranous colitis**)
- That product must be taken in equal intervals around the clock to maintain blood levels

- To wear or carry emergency ID if allergic to penicillins

TREATMENT OF HYPERSENSITIVITY:

Withdraw product, maintain airway, administer EPINEPHrine, aminophylline, O₂, IV corticosteroids for anaphylaxis

✳ Canada only Side effects: *italics* = common; **bold** = life-threatening ⚠
Nurse Alert

amphotericin B lipid complex

(am-foe-ter'i-sin)

Abelcet

Func. class.: Antifungal

Chem. class.: Amphoteric polyene

ACTION:

Increases cell membrane permeability in susceptible fungi by binding sterols; alters cell membrane, thereby causing leakage of cell components, cell death

USES:

Indicated for the treatment of invasive fungal infections in patients who cannot tolerate or have failed conventional amphotericin B therapy; broad-spectrum activity against many fungal, yeast and mold pathogen infections, including *Aspergillus*, *Zygomycetes*, *Fusarium*, *Cryptococcus*, and many hard-to-treat *Candida* species; *Aspergillus fumigatus*, *Aspergillus* sp., *Blastomyces dermatitidis*, *Candida albicans*, *Candida guilliermondii*, *Candida* sp., *Candida stellatoidea*, *Candida tropicalis*, *Coccidioides immitis*, *Cryptococcus* sp., *Histoplasma* sp.

CONTRAINDICATIONS:

Hypersensitivity, severe bone marrow depression

DOSAGE AND ROUTES

Calculator

• **Adult: IV** 5 mg/kg/day as a single inf given at 2.5 mg/kg/hr

Available forms: Susp for inj 100 mg/20-ml vial

Administer:

 Do not confuse four different types; these are not interchangeable: conventional amphotericin B, amphotericin B cholesteryl, amphotericin B lipid complex, amphotericin B liposome

IV route

- Give product only after C&S confirms organism, product needed to treat condition; make sure product is used for life-threatening infections
- Handle with aseptic technique because amphotericin B lipid complex (ABLC) does

not contain any preservatives; visually inspect parenteral products for particulate matter and discoloration before use

Filtration and dilution:

- Prepare the admixture for infusion by first shaking the vial until there is no evidence of yellow sediment on the bottom of the vial.
- Transfer the appropriate amount of drug from the required number of vials into one or more sterile syringes using an 18-gauge needle.
- Attach the provided 5-micron filter needle to the syringe; inject the syringe contents through the filter needle, into an IV bag containing the appropriate amount of D5W injection. Each filter needle may be used on the contents of no more than four 100-mg vials.
- The suspension must be diluted with D5W injection to a final concentration of 1 mg/ml. For pediatric patients and patients with cardiovascular disease, the final concentration may be 2 mg/ml. **DO NOT USE SALINE SOLUTIONS OR MIX WITH OTHER DRUGS OR ELECTROLYTES.**
- The diluted ready-for-use admixture is stable for up to 48 hr at 2-8 degrees C (36-46 degrees F) and an additional 6 hr at room temperature. Do not freeze.

IV INF:

- Flush IV line with D₅W injection before use or use a separate IV line; **DO NOT USE AN IN-LINE FILTER.**
- Before infusion, shake the bag until the contents are thoroughly mixed; max rate 2.5 mg/kg/hr. If the infusion time exceeds 2 hr, mix the contents by shaking the infusion bag every 2 hr.

Y-site compatibilities: anidulafungin, ertapenem, octreotide

SIDE EFFECTS

CNS: *Headache, fever, chills*, peripheral nerve pain, paresthesias, peripheral neuropathy, **seizures**, dizziness

CV: Bradycardia, hypotension, **cardiac arrest**

EENT: Tinnitus, deafness, diplopia, blurred vision

GI: *Nausea, vomiting, anorexia*, diarrhea, cramps, **hemorrhagic gastroenteritis, acute liver failure**

GU: *Hypokalemia*, **azotemia, hyposthenuria, renal tubular acidosis**,

nephrocalcinosis, permanent renal impairment, anuria, oliguria

HEMA: Normochromic, normocytic anemia, thrombocytopenia, agranulocytosis, leukopenia, eosinophilia, hyponatremia, hypomagnesemia

INTEG: *Burning, irritation*, pain, *necrosis at inj site with extravasation*, flushing, dermatitis

MS: Arthralgia, myalgia, generalized pain, weakness, weight loss

SYST: *Toxic epidermal neurolysis, exfoliative dermatitis, anaphylaxis*

PHARMACOKINETICS

IV: Peak 1-2 hr; initial half-life (LAmB) mean 4-6 days; metabolized in liver; excreted in urine (metabolites), breast milk; protein binding 90%; poorly penetrates CSF, bronchial secretions, aqueous humor, muscle, bone; terminal half-life lipid complex mean 7 days

INTERACTIONS

Increase: nephrotoxicity—other nephrotoxic antibiotics (aminoglycosides, CISplatin, vancomycin, cycloSPORINE, polymyxin B)

Increase: hypokalemia—corticosteroids, digoxin, skeletal muscle relaxants, thiazides

NURSING CONSIDERATIONS

Assess:

- VS every 15-30 min during first inf; note changes in pulse, B/P
- I&O ratio; watch for decreasing urinary output, change in specific gravity; discontinue product to prevent permanent damage to renal tubules
- Blood studies: CBC, potassium, sodium, calcium, magnesium every 2 wk; BUN, creatinine 2-3 $\times$ /wk
- Weight weekly; if weight increases by more than 2 lb/wk, edema is present; renal damage should be considered
- **For renal toxicity:** increasing BUN, serum creatinine; if BUN is >40 mg/dl or if serum creatinine is >3 mg/dl, product may be discontinued, dosage reduced
- **For hepatotoxicity:** increasing AST, ALT, alk phos, bilirubin
- *For allergic reaction: dermatitis, rash; product should be discontinued, antihistamines (mild reaction) or EPINEPHrine (severe reaction) should be administered*
- *For hypokalemia: anorexia, drowsiness, weakness, decreased reflexes, dizziness, increased urinary output, increased thirst, paresthesias*
- *For ototoxicity: tinnitus (ringing, roaring in ears), vertigo, loss of hearing (rare)*

Perform/provide:

- Prior to dilution, store at 2°-8° C (36°-46° F), protected from moisture and light; do not freeze; the diluted, ready-for-use admixture is stable for up to 48 hours at 2°-8° C (36°-46° F) and an additional 6 hours at room temperature; do not freeze

Evaluate:

- Therapeutic response: decreased fever, malaise, rash, negative C&S for infecting organism

Teach patient/family:

- That long-term therapy may be needed to clear infection (2 wk-3 mo, depending on type of infection)
- To notify prescriber of bleeding, bruising, or soft-tissue swelling

🍁 Canada only Side effects: *italics* = common; **bold** = life-threatening ⚠️
Nurse Alert

amphotericin B liposomal (LAmB)

(am-foe-ter'i-sin)

AmBisome

Func. class.: Antifungal

Chem. class.: Amphoteric polyene

ACTION:

Increases cell membrane permeability in susceptible fungi by binding to membrane sterols; alters cell membrane, thereby causing leakage of cell components, cell death

THERAPEUTIC OUTCOME

Resolution of infection

USES:

Empirical therapy for presumed fungal infection in febrile neutropenic patients; treatment of *Cryptococcal* Meningitis in HIV-infected patients; treatment of *Aspergillus* species, *Candida* species and/or *Cryptococcus* species infections refractory to amphotericin B deoxycholate, or in patients where renal impairment or unacceptable toxicity precludes the use of amphotericin B deoxycholate (*Aspergillus flavus*, *Aspergillus fumigatus*, *Blastomyces dermatitidis*, *Candida albicans*, *Candida krusei*, *Candida lusitanae*, *Candida parapsilosis*, *Candida tropicalis*, *Cryptococcus neoformans*); treatment of visceral leishmaniasis

CONTRAINDICATIONS:

Hypersensitivity, severe bone marrow depression

DOSAGE AND ROUTES

Calculator

Visceral leishmaniasis

- **Adult and child ≥ 1 mo: IV** 3 mg/kg every 24 hr days 1-5, and days 14, 21 (immunocompetent), 4 mg/kg every 24 hr days 1-5, and days 10, 17, 24, 31, 38

(immunocompromised)

Cryptococcal meningitis in HIV

- **Adult and child ≥ 1 mo: IV 6 mg/kg/day**

Fungal infection, empirical

- **Adult and child ≥ 1 mo: IV 3 mg/kg/day**

Fungal infection, systemic

- **Adult and child ≥ 1 mo: IV 3-5 mg/kg/day**

Available forms: Powder for inj 50-mg vial

Administer

 **Do not confuse four different types; these are not interchangeable: conventional amphotericin B, amphotericin B cholesteryl, amphotericin B lipid complex, amphotericin B liposome**

IV route

- Give only after C&S confirms organism, product needed to treat condition; make sure product is used for life-threatening infections • Administer by IV infusion only; handle with aseptic technique as LAmB does not contain any preservatives • Visually inspect products for particulate matter and discoloration

Reconstitution

- LAmB *must* be reconstituted using sterile water for injection (without a bacteriostatic agent). **DO NOT RECONSTITUTE WITH SALINE OR ADD SALINE TO THE RECONSTITUTED SUSPENSION, DO NOT MIX WITH OTHER DRUGS;** doing so can cause a precipitate to form.
- Reconstitute vials containing 50 mg of LAmB *12 ml of sterile water (4 mg/ml)*.
- Immediately after the addition of water, **SHAKE THE VIAL VIGOROUSLY** for 30 sec; the suspension should be yellow and translucent. Visually inspect vial for particulate matter and continue shaking until product is completely dispersed.
- Store suspension for up to 24 hours refrigerated if using sterile water for injection; do not freeze.

Filtration and dilution

- Calculate the amount of reconstituted (4 mg/ml) suspension to be further diluted and withdraw this amount into a sterile syringe.
- Attach the provided 5-micron filter to the syringe; inject the syringe

contents through the filter, into the appropriate amount of D₅W injection. Use only one filter per vial.

- The suspension must be diluted with D₅W injection to a final concentration of 1-2 mg/ml before administration. For infants and small children, lower concentrations (0.2-0.5 mg/ml) may be appropriate to provide sufficient volume for infusion.
- Use injection of LAmB within 6 hr of dilution with D5W

IV INF

- Flush intravenous line with D5W injection before infusion. If this cannot be done, then a separate IV line must be used.
- An inline membrane filter may be used provided the mean pore diameter of the filter is not less than 1 micron.
- Administer by IV infusion using a controlled infusion device over a period of approximately 120 min. Infusion time may be reduced to approximately 60 min in patients who tolerate the infusion. If discomfort occurs during infusion, the duration of infusion may be increased.

Acetaminophen and diphenhydrAMINE

- 30 min before inf to reduce fever, chills, headache
- Storage protected from moisture and light; diluted solution is stable for 24 hr at room temp

Y-site compatibilities: Acyclovir, amifostine, aminophylline, anidulafungin, atropine, azithromycin, bivalirudin, bumetanide, buprenorphine, busulfan, butorphanol, CARBOplatin, carmustine, ceFAZolin, ceFOXitin, ceftizoxime, cefTRIAxone, cefuroxime, cimetidine, clindamycin, cyclophosphamide, cytarabine, DACTINomycin, DAPTOmycin, dexamethasone, dexmedetomidine, diphenhydrAMINE, doxacurium, enalaprilat, ePHEDrine, EPINEPHrine, eptifibatide, ertapenem, esmolol, etoposide, famotidine, fenoldopam, fentaNYL, fludarabine, fluorouracil, fosphenytoin, furosemide, granisetron, haloperidol, heparin, hydrocortisone, HYDROmorphine, ifosfamide, isoproterenol, ketorolac, levorphanol, lidocaine, linezolid, mesna, methotrexate, methylPREDNISolone, metoprolol, milrinone, mitoMYcin, nesiritide, nitroglycerin, nitroprusside, octreotide, oxaliplatin, oxytocin, palonosetron, pancuronium, pantoprazole, PEMEtrexed, PENTobarbital, PHENObarbital, phenylephrine, piperacillin/tazobactam, potassium chloride, procainamide,

ranitidine, SUFentanil, tacrolimus, theophylline, thiopental, thiotepa, ticarcillin/clavulanate, tigecycline, trimethoprim-sulfamethoxazole, vasopressin, vinCRIStine, voriconazole, zidovudine

SIDE EFFECTS

CNS: *Headache, fever, chills*, peripheral nerve pain, paresthesias, peripheral neuropathy, seizures, dizziness

CV: Bradycardia, hypotension, cardiac arrest

EENT: Tinnitus, deafness, diplopia, blurred vision

GI: *Nausea, vomiting, anorexia*, diarrhea, cramps, **hemorrhagic gastroenteritis, acute liver failure**

GU: *Hypokalemia*, **azotemia, hyposthenuria**, renal tubular acidosis, **nephrocalcinosis**, permanent renal impairment, anuria, oliguria

HEMA: **Normochromic normocytic anemia, thrombocytopenia, agranulocytosis, leukopenia, eosinophilia**, hyponatremia, hypomagnesemia

INTEG: *Burning, irritation*, pain, **necrosis at inj site with extravasation**, flushing, dermatitis, skin rash (topical route)

MS: Arthralgia, myalgia, generalized pain, weakness, weight loss

SYST: **Stevens–Johnson syndrome, toxic epidermal neurolysis, exfoliative dermatitis, anaphylaxis**

PHARMACOKINETICS

IV: Peak 1-2 hr; initial half-life (LAmB) mean 4-6 days; metabolized in liver; excreted in urine (metabolites), breast milk; protein binding 90%; poorly penetrates CSF, bronchial secretions, aqueous humor, muscle, bone; terminal half-life mean 4-6 days

INTERACTIONS

Increase: Nephrotoxicity—other nephrotoxic antibiotics (aminoglycosides, CISplatin, vancomycin, cycloSPORINE, polymyxin B)

Increase: Hypokalemia—corticosteroids, digoxin, skeletal muscle relaxants, thiazides

NURSING CONSIDERATIONS

Assess:

- VS every 15-30 min during first inf; note changes in pulse, B/P
- I&O ratio; watch for decreasing urinary output, change in specific gravity; discontinue product to prevent permanent damage to renal tubules • Blood studies: CBC, potassium, sodium, calcium, magnesium every 2 wk, BUN, creatinine 2-3 $\times$ /wk • Weight weekly; if weight increases by more than 2 lb/wk, edema is present; renal damage should be considered • **For renal toxicity:** increasing BUN, serum creatinine; if BUN is >40 mg/dl or if serum creatinine is >3 mg/dl, product may be discontinued, dosage reduced • **For hepatotoxicity:** increasing AST, ALT, alk phos, bilirubin
- **For allergic reaction:** dermatitis, rash; product should be discontinued, antihistamines (mild reaction) or EPINEPHrine (severe reaction) administered
- **For hypokalemia:** anorexia, drowsiness, weakness, decreased reflexes, dizziness, increased urinary output, increased thirst, paresthesias • **For ototoxicity:** tinnitus (ringing, roaring in ears), vertigo, loss of hearing (rare)

Evaluate:

- Therapeutic response: decreased fever, malaise, rash, negative C&S for infecting organism

Teach patient/family:

- That long-term therapy may be needed to clear infection (2 wk-3 mo, depending on type of infection) • To notify prescriber of bleeding, bruising, or soft-tissue swelling

ampicillin (Rx)

(am-pi-sill'in)

Func. class.: Antiinfective—broad-spectrum

Chem. class.: Aminopenicillin

Do not confuse: **Omnipen**/imipenem

ACTION:

Interferes with cell wall replication of susceptible organisms; the cell wall, rendered osmotically unstable, swells, bursts from osmotic pressure; lysis mediated by cell wall autolysins

USES:

Effective for gram-positive cocci (*Staphylococcus aureus*, *Streptococcus pyogenes*, *Streptococcus faecalis*, *Streptococcus pneumoniae*), gram-negative cocci (*Neisseria meningitidis*), gram-negative bacilli (*Haemophilus influenzae*, *Proteus mirabilis*, *Salmonella*, *Shigella*, *Listeria monocytogenes*), gram-positive bacilli; meningitis, GI/GU/respiratory infections, endocarditis, septicemia, otitis media

Unlabeled uses: Biliary tract infection, shigellosis, typhoid fever, PID, OB/GYN infections, leptospirosis

CONTRAINDICATIONS:

Hypersensitivity to penicillins, antimicrobial resistance

Precautions: Pregnancy (B), breastfeeding, neonates, hypersensitivity to cephalosporins, renal disease, mononucleosis

DOSAGE AND ROUTES

Calculator

Systemic infections

- **Adult and child ≥ 40 kg:** PO 250-500 mg q6hr; IV/IM 2-8 g/day in divided doses q4-6hr
- **Child < 40 kg:** PO 50-100 mg/kg/day in divided doses q6-8hr; IV/IM 100-200 mg/kg/day in divided doses q6-8hr

Bacterial meningitis

- **Adult and adolescent:** IM/IV 150-200 mg/kg/day in divided doses q3-4hr; IDSA dose IV 12 g in divided doses q4hr
- **Infant and child:** IM/IV 150-200 mg/kg/day in divided doses q3-4hr; IDSA dose IV 300 mg/kg/day in divided doses q6hr
- **Neonates >7 days and >2000 g:** IM/IV 200 mg/kg/day in divided doses q6hr; IDSA dose IV 200 mg/kg/day in divided doses q6-8hr

Gonorrhea (urethritis)

- **Adult and child ≥ 45 kg:** PO 3.5 g given with 1 g probenecid as a single dose (not recommended by CDC)

Prevention of bacterial endocarditis

- **Adult:** IM/IV 2 g 30 min before procedure
- **Child:** IM/IV 50 mg/kg 30 min before procedure, max 2 g

GI/GU infections other than *N. gonorrhoeae*

- **Adult and child >20 kg:** PO 250-500 mg q6hr, may use larger dose for more serious infections
- **Child ≤ 20 kg:** PO 50-100 mg/kg/day in divided doses q6hr

Renal disease

- **Adult and child:** CCr 10-50 ml/min extend to q6-12hr; CCr <10 ml/min extend to q12-16hr

Shigellosis in AIDS patients (unlabeled)

- **Adult:** PO 500 mg qid $\times$ 5 days (not recommended by CDC)

Typhoid fever (unlabeled)

- **Adult/adolescent/child:** IV 100 mg/kg/day in divided doses q6hr $\times$ 14 days or more

Available forms: Powder for inj 125, 250, 500 mg, 1, 2, 10 g; IV inj 500 mg, 1, 2 g; caps 250, 500 mg; powder for oral susp 125, 250/5 ml

Administer:

PO route

- On empty stomach with plenty of water for best absorption (1-2 hr before meals or 2-3 hr after meals) • Shake susp well before each dose

IM route

- **Reconstitute** by adding 0.9-1.2 ml/125-mg vial; 0.9-1.9 ml/250-mg vial; 1.2-1.8 ml/500-mg vial; 2.4-7.4 ml/1-g vial; 6.8 ml/2-g vial

IV route

- **IV direct:** after diluting with sterile water 0.9-1.2 ml/125 mg product,

administer over 3-5 min (up to 500 mg), 10-15 min (>500 mg)

Intermittent IV INF route

- May be diluted in 50 ml or more of D₅W, D₅ 0.45% NaCl to a conc of 30 mg/ml or less; IV sol is stable for 1 hr; give at prescribed rate, do not give in same tubing as aminoglycosides, separate by ≥1 hr

Y-site compatibilities: Acyclovir, alprostadil, amifostine, aminocaproic acid, anidulafungin, atenolol, bivalirudin, bleomycin, CARBOplatin, CISplatin, clarithromycin, cyclophosphamide, DACTINomycin, DAPTOmycin, dexmedetomidine, docetaxel, doxacurium, DOXOrubicin liposome, eptifibatide, etoposide, filgrastim, fludarabine, fluorouracil, foscarnet, gatafloxacin, gemcitabine, granisetron, hetastarch, ifosfamide, irinotecan, levofloxacin, linezolid, mechlorethamine, methotrexate, metroNIDAZOLE, octreotide, ofloxacin, oxaliplatin, PACLitaxel, palonosetron, pamidronate, pancuronium, pantoprazole, PEMEtrexed, perphenazine, propofol, remifentanyl, riTUXimab, rocuronium, sodium acetate, teniposide, thiotepa, tigecycline, tirofiban, TNA, trastuzumab, vinCRISTine, vit B/C, voriconazole

SIDE EFFECTS

CNS: Lethargy, hallucinations, anxiety, depression, twitching, **coma, seizures**

GI: *Nausea, vomiting, diarrhea, pseudomembranous colitis*, stomatitis

GU: Oliguria, proteinuria, hematuria, *vaginitis, moniliasis, glomerulonephritis*

HEMA: Anemia, increased bleeding time, **bone marrow depression, granulocytopenia**, leukopenia, eosinophilia, **hemolysis**

INTEG: *Rash, urticaria*, erythema multiforme

MISC: **Anaphylaxis, serum sickness, Stevens-Johnson syndrome, toxic epidermal necrolysis**

PHARMACOKINETICS

Half-life 50-110 min; metabolized in liver; excreted in urine, bile, breast milk; crosses placenta; removed by dialysis

PO: Peak 2 hr, duration 6-8 hr

IM: Peak 1 hr

IV: Peak 5 min

INTERACTIONS

Increase: bleeding, oral anticoagulants, monitor INR/PIJ

Increase: ampicillin concentrations—probenecid

Increase: ampicillin-induced skin rash—allopurinol, monitor for rash

Drug/Lab Test

Increase: AST, ALT

Decrease: conjugated estrone during pregnancy, conjugated estriol

False positive: urine glucose

NURSING CONSIDERATIONS

Assess:

- **Infection:** characteristics of wound, sputum, WBC; baseline, periodically; C&S before product therapy, product may be taken as soon as culture is taken ⚠

- **Nephrotoxicity:** I&O ratio; report hematuria, oliguria; renal studies: urinalysis, protein, blood, BUN, creatinine • Hepatic studies: AST, ALT

- Blood studies: WBC, RBC, Hgb, Hct, bleeding time

- Bowel pattern before, during treatment

- Skin eruptions after administration of penicillin to 1 wk after discontinuing product; identify allergies before using • Respiratory status: rate, character, wheezing, tightness in chest

- ⚠ **Anaphylaxis:** rash, itching, dyspnea, facial swelling; stop product, notify prescriber, have emergency equipment available

Perform/provide:

- Adequate intake of fluids (2 L) during diarrhea episodes

- Scratch test to assess allergy after securing order from prescriber; usually done when penicillin is only product of choice • Storage in tight container; after reconstituting, oral suspension refrigerated for 2 wk or stored at room temp for 1 wk

Evaluate:

- Therapeutic response: absence of fever, draining wounds, other symptoms of infection

Teach patient/family:

- That tabs may be crushed; caps may be opened, mixed with water

- To take oral ampicillin on empty stomach with full glass of water

- All aspects of product therapy: to complete entire course of medication to ensure organism death (10-14 days); that culture may be taken after completed

course of medication ⚠️ To report sore throat, fever, fatigue, diarrhea (may indicate **superinfection**); to report rash, other signs of allergy • That product must be taken in equal intervals around the clock to maintain blood levels

- To wear or carry emergency ID if allergic to penicillins

- **Pseudomembranous colitis**: diarrhea with blood or pus; notify prescriber

TREATMENT OF ANAPHYLAXIS:

Withdraw product, maintain airway; administer EPINEPHrine, aminophylline, O₂, IV corticosteroids

🍁 Canada only Side effects: *italics* = common; **bold** = life-threatening ⚠️
Nurse Alert

ampicillin, sulbactam (Rx)

Unasyn

Func. class.: Antiinfective—broad-spectrum

Chem. class.: Aminopenicillin with β -lactamase inhibitor

ACTION:

Interferes with cell wall replication of susceptible organisms; the cell wall, rendered osmotically unstable, swells, bursts from osmotic pressure; lysis due to cell wall autolytic enzymes; combination extends spectrum of activity by β -lactamase inhibition

USES:

Skin infections, intraabdominal infections, pneumonia (*Staphylococcus aureus*, *Escherichia coli*, *Klebsiella*, *Proteus mirabilis*, *Bacteroides fragilis*, *Haemophilus influenzae*, *Enterobacter*, *Acinetobacter calcoaceticus*), intraabdominal infections (*Enterobacter*, *Klebsiella*, *Bacteroides*, *E. coli*), gynecologic infections (*E. coli*, *Bacteroides*), meningitis, septicemia

Unlabeled uses: Aspiration pneumonia, bone/joint infections, gonorrhea, infectious arthritis, lower respiratory infections, osteomyelitis, PID, UTI

CONTRAINDICATIONS:

Hypersensitivity to penicillins, ampicillin, sulbactam

Precautions: Pregnancy (B), breastfeeding, neonates, hypersensitivity to cephalosporins/carbapenems, renal disease, mononucleosis, viral infections, syphilis

DOSAGE AND ROUTES

Calculator

- **Adult/adolescent/child ≥ 40 kg:** IM/IV 1.5-3 g q6hr, max 4 g/day sulbactam
- **Child ≤ 40 kg:** IV 150-300 mg/kg/day divided q6hr, max 4 g/day

Renal disease

- **Adult ≥ 40 kg:** IM/IV CCr 15-30 ml/min dose q12hr; CCr 5-15 ml/min dose q24hr

Available forms: Powder for inj 1.5 g (1 g ampicillin, 0.5 g sulbactam), 3 g (2 g

ampicillin, 1 g sulbactam), 10 g (10 g ampicillin, 5 g sulbactam)

Administer:

IM route

- Reconstitute by adding 3.2 ml sterile water/1.5-g vial; 6.4 ml/3-g vial, give deep in large muscle, aspirate
- Do not use IM in child

Direct IV route

- After diluting 1.5 g/3.2 ml sterile water for inj or 3 g/6.4 ml (250 mg ampicillin/125 mg sulbactam), allow to stand until foaming stops; may give over 15 min

Intermittent IV INF route

- Dilute further in 50 ml or more of D₅W, NaCl; administer within 1 hr after reconstitution; give over 15-30 min, separate doses from aminoglycosides by ≥1 hr

Y-site compatibilities: Amifostine, aminocaproic acid, anidulafungin, atenolol, bivalirudin, bleomycin, CARBOplatin, cefepime, CISplatin, codeine, cyclophosphamide, cytarabine, DAPTOmycin, dexmedetomidine, docetaxel, doxacurium, eptifibatide, etoposide, fenoldopam, filgrastim, fludarabine, fluorouracil, gallium, gatifloxacin, gemcitabine, granisetron, hetastarch, irinotecan, levofloxacin, linezolid, methotrexate, metroNIDAZOLE, octreotide, oxaliplatin, PACLitaxel, palonosetron, pamidronate, pancuronium, pantoprazole, PEMEtrexed, remifentanyl, riTUXimab, rocuronium, tacrolimus, teniposide, thiotepa, tigecycline, tirofiban, TNA, TPN, trastuzumab, vencuronium, vinCRIStine, voriconazole

SIDE EFFECTS

CNS: Lethargy, hallucinations, anxiety, depression, twitching, **coma, seizures**

GI: *Nausea, vomiting, diarrhea*, increased AST/ALT, abdominal pain, glossitis, colitis, **pseudomembranous colitis, hepatic necrosis/failure**

GU: Oliguria, proteinuria, hematuria, *vaginitis, moniliasis*, **glomerulonephritis**, dysuria

HEMA: Anemia, increased bleeding time, **bone marrow depression, granulocytopenia, leukopenia, eosinophilia, hemolysis**

INTEG: Injection site reactions, rash, edema, urticaria

MISC: **Anaphylaxis, serum sickness, toxic epidermal necrolysis, Stevens-**

Johnson syndrome

PHARMACOKINETICS

IV: Peak 5 min, half-life 50-110 min, little metabolized in liver, 75%-85% of both products excreted in urine, diffuses to breast milk, crosses placenta

INTERACTIONS

Increase: bleeding risk—oral anticoagulants; check, INR, PT

Increase: ampicillin-induced skin rash—allopurinol, check for rash

Increase: ampicillin level—probenecid

Increase: methotrexate level—methotrexate

Drug/Lab Test

False positive: urine glucose, urine protein

NURSING CONSIDERATIONS

Assess:

- **Infection:** characteristics of wound, sputum; take temperature, WBC count; C&S before product therapy, product may be given as soon as culture is taken
- Bowel pattern before, during treatment
- I&O ratio; report hematuria, oliguria because penicillin in high doses is nephrotoxic

⚠️ Any patient with compromised renal system, because product excreted slowly with poor renal system function; toxicity may occur rapidly • Hepatic studies: AST, ALT if on long-term therapy

- Blood studies: WBC, RBC, Hct, Hgb, bleeding time
- Renal studies: urinalysis, protein, blood, BUN, creatinine

⚠️ **Anaphylaxis:** skin eruptions after administration of ampicillin to 1 wk after discontinuing product • Allergies before treatment; reaction to each medication; report allergies

Perform/provide:

- Scratch test to assess allergy after securing order from prescriber; usually done when penicillin is only product choice • Storage in tight container, out of light

Evaluate:

- Therapeutic response: absence of fever, draining wounds; negative C&S

Teach patient/family:

- To report superinfection: vaginal itching; loose, foul-smelling stools; black

furry tongue

 **Pseudomembranous colitis:** fever, diarrhea with pus, blood, mucus; may occur up to 4 wk after treatment; report immediately to health care provider • To wear or carry emergency ID if allergic to penicillin products

TREATMENT OF ANAPHYLAXIS:

Withdraw product, maintain airway; administer EPINEPHrine, aminophylline, O₂, IV corticosteroids

🍁 Canada only Side effects: *italics* = common; **bold** = life-threatening 
Nurse Alert

anakinra (Rx)

(an-ah-kin'rah)

Kineret

Func. class.: Antirheumatic (DMARD), immunomodulator

Chem. class.: Recombinant form of human interleukin-1 receptor antagonist (IL-1Ra)

Do not confuse: **Anakinra**/amikacin

ACTION:

A form of human interleukin-1 receptor antagonist (IL-1Ra) produced by DNA technology; blocks activity of IL-1, thereby resulting in decreased inflammation, cartilage degradation, bone resorption

USES:

Reduction in signs and symptoms of moderate to severe active rheumatoid arthritis in patients ≥ 18 yr who have not responded to other disease-modifying agents

Unlabeled uses: Cryopyrin-associated periodic syndromes

CONTRAINDICATIONS:

Hypersensitivity to *Escherichia-coli*-derived proteins, product, latex; sepsis

Precautions: Pregnancy (B), breastfeeding, children, geriatric patients, renal impairment, active infections, immunosuppression, neoplastic disease, asthma

DOSAGE AND ROUTES

Calculator

• **Adult:** SUBCUT 100 mg/day

Renal dose

• **Adult:** CCr < 30 ml/min **SUBCUT** 100 mg every other day

Available form: Inj 100 mg/0.67 ml prefilled glass syringe

Administer:

SUBCUT route

- Do not use if cloudy, discolored, if particulate is present; protect from light
- Do not admix with other sol or medications; do not use filter; give at same time each day

- Apply cold compress before, after inj, allow sol to warm to room temp before use
- Use middle thigh, abdomen (outside 2 inches from navel), upper outer buttocks, upper outer area of arm; rotate sites, give inj at least 1 inch from old site; do not give in skin that is bruised, red, tender, hard; remove needle cover immediately before use, pull gently back on plunger, if no blood appears, inject entire contents of prefilled syringe; discard any unused portion

SIDE EFFECTS

CNS: *Headache*

CV: *Cardiac arrest*

EENT: *Sinusitis*

GI: *Abdominal pain, nausea, diarrhea*

HEMA: *Neutropenia*

INTEG: *Rash, inj site reaction, allergic reaction*

MISC: *Flulike symptoms, infection*

MS: *Worsening of RA, arthralgia*

RESP: *URI*

PHARMACOKINETICS

Terminal half-life 4-6 hr; eliminated renally

INTERACTIONS

- Do not use rilonacept

Increase: risk for severe infection—TNF-blocking agents, do not use together

Decrease: antibody reactions—vaccines, avoid concurrent use

NURSING CONSIDERATIONS

Assess:

- **Rheumatoid arthritis:** pain, stiffness, ROM, swelling of joints, baseline, periodically during treatment
- For inj site pain, swelling; usually occurs after 2 inj (4-5 days)
- For infections (increased WBC, fever, flulike symptoms); stop treatment if present, do not start if patient has active infection
- CBC with differential, neutrophil counts before treatment, monthly $\times$ 3 mo, quarterly for up to 1 yr thereafter
- For allergic reactions (rash, dyspnea); discontinue if severe

- For urinary status: decreasing urinary output

Evaluate:

- Therapeutic response: decreased inflammation, pain in joints

Teach patient/family:

- Not to receive vaccines while taking this product; to update vaccines before treatment
- About self-administration, if appropriate: inj should be made in thigh, abdomen, upper arm; rotate sites at least 1 inch from old site; give at same time of day, store in refrigerator, do not freeze
- To notify prescriber if pregnancy is planned, suspected, to avoid breastfeeding; to notify prescriber of allergic reaction, decreasing urine output, signs/symptoms of infection

☼ Canada only Side effects: *italics* = common; **bold** = life-threatening ⚠
Nurse Alert

⚠ **HIGH ALERT**

anastrozole (Rx)

(an-a-stroh'zole)

Arimidex

Func. class.: Antineoplastic

Chem. class.: Aromatase inhibitor

ACTION:

Highly selective nonsteroidal aromatase inhibitor that lowers serum estradiol concentrations; many breast cancers have strong estrogen receptors

USES:

Advanced breast carcinoma not responsive to other therapy in estrogen-receptor-positive patients (postmenopausal); patients with advanced disease taking tamoxifen, adjunct therapy for early breast cancer

Unlabeled uses: Uterine leiomyomata, breast cancer (in those who have received tamoxifen for 2-3 yr)

CONTRAINDICATIONS:

Pregnancy (X), breastfeeding, hypersensitivity

Precautions: Children, geriatric patients, premenopausal women, osteoporosis, hepatic/cardiac disease

DOSAGE AND ROUTES

Calculator

- **Adult: PO** 1 mg/day

Available forms: Tabs 1 mg

Administer:

- Give without regard to meals at same time of day

SIDE EFFECTS

CNS: *Hot flashes, headache, light-headedness*, depression, dizziness, confusion, insomnia, anxiety, fatigue, mood changes

CV: Chest pain, *hypertension, thrombophlebitis, edema*, angina, **MI, cerebral infarct, CVA, vasodilation**

GI: *Nausea, vomiting*, altered taste leading to anorexia, diarrhea, constipation, abdominal pain, dry mouth

GU: Vaginal bleeding, vaginal dryness, pelvic pain, pruritus vulvae, UTI

HEMA: **Leukopenia**

INTEG: *Rash, Stevens-Johnson syndrome*, anemia

MISC: Hypercholesterolemia

MS: Bone pain, myalgia, *asthenia*, bone loss/osteoporosis, arthralgia, fractures

RESP: Cough, sinusitis, dyspnea, **pulmonary embolism**

PHARMACOKINETICS

Peak 2 hr; half-life 50 hr; excreted in feces, urine, terminal half-life 50 hr

INTERACTIONS

- **Do not use with oral contraceptives, estrogen, tamoxifen, androstenedione, DHEA**

Drug/Lab Test

Increase: GGT, AST, ALT, alk phos, cholesterol, LDL

NURSING CONSIDERATIONS

Assess:

- Bone mineral density, cholesterol, lipid panel, periodically

 **Serious skin reactions:** Stevens-Johnson syndrome • Not effective in hormone-receptor–negative disease, use only in postmenopausal women

Perform/provide:

- Storage in light-resistant container at room temp

Evaluate:

- Therapeutic response: decreased tumor size, spread of malignancy

Teach patient/family:

- To report any complaints, side effects to prescriber
- That vaginal bleeding, pruritus, hot flashes reversible after discontinuing treatment
- To report continued vaginal bleeding immediately
- That **tumor flare**—increase in size of tumor, increased bone pain—may occur and will subside rapidly; may take analgesics for pain • To take adequate calcium and vitamin D due to risk for bone loss/fractures

☼ Canada only Side effects: *italics* = common; **bold** = life-threatening 
Nurse Alert

anidulafungin (Rx)

(a-nid-yoo-luh-fun'jin)

Eraxis

Func. class.: Antifungal, systemic

Chem. class.: Echinocandin

ACTION:

Inhibits fungal enzyme synthesis; causes direct damage to fungal cell wall

USES:

Esophageal candidiasis, *Candida albicans*, *C. glabrata*, *C. parapsilosis*, *C. tropicalis*

Unlabeled uses: Fungal prophylaxis, disseminated candidiasis, oropharyngeal candidiasis, *Aspergillois* sp.

CONTRAINDICATIONS:

Hypersensitivity to product, other echinocandins

Precautions: Pregnancy (C), breastfeeding, children, severe hepatic disease

DOSAGE AND ROUTES

Calculator

Candidemia and other *Candida* infections

- **Adult:** IV 200 mg loading dose on day 1 then 100 mg/day $\times$ 14 days or more until last positive culture

Esophageal candidiasis

- **Adult:** IV 100 mg loading dose on day 1 then 50 mg/day $\times$ 14 days, for at least 7 days after symptoms resolved

Fungal prophylaxis (unlabeled)

- **Adolescent and child 2-17 yr:** IV 1.5 mg/kg over 90 min then 0.75 mg/kg/day over 45 min $\times$ 5-28 days

Available forms:

Powder for inj, lyophilized 50, 100 mg

Administer:

IV route

- **Reconstitution:** If dehydrated alcohol diluents supplied, use supplied diluent

(dehydrated alcohol in water for inj); reconstitute each 50-mg vial/15 ml of diluents or 100-mg vial/30 ml (3.33 mg/ml); if diluents not supplied, reconstitute each 50-mg vial/15 ml sterile water for inj or 100-mg vial/30 ml of sterile water for inj (3.33 mg/ml) • **Dilution: 200 mg loading dose inf with vials (dehydrated alcohol)**, withdraw contents of 4 (50-mg reconstituted vials) or 2 (100-mg reconstituted vials)/500 ml of D₅W or NS (0.36 mg/ml); **200 mg loading dose inf with vials (sterile water for inj)**, withdraw contents of 4 (50-mg reconstituted vials) or 2 (100-mg reconstituted vials)/200 ml of D₅W or NS, total volume 260 ml; **100 mg daily inf with vials (dehydrated alcohol)**, withdraw contents of 1 (100-mg reconstituted vial) or 2 (50-mg reconstituted vial) and add to 250 ml D₅W or NS (0.36 mg/ml); **100 mg daily inf with vials (sterile water)**, withdraw contents of 1 (100-mg reconstituted vial) or 2 (50-mg reconstituted vials)/100 ml D₅W or NS (total volume 130 ml); **50 mg daily inf (dehydrated alcohol)**, withdraw contents of 1 (50-mg reconstituted vial)/100 ml D₅W or NS final conc (0.43/ml) • Inf rate max 1.1 mg/min (dehydrated alcohol); inf rate 1.4 mg/min (sterile water) or 84 ml/hr • Give only as IV inf, not for IV bolus

- Do not use if cloudy or precipitated; do not admix

Y-site compatibilities:

Acyclovir, alemtuzumab, alfentanil, allopurinol, amifostine, amikacin, aminocaproic acid, aminophylline, amiodarone, amphotericin B lipid complex, amphotericin B liposome, ampicillin, ampicillin sulbactam, argatroban, arsenic trioxide, atenolol, atracurium, azithromycin, aztreonam, bivalirudin, bleomycin, bumetanide, buprenorphine, busulfan, butorphanol, calcium chloride/gluconate, CARBOplatin, carmustine, caspofungin, ceFAZolin, cefepime, cefotaxime, cefoTEtan, cefOXitin, cefTAZidime, ceftizoxime, cefTRIAxone, cefuroxime, chloramphenicol, chlorproMAZINE, cimetidine, ciprofloxacin, cisatracurium, CISplatin, clindamycin, cyclophosphamide, cycloSPORINE, cytarabine, dacarbazine, DACTINomycin, DAUNOrubicin liposome, DAUNOrubicin hydrochloride, dexamethasone, dexmedetomidine, dexrazoxane, digoxin, diltiazem, diphenhydrAMINE, DOBUtamine, DOCEtaxel, dolasetron, DOPamine, doripenem, doxacurium, DOXOrubicin, DOXOrubicin liposomal, doxycycline, droperidol, enalaprilat, ePHEDrine, EPINEPHrine, epirubicin, eptifibatide, erythromycin, esmolol, etoposide, etoposide phosphate, famotidine,

fenoldopam, fentaNYL, fluconazole, fludarabine, fluorouracil, foscarnet, fosphenytoin, furosemide, gallium nitrate, ganciclovir, gatifloxacin, gemcitabine, gentamicin, glycopyrrolate, granisetron, haloperidol, heparin, hydrALAZINE, hydrocortisone, HYDROmorphone, hydrOXYzine, IDArubicin, ifosfamide, imipenem-cilastatin, inamrinone, insulin (regular), irinotecan, isoproterenol, ketorolac, labetalol, leucovorin, levofloxacin, lidocaine, linezolid injection, LORazepam, mannitol, mechlorethamine, melphalan, meperidine, meropenem, mesna, metaraminol, methotrexate, methyldopate, methylPREDNISolone, metoclopramide, metoprolol, metroNIDAZOLE, midazolam, milrinone, mitoMYcin, mitoXANtrone, mivacurium, morphine, moxifloxacin, mycophenolate mofetil, nafcillin, naloxone, nesiritide, niCARdipine, nitroglycerin, nitroprusside, norepinephrine, octreotide, ondansetron, oxaliplatin, oxytocin, PACLitaxel, palonosetron, pamidronate, pancuronium, pantoprazole, PEMEtrexed, pentamidine, pentazocine, PENTobarbital, PHENobarbital, phentolamine, phenylephrine, piperacillin-tazobactam, polymyxin B, potassium acetate/chloride, procainamide, prochlorperazine, promethazine, propranolol, quiNIDine, quinupristin-dalfopristin, ranitidine, remifentanyl, rocuronium, sodium acetate, streptozocin, succinylcholine, SUFentanyl, sulfamethoxazole-trimethoprim, tacrolimus, teniposide, theophylline, thiopental, thiotepa, ticarcillin, ticarcillin-clavulanate, tirofiban, tobramycin, topotecan, trimethobenzamide, vancomycin, vasopressin, vecuronium, verapamil, vinBLASTine, vinCRISTine, vinorelbine, voriconazole, zidovudine, zoledronic acid

SIDE EFFECTS

Candidemia/other *Candida* infections

CNS: Seizures, dizziness, headache

CV: DVT, atrial fibrillation, right bundle branch block, hypotension, sinus arrhythmia, thrombophlebitis superficial, ventricular extrasystoles, QT prolongation (rare)

GI: Nausea, anorexia, vomiting, diarrhea, increased AST, ALT

META: Hypokalemia

Esophageal candidiasis

CNS: Headache

GI: Nausea, anorexia, vomiting, diarrhea, hepatic necrosis

HEMA: Neutropenia, thrombocytopenia, leukopenia, coagulopathy

INTEG: Rash, urticaria, itching, flushing

META: Hypocalcemia, hyperglycemia, hyperkalemia, hypernatremia, hypomagnesium (rare)

MS: Back pain, rigors

PHARMACOKINETICS

Steady state after loading dose, distribution half-life 0.5-1 hr, terminal half-life 40-50 hr, protein binding 99%

INTERACTIONS

Increase: plasma concentrations—cycloSPORINE

Drug/Lab Test

Increase: amylase, bilirubin, CPK, creatinine, ECG, lipase, PT

Decrease: platelets, magnesium, potassium, transferase, urea

NURSING CONSIDERATIONS

Assess:

- **Infection:** clearing of cultures during treatment; obtain culture at baseline and throughout treatment; product may be started as soon as culture is taken, those with HIV pharyngeal candidiasis may need antifungals ⚠️ **Blood dyscrasias (rare):** CBC (RBC, Hct, Hgb), differential, platelet count periodically; notify prescriber of results • Hepatic studies before, during treatment: bilirubin, AST, ALT, alk phos, as needed; also uric acid ⚠️ **Bleeding:** hematuria, heme-positive stools, bruising/petechiae of mucosa or orifices; blood dyscrasias can occur • GI symptoms: frequency of stools, cramping; if severe diarrhea occurs, electrolytes may need to be given

Perform/provide:

- Store reconstituted vials at 59° F-86° F for up to 24 hr, do not freeze (dehydrated alcohol); store reconstituted vials at 36° F-46° F (sterile water) for up to 24 hr, do not freeze

Evaluate:

- Therapeutic response: decreased symptoms of *Candida* infection, negative culture

Teach patient/family:

- To notify prescriber if pregnancy is suspected, planned; use nonhormonal form

of contraception while taking this product • To avoid breastfeeding while taking this product

- To inform prescriber of renal/hepatic disease
 - To report bleeding
 - To report signs of infection: increased temp, sore throat, flulike symptoms
 - To notify prescriber of nausea, vomiting, diarrhea, jaundice, anorexia, clay-colored stools, dark urine; hepatotoxicity may occur
-

🍁 Canada only Side effects: *italics* = common; **bold** = life-threatening ⚠️
Nurse Alert

antithymocyte

See [lymphocyte immune globulin](#)

apomorphine

(ah-poe-more'feen)

[Apokyn](#)

Func. class.: Antiparkinson agent

Chem. class.: Dopamine agonist, non-ergot

ACTION:

Has similarities to dopamine that are thought to contribute to its central dopamine receptor agonist properties; exhibits a high affinity for dopamine D₄ receptors, a moderate affinity for dopamine D₂, D₃, and D₅ receptors, and a low affinity for D₁ receptors; treats erectile dysfunction by activating dopamine receptors in the hypothalamus and limbic and neural pathways to increase erections

USES:

For use as rescue of “off” episodes associated with advanced Parkinson’s disease

CONTRAINDICATIONS:

Hypersensitivity to this product, sulfites, or benzyl alcohol, IV use, major psychotic disorder; concurrent treatment with drugs of the 5-HT₃ antagonist class (e.g., ondansetron, granisetron, alosetron)

Precautions:

History of suicidal ideation or depression, CNS/respiratory depression, decreased alertness, gag reflex depression, seizures, seizure disorder, coma, asthma, emphysema, atrial fibrillation, hypertension, bradycardia, orthostatic hypotension, QT prolongation, vasovagal syncope, acute circulatory failure, orthostatic hypotension, cardiac disease, congenital heart disease, cardiac arrhythmias, cardiac depression, heart failure, shock, hepatic/renal disease, pregnancy C, breastfeeding, debilitated/geriatric patients, abrupt discontinuation

DOSAGE AND ROUTES

Calculator

• **Adult:** Test dose: **SUBCUT** 0.2 ml (2 mg) (test dose) where B/P can be closely monitored (before dose and 20, 40, 60 min after); if tolerated and patient response, then begin with 0.2 ml (2 mg); may increase by 1 mg every few days, max 0.6 ml (6 mg). If the test dose of 0.2 ml (2 mg) is tolerated but the patient does not respond, give a test dose of 0.4 ml (4 mg) no sooner than 2 hr after the 0.2 ml (2 mg) test dose, where BP can be closely monitored (before dose and 20, 40, and 60 min after the dose); If the 0.4 ml (4 mg) test dose is tolerated, the starting dose should be 0.3 ml (3 mg); may be increased by 1 mg every few days as required, max 0.6 ml (6 mg). If the 0.4 ml (4 mg) test dose is not tolerated, administer a test dose of 0.3 ml (3 mg) no sooner than 2 hr after the 0.4 ml (4 mg) test dose where BP can be closely monitored (before dose and 20, 40, and 60 min after the dose). If the 0.3 ml (3 mg) test dose is tolerated, begin with 0.2 ml (2 mg); may be increased by 0.1 ml (1 mg) every few days as required, max 0.4 ml (4 mg; outpatient) • Usual dosage: 0.3-0.6 ml (3 to 6 mg), average frequency three times a day.

Available forms:

Penfill sol for inj 10 mg/ml

Administer

Subcut route

- To reduce nausea/vomiting, give trimethobenzamide × 3 days before the first dose, and continued ≥2 months of treatment • For subcut use only; do use IM or IV
- Wash hands before and after use, skin contact can cause an allergic skin reaction
- To be used by those qualified and who have received instruction on the use
- **Dosing pen (Apokyn Pen) is dosed in ml, not mg.** The pen allows the patient's usual dose to be dialed in, even if there is not enough medicine in the pen to do so. If there is not enough medicine for the usual dose, the device must be "rearmed" and the remaining amount needed should be dialed in. This process should be avoided if possible to avoid dosage errors. Keep a record of doses used so the cartridges can be replaced as needed • Do not inject into infected, erythematous, or irritated skin
- Double-check dosage in syringe before use
- Aspirate before injection to avoid injection into a blood vessel; inject subcut,

taking care not to inject ID

- Rotate injection sites with each injection (abdomen, upper arm, thigh)

SIDE EFFECTS

CNS: Drowsiness, dizziness, flushing, hallucinations, confusion, worsening psychiatric/behavioral effects, dyskinesias, sweating

CV: Hypotension, CHF, edema, MI, cardiac arrest

GI: Nausea, vomiting, constipation or diarrhea

INTEG: Contact dermatitis, ecchymosis, injection reaction

MISC: Yawning, rhinorrhea, respiratory depression

MS: Arthralgia, back pain

PHARMACOKINETICS

Subcut:

Onset 20 min, peak 20-60 min, duration 2 hr, half-life 30-60 min

INTERACTIONS

Do not use with dronedarone

Increase: Hypotension, unconsciousness—serotonin-receptor antagonists (alosetron, dolasetron, granisetron, ondansetron, palonosetron), do not use together

Increase: QT interval—antiemetics (dolasetron, ondansetron, palonosetron), other products that increase QT, can occur at high doses

Increase: Hypotension—antihypertensives, vasodilators

Decrease: Apomorphine effect—antipsychotics

NURSING CONSIDERATIONS

Assess:

- Assess for the acute, intermittent treatment of hypomobility, “off” episodes (“end-of-dose wearing off” and unpredictable “on/off” episodes) associated with advanced Parkinson’s disease
- During the test dosing to determine dose titration, B/P should be closely monitored (before dose and 20, 40, and 60 min after the injection)
- Monitor for patient response to the injection (i.e., reduction in “off” episode symptoms)
- Contact the health care provider if patient’s symptoms do not respond to the first dose for a particular “off” episode; do not use a second dose for that episode

- If the patient has not received an apomorphine injection in more than 1 wk, must reinstitute following the initial test dosage and titration instructions

Evaluate:

- Positive therapeutic outcome—reduction of “off” episode symptoms in Parkinson’s disease

Teach patient/family:

- Not to rise quickly, fainting can occur
- To use with antiemetic, nausea and vomiting are common
- All persons involved in care, how to use subcut pen
- To report hallucinations, other psychiatric symptoms to prescriber immediately
- Not to consume alcohol or kava, CNS effects can worsen

☼ Canada only Side effects: *italics* = common; **bold** = life-threatening ⚠
Nurse Alert

apraclonidine ophthalmic

See [Appendix B](#)

aprepitant (Rx)

(ap-re'pi-tant)

Emend

fosaprepitant

Emend

Func. class.: Antiemetic

Chem. class.: Miscellaneous

ACTION:

Selective antagonist of human substance P/neurokinin 1 (NK₁) receptors that decreases emetic reflex

USES:

Prevention of nausea/vomiting associated with cancer chemotherapy (highly emetogenic/moderately emetogenic), including high-dose CISplatin; used in combination with other antiemetics; postoperative nausea/vomiting

CONTRAINDICATIONS:

Hypersensitivity

Precautions: Pregnancy (B), breastfeeding, children, geriatric patients, hepatic disease

DOSAGE AND ROUTES

Calculator

Highly emetogenic (aprepitant)

- **Adult: PO** Day 1 (1 hr before chemotherapy) aprepitant 125 mg with 12 mg dexamethasone **PO**, with 32 mg ondansetron IV; day 2 aprepitant 80 mg with 8 mg dexamethasone **PO**; day 3 aprepitant 80 mg with 8 mg dexamethasone **PO**; day 4 only dexamethasone 8 mg **PO**; **IV INF** 115 mg over 15 min, 30 min before chemotherapy as alternative to 1st dose of aprepitant on day 1 of regimen

(fosaprepitant)

Moderately emetogenic

• **Adult: PO** Day 1 125 mg aprepitant with dexamethasone 12 mg **PO**, with ondansetron 8 mg **PO** × 2; days 2 and 3 80 mg aprepitant only (aprepitant); **IV INF** 115 mg over 15 min, 30 min before chemotherapy as alternative to 1st dose of aprepitant on day 1 of regimen (fosaprepitant)

Prevention of postoperative nausea/vomiting

• **Adult: PO** 40 mg within 3 hr of induction of anesthesia

Available forms:

Caps 40, 80, 125 mg; powder for inj 115, 150 mg; combo pack cap 80-125 mg

Administer:

PO route

- Do not break, crush, or chew
- PO on 3-day schedule, give with full glass of water 1 hr before chemotherapy, with or without food, given with other antiemetics

Intermittent IV INF route

- Only approved as a substitute for the 1st dose of aprepitant in 3-day regimen
- **Reconstitution:** use aseptic technique; inject 5 ml 0.9% NaCl into the vial, directing stream to wall of vial to prevent foam; swirl (do not shake)
- Prepare inf bag with 110 ml NS/115 mg; 145 ml/150 mg; do not dilute, reconstitute with any divalent cations such as calcium, magnesium, including LR, Hartmann's sol
- Withdraw entire volume from vial, transfer to inf bag; total volume 115 ml (1 mg/1 ml)
- Gently invert bag 2-3 times; reconstituted sol stable for 24 hr at lower room temp or <25° C
- Visually inspect for particulates, discoloration
- Infuse over 15 min, stable for 24 hr at room temperature

SIDE EFFECTS

CNS: *Headache, dizziness, insomnia, anxiety, depression, confusion, peripheral neuropathy*

CV: Bradycardia, tachycardia, DVT, hypo/hypertension

GI: *Diarrhea, constipation, abdominal pain, anorexia, gastritis, increased AST, ALT, nausea, vomiting, heartburn*

GU: Increased BUN, serum creatine, proteinuria, dysuria

HEMA: Anemia, thrombocytopenia, neutropenia

INTEG: Pruritus, rash, urticaria

MISC: Asthenia, fatigue, dehydration, fever, hiccups, tinnitus, alopecia

SYST: Anaphylaxis

PHARMACOKINETICS

Absorption 60%-65%, peak 4 hr, metabolized in liver by CYP3A4 enzymes to active metabolite, half-life 9-12 hr, 95% protein bound, not excreted in kidneys, crosses blood-brain barrier

INTERACTIONS

Increase: aprepitant action—CYP3A4 inhibitors (ketoconazole, itraconazole, nefazodone, troleandomycin, clarithromycin, ritonavir, nelfinavir, diltiazem)

Increase: action of CYP3A4 substrates (pimozide, cisapride, dexamethasone, methylPREDNISolone, midazolam, ALPRAZolam, triazolam, docetaxel, PACLitaxel, etoposide, irinotecan, imatinib, ifosfamide, vinorelbine, vinBLASTine, vinCRISTine)

Decrease: aprepitant action—CYP3A4 inducers (rifampin, carbamazepine, phenytoin)

Decrease: action of CYP2C9 substrates (warfarin, tolbutamide, phenytoin), oral contraceptives

Decrease: action of both products—paroxetine

Drug/Food

Decrease: effect—grapefruit juice

NURSING CONSIDERATIONS

Assess:

 **For hypersensitive reactions:** pruritus, rash, urticaria, anaphylaxis • CV status: hypo/hypertension, bradycardia, tachycardia, DVT

- For absence of nausea, vomiting during chemotherapy
- CBC, LFTs, creatinine baseline and periodically

Perform/provide:

- Storage at room temp; keep in original bottles, blisters (PO)

Evaluate:

- Therapeutic response: absence of nausea, vomiting during cancer chemotherapy

Teach patient/family:

- To report diarrhea, constipation
 - To take only as prescribed; to take 1st dose 1 hr before chemotherapy
 - To report all medications and herbals to prescriber before taking this medication
 - To use nonhormonal form of contraception while taking this agent and for 1 mo thereafter; oral contraceptive effect may be decreased • That those patients also taking warfarin should have clotting monitored closely during 2-wk period after administration of aprepitant • To avoid breastfeeding
-

🍁 Canada only Side effects: *italics* = common; **bold** = life-threatening ⚠️
Nurse Alert

arformoterol (Rx)

(ar-for-moe'ter-ole)

Brovana

Func. class.: Long-acting adrenergic β_2 -agonist, sympathomimetic, bronchodilator

Do not confuse:

Brovana/Boniva

ACTION:

Causes bronchodilation by action on β_2 (pulmonary) receptors by increasing levels of cAMP, which relaxes smooth muscle; produces bronchodilation and CNS, cardiac stimulation as well as increased diuresis and gastric acid secretion; longer acting than isoproterenol

USES:

Maintenance bronchospasm prevention in COPD, including chronic bronchitis, emphysema

CONTRAINDICATIONS:

Hypersensitivity to sympathomimetics, product, racemic formoterol; tachydysrhythmias, severe cardiac disease, heart block, children, monotherapy in asthma

Precautions: Pregnancy (C), breastfeeding, cardiac disorders, hyperthyroidism, diabetes mellitus, hypertension, prostatic hypertrophy, angle-closure glaucoma, seizures, hypoglycemia

Black Box Warning:

Asthma-related death

DOSAGE AND ROUTES

Calculator

COPD

• **Adult:** NEB 15 mcg, bid, AM, PM

Available forms: Inh sol 15 mcg/2 ml

Administer:

• By nebulization only; no dilution needed, give over 10-15 min; sol should be colorless

SIDE EFFECTS

CNS: Tremors, anxiety, insomnia, headache, dizziness, stimulation, restlessness, hallucinations, flushing, irritability

CV: Palpitations, tachycardia, hypertension, angina, hypotension, dysrhythmias, AV block heart failure, prolonged QT supraventricular tachycardia

EENT: Dry nose, irritation of nose, throat

GI: Heartburn, nausea, vomiting

MISC: Flushing, sweating, anorexia, bad taste/smell changes, hypokalemia, anaphylaxis, hypoglycemia

MS: Muscle cramps

RESP: Cough, wheezing, dyspnea, bronchospasm, dry throat

PHARMACOKINETICS

Onset 5 min; peak 1-1½ hr; duration 4-6 hr; terminal half-life (COPD) 26 hr; extensively metabolized by direct conjugation by CYP2D6, CYP2C19; crosses placenta; protein binding 52%-65%; excreted in urine 63%, feces 11%

INTERACTIONS

Increase: QT prolongation—Class IA/III antidysrhythmics, MAOIs, tricyclics

Increase: severe hypotension—oxytocics

Increase: toxicity—theophylline

Increase: ECG changes/hypokalemia—potassium-losing diuretics

Increase: action of nebulized bronchodilators

Increase: action of arformoterol—tricyclics, MAOIs, other adrenergics; do not use together

Decrease: arformoterol action, asthma-related death—other β-blockers

Drug/Herb

Increase: stimulation—caffeine (cola nut, green/black tea, guarana, yerba maté, coffee, chocolate)

NURSING CONSIDERATIONS

Assess:

Black Box Warning:

Respiratory function: vital capacity, forced expiratory volume, ABGs; lung sounds, heart rate, rhythm, B/P, sputum (baseline, peak); actively deteriorating COPD may occur, a rescue inhaler should be readily available

- Whether patient has received theophylline therapy, other bronchodilators before giving dose
- Patient's ability to self-medicate
- For evidence of allergic reactions; anaphylaxis may occur
- For **paradoxical bronchospasm**; hold medication, notify prescriber if bronchospasm occurs

Perform/provide:

- Storage in refrigerator; if stored at room temp, discard after 6 wk or if past expiration date, whichever is sooner

Evaluate:

- Therapeutic response: absence of dyspnea, wheezing after 1 hr, improved airway exchange, improved ABGs

Teach patient/family:

- To use exactly as prescribed; that death has resulted from asthma with products similar to this one, to have a rescue inhaler always
- Not to use OTC medications because excess stimulation may occur
- An opened unit-dose vial should be used right away

☼ Canada only Side effects: *italics* = common; **bold** = life-threatening ⚠
Nurse Alert

HIGH ALERT

argatroban (Rx)

(are-ga-troe'ban)

Func. class.: Anticoagulant

Chem. class.: Thrombin inhibitor

Do not confuse:

argatroban/Aggrastat

ACTION:

Direct inhibitor of thrombin, it reversibly binds to thrombin active site

USES:

Anticoagulation prevention/treatment of thrombosis in heparin-induced thrombocytopenia; adjunct to percutaneous coronary intervention (PCI) in those with history of HIT

Unlabeled uses: Acute MI, DIC, use in infants/children/adolescents

CONTRAINDICATIONS:

Hypersensitivity, overt major bleeding

Precautions: Pregnancy (B), breastfeeding, children, intracranial bleeding, renal function impairment, hepatic disease, severe hypertension, after lumbar puncture, spinal anesthesia, major surgery, congenital/acquired bleeding, GI ulcers

DOSAGE AND ROUTES

Calculator

DVT, Pulmonary Embolism

- **Adult:** CONT IV INF 2 mcg/kg/min; adjust dose until steady-state aPTT is 1.5-3× initial baseline, max 100 sec, max dose 10 mcg/kg/min
- **Infant/child/adolescent (unlabeled):** CONT IV INF 0.75 mcg/kg/min, monitor aPTT q2hr until stable then at least daily

Hepatic dose

- **Adult:** CONT INF 0.5 mcg/kg/min, adjust rate based on aPTT

Percutaneous coronary intervention (PCI) in HIT

- **Adult: IV INF** 25 mcg/kg/min and bolus of 350 mcg/kg given over 3-5 min, check ACT 5-10 min after bolus completed, proceed if ACT >300 sec; if ACT <300 sec, give another 150 mcg/kg **BOL**, increase inf rate to 30 mcg/kg/min, recheck ACT in 5-10 min; if ACT >450 sec, decrease inf rate to 15 mcg/kg/min, recheck ACT in 5-10 min; when ACT is therapeutic, continue for duration of procedure

Acute MI (unlabeled)

- **Adult: IV** loading dose of 1000 mcg/kg over 1 min, then 1-3 mcg/kg/min

DIC (unlabeled)

- **Adult: CONT IV** 0.7 mcg/kg/min

Available forms:

Inj 100 mg/ml (2.5 ml; must dilute 100-fold)

Administer:

- Avoid all IM inj that may cause bleeding

IV, direct route

- **For PCI:** 350 mg/kg bol and continuous inf of 25 mcg/kg/min; check ACT 5-10 min after bolus

Intermittent IV INF route

- **Dilute** in 0.9% NaCl, D₅, LR to a final conc of 1 mg/ml; **dilute** each 2.5-ml vial 100-fold by mixing with 250 ml of diluent, mix by repeated inversion of the diluent bag for 1 min; may briefly be slightly hazy • Dosage adjustment may be made after review of aPTT, max 10 mcg/kg/min

SIDE EFFECTS

CNS: *Fever, intracranial bleeding, headache*

CV: *Atrial fibrillation, coronary thrombosis, MI, myocardial ischemia, coronary occlusion, ventricular tachycardia, bradycardia, chest pain, hypotension*

GI: *Nausea, vomiting, abdominal pain, diarrhea, GI bleeding*

GU: *Hematuria, abnormal kidney function, UTI*

HEMA: *Hemorrhage*

MISC: *Back pain, headache, infection*

RESP: *Pneumonia, dyspnea, coughing, hemoptysis*

SYST: *Sepsis*

PHARMACOKINETICS

Metabolized in liver by P450 CYP3A 4/5, distributed to extracellular fluid, 54%

plasma protein binding, half-life 39-51 min, excreted in feces, steady state 1-3 hr

INTERACTIONS

Increase: bleeding risk—antiplatelets, NSAIDs, salicylates, dipyridamole, clopidogrel, ticlopidine, heparin, warfarin, glycoprotein IIb/IIIa antagonists (abciximab, tirofiban, eptifibatide), thrombolytics (alteplase, reteplase, urokinase, tenecteplase), other anticoagulants

NURSING CONSIDERATIONS

Assess:

- Baseline aPTT before treatment; do not start treatment if aPTT ratio is ≥ 2.5 , then check aPTT 2 hr after initiation of treatment and at least daily thereafter
- aPTT, which should be $1.5\text{--}3 \times$ control, draw blood for ACT every 20-30 min during long PCI

 **Bleeding** gums: petechiae; ecchymosis; black, tarry stools; hematuria/epistaxis; B/P; vaginal bleeding, possible hemorrhage 

Anaphylaxis: dyspnea, rash during treatment • Fever, skin rash, urticaria

Evaluate:

- Therapeutic response: absence or decrease of thrombosis

Teach patient/family:

- To use a soft-bristle toothbrush to avoid bleeding gums; avoid contact sports; use electric razor; avoid IM inj
- To report any signs of bleeding: gums, under skin, urine, stools; trouble breathing wheezing, skin rash • To notify prescriber if planning to become pregnant, breastfeeding

☼ Canada only Side effects: *italics* = common; **bold** = life-threatening 
Nurse Alert

ARIPiprazole (Rx)

(a-rip-ip-pra'zol)

Abilify, Abilify Discmelt

Func. class.: Antipsychotic

Chem. class.: Quinolinone

ACTION:

Exact mechanism unknown; may be mediated through both DOPamine type 2 (D_2 , D_3) and serotonin type 2 ($5-HT_{1A}$, $5-HT_{2A}$) antagonism

USES:

Schizophrenia and bipolar disorder (adults and adolescents), agitation, mania, major depressive disorder, short-term mania or mixed episodes of bipolar disorder; irritability in patients with autism

Unlabeled uses:

Psychosis in patients with dementia

CONTRAINDICATIONS:

Breastfeeding, hypersensitivity, seizure disorders

Precautions: Pregnancy (C), geriatric patients, renal/hepatic/cardiac disease

Black Box Warning:

Children, dementia, suicidal ideation

DOSAGE AND ROUTES

Calculator

Major depressive disorder

- **Adult: PO** 2-5 mg/day as an adjunct to other antidepressant treatment; adjust by 5 mg at ≥ 1 wk (range, 2-15 mg/day)

Schizophrenia

- **Adult: PO** 10-15 mg/day; if needed, dosage may be increased to 30 mg/day after 2 wk; maintenance 15 mg/day; periodically reassess
- **Adolescent 13-17 yr: PO** 2 mg/day, may increase to 5 mg after 2 days, then 10 mg after 2 more days, max 30 mg/day

Bipolar disorder

- **Adult: PO** 15 mg/day, may increase to 30 mg if needed (monotherapy); adjunctive to lithium or valproate PO 10-15 mg qd, may increase to 30 mg if

needed

- **Child >10 yr, adolescents: PO** 2 mg, titrate to 5 mg/day after 2 days to target of 10 mg/day after another 2 days

Agitation with bipolar disorder/schizophrenia

- **Adult: IM** 9.75 mg as a single dose, may start with a lower dose, max 30 mg/day

Irritability associated with autism

- **Child ≥6 yr, adolescents: PO** 2 mg/day, increase to 5 mg/day after 1 wk, may increase to 10-15 mg/day if needed; dose changes should not occur more frequently than q1wk

Potential CYP2D6 inhibitor, strong CYP3A4 inhibitors

- **Adult: PO** Reduce to 50% of usual dose, increase dose when CYP2D6, CYP3A4 inhibitor withdrawn

Combination of strong CYP3A4/CYP2D6 inhibitors

- **Adult: PO** reduce to 25% of usual dose

Acute psychosis (unlabeled)

- **Adults: PO** 15 mg/day, may increase to 20-30 mg/day after 3 wk

Available forms:

Tabs 2, 5, 10, 15, 20, 30 mg; inj 9.75 mg/1.3 ml; orally disintegrating tab 10, 15 mg; oral sol 1 mg/ml

Administer:

PO route

- May be given without regard to meals
- Orally disintegrating tabs; do not open blister until ready to use, do not push tab through foil; place on tongue, allow to dissolve, swallow, do not divide
- Oral liquid: use calibrated measuring device
- Oral solution: can be substituted for tablet on a mg-per-mg, up to 25 mg dose. Patients receiving 30-mg tablets should receive 25 mg of solution

IM route

- Give IM only; inject slowly, deeply into muscle mass; discard unused portion

SIDE EFFECTS

CNS: Drowsiness, insomnia, agitation, anxiety, headache, seizures, neuroleptic malignant syndrome, light-headedness, akathisia, asthenia, tremor, stroke, suicidal ideation, dystonia

CV: Orthostatic hypotension, tachycardia

EENT: *Blurred vision, rhinitis*

GI: *Constipation, nausea, vomiting, jaundice, weight gain*

INTEG: *Rash*

META: Hyperglycemia, dyslipidemia

RESP: *Cough*

SYST: *Death among geriatric patients with dementia*

PHARMACOKINETICS

PO: Absorption 87%; extensively metabolized by liver to a major active metabolite; plasma protein binding >99%; terminal half-life 75-146 hr; excretion via urine 25%, feces 55%; clearance decreased in geriatric patients

INTERACTIONS

Increase: effects of Aripiprazole—CYP3A4 inhibitors (ketoconazole, erythromycin), CYP2D6 inhibitors (quinidine, fluoxetine, paroxetine); reduce dose of Aripiprazole

Increase: sedation—other CNS depressants, alcohol

Increase: EPS—other antipsychotics, lithium

Decrease: Aripiprazole level—famotidine, valproate

Decrease: effects of Aripiprazole—CYP3A4 inducers (carbamazepine)

Drug/Herb

Decrease: Aripiprazole effect—St. John's wort

NURSING CONSIDERATIONS

Assess:

Black Box Warning:

Mental status before initial administration, children/young adults may exhibit suicidal thoughts/behaviors, therefore smallest amount of product should be given; elderly patients with dementia-related psychosis are at increased risk of death

- Swallowing of PO medication; check for hoarding, giving of medication to other patients
- I&O ratio; palpate bladder if urinary output is low
- Bilirubin, CBC, LFTs, weight, lipid profile, fasting blood glucose q mo
- Affect, orientation, LOC, reflexes, gait, coordination, sleep pattern disturbances
- B/P standing and lying; also pulse, respirations; take q4hr during initial treatment; establish baseline before starting treatment; report drops of 30 mm

Hg; watch for ECG changes • Dizziness, faintness, palpitations, tachycardia on rising

• **EPS**, including akathisia (inability to sit still, no pattern to movements), tardive dyskinesia (bizarre movements of the jaw, mouth, tongue, extremities), pseudoparkinsonism (rigidity, tremors, pill rolling, shuffling gait) **⚠️Neuroleptic malignant syndrome:** hyperthermia, increased CPK, altered mental status, muscle rigidity; **notify prescriber immediately** • Constipation, urinary retention daily; if these occur, increase bulk, water in diet; stool softeners, laxatives may be needed

Perform/provide:

• Supervised ambulation until patient is stabilized on medication; do not involve patient in strenuous exercise program because fainting is possible; patient should not stand still for a long time • Storage in tight, light-resistant container

Evaluate:

• Therapeutic response: decrease in emotional excitement, hallucinations, delusions, paranoia; reorganization of patterns of thought, speech

Teach patient/family:

• That orthostatic hypotension may occur; to rise from sitting or lying position gradually
• To avoid hot tubs, hot showers, tub baths; hypotension may occur
• **To avoid abrupt withdrawal of this product; EPS may result; product should be withdrawn slowly** • To avoid OTC preparations (cough, hay fever, cold) unless approved by prescriber because serious product interactions may occur; to avoid use with alcohol, CNS depressants because increased drowsiness may occur • To avoid hazardous activities if drowsy, dizzy
• About compliance with product regimen
• To report impaired vision, tremors, muscle twitching, urinary retention
• **That heat stroke may occur in hot weather; to take extra precautions to stay cool** • To notify prescriber if pregnant or intending to become pregnant; not to breastfeed

Black Box Warning:

To report suicidal thoughts/behaviors immediately

TREATMENT OF OVERDOSE:

Lavage if orally ingested; provide airway; *do not induce vomiting*

🍁 Canada only Side effects: *italics* = common; **bold** = life-threatening ⚠️
Nurse Alert

RARELY USED

armodafinil (Rx)

(ar-moe-daf'in-il)
Nuvigil

Controlled Substance Schedule IV

USES:

Narcolepsy, obstructive sleep apnea/hypoapnea syndrome, circadian rhythm disruption (shift-work sleep problems)

CONTRAINDICATIONS:

Hypersensitivity to this product or modafinil

DOSAGE AND ROUTES

Calculator

Narcolepsy, obstructive sleep apnea/hypoapnea syndrome

- **Adult and adolescent ≥17 yr: PO** 150-250 mg in AM

Circadian rhythm disruption (shift work sleep problems)

- **Adult and adolescent ≥17 yr: PO** 150 mg at start of shift

🇨🇦 Canada only Side effects: *italics* = common; **bold** = life-threatening ⚠️
Nurse Alert

ascorbic acid (vit C) (OTC, Rx)

(a-skor'bic)

Acerola C, Apo-C , Ascor L-500, Cenolate, Equaline Vitamin C, Walgreens Gold Seal, and many more *Func. class.:* Vit C—water-soluble vitamin

ACTION:

Wound healing, collagen synthesis, antioxidant, carbohydrate metabolism

USES:

Vit C deficiency, scurvy; delayed wound, bone healing; chronic disease; urine acidification; before gastrectomy; dietary supplement

Unlabeled uses:

Common cold prevention

CONTRAINDICATIONS:

Tartrazine, sulfite sensitivity; G6PD deficiency

Precautions: Pregnancy (C), gout, diabetes, renal calculi (large doses)

DOSAGE AND ROUTES

Calculator

Dietary supplementation

- **Adult:** 50-500 mg/day
- **Child 14-18 yr:** PO 65 mg (female), 75 mg (male)
- **Child 9-13 yr:** PO 45 mg/day
- **Child 4-8 yr:** PO 25 mg/day
- **Child 1-3 yr:** PO 15 mg/day
- **Infant:** PO 40-50 mg/day

Scurvy

- **Adult:** PO/SUBCUT/IM/IV 100-250 mg/day × 2 wk then 50 mg or more daily
- **Child:** PO/SUBCUT/IM/IV 100-300 mg/day × 2 wk then 35 mg or more daily

Wound healing/chronic disease/fracture (may be given with zinc)

- **Adult:** SUBCUT/IM/IV/PO 200-500 mg/day for 1-2 mo
- **Child:** SUBCUT/IM/IV/PO 100-200 mg added doses for 1-2 mo

Urine acidification

- **Adult:** 4-12 g/day in divided doses
- **Child:** 500 mg q6-8hr

Available forms:

Tabs 25, 50, 100, 250, 500, 1000, 1500 mg; effervescent tabs 1000 mg; chewable tabs 100, 250, 500 mg; timed-release tabs 500, 750, 1000, 1500 mg; timed-release caps 500 mg; crys 4 g/tsp; powder 4 g/tsp; liq 35 mg/0.6 ml; sol 100 mg/ml; syr 20 mg/ml, 500 mg/5 ml; inj SUBCUT, IM, IV 100, 250, 500 mg/ml

Administer:

PO route

- Do not crush or chew ext rel tab or caps
- Caps may be opened and contents mixed with jelly

IV, direct route

- 100 mg undiluted by direct IV over at least 1 min; rapid inf may cause fainting

Intermittent IV INF route

- Diluted with D₅W, D₅NaCl, NS, LR, Ringer's, sodium lactate and given over 15 min

Syringe compatibilities:

Metoclopramide, aminophylline, theophylline

Y-site compatibilities: Warfarin

SIDE EFFECTS

CNS: Headache, insomnia, dizziness, fatigue, flushing

GI: Nausea, vomiting, diarrhea, anorexia, heartburn, cramps

GU: Polyuria, urine acidification, oxalate/urate renal stones, dysuria

HEMA: Hemolytic anemia in patients with G6PD

INTEG: Inflammation at inj site

PHARMACOKINETICS

PO/INJ: Readily absorbed PO, metabolized in liver; unused amounts excreted in urine (unchanged), metabolites; crosses placenta, breast milk

INTERACTIONS

Drug/Lab Test

False positive: negatives in glucose tests

False negative: occult blood, urine bilirubin, leukocyte determination

NURSING CONSIDERATIONS

Assess:

- I&O ratio; urine pH (acidification)
- Ascorbic acid levels throughout treatment if continued deficiency is suspected
- Nutritional status: citrus fruits, vegetables
- Inj sites for inflammation
- Thrombophlebitis if receiving large dose

Evaluate:

- Therapeutic response: absence of anorexia, irritability, pallor, joint pain, hyperkeratosis, petechiae, poor wound healing

Teach patient/family:

- Necessary foods to include in diet, such as citrus fruits
- That smoking decreases vit C levels; not to exceed prescribed dose; that excesses will be excreted in urine, except when taking timed-release forms

🍁 Canada only Side effects: *italics* = common; **bold** = life-threatening ⚠️

asenapine (Rx)

(a-sen'a-peen)

Saphris

Func. class.: Antipsychotic, atypical

Chem. class.: Dibenzapine

ACTION:

Unknown; may be mediated through both DOPamine type 2 (D2) and serotonin type 2 (5-HT2A) antagonism

USES:

Bipolar 1 disorder, schizophrenia

CONTRAINDICATIONS:

Breastfeeding, hypersensitivity

Precautions: Pregnancy (C), children, geriatric patients, cardiac/renal/hepatic disease, breast cancer, Parkinson's disease, dementia, seizure disorder, CNS depression, agranulocytosis, QT prolongation, torsades de pointes, suicidal ideation, substance abuse

Black Box Warning:

Increased mortality in elderly patients with dementia-related psychosis

DOSAGE AND ROUTES

Calculator

Schizophrenia

- **Adult:** SL 5 mg bid, max 20 mg/day

Bipolar 1 disorder

- **Adult:** SL 10 mg bid, may decrease to 5 mg bid as needed, max 20 mg/day

Available forms: SL tab 5, 10 mg

Administer:

- Anticholinergic agent to be used for EPS
- **SL tab:** remove tab; place tab under tongue; after it dissolves, swallow; advise patient not to chew, crush, swallow tabs, not to eat, drink for 10 min

SIDE EFFECTS

CNS: *EPS, pseudoparkinsonism, akathisia, dystonia, tardive dyskinesia; drowsiness, insomnia, agitation, anxiety, headache, seizures, neuroleptic malignant syndrome, dizziness*

CV: Orthostatic hypotension, sinus tachycardia; heart failure, QT prolongation, stroke, bundle branch block

GI: Nausea, vomiting, constipation, weight gain, increased appetite; oral hypoesthesia/parasthesia, mucosal ulcers, increased salivation (SL)

GU: Hyperprolactinemia, hyperglycemia, hyponatremia

HEMA: Thrombocytopenia

INTEG: Serious allergic reactions

PHARMACOKINETICS

Extensively metabolized by liver, protein binding 95%, peak 0.5-1.5 hr, terminal half-life 24 hr

INTERACTIONS

Increase: sedation—other CNS depressants, alcohol

Increase: EPS—CYP2D6 inhibitors/substrates (SSRIs)

Increase: EPS—other antipsychotics

Increase: asenapine excretion—carbamazepine

Increase: QT prolongation—class IA/III antidysrhythmics, some phenothiazines, β -agonists, local anesthetics, tricyclics, haloperidol, methadone, chloroquine, clarithromycin, droperidol, erythromycin, pentamidine

Decrease: asenapine action—CYP2D6 inducers (carbamazepine, barbiturates, phenytoins, rifampin)

Drug/Herb

Increase: CNS depression—kava

Increase: EPS—betel palm, kava

Drug/Lab Test

Increase: prolactin levels, glucose LFTs

NURSING CONSIDERATIONS

Assess:

 **Mental status before initial administration; watch for suicidal thoughts and behaviors; dementia and death may occur among elderly patients**

- Affect, orientation, LOC, reflexes, gait, coordination, sleep pattern disturbances
- B/P standing and lying; also pulse, respirations; take these q4hr during initial treatment; establish baseline before starting treatment; report drops of 30 mm Hg; watch for ECG changes; QT prolongation may occur
- Dizziness, faintness, palpitations, tachycardia on rising
- **EPS**, including akathisia, tardive dyskinesia (bizarre movements of the jaw, mouth, tongue, extremities), pseudoparkinsonism (rigidity, tremors, pill rolling, shuffling gait)
- **Neuroleptic malignant syndrome:** hyperthermia, increased CPK, altered mental status, muscle rigidity
- Constipation daily; increase bulk, water in diet if needed
- Weight gain, hyperglycemia, metabolic changes with diabetes

Perform/provide:

- Supervised ambulation until patient stabilized on medication; do not involve patient in strenuous exercise program because fainting is possible; patient should not stand still for a long time
- Storage in tight, light-resistant container

Evaluate:

- Therapeutic response: decrease in emotional excitement, hallucinations, delusions, paranoia; reorganization of patterns of thought, speech

Teach patient/family:

- That orthostatic hypotension may occur; to rise from sitting or lying position gradually
- To avoid hot tubs, hot showers, tub baths; hypotension may occur
- To avoid abrupt withdrawal of this product; EPS may result; product should be withdrawn slowly
- To avoid OTC preparations (cough, hay fever, cold) unless approved by prescriber; serious product interactions may occur; to avoid use of alcohol;

increased drowsiness may occur

- To avoid hazardous activities if drowsy, dizzy
- About compliance with product regimen
- That heat stroke may occur in hot weather; to take extra precautions to stay cool
- To use contraception; to inform prescriber if pregnancy is planned, suspected

Black Box Warning:

To report suicidal thoughts/behaviors immediately

TREATMENT OF OVERDOSE:

Lavage if orally ingested; provide airway; *do not induce vomiting*

☼ Canada only Side effects: *italics* = common; **bold** = life-threatening ⚠

RARELY USED
⚠ HIGH ALERT

asparaginase (Rx)

(a-spare'a-gi-nase)

Elspar

Func. class.: Antineoplastic

Chem. class.: *Escherichia coli* enzyme

USES:

Acute lymphocytic leukemia in combination with other antineoplastics

CONTRAINDICATIONS:

Hypersensitivity to product or *E. coli* protein, thromboembolic disease, infants, breastfeeding, pancreatitis

DOSAGE AND ROUTES

Calculator

In combination

• **Adult and child:** **IM/IV** 25,000 international units/m²/wk × 2 wk or 6000 international units/m² every other day × 3-4 wk or 1000-20,000 international units/m² for 10-12 days

☼ Canada only Side effects: *italics* = common; **bold** = life-threatening ⚠
Nurse Alert

asparaginase *Erwinia chrysanthemi*

Erwinaze

Func. class.: Antineoplastic, natural and semisynthetic

ACTION:

Contains an asparaginase specific enzyme L-asparaginase derived from *Erwinia chrysanthemi*, which catalyzes of asparagine to aspartic acid and ammonia and causes reduced circulating concentrations of asparagine; efficacy of asparaginase *Erwinia chrysanthemi* may be leukemic cell cytotoxicity from asparagine deficiency

USES:

Treatment of acute lymphocytic leukemia (ALL) in combination with other chemotherapeutic agents in patients who have developed hypersensitivity to *E. coli*-derived asparaginase

CONTRAINDICATIONS:

Hypersensitivity, breastfeeding, history of serious pancreatitis, bleeding, or serious thrombosis with prior L-asparaginase therapy

Precautions:

Pregnancy (C), children <2 yr, hepatic disease, diabetes mellitus

DOSAGE AND ROUTES

Calculator

- **Adult, adolescent, child ≥ 2 yr (substitute for pegaspargase):** IM 25,000 IU/m² 3 $\times$ /wk (Monday/Wednesday/Friday) $\times$ 6 doses for each planned dose of pegaspargase within a treatment
- **Adult (substitute for L-asparaginase *E. coli*):** IM 25,000 IU/m² for each scheduled dose of native *E. coli* asparaginase within a treatment

Available forms:

Powder for inj 10,000 Units

Administer:

- Slowly inject 1 or 2 ml of preservative-free sterile sodium chloride (0.9%) inj against inner vial wall; do not forcefully inject sol directly onto or into powder; if 1 ml of NS is used, conc is 10,000 IU/ml; if 2 ml of NS is used, conc is 5000 IU/ml; dissolve contents by gentle mixing or swirling; do not shake or invert vial
- Reconstituted sol should be clear and colorless; discard if any visible particles or protein aggregates are present
- Calculate the volume needed to obtain dose; withdraw volume containing calculated dose from vial into polypropylene syringe within 15 min of reconstitution

IM route

Administer dose by IM inj within 4 hr of reconstitution; limit volume to 2 ml per inj site; multiple inj sites may be needed

SIDE EFFECTS

ENDO: Hyperglycemia

GI: Pancreatitis

HEMA: Bleeding, serious thrombosis

INTEG: Local inj site reaction

MISC: Hyperammonemia (seizure, headache), neurotoxicity, elevated hepatic enzymes, hyperbilirubinemia

SYST: Anaphylaxis

PHARMACOKINETICS

Achieved serum trough asparaginase activity concentrations ≥ 0.1 IU/ml by 72 hr after dose 3

INTERACTIONS

Synergistic or antagonistic action of: methotrexate

Increase: neurotoxicity—vinCRISTine

Increase: pancreatitis risk—cytarabine

Increase: hyperglycemia—corticosteroids

Increase: bleeding risk—NSAIDs, thrombolytics, salicylates, anticoagulants, platelet inhibitors

Drug/Lab Test

Increase: liver function tests, ammonia

Decrease: fibrinogen, protein C activity, protein S activity, antithrombin III

NURSING CONSIDERATIONS

Assess:

- **Anaphylaxis:** give only with resuscitation equipment and other agents necessary to treat anaphylaxis; if a serious hypersensitivity reaction occurs, discontinue product
- **Bleeding:** identify if NSAIDs, salicylates, thrombolytics, platelet inhibitors, anticoagulants have been used; grade 1 or 2 bleeding or coagulation abnormalities may occur (serious thrombosis, sagittal sinus thrombosis); discontinue for a thrombotic or hemorrhagic event until symptoms resolve; after resolution, treatment may be resumed; coagulation proteins were decreased in most patients after a 2-wk course: fibrinogen, protein C activity, protein S activity, antithrombin III
- ⚠ **Pancreatitis:** discontinue for severe or hemorrhagic pancreatitis (abdominal pain >72 hr and amylase elevation $\geq 2 \times$ upper limit of normal); mild pancreatitis, hold until the signs, symptoms subside and amylase concentrations return to normal, then resume
- **Hyperglycemia:** glucose intolerance that is irreversible in some cases; monitor baseline and periodic glucose concentration; administer insulin therapy as needed
- ⚠ **Hyperammonemia/neurotoxicity:** seizures, headache; asparagine rescue may be used to treat acute CNS toxicity; doses of asparagine used were 1-2 mmol/kg/day continuous IV inf $\times$ 5 days
Monitor liver function tests and for hyperbilirubinemia
Local injection site reaction: no more than 2 ml of the reconstituted product is to be administered at a single injection site

Perform/provide:

- Do not freeze or refrigerate the reconstituted solution; discard any unused portions

Evaluate:

- Decreased spread of malignancy

Teach patient/family:

⚠ To get immediate medical advice if they experience abdominal pain, nausea, vomiting, diarrhea; pancreatitis may occur

⚠ To get immediate medical advice if experiencing anaphylactic reactions

- To contact provider if patient experiences excessive thirst or any increase in volume or frequency of urination; hyperglycemia may occur

🍁 Canada only Side effects: *italics* = common; **bold** = life-threatening ⚠

Nurse Alert

aspirin (OTC)

(as'pir-in)

APC-ASA Coated Aspirin , A.S.A., Ascriptin Enteric, Aspergum, Aspirin , Aspir-Low, Aspir-trin , Bayer Aspirin, Bayer Children's Aspirin, Bufferin, Ecotrin, Equaline, Good Sense Aspirin, Halfprin, PMS-ASA , St. Joseph Children's, St. Joseph's Adult, Walgreens Aspirin Adult

Func. class.: Nonopioid analgesic, nonsteroidal antiinflammatory, antipyretic, antiplatelet

Chem. class.: Salicylate

Do not confuse:

Ascendin/Afrin

ACTION:

Blocks pain impulses in CNS, reduces inflammation by inhibition of prostaglandin synthesis; antipyretic action results from vasodilation of peripheral vessels; decreases platelet aggregation

USES:

Mild to moderate pain or fever including RA, osteoarthritis, thromboembolic disorders; TIAs, rheumatic fever, post-MI, prophylaxis of MI, ischemic stroke, angina, acute MI

Unlabeled uses: Prevention of cataracts (long-term use), prevention of pregnancy loss in women with clotting disorders, bone pain, claudication, colorectal cancer prophylaxis, Kawasaki disease, PCI, preeclampsia/thrombosis prophylaxis, vernal keratoconjunctivitis, pericarditis

CONTRAINDICATIONS:

Pregnancy (D) 3rd trimester, breastfeeding, children <12 yr, children with flulike symptoms, hypersensitivity to salicylates, tartrazine (FDC yellow dye #5), GI bleeding, bleeding disorders, vit K deficiency, peptic ulcer, acute bronchospasm, agranulocytosis, increased intracranial pressure, intracranial bleeding, nasal polyps, urticaria

Precautions: Abrupt discontinuation, acetaminophen/NSAIDs hypersensitivity,

acid/base imbalance, alcoholism, ascites, asthma, bone marrow suppression in elderly patients, dehydration, G6PD deficiency, gout, heart failure, anemia, renal/hepatic disease, pre/postoperatively, gastritis, pregnancy (C) 1st trimester

DOSAGE AND ROUTES

Calculator

Arthritis

- **Adult: PO** 3 g/day in divided doses q4-6hr
- **Child >25 kg (55 lb): PO/RECT** 90-130 mg/kg/day in divided doses

Pain/fever

- **Adult: PO/RECT** 325-650 mg q4hr prn, max 4 g/day
- **Child 2-11 yr: PO** 10-15 mg/kg/dose q4hr, max 4 g/day

Thromboembolic disorders

- **Adult: PO** 325-650 mg/day or bid

Transient ischemic attacks (risk)

- **Adult: PO** 50-325 mg/day (grade 1A)

Evolving MI with ST segment elevation (STEMI)

- **Adult: PO** 160-325 mg nonenteric, chewed and swallowed immediately, maintenance 75-162 mg daily

MI, stroke prophylaxis

- **Adult: PO** 50-325 mg/day

Prevention of recurrent MI

- **Adult: PO** 75-162 mg/day

CABG

- **Adult: PO** 75-325 mg/day starting 6 hr postprocedure, continue for 1 yr

PTCA

- **Adult: PO** 325 mg 2 hr before surgery

Thrombosis prophylaxis in ACS (unlabeled)

- **Adult: PO** 160-325 mg nonenteric, chewed and swallowed immediately

Idiopathic/viral pericarditis (unlabeled)

- **Adult: PO** 800 mg tid-qid × 7-10 days with gradual tapering to 800 mg/day q

wk for an additional 2-3 wk

Colorectal cancer prophylaxis (unlabeled)

- **Adult: PO** 325 mg every other day

Kawasaki disease (unlabeled)

- **Child: PO** 80-100 mg/kg/day in 4 divided doses, maintenance 3-5 mg/kg/day

Available forms:

Tabs 81, 325, 500, 650, 800 mg; chewable tabs 81 mg; supp 300, 600 mg; gum 227 mg; enteric-coated tabs 81, 325, 500, 975 mg; ext rel tabs 800 mg; del rel tabs 325, 500 mg; suppository 300, 600 mg

Administer:

PO route

- Do not break, crush, or chew enteric product
- Crushed or whole; chewable tablets may be chewed
- 1/2 hr before planned exercise
- With food or milk to decrease gastric symptoms; separate by 2 hr from enteric products
- With 8 oz of water; sit upright for 1/2 hr after dose to facilitate product passing into stomach

Rectal route

- Place suppository in refrigerator for at least 30 minutes before removing wrapper

SIDE EFFECTS

CNS: Stimulation, drowsiness, dizziness, confusion, **seizures**, headache, flushing, hallucinations, **coma**

CV: Rapid pulse, pulmonary edema

EENT: Tinnitus, hearing loss

ENDO: Hypoglycemia, hyponatremia, hypokalemia

GI: Nausea, vomiting, **GI bleeding**, diarrhea, heartburn, anorexia, **hepatitis**, GI ulcer

HEMA: **Thrombocytopenia**, **agranulocytosis**, **leukopenia**, **neutropenia**, **hemolytic anemia**, increased PT, aPTT, bleeding time

INTEG: *Rash*, urticaria, bruising

RESP: Wheezing, hyperpnea, bronchospasm

SYST: Reye's syndrome (children), anaphylaxis, laryngeal edema

PHARMACOKINETICS

Enteric metabolized by liver; inactive metabolites excreted by kidneys; crosses placenta; excreted in breast milk; half-life 15-20 min, up to 9 hr in large dose; rectal products may be erratic, protein binding 90%

PO: Onset 15-30 min, peak 1-2 hr, duration 4-6 hr, well absorbed

RECT: Onset slow, duration 4-6 hr

INTERACTIONS

Increase: gastric ulcer risk—corticosteroids, antiinflammatories, NSAIDs, alcohol

Increase: bleeding—alcohol, plicamycin, cefamandole, thrombolytics, ticlopidine, clopidogrel, tirofiban, eptifibatide, anticoagulants

Increase: effects of warfarin, insulin, methotrexate, thrombolytic agents, penicillins, phenytoin, valproic acid, oral hypoglycemics, sulfonamides

Increase: salicylate levels—urinary acidifiers, ammonium chloride, nizatidine

Increase: hypotension—nitroglycerin

Decrease: effects of aspirin—antacids (high doses), urinary alkalizers, corticosteroids

Decrease: antihypertensive effect—ACE inhibitors

Decrease: effects of probenecid, spironolactone, sulfinpyrazone, sulfonamides, NSAIDs, β -blockers, loop diuretics

Drug/Herb

Increase: risk of bleeding—feverfew, garlic, ginger, ginkgo, ginseng (*Panax*), horse chestnut

Drug/Food

Increase: risk of bleeding—fish oil (omega-3 fatty acids)

- Foods that acidify urine may increase aspirin level

Drug/Lab Test

Increase: coagulation studies, LFTs, serum uric acid, amylase, CO₂, urinary protein

Decrease: serum potassium, cholesterol

Interference: VMA, 5-HIAA, xylose tolerance test, TSH, pregnancy test

NURSING CONSIDERATIONS

Assess:

- **Pain:** character, location, intensity; ROM before and 1 hr after administration
- **Fever:** temp before and 1 hr after administration
- Hepatic studies: AST, ALT, bilirubin, creatinine if patient is receiving long-term therapy
- Renal studies: BUN, urine creatinine; I&O ratio; decreasing output may indicate renal failure (long-term therapy)
- Blood studies: CBC, Hct, Hgb, PT if patient is receiving long-term therapy
- **Hepatotoxicity:** dark urine, clay-colored stools, yellowing of skin, sclera, itching, abdominal pain, fever, diarrhea if patient is receiving long-term therapy
- **Allergic reactions:** rash, urticaria; if these occur, product may have to be discontinued; patients with asthma, nasal polyps, allergies: severe allergic reaction may occur
- **Ototoxicity:** tinnitus, ringing, roaring in ears; audiometric testing needed before, after long-term therapy
- **Salicylate level:** therapeutic level 150-300 mcg/ml for chronic inflammation
- Edema in feet, ankles, legs
- Product history; many product interactions

Evaluate:

- Therapeutic response: decreased pain, inflammation, fever

Teach patient/family:

- To report any symptoms of hepatotoxicity, renal toxicity, visual changes, ototoxicity, allergic reactions, bleeding (long-term therapy)
- To avoid if allergic to tartrazine
- Not to exceed recommended dosage; acute poisoning may result
- To read labels on other OTC products because many contain aspirin, salicylates
- That the therapeutic response takes 2 wk (arthritis)
- To report tinnitus, confusion, diarrhea, sweating, hyperventilation
- To avoid alcohol ingestion; GI bleeding may occur
- That patients who have allergies, nasal polyps, asthma may develop allergic reactions

- To discard tabs if vinegar-like smell is detected
- That medication is not to be given to children or teens with flulike symptoms or chickenpox because Reye's syndrome may develop
- To take with a full glass of water
- Not to use during 3rd trimester of pregnancy (D)

TREATMENT OF OVERDOSE:

Lavage, activated charcoal, monitor electrolytes, VS

🍁 Canada only Side effects: *italics* = common; **bold** = life-threatening ⚠️
Nurse Alert

atazanavir (Rx)

(at-a-za-na'veer)

Reyataz

Func. class.: Antiretroviral

Chem. class.: Protease inhibitor

ACTION:

Inhibits human immunodeficiency virus (HIV-1) protease, which prevents maturation of the infectious virus

USES:

HIV-1 infection in combination with other antiretroviral agents

CONTRAINDICATIONS:

Hypersensitivity

Precautions:

Pregnancy (B), breastfeeding, children, geriatric patients, hepatic disease, alcoholism, drug resistance, AV block, diabetes, dialysis, elderly, females, hemophilia, hypercholesterolemia, immune reconstitution syndrome, lactic acidosis, pancreatitis

DOSAGE AND ROUTES

Calculator

Antiretroviral-naïve patients

- **Adult: PO** 400 mg/day (unable to take ritonavir); 300 mg with ritonavir 100 mg/day
- **Child ≥6 yr/adolescent ≥40 kg: PO** 300 mg with ritonavir 100 mg daily
- **Child ≥6 yr/adolescent 20 to <40 kg: PO** 200 mg with ritonavir 100 mg daily
- **Child ≥6 yr/adolescent 15 to <20 kg: PO** 150 mg with ritonavir 80 mg daily

Antiretroviral-experienced patients

- **Adult: PO** 300 mg with ritonavir 100 mg daily

- **Pregnant adults/adolescents (2nd/3rd trimester) with H2 blocker or tenofovir: PO 400 mg with ritonavir 100 mg daily**
- **Child ≥6 yr/adolescent ≥40 kg: PO 300 mg with ritonavir 100 mg daily**
- **Child ≥6 yr/adolescent 20 to <40 kg: PO 200 mg with ritonavir 100 mg daily**

Hepatic dose

- **Adult: PO Child-Pugh B: 300 mg/day; Child-Pugh C: do not use**

Available forms:

Caps 100, 150, 200, 300 mg

Administer:

- With food; 2 hr before or 1 hr after antacid or didanosine, swallow cap whole

SIDE EFFECTS

CNS: Headache, depression, dizziness, insomnia, peripheral neurologic symptoms

GI: Vomiting, *diarrhea, abdominal pain, nausea, hepatotoxicity*

INTEG: *Rash, Stevens-Johnson syndrome, photosensitivity*

MISC: Fatigue, fever, arthralgia, back pain, cough, lipodystrophy, pain, gynecomastia, nephrolithiasis; *lactic acidosis, hyperbilirubinemia (pregnancy, females, obesity)*

PHARMACOKINETICS

Rapidly absorbed, absorption increased with food, peak 2½ hr, 86% protein bound, extensively metabolized in liver by CYP3A4, 27% excreted unchanged in urine/feces (minimal), half-life 7 hr

INTERACTIONS

⚠ Increase: levels, toxicity of immunosuppressants (cycloSPORINE, sirolimus, tacrolimus, sildenafil), tricyclic antidepressants, warfarin, calcium channel blockers, clarithromycin, chlorazepate, diazepam, irinotecan, HMG-CoA reductase inhibitors, antidysrhythmics, midazolam, triazolam, ergots, pimozide, *other protease inhibitors*

Increase: effects of estrogens, oral contraceptives

Increase: atazanavir levels—CYP3A4 substrates, CYP3A4 inhibitors

Increase: hyperbilirubinemia—indinavir

Decrease: teleprevir level when used with atazanavir and ritonavir

Decrease: atazanavir levels—CYP3A4 inducers, rifampin, antacids, didanosine, efavirenz, proton-pump inhibitors, H₂-receptor antagonists

Drug/Herb

Decrease: atazanavir levels—St. John's wort, avoid concurrent use

Increase: myopathy, rhabdomyolysis—red yeast rice

Drug/Lab Test

Increase: AST, ALT, total bilirubin, amylase, lipase, CK

Decrease: Hgb, neutrophils, platelets

NURSING CONSIDERATIONS

Assess:

 **For hepatic failure; hepatic studies: ALT, AST, bilirubin**

- Immune reconstitution syndrome: When given with combination antiretroviral therapy
- **For lactic acidosis, hyperbilirubinemia (females, pregnancy, obesity), if pregnant call Antiretroviral Pregnancy Registry 800-258-4263**
- For signs of infection, anemia, nephrolithiasis
- Bowel pattern before, during treatment; if severe abdominal pain with bleeding occurs, product should be discontinued; monitor hydration
- Viral load, CD4 count throughout treatment
- Skin eruptions, rash, urticaria, itching

Evaluate:

- Therapeutic response: increasing CD4 counts; decreased viral load, resolution of symptoms of HIV-1 infection

Teach patient/family:

- To take as prescribed with other antiretrovirals as prescribed; if dose is missed, to take as soon as remembered up to 1 hr before next dose; not to double dose, share with others
- That product must be taken daily to maintain blood levels for duration of therapy
- That product may cause photosensitivity; to use protective clothing, stay out of the sun
- To notify prescriber if diarrhea, nausea, vomiting, rash occurs; dizziness,

lightheadedness may occur; ECG may be altered

- That product interacts with many products; St. John's wort; to advise prescriber of all products, herbal products used
 - That redistribution of body fat may occur, the effect is not known
 - That product does not cure HIV-1 infection, prevent transmission to others; only controls symptoms
 - That, if taking phosphodiesterase type 5 inhibitor with atazanavir, there may be increased risk of phosphodiesterase type 5 inhibitor-associated adverse events (hypotension, prolonged penile erection); to notify physician promptly of these symptoms
-

🍁 Canada only Side effects: *italics* = common; **bold** = life-threatening ⚠️
Nurse Alert

atenolol (Rx)

(a-ten'oh-lole)

Tenormin

Func. class.: Antihypertensive, antianginal

Chem. class.: β -Blocker, β_1 -, β_2 -blocker (high doses)

Do not confuse:

atenolol/albuterol

Tenormin/thiamine/Imuran

ACTION:

Competitively blocks stimulation of β -adrenergic receptor within vascular smooth muscle; produces negative chronotropic activity (decreases rate of SA node discharge, increases recovery time), slows conduction of AV node, decreases heart rate, negative inotropic activity decreases O_2 consumption in myocardium; decreases action of renin-aldosterone-angiotensin system at high doses, inhibits β_2 receptors in bronchial system at higher doses

USES:

Mild to moderate hypertension, prophylaxis of angina pectoris; suspected or known MI (IV use); MI prophylaxis

Unlabeled uses:

Migraine prophylaxis, supraventricular tachycardia prophylaxis (PSVT), unstable angina, alcohol withdrawal, lithium-induced tremor

CONTRAINDICATIONS:

Pregnancy (D), hypersensitivity to β -blockers, cardiogenic shock, 2nd-or 3rd-degree heart block, sinus bradycardia, cardiac failure, Raynaud's disease, pulmonary edema

Precautions: Breastfeeding, major surgery, diabetes mellitus, thyroid/renal disease, CHF, COPD, asthma, well-compensated heart failure, dialysis, myasthenia gravis

Black Box Warning:

Abrupt discontinuation

DOSAGE AND ROUTES

Calculator

- **Adult: PO** 25-50 mg/day, increasing q1-2wk to 100 mg/day; may increase to 200 mg/day for angina, up to 100 mg/day for hypertension
- **Child: PO** 0.8-1 mg/kg/dose initially; range, 0.8-1.5 mg/kg/day; max 2 mg/kg/day
- **Geriatric: PO** 25 mg/day initially

Chronic stable angina

- **Adult: PO** 50 mg/day, then 100 mg/day as needed after 7 days, max 200 mg/day

Post MI, MI prophylaxis

- **Adult: PO** 100 mg/day in 1-2 divided doses; may need for 1-3 yr after MI

Renal disease

- **Adult: PO** CCr 15-35 ml/min, max 50 mg/day; CCr <15 ml/min, max 25 mg/day; hemodialysis 25-50 mg after dialysis

PSVT prophylaxis (unlabeled)

- **Child: PO** 0.3-1.3 mg/kg/day

Ethanol withdrawal prevention (unlabeled)

- **Adult: PO** 50-100 mg/day

Migraine prophylaxis (unlabeled)

- **Adult: PO** 50-150 mg/day, titrate to response

Lithium-induced tremor (unlabeled)

- **Adult: PO** 50 mg/day

Available forms:

Tabs 25, 50, 100 mg

Administer:

PO route

- Before meals, at bedtime; tab may be crushed, swallowed whole

- Reduced dosage with renal dysfunction

SIDE EFFECTS

CNS: *Insomnia, fatigue, dizziness, mental changes, memory loss, hallucinations, depression, lethargy, drowsiness, strange dreams, catatonia*

CV: *Profound hypotension, bradycardia, CHF, cold extremities, postural hypotension, 2nd-or 3rd-degree heart block*

EENT: Sore throat; dry, burning eyes; blurred vision; stuffy nose

ENDO: Increased hypoglycemic response to insulin

GI: *Nausea, diarrhea, vomiting, mesenteric arterial thrombosis, ischemic colitis*

GU: Impotence, decreased libido

HEMA: *Agranulocytosis, thrombocytopenia purpura*

INTEG: Rash, fever, alopecia

RESP: *Bronchospasm, dyspnea, wheezing, pulmonary edema*

PHARMACOKINETICS

PO: Peak 2-4 hr; onset 1 hr; duration 24 hr; half-life 6-9 hr; excreted unchanged in urine, feces (50%); protein binding 5%-15%

INTERACTIONS

- Mutual inhibition: sympathomimetics (cough, cold preparations)

Increase: hypotension, bradycardia—reserpine, hydralazine, methyldopa, prazosin, anticholinergics, digoxin, diltiazem, verapamil, cardiac glycosides, antihypertensives

Increase: hypoglycemia—insulins, oral antidiabetics

Increase: hypertension—amphetamines, ephedrine, pseudoephedrine

Decrease: effect—insulin, oral antidiabetic agents, theophylline, DOPAmine, MAOIs

Drug/Herb

Increase: atenolol effect—hawthorn

Decrease: atenolol effect—ephedra (ma huang)

Drug/Lab Test

Increase: blood glucose, BUN, potassium, triglycerides, uric acid, ANA titer

NURSING CONSIDERATIONS

Assess:

- I&O, weight daily; watch for CHF (rales/crackles, jugular vein distention, weight gain, edema)
- **Hypertension:** B/P, pulse q4hr; note rate, rhythm, quality; apical/radial pulse before administration; notify prescriber of any significant changes (<50 bpm); ECG
- **Hypotension:** may be caused in hemodialysis
- **Hypoglycemia:** may be masked in diabetes mellitus
- Baselines in renal/hepatic studies before therapy begins

Black Box Warning:

Taper gradually do not discontinue abruptly

Perform/provide:

- Storage protected from light, moisture; place in cool environment

Evaluate:

- Therapeutic response: decreased B/P after 1-2 wk, increased activity tolerance, decreased anginal pain

Teach patient/family:**Black Box Warning:**

Not to discontinue product abruptly, taper over 2 wk (angina); to take at same time each day as directed

- Not to use OTC products unless directed by prescriber
- To report bradycardia, dizziness, confusion, depression, fever
- To take pulse at home; advise when to notify prescriber
- To limit alcohol, smoking, sodium intake
- To comply with weight control, dietary adjustments, modified exercise program
- To carry emergency ID to identify product, allergies, conditions being treated
- To avoid hazardous activities if dizziness is present
- To change position slowly
- That product may mask symptoms of hypoglycemia in diabetic patients
- **To use contraception while taking this product, pregnancy category (D), avoid breastfeeding**

TREATMENT OF OVERDOSE:

Lavage, IV atropine for bradycardia, IV theophylline for bronchospasm, dextrose for hypoglycemia, digoxin, O₂, diuretic for cardiac failure, hemodialysis

☼ Canada only Side effects: *italics* = common; **bold** = life-threatening ⚠
Nurse Alert

atomoxetine (Rx)

(at-o-mox'eh-teen)

Strattera

Func. class.: Psychotherapeutic—miscellaneous

Chem. class.: Selective norepinephrine reuptake inhibitor

ACTION:

Selective norepinephrine reuptake inhibitor; may inhibit the presynaptic norepinephrine transporter

USES:

Attention deficit hyperactivity disorder

CONTRAINDICATIONS:

Hypersensitivity, angle-closure glaucoma, arteriosclerosis, cardiac disease, cardiomyopathy, heart failure, jaundice, MAOI therapy, history of pheochromocytoma

Precautions: Pregnancy (C), breastfeeding, hepatic disease, angioedema, bipolar disorder, dysrhythmias, CAD, hypo/hypertension

Black Box Warning:

Children <6 yr, suicidal ideation

DOSAGE AND ROUTES

Calculator

- **Child ≤70 kg >6 yrs:** PO 0.5 mg/kg/day, increase after 3 days to target daily dose of 1.2 mg/kg in AM or evenly divided doses AM, late afternoon; max 1.4 mg/kg/day or 100 mg/day, whichever is less
- **Adult and child >70 kg:** PO 40 mg/day, increase after 3 days to target daily dose of 80 mg in AM or evenly divided doses AM, late afternoon; max 100 mg/day

Maintenance

- **Adolescent ≤ 15 yr and child ≥ 6 yr: PO 1.2-1.8 mg/kg/day**

Initial dose titration with strong CYP2D6 inhibitors

- **Adult and child > 6 yr weighing > 70 kg: PO 40 mg/day each AM or 2 evenly divided doses, titrate to target of 80 mg/day if symptoms do not improve after 4 wk and dose is well tolerated**

Hepatic dose

- Child-Pugh B: reduce dose by 50%; Child-Pugh C: reduce dose by 75%

Available forms:

Caps 10, 18, 25, 40, 60, 80, 100 mg

Administer:

- Whole; do not break, crush, chew
- Gum, hard candy, frequent sips of water for dry mouth
- Without regard to food

SIDE EFFECTS

CNS: *Insomnia*, dizziness, headache, irritability, crying, mood swings, fatigue, hypoesthesia, lethargy, paresthesia

CV: *Palpitations*, hot flushes, tachycardia, increased B/P

ENDO: Growth retardation

GI: Dyspepsia, nausea, anorexia, dry mouth, weight loss, vomiting, diarrhea, constipation, **hepatic injury**

GU: Urinary hesitancy, retention, dysmenorrhea, erectile disturbance, ejaculation failure, impotence, prostatitis, abnormal orgasm, male pelvic pain

INTEG: **Exfoliative dermatitis**, sweating, rash

MISC: Cough, rhinorrhea, dermatitis, ear infection

PHARMACOKINETICS

Peak 1-2 hr, metabolized by liver, excreted by kidneys, 98% protein binding

INTERACTIONS

Increase: hypertensive crisis—MAOIs or within 14 days of MAOIs, vasopressors

Increase: cardiovascular effects of albuterol, pressor agents

Increase: effects of atomoxetine—CYP2D6 inhibitors (amiodarone, cimetidine [weak], clomipramine, delavirdine, gefitinib, imatinib, propafenone, quinidine)

[potent], ritonavir, citalopram, escitalopram, FLUoxetine, sertraline, PARoxetine, thioridazine, venlafaxine)

NURSING CONSIDERATIONS

Assess:

- VS, B/P; check patients with cardiac disease more often for increased B/P
- **Hepatic injury:** May cause liver failure: monitor LFT; assess for jaundice, pruritus, flulike symptoms, upper right quadrant pain
- ⚠ **Mental status:** mood, sensorium, affect, stimulation, insomnia, aggressiveness, suicidal ideation in children/young adults
- Appetite, sleep, speech patterns
- For increased attention span, decreased hyperactivity with ADHD, growth rate weight, therapy may need to be discontinued

Evaluate:

- Therapeutic response: decreased hyperactivity (ADHD)

Teach patient/family:

- To avoid OTC preparations unless approved by prescriber, no tapering needed when discontinuing product
- To avoid alcohol ingestion
- To avoid hazardous activities until stabilized on medication
- To get needed rest; patients will feel more tired at end of day; not to take dose late in day, insomnia may occur

Black Box Warning:

To report suicidal ideation

- To notify prescriber immediately if erection >4 hr

☼ Canada only Side effects: *italics* = common; **bold** = life-threatening ⚠
Nurse Alert

atorvastatin (Rx)

(a-tore'va-stat-in)

Lipitor

Func. class.: Antilipidemic

Chem. class.: HMG-CoA reductase inhibitor (statin)

Do not confuse:

Lipitor/Levatol

ACTION:

Inhibits HMG-CoA reductase enzyme, which reduces cholesterol synthesis; high doses lead to plaque regression

USES:

As adjunct for primary hypercholesterolemia (types Ia, Ib), dysbetalipoproteinemia, elevated triglyceride levels, prevention of CV disease by reduction of heart risk in those with mildly elevated cholesterol

Unlabeled uses: Atherosclerosis

CONTRAINDICATIONS:

Pregnancy (X), breastfeeding, hypersensitivity, active hepatic disease

Precautions: Previous hepatic disease, alcoholism, severe acute infections, trauma, severe metabolic disorders, electrolyte imbalance

DOSAGE AND ROUTES

Calculator

- **Adult: PO** 10-20 mg/day, usual range 10-80 mg/day, dosage adjustments may be made in 2-4 wk intervals, max 80 mg/day; patients who require >45% reduction in LDL may be started at 40 mg/day

Atherosclerosis (unlabeled)

- **Adult: PO** 80 mg/day

Available forms: Tabs 10, 20, 40, 80 mg

Administer:

- Total daily dose at any time of day without regard to meals

SIDE EFFECTS

CNS: Headache, asthenia

EENT: Lens opacities

GI: *Abdominal cramps, constipation, diarrhea, flatus, heartburn, dyspepsia, liver dysfunction, pancreatitis*, nausea, increased serum transaminase

GU: Impotence

INTEG: Rash, pruritus, alopecia; photosensitivity (rare)

MISC: Hypersensitivity

MS: Arthralgia, myalgia, *rhabdomyolysis*

RESP: Pharyngitis, sinusitis

PHARMACOKINETICS

Peak 1-2 hr, metabolized in liver, highly protein bound, excreted primarily in urine, half-life 14 hr, protein binding 98%

INTERACTIONS

Increase: *rhabdomyolysis—azole antifungals, cycloSPORINE, erythromycin, niacin, gemfibrozil, clofibrate*

Increase: serum level of digoxin

Increase: levels of oral contraceptives

Increase: levels of atorvastatin—erythromycin

Increase: effects of warfarin

Decrease: atorvastatin levels—colestipol

Drug/Herb

Decrease: effect—St. John's wort

Drug/Food

- Possible toxicity when used with grapefruit juice; oat bran may reduce effectiveness

Drug/Lab Test

Increase: bilirubin, alk phos, ALT, AST, CK

Interference: thyroid function tests

NURSING CONSIDERATIONS

Assess:

- **Hypercholesterolemia:** diet, obtain diet history including fat, cholesterol in diet; cholesterol triglyceride levels periodically during treatment; check lipid panel 6-12 wk after changing dose
- Hepatic studies q1-2mo, at initiation, 6, 12 wk after initiation or change in dose, periodically thereafter; AST, ALT, LFTs may be increased
- Renal studies in patients with compromised renal system: BUN, I&O ratio, creatinine
- Bowel status: constipation, stool softeners may be needed; if severe, add fiber, water to diet

⚠ Rhabdomyolysis: for muscle pain, tenderness, obtain CPK baseline; if markedly increased, product may need to be discontinued

Perform/provide:

- Storage in cool environment in tight container protected from light

Evaluate:

- Therapeutic response: decrease in LDL, total cholesterol, triglycerides, CAD; increase in HDL

Teach patient/family:

- That blood work and eye exam will be necessary during treatment
- To report blurred vision, severe GI symptoms, headache, muscle pain, weakness
- That previously prescribed regimen will continue: low-cholesterol diet, exercise program, smoking cessation
- **Not to take product if pregnant (X), breastfeeding; to avoid alcohol**
- To stay out of the sun; to use sunscreen, protective clothing to prevent photosensitivity (rare)

☼ Canada only Side effects: *italics* = common; **bold** = life-threatening ⚠
Nurse Alert

atovaquone (Rx)

(a-toe'va-kwon)

Mepron

Func. class.: Antiprotozoal

Chem. class.: Aromatic diamide derivative, analog of ubiquinone

ACTION:

Interferes with DNA/RNA synthesis in protozoa

USES:

Pneumocystis jiroveci infections in patients intolerant of trimethoprim-sulfamethoxazole, prophylaxis, *Toxoplasma gondii*, toxoplasmosis

Unlabeled uses: Babesiosis, malaria treatment/prophylaxis, toxoplasmosis prophylaxis, *Plasmodium* sp.

CONTRAINDICATIONS:

Hypersensitivity or history of developing life-threatening allergic reactions to any component of the formulation, benzyl alcohol sensitivity

Precautions: Pregnancy (C), breastfeeding, neonates, hepatic disease, GI disease, respiratory insufficiency

DOSAGE AND ROUTES

Calculator

Acute, mild, moderate *Pneumocystis jiroveci* pneumonia

- **Adult and adolescent 13-16 yr:** PO 750 mg with food bid for 21 days

***Pneumocystis jiroveci* pneumonia, prophylaxis**

- **Adult and adolescent:** PO 1500 mg/day with meal

Babesiosis (unlabeled)

- **Adult:** PO 750 mg q12hr with azithromycin (500-1000 mg on day 1 then 250 mg/day × 7-14 days)

Toxoplasmosis prophylaxis in AIDS (unlabeled)

- **Adult: PO** 1500 mg alone or in combination

***Plasmodium falciparum* (unlabeled)**

- **Adult: PO** 250 mg with proguanil daily
- **Child: PO** 17 mg/kg with proguanil daily

Available forms: Susp 750 mg/5 ml

Administer:

- With high-fat food to increase absorption of product and higher plasma concentrations
- Oral susp, shake before using
- All contents of foil pouch

SIDE EFFECTS

CNS: *Dizziness, headache, anxiety, insomnia*, asthenia, fever

CV: Hypotension

GI: *Nausea, vomiting, diarrhea*, anorexia, increased AST/ALT, **acute pancreatitis**, constipation, abdominal pain

HEMA: Anemia, **neutropenia**

INTEG: Pruritus, urticaria, *rash*

META: Hyperkalemia, hypoglycemia, hyponatremia

OTHER: Cough, dyspnea

PHARMACOKINETICS

Excreted unchanged in feces (94%), highly protein bound (99%), half-life 2-3 days

INTERACTIONS

Increase: level of—zidovudine, monitor for toxicity

Decrease: effect of atovaquone—rifampin, rifabutin, tetracycline, avoid concurrent use

Drug/Lab Test

Increase: AST, ALT, alk phos

Decrease: glucose, neutrophils, Hgb, sodium

NURSING CONSIDERATIONS

Assess:

Infection: WBC, vital signs; sputum baseline, periodically; obtain specimens needed before giving 1st dose

- Bowel pattern before, during treatment
- Respiratory status: rate, character, wheezing, dyspnea; risk for respiratory infection
- Allergies before treatment, reaction to each medication

Evaluate:

- Therapeutic response: decreased temp, ability to breathe

Teach patient/family:

- To take with food to increase plasma concentrations

☼ Canada only Side effects: *italics* = common; **bold** = life-threatening ⚠

Nurse Alert

atovaquone/proguanil

(a-toe'va-kwon)

Malarone

Func. class.: Antiprotozoal

Chem. class.: Aromatic diamide derivative

ACTION:

The constituents of Malarone, atovaquone, and proguanil hydrochloride interfere with 2 different pathways involved in DNA/RNA synthesis in protozoa

USES:

Malaria, malaria prophylaxis

CONTRAINDICATIONS:

Hypersensitivity to this product, malaria prophylaxis in patients with severe renal impairment

Precautions: Pregnancy (C), breastfeeding, children, hepatic/GI/renal disease

DOSAGE AND ROUTES

Calculator

Treatment of acute, uncomplicated *P. falciparum* malaria malarone adult strength tabs

- **Adult/adolescent/child >40 kg: PO** 4 adult strength tabs every day as a single dose × 3 consecutive days
- **Child 31-40 kg: PO** 3 adult strength tabs every day as a single dose × 3 consecutive days
- **Child 21-30 kg: PO** 2 adult strength tabs every day as a single dose × 3 consecutive days
- **Infant/child 11-20 kg: PO** 1 adult strength tab every day × 3 consecutive days

Malarone Pediatric Tabs

- **Infant/child 11-20 kg: PO** 4 pediatric tabs every day × 3 consecutive days

- **Infant/child 9-10 kg: PO** 3 pediatric tabs every day × 3 consecutive days
- **Infant/child 5-8 kg: PO** 2 pediatric tabs every day every 3 consecutive days

***P. falciparum* malaria prophylaxis, including chloroquine resistance areas**

- Each Malarone adult strength tab contains atovaquone 250 mg/proguanil 100 mg; Malarone Pediatric tablet contains atovaquone 62.5 mg/proguanil 25 mg

Malarone adult strength tabs

- **Adult/adolescent/child >40 kg: PO** 1 adult strength tab every day; begin prophylaxis 1-2 days before entering the endemic area; continue daily during the stay and for 7 days after leaving the area

Malarone Pediatric Tab

- **Child 31-40 kg: PO** 3 pediatric tabs every day; begin prophylaxis 1-2 days before entering the endemic area; continue daily during the stay and for 7 days after leaving the area
- **Child 21-30 kg: PO** 2 pediatric tabs every day; begin prophylaxis 1-2 days before entering the endemic area; continue daily during the stay and for 7 days after leaving the area
- **Infant/child 11-20 kg: PO** 1 pediatric tab every day; begin prophylaxis 1-2 days before entering the endemic area; continue daily during the stay and for 7 days after leaving the area

Available forms: Tabs (adult) 250 mg atovaquone/proguanil 100 mg; tabs (pediatric) 62.5 atovaquone/proguanil 25 mg

Administer

- Give with food or with milk or milk-based drink (nutritional supplement shake) to enhance oral absorption of atovaquone; food with high fat content is desired
- Give dose at the same time each day, administer a repeat dose if vomiting occurs within 1 hour after dosing
- Tabs may be crushed and mixed with condensed milk for children unable to swallow whole tablets

SIDE EFFECTS

CNS: *Dizziness, headache, anxiety, insomnia, asthenia, fever*

CV: Hypotension

GI: *Nausea, vomiting, diarrhea, anorexia, increased AST/ALT, acute pancreatitis, constipation, abdominal pain*

HEMA: Anemia, neutropenia

INTEG: Pruritus, urticaria, *rash*

META: Hyperkalemia, hypoglycemia, hyponatremia

OTHER: Cough, dyspnea

PHARMACOKINETICS

Atovaquone excreted unchanged in feces (94%), highly protein bound (99%), Proguanil 75% protein bound, 40%-60% excreted in urine, hepatic metabolism; half-life 2-3 days

INTERACTIONS

Increase: Level of indinavir

Decrease: Effect of atovaquone-rifampin, rifabutin, tetracycline, metoclopramide

Increase: AST, ALT, alk phos

Decrease: Glucose, neutrophils, Hgb, sodium

NURSING CONSIDERATIONS

Assess:

- **Malaria:** Identify when the patient will be entering an area with malaria
- Bowel pattern before, during treatment
- Respiratory status: rate, character, wheezing, dyspnea; risk for respiratory infection
- Allergies before treatment, reaction to each medication
- CBC, LFTs, serum amylase, creatinine/BUN, sodium; increases in LFTs can persist for 4 wk after discontinuation of treatment

Evaluate:

Therapeutic response:

- Resolution/prevention of malaria

Teach patient/family:

- To take with food to increase plasma concentrations

☛ Canada only Side effects: *italics* = common; **bold** = life-threatening ⚠

Nurse Alert

RARELY USED

atracurium (Rx)

(a-tra-kyoor'ee-um)

Func. class.: Neuromuscular blocker (nondepolarizing)

USES:

Facilitation of endotracheal intubation, skeletal muscle relaxation during mechanical ventilation, surgery, or general anesthesia

CONTRAINDICATIONS:

Hypersensitivity

Black Box Warning:

Respiratory insufficiency

DOSAGE AND ROUTES

Calculator

- **Adult and child >2 yr: IV BOL** 0.4-0.5 mg/kg then 0.08-0.1 mg/kg 20-45 min after 1st dose if needed for prolonged procedures; give smaller doses with halothane
- **Child 1 mo-2 yr: IV BOL** 0.3-0.4 mg/kg

HIGH ALERT

atropine (Rx)

(a'troe-peen)

Atreza, AtroPen, Sal-Tropine

Func. class.: Antidysrhythmic, anticholinergic parasympatholytic, antimuscarinic

Chem. class.: Belladonna alkaloid

Do not confuse: atropine/Akarpine

ACTION:

Blocks acetylcholine at parasympathetic neuroeffector sites; increases cardiac output, heart rate by blocking vagal stimulation in heart; dries secretions by blocking vagus

USES:

Bradycardia <40-50 bpm, bradydysrhythmia, reversal of anticholinesterase agents, insecticide poisoning, blocking cardiac vagal reflexes, decreasing secretions before surgery, antispasmodic with GU, biliary surgery, bronchodilator, AV heart block

Unlabeled uses: Cardiac arrest, CPR, diarrhea, pulseless electrical activity, ventricular asystole, asthma

CONTRAINDICATIONS:

Hypersensitivity to belladonna alkaloids, closed-angle glaucoma, GI obstructions, myasthenia gravis, thyrotoxicosis, ulcerative colitis, prostatic hypertrophy, tachycardia/tachydysrhythmias, asthma, acute hemorrhage, severe hepatic disease, myocardial ischemia, paralytic ileus

Precautions: Pregnancy (C), breastfeeding, children <6 yr, geriatric patients, renal disease, CHF, hyperthyroidism, COPD, hypertension, intraabdominal infection, Down syndrome, spastic paralysis, gastric ulcer

DOSAGE AND ROUTES

Calculator

Bradycardia/bradydysrhythmia

- **Adult: IV BOL** 0.5-1 mg given q3-5min, max 3 mg
- **Child: IV BOL** 0.01 mg/kg up to 0.4 mg or 0.3 mg/m²; may repeat q4-6hr; min dose 0.1 mg to avoid paradoxical reaction, max single dose 0.5 mg

Organophosphate poisoning

- **Adult and child: IM/IV** 1-2 mg hourly until muscarinic symptoms disappear; may need 6 mg every hr
- **Adult and child >90 lb, usually >10 yr: AtroPen** 2 mg
- **Child 40-90 lb, usually 4-10 yr: AtroPen** 1 mg
- **Child 15-40 lb: AtroPen** 0.5 mg
- **Infant <15 lb: IM/IV** 0.05 mg/kg q5-20min as needed

Presurgery

- **Adult and child >20 kg: SUBCUT/IM/IV** 0.4-0.6 mg 30-60 min before anesthesia
- **Child <20 kg: IM/SUBCUT** 0.01 mg/kg up to 0.4 mg 1/2-1 hr preop, max 0.6 mg/dose

Available forms: Inj 0.05, 0.1, 0.4, 0.5, 0.8, 1 mg/ml; tabs 0.4 mg; AtroPen 0.5, 1, 2 mg inj prefilled autoinjectors

Administer:

PO route

- Increased bulk, water in diet if constipation occurs
- Without regard to meals

IM route

- Atropine flush may occur in children and is not harmful

AtroPen

- Use no more than 3 AtroPen inj unless under the supervision of trained medical provider
- Use as soon as symptoms appear (tearing, wheezing, muscle fasciculations, excessive oral secretions)

IV route

- Undiluted or diluted with 10 ml sterile water; give at 0.6 mg/min through Y-

tube or 3-way stopcock; do not add to IV sol; may cause paradoxical bradycardia for 2 min

Y-site compatibilities: Amrinone, etomidate, famotidine, heparin, hydrocortisone, meropenem, nafcillin, potassium chloride, sufentanil, vit B/C

SIDE EFFECTS

CNS: Headache, dizziness, involuntary movement, confusion, psychosis, anxiety, **coma**, flushing, drowsiness, insomnia, weakness; delirium (geriatric patients)

CV: Hypo/hypertension, paradoxical bradycardia, angina, PVCs, **tachycardia**, ectopic ventricular beats, **bradycardia**

EENT: Blurred vision, photophobia, glaucoma, eye pain, pupil dilation, nasal congestion

GI: Dry mouth, nausea, vomiting, abdominal pain, anorexia, constipation, **paralytic ileus**, abdominal distention, altered taste

GU: Retention, hesitancy, impotence, dysuria

INTEG: Rash, urticaria, contact dermatitis, dry skin, flushing

MISC: Suppression of lactation, decreased sweating, **anaphylaxis**

PHARMACOKINETICS

Half-life 2-3 hr, terminal 12.5 hr, excreted by kidneys unchanged (70%-90% in 24 hr), metabolized in liver, 40%-50% crosses placenta, excreted in breast milk

PO: Onset 1/2-2 hr, peak 1/2-1 hr, duration 4-6 hr, well absorbed

IM/SUBCUT: Onset 15-50 min, peak 30 min, duration 4-6 hr, well absorbed

IV: Peak 2-4 min, duration 4-6 hr

INTERACTIONS

Increase: Mucosal lesions—potassium chloride tab

Increase: anticholinergic effects—tricyclics, amantadine, antiparkinson agents

Decrease: absorption—ketoconazole, levodopa

Decrease: effect of atropine—antacids

NURSING CONSIDERATIONS

Assess:

- I&O ratio; check for urinary retention, daily output

- **ECG** for ectopic ventricular beats, PVC, tachycardia in cardiac patients
- For bowel sounds, constipation
- Respiratory status: rate, rhythm, cyanosis, wheezing, dyspnea, engorged neck veins
- **Increased intraocular pressure:** eye pain, nausea, vomiting, blurred vision, increased tearing
- Cardiac rate: rhythm, character, B/P continuously
- Allergic reaction: rash, urticaria

Evaluate:

- Therapeutic response: decreased dysrhythmias, increased heart rate, secretions; GI, GU spasms; bronchodilation

Teach patient/family:

- To report blurred vision, chest pain, allergic reactions, constipation, urinary retention, to use sunglasses to protect the eyes
- Not to perform strenuous activity in high temperatures; heat stroke may result
- To take as prescribed; not to skip or double doses
- Not to operate machinery if drowsiness occurs
- Not to take OTC products without approval of prescriber
- Not to freeze or expose to light (AtroPen)

TREATMENT OF OVERDOSE:

O₂, artificial ventilation, ECG; administer DOPamine for circulatory depression; administer diazepam or thiopental for seizures; assess need for antidysrhythmics

☼ Canada only Side effects: *italics* = common; **bold** = life-threatening ⚠
Nurse Alert

atropine ophthalmic

See [Appendix B](#)

RARELY USED

auranofin (Rx)

(au-rane'oh-fin)

[Ridaura](#)

Func. class.: Antiinflammatory, gold compound

Do not confuse: [Ridaura](#)/Cardura

USES:

RA; not for 1st-line therapy

Unlabeled uses: SLE, psoriatic arthritis, pemphigus

CONTRAINDICATIONS:

Breastfeeding, children <6 yr, hypersensitivity to gold, necrotizing enterocolitis, pulmonary fibrosis, exfoliative dermatitis, recent radiation therapy, renal/hepatic disease, marked hypertension, uncontrolled CHF

Black Box Warning:

Bone marrow suppression, blood dyscrasias, hematuria, anemia, diarrhea

DOSAGE AND ROUTES

Calculator

- **Adult: PO** 6 mg/day or 3 mg bid; may increase to 9 mg/day after 3 mo

☼ Canada only Side effects: *italics* = common; **bold** = life-threatening ⚠
Nurse Alert

avanafil

(a-van'a-fil)

Stendra

Func. class.: Impotence agent

Chem. class.: Phosphodiesterase type 5 inhibitor

ACTION:

Inhibits phosphodiesterase type 5 (PDE5); enhances erectile function by increasing the amount of cGMP causing smooth muscle relaxation and increasing blood flow to the corpus cavernosum

USES:

Treatment of erectile dysfunction

CONTRAINDICATIONS:

Hypersensitivity, severe renal/hepatic disease, current nitrates/nitrites, patients <18 yr

Precautions: Pregnancy (C) although not indicated for women, anatomic penile deformities, sickle cell anemia, leukemia, multiple myeloma, renal/hepatic/CV disease, bleeding disorders, active peptic ulcer, prolonged erection, aortic stenosis, HIV, stroke, geriatric patients, tinnitus, MI, visual disturbances, retinitis pigmentosa

DOSAGE AND ROUTES

Calculator

Erectile dysfunction

- **Adult: PO** 100 mg 30 min before sexual activity, dose may be reduced to 50 mg or increased to 200 mg; usual max dose frequency is 1 time/day

Potent CYP3A4 inhibitors/nitrates

- Do not use

Moderate CYP3A4 inhibitors/alpha-blockers

- **Adult: PO** Max 50 mg/day

Hepatic dosage/severe renal disease

- **Adult: Child–Pugh C: PO** not recommended

Available forms: Tabs 50, 100, 200 mg

Administer

PO route

- May be taken 30 min before sexual activity on an as-needed basis, but no more than once per day
- May be used without regard to meals
- Products should not be used with nitrates/nitrites or strong CYP3A4 inhibitors

SIDE EFFECTS

CNS: *Headache, flushing*

EENT: Nasal congestion, nasopharyngitis

MISC: Back pain

PHARMACOKINETICS

99% protein binding, metabolized by CYP3A4, excreted as metabolites; urine 62%; 21% feces, half-life 5 hr, peak 45 min

INTERACTIONS

Do not use with nitrates/nitrites because of unsafe drop in B/P, which could result in MI, stroke

Do not use with strong CYP3A4 inhibitors (ketoconazole, ritonavir, atazanavir, clarithromycin, indinavir, itraconazole, nefazodone, nelfinavir, saquinavir, telithromycin)

Increase: Avanafil level—moderate CYP3A4 inhibitors (erythromycin, amprenavir, aprepitant, diltiazem, fluconazole, fosamprenavir, verapamil)

Decrease: B/P—alcohol, alpha-blockers, amLODIPine

Increase: Avanafil effect—grapefruit juice

NURSING CONSIDERATIONS

Assess:

Erectile dysfunction: Assess for underlying cause before treatment; use of organic nitrates that should not be used with this product; any loss of

vision/hearing while taking this product, hypersensitivity reactions

Evaluate:

Therapeutic response: Ability to engage in sexual intercourse

Teach patient/family:

- Sexual dysfunction: May be taken 30 min before sexual activity on an as-needed basis, but no more than once per day
- May be used without regard to meals

 **That products should not be used with nitrates/nitrates, or strong CYP3A4 inhibitors**

- That product does not protect against sexually transmitted disease including HIV
- That product has no effect in the absence of sexual stimulation, to seek help if erection lasts >4 hr
- To tell prescriber about all medication, vitamins, herbs being taken, especially ritonavir, indinavir, ketoconazole, itraconazole, erythromycin, nitrates, α -blockers
- Not to drink large amounts of alcohol

 **To notify prescriber immediately and to stop taking product if vision or hearing loss occurs, if erection lasts >4 hr, or if chest pain occurs**

☼ Canada only Side effects: *italics* = common; **bold** = life-threatening 
Nurse Alert

axitinib

Inlyta

Func. class.: Antineoplastics, biologic response modifiers, signal transduction inhibitors (STIs)

Chem. class.: Tyrosine kinase inhibitor

ACTION:

Inhibits receptor tyrosine kinases including vascular endothelial growth factor receptors (VEGFR)-1, VEGFR-2, and VEGFR-3; inhibits tumor growth and phosphorylation of VEGFR-2 and VEGF-mediated endothelial cell proliferation

USES:

Treatment of advanced renal cell cancer after failure of 1 prior systemic therapy

CONTRAINDICATIONS:

Pregnancy (D), breastfeeding

Precautions

Risk for or history of thromboembolic disease, recent bleeding, untreated brain metastasis, recent GI bleeding, GI perforation, fistula, surgery, moderate hepatic disease, uncontrolled hypertension, hyper/hypothyroidism, proteinuria, infertility, end-stage renal disease (CrCl <15 ml/min); not intended for use in adolescents, children, infants, neonates

DOSAGE AND ROUTES

Calculator

- **Adult:** PO 5 mg bid (at 12 hr intervals), may increase to 7 mg bid and then to 10 mg bid in those not receiving antihypertensives who tolerate the lower dosage for at least 2 consecutive wk with no more than grade 2 adverse reactions. Reduce to 3 mg bid if a dose reduction is needed; if further reduction is necessary, reduce to 2 mg bid
- **Adult receiving a strong CYP 3A4/5 inhibitor:** Reduce dose by 1/2, adjust as needed

Administer:

- Give with or without food; swallow tablet whole with a glass of water
- If patient vomits or misses a dose, an additional dose should not be taken; the next dose should be taken at the usual time

SIDE EFFECTS

CNS: Dizziness, headache, reversible posterior leukoencephalopathy syndrome (RPLS), fatigue

CV: Hypertension, arterial thromboembolic events (ATE), venous thromboembolic events (VTE)

ENDO: Hypothyroidism, hyperthyroidism

GI: Lower GI bleeding/perforation/fistula, abdominal pain, constipation, diarrhea, dysgeusia, dyspepsia, dysphonia, hemorrhoids, nausea, mucosal inflammation, stomatitis, vomiting, increased ALT/AST

GU: Proteinuria

HEMA: Bleeding intracranial bleeding, anemia, polycythemia, decreased/increased hemoglobin, lymphopenia thrombocytopenia, neutropenia

INTEG: Palmar-plantar erythrodysesthesia (hand and foot syndrome) rash, dry skin, pruritus, alopecia, erythema

MISC: Weight loss dehydration metabolic and electrolyte laboratory abnormalities included

MS: Asthenia, arthralgia, musculoskeletal pain, myalgia

RESP: Cough, dyspnea

PHARMACODYNAMICS

Absorption: bioavailability 58%; distribution: protein binding >99%; metabolized in liver by CYP3A4/5, CYP1A2, CYP2C19, and UGT1A1; metabolites are carboxylic acid, sulfoxide, and N-glucuronide; excretion 41% in feces and 23% in urine, 12% unchanged; half-life: 2.5-6.1 hr; steady state 2-3 days; onset unknown, peak 2.5-4.1 hr, increased in moderate hepatic disease; duration unknown

INTERACTIONS

Increase: effect of axitinib—CYP3A4/5 inhibitor, strong, moderate (ketoconazole, boceprevir, chloramphenicol, conivaptan, delavirdine,

fosamprenavir, imatinib, indinavir, isoniazid itraconazole, dalfopristin, quinupristin, posaconazole, ritonavir, telithromycin, tipranavir (boosted with ritonavir), darunavir (boosted with ritonavir), aldesleukin, IL-2, amiodarone, aprepitant, fosaprepitant atazanavir, bromocriptine, clarithromycin, crizotinib, danazol, diltiazem, dronedarone, erythromycin, fluvoxamine, lanreotide, lapatinib, miconazole, mifepristone, nefazodone, nelfinavir, nifedipine, octreotide, pantoprazole, saquinavir, tamoxifen, verapamil, voriconazole, grapefruit juice)

Decrease: effect of axitinib—CYP3A4/5 inducers, strong/moderate (rifampin, carbamazepine, dexamethasone, phenytoin, phenobarbital, rifabutin, rifapentine, St. John's wort, ethanol, bexarotene, bosentan, efavirenz, etravirine, griseofulvin, metyrapone, modafinil, nafcillin, nevirapine, oxcarbazepine, vemurafenib, pioglitazone, topiramate)

Increase or decrease: effect of axitinib—CYP3A4/5 inhibitor and inducers (quinidine)

Drug/Lab Test

Increase: creatinine, lipase, amylase, sodium, potassium, glucose

Decrease: bicarbonate, calcium, albumin, glucose, phosphate, sodium

Increase or decrease: sodium, glucose

Drug/Herb

Decrease: effect of axitinib—St. John's wort

NURSING CONSIDERATIONS

Assess:

- **Bleeding:** monitor for GI bleeding or perforation; temporarily discontinue therapy if a patient develops any bleeding that requires treatment
- **Surgery:** discontinue ≥ 24 hr before surgery, may be resumed after adequate wound healing
- **Hepatic/renal disease:** dosage should be reduced in patients with moderate (Child-Pugh Class B) hepatic disease, monitor liver function tests (ALT, AST, bilirubin) before and periodically during therapy; monitor CCr before and during treatment
- **Hypertension:** B/P should be well controlled before starting treatment; monitor patients for hypertension and administer antihypertensive therapy as

needed before and during therapy; dose should be reduced for persistent hypertension; therapy should be discontinued if B/P remains elevated after a dosage reduction or if there is evidence of hypertensive crisis; after discontinuation monitor B/P for hypotension in those receiving antihypertensives

- **Hyper/hypothyroidism:** monitor thyroid function tests before and periodically during therapy; thyroid disease should be treated with thyroid medications
- Monitor for proteinuria before and periodically during therapy; product may need to be decreased or discontinued if moderate to severe proteinuria occurs

 **Pregnancy/breastfeeding:** pregnancy category D; determine if the patient is pregnant or breastfeeding before using this product; may also cause infertility

Perform/provide:

- Storage at room temperature

Evaluate:

- Decreased spread of malignancy

Teach patient/family:

 To use contraception during treatment (pregnancy category D) or to avoid use of this product; to notify prescriber if pregnancy is planned to suspected, not to breastfeed

 To notify prescriber of bleeding that is severe or that requires treatment

- That product will be discontinued ≥ 24 hr before surgery; may be resumed after adequate wound healing
- That laboratory testing will be required before and periodically during product use
- How to monitor B/P and that B/P products should be continued as directed by prescriber

☼ Canada only Side effects: *italics* = common; **bold** = life-threatening 
Nurse Alert

HIGH ALERT

azaCITIDine (Rx)

(a-za-sie-ti'deen)

Vidaza

Func. class.: Antineoplastic-nucleoside analog

Chem. class.: DNA demethylation agent

Do not confuse: azaCITIDine/azaTHIOprine

ACTION:

Cytotoxic by producing damage to double-strand DNA during DNA synthesis

USES:

Myelodysplastic syndrome (MDS)

Unlabeled uses: Acute myelogenous leukemia (AML), chronic myelogenous leukemia (CML)

CONTRAINDICATIONS:

Pregnancy (D), hypersensitivity to product or mannitol, advanced malignant hepatic tumors

Precautions: Breastfeeding, children, geriatric patients, renal/hepatic disease, baseline albumin <30 g/L; a man should not father a child while taking product

DOSAGE AND ROUTES

Calculator

• **Adult: SUBCUT/IV** 75 mg/m²/day × 7 days q4wk, dose may be increased to 100 mg/m² if no response seen after 2 treatment cycles; minimum treatment, 4 cycles

Available forms: Powder for inj 100 mg

Administer:

• Use cytotoxic handling procedures

SUBCUT route

- **Reconstitute** with 4 ml sterile water for inj (25 mg/ml), inject diluents slowly into vial, invert vial 2-3 times, gently rotate; sol will be cloudy, use immediately; divide doses >4 ml into 2 syringes; invert contents 2-3 times, gently roll syringe between the palms for 30 sec immediately before administration, rotate inj site

Intermittent IV INF route

- **Reconstitute** each vial with 10 ml sterile water for inj, shake well until all solids are dissolved, withdraw sol (10 mg/ml), inject in 50-100 NS or LR inf run over 10-40 min

SIDE EFFECTS

CNS: Anxiety, depression, dizziness, fatigue, headache, fever, insomnia

CV: Cardiac murmur, hypotension, tachycardia, peripheral edema, chest pain

GI: Diarrhea, nausea, vomiting, anorexia, constipation, abdominal pain, distention, tenderness, hemorrhoids, mouth hemorrhage, tongue ulceration, stomatitis, dyspepsia, hepatotoxicity, hepatic coma

GU: Renal failure, renal tubular acidosis, dysuria, UTI

HEMA: Leukopenia, anemia, thrombocytopenia, neutropenia, febrile neutropenia, ecchymosis, petechiae

INTEG: Irritation at site, rash, sweating, pyrexia, pruritus

META: Hypokalemia

MS: Weakness, arthralgia, muscle cramps, myalgia, back pain

RESP: Cough, dyspnea, pharyngitis, pleural effusion

PHARMACOKINETICS

Rapidly absorbed, peak 1/2 hr, metabolized in the liver, half-life 4 hr, excreted in urine

INTERACTIONS

Increase: bone marrow depression—other antineoplastics

NURSING CONSIDERATIONS

Assess:

- For CNS symptoms: fever, headache, chills, dizziness
- **Bone marrow suppression/hematologic response:** CBC with differential,

baseline WBC $\geq 3000/\text{mm}^3$, absolute neutrophil count (ANC) $\geq 1500/\text{mm}^3$, platelets $> 7500/\text{mm}^3$, adjust dose based on nadir; ANC $< 500/\text{mm}^3$, platelets $< 25,000/\text{mm}^3$, give 50% dose next course; ANC 500-1500/ mm^3 , platelets 25,000-50,000/ mm^3 , give 67% next course; bruising, bleeding, blood in stools, urine, sputum, emesis; myelodysplastic syndrome (MDS), splenomegaly

- Buccal cavity q8hr for dryness, sores, or ulceration, white patches, oral pain, bleeding, dysphagia

- **Myelodysplastic syndrome:** severe anemia, cytopenias, splenomegaly

- Blood studies: BUN, bicarbonate, creatine, LFTs

Perform/provide:

- Increased fluid intake to 2-3 L/day to prevent dehydration unless contraindicated

- Rinsing of mouth tid-qid with water, club soda; brushing of teeth bid-tid with soft brush or cotton-tipped applicator for stomatitis; use unwaxed dental floss

- Nutritious diet with iron, vitamin supplement, low fiber, few dairy products

Evaluate:

- Therapeutic response: improvement in blood counts with refractory anemia or refractory anemia with excess blasts

Teach patient/family:

- To avoid crowds, persons with known infections; not to receive immunizations
- To avoid foods with citric acid or hot or rough texture if stomatitis is present; to drink adequate fluids

- To report stomatitis; any bleeding, white spots, ulcerations in mouth; to examine mouth daily, report symptoms, infection site reactions, pruritus, fever

- To use contraception during and for several months after therapy (pregnancy [D]); not to breastfeed; not to father a child while receiving product

☼ Canada only Side effects: *italics* = common; **bold** = life-threatening ⚠
Nurse Alert

azaTHIOprine (Rx)

(ay-za-thye'oh-preen)

Azasan, Imuran

Func. class.: Immunosuppressant

Chem. class.: Purine antagonist

Do not confuse: Imuran/Imferon/Elmiron/IMDUR/Enduron/Tenormin
azaTHIOprine/azaCITIDine

ACTION:

Produces immunosuppression by inhibiting purine synthesis in cells

USES:

Renal transplants to prevent graft rejection, refractory rheumatoid arthritis

Unlabeled uses: Myasthenia gravis, chronic ulcerative colitis, Crohn's disease, Behçet's disease, autoimmune hepatitis, dermatomyositis, thrombocytopenic purpura, lupus nephritis, polymyositis, pulmonary fibrosis, systemic lupus erythematosus (SLE), Wegener's granulomatosis, vasculitis, atopic dermatitis

CONTRAINDICATIONS:

Pregnancy (D), hypersensitivity, breastfeeding

Precautions: Severe renal/hepatic disease, geriatric patients, thiopurine methyltransferase deficiency, infection

Black Box Warning:

Bone marrow suppression, neoplastic disease, must be used by experienced clinician

DOSAGE AND ROUTES

Calculator

Prevention of rejection

- **Adult and child:** IV 3-5 mg/kg/day then maintenance **(PO)** of ≥ 1 -3 mg/kg/day

Refractory rheumatoid arthritis

- **Adult: PO** 1 mg/kg/day, may increase dose after 2 mo by 0.5 mg/kg/day and then q4wk, max 2.5 mg/kg/day

Lupus nephritis/SLE/Wegener's granulomatosis/idiopathic pulmonary fibrosis (unlabeled)

- **Adult: PO** 2-3 mg/kg/day

Atopic dermatitis (unlabeled)

- **Adult/adolescent ≥16 yr: PO** 2.5 mg/kg/day

Available forms: Tabs 50, 75, 100 mg; inj 100 mg

Administer:

- For several days before transplant surgery
- All medications PO if possible; avoid IM inj because bleeding may occur

PO route

- With meals to reduce GI upset

IV route

- Prepare in biologic cabinet with gown, gloves, mask

Direct IV

- **Dilute** to 10 mg/ml with 0.9% NaCl, 0.45% NaCl, D₅W, **give** over 5 min

Intermittent IV INF route

- **Reconstitute** 100 mg/10 ml of sterile water for inj; rotate to dissolve; **further dilute** with 50 ml or more saline or glucose in saline, **give** over 1/2-1 hr

Y-site compatibilities: Alfentanil, atracurium, atropine, benztropine, calcium gluconate, cycloSPORINE, enalaprilat, epoetin alfa, erythromycin, fentaNYL, fluconazole, folic acid, furosemide, glycopyrrolate, heparin, insulin, mannitol, mechlorethamine, metoprolol, naloxone, nitroglycerin, oxytocin, penicillin G, potassium chloride, propranolol, protamine, SUFentanil, trimetaphan, vasopressin

Solution compatibilities: D₅W, NaCl 0.9%, NaCl 0.45%

SIDE EFFECTS

GI: Nausea, vomiting, stomatitis, esophagitis, pancreatitis, hepatotoxicity,

jaundice, hepatic veno-occlusive disease

HEMA: Leukopenia, thrombocytopenia, anemia, pancytopenia, bleeding

INTEG: Rash, alopecia

MISC: Serum sickness, Raynaud's symptoms, secondary malignancy, infection

MS: Arthralgia, muscle wasting

PHARMACOKINETICS

Metabolized in liver, excreted in urine (active metabolite), crosses placenta, half-life 3 hr

INTERACTIONS

Increase: leukopenia—ACE inhibitors, sulfamethoxazole-trimethoprim

Increase: myelosuppression—cycloSPORINE, mercaptopurine

Increase: action of azaTHIOprine—allopurinol

Decrease: immune response—vaccines, toxoids

Decrease: action of warfarin—warfarin

- Do not admix with other products

Drug/Lab Test

Increase: LFTs

Decrease: uric acid

Interference: CBC, differential count

NURSING CONSIDERATIONS

Assess:

- **For infection:** increased temp, WBC; sputum, urine
- I&O, weight daily, report decreasing urine output; toxicity may occur

Black Box Warning:

Bone marrow suppression: severe leukopenia, pancytopenia, thrombocytopenia; Hgb, WBC, platelets during treatment monthly; if leukocytes are $<3000/\text{mm}^3$ or platelets $<100,000/\text{mm}^3$, product should be discontinued, CBC

 **Hepatotoxicity:** if dark urine, jaundice, itching, light-colored stools, increased LFTs, product should be discontinued; hepatic studies: alk phos, AST, ALT, bilirubin

- **Arthritis:** pain, ROM, swelling, mobility before, during treatment

Evaluate:

- Therapeutic response: absence of graft rejection, immunosuppression in autoimmune disorders

Teach patient/family:

- To take as prescribed; not to miss doses; if dose is missed on daily regimen, to skip dose; if taking multiple doses/day, to take as soon as remembered
- That therapeutic response may take 3-4 mo with RA; to continue with prescribed exercise, rest, other medications
- To report fever, rash, severe diarrhea, chills, sore throat, fatigue because **serious infections** may occur; report unusual bleeding, bruising; signs/symptoms of **renal/hepatic toxicity**
- To use contraceptive measures during treatment, for 16 wk after ending therapy (pregnancy [D]); to avoid vaccinations
- To avoid crowds to reduce risk for infection
- To take with food to decrease GI intolerance
- On multiple significant drug-drug interactions
- To use soft-bristled toothbrush to prevent bleeding
- That treatment is ongoing to prevent transplant rejection

☼ Canada only Side effects: *italics* = common; **bold** = life-threatening ⚠
Nurse Alert

azelaic acid

(aze-eh-lay'ik)

Azelex, Finacea

Func. class.: Antiacne agent

Chem. class.: Dicarboxylic acid

ACTION:

Active for *Staphylococcus epidermidis*, *Propionibacterium acnes* by inhibiting microbial protein synthesis in the cell

USES:

Mild to moderate inflammatory acne vulgaris, rosacea

CONTRAINDICATIONS:

Hypersensitivity

Precautions: Pregnancy (B), breastfeeding; patients with dark complexions should be monitored for early signs of hypopigmentation

DOSAGE AND ROUTES

Calculator

Adult/child ≥ 12 yr:

- Apply a thin film and massage into affected areas bid am and pm

Available forms: Cream 20%, Gel 15%

Administer

- Before applying, the affected areas should be thoroughly washed and patted dry. Then apply cream or gel and massage gently into the affected areas. Occlusive dressings or wrappings should not be used. Wash hands after applying.
- Do not apply to the eye; avoid contact with the mouth, eyes, and other mucous membranes. If contact with the eye(s) occur, the eye(s) should be washed with large amounts of water; contact prescriber if ocular irritation persists.

- Avoid concurrent use of alcoholic cleansers, astringents, abrasives, and peeling agents.
- Store at room temperature, do not freeze.

SIDE EFFECTS

MISC: Allergic reaction

SKIN: Itching, burning, stinging, dermatitis, peeling, erythema, edema, acne

PHARMACOKINETICS

Onset, peak, duration unknown; half-life 12 hr

NURSING CONSIDERATIONS

Assess

- Skin: assess for redness, irritation, stinging; if severe, product might need to be discontinued
- Hypopigmentation: In patients with dark complexion

Evaluate

- Therapeutic response: Decreased acne lesions

Teach patient/family:

- To thoroughly wash and pat dry the affected areas before applying product. Apply cream or gel and massage gently into the affected areas. Occlusive dressings or wrappings should not be used. Wash hands after applying.
- Not to apply to the eye; avoid contact with the mouth, eyes, and other mucous membranes. If contact with the eyes occurs, wash with large amounts of water; contact prescriber if ocular irritation persists.
- To avoid concurrent use of alcoholic cleansers, astringents, abrasives, and peeling agents.
- To store at room temperature, not to freeze
- To use for prescribed amount of time
- To report burning, stinging, irritation
- To report change in skin color

🍁 Canada only Side effects: *italics* = common; **bold** = life-threatening ⚠️

azelastine (ophthalmic)

(ah-zell'ah-steen)

Optivar

Func. class.: Antihistamine (ophthalmic)

Chem. class.: H₁ receptor antagonist

ACTION:

Decreases the allergic response by inhibiting histamine release

USES:

Pruritus from allergic conjunctivitis

CONTRAINDICATIONS:

Hypersensitivity

Precautions: Pregnancy (C), breastfeeding, child <3 yr

DOSAGE AND ROUTES

Calculator

• **Adult/child ≥3 yr: OPHTH** 1 drop into each affected eye bid

Available forms: Ophthalmic sol: 0.05%

Administer

- Tip of dropper should not touch the eye
- Store upright and tightly closed at room temperature

SIDE EFFECTS

CNS: Headache

EENT: Eye burning/stinging/irritation, blurred vision, rhinitis, bitter taste

INTEG: Pruritus

RESP: Asthma, dyspnea, wheezing

PHARMACOKINETICS

Onset 3 min, duration 8 hr, half-life 22 hr, protein binding 88%

NURSING CONSIDERATIONS

Assess:

- Eyes: for itching, redness, use of soft or hard contact lenses

Evaluate:

- Therapeutic response: Absence of redness, itching in the eyes

Teach patient/family:

- To use in the eyes only; not to touch dropper to eye/eyelid
- Not to wear contact lenses if eyes are red and itching
- To wait at least 10 min before inserting contact lenses, soft contact lenses can absorb preservative

🌿 Canada only Side effects: *italics* = common; **bold** = life-threatening ⚠️
Nurse Alert

azelastine nasal agent

See [Appendix B](#)

azilsartan

Edarbi

Func. class.: Antihypertensive

Chem. class.: Angiotensin II receptor antagonist

ACTION:

Antagonizes angiotensin II at the AT₁ receptor in tissues like vascular smooth muscle and the adrenal gland. Two angiotensin II receptors, AT₁ and AT₂, have been identified; azilsartan exhibits more than 10,000-fold greater affinity for the AT₁ receptor than the AT₂ receptor.

USES:

Hypertension, alone or in combination with other antihypertensives

CONTRAINDICATIONS:

Black Box Warning:

Pregnancy (D) 2nd/3rd trimesters

Precautions: Pregnancy (C) 1st trimester, breastfeeding, children, geriatric patients, angioedema, African descent, renal disease, renal artery stenosis, heart failure, hypovolemia

DOSAGE AND ROUTES:

Calculator

- **Adult: PO** 80 mg/day, may give an initial dose of 40 mg/day in patients receiving high-dose diuretic therapy

Available forms: Tabs 40, 80 mg

Administer:

- May administer without regard to food

SIDE EFFECTS

CNS: Dizziness, fatigue, asthenia

CV: Hypotension, orthostatic hypotension

GI: Nausea, diarrhea

HEMA: Anemia

INTEG: Angioedema

MS: Muscle cramps

RESP: Cough

SYST: Secondary malignancy

PHARMACOKINETICS:

Protein binding >99% to serum albumin; metabolized by CYP2C9; elimination half-life 11 hr, steady state within 5 days and no accumulation in plasma occurs with once-daily dosing; elimination 55% in feces, 42% in urine; hydrolyzed to the active metabolite, azilsartan, in GI tract during absorption, rapidly absorbed, peak 1.5-3 hr; absolute bioavailability (60%) not affected by food

INTERACTIONS:

Increase: hypotensive effect—other antihypertensives, other angiotensin receptor antagonists, MAOIs

Increase: hypoglycemia—antidiabetics

 **Increase:** renal failure risk—cyclosporine, diuretics, NSAIDs in those with poor renal function; monitor closely

 **Increase:** lithium toxicity—lithium

 **Increase:** phosphate nephropathy—sodium phosphate monobasic monohydrate; sodium phosphate dibasic anhydrous

Drug/Herb:

Increase: antihypertensive effect—Hawthorn

Decrease: antihypertensive effect—ephedra

NURSING CONSIDERATIONS**Assess:**

 **Angioedema:** Assess for facial swelling, difficulty breathing

Black Box Warning:

For pregnancy (D) 2nd/3rd trimester, can cause fetal death

- Response and adverse reactions especially in renal disease
- B/P, pulse when beginning therapy and periodically thereafter; note rhythm, rate, quality; obtain electrolytes before beginning therapy

Perform/provide:

- Use original package to protect from light and moisture

Evaluate:

- Therapeutic response: decreased B/P

Teach patient/family:

- To comply with dosage schedule even if feeling better

 **To notify prescriber of facial swelling; if pregnancy is planned or suspected (category D 2nd/3rd trimester)**

- That diarrhea, dehydration, excessive perspiration, vomiting, may lead to fall in B/P; to consult prescriber if these occur
- To rise slowly from lying or sitting to minimize orthostatic hypotension; that product may cause dizziness
- To avoid OTC medications unless approved by prescriber; to inform all health care providers of product use
- To use proper technique for obtaining B/P

☼ Canada only Side effects: *italics* = common; **bold** = life-threatening 
Nurse Alert

azithromycin (Rx)

(ay-zi-thro-my'sin)

Zithromax, Zmax, Zithromax Tri Pak, Zithromax Z Pak

Func. class.: Antiinfective

Chem. class.: Macrolide (azalide)

Do not confuse: azithromycin/erythromycin
Zithromax/Zinacef

ACTION:

Binds to 50S ribosomal subunits of susceptible bacteria and suppresses protein synthesis; much greater spectrum of activity than erythromycin; more effective against gram-negative organisms

USES:

Mild to moderate infections of the upper respiratory tract, lower respiratory tract; uncomplicated skin and skin structure infections caused by *Moraxella catarrhalis*, *Streptococcus pneumoniae*, *Streptococcus pyogenes*, *Staphylococcus aureus*, *Streptococcus agalactiae*, *Mycoplasma pneumoniae*, *Haemophilus influenzae*, *Clostridium*, *Legionella pneumophila*; NGU or cervicitis due to *Chlamydia trachomatis*; in children: acute otitis media (*H. influenzae*, *M. catarrhalis*, *S. pneumoniae*) **PO**; acute pharyngitis/tonsillitis (group A streptococcal) **PO**; acute skin/soft tissue infections **PO**; community-acquired pneumonia (*Chlamydia pneumoniae*, *H. influenzae*, *M. pneumoniae*, *S. pneumoniae*) **PO**; pharyngitis/tonsillitis (*S. pyogenes*); prophylaxis of disseminated *Mycobacterium avium* complex (MAC)

Unlabeled uses: Babesiosis, cholera, cystic fibrosis, dental abscess/infection, endocarditis prophylaxis, granuloma inguinale, *Helicobacter pylori*, *Klebsiella granulomatis*, Legionnaire's disease, Lyme disease, lymphogranuloma venereum, MAC, *Mycoplasma hominis*, periodontitis, pertussis, prostatitis, *Rickettsia tsutsugamushi*, *Salmonella typhi*, shigellosis, syphilis, toxoplasmosis, typhoid fever

CONTRAINDICATIONS:

Hypersensitivity to azithromycin, erythromycin, any macrolide

Precautions: Pregnancy (B), breastfeeding; geriatric patients; renal/hepatic/cardiac disease; <6 mo for otitis media; <2 yr for pharyngitis, tonsillitis

DOSAGE AND ROUTES

Calculator

Most infections

- **Adult: PO** 500 mg on day 1 then 250 mg/day on days 2-5 for a total dose of 1.5 g or 500 mg a day $\times$ 3 days
- **Child 2-15 yr: PO** 10 mg/kg on day 1 then 5 mg/kg $\times$ 4 days

Disseminated MAC infections

- **Adult: PO** 600 mg/day with ethambutol 15 mg/kg/day

Pelvic inflammatory disease

- **Adult: PO/IV** 500 mg **IV** q24hr $\times$ 2 doses then 500 mg **PO** q24hr $\times$ 7-10 days

Cervicitis, chlamydia, chancroid, nongonococcal urethritis, syphilis

- **Adult: PO** 1 g single dose

Gonorrhea

- **Adult: PO** 2 g single dose

Lower respiratory tract infections

- **Adult: PO** 500 mg day 1, then 250 mg $\times$ 4 days
- **Child: PO** 5-12 mg/kg/day $\times$ 5 days

Acute otitis media

- **Child >6 mo: PO** 30 mg/kg as a single dose or 10 mg/kg/day $\times$ 3 days or 10 mg/kg as a single dose on day 1 (max 500 mg/day) then 5 mg/kg on days 2-5 (max 250 mg/day)

Prevention of acute otitis media

- **Child: PO** 10 mg/kg q wk $\times$ 6 mo

Bacterial conjunctivitis

- **Adult/adolescent/child $\geq$ 1 yr: OPHTHALMIC** 1 drop in affected eye BID

×2 days, then 1 drop × next 5 days

Legionnaire's disease/early Lyme disease (unlabeled)

- **Adult: PO** 500 mg/day

Pertussis (unlabeled)

- **Adult: PO** 500 mg on day 1 then 250 mg/day for 2-5 days

- **Infant <6 mo: PO** 10 mg/kg/day × 5 days

Available forms: Tabs 250, 500, 600 mg; powder for inj 500 mg; susp 100, 200 mg/5 ml 1 g single-dose powder for susp; ext rel powder for susp 2 g; ophthalmic drops 1% solution

Administer:

PO route

- **Susp** 1 hr before meal or 2 hr after meal; reconstitute 1 g packet for susp with 60 ml water, mix, rinse glass with more water and have patient drink to consume all medication; packets not for pediatric use

Intermittent IV INF route

- **Reconstitute** 500 mg of product with 4.8 ml sterile water for inj (100 mg/ml); shake, **dilute** with 250 or 500 ml 0.9% NaCl, 0.45% NaCl, or LR to 1-2 mg/ml; diluted sol stable for 24 hr or 7 days if refrigerated
- **Give** 1 mg/ml sol over 3 hr or 2 mg/ml sol over 1 hr; never give IM or as bolus

Y-site compatibilities: Aminocaproic acid, amphotericin B liposome, anidulafungin, atenolol, bivalirudin, bleomycin, CARBOplatin, CISplatin, cytarabine, DAPTOmycin, dexmedetomidine, diphenhydrAMINE, docetaxel, dolasetron, doripenem, doxacurium, droperidol, epirubicin, eptifibatide, ertapenem, fenoldopam, fluorouracil, IDArubicin, irinotecan, methochlorethamine, meperidine, nesiritide, octreotide, ondansetron, oxaliplatin, palonosetron, pamidronate, pantoprazole, pemetrexed, rocuronium, sodium acetate, tigecycline, tirofiban, TPN, vasopressin, vinCRISTine, voriconazole

SIDE EFFECTS

CNS: Dizziness, headache, vertigo, somnolence, myasthenia gravis

CV: Palpitations, chest pain

EENT: Hearing loss, tinnitus, loss of smell (anosmia)

GI: Nausea, vomiting, diarrhea, hepatotoxicity, abdominal pain, stomatitis, heartburn, dyspepsia, flatulence, melena, cholestatic jaundice, pseudomembranous colitis, tongue discoloration

GU: Vaginitis, moniliasis, nephritis

HEMA: Anemia

INTEG: Rash, urticaria, pruritus, photosensitivity

SYST: Angioedema, Stevens-Johnson syndrome, toxic epidermal necrolysis

PHARMACOKINETICS

PO: Peak 2-4 hr, duration 24 hr

IV: Peak end of inf; duration 24 hr; half-life 11-57 hr; excreted in bile, feces, urine primarily as unchanged product; may be inhibitor of P-glycoprotein

INTERACTIONS

Increase: ergot toxicity—ergotamine

⚠ Increase: Dysrhythmias—pimozide: fatal reaction, do not use concurrently

Increase: effects of oral anticoagulants, digoxin, theophylline, methylPREDNISolone, cycloSPORINE, bromocriptine, disopyramide, triazolam, carBAMazepine, phenytoin, tacrolimus, nelfinavir

Decrease: clearance of triazolam

Decrease: absorption of azithromycin—aluminum, magnesium antacids, separate by ≥ 2 hr

Drug/Lab Test

Increase: CPK, ALT, AST, bilirubin, BUN, creatinine, alk phos

Drug/Food

Decrease: absorption—food (susp)

NURSING CONSIDERATIONS

Assess:

- I&O ratio; report hematuria, oliguria with renal disease
- Hepatic studies: AST, ALT, CBC with differential
- Renal studies: urinalysis, protein, blood
- C&S before product therapy; product may be taken as soon as culture is taken; C&S may be repeated after treatment
- **Serious skin reactions:** Stevens-Johnson syndrome, toxic epidermal

necrolysis, angioedema; discontinue if rash develops, treat symptomatically

- **Superinfection:** sore throat, mouth, tongue; fever, fatigue, diarrhea, anogenital pruritus

- **Pseudomembranous colitis:** diarrhea, abdominal pain, fever, fatigue, anorexia; obtain CBC, serum albumin

- Bowel pattern before, during treatment

- Respiratory status: rate, character; wheezing, tightness in chest: discontinue product

- Cardiovascular death has occurred in those with serious bradycardia or ongoing hypokalemia, hypomagnesemia, avoid use

Perform/provide:

- Storage at room temperature

Evaluate:

- Therapeutic response: C&S negative for infection; decreased signs of infection

Teach patient/family:

⚠ To report sore throat, fever, fatigue, severe diarrhea, anal/genital itching (may indicate superinfection)

- Not to take aluminum-magnesium-containing antacids simultaneously with this product (PO)

⚠ To notify nurse of diarrhea, dark urine, pale stools; yellow discoloration of eyes, skin; severe abdominal pain

- To complete dosage regimen

- To take ZMAX 1 hr before or 2 hr after a meal; shake well before use

- To use protective clothing or stay out of the sun, photosensitivity may occur

TREATMENT OF HYPERSENSITIVITY:

Withdraw product, maintain airway; administer EPINEPHrine, aminophylline, O₂, IV corticosteroids

☼ Canada only Side effects: *italics* = common; **bold** = life-threatening ⚠
Nurse Alert

azithromycin ophthalmic

See [Appendix B](#)

RARELY USED

aztreonam (Rx)

(az-tree'oh-nam)

Azactam, Cayston

Func. class.: Antibiotic—miscellaneous

USES:

Urinary tract infection; septicemia; skin, muscle, bone infection; lower respiratory tract, intraabdominal infections; other infections caused by gram-negative organisms

CONTRAINDICATIONS:

Hypersensitivity to product, penicillins, cephalosporins, severe renal disease

DOSAGE AND ROUTES

Calculator

Urinary tract infections

- **Adult:** IM/IV 500 mg-1 g q8-12hr

Systemic infections

- **Adult:** IM/IV 1-2 g q8-12hr
- **Child:** IM/IV 90-120 mg/kg/day in divided doses q6-8hr; max 8 g/day **IV**

Severe systemic infections

- **Adult:** IM/IV 2 g q6-8hr; max 8 g/day; continue treatment for 48 hr after negative culture or until patient is asymptomatic

Cystic fibrosis with *Pseudomonas aeruginosa*

- **Adult, adolescent, child ≥ 7 yr: NEB** 75 mg tid $\times$ 28 days, then 28 days off; give q4hr or more; give bronchodilator before aztreonam
-

✳ Canada only Side effects: *italics* = common; **bold** = life-threatening ⚠
Nurse Alert

baclofen (Rx)

(bak'loe-fen)

Gablofen, Lioresal

Func. class.: Skeletal muscle relaxant, central acting *Chem. class.:* GABA chlorophenyl derivative

Do not confuse: Lioresal/Lotensin

ACTION:

Inhibits synaptic responses in CNS by stimulating GABA_B receptor subtype, which decreases neurotransmitter function; decreases frequency, severity of muscle spasms

USES:

Spasticity with spinal cord injury, multiple sclerosis

Unlabeled uses: Neuropathic pain, hiccups, trigeminal neuralgia/nystagmus, recurrent priapism

CONTRAINDICATIONS:

Hypersensitivity

Precautions: Pregnancy (C), breastfeeding, geriatric patients, peptic ulcer disease, renal/hepatic disease, stroke, seizure disorder, diabetes mellitus

Black Box Warning:

Abrupt discontinuation

DOSAGE AND ROUTES

Calculator

• **Adult: PO** 5 mg tid × 3 days, then 10 mg tid × 3 days, then 15 mg tid × 3 days, then 20 mg tid × 3 days, then titrated to response, max 80 mg/day;

INTRATHECAL use implantable intrathecal inf pump, use screening trial of 3 separate bol doses if needed 24 hr apart (50 mcg, 75 mcg, 100 mcg); patients who do not respond to 100 mcg should not be considered for chronic IT therapy; initial: double screening dose that produced result, give over 24 hr, increase by 10%-30% q24hr only; maintenance: 1200-1500 mcg/day

• **Child >2-7 yr: PO** 10-15 mg/day divided q8hr; titrate q3days by 5-15 mg/day to max 40 mg/day

• **Child ≥8 yr:** As above; max 60 mg/day

• **Child: INTRATHECAL** initial test dose same as adult; for small children,

initial dose of 25 mcg/dose may be used; 25-1200 mcg/day inf titrated to response in screening phase

- **Geriatric:** PO 5 mg bid-tid

Neuropathic pain including trigeminal neuralgia (unlabeled)

- **Adult:** PO 10 mg tid, may increase by 10 mg every other day; max 80 mg/day

Hiccups (unlabeled)

- **Adult:** PO 10 mg qid

Stuttering/recurrent priapism (unlabeled)

- **Adult:** PO 40 mg at bedtime

Available forms: Tabs 10, 20 mg; IT inj 10 mg/20 ml (500 mcg/ml), 10 mg/5 ml (2000 mcg/ml); pharmacy can prepare extemporaneous liquid preparations

Administer:

PO route

- With meals for GI symptoms

IT route

- **For screening,** dilute to a concentration of 50 mcg/ml with NaCl for inj (preservative free), give test dose over 1 min; watch for decreasing muscle tone, frequency of spasm; if inadequate, use 2 more test doses q24hr; **maintenance inf** via implantable pump of 500-2000 mcg/ml because individual titration is required • Do not give IT dose by inj, IV, IM, SUBCUT, epidural

Additive compatibilities: CloNIDine, morphine, ziconotide

SIDE EFFECTS

CNS: *Dizziness, weakness, fatigue, drowsiness, headache, disorientation, insomnia, paresthesias, tremors; seizures, life-threatening CNS depression, coma; CNS infection (IT)*

CV: Hypotension, chest pain, palpitations, edema; *cardiovascular collapse (IT)*

EENT: Nasal congestion, blurred vision, mydriasis, tinnitus

GI: *Nausea, constipation, vomiting, increased AST, alk phos, abdominal pain, dry mouth, anorexia*

GU: Urinary frequency, hematuria

INTEG: Rash, pruritus

RESP: Dyspnea; respiratory failure (IT)

PHARMACOKINETICS

PO: Onset 3-4 days, peak 2-3 hr, duration >8 hr, half-life 2½-4 hr, partially metabolized in liver, excreted in urine (unchanged)

INTRATHECAL: CSF levels with plasma levels 100 times that of the oral route, peak 4 hr, duration 4-8 hr

BOLUS: Onset 1/2-1 hr

CONT INF: Onset 6-8 hr, peak 24-48 hr

INTERACTIONS

Increase: CNS depression—alcohol, tricyclics, opiates, barbiturates, sedatives, hypnotics, MAOIs

Increase: hypotension—antihypertensives

Drug/Herb

Increase: CNS depression—kava, valerian

Drug/Lab Test

Increase: AST, alk phos, blood glucose

NURSING CONSIDERATIONS

Assess:

- **Multiple sclerosis:** spasms, spasticity, ataxia; improvement should occur with product
- B/P, weight, blood glucose, hepatic function periodically

 **Seizures:** for increased seizure activity with seizure disorders; product decreases seizure threshold; EEG in epileptic patients

- I&O ratio; check for urinary frequency

- Allergic reactions: rash, fever, respiratory distress

- Severe weakness, numbness in extremities

- Tolerance: increased need for medication, more frequent requests for medication, increased pain
- **Withdrawal symptoms:** CNS depression, dizziness, drowsiness, psychiatric symptoms
- **Intrathecal:** have emergency equipment nearby; assess test dose and titration; if no response, check pump, catheter for proper functioning

Perform/provide:

- Storage in tight container at room temperature

- Assistance with ambulation if dizziness, drowsiness occurs

Evaluate:

- Therapeutic response: decreased pain, spasticity

Teach patient/family:

- Not to discontinue medication quickly; hallucinations, spasticity, tachycardia will occur; product should be tapered off over 1-2 wk • Not to take with alcohol, other CNS depressants
- To avoid hazardous activities if drowsiness, dizziness occurs; to rise slowly to prevent orthostatic hypotension • To avoid using OTC medications; not to take cough preparations, antihistamines unless directed by prescriber • To notify prescriber if nausea; headache; tinnitus; insomnia; confusion; constipation; inadequate, painful urination continues • **MS:** may require 1-2 mo for full response

TREATMENT OF OVERDOSE:

Induce emesis in conscious patient, activated charcoal, dialysis, physostigmine to reduce life-threatening CNS side effects

🍁 Canada only Side effects: *italics* = common; **bold** = life-threatening ⚠️
Nurse Alert

HIGH ALERT

basiliximab (Rx)

(bas-ih-lik's'ih-mab)

Simulect

Func. class.: Immunosuppressant

Chem. class.: Murine/human monoclonal antibody (interleukin-2) receptor antagonist

ACTION:

Binds to and blocks the IL-2 receptor, which is selectively expressed on the surface of activated T lymphocytes; impairs the immune system to antigenic challenges

USES:

Acute allograft rejection in renal transplant patients when used with cycloSPORINE and corticosteroids

Unlabeled uses: Liver transplant rejection prophylaxis, graft-versus-host disease

CONTRAINDICATIONS:

Breastfeeding, hypersensitivity to mannitol/murine, exposure to viral infections

Precautions: Pregnancy (B), children, geriatric patients, human anti-murine antibody

Black Box Warning:

Infections

DOSAGE AND ROUTES

Calculator

• **Adult/child ≥ 35 kg:** IV 20 mg $\times$ 2 doses; 1st dose within 2 hr before transplant surgery; 2nd dose 4 days after transplantation

• **Child/adolescent < 35 kg:** IV 10 mg $\times$ 2 doses; 1st dose within 2 hr before transplant surgery; 2nd dose 4 days after transplantation

Available forms: Powder for inj 10, 20 mg

Administer:

Intermittent IV INF route

- **Reconstitute** 10 mg vial/2.5 ml or 20-mg vial in 5 ml sterile water for inj; shake gently to dissolve, **dilute** reconstituted sol in 25 ml (10 mg vial) or 50

ml (20-mg vial) with 0.9% NaCl or D₅, gently invert bag, do not shake; **give** over 1/2 hr, do not admix

SIDE EFFECTS

CNS: *Pyrexia, chills, tremors, headache, insomnia, weakness, dizziness*

CV: *Chest pain, angina, cardiac failure, hypotension, hypertension, edema*

GI: *Vomiting, nausea, diarrhea, constipation, abdominal pain, GI bleeding, gingival hyperplasia, stomatitis*

INTEG: *Acne, pruritus, impaired wound healing*

META: *Acidosis, hypercholesterolemia, hyperuricemia, hypo/hyperkalemia, hypocalcemia, hypophosphatemia*

MISC: *Infection, moniliasis, anaphylaxis, anemia, allergic reaction, dysuria, CMV infection, candidiasis*

MS: *Arthralgia, myalgia*

RESP: *Dyspnea, wheezing, pulmonary edema, cough*

PHARMACOKINETICS

Peak 1/2 hr (adults); terminal half-life 7 days (adult), 9½ days (children)

INTERACTIONS

Increase: immunosuppression—other immunosuppressants

Drug/Herb

Decrease: St. John's wort, turmeric

Drug/Lab Test

Increase: cholesterol, BUN, uric acid, creatinine, K, Ca, blood glucose, Hgb, Hct

Decrease: Hgb, Hct, platelets, magnesium, phosphate

NURSING CONSIDERATIONS

Assess:

Black Box Warning:

For infection: increased temp, WBC, sputum, urine; may be fatal (bacterial, protozoal, fungal)

- Blood studies: Hgb, WBC, platelets during treatment monthly; if leukocytes are $<3000/\text{mm}^3$, product should be discontinued; electrolytes, B/P, edema assessment
- Hepatic studies: alk phos, AST, ALT, bilirubin

⚠ Anaphylaxis, hypersensitivity: dyspnea, wheezing, rash, pruritus,

hypotension, tachycardia; if severe hypersensitivity reactions occur, product should not be used again

Perform/provide:

- Storage of reconstituted sol refrigerated for up to 24 hr or at room temp for 4 hr

Evaluate:

- Therapeutic response: absence of graft rejection

Teach patient/family:

Black Box Warning:

To report fever, chills, sore throat, fatigue, serious infection may occur

- To avoid crowds, persons with known upper respiratory tract infections
- To use contraception during treatment
- To report GI symptoms, bleeding, allergic reactions

🍁 Canada only Side effects: *italics* = common; **bold** = life-threatening ⚠️
Nurse Alert

beclomethasone (Rx)

(be-kloe-meth'a-sone)

QVAR

Func. class.: Corticosteroid, synthetic

Chem. class.: Glucocorticoid

Do not confuse: beclomethasone/betamethasone

ACTION:

Prevents inflammation by suppression of the migration of polymorphonuclear leukocytes, fibroblasts and the reversal of increased capillary permeability and lysosomal stabilization; does not suppress hypothalamus and pituitary function

USES:

Chronic asthma, allergic/vasomotor rhinitis, nasal polyps

CONTRAINDICATIONS:

Hypersensitivity, status asthmaticus (primary treatment)

Precautions: Pregnancy (C), breastfeeding, children <12 yr, nasal disease/surgery, nonasthmatic bronchial disease; bacterial, fungal, viral infections of mouth, throat, lungs; HPA suppression, osteoporosis, Cushing's syndrome, diabetes mellitus, measles, cataracts, corticosteroid hypersensitivity, glaucoma, herpes infection

DOSAGE AND ROUTES

Calculator

• **Adult and child >12 yr: ORAL INH** 40-80 mcg bid (alone) or 40-160 mcg bid (previous inhaled corticosteroids); max 320 mcg bid

• **Child 5-11 yr: ORAL INH** 40 mcg bid; max 80 mcg bid

Available forms: Oral inh 40, 80, 250  mcg/metered spray

Administer:

• Bronchodilator spray; if used, should be used 1st, then wait a few minutes, then use beclomethasone

• Prime before 1st use or if not used for 7-10 days; prime by spraying 2 actuations into the air, away from the face; do not share inhaler • **Oral**

inhalation (metered-dose non-CFC aerosol) (QVAR); shake well, use spacer;

after using, rinse mouth, gargle if possible; clean weekly with dry cloth/tissue, do not wash inhaler • Titrated dose, use lowest effective dose

SIDE EFFECTS

CNS: *Headache*

EENT: *Hoarseness, candidal infection of oral cavity, sore throat, loss of taste/smell, dysgeusia*

ENDO: HPA suppression

GI: Dry mouth, dyspepsia

MISC: *Angioedema, adrenal insufficiency*, facial edema, Churg-Strauss syndrome (rare)

RESP: *Bronchospasm*, wheezing, cough

PHARMACOKINETICS

INH: Onset 1-4 wk; excreted in feces, urine (metabolites); half-life 2.8 hr; crosses placenta; metabolized in lungs, liver (by CYP3A)

NURSING CONSIDERATIONS

Assess:

- For fungal infection in mucous membranes
- Adrenal function periodically for HPA axis suppression during prolonged therapy, monitor growth/development

Perform/provide:

- Gum, rinsing of mouth for dry mouth

Evaluate:

- Therapeutic response: decreased dyspnea, wheezing, dry crackles

Teach patient/family:

- To gargle/rinse mouth after each use to prevent oral fungal infections
 - That during times of stress, systemic corticosteroids may be needed to prevent adrenal insufficiency; not to discontinue oral product abruptly, to taper slowly
 - To notify prescriber if therapeutic response decreases; dosage adjustment may be needed • Proper administration technique and cleaning technique
 - About all aspects of product usage, including cushingoid symptoms
 - About **adrenal insufficiency symptoms:** nausea, anorexia, fatigue, dizziness, dyspnea, weakness, joint pain, depression
-

🍁 Canada only Side effects: *italics* = common; **bold** = life-threatening ⚠️
Nurse Alert

beclomethasone (nasal)

(be-kloe-meth'a-sone)

Beconase AQ, Qnasal

Func. class.: Nasal corticosteroid

ACTION:

Readily crosses cell membranes and binds with high affinity to specific cytoplasmic receptors; inhibition of leukocyte infiltration at the site of inflammation, interference in the function of mediators of inflammatory response, and suppression of humoral immune responses

USES:

To relieve symptoms of seasonal/perennial rhinitis

CONTRAINDICATIONS:

Hypersensitivity

Precautions: Child <6 yr, untreated fungal infections, glaucoma and/or cataracts, nasal septum ulcers/surgery/trauma

DOSAGE AND ROUTES

Calculator

- **Adult/child ≥ 12 yr:** Nasal 1-2 sprays in each nostril bid (42 mcg/spray); 2 sprays in each nostril every day (80 mcg/actuation)
- **Child 6-12 yr:** Nasal 1 spray in each nostril bid

Available forms: nasal spray 42 mcg/metered spray; nasal aerosol 80 mcg/actuation

Administer

- Products are not always interchangeable owing to differences in route of administration and in the amount of active drug released per spray
- To avoid the spread of infection, do not use the container for more than one person
- Product's effectiveness depends on regular use

Nasal inhalation (metered-dose aerosol) (Qnasal):

- Instruct patient to shake the canister well before administering
- Before first use, instruct the patient to prime the pump by actuating 4 times. After the initial priming, the dose-counter should read 120

- If the canister is not used for 7 consecutive days, instruct the patient to prime by actuating 2 times • Instruct patient on proper administration technique

Nasal inhalation (pump spray) (Beconase AQ):

- Instruct patient to shake the nasal sprayer well before use
- Before first use, instruct the patient to prime the pump by actuating 6 times
- If the pump is not used for 7 days, prime until a fine spray appears
- Instruct patient on proper administration technique
- After use, rinse the tip of the bottle with hot water, taking care not to suck water into the bottle, and dry with a clean tissue; replace the cap

SIDE EFFECTS

CNS: Headache, dizziness

EENT: Nasal burning, epistaxis, nasal fungal infections, nasal congestion, sneezing

GI: Nausea

PHARMACOKINETICS

Onset 7 days, peak 21 days, half-life 15 hr

NURSING CONSIDERATIONS

Assess:

- Nasal symptoms: Assess for sneezing, running of nose before and after use, avoid use longer than 3 wk, check for fungal infections, changes in vision

Evaluate:

- Decrease nasal running, sneezing, other symptoms of seasonal/perennial rhinitis

Teach patient/family:

- That products are not always interchangeable owing to differences in route of administration and in the amount of active drug released per spray • To avoid the spread of infection, do not use the container for more than one person • That product effectiveness depends on regular use

Nasal inhalation (metered-dose aerosol) (Qnasal):

- Instruct patient to shake the canister well before administering
- Before first use, instruct the patient to prime the pump by actuating 4 times. After the initial priming, the dose-counter should read 120
- If the canister is not used for 7 consecutive days, instruct the patient to prime

by actuating 2 times • Instruct patient on proper administration technique

Nasal inhalation (pump spray) (Beconase AQ):

- Instruct patient to shake the nasal sprayer well before use
- Before first use, instruct the patient to prime the pump by actuating 6 times
- If the pump is not used for 7 days, prime until a fine spray appears
- Instruct patient on proper administration technique
- After use, rinse the tip of the bottle with hot water, taking care not to suck water into the bottle, and dry with a clean tissue; replace the cap

🌿 Canada only Side effects: *italics* = common; **bold** = life-threatening ⚠️
Nurse Alert

belatacept

(bel-a-ta'sept)

Nulojix

Func. class.: Biologic response modifier

Chem. class.: Fusion protein

ACTION:

Activated T lymphocytes are the mediators of immunologic rejection, this product is a selective T-cell costimulation blocker; blocks the CD28 mediated costimulation of T lymphocytes by binding to CD80 and CD86 on antigen-presenting cells; inhibits T lymphocyte proliferation and the production of the cytokines interleukin-2, interferon-gamma, interleukin-4, and TNF-alpha.

USES:

Kidney transplant rejection prophylaxis given with basiliximab induction, mycophenolate mofetil, corticosteroids

CONTRAINDICATIONS:

Hypersensitivity

Precautions: Breastfeeding, child/infant/neonate, pregnancy (C), diabetes mellitus, progressive multifocal leukoencephalopathy, immunosuppression, sunlight exposure, TB

Black Box Warning:

Infection, organ transplant, requires an experienced clinician, secondary malignancy, posttransplant lymphoproliferation disorder

DOSAGE AND ROUTES

Calculator

- **Adult: IV** 10 mg/kg rounded to the nearest 12.5 mg increment; give over 30 min the day of transplantation (day 1) but before transplantation, on day 5 approximately 96 hours after the day 1 dose 1, at the end of wk 2, at the end of wk 4, at the end of wk 8, and at the end of wk 12; maintenance dosage is 5 mg/kg rounded to the nearest 12.5 mg increment; give over 30 min at the end of wk 16 and every 4 wk $\pm$ 3 days thereafter; doses should be calculated on actual body weight on the transplantation day unless the patient's weight varies by >10%

Available forms: Powder for inj 250 mg

Administer:

Black Box Warning:

Only providers skilled in the use of immunosuppressant and management of transplant should use these products

IV route

- Visually inspect product for particulate matter, discoloration whenever sol/container permit, discard if present • Calculate the number of drug vials required to provide total inf dose
- Reconstitute each vial/10.5 ml of sterile water for injection, 0.9% sodium chloride, D₅W, using the silicone-free disposable syringe provided with each vial and an 18-21G needle. If silicone-free disposable syringe is dropped or becomes contaminated, use a new silicone-free disposable syringe from inventory. If you need additional silicone-free disposable syringes, call 1-888-685-6549. If the powder is accidentally reconstituted using a different syringe than the one provided, the sol may develop a few translucent particles. Discard any sol prepared using siliconized syringes.
- Using aseptic technique, inject the diluent into the vial and direct the stream of diluent to the glass wall of the vial; to minimize foaming, rotate the vial and invert with gentle swirling until the contents are dissolved; do not shake when reconstituted (25 mg/ml), should be clear to slightly opalescent and colorless to pale yellow; do not use if opaque particles, discoloration, or other foreign particles are present.
- Calculate the total volume of the reconstituted 25 mg/ml sol required to provide the total inf dose; further dilute this volume with a volume of inf fluid equal to the volume of the reconstituted drug sol required to provide the prescribed dose. Use either NS or D₅W if drug was reconstituted with SWFI; use NS if drug was reconstituted with NS; use D₅W if drug was reconstituted with D₅W. With the same silicone-free disposable syringe used for reconstitution, withdraw the required amount of belatacept sol from the vial, inject it into the inf container, gently rotate the inf container to ensure mixing; final conc in inf container should range (2-10 mg/ml). Volume of 100 ml will be appropriate for most patients and doses, but total inf volumes ranging from 50-250 ml may be used. Discard any unused drug sol remaining in the vials;

after reconstitution, immediately transfer the reconstituted sol from the vial to the inf bag or bottle; complete within 24 hr.

IV INF route

- Give over 30 min, use an inf set and a sterile, nonpyrogenic, low-protein-binding filter (0.2-1.2 mm), use a separate line

SIDE EFFECTS

CNS: Guillain-Barré syndrome, anxiety, dizziness, headache, fever, insomnia, tremor

EENT: Pharyngitis, stomatitis

GI: Abdominal pain, constipation, diarrhea, nausea, vomiting

GU: Renal tubular necrosis, renal failure, proteinuria, urinary incontinence

HEMA: Anemia, neutropenia, leucopenia, leukoencephalopathy

INTEG: Acne, alopecia

META: Hypercholesterolemia, hyperglycemia, hyper/hypokalemia, hypocalcemia, hypophosphatemia, hypomagnesemia

MS: Arthralgia

SYST: Secondary malignancy, posttransplant lymphoproliferation disorder, wound dehiscence, BK-virus-associated neuropathy

PHARMACOKINETICS

Half-life, 6.1-15.1 days during receipt of 10 mg/kg IV doses; during receipt of 5 mg/kg IV doses, terminal half-life 3.1-11.9; steady-state by wk 8 after transplantation and by month 6 during maintenance phase

INTERACTIONS

Increase: Basiliximab induction, mycophenolate mofetil

NURSING CONSIDERATIONS

Assess:

Black Box Warning:

Transplant rejection: flulike symptoms, decreasing urinary output, malaise; some may experience pain in area (rare; monitor BUN/creatinine)

Black Box Warning:

Infection: monitor for fever, chills, increased WBC, wound dehiscences

Black Box Warning:

Posttransplant lymphoproliferation disorder: may lead to secondary malignancy (lymphoma) or infectious mononucleosis-like lesions; may be treated with antivirals or immunosuppressant; product may need to be discontinued

- Hyperlipidemia: monitor cholesterol, triglycerides; an antilipidemic may be needed

Perform/provide:

- Storage: refrigerated, protected from light ≤24 hr; max 4 hr of the total 24 hr can be at room temp and room light

Evaluate:

- Therapeutic response: absence of renal transplant rejection

Teach patient/family:

- Reason for product and expected result
- To avoid exposure to sunlight, tanning beds, risk of secondary malignancy
- To avoid crowds, persons with known infections
- That repeated lab test will be needed
- To avoid with vaccines
- That immunosuppressants will be needed for life to prevent rejection; teach symptoms of rejection and to call provider immediately

🍁 Canada only Side effects: *italics* = common; **bold** = life-threatening ⚠️
Nurse Alert

belimumab

(be-lim'ue-mab)

Benlysta

Func. class.: Monoclonal antibody

Chem. class.: Disease-Modifying Antirheumatic Drugs (DMARDs)

ACTION:

Inhibits B lymphocyte stimulator (BLyS), needed for B-cell survival; normally, soluble BLyS binds to its receptors on B cells and allows B-cell survival; binds BLyS and prevents binding to its receptors on B-cells

USES:

Active, autoantibody-positive, systemic lupus erythematosus (SLE) in combination with standard therapy

CONTRAINDICATIONS:

Hypersensitivity

Precautions: Pregnancy (C), breastfeeding, children/infants, geriatric patients, African decent patients, depression, immunosuppression, infection, suicidal ideation, vaccination, secondary malignancy, cardiac disease; requires experienced clinician

DOSAGE AND ROUTES

Calculator

• **Adult: IV** 10 mg/kg over 1 hr q2wk for the first 3 doses then q4wk

Available forms: Powder for injection 120, 400 mg

Administer:

• Only health care providers prepared to manage anaphylaxis should administer this product; may give premedication for prophylaxis against infusion and hypersensitivity reactions

Intermittent IV INF route

• Visually inspect particulate matter and discoloration whenever sol and container permits • Give as IV inf only, do not give IV bolus or push; give over 1 hr and slow or stop if inf reactions occur • Do not give with any other agents in the same IV line

- Allow to stand at room temp for 10-15 min before using
- Reconstitute with the appropriate amount of sterile water for injection (80 mg/ml); add 1.5 ml of sterile water (120 mg/vial) or 4.8 ml of sterile water (400 mg/vial) • Direct the stream of sterile water toward the side of the vial to minimize foaming; gently swirl for 60 sec, allow to sit during reconstitution, gently swirl for 60 sec q5min until the powder is dissolved; do not shake; reconstitution is complete in 10 to 30 min • If a mechanical reconstitution device (swirler) is used, max 500 rpm swirled for ≤ 30 min.
- Sol should be opalescent and colorless to pale yellow and without particles; small air bubbles are expected; protect from sunlight • Dilution: only dilute in normal saline for injection; dilute reconstituted sol with enough normal saline to 250 ml. From a 250-ml inf bag or bottle of normal saline, withdraw and discard a volume equal to the volume of the reconstituted sol required for dose; add the required volume of the reconstituted sol the infusion bag/bottle; gently invert to mix • Discard any unused sol

SIDE EFFECTS

CNS: Headache, dizziness, anxiety, depression, fever, insomnia, migraine, suicidal ideation

CV: Bradycardia, hypotension

GI: Nausea, diarrhea

MISC: Rash, dyspnea, cystitis, leukopenia, myalgia, rash, bronchitis, nasopharyngitis, pharyngitis

SYST: Anaphylaxis, angioedema, antibody formation, secondary malignancy, infection, influenza

PHARMACOKINETICS

Terminal half-life 19.4 days; distribution half-life 1.75 days

NURSING CONSIDERATIONS

Assess:

- **SLE:** monitor for decreasing fever, malaise, fatigue, joint pain, myalgias
- **Suicidal ideation:** more common in those with preexisting depression
- **Infection:** determine if a chronic or acute infection is present, may be fatal when used with this product; do not begin therapy if any products are being used for a chronic infection; leucopenia may occur with this product and

susceptibility to infections increased • **Anaphylaxis**, infusion site reactions: if these occur, stop infusion • **African descent patients**: use cautiously in these patients, may not respond to this product • Cardiac disease: monitor closely for cardiovascular side effects, bradycardia, hypotension • **Pregnancy**: determine if pregnant or if pregnancy is planned or suspected; if pregnant, call 1-877-681-6269 to enroll in registry

Perform/provide:

- Storage in refrigerator or at room temp; total time from reconstitution to completion of inf max 8 hr

Evaluate:

- Positive response: Decreasing symptoms of SLE: decreasing fatigue, fever, malaise

Teach patient/family:

- To notify prescriber if pregnancy is planned or suspected, to use reliable contraception during and for 4 months after final treatment; to avoid breastfeeding
- To seek treatment immediately for serious hypersensitive reactions
- Not to receive vaccinations during treatment

☼ Canada only Side effects: *italics* = common; **bold** = life-threatening ⚠
Nurse Alert

benazepril (Rx)

(ben-aze'uh-pril)

Lotensin

Func. class.: Antihypertensive

Chem. class.: Angiotensin-converting enzyme (ACE) inhibitor

Do not confuse: **benazepril**/Benadryl

ACTION:

Selectively suppresses renin-angiotensin-aldosterone system; inhibits ACE, thus preventing conversion of angiotensin I to angiotensin II

USES:

Hypertension, alone or in combination with thiazide diuretics

Unlabeled uses: CHF, diabetic nephropathy, proteinuria, renal impairment

CONTRAINDICATIONS:

Breastfeeding, children, hypersensitivity to ACE inhibitors, angioedema

Black Box Warning:

Pregnancy (D)

Precautions: Geriatric patients, impaired renal/hepatic function, dialysis patients, hypovolemia, blood dyscrasias, CHF, COPD, asthma, bilateral renal artery stenosis

DOSAGE AND ROUTES

Calculator

- **Adult: PO** 10 mg/day initially, then 20-40 mg/day divided bid or daily (without a diuretic); reduce initial dose to 5 mg **PO** daily (with a diuretic); max 80 mg/day
- **Geriatric: PO** used on the basis of the clinical response
- **Child ≥6 yrs: PO** 0.2 mg/kg/day max 5 mg/day

Renal dose

- **Adult: PO** CCr <30 ml/min 5 mg **PO** daily, max 40 mg/day

Renal impairment due to diabetic nephropathy (unlabeled)

- **Adult: PO** 10 mg/day

Heart failure (unlabeled)

- **Adult: PO** 2-20 mg/day

Available forms: Tabs 5, 10, 20, 40 mg

Administer:

- May give without regard to food
- Do not discontinue product abruptly

SIDE EFFECTS

CNS: Anxiety, hypertonia, insomnia, paresthesia, headache, dizziness, fatigue

CV: Hypotension, postural hypotension, syncope, palpitations, angina

GI: Nausea, constipation, vomiting, gastritis, melena, diarrhea

GU: Increased BUN, creatinine, decreased libido, impotence, UTI

HEMA: Agranulocytosis, neutropenia

INTEG: Rash, flushing, sweating

META: Hyperkalemia, hyponatremia

MISC: Angioedema

MS: Arthralgia, arthritis, myalgia

RESP: Cough, asthma, bronchitis, dyspnea, sinusitis

PHARMACOKINETICS

Peak 1-2 hr fasting, 2-4 hr after food; protein binding 89%-95%; half-life 10-11 hr; metabolized by liver (metabolites); excreted in urine 33%

INTERACTIONS

Increase: hypotension—phenothiazines, nitrates, acute alcohol ingestion, diuretics, other antihypertensives

Increase: hyperkalemia—potassium-sparing diuretics, potassium supplements

Increase: myelosuppression—azaTHIOprine

Increase: serum levels of lithium, digoxin

Decrease: hypotensive effects—NSAIDs

Drug/Herb

Increase: antihypertensive effect—hawthorn

Decrease: antihypertensive effect—ephedra (Ma huang)

Drug/Lab Test

Increase: AST, ALT, alk phos, bilirubin, uric acid, blood glucose

Positive: ANA titer

False positive: ANA titer

NURSING CONSIDERATIONS

Assess:

- **Hypertension:** B/P, pulse at baseline, periodically; orthostatic hypotension, syncope when used with diuretic; notify prescriber of changes; monitor compliance
- **Blood dyscrasias:** neutrophils, decreased platelets; WBC with differential at baseline, q3mo; if neutrophils $<1000/\text{mm}^3$, discontinue treatment; recommended with **collagen-vascular disease**
- Renal studies: protein, BUN, creatinine; increased levels may indicate nephrotic syndrome; monitor urine for protein; LFTs, uric acid, glucose may be increased; diuretic should be discontinued 3 days before initiation of benazepril, if hypertension is not controlled, a diuretic can be added; measure B/P at peak 2-4 hr and trough (before next dose); this product is less effective in African descent patients
- Potassium levels, although hyperkalemia rarely occurs
- **Allergic reactions:** rash, fever, pruritus, urticaria; product should be discontinued if antihistamines fail to help; **angioedema is more common in patients of African descent**
- Renal symptoms: polyuria, oliguria, frequency, dysuria
- **CHF (unlabeled):** edema in feet, legs daily; weight daily

Perform/provide:

- Storage in tight container at 86° F (30° C) or less

Evaluate:

- Therapeutic response: decrease in B/P

Teach patient/family:

- Not to use OTC products (cough, cold, allergy) unless directed by prescriber; not to use salt substitutes that contain potassium without consulting prescriber
- The importance of complying with dosage schedule, even if feeling better

Black Box Warning:

To notify prescriber of pregnancy (D); product will need to be discontinued

- To rise slowly to sitting or standing position to minimize orthostatic hypotension
- **To notify prescriber of mouth sores, sore throat, fever, swelling of hands or feet, irregular heartbeat, chest pain, bruising, bleeding, swelling of face, tongue, lips, difficulty breathing**
- To report excessive perspiration, dehydration, vomiting, diarrhea; may lead to fall in B/P; to use caution in hot weather
- That product may cause dizziness, fainting, lightheadedness; that this may occur

during first few days of therapy • That product may cause skin rash or impaired perspiration

- How to take B/P, and normal readings for age-group
- To avoid potassium-containing products (salt substitutes)

TREATMENT OF OVERDOSE:

0.9% NaCl IV INF, hemodialysis

🍁 Canada only Side effects: *italics* = common; **bold** = life-threatening ⚠️
Nurse Alert

HIGH ALERT

bendamustine (Rx)

(ben-da-muss'teen)

Treanda

Func. class.: Antineoplastic alkylating agent

Chem. class.: Mechlorethamine derivative

ACTION:

Cross-linking DNA that causes single strand and double strand breaks, inhibits several mitotic checkpoints, combines alkylating and antimetabolite properties

USES:

Chronic lymphocytic leukemia, non-Hodgkin's lymphoma

Unlabeled uses: Mantle cell lymphoma (MCL)

CONTRAINDICATIONS:

Pregnancy (D), fetal harm may occur; breastfeeding, children, hepatic disease, renal impairment, hypersensitivity to product or mannitol

Precautions: Hyperuricemia, infusion-related reactions, myelosuppression, infection, skin reactions

DOSAGE AND ROUTES

Calculator

Chronic lymphocytic leukemia

- **Adult:** IV INF 100 mg/m² over 30 min on days 1, 2 q28days up to 6 cycles

Non-Hodgkin's lymphoma

- **Adult:** IV INF 120 mg/m² over 60 min on days 1, 2 q21days up to 8 cycles

Mantle cell lymphoma (unlabeled)

- **Adult:** IV INF 90 mg/m² on days 1, 2 with rituximab on day 1 q28days for 6 cycles

Renal/hepatic dose

- **Adult:** IV INF CCr <40 ml/min, do not use; AST or ALT 2.5-10 × upper limit normal or bilirubin 1.5-3 × ULN, do not use

Available forms: Powder for inj 25, 100 mg

Administer:

- Allopurinol for 1-2 wk to those at high risk for tumor lysis syndrome, usually develops in first treatment cycle
- Blood transfusions, RBC colony-stimulating factors to counter anemia
- Antiemetic 30-60 min before giving product to prevent vomiting
- All medications PO; if possible, avoid IM inj if platelets are $<100,000/\text{mm}^3$

Intermittent IV INF route

- Prepare in biologic cabinet wearing gown, gloves, mask; avoid contact with skin, can cause burning, stain the skin brown; use cytotoxic handling procedures
- After **reconstituting** 100 mg product/20 ml or 25 mg/5 ml sterile water for inj (5 mg/ml), sol should be clear, colorless to pale yellow, completely dissolve in 5 min; if particulate is present, do not use
- Within 30 min of reconstitution, withdraw volume needed and **further dilute** in 500 ml NS or $D_{2.5/0.45}\%$ NS to a final conc of 0.2-0.6 mg/ml; doses of $\leq 100 \text{ mg/m}^2$, **give** over 30 min; doses of $>100 \text{ mg/m}^2$, **give** over 60 min
- Monitor for inf reactions; may use antihistamines or corticosteroids for grade 1, 2 reactions; if grade 3 or 4 occurs, discontinue if needed

SIDE EFFECTS

CNS: Asthenia, *fatigue*, fever, *headache*, chills, hypertension

CV: Hypertension, **hypertensive crisis**

GI: *Nausea, vomiting, diarrhea*, hyperbilirubinemia, *constipation*, stomatitis, *anorexia*, weight loss

GU: **Renal failure**

HEMA: **Thrombocytopenia, leukopenia, anemia, lymphocytopenia, neutropenia, secondary malignancy, toxic epidermal necrolysis, tumor lysis syndrome**

INTEG: *Bulbous rash, pruritus*, extravasation

META: Hyperuricemia

SYST: **Anaphylaxis**, infection, dehydration, **severe skin toxicities, tumor lysis syndrome, Stevens-Johnson syndrome**

PHARMACOKINETICS

95% protein binding, metabolized by hydrolysis via CYP450 1A2, 2 metabolites are produced, half-life 40 min, 90% excreted unchanged (feces)

INTERACTIONS

Increase: agranulocytosis risk—cloZAPine (do not use concurrently)

Increase: bleeding risk—aspirin, anticoagulants, NSAIDs, platelet inhibitors, thrombolytics

Increase: myelosuppression—myelosuppressive agents

Increase: toxicity—other antineoplastics, radiation

Increase: adverse reactions, decreased antibody reaction—live vaccines

Increase: bendamustine—CYP1A2 inhibitors (atazanavir, cimetidine, ciprofloxacin, enoxacin, ethyl estradiol, fluvoxamine, mexiletine, norfloxacin, tacrine, thiabendazole, zileuton)

Decrease: bendamustine—CYP1A2 inducers (barbiturates, carbamazepine, rifampin)

Drug/Lab Test

Increase: LFTs

NURSING CONSIDERATIONS

Assess:

- **Blood dyscrasias:** CBC, differential, platelet count weekly; withhold product if WBC is <1000 or if platelet count is <75,000; notify prescriber of results
- Hepatic studies: AST, ALT, bilirubin
- Renal studies: BUN, serum uric acid, urine CCr before, during therapy; I&O ratio; report fall in urine output of 30 or 40 ml/hr; electrolytes
- Monitor for cold, cough, fever (may indicate beginning infection)
- For malignancy regression
- Bleeding: hematuria, guaiac, bruising, petechiae, mucosa, orifices q8hr
- **Serious skin toxicities:** toxic epidermal necrolysis, Stevens-Johnson syndrome; product should be discontinued
- **Tumor lysis syndrome:** monitor uric acid, potassium; may occur during 1st treatment cycle; use allopurinol for patients at high risk for this condition, usually during the 1st 2 wk; provide adequate hydration

Perform/provide:

- Storage of reconstituted sol in refrigerator for 24 hr or at room temp for 3 hr; protect from light; store vials at room temp

Evaluate:

- Therapeutic response: improvement in blood counts, morphology

Teach patient/family:

- To avoid hazardous activity that requires mental alertness
 - To avoid crowds, persons with upper respiratory infections
 - To report immediately fever, sore throat, flulike symptoms, indicates infection
 - To report immediately allergic reaction, facial swelling, difficulty breathing, itchy rash • Until reaction is known, not to breastfeed, males should also use contraception during and for 3 months after
 - To use contraception during therapy and for 3 mo after pregnancy (D) • To avoid use of aspirin, ibuprofen, razors, commercial mouthwash • To report signs of anemia (fatigue, irritability, SOB, faintness)
 - To report signs of infection, myelosuppression, skin toxicities, diarrhea, nausea, vomiting
-

- **Adult and child:** PO 100 mg up to tid; max 600 mg/day

☼ Canada only Side effects: *italics* = common; **bold** = life-threatening ⚠

Nurse Alert

benztropine (Rx)

(benz'troe-peen)

Cogentin

Func. class.: Cholinergic blocker, antiparkinson's agent *Chem. class.:* Tertiary amine

ACTION:

Blockade of central acetylcholine receptors, balances cholinergic activity

USES:

Parkinson's symptoms, EPS associated with neuroleptic products, acute dystonic reactions, hypersalivation

CONTRAINDICATIONS:

Children <3 yr, hypersensitivity, closed-angle glaucoma, myasthenia gravis, GI/GU obstruction, peptic ulcer, megacolon, prostate hypertrophy, dementia, tardive dyskinesia

Precautions: Pregnancy (C), breastfeeding, children, geriatric patients, tachycardia, renal/hepatic disease, substance abuse history, dysrhythmias, hypo/hypertension, psychiatric patients

DOSAGE AND ROUTES

Calculator

Drug-induced EPS

- **Adult: IM/IV/PO** 1-4 mg daily/bid; give **PO** dose as soon as possible
- **Child >3 yr: IM/IV/PO** 0.02-0.05 mg/kg/dose 1-2×/day

Parkinson's symptoms

- **Adult: PO/IM** 0.5-1 mg at bedtime; increase by 0.5 mg q5-6days titrated to patient response, max 6 mg/day

Acute dystonic reactions

- **Adult: IM/IV** 1-2 mg, may increase to 1-2 mg bid (**PO**)

Available forms: Tabs 0.5, 1, 2 mg; inj 1 mg/ml

Administer:

PO route

- With or after meals to prevent GI upset; may give with fluids other than water
- At bedtime to avoid daytime drowsiness with parkinsonism

IM route

- Inject deeply in muscle, use filtered needle to remove solution from ampule

IV, direct route

- **Undiluted IV** (1 mg 5 1 ml): **give** 1 mg/1 min (rarely used)

Syringe compatibilities: Metoclopramide, perphenazine

Y-site compatibilities: Fluconazole, tacrolimus

SIDE EFFECTS

CNS: Anxiety, restlessness, irritability, delusions, hallucinations, headache, sedation, depression, incoherence, dizziness, memory loss; *confusion*; delirium (geriatric patients)

CV: Palpitations, tachycardia, hypotension, bradycardia

EENT: Blurred vision, photophobia, dilated pupils, difficulty swallowing

GI: *Dryness of mouth, constipation*, nausea, vomiting, abdominal distress, *paralytic ileus*

GU: Urinary hesitancy/retention, dysuria

INTEG: Rash, urticaria, dermatoses

MISC: Increased temperature, flushing, decreased sweating, *hyperthermia, heat stroke*, numbness of fingers

PHARMACOKINETICS

PO: Onset 1 hr, duration 6-10 hr

IM/IV: Onset 15 min, duration 6-10 hr

INTERACTIONS

Increase: anticholinergic effect—amantadine; antihistamines, phenothiazines, tricyclics, disopyramide, quinidine; reduce dose

Decrease: absorption—antidiarrheals, antacids

Decrease: anticholinergic effect of—cholinergic

NURSING CONSIDERATIONS

Assess:

- **Parkinsonism:** EPS, shuffling gait, muscle rigidity, involuntary movements, loss of balance
- **Paralytic ileus:** abdominal pain, intermittent constipation/diarrhea

- I&O ratio; commonly causes decreased urinary output; urinary hesitancy,

retention; palpate bladder if retention occurs • Constipation: increase fluids, bulk, exercise if this occurs

- Mental status: affect, mood, CNS depression, worsening of mental symptoms during early therapy • Use caution during hot weather; product may increase susceptibility to heat stroke by decreasing sweating • With benztropine “buzz” or “high,” patients may imitate EPS

Perform/provide:

- Storage at room temp
- Hard candy, gum, frequent drinks to relieve dry mouth

Evaluate:

- Therapeutic response: absence of involuntary movements after 2 days of treatment

Teach patient/family:

- To report urinary hesitancy/retention, dysuria
- That tabs may be crushed, mixed with food, may take whole dose at bedtime if approved by prescriber • Not to discontinue product abruptly; to taper off over 1 wk or withdrawal symptoms may occur (EPS, tremors, insomnia, tachycardia, restlessness); to take as directed; not to double dose • To avoid driving, other hazardous activities; drowsiness/dizziness may occur
- To avoid OTC medications: cough, cold preparations with alcohol, antihistamines, antacids, antidiarrheals within 2 hr unless directed by prescriber
- To change positions slowly to prevent orthostatic hypotension
- To use good oral hygiene, frequent sips of water, sugarless gum for dry mouth

☼ Canada only Side effects: *italics* = common; **bold** = life-threatening ⚠
Nurse Alert

bepotastine

(beh-pot'uh-steen)

Bepreve

Func. class.: Antihistamine (ophthalmic)

Chem. class.: Histamine 1 receptor antagonist

ACTION:

A topically active, direct H₁- receptor antagonist and mast cell stabilizer; by reducing these inflammatory mediators, relieves the ocular pruritus associated with allergic conjunctivitis

USES:

Ocular pruritus associated with signs and symptoms of allergic conjunctivitis

CONTRAINDICATIONS:

Hypersensitivity

Precautions: Pregnancy (C), breastfeeding, children, contact lenses

DOSAGE AND ROUTES

Calculator

• **Adult/child ≥2 yrs: OPHTH** Instill 1 drop in each eye bid, max 2 drops/day in each eye

Available forms: Ophthalmic solution 1.5%

Administer

Ophthalmic route

- For topical ophthalmic use only
- Wash hands before and after use. Tilt the head back slightly and pull the lower eyelid down with the index finger. Squeeze the prescribed number of drops into the conjunctival sac and gently close eyes for 1–2 min, do not blink
- Do not touch the tip of the dropper to the eye, fingertips, or other surface
- Wait ≥10 min after instilling the ophthalmic solution before inserting contact lenses; contact lenses should not be worn if eye is red. The preservative in this product may be absorbed by soft contact lenses
- Do not share ophthalmic drops with others

SIDE EFFECTS

CNS: Headache

EENT: Taste change, ocular irritation, pharyngitis

NURSING CONSIDERATIONS

Assess:

- Eyes: for itching, redness, use of soft or hard contact lenses

Evaluate:

- Therapeutic response: absence of redness, itching in the eyes

Teach patient/family:

Ophthalmic route

- Product is for topical ophthalmic use only
- Wash hands before and after use. Tilt the head back slightly and pull the lower eyelid down with the index finger. Squeeze the prescribed number of drops into the conjunctival sac and gently close eyes for 1–2 min, do not blink • Do not touch the tip of the dropper to the eye, fingertips, or other surface
- Wait ≥ 10 min after instilling the ophthalmic solution before inserting contact lenses; contact lenses should not be worn if eye is red • Do not share ophthalmic drops with others
- Remove **contact lenses** before use because the preservative, benzalkonium chloride, may be absorbed by soft contact lenses; product should not be used to treat contact lens–related irritation

Nurse Alert

betamethasone (topical)

(bay-ta-meth'a-sone)

betamethasone dipropionate

Diprolene, Diprolene AF

betamethasone augmented dipropionate

betamethasone valerate

Beta-Val, Luxiq

Func. class.: Corticosteroid, topical

ACTION:

Crosses cell membrane to attach to receptors to decrease inflammation, itching; inhibits multiple inflammatory cytokines

USES:

Inflammation/itching corticosteroid-responsive dermatoses on the skin/scalp

CONTRAINDICATIONS:

Hypersensitivity, use of some preparations on face, axilla, groin

Precautions: Pregnancy (C), skin infections

DOSAGE AND ROUTES

Calculator

• **Adult: TOP** 1-2 times/day (dipropionate) or 1-3 times/day (valerate)

Available forms: dipropionate: gel, lotion, ointment, cream 0.05%; valerate: cream, lotion, ointment 0.1%, foam 0.12%

SIDE EFFECTS

INTEG: Burning, folliculitis, pruritus, dermatitis, maceration, erythema

MISC: Hyperglycemia; glycosuria, Cushing syndrome, HPA axis suppression

PHARMACOKINETICS

Unknown

NURSING CONSIDERATIONS

Assess:

- Skin reactions: burning pruritus, folliculitis, dermatitis

Evaluate:

- Decreased itching, inflammation on the skin, scalp

Teach patient/family:

Topical route

- That betamethasone valerate may be used with occlusive dressings for psoriasis or recalcitrant conditions, **do not use dipropionate with occlusive dressings**

Cream/ointment/lotion:

- To apply sparingly in a thin film, using gloves, and rub gently into the cleansed, slightly moist affected area

Gel:

- To apply sparingly in a thin film, using gloves, and rub gently into the cleansed, slightly moist affected area

Scalp foam:

- To invert can and dispense a small amount of foam onto a saucer or other cool surface. Do not dispense directly onto hands. Pick up small amounts of foam with fingers and gently massage into affected area until foam disappears. Repeat until entire affected scalp area is treated.
- That treatment should be limited to 2 wk

🍁 Canada only Side effects: *italics* = common; **bold** = life-threatening ⚠️

betaxolol (ophthalmic)

(beh-tax'oh-lol)

Betoptic-S

Func. class.: Antiglaucoma

Chem. class.: Beta blocker

ACTION:

Can decrease aqueous humor and increase outflows

USES:

Treatment of chronic open-angle glaucoma and ocular hypertension

CONTRAINDICATIONS:

Hypersensitivity, AV block, heart failure, bradycardia, sick sinus syndrome

Precautions: Abrupt discontinuation, children, pregnancy, breastfeeding, asthma, COPD, depression, diabetes mellitus, myasthenia gravis, hyperthyroidism, pulmonary disease, angle-closure glaucoma

DOSAGE AND ROUTES

Calculator

• **Adult: IV INF** Instill 1–2 drops in the affected eye(s) bid.

Available forms: Ophthalmic sol 0.5%; ophthalmic susp 0.25%

SIDE EFFECTS

CNS: Insomnia, headache, dizziness

CV: Palpitations

EENT: Eye stinging/burning, tearing, photophobia

MISC: Bronchospasm

PHARMACOKINETICS

Onset 30 min, peak 2 hr, duration ≥ 12 hr

NURSING CONSIDERATIONS

Assess:

 **Systemic absorption:** When used in the eye, systemic absorption is common, with the same adverse reactions and interactions • Glaucoma: Monitor intraocular pressure

Evaluate:

- Decreasing intraocular pressure

Teach patient/family:

- That strength is expressed in betaxolol base
- That drug is for ophthalmic use only. Shake the ophthalmic suspension well before use • Not to touch the tip of the dropper to the eye, fingertips, or other surface to prevent contamination • To wash hands before and after use. Tilt the head back slightly and pull the lower eyelid down with the index finger to form a pouch. Squeeze the prescribed number of drops into the pouch. Close eyes to spread drops. To avoid excessive systemic absorption, apply finger pressure on the lacrimal sac for 1–2 min following use • That if more than one topical ophthalmic drug product is being used, the drugs should be administered at least 5 min apart • To avoid contamination or the spread of infection, do not use dropper for more than one person

☼ Canada only Side effects: *italics* = common; **bold** = life-threatening 
Nurse Alert

bethanechol (Rx)

(be-than'e-kole)

Urecholine

Func. class.: Urinary tract stimulant, cholinergic *Chem. class.:* Synthetic choline ester

ACTION:

Stimulates muscarinic ACH receptors directly; mimics effects of parasympathetic nervous system stimulation; stimulates gastric motility, micturition; increases lower esophageal sphincter pressure

USES:

Urinary retention (postoperative, postpartum), neurogenic atony of bladder with retention

Unlabeled uses: Ileus, GERD, anticholinergic syndrome

CONTRAINDICATIONS:

Hypersensitivity, severe bradycardia, asthma, severe hypotension, hyperthyroidism, peptic ulcer, parkinsonism, seizure disorders, CAD, COPD, coronary occlusion, mechanical obstruction, peritonitis, recent urinary/GI surgery, GI/GU obstruction

Precautions: Pregnancy (C), breastfeeding, children <8 yr, hypertension

DOSAGE AND ROUTES

Calculator

- **Adult: PO** 10-50 mg bid-qid
- **Child (unlabeled): PO** 0.6 mg/kg/day in 3-4 divided doses

Ileus (unlabeled)

- **Adult: PO** 10-20 mg tid-qid before meals

Available forms: Tabs 5, 10, 25, 50 mg

Administer:

- To avoid nausea, vomiting, take on an empty stomach
- Only after all other cholinergics have been discontinued

SIDE EFFECTS

CNS: Dizziness, headache, malaise

CV: Hypotension, bradycardia, reflex tachycardia, **cardiac arrest, circulatory collapse**

EENT: Miosis, increased salivation, lacrimation, blurred vision

GI: *Nausea, bloody diarrhea, belching, vomiting, cramps, fecal incontinence*

GU: Urgency

INTEG: Rash, urticaria, flushing, increased sweating

RESP: **Acute asthma, dyspnea, bronchoconstriction**

PHARMACOKINETICS

PO: Onset 30-90 min, duration 6 hr

INTERACTIONS

Increase: severe hypotension—ganglionic blockers

Increase: action or toxicity—cholinergic agonists, anticholinesterase agents

Decrease: action of anticholinergics, procainamide, quinidine

Drug/Lab Test

Increase: AST, lipase/amylase, bilirubin

NURSING CONSIDERATIONS

Assess:

- **Urinary patterns:** retention, urgency
- B/P, pulse: observe after parenteral dose for 1 hr; may need to use atropine subcut 0.6 mg or IV push slowly for bronchoconstriction • I&O ratio: check for urinary retention, urge incontinence
- **Toxicity:** bradycardia, hypotension, bronchospasm, headache, dizziness, seizures, respiratory depression; product should be discontinued if toxicity occurs

Perform/provide:

- Storage at room temp

Evaluate:

- Therapeutic response: absence of urinary retention, abdominal distention

Teach patient/family:

- To take product exactly as prescribed; 1 hr before meals or 2 hr after meals
- To make position changes slowly; orthostatic hypotension may occur
- To avoid driving, hazardous activities until effects are known

TREATMENT OF OVERDOSE:

Administer atropine 0.6-1.2 mg IV or IM (adult)

🍁 Canada only Side effects: *italics* = common; **bold** = life-threatening ⚠️

Nurse Alert

HIGH ALERT

bevacizumab (Rx)

(beh-va-kiz'you-mab)

Avastin

Func. class.: Antineoplastic—miscellaneous

Chem. class.: Monoclonal antibody

Do not confuse: Avastin/Astelin

ACTION:

DNA-derived monoclonal antibody selectively binds to and inhibits activity of human vascular endothelial growth factor (VEGF) to reduce microvascular growth and metastatic disease progression

USES:

Non–small-cell lung cancer (NSCLC), metastatic carcinoma of the colon or rectum in combination with 5-FU IV; renal cell carcinoma, glioblastoma

Unlabeled uses: Adjunctive for pancreatic/neovascular/ovarian cancer; (wet) macular degeneration

CONTRAINDICATIONS:

Hypersensitivity

Precautions: Pregnancy (C), breastfeeding, children, geriatric patients, CHF, blood dyscrasias, CV disease, hypertension, surgery, thromboembolic disease, hamster protein/murine hypersensitivity

Black Box Warning:

GI perforation, wound dehiscence

DOSAGE AND ROUTES

Calculator

Non–small-cell lung cancer

• **Adult:** IV 15 mg/kg over 60-90 min with CARBOplatin and paclitaxel q3wk

Colorectal cancer

• **Adult:** IV INF 5-10 mg/kg q14days given over 90 min; if well tolerated, next inf may be given over 60 min; if 60-min infs well tolerated, subsequent inf may be given over 30 min

Metastatic renal cell carcinoma

- **Adult: IV** 10 mg/kg q2wk with interferon alfa 9 million units SUBCUT 3×/wk up to 52 wk

Glioblastoma single agent

- **Adult: IV** 10 mg/kg q2wk given over 60-90 min; 28-day cycle

Advanced pancreatic cancer (unlabeled)

- **Adult: IV** 10 mg/kg on days 1, 15 with gemcitabine 1000 mg/m² on days 1, 8, 15 in 28-day cycle

Metastatic Breast Cancer (unlabeled)

- **Adult: IV** 15 mg/kg on day 1 with docetaxel 100 mg/m² q3wk, up to 9 cycles (those who have not received previous chemotherapy)

Metastatic renal cell cancer (unlabeled)

- **Adult (single agent): IV** 10 mg/kg over 60-90 min q2wk; may be given in combination with other products

Ovarian cancer (unlabeled)

- **Adult: IV** 15 mg/kg q21days until unacceptable toxicity, disease progression

Neovascular (wet) macular degeneration (unlabeled)

- **Adult: INTRAVITREOUS INJ** 1.25 mg monthly

Available forms: Inj 25 mg/ml

Administer:

Intermittent IV INF route

- Do not give by IV bolus, IV push; do not shake vial
- Withdraw amount of product to be given, dilute in 100 ml 0.9% NaCl, discard any unused portion

Black Box Warning:

Wound dehiscence: do not give for ≥28 days after surgery; make sure wound is healed before giving product

- Give as IV inf over 90 min for 1st dose and 60 min thereafter if well tolerated; subsequent inf may be given over 30 min; do not admix with dextrose • **Rapid infusion rate (unlabeled):** give at rate of 0.5 mg/kg/min for all doses including initial inf (5 mg/kg over 10 min; 10 mg/kg over 20 min; 15 mg/kg over 30 min)

SIDE EFFECTS

CNS: *Asthenia, dizziness, intracranial hemorrhage* (malignant glioma), headache, fatigue, confusion

CV: Deep vein thrombosis, hypo/hypertension, hypertensive crisis, heart failure

GI: Nausea, vomiting, anorexia, diarrhea, constipation, abdominal pain, colitis, stomatitis, GI hemorrhage/perforation

GU: Proteinuria, urinary frequency/urgency, nephrotic syndrome, ovarian failure

HEMA: Leukopenia, neutropenia, thrombocytopenia, microangiopathic hemolytic anemia, thromboembolism, bleeding

META: Bilirubinemia, hypokalemia

MISC: Exfoliative dermatitis, hemorrhage, non-GI fistula formation, alopecia, impaired wound healing, osteonecrosis of the jaw

RESP: Dyspnea, upper respiratory tract infection

PHARMACOKINETICS

Half-life 20 days, steady-state 100 days

INTERACTIONS

- Avoid concurrent use with SUNItinib; microangiopathic hemolytic anemia may occur

NURSING CONSIDERATIONS

Assess:

- B/P; take frequently if hypertension develops
- For symptoms of infection; may be masked by product
- **CNS reaction:** dizziness, confusion
- **CHF:** crackles, jugular venous distention, dyspnea during treatment **⚠️ GU status** (proteinuria): nephrotic syndrome may occur; monitor urinalysis for increasing protein level; product should be held if protein ≥ 2 g/24 hr; resume when < 2 g/24 hr

Black Box Warning:

Wound dehiscence: Hold for ≥ 28 days until incision is healed

Black Box Warning:

GI perforation, serious bleeding, nephrotic syndrome, hypertensive crisis; product should be discontinued permanently, surgery should be postponed

- Reversible posterior leukoencephalopathy syndrome (RPLS): Discontinue if this disorder develops

Evaluate:

- Therapeutic response: decrease in size of tumors

Teach patient/family:

- To avoid hazardous tasks because confusion, dizziness may occur
 - To report signs of infection: sore throat, fever, diarrhea, vomiting
 - Not to become pregnant while taking this product or for several months after discontinuing treatment
 - To report bleeding, changes in urinary patterns, edema, abdominal pain
 - To avoid immunizations
-

🍁 Canada only Side effects: *italics* = common; **bold** = life-threatening ⚠️
Nurse Alert

HIGH ALERT

bicalutamide (Rx)

(bye-kal-u'ta-mide)

Casodex

Func. class.: Antineoplastic hormone

Chem. class.: Nonsteroidal antiandrogen

Do not confuse: Casodex/Kapidex

ACTION:

Binds to cytosolic androgen in target tissue, which competitively inhibits the action to androgens

USES:

Stage D-2 metastatic prostate cancer in combination with luteinizing-hormone releasing hormone (LHRH) analog

Unlabeled uses: Recurrent priapism

CONTRAINDICATIONS:

Pregnancy (X), women, hypersensitivity

Precautions: Breastfeeding, geriatric patients, renal/hepatic disease, diabetes mellitus

DOSAGE AND ROUTES

Calculator

• **Adult: PO** 50 mg/day with LHRH analog

Recurrent priapism (unlabeled)

• **Adult: PO** 50 mg every other day

Available forms: Tabs 50 mg

Administer:

• At same time each day, either AM or PM, with/without food • With LHRH treatment; start both products at same time

SIDE EFFECTS

CNS: Dizziness, paresthesia, insomnia, anxiety, neuropathy, headache

CV: CHF, edema, hot flashes, hypertension, chest pain, MI

GI: *Diarrhea, constipation, nausea, vomiting, increased hepatic enzymes, anorexia, dry mouth, melena, abdominal pain, hepatitis, hepatotoxicity*

GU: *Nocturia, hematuria, UTI, impotence, gynecomastia; urinary incontinence, frequency, dysuria, retention, urgency; breast tenderness, decreased libido*

INTEG: *Rash, sweating, dry skin, pruritus, alopecia*

MISC: *Infection, anemia, dyspnea, bone pain, headache, asthenia, back pain, flu-like symptoms*

PHARMACOKINETICS

Well absorbed; peak 3 1/2 hr; metabolized by liver; excreted in urine, feces; half-life 5.8 days; 96% protein binding

INTERACTIONS

Increase: anticoagulation—anticoagulants

Increase: bicalutamide effects—CYP3A4 inhibitors (amiodarone, antiretrovirals, protease inhibitors, clarithromycin, dalfopristin, quinupristin, delavirdine, efavirenz, erythromycin, FLUoxetine, fluvoxamine, imatinib, mifepristone, RU-486, nefazodone, some azole antifungals)

Decrease: bicalutamide effects—CYP3A4 inducers (barbiturates, bosentan, carbamazepine, dexamethasone, nevirapine, oxcarbazepine, phenytoins, rifabutin, rifampin, rifapentine)

Drug/Herb

- May require dosage change when used with St. John's wort

Drug/Food

- Do not use with grapefruit juice

Drug/Lab Test

Increase: AST, ALT, bilirubin, BUN, creatinine

Decrease: Hgb, WBC

NURSING CONSIDERATIONS

Assess:

- For diarrhea, constipation, nausea, vomiting
- For hot flashes, gynecomastia; assure patient that these are common side effects
- Prostate-specific antigen, LFTs

Evaluate:

- Therapeutic response: decreased tumor size, decreased spread of malignancy

Teach patient/family:

- To recognize, report signs of anemia, hepatotoxicity, renal toxicity
 - That hair may be lost but this is reversible after therapy is completed
 - Not to use other products unless approved by prescriber
 - To report severe diarrhea
 - To use contraception while taking this product
-

🍁 Canada only Side effects: *italics* = common; **bold** = life-threatening ⚠️
Nurse Alert

bimatoprost (ophthalmic/topical)

(by-mat'oh-prost)

Latisse, Lumigan

Func. class.: Antiglaucoma agent

Chem. class.: Prostaglandin agonist

Do not confuse: **latanoprost**/travoprost

ACTION:

Latisse

Promotion of eyelash growth, thickness, and darkness: unknown; possible increase in the percent of hairs and an increase in the duration of the hair growth (anagen) phase

Lumigan

Reduction of intraocular pressure (IOP) in patients with ocular hypertension or open-angle glaucoma; selectively mimics endogenous prostamides to produce ocular hypotension

USES:

Increased intraocular pressure in those with open-angle glaucoma/ocular hypertension (Lumigan); eyelash hypotrichosis (Latisse)

CONTRAINDICATIONS:

Hypersensitivity to this product, benzalkonium chloride

Precautions: Children, intraocular inflammation, closed-angle glaucoma, macular edema, contact lenses

DOSAGE AND ROUTES

Calculator

Increased intraocular pressure/ocular hypertension (Lumigan)

- **Adult: OPHTH Instill** 1 drop in each affected eye (conjunctival sac) every night

Eyelash Hypotrichosis (Latisse)

- **Adult: Apply** 1 drop to skin of upper eyelid margin at base of eyelashes every night using a new supplied disposable sterile applicator

Available forms: Ophthalmic solution 0.01%, 0.03%; topical solution 0.03%

SIDE EFFECTS

Conjunctival hyperemia, growth of eyelashes (hypertrichosis), ocular pigment changes ocular pruritus, xerophthalmia, visual disturbance, ocular irritation/burning, foreign body sensation, ocular pain, blepharitis, cataracts, superficial punctate keratitis

INTEG: Hyperpigmentation of the periocular skin, eyelash darkening, lacrimation, photophobia, conjunctivitis, asthenopia, iritis, macular edema

MISC: Influenza, upper respiratory tract infections, asthenia, headache, hirsutism

PHARMACOKINETICS

Ophthalmic: Onset 4 hr, peak 8-12 hr; half-life 45 min

INTERACTIONS

Decrease: Intraocular pressure lowering effect—latanoprost, travoprost (no longer available in the US)

Drug/Lab Test

Increase: LFTs

NURSING CONSIDERATIONS

Assess:

- **Intraocular pressure:** in those with ongoing increased IOP or those using latanoprost, travoprost (no longer available in the US)

Evaluate:

- Decreasing IOP or increased growth of eyelashes

Teach patient/family:

Ophthalmic route (Lumigan)

- To wash hands before and after use; remove contact lenses before use and reinsert 15 min after use; Lumigan contains benzalkonium chloride, which can be absorbed by soft contact lenses
- To tilt the head back slightly and pull the lower eyelid down with the index finger to form a pouch. Squeeze the prescribed number of drops into the pouch and gently close the eyes for 1–2 min; do not blink; to avoid contamination, do not touch the tip of the dropper to the eye, fingertips, or other surface
- That the solution may be used concomitantly with

other topical ophthalmic drug products to lower IOP. If more than one topical ophthalmic drug is being used, the drugs should be administered at least 5 min apart

Topical route (Latisse)

- To ensure the patient's face is clean and makeup is removed before using Latisse; the disposable sterile applicator is the only applicator that should be used. Each applicator should be used for 1 eye only; dispose of the applicator after each use; after applying 1 drop of solution to the applicator, apply evenly along the skin of the upper eyelid margin at the base of the eyelashes; blot excess solution runoff outside the upper eyelid margin with a tissue or other absorbent cloth; do not apply to the lower eyelash line

🍁 Canada only Side effects: *italics* = common; **bold** = life-threatening ⚠️
Nurse Alert

bisacodyl (Rx, OTC)

(bis-a-koe'dill)

Alophen, Correctol, Dacodyl, Dulcolax, Ex-Lax Ultra Tab, Femilax, Feminine, Good Sense Women's, Leader Laxative, Top Care Laxative, Veracolate, Walgreens Gentle, Walgreens Women's *Func. class.:* Laxative, stimulant

Chem. class.: Diphenylmethane

ACTION:

Acts directly on intestine by increasing motor activity; thought to irritate colonic intramural plexus

USES:

Short-term treatment of constipation; bowel or rectal preparation for surgery, examination

CONTRAINDICATIONS:

Hypersensitivity, rectal fissures, abdominal pain, nausea, vomiting, appendicitis, acute surgical abdomen, ulcerated hemorrhoids, acute hepatitis, fecal impaction, intestinal/biliary tract obstruction

Precautions: Pregnancy (C), breastfeeding

DOSAGE AND ROUTES

Calculator

• **Adult and child ≥12 yr:** **PO** 10-15 mg in PM or AM; may use up to 30 mg for bowel or rectal preparation; **RECT** 10 mg as a single dose; 30-ml enema

• **Child 3-11 yr:** **PO** 5-10 mg as a single dose; **RECT** 5-10 mg as a single dose

Available forms: Tabs del rel 5, 10 mg; enteric-coated tabs 5 mg; supp 5, 10 mg; enema 10 mg/30 ml

Administer:

PO route

- Swallow tabs whole with full glass of water; do not break, crush, chew tabs
- Alone only with water for better absorption; do not take within 1 hr of other products or within 1 hr of antacids, milk, H₂ antagonists; do not take enteric product with proton-pump inhibitors
- In AM or PM

Rectal route

- Insert high in rectum

SIDE EFFECTS

CNS: Muscle weakness

GI: *Nausea, vomiting, anorexia, cramps*, diarrhea, rectal burning (suppositories)

META: Protein-losing enteropathy, alkalosis, hypokalemia, **tetany**; electrolyte, fluid imbalances

PHARMACOKINETICS

Small amounts metabolized by liver; excreted in urine, bile, feces, breast milk

PO: Onset 6-10 hr

RECT: Onset 15-60 min

INTERACTIONS

Increase: gastric irritation—antacids, milk, H₂-blockers, gastric acid pump inhibitors

Drug/Food

- Increase irritation—dairy products separate by 2 hr

Drug/Lab

Increase: Sodium phosphate

Decrease: Calcium, magnesium

NURSING CONSIDERATIONS

Assess:

- Blood, urine electrolytes if product is used often by patient
- I&O ratio to identify fluid loss
- Cause of constipation; identify whether fluids, bulk, exercise missing from lifestyle; determine use of constipating products
- **GI symptoms:** cramping, rectal bleeding, nausea, vomiting; if these symptoms occur, product should be discontinued
- Multiple products/routes may be used for bowel prep

Evaluate:

- Therapeutic response: decrease in constipation

Teach patient/family:

- Not to use laxatives for long-term therapy because bowel tone will be lost, 1 wk use is usually sufficient
- That normal bowel movements do not always occur daily

- Not to use in presence of abdominal pain, nausea, vomiting
 - To notify prescriber if constipation is unrelieved or if symptoms of electrolyte imbalance occur: muscle cramps, pain, weakness, dizziness • To take with a full glass of water, do not take with dairy products
 - Identify bulk, water, constipating products, exercise in patient's life
-

🍁 Canada only Side effects: *italics* = common; **bold** = life-threatening ⚠️
Nurse Alert

bismuth subsalicylate (OTC)

(bis'muth sub-sal-iss'uh-late)

Bismatrol, Equaline Stomach Relief, Good Sense Stomach Relief, GNP Pink Bismuth, Leader Pink Bismuth, Peptic Relief, Pepto-Bismol, Pink Bismuth, Top Care Stomach Relief, Walgreens Soothe *Func. class.:* Antidiarrheal, weak antacid

Chem. class.: Salicylate

Do not confuse: **Kaopectate**/Kayoxalate

ACTION:

Inhibits the prostaglandin synthesis responsible for GI hypermotility, intestinal inflammation; stimulates absorption of fluid and electrolytes; binds toxins produced by *Escherichia coli*

USES:

Diarrhea (cause undetermined), prevention of diarrhea when traveling; may be included to treat *Helicobacter pylori*, heartburn, indigestion, nausea

CONTRAINDICATIONS:

Children <3 yr, children with chickenpox, history of GI bleeding, renal disease, flulike symptoms, hypersensitivity to product or salicylates

Precautions: Pregnancy (C), breastfeeding, geriatric patients, anticoagulant therapy, immobility, gout, diabetes mellitus, bleeding disorders, previous hypersensitivity to NSAIDs, *Clostridium-difficile*–associated diarrhea when used with antiinfectives for *H. pylori*

DOSAGE AND ROUTES

Calculator

Antidiarrheal/Gastric Distress

- **Adult: PO** 2 tabs or 30 ml (15 ml extra/max strength) q30min or 2 tabs q60min, max 4.2 g/24 hr

Antiulcer (unlabeled)

- **Adult/adolescent: PO** 525 mg qid, max 4.2 g/24 hr; given with metroNIDAZOLE or tetracycline and acid-suppressive therapy × 14 days

Available forms: Tabs 262 mg; chewable tabs 262 mg; susp 87 mg/5 ml, 130 mg/15 ml, 262 mg/15 ml, 525 mg/15 ml

Administer:**PO route**

- Increased fluids to rehydrate patient
- **Susp:** shake liquid before using
- Tabs can be chewed, dissolved in mouth; caplets to be swallowed whole with water

SIDE EFFECTS

CNS: Confusion, twitching, **neurotoxicity (high doses)**

EENT: Hearing loss, tinnitus, metallic taste, blue gums, black tongue

GI: Increased fecal impaction (high doses), dark stools, constipation, diarrhea, nausea

HEMA: Increased bleeding time

PHARMACOKINETICS

PO: Onset 1 hr, peak 2 hr, duration 4 hr

INTERACTIONS

Increase: toxicity—salicylates, methotrexate

Increase: effects of oral anticoagulants, oral antidiabetics

Decrease: absorption of tetracycline, quinolones, separate for ≥ 2 hr

Drug/Lab Test

Interference: radiographic studies of GI system

NURSING CONSIDERATIONS**Assess:**

- **Diarrhea:** bowel pattern before product therapy, after treatment
- Electrolytes potassium, sodium, chloride if diarrhea is severe or continues long term; assess skin turgor, other signs of dehydration

Evaluate:

- Therapeutic response: decreased diarrhea, absence of diarrhea when traveling; resolution of ulcers

Teach patient/family:

- To chew, dissolve medication in mouth; not to swallow whole; to shake liquid before using
- To avoid other salicylates unless directed by prescriber; not to give to children, possibility of Reye's syndrome
- That stools may turn black;

that tongue may darken; that impaction may occur in debilitated patients • To stop use if symptoms do not improve within 2 days or become worse or if diarrhea is accompanied by high fever

🍁 Canada only Side effects: *italics* = common; **bold** = life-threatening ⚠️
Nurse Alert

bisoprolol (Rx)

(bis-oh'pro-lole)

Zebeta

Func. class.: Antihypertensive

Chem. class.: β_1 -Blocker

Do not confuse: Zebeta/DiaBeta/Zetia

ACTION:

Preferentially and competitively blocks stimulation of β_1 -adrenergic receptors within cardiac muscle (decreases rate of SA node discharge, increases recovery time), slows conduction of AV node, decreases heart rate, which decreases O_2 consumption in myocardium; decreases renin-angiotensin-aldosterone system; inhibits β_2 -receptors in bronchial and vascular smooth muscle at high doses

USES:

Mild to moderate hypertension

Unlabeled uses: Stable angina, stable CHF

CONTRAINDICATIONS:

Hypersensitivity to β -blockers, cardiogenic shock, heart block (2nd, 3rd degree), sinus bradycardia, CHF, cardiac failure

Precautions: Pregnancy (C), breastfeeding, children, major surgery, diabetes mellitus, thyroid/renal/hepatic disease, COPD, asthma, well-compensated heart failure, aortic or mitral valve disease, peripheral vascular disease, myasthenia gravis

Black Box Warning:

Abrupt discontinuation

DOSAGE AND ROUTES

Calculator

Hypertension

- **Adult: PO** 2.5-5 mg/day; may increase to 20 mg/day if necessary; max 20 mg/day

Renal/hepatic dose

- **Adult: PO** CCr <40 ml/min 2.5 mg, titrate upward

Angina (unlabeled)

- **Adult: PO** 5-20 mg/day

Heart failure (unlabeled)

- **Adult: PO** 1.25 mg/day $\times$ 48 hr, then 2.5 mg/day for 1st mo, then 5 mg/day; max 10 mg/day

Available forms: Tabs 5, 10 mg

Administer:

- Product before meals, bedtime; tab may be crushed, swallowed whole; may give without regard to meals
- Reduced dosage with renal/hepatic dysfunction

SIDE EFFECTS

CNS: Vertigo, headache, insomnia, fatigue, dizziness, mental changes, memory loss, hallucinations, depression, lethargy, drowsiness, strange dreams, catatonia, peripheral neuropathy

CV: Ventricular dysrhythmias, profound hypotension, bradycardia, CHF, cold extremities, postural hypotension, 2nd-or 3rd-degree heart block

EENT: Sore throat; dry, burning eyes

ENDO: Increased hypoglycemic response to insulin

GI: Nausea, diarrhea, vomiting, mesenteric arterial thrombosis, ischemic colitis, flatulence, gastritis, gastric pain

GU: Impotence, decreased libido

HEMA: Agranulocytosis, thrombocytopenia, purpura, eosinophilia

INTEG: Rash, flushing, alopecia, pruritus, sweating

MISC: Facial swelling, weight gain, decreased exercise tolerance

MS: Joint pain, arthralgia

RESP: Bronchospasm, dyspnea, wheezing, cough, nasal stuffiness

PHARMACOKINETICS

Peak 2-4 hr, half-life 9-12 hr, 50% excreted unchanged in urine, protein binding 30%-36%, metabolized in liver to inactive metabolites

INTERACTIONS

Increase: hypotension—reserpine, guanethidine

Increase: myocardial depression—calcium channel blockers

Increase: antihypertensive effect—ACE inhibitors, α -blockers, calcium channel blockers, diuretics

Increase: bradycardia—digoxin, amiodarone

Increase: peripheral ischemia—ergots

Increase: antidiabetic effect—antidiabetics

Decrease: antihypertensive effect—NSAIDs, salicylates

Drug/Herb

Increase: β -blocking effect—hawthorn

Decrease: β -blocking effect—ephedra

Drug/Lab Test

Increase: AST, ALT, ANA titer, blood glucose, BUN, uric acid, potassium, lipoprotein

Interference: glucose/insulin tolerance tests

NURSING CONSIDERATIONS

Assess:

- **Hypertension:** B/P during beginning treatment, periodically thereafter; pulse q4hr: note rate, rhythm, quality; apical/radial pulse before administration; notify prescriber of any significant changes (pulse <50 bpm)
- Baselines of renal, hepatic studies before therapy begins
- **CHF:** I&O, weight daily; increased weight, jugular venous distention, dyspnea, crackles, edema in feet, legs daily
- Skin turgor, dryness of mucous membranes for hydration status, especially for geriatric patients

Perform/provide:

- Storage protected from light, moisture; place in cool environment

Evaluate:

- Therapeutic response: decreased B/P after 1-2 wk

Teach patient/family:

Black Box Warning:

Not to discontinue product abruptly; may cause precipitate angina, rebound hypertension; evaluate noncompliance

- Not to use OTC products that contain α -adrenergic stimulants (e.g., nasal decongestants, OTC cold preparations) unless directed by prescriber
- To report bradycardia, dizziness, confusion, depression, fever, cold extremities
- To take pulse at home; advise when to notify prescriber
- To avoid alcohol, smoking, sodium intake
- To comply with weight control, dietary adjustments, modified exercise program

- To carry emergency ID to identify product, allergies
- To avoid hazardous activities if dizziness is present
- ⚠️ To report symptoms of CHF: difficulty breathing, especially on exertion or when lying down, night cough, swelling of extremities
- That, if diabetic, product may mask signs of hypoglycemia or alter blood glucose levels

TREATMENT OF OVERDOSE:

Lavage, IV atropine for bradycardia; IV theophylline for bronchospasm; digoxin, O₂, diuretic for cardiac failure; hemodialysis, IV glucose for hypoglycemia; IV diazepam or phenytoin for seizures

🌿 Canada only Side effects: *italics* = common; **bold** = life-threatening ⚠️
Nurse Alert

HIGH ALERT

bivalirudin (Rx)

(bye-val-i-rue'din)

Angiomax

Func. class.: Anticoagulant

Chem. class.: Thrombin inhibitor

ACTION:

Direct inhibitor of thrombin that is highly specific; able to inhibit free and clot-bound thrombin

USES:

Unstable angina in patients undergoing percutaneous transluminal coronary angioplasty (PTCA), used with aspirin; heparin-induced thrombocytopenia, with/without thrombosis syndrome

Unlabeled uses: Acute MI, DVT prophylaxis

CONTRAINDICATIONS:

Hypersensitivity, active bleeding, cerebral aneurysm, intracranial hemorrhage, recent surgery, CVA

Precautions: Pregnancy (B), breastfeeding, children, geriatric patients, renal function impairment, hepatic disease, asthma, blood dyscrasias, thrombocytopenia, GI ulcers, hypertension

DOSAGE AND ROUTES

Calculator

• **Adult: IV BOL** 0.75 mg/kg then **IV INF** 1.75 mg/kg/hr for 4 hr; another **IV INF** may be used at 0.2 mg/kg/hr for ≤ 20 hr; this product is intended to be used with aspirin (325 mg/day) adjusted to body weight

Renal dose

• **Adult: IV** CCr ≥ 30 ml/min no adjustment; CrL 10-29 ml/min consider reducing to 1 mL/kg/hr

Acute MI (unlabeled)

• **Adult: IV BOL** 0.25 mg/kg then **CONT IV INF** 0.5 mg/kg/hr $\times$ 12 hr

DVT prophylaxis (unlabeled)

- **Adult: SUBCUT** 1 mg/kg q8hr for those undergoing orthopedic surgery

Available forms: Inj, lyophilized 250 mg/vial

Administer:

- Before PTCA; give with aspirin (325 mg)

IV, direct route

- Dilute by adding 5 ml of sterile water for inj/250 mg bivalirudin, swirl until dissolved, further dilute in 50 ml of D₅W or 0.9% NaCl (5 mg/ml), give by bolus inj 0.75 mg/kg, then intermittent inf

Continuous IV INF route

- To each 250-mg vial add 5 ml of sterile water for inj, swirl until dissolved, further dilute in 500 ml D₅W or 0.9% NaCl (0.5 mg/ml); give inf after bolus dose at a rate of 1.75 mg/kg/hr; may give an additional inf at 0.2 mg/kg/hr
- Do not mix other IV medications with bivalirudin or provide via the same IV line as bivalirudin

Y-site compatibilities: Abciximab, acyclovir, alfentanil, allopurinol, amifostine, amikacin, aminocaproic acid, aminophylline, amphotericin B liposome, ampicillin, ampicillin-sulbactam, anidulafungin, argatroban, arsenic trioxide, atenolol, atracurium, atropine, azithromycin, aztreonam, bleomycin, bumetanide, buprenorphine, busulfan, butorphanol, calcium chloride/gluconate, capreomycin, CARBOplatin, carmustine, ceFAZolin, cefepime, cefoperazone, cefotaxime, cefoTEtan, cefOXitin, cefTAZidime, ceftizoxime, cefTRIAxone, cefuroxime, chloramphenicol, cimetidine, ciprofloxacin, cisatracurium, CISplatin, clindamycin, cyclophosphamide, cycloSPORINE, cytarabine, dacarbazine, DACTINomycin, DAPTOmycin, DAUNOrubicin, DAUNOrubicin liposome, dexamethasone, dexmedetomidine, dexrazoxane, digoxin, diltiazem, diphenhydrAMINE, DOCEtaxel, dolasetron, DOPamine, DOXOrubicin, DOXOrubicin liposomal, doxycycline, droperidol, enalaprilat, ePHEDrine, EPINEPHrine, epirubicin, epoprostenol, eptifibatide, ertapenem, erythromycin, esmolol, etoposide, etoposide phosphate, famotidine, fenoldopam, fentaNYL, fluconazole, fludarabine, fluorouracil, foscarnet, fosphenytoin, furosemide, gallium, ganciclovir, gatifloxacin, gemcitabine, gentamicin, glycopyrrolate, granisetron, haloperidol, heparin, hydrALAZINE, hydrocortisone, HYDROmorphine, hydrOXYzine, IDArubicin, ifosfamide, imipenem-cilastatin,

inamrinone, insulin (regular), irinotecan, isoproterenol, ketorolac, labetalol, leucovorin, levofloxacin, lidocaine, linezolid, LORazepam, magnesium, mannitol, mechlorethamine, melphalan, meperidine, meropenem, mesna, methohexital, methotrexate, methylDopate, methylPREDNISolone, metoclopramide, metoprolol, metroNIDAZOLE, midazolam, milrinone, mitoMYcin, mitoXANtrone, mivacurium, morphine, moxifloxacin, mycophenolate mofetil, nafcillin, nalbuphine, naloxone, nesiritide, niCARdipine, nitroglycerin, nitroprusside, norepinephrine, octreotide, ofloxacin, ondansetron, oxaliplatin, oxytocin, PACLitaxel, palonosetron, pamidronate, pancuronium, PEMEtrexed, PENTobarbital, PHENobarbital, phenylephrine, piperacillin, piperacillin-tazobactam, polymyxin B, potassium acetate/chloride/phosphates, procainamide, promethazine, propranolol, ranitidine, remifentanyl, rocuronium, sodium acetate/bicarbonate/phosphates, streptozocin, succinylcholine, SUFentanyl, sulfamethoxazole-trimethoprim, tacrolimus, teniposide, theophylline, thiopental, thiotepa, ticarcillin, ticarcillin-clavulanate, tigecycline, tirofiban, tobramycin, topotecan, vasopressin, vecuronium, verapamil, vinBLASTine, vinCRISTine, vinorelbine, voriconazole, warfarin, zidovudine, zoledronic acid

SUBCUT injection (unlabeled)

- May be used for DVT prophylaxis

SIDE EFFECTS

CNS: *Headache, insomnia, anxiety, nervousness*

CV: *Hypo/hypertension, bradycardia*

GI: *Nausea, vomiting, abdominal pain, dyspepsia*

HEMA: *Hemorrhage, thrombocytopenia*

MISC: Pain at inj site, pelvic pain, urinary retention, fever, *anaphylaxis*

MS: *Back pain*

PHARMACOKINETICS

Excreted in urine, half-life 25 min, duration 1 hr, no protein binding

INTERACTIONS

Increase: bleeding risk—anticoagulants, aspirin, treprostinil, thrombolytics

Drug/Herb

Increase: bleeding risk—agrimony, alfalfa, angelica, anise, bilberry, black haw,

bogbean, buchu, cat's claw, chamomile, chondroitin, devil's claw, dong quai, evening primrose, fenugreek, feverfew, fish oil, garlic, ginger, ginkgo, ginseng, horse chestnut, Irish moss, kava, kelp, kelpware, khella, licorice, lovage, lungwort, meadowsweet, motherwort, mugwort, nettle, papaya, parsley (large amts), pau d'arco, pineapple, poplar, prickly ash, red clover, safflower, saw palmetto, senega, skullcap, tonka bean, turmeric, wintergreen, yarrow

Decrease: anticoagulant effect—coenzyme Q10, flax, glucomannan, goldenseal, guar gum

NURSING CONSIDERATIONS

Assess:

- Baseline and periodic ACT, APTT, PT, INR, TT, platelets, Hgb, Hct
-  **Bleeding:** check arterial and venous sites, IM inj sites, catheters; all punctures should be minimized; fall in B/P or Hct may indicate hemorrhage, hematoma, hemorrhage at puncture site are more common in the elderly • Fever, skin rash, urticaria
- CV status: B/P, watch for hypo/hypertension, bradycardia
- Neurologic status: any focal or generalized deficits should be reported immediately
- PCI use: possible thrombosis, stenosis, unplanned stent, prolonged ischemia, decreased reflow

Perform/provide:

- Storage of reconstituted vials in refrigerator for up to 24 hr; store diluted conc at room temp for 24 hr

Evaluate:

- Therapeutic response: anticoagulation with PTCA; resolution of heparin-induced thrombocytopenia, thrombosis syndrome

Teach patient/family:

- About the reason for the product and expected results
- To report black, tarry stools; blood in urine; difficulty breathing
- Not to use any OTC, herbal product unless approved by prescriber
- Not to use hard-bristle toothbrush, regular razor to avoid any injury, hemorrhage may result

Nurse Alert

HIGH ALERT

bleomycin (Rx)

(blee-oh-mye'sin)

Blenoxane

Func. class.: Antineoplastic, antibiotic

Chem. class.: Glycopeptide

ACTION:

Inhibits synthesis of DNA, RNA, protein; derived from *Streptomyces verticillus*; phase specific to the G₂ and M phases; a nonvesicant, sclerosing agent

USES:

Cancer of head, neck, penis, cervix, vulva of squamous cell origin; Hodgkin's/non-Hodgkin's disease; testicular carcinoma; as a sclerosing agent for malignant pleural effusion

Unlabeled uses: Cutaneous T-cell lymphoma (CTCL), hemangioma, Kaposi's sarcoma, malignant ascites, verruca plantaris/vulgaris, osteogenic sarcoma

CONTRAINDICATIONS:

Pregnancy (D), breastfeeding, hypersensitivity, prior idiosyncratic reaction

Precautions: Patients >70 yr old, renal/hepatic disease, respiratory disease

Black Box Warning:

Idiosyncratic reaction, pulmonary fibrosis

DOSAGE AND ROUTES

Calculator

Test dose

- **Adult and child (unlabeled): IM/IV/SUBCUT** ≤2 units for first 2 doses followed by 24 hr of observation
- **Adult and child: SUBCUT/IV/IM** 0.25-0.5 units/kg 1-2 ×/wk or 10-20 units/m², then 1 unit/day or 5 units/wk; may also be given by **CONT INF**; do not exceed total dose of 400 units during lifetime

Renal dose

- **Adult/child:** CCr 40-50 ml/min reduce dose by 30%; CCr 30-39 ml/min reduce dose by 40%; CCr 20-29 ml/min reduce dose by 45%; CCr 10-19 ml/min

reduce dose by 55%; CCr 5-10 ml/min reduce dose by 60%

Cutaneous T-cell lymphoma (CTCL) (unlabeled)

- **Adult: IV** 15 units twice weekly with vinBLASine and predniSONE

Kaposi's sarcoma (unlabeled)

- **Adult: IV** 15 units q2wk with DOXOrubicin and vinCRISine

Available forms: Powder for inj, 15, 30 units/vial

Administer:

- Antiemetic 30-60 min before giving product to prevent vomiting; continue antiemetics 6-10 hr after treatment
- Topical or systemic analgesics for pain of stomatitis as ordered; antihistamines and antipyretics for fever, chills
- May be given IM, subcut, IV, intrapleurally, intralesionally, intraarterially

IM/SUBCUT route

- After reconstituting 15 units/1-5 ml or 30 mg/2-10 ml of 0.9% NaCl or bacteriostatic water for inj, rotate inj sites; do not use products that contain benzyl alcohol when giving to neonates or that contain dextrose because of loss of potency

Intrapleural route

- 60 units/100 ml of 0.9% NaCl administered by MD through thoracostomy tube

IV route

- Use cytotoxic handling procedures
- After reconstituting 15- or 30-unit vial with 5 or 10 ml of NS, respectively, inj slowly over 10 min or after further dilution with 50-100 ml 0.9% NaCl; give 15 units or less over 10 min through Y-tube or 3-way stopcock
- For patients with lymphoma, give 2 test doses of 2-5 units before initial dose; monitor for anaphylaxis

Y-site compatibilities: Acyclovir, alfentanil, allopurinol, amifostine, amikacin, aminocaproic acid, aminophylline, amiodarone, ampicillin, ampicillin-sulbactam, anidulafungin, atenolol, atracurium, azithromycin, aztreonam, bivalirudin, bumetanide, buprenorphine, busulfan, butorphanol, calcium chloride/gluconate, CARBOplatin, carmustine, caspofungin, ceFAZolin, cefepime, cefotaxime, cefoTetan, cefOXitin, cefTAZidime, ceftizoxime, cefTRIAXone, cefuroxime, chloramphenicol, chlorproMAZINE, cimetidine, ciprofloxacin, cisatracurium, CISplatin, clindamycin, codeine, cyclophosphamide, cycloSPORINE, cytarabine, dacarbazine, DACTINomycin,

DAPTOmycin, DAUNOrubicin, dexamethasone, dexmedetomidine, dexrazoxane, digoxin, diltiazem, diphenhydrAMINE, DOBUTamine, DOCEtaxel, DOPamine, doxacurium, DOXOrubicin, DOXOrubicin liposomal, doxycycline, droperidol, enalaprilat, ePHEDrine, EPINEPHrine, epirubicin, ertapenem, erythromycin, esmolol, etoposide, famotidine, fenoldopam, fentaNYL, filgrastim, fluconazole, fludarabine, fluorouracil, foscarnet, fosphenytoin, furosemide, ganciclovir, gatifloxacin, gemcitabine, gentamicin, glycopyrrolate, granisetron, haloperidol, heparin, hydrALAZINE, hydrocortisone sodium succinate, HYDROmorphine, hydrOXYzine, IDArubicin, ifosfamide, imipenem-cilastatin, inamrinone, insulin (regular), irinotecan, isoproterenol, ketorolac, labetalol, leucovorin, levofloxacin, levorphanol, lidocaine, linezolid, LORazepam, magnesium sulfate, mannitol, mechlorethamine, melphalan, meperidine, meropenem, mesna, metaraminol, methohexital, methotrexate, methyl dopate, methylPREDNISolone, metoclopramide, metoprolol, metroNIDAZOLE, midazolam, milrinone, minocycline, mitoMYcin, mitoXANtrone, mivacurium, morphine, nafcillin, nalbuphine, naloxone, nesiritide, niCARdipine, nitroglycerin, nitroprusside, norepinephrine, octreotide, ondansetron, oxaliplatin, palonosetron, pamidronate, pancuronium, pantoprazole, PEMEtrexed, pentamidine, pentazocine, PENTobarbital, PHENobarbital, phenylephrine, piperacillin, piperacillin-tazobactam, polymyxin B, potassium chloride, potassium phosphates, procainamide, prochlorperazine, promethazine, propranolol, quiNIDine, ranitidine, remifentanyl, riTUXimab, rocuronium, sargramostim, sodium acetate, sodium bicarbonate, sodium phosphates, succinylcholine, SUFentanyl, sulfamethoxazole-trimethoprim, tacrolimus, teniposide, theophylline, thiopental, thiotepa, ticarcillin, ticarcillin-clavulanate, tirofiban, tobramycin, tolazoline, trastuzumab, trimethobenzamide, vancomycin, vasopressin, vecuronium, verapamil, vinBLASStine, vinCRISStine, vinorelbine, voriconazole, zidovudine

SIDE EFFECTS

CNS: Pain at tumor site, headache, confusion

CV: MI, stroke

GI: Nausea, vomiting, anorexia, stomatitis, weight loss, ulceration of mouth, lips

GU: Hemolytic-uremic syndrome

IDIOSYNCRATIC REACTION: Hypotension, confusion, fever, chills,

wheezing

INTEG: *Rash, hyperkeratosis, nail changes, alopecia, pruritus, acne, striae, peeling, hyperpigmentation, phlebitis*

RESP: *Fibrosis, pneumonitis, wheezing, pulmonary toxicity*

SYST: *Anaphylaxis, radiation recall, Raynaud's phenomenon*

PHARMACOKINETICS

Half-life 2 hr; when CCr is >35 ml/min, half-life is increased with lower clearance; metabolized in liver; 50% excreted in urine (unchanged)

INTERACTIONS

- Avoid live virus vaccines concurrently

Increase: toxicity—other antineoplastics, radiation therapy, general anesthesia, filgrastim, sargramostim

Decrease: serum phenytoin levels—phenytoin, fosphenytoin

Drug/Lab Test

Increase: uric acid

NURSING CONSIDERATIONS

Assess:

- IM test dose in patients with lymphoma of 1-2 units before 1st 2 doses

Black Box Warning:

Pulmonary toxicity/fibrosis: pulmonary function tests; chest x-ray before, during therapy, should be obtained q2wk during treatment; pulmonary diffusion capacity for carbon monoxide (DLCO) monthly, if <40% of pretreatment value, stop treatment; treat pulmonary infection before treatment; dyspnea, crackles, unproductive cough, chest pain, tachypnea, fatigue, increased pulse, pallor, lethargy, more common in the elderly, radiation therapy, pulmonary disease

- Temp; fever may indicate beginning infection
- Renal status: serum creatinine/BUN; CBC
- Effects of alopecia, skin color alterations on body image; discuss feelings about body changes
- Buccal cavity q8hr for dryness, sores, ulceration, white patches, oral pain, bleeding, dysphagia
- Local irritation, pain, burning, discoloration at inj site

⚠ Anaphylaxis: rash, pruritus, urticaria, purpuric skin lesions, itching, flushing, wheezing, hypotension; have emergency equipment available

Black Box Warning:

Idiosyncratic reaction: hypotension, mental confusion, fever, chills, wheezing

Perform/provide:

- Storage for 2 wk after reconstituting if refrigerated or for 24 hr at room temp; discard unused portions
- Rinsing of mouth tid-qid with water, club soda; brushing of teeth with baking soda bid-tid with soft brush or cotton-tipped applicators for stomatitis; use unwaxed dental floss

Evaluate:

- Therapeutic response: decrease in size of tumor

Teach patient/family:

- To report any changes in breathing, coughing, fever
- That hair may be lost during treatment and that wig or hairpiece may make patient feel better; that new hair may be different in color, texture
- To avoid foods with citric acid, hot or rough texture
- To report any bleeding, white spots, ulcerations in mouth; to examine mouth daily and report symptoms
- To use contraception during treatment (pregnancy D), avoid breastfeeding
- Not to receive vaccines during treatment

🍁 Canada only Side effects: *italics* = common; **bold** = life-threatening ⚠️
Nurse Alert

boceprevir

(boe-se'pre-vir)

Victrelis

Func. class.: Antiviral, anti-hepatitis agents

ACTION:

Prevents hepatitis C viral (HCV) replication by blocking the activity of HCV NS3/4A serine protease. Hepatitis C virus NS3/4A serine protease is an enzyme responsible for the conversion of HCV encoded polyproteins to mature/functioning viral proteins.

USES:

Hepatitis C infection in combination with peginterferon alfa and ribavirin

CONTRAINDICATIONS:

Pregnancy (X), male partners of women who are pregnant

Precautions: Breastfeeding, neonates, infants, children, adolescents <18 years of age, anemia, neutropenia, thrombocytopenia, HIV, hepatitis B, decompensated hepatic disease, in liver or other organ transplants

DOSAGE AND ROUTES

Calculator

Chronic hepatitis C infection (genotype 1) compensated liver disease (without cirrhosis, previously untreated with interferon and ribavirin therapy)/(Partial responders/relapsers)

- **Adults: PO** Before starting therapy peginterferon alfa and ribavirin must be given 4 wk, then add boceprevir 800 mg (four 200 mg caps) PO TID (7-9 hours). Treatment length is determined by HCV RNA conc at treatment wk 4, 8, 12, and 24. If patient has undetectable HCV RNA conc at wk 8 and 24, discontinue all 3 medications at wk 28 (previously untreated); 36 wk (partial responders/relapsers). If HCV RNA is detectable at wk 8 but undetectable at wk 24, the 3-drug regimen through wk 36, then give only peginterferon alfa and ribavirin through treatment wk 48. If the patient has a poor response to peginterferon alfa and ribavirin during the initial 4 wk, continue treatment with all 3 medications for a total of 48 wk. Discontinue the 3-drug regimen if the

HCV RNA conc >100 international units/ml at treatment wk 12 or a detectable HCA RNA conc at treatment wk 24.

Chronic hepatitis C infection (genotype 1) compensated liver disease with cirrhosis

• **Adults: PO** Before starting therapy with boceprevir; peginterferon alfa and ribavirin must be given 4 wk; then add boceprevir 800 mg (four 200 mg caps) PO TID (7-9 hr) to peginterferon alfa and ribavirin for an additional 44 wk (48 wk total)

Available forms: Caps 200 mg

Administer:

- Only use in combination with peginterferon alfa and ribavirin; never give as monotherapy.
- Discontinue in hepatitis C virus (HCV) if RNA concentrations ≥ 100 international units/ml at wk 12 or a confirmed detectable HCV RNA concentrations at wk 24
- Any contraindication to peginterferon alfa or ribavirin also applies to boceprevir.
- Give with food

SIDE EFFECTS

When used in combination with peginterferon/ribavirin

CNS: *Fatigue, chills, asthenia, insomnia, irritability, dizziness*

GI: *Nausea, vomiting, diarrhea, dysgeusia, decreased appetite, xerostomia*

HEMA: *Anemia (Hgb <10 g/dL), neutropenia, thrombocytopenia*

INTEG: *Alopecia, rash, xerosis*

MISC: *Arthralgia, exertional dyspnea*

INTERACTIONS

 **Increase:** life-threatening reactions of each product: alfuzosin, ergots (dihydro ergotamine, ergotamine, ergonovine, methylergonovine), cisapride, pimozide, lovastatin, simvastatin, ezetimibe, niacin with simvastatin and boceprevir; triazolam, oral midazolam; sildenafil, tadalafil (pulmonary arterial hypertension); do not use concurrently

Increase: adverse reactions of each product—phosphodiesterase type 5 (PDE5) inhibitors (for erectile dysfunction), acetaminophen, alfentanil, aliskiren,

almotriptan, alosetron, ALPRAZolam, aminophylline, amiodarone, amitriptyline, amLODIPine, ARIPiprazole, astemizole, atorvastatin, atorvastin, bepridil, boceprevir, bosentan, budesonide, bupivacaine, buprenorphine, busPIRone, carvedilol, cevimeline, chloroquine, cilostazol, cinacalcet, citalopram, clarithromycin, clomiPRAMINE, clonazePAM, clopidogrel, cloZAPine, colchicine, cyclobenzaprine, cycloSPORINE, dapsone, DAUNOrubicin, desipramine, desloratadine, dexamethasone, dexlansoprazole, dextromethorphan, diazepam, diclofenac, digoxin, diltiazem, disopyramide, disulfiram, DOCEtaxel, dolasetron, donepezil, DOXOrubicin, droperidol, dutasteride, ebastine, eletriptan, eplerenone, erlotinib, erythromycin, estazolam, eszopiclone, ethosuximide, etoposide, exemestane, felodipine, fentaNYL, fexofenadine, finasteride, flecainide, flunitrazepam, flurazepam, galantamine, gefitinib, glyburide, granisetron, halofantrine, haloperidol, HYDROcodone, ifosfamide, imipramine, indiplon, irinotecan, isradipine, itraconazole, ivermectin, ixabepilone, ketoconazole, lansoprazole, lidocaine, loperamide, loratadine, losartan, maraviroc, mefloquine, meloxicam, mirtazapine, mitoMYcin, montelukast, morphine, nateglinide, niCARDipine, NIFEdipine, nisoldipine, nortriptyline, omeprazole, ondansetron, oxybutynin, oxyCODONE, PACLitaxel, palonosetron, paricalcitol, plicamycin, posaconazole, prasugrel, praziquantel, propafenone, quazepam, QUetiapine, quinacrine, quiNIDine, ramelteon, repaglinide, rifabutin, risperiDONE, ropivacaine, salmeterol, selegiline, sertraline, sibutramine, silodosin, sirolimus, sitaxsentan, solifenacin, SUFentanil, SUNItinib, systemic corticosteroids, tacrolimus, telithromycin, teniposide, terfenadine, testosterone, theophylline, tiaGABine, tinidazole, tolterodine, tolvaptan, traMADol, traZODone, vardenafil, venlafaxine, verapamil, vinBLASTine, vinCRISTine, voriconazole, warfarin, and others; use cautiously, may need to reduce dose

Increase: hyperkalemia—drospirenone

Decrease: estrogen levels—ethinyl estradiol

Decrease: boceprevir effect—CYP3A4 inhibitors (phenytoin, carbamazepine, phenobarbital, rifampin)

Decrease: effect of—methadone

Possible treatment failure: efavirenz, ritonavir, atazanavir, lopinavir with ritonavir

Drug/Herb

- Do not use with St. John's wort

Drug/Lab Test

Decrease: Hgb

NURSING CONSIDERATIONS

Assess:

 **Pregnancy:** obtain a pregnancy test before, monthly during, and for 6 mo after treatment is completed; those who are not willing to practice strict contraception should not receive treatment; report any cases of prenatal ribavirin exposure to the Ribavirin Pregnancy Registry at (800) 593-2214

- **Anemia:** monitor Hgb before, at treatment wk 4, 8, 12, and as needed. If Hgb is <10 g/dL, decrease ribavirin dosage; if Hgb is <8.5 g/dL, discontinuation of therapy is recommended; dosage should not be altered based on adverse reactions; anemia may be managed through ribavirin dose modifications; never alter the dose of boceprevir. If anemia persists despite a reduction in ribavirin dose, consider discontinuing boceprevir. If management of anemia requires permanent discontinuation of ribavirin, treatment with boceprevir **MUST** also be permanently discontinued. Once boceprevir has been discontinued, it must not be restarted; monitor CBC with differential at treatment wk 4, 8, 12, and at other treatment points as needed

Teach patient/family:

- To take with food to increase absorption
- To use precautions to prevent transmission of hepatitis C
- To inform prescriber of all medications, herbs, supplements used
- To use 2 forms of effective contraception (intrauterine devices and barrier methods) during treatment and for 6 mo after treatment (pregnancy X), to avoid breastfeeding

☼ Canada only Side effects: *italics* = common; **bold** = life-threatening 
Nurse Alert

boric acid otic

See [Appendix B](#)

HIGH ALERT

bortezomib (Rx)

(bor-tez'oh-mib)

Velcade

Func. class.: Antineoplastic—miscellaneous

Chem. class.: Proteasome inhibitor

ACTION:

Reversible inhibitor of chymotrypsin-like activity in mammalian cells; causes delay in tumor growth by disrupting normal homeostatic mechanisms

USES:

Multiple myeloma previously untreated or when at least 2 other treatments have failed; mantle cell lymphoma who have received ≥ 1 prior therapy

Unlabeled uses: Non-Hodgkin's lymphoma (NHL)

CONTRAINDICATIONS:

Pregnancy (D), breastfeeding; hypersensitivity to product, boron, mannitol

Precautions: Children, geriatric patients, peripheral neuropathy, renal/hepatic disease, hypotension, tumor lysis syndrome, thrombocytopenia, infection, diabetes mellitus, bone marrow suppression

DOSAGE AND ROUTES

Calculator

Multiple myeloma (previously untreated)

- **Adult: IV BOL/SUBCUT** Give for nine 6-wk cycles; cycles 1-4, 1.3 mg/m²/dose given on days 1, 4, 8, 11, then a 10-day rest period (days 12-21), then give again on days 22, 25, 29, 32, then a 10-day rest period (days 33-42); given with melphalan (9 mg/m²/day on days 1-4) and predniSONE (60 mg/m²/day on days 1-4); during cycles 5-9, give bortezomib 1.3 mg/m²/dose on days 1, 8, 22, 29 with melphalan (9 mg/m²/day on days 1-4) and predniSONE

(60 mg/m²/day on days 1-4); this 6-wk cycle is considered 1 course; at least 72 hr should elapse between consecutive doses

Mantle cell lymphoma

- **Adult: IV BOL/SUBCUT** 1.3 mg/m²/dose on days 1, 4, 8, 11 followed by a 10-day rest period (days 12 to 21); max 8 cycles

Hepatic dose

- **Adult: IV** bilirubin >1.5 × ULN, reduce to 0.7 mg/m² during cycle 1; consider dose escalation to 1 mg/m² or further reduction to 0.5 mg/m² during next cycles based on tolerability

Non-Hodgkin's Lymphoma (unlabeled)

- **Adult: IV BOL** 1.3 mg/m² on days 1, 4, 8, 11 repeated every 21 days

Available forms: Lyophilized powder for inj 3.5 mg

Administer:

IV bolus route

- **Reconstitute** each vial with 3.5 ml of 0.9% NaCl (1 mg/ml); sol should be clear/colorless; **inj** as bolus over 3-5 sec • Store unopened product at room temperature, protect from light
- Wear protective clothing during handling, preparation; avoid contact with skin

SIDE EFFECTS

CNS: Anxiety, insomnia, dizziness, headache, *peripheral neuropathy*, rigors, paresthesia, fever

CV: *Hypotension*, edema, **CHF**

GI: Abdominal pain, *constipation*, *diarrhea*, dyspepsia, *nausea*, *vomiting*, anorexia

HEMA: *Anemia*, **neutropenia**, **thrombocytopenia**

MISC: Dehydration, weight loss, herpes zoster, *rash*, pruritus, blurred vision

MS: *Fatigue*, *malaise*, *weakness*, arthralgia, bone pain, muscle cramps, myalgia, back pain, **tumor lysis syndrome**

RESP: Cough, pneumonia, dyspnea, URI

PHARMACOKINETICS

Half-life 9-15 hr, protein binding 83%, metabolized by CYP450 enzymes (3A4, 2D6, 2C19, 2C9, 1A2)

INTERACTIONS

• Do not use hematopoietic progenitor cells (sargramostim, filgrastim) within 24 hr of chemotherapy • Oral hypoglycemics: may result in hypo/hyperglycemia

Increase: risk for bleeding—anticoagulants, NSAIDs, platelet inhibitors, salicylates, thrombolytics

Increase: hypotension—antihypertensives

Increase: peripheral neuropathy—amiodarone, antivirals (amprenavir; atazanavir; didanosine, lamiVUDine, 3TC; ritonavir; stavudine, zidovudine), chloramphenicol, CISplatin, colchicine, cycloSPORINE, dapson, disulfiram, DOCEtaxel, gold salts, HMG-CoA reductase inhibitors, iodoquinol, INH, metroNIDAZOLE, nitrofurantoin, oxaliplatin, PACLitaxel, penicillamine, phenytoin, sulfaSALazine, thalidomide, vinBLASTine, vinCRISTine, zalcitabine ddc, isoniazid, statins, others

Increase: toxicity or decrease efficacy when administered with products that induce or inhibit CYP3A4

Drug/Herb

Increase: toxicity or decrease efficacy—St. John's wort

NURSING CONSIDERATIONS

Assess:

- Hematologic status: platelets, CBC throughout treatment; platelets $\geq 70 \times 10^9/L$ and ANC $\geq 1.0 \times 10^9/L$ before any cycle; nonhematologic toxicities should be grade 1 or baseline before any cycle • For extravasation at inj site
- B/P, fluid status, peripheral neuropathy symptoms

Evaluate:

- Therapeutic response: improvement of multiple myeloma symptoms

Teach patient/family:

- To use contraception while taking this product (pregnancy [D]); to avoid breastfeeding
 - To monitor blood glucose levels if diabetic
 - To contact prescriber about new or worsening peripheral neuropathy, severe vomiting, diarrhea, easy bruising, bleeding, infection • To avoid driving, operating machinery until effect is known
 - To avoid using other medications unless approved by prescriber
-

🍁 Canada only Side effects: *italics* = common; **bold** = life-threatening ⚠️
Nurse Alert

bosentan (Rx)

(boh'sen-tan)

Tracleer

Func. class.: Vasodilator

Chem. class.: Endothelin receptor antagonist

ACTION:

Peripheral vasodilation occurs via the antagonism of the effect of endothelin on endothelium and vascular smooth muscle

USES:

Pulmonary arterial hypertension with WHO class III, IV symptoms

Unlabeled uses: Septic shock to improve microcirculatory blood flow, functional class II pulmonary arterial hypertension

CONTRAINDICATIONS:

Hypersensitivity, CVA, CAD

Black Box Warning:

Pregnancy X

Precautions: Breastfeeding, children, geriatric patients, mitral stenosis

Black Box Warning:

Hepatic disease

DOSAGE AND ROUTES

Calculator

• **Adult and adolescent >40 kg: PO** 62.5 mg bid × 4 wk then 125 mg bid

• **Adult and adolescent <40 kg: PO** 62.5 mg bid

Available forms: Tabs 62.5, 125 mg

Administer:

- Give without regard to meals
- Only available through the TAP program; 866-228-3546
- Do not stop product abruptly; taper

SIDE EFFECTS

CNS: Headache, flushing, fatigue, fever

CV: *Hypo/hypertension*, palpitations, edema of lower limbs, fluid retention

GI: Abnormal hepatic function, diarrhea, dyspepsia, **hepatotoxicity**
HEMA: **Anemia, leukopenia, neutropenia, lymphopenia, thrombocytopenia**
INTEG: Pruritus, **anaphylaxis**, rash, **Stevens-Johnson syndrome, toxic epidermal necrolysis**
MISC: Oligospermia, **tumor lysis syndrome**
SYST: **Secondary malignancy**

PHARMACOKINETICS

Metabolized by inducer of CYP2C9, CYP3A4, possibly CYP2C19; metabolized by the liver; terminal half-life 5 hr; steady state 3-5 days

INTERACTIONS

- Do not coadminister cycloSPORINE with bosentan; bosentan is increased, cycloSPORINE is decreased
- Do not coadminister glyBURIDE with bosentan; glyBURIDE is decreased significantly, bosentan is also decreased, hepatic enzymes may be increased

Increase: bosentan effects—CYP2C9, CYP3A4 inhibitors

Increase: bosentan level—ketoconazole

Decrease: effects of warfarin, hormonal contraceptives, statins

Drug/Lab Test

Increase: ALT, AST

Decrease: Hgb, Hct

NURSING CONSIDERATIONS

Assess:

- **Serious skin toxicities:** **Angioedema occurring 8-21 days after initiating therapy**
- B/P, pulse during treatment until stable
- Blood studies: Hct, Hgb after 1 month, 3 months, then every 3 months may be decreased
- Pulmonary hypertension/CHF: Fluid retention, weight gain, increased leg edema; may occur within weeks

Black Box Warning:

Hepatic toxicity: vomiting, jaundice; product should be discontinued; hepatic studies: AST, ALT, bilirubin; hepatic enzymes may increase; if ALT/AST $>3\times$ and $\leq 5\times$ ULN, decrease dose or interrupt treatment and monitor AST/ALT q2wk; if bilirubin $>2\times$ ULN or signs of hepatitis or hepatic disease are present, stop treatment

Perform/provide:

- Storage at room temp

Evaluate:

- Therapeutic response: decrease in pulmonary hypertension

Teach patient/family:

- To report jaundice, dark urine, joint pain, fatigue, malaise, bruising, easy bleeding

Black Box Warning:

Pregnancy (X), monitor pregnancy test monthly

- To avoid pregnancy; to use nonhormonal form of contraception, hormonal contraceptives may not be effective
- That lab work will be required periodically
- To take without regard to food

🍁 Canada only Side effects: *italics* = common; **bold** = life-threatening ⚠️
Nurse Alert

HIGH ALERT

brentuximab

(bren-tuk'see-mab)

Adcetris

Func. class.: Monoclonal antibody; antineoplastic

ACTION:

The anticancer activity is due to the binding of the ADC to CD30-expressing cells, followed by the internalization and transportation of the ADC-CD30 complex to lysosomes and the release of MMAE via selective proteolytic cleavage. MMAE binds to tubulin and disrupts the microtubule network within the cell, inducing cell cycle arrest and apoptotic death of the cells

USES:

For the treatment of Hodgkin's disease after failure of autologous stem cell transplant (ASCT) or after failure of at least 2 prior multiagent chemotherapy regimens in patients who are not ASCT candidates; for the treatment of non-Hodgkin's lymphoma (NHL); for the treatment of systemic anaplastic large cell lymphoma (sALCL) after failure of at least 1 prior multiagent chemotherapy regimen

CONTRAINDICATIONS

Hypersensitivity, pregnancy (category D)

Precautions: Breastfeeding, children, infants, neonates, neutropenia, peripheral neuropathy, tumor lysis syndrome (TLS)

Black Box Warning:

Progressive multifocal leukoencephalopathy

DOSAGE AND ROUTES

Calculator

- **Adult: IV** 1.8 mg/kg over 30 min every 3 wk until a maximum of 16 cycles, disease progression, or unacceptable toxicity. For patients >100 kg, max weight used for dosage calculation should be 100 kg, which translates to no more than 180 mg/dose

Dose adjustments for toxicity due to peripheral neuropathy:

- For grade <3: no dosage adjustments are recommended; for new or worsening grade 2-3: interrupt treatment until toxicity resolves to grade ≤1; when resuming treatment, reduce dosage to 1.2 mg/kg IV q3wk; for grade 4: discontinue treatment

Dose adjustments for toxicity due to neutropenia:

- For neutropenia grade <3: no dosage adjustments; for grade 3-4 neutropenia: interrupt treatment until toxicity resolves to baseline or grade ≤2; consider the use of growth factors (CSFs) for subsequent cycles of therapy; for grade 4 neutropenia despite the use of growth factors: discontinue treatment or reduce the dose to 1.2 mg/kg IV q3wk

Available forms: Powder for inj 50 mg

Administer:

Intermittent IV INF route

- Visually inspect for particulate matter and discoloration whenever sol and container permit
- Only as an IV inf, do not give as an IV push or bolus
- Use cytotoxic handling procedures
- Do not mix, or administer as an infusion, with other IV products
- Calculate the dose (mg) and the number of vials required. For patients weighing >100 kg, use 100 kg to calculate the dose; reconstitute each 50-mg vial per 10.5 ml of sterile water for inj (5 mg/ml)
- Direct the stream of sterile water toward the wall of the vial and not directly at the cake or powder; gently swirl the vial to aid in dissolution, do not shake
- Discard any unused portion left in the vial
- After reconstitution, dilute immediately with ≥100 ml of 0.9% sodium chloride, 5% dextrose, or lactated ringers solution to a final concentration (0.4 mg/ml-1.8 mg/ml)
- Infuse over 30 min

SIDE EFFECTS

CNS: Headache, dizziness, *fever*, peripheral neuropathy, anxiety, chills, confusion, *fatigue*, paresthesias, insomnia, night sweats **Progressive multifocal leukoencephalopathy**

CV: Peripheral edema, supraventricular arrhythmia

GI: *Abdominal pain, nausea, vomiting*, constipation, *diarrhea*, weight loss

INTEG: *Rash*, pruritus, alopecia, xerosis

RESP: **Pneumothorax, pneumonitis, pulmonary embolism**, dyspnea, *cough*

SYST: Anaphylaxis, tumor lysis syndrome, antibody formation, Stevens-Johnson Syndrome

HEMA: Anemia, neutropenia, thrombocytopenia

PHARMACOKINETICS

Protein binding is 68%-82%, only a small amount is metabolized; potent inhibitors or inducers of CYP3A4 may alter action; ADC peak at end of infusion; MME peak 1-3 days; terminal half-life is 4–6 days; 3 components are released: MMAE (monomethyl auristatin E), ADC, and the total antibody; the half-life of MMAE a component is 3.43-3.6 days

INTERACTIONS

Increase: brentuximab component action: ketoconazole, boceprevir, delavirdine, isoniazid, indinavir, itraconazole, dalfopristin; quinupristin, telithromycin, tipranavir, rifampin, ritonavir

Increase noninfectious pulmonary toxicity: bleomycin, do not use together
Drug/Herb

- Increased brentuximab component action: St. John's Wort

NURSING CONSIDERATIONS

Assess:

- **Tumor lysis syndrome (TLS):** assess for hyperkalemia, hypophosphatemia, hypocalcemia; may develop renal failure may use allopurinol or rasburicase to prevent TLS; monitor serum BUN/creatinine

• **Pregnancy: determine if pregnancy is planned or suspected, pregnancy category D**

• **Peripheral neuropathy: Progressive multifocal leukoencephalopathy:**

Assess for weakness, or paralysis, vision loss, impaired speech, and cognitive deterioration; often fatal • Monitor CBC, and differential

Perform/provide:

- Use the diluted sol immediately or store in refrigerator for ≤24 hr after reconstitution; do not freeze

Evaluate:

- Decreasing symptoms of Hodgkin's disease (increased lymph nodes, night sweats, weight loss, splenomegaly, hepatomegaly)

Teach patient/family:

- To report immediately weakness, change in vision, impaired speech • To use

reliable contraception (pregnancy D); to avoid breastfeeding

✳ Canada only Side effects: *italics* = common; **bold** = life-threatening ⚠
Nurse Alert

brimonidine (ophthalmic)

(bri-moe'ni-deen)

Alphagan P

Func. class.: Antiglaucoma

Chem. class.: Selective alpha-2 agonist

Do not confuse: **brimonidine**/bimatoprost

ACTION:

Decrease aqueous humor and increase outflows

USES:

Treatment of chronic open-angle glaucoma and ocular hypertension

CONTRAINDICATIONS:

Hypersensitivity, AV block, heart failure, bradycardia, sick sinus syndrome, within 14 days of MAOIs therapy

Precautions: Breastfeeding, depression, cerebrovascular disease, hepatic/renal impairment, Raynaud's phenomenon, orthostatic hypotension, thromboangiitis obliterans

DOSAGE AND ROUTES

Calculator

• **Adult/child >2 yr:** Instill 1 drop in the affected eye(s) tid

Available forms: Ophthalmic solution 0.1%, 0.15%, 0.2%

SIDE EFFECTS

CNS: Headache, dizziness, somnolence

CV: Hyper/hypotension

EENT: Eye stinging/burning, tearing, photophobia, change in vision, sinus infection

PHARMACOKINETICS

Peak ½-2 hr, half-life 2 hr

INTERACTIONS

Increase: intraocular pressure reduction—apraclonidine, dorzolamide, pilocarpine, timolol

Increase: effects of—CNS depressants

Decrease: B/P—beta blockers, antihypertensives

Decrease: brimonidine effect—tricyclic antidepressants, may cause HTN crisis
MAOIs, linezolid

NURSING CONSIDERATIONS

Assess:

- Glaucoma: Monitor intraocular pressure

Evaluate:

- Decreasing intraocular pressure

Teach patient/family:

- That drug is for ophthalmic use only
- Not to touch the tip of the dropper to the eye, fingertips, or other surface to prevent contamination
- To wash hands before and after use. Tilt the head back slightly and pull the lower eyelid down with the index finger to form a pouch. Squeeze the prescribed number of drops into the pouch. Close eyes to spread drops. To avoid excessive systemic absorption, apply finger pressure on the lacrimal sac for 1–2 min following use
- That if more than one topical ophthalmic drug product is being used, the drugs should be administered at least 5 minutes apart
- To avoid contamination or the spread of infection, do not use dropper for more than one person

☼ Canada only Side effects: *italics* = common; **bold** = life-threatening ⚠
Nurse Alert

brinzolamide ophthalmic

See [Appendix B](#)

bromfenac (ophthalmic)

(brom'fen-ak)

Bromday

Func. class.: Antiinflammatory (ophthalmic)

Chem. class.: Nonsteroidal antiinflammatory drug

ACTION:

The mechanism of action is thought to be ability to block prostaglandin synthesis by inhibiting cyclooxygenase 1 and 2. In studies performed in animal eyes, prostaglandins have been shown to produce disruption of the blood–aqueous humor barrier, vasodilation, increased vascular permeability, leukocytosis, and increased intraocular pressure

USES:

To reduce pain and inflammation after cataract surgery

CONTRAINDICATIONS:

Hypersensitivity to this product, sulfites, NSAIDs, salicylates

Precautions: Bleeding disorders, complicated ocular surgery, corneal denervation, diabetes mellitus, rheumatoid arthritis, dry eye syndrome, pregnancy (C), breastfeeding Do not administer while wearing contact lenses

DOSAGE AND ROUTES

Calculator

- **Adult:** Instill 1 drop (0.09 mg) into affected eye twice daily beginning 24 hr before cataract surgery, continued on the day of surgery and through the first 14 days of the postoperative period

Available forms: Ophthalmic solution 0.09%

Administer

- Apply topically to the eye
- Remove contact lenses before instilling solution. Contact lenses should not be

worn during use of this product.

- Instruct patient on proper instillation of eye solution
- Do not touch the tip of the dropper to the eye, fingertips, or other surface
- Do not share bottle with other patients
- If more than one ophthalmic medication is being used, the medications should be administered at least 5 min apart

SIDE EFFECTS

CNS: Headache

EENT: Abnormal sensation in eye, conjunctival hyperemia, ocular irritation, ocular pain, ocular pruritus, conjunctival hyperemia, iritis, keratitis

PHARMACOKINETICS

Unknown

INTERACTIONS

Increase: corneal erosion, poor healing—topical corticosteroids

Increase: bleeding—anticoagulants

NURSING CONSIDERATIONS

Assess:

Eyes:

- For pain, inflammation, burning, redness after cataract surgery
- Identify if patient is using topical corticosteroids, anticoagulants, use cautiously in those using these products

Evaluate:

- Decreased pain and inflammation after cataract surgery

Teach patient/family:

- To apply topically to the eye
 - To remove contact lenses before instilling solution; contact lenses should not be worn during use of this product
 - Proper instillation of eye solution
 - Not to touch the tip of the dropper to the eye, fingertips, or other surface
 - Not to share bottle with other patients
 - That if more than one ophthalmic medication is being used, the medications should be administered at least 5 minutes apart
-

🍁 Canada only Side effects: *italics* = common; **bold** = life-threatening ⚠️
Nurse Alert

bromocriptine (Rx)

(broe-moe-krip'teen)

Cycloset, Parlodel

Func. class.: Dopamine receptor agonist, antiparkinson agent *Chem. class.:* Ergot alkaloid derivative

Do not confuse: **Parlodel**/pindolol/Provera
bromocriptine/benzotropine/brimonidine

ACTION:

Inhibits prolactin release by activating postsynaptic dopamine receptors; activation of striatal dopamine receptors may be reason for improvement in Parkinson's disease

USES:

Parkinson's disease, amenorrhea/galactorrhea caused by hyperprolactinemia, infertility, acromegaly, pituitary adenomas, adjunct for type 2 diabetes

Unlabeled uses: Neuroleptic malignant syndrome, alcoholism, premenstrual syndrome, mastalgia, cocaine withdrawal, premenstrual breast symptoms

CONTRAINDICATIONS:

Severe ischemic disease, uncontrolled hypertension, severe peripheral vascular disease; hypersensitivity to ergot, bromocriptine; migraine, preeclampsia

Precautions: Pregnancy (B), breastfeeding, children, renal/hepatic disease, pituitary tumors, peptic ulcer disease, sulfite hypersensitivity, pulmonary fibrosis, dementia, GI bleeding, bipolar disorder

DOSAGE AND ROUTES

Calculator

Hyperprolactinemia

- **Adult: PO** 1.25-2.5 mg with meals; may increase by 2.5 mg q3-7days, usual range 2.5-15 mg/day

Acromegaly

- **Adult: PO** 1.25-2.5 mg $\times$ 3 days at bedtime; may increase by 1.25-2.5 mg q3-7days; usual range 20-30 mg/day, max 100 mg/day

Parkinson's disease

- **Adult: PO** 1.25 mg bid with meals; may increase q2-4wk by 2.5 mg/day, max

100 mg/day; levodopa should be continued while bromocriptine is being instituted

Pituitary adenoma

- **Adult: PO** 1.25 mg bid-tid; may increase over several wk to 10-20 mg/day

Type 2 diabetes (Cycloset only)

- **Adult: PO** (initially) 0.8 mg daily in AM within 2 hr of waking; titrate by 0.8 mg/day no more than weekly to max 1.6-4.8 mg/day

Neuroleptic malignant syndrome (unlabeled)

- **Adult: PO** 2.5-10 mg tid

Cocaine withdrawal (unlabeled)

- **Adult: PO** 0.625 mg qid × 42 days

Alcoholism (unlabeled)

- **Adult: PO** 7.5 mg/day

Mastalgia (unlabeled)

- **Adult: PO** 2.5-7.5 bid starting 10-14 days before menses; discontinue when menses begins

Available forms: Caps 5 mg; tabs 2.5 mg; Cycloset tabs 0.8 mg

Administer:

- With meal to prevent GI symptoms
- At bedtime so that dizziness, orthostatic hypotension do not occur

SIDE EFFECTS

CNS: *Headache*, depression, restlessness, anxiety, nervousness, confusion, *seizures*, *hallucinations*, dizziness, fatigue, drowsiness, abnormal involuntary movements, psychosis

CV: Orthostatic hypotension, decreased B/P, palpitations, extrasystole, *shock*, dysrhythmias, bradycardia, *MI*

EENT: Blurred vision, diplopia, burning eyes, nasal congestion

GI: *Nausea*, *vomiting*, *anorexia*, cramps, constipation, diarrhea, dry mouth, GI hemorrhage

GU: Frequency, retention, incontinence, diuresis

INTEG: *Rash on face, arms*; alopecia; coolness, pallor of fingers, toes; peripheral edema

PHARMACOKINETICS

Peak 1-3 hr, duration 4-8 hr, 90%-96% protein bound, half-life 3 hr, metabolized by liver (inactive metabolites), 85%-98% of dose excreted in feces, >90% of absorbed dose undergoes 1st-pass metabolism

INTERACTIONS

- Disulfiram-like reaction: alcohol

Increase: action of antihypertensives, levodopa, chloramphenicol, probenecid, salicylates, sulfonamides

Decrease: action of bromocriptine—phenothiazines, oral contraceptives, progestins, estrogens, haloperidol, loxapine, methyldopa, metoclopramide, MAOIs, reserpine

Decrease/increase: effect of Cycloset-CYP3A4 inhibitors/inducers

Decrease: effect of Cycloset-butyrophenones, metoclopramide, phenothiazine, thioxanthenes

Drug/Lab Test

Increase: growth hormone, AST, ALT, CK, BUN, uric acid, alk phos

NURSING CONSIDERATIONS

Assess:

- B/P; establish baseline, compare with other readings; this product decreases B/P and causes orthostatic hypotension
- **Parkinson's symptoms:** pill rolling, shuffling gait, restlessness, tremors, postural instability before and during treatment
- **Neuroleptic malignant syndrome:** decreased temp, seizures, sweating, pulse indicates resolution of symptoms
- Change in size of soft-tissue volume with acromegaly
- **Pregnancy:** may cause postpartum conception, use pregnancy testing q4wk or if menstruation does not occur

Perform/provide:

- Storage at room temp in tight, light-resistant container

Evaluate:

- Therapeutic response (Parkinson's disease): decreased dyskinesia, slow movements, drooling

Teach patient/family:

- That tabs may be crushed, mixed with food; Cycloset to be taken within 2 hr of rising

- To change position slowly to prevent orthostatic hypotension
 - To use contraceptives during treatment with this product; that pregnancy may occur; to use methods other than oral contraceptives/subdermal implants
 - That therapeutic effect for Parkinson's disease may take 2 mo
 - To avoid hazardous activity if dizziness occurs
 - To report symptoms of MI immediately
 - To take with food, avoid alcohol
-

☼ Canada only Side effects: *italics* = common; **bold** = life-threatening ⚠
Nurse Alert

budesonide (Rx)

(byoo-des'oh-nide)

Entocort EC, Pulmicort, Pulmicort Flexhaler, Rhinocort Aqua

Func. class.: Glucocorticoid

Chem. class.: Nonhalogenated

ACTION:

Prevents inflammation by depressing migration of polymorphonuclear leukocytes and fibroblasts, reversal of increased capillary permeability, and lysosomal stabilization; does not suppress hypothalamus or pituitary function

USES:

Rhinitis; prophylaxis for asthma; Crohn's disease

Unlabeled uses: Microscopic colitis

CONTRAINDICATIONS:

Hypersensitivity, status asthmaticus

Precautions: Pregnancy (C), inhaled form (B); breastfeeding; children; TB; fungal, bacterial, systemic viral infections; ocular herpes simplex; nasal septal ulcers; hepatic disease (caps)

DOSAGE AND ROUTES

Calculator

Rhinitis (Rhinocort Aqua)

- **Adult and child >12 yr: SPRAY/INH** 256 mcg/day (2 sprays in each nostril AM, PM or 4 sprays in each nostril AM)

Asthma

- **Adult: INH** 360 mcg bid, max 720 mcg bid

Crohn's disease

- **Adult: PO** 9 mg/day AM $\times$ 8 wk

Available forms: Dry powder for INH 90, 180, 200 mcg/actuation (Pulmicort Flexhaler); 32 mcg/actuation (Rhinocort Aqua) nasal spray; susp for INH 0.5 mg/2 ml, 0.25 mg/2 ml; cap 3 mg

Administer:

PO route (Crohn's disease)

- Swallow caps whole; do not break, crush, chew
- May repeat 8-wk course if needed; may taper to 6 mg/day for 2 wk before cessation

SIDE EFFECTS

CNS: *Headache*, insomnia, hypertonia, syncope, dizziness, drowsiness

CV: Chest pain, hypertension, sinus tachycardia, palpitation

EENT: *Sinusitis*, *pharyngitis*, rhinitis, oral candidiasis

ENDO: Adrenal insufficiency, growth suppression in children

GI: Dry mouth, dyspepsia, nausea, vomiting, abdominal pain

MISC: Ecchymosis, fever, *hypersensitivity*, flulike symptoms, epistaxis, dysuria

MS: Back pain, myalgias, fractures

RESP: Nasal irritation, cough, nasal bleeding, *respiratory infections*,
bronchospasm

PHARMACOKINETICS

Peak: Respules 4-6 wk, Rhinocort Aqua 2 wk, half-life 2-3.6 hr

Onset: Respules 2-8 days, Rhinocort Aqua 10 hr

Enters breast milk

INTERACTIONS

Increase: budesonide effect, CYP3A inhibitors, dose adjustment may be needed

- Avoid concurrent use of varicella live vaccine in pediatric patients

NURSING CONSIDERATIONS

Assess:

- Respiratory status: rate, rhythm, increase in bronchial secretions, wheezing, chest tightness; provide fluids to 2 L/day to decrease thickness of secretions; check for oral candidiasis
- **Bronchospasm:** stop treatment, give bronchodilator
- Viral infections: corticosteroid use can mask infections
- Increased intraocular pressure: discontinue use if this occurs

Perform/provide:

- Storage at 59° F-86° F (15° C-30° C); keep away from heat, open flame

Evaluate:

- Therapeutic response: absence of asthma, rhinitis

Teach patient/family:

- To notify prescriber of pharyngitis, nasal bleeding, oral candidiasis
- Not to exceed recommended dose because adrenal suppression may occur
- To carry emergency ID that identifies steroid use
- To read and follow package directions
- To prevent exposure to infections (especially viral)
- To use good oral hygiene if using nebulizer or inhaler
- To avoid breastfeeding
- That burning or stinging may occur with first few doses of inhalation use
- That product is not a bronchodilator and not to be used for asthma; to use regularly
- Teach how to use as described in “administer”
- To notify prescriber if symptoms persist after wks, that results usually take 2 wk
- To notify prescriber if exposure to measles, chickenpox occurs

🍁 Canada only Side effects: *italics* = common; **bold** = life-threatening ⚠️
Nurse Alert

budesonide nasal agent

See [Appendix B](#)

bumetanide (Rx)

(byoo-met'a-nide)

Func. class.: Loop diuretic, antihypertensive

Chem. class.: Sulfonamide derivative

ACTION:

Acts on ascending loop of Henle by inhibiting reabsorption of chloride, sodium

USES:

Edema in CHF, renal/hepatic disease, heart failure

Unlabeled uses: Hypercalcemia, hypertension, ascites

CONTRAINDICATIONS:

Hypersensitivity to sulfonamides, anuria, hepatic coma

Black Box Warning:

Electrolyte imbalance

Precautions: Pregnancy (C), breastfeeding, neonates, ascites, severe renal disease, hepatic cirrhosis, blood dyscrasias, ototoxicity, hyperuricemia, hypokalemia, hyperglycemia, oliguria, hypomagnesemia, hypovolemia

Black Box Warning:

Dehydration

DOSAGE AND ROUTES

Calculator

• **Adult and adolescent: PO** 0.5-2.0 mg/day; may give 2nd or 3rd dose at 4-5 hr intervals, max 10 mg/day; may be given on alternate days or intermittently;
IV/IM 0.5-1.0 mg; may give 2nd or 3rd dose at 2-3 hr intervals, not to exceed 10 mg/day

• **Child and infant (unlabeled): PO/IM/IV** 0.015-0.1 mg/kg daily or every other day, max 10 mg/day

Hypercalcemia (unlabeled)

• **Adult: IV** 1-2 mg q1-4hr to maintain urine output of 200-250 ml/hr; give

saline before 1st dose of this product

Hypertension (unlabeled)

- **Adult and adolescent: PO** 0.5-2 mg/day, max 10 mg/day in 2 divided doses

Available forms: Tabs 0.5, 1, 2 mg; inj 0.25 mg/ml

Administer:

- In AM to avoid interference with sleep if using product as a diuretic; without regard to meals
- Potassium replacement if potassium is <3.0

PO route

- With food if nausea occurs; absorption may be decreased slightly

IV, direct route

- Direct IV undiluted slowly over 1-2 min through **Y**-tube, 3-way stopcock, or heplock

Intermittent IV INF route

- Dilute in LR, D₅W, 0.9% NaCl (rarely given by this method), give over 12 hr with renal disease

Syringe compatibilities: Doxapram

Y-site compatibilities: Acyclovir, alfentanil, allopurinol, amifostine, amikacin, aminocaproic acid, aminophylline, amiodarone, amoxicillin, amphotericin B lipid complex (Abelcet), amphotericin B liposome (AmBisome), anidulafungin, ascorbic acid injection, atenolol, atracurium, atropine, aztreonam, benztropine, bivalirudin, bleomycin, buprenorphine, butorphanol, calcium chloride/gluconate, CARBOplatin, caspofungin, cefamandole, ceFAZolin, cefepime, cefmetazole, cefonicid, cefoperazone, cefotaxime, cefoTEtan, cefOXitin, cefTAZidime, ceftizoxime, ceftobiprole, cefTRIAxone, cefuroxime, cephalothin, cephapirin, chloramphenicol, cimetidine, cisatracurium, CISplatin, cladribine, clarithromycin, clindamycin, codeine, cyanocobalamin, cyclophosphamide, cycloSPORINE, cytarabine, DACTINomycin, DAPTOMycin, dexamethasone, dexmedetomidine, digoxin, diltiazem, diphenhydrAMINE, DOBUTamine, DOCEtaxel, DOPamine, doripenem, doxacurium, DOXOrubicin, doxycycline, enalaprilat, ePHEDrine, EPINEPHrine, epirubicin, epoetin alfa, eptifibatide, ertapenem, erythromycin, esmolol, etoposide, famotidine, fentaNYL, filgrastim, fluconazole, fludarabine, fluorouracil, folic acid, furosemide, gatifloxacin, gemcitabine, gentamicin, glycopyrrolate, granisetron, heparin, hydrocortisone sodium succinate, HYDROmorphone, hydrOXYzine, IDArubicin, ifosfamide,

imipenem-cilastatin, indomethacin, insulin (regular), irinotecan, isoproterenol, ketorolac, labetalol, levofloxacin, lidocaine, linezolid, LORazepam, magnesium sulfate, mannitol, mechlorethamine, melphalan, meperidine, metaraminol, methotrexate, methoxamine, methyl dopate, methylPREDNISolone, metoclopramide, metoprolol, metroNIDAZOLE, mezlocillin, micafungin, miconazole, milrinone, mitoXANtrone, morphine, moxalactam, multiple vitamins injection, mycophenolate, nafcillin, nalbuphine, naloxone, netilmicin, nitroglycerin, nitroprusside, norepinephrine, octreotide, ondansetron, oxacillin, oxaliplatin, oxytocin, palonosetron, pamidronate, pan curonium, pantoprazole, PEMEtrexed, penicillin G potassium/sodium, pentazocine, PENTobarbital, PHENobarbital, phenylephrine, phytonadione, piperacillin, piperacillin-tazobactam, polymyxin B, potassium chloride, procainamide, promethazine, propofol, propranolol, protamine, pyridoxine, quiNIDine, ranitidine, remifentanyl, rifampin, ritodrine, riTUXimab, rocuronium, sodium acetate, sodium bicarbonate, succinylcholine, SUFentanyl, tacrolimus, teniposide, theophylline, thiamine, thiotepa, ticarcillin, ticarcillin-clavulanate, tigecycline, tirofiban, TNA, tobramycin, tolazoline, TPN, traMADol, trastuzumab, trimetaphan, urokinase, vancomycin, vasopressin, vecuronium, verapamil, vinCRIStine, vinorelbine, voriconazole

SIDE EFFECTS

CNS: *Headache, fatigue, weakness, dizziness, encephalopathy*

CV: *Chest pain, hypotension, circulatory collapse, ECG changes, dehydration*

EENT: *Loss of hearing*

ELECT: *Hypokalemia, hypochloremic alkalosis, hypomagnesemia, hyperuricemia, hypocalcemia, hyponatremia*

ENDO: *Hyperglycemia*

GI: *Nausea, diarrhea, dry mouth, vomiting, anorexia, cramps, upset stomach, abdominal pain, acute pancreatitis, jaundice*

GU: *Polyuria, renal failure, glycosuria, premature ejaculation, hypercholesterolemia*

HEMA: *Thrombocytopenia, leukopenia, granulocytopenia, hemoconcentration*

INTEG: *Rash, pruritus, purpura, Stevens-Johnson syndrome, sweating, photosensitivity*

MS: *Muscular cramps, arthritis, stiffness*

PHARMACOKINETICS

Excreted by kidneys (50% unchanged), feces (20%); crosses placenta; excreted in breast milk; protein binding >96%; half-life 1-11/2 hr, 6-15 hr in neonates

PO: Onset 1/2-1 hr, peak 1-2 hr, duration 3-6 hr

IM: Onset 40 min, peak 1-2 hr, duration 4-6 hr

IV: Onset 5 min, peak 15-30 min, duration 3-6 hr

INTERACTIONS

- Ototoxicity: aminoglycosides
- Hypokalemia: potassium-wasting products

Increase: toxicity—lithium, digoxin

Increase: diuresis, electrolyte loss—metolazone

Decrease: diuretic effect—indomethacin, NSAIDs, probenecid

Decrease: antidiabetic effects—antidiabetics

Drug/Herb

Increase: effect—hawthorn, horse chestnut

Decrease: effect of bumetanide—ginseng, ephedra

NURSING CONSIDERATIONS

Assess:

- For tinnitus; obtain audiometric testing for long-term IV treatment
- Weight, I&O daily to determine fluid loss; if urinary output decreases or azotemia occurs, product should be discontinued; safest dosage schedule is alternate days
- B/P lying, standing; postural hypotension may occur

Black Box Warning:

Electrolyte imbalances: Potassium, sodium, calcium; include BUN, blood glucose, CBC, serum creatinine, blood pH, ABGs, uric acid, calcium, magnesium; severe electrolyte imbalances should be corrected before starting treatment

- Blood glucose if patient is diabetic; blood uric acid levels in those with gout
- Improvement in edema of feet, legs, sacral area daily if medication is being used for CHF
- Signs of metabolic alkalosis: drowsiness, restlessness
- **Hypokalemia:** postural hypotension, malaise, fatigue, tachycardia, leg cramps, weakness
- Rashes, temp elevation daily
- Confusion, especially in geriatric patients; take safety precautions if needed
- **Digoxin toxicity** in patients taking digoxin products: anorexia, nausea,

vomiting, confusion, paresthesia, muscle cramps; **lithium toxicity** in those taking lithium

Evaluate:

- Therapeutic response: decreased edema, B/P

Teach patient/family:

- To increase fluid intake to 2-3 L/day unless contraindicated; to take potassium supplement; to rise slowly from lying or sitting position
- To recognize adverse reactions: muscle cramps, weakness, nausea, dizziness
- To take with food, milk for GI symptoms; to avoid alcohol
- To take early in day to prevent nocturia
- To use sunscreen to prevent photosensitivity

TREATMENT OF OVERDOSE:

Lavage if taken orally; monitor electrolytes; administer dextrose in saline; monitor hydration, CV, renal status

☼ Canada only Side effects: *italics* = common; **bold** = life-threatening ⚠
Nurse Alert

buprenorphine (Rx)

(byoo-pre-nor'feen)

Buprenex, Butrans

Func. class.: Opioid analgesic, partial agonist

Chem. class.: Thebaine derivative

Controlled Substance Schedule V (Parenteral); Schedule III (Tablet, TD)

Do not confuse: Buprenex/Bumex

ACTION:

Depresses pain impulse transmission at the spinal cord level by interacting with opioid receptors

USES:

Moderate to severe pain, opiate agonist withdrawal

Unlabeled uses: Cocaine withdrawal

CONTRAINDICATIONS:

Hypersensitivity, ileus

Black Box Warning:

Respiratory depression

Precautions: Pregnancy (C), breastfeeding, substance abuse/alcoholism, increased intracranial pressure, MI (acute), severe heart disease, respiratory depression, renal/hepatic/pulmonary disease, hypothyroidism, Addison's disease

Black Box Warning:

QT prolongation, use of heating pad, accidental exposure, potential for overdose/poisoning, substance abuse

DOSAGE AND ROUTES

Calculator

- **Adult:** IM/IV 0.3 mg q6hr prn, reduce dosage in geriatric patients, may repeat after 30-60 min; **EPIDURAL** (unlabeled) 4 mcg/kg or 2 mcg/kg (epidural inj); **TD** each patch is worn for 7 days (moderate-severe pain); **opioid-naïve patients** (those taking <30 mg of oral morphine or equivalent before beginning treatment with TD buprenorphine), 5 mcg/hr q7days, overestimating dose can be fatal;

conversion from other opiate agonist therapy, titrate from other opioids for up to 7 days to no more than 30 mg oral morphine or equivalent before beginning TD therapy, begin with 5 mcg/hr q7days; for those with daily dose of 30-80 mg oral morphine or equivalent, start with 10 mcg/hr q7days; for those taking >80 mg oral morphine or equivalent, start with 20 mcg/hr q7days

• **Child 2-12 yr: IM/IV** 2-6 mcg/kg q4-6hr

Available forms: Inj 0.3 mg/ml (1-ml vials); SL tab 2, 8 mg as base; TD system 5, 10, 20 mcg/hr (weekly)

Administer:

SL route

- Do not chew, dissolve under tongue, take 2 or more at same time

Transdermal route

- Apply to clean, dry, intact skin; each patch should be worn for 7 days; do not apply direct heat source to patch, will increase absorption of product
- Apply to upper outer arm, upper chest/back, or side of chest

IM route

- In deep muscle mass

IV, direct route

- **Give** undiluted over ≥ 2 min, titrate to patient response
- With antiemetic if nausea, vomiting occur
- When pain is beginning to return; determine dosage interval by patient response

Additive compatibilities: Bupivacaine, glycopyrrolate, haloperidol

Syringe compatibilities: Glycopyrrolate, haloperidol, heparin, midazolam

Y-site compatibilities: Acyclovir, alfentanil, allopurinol, amifostine, amikacin, aminocaproic acid, amphotericin B liposome (AmBisone), anidulafungin, ascorbic acid injection, atenolol, atracurium, atropine, aztreonam, benztropine, bivalirudin, bleomycin, bumetanide, butorphanol, calcium chloride/gluconate, CARBOplatin, cefamandole, ceFAZolin, cefepime, cefmetazole, cefonicid, cefoperazone, cefotaxime, cefoTEtan, cefOXitin, cefTAZidime, ceftizoxime, cefTRIAxone, cefuroxime, cephalothin, cephapirin, chloramphenicol, chlorproMAZINE, cimetidine, cisatracurium, CISplatin, cladribine, clindamycin, cyanocobalamin, cyclophosphamide, cycloSPORINE, cytarabine, D₅W-dextrose 5%, DACTINomycin, DAPTOmycin, dexamethasone, dexmedetomidine,

digoxin, diltiazem, diphenhydrAMINE, DOBUamine, DOCEtaxel, DOPamine, doxacurium, DOXOrubicin HCl, doxycycline, enalaprilat, ePHEDrine, EPINEPHrine, epirubicin, epoetin alfa, eptifibatide, ertapenem, erythromycin, esmolol, etoposide, famotidine, fenoldopam, fentaNYL, filgrastim, fluconazole, fludarabine, gatifloxacin, gemcitabine, gentamicin, glycopyrrolate, granisetron, heparin, hydrocortisone, hydrOXYzine, IDArubicin, ifosfamide, imipenem-cilastatin, inamrinone, insulin (regular), irinotecan, isoproterenol, ketorolac, labetalol, lactated Ringer's injection, levofloxacin, lidocaine, linezolid, LORazepam, magnesium sulfate, mannitol, mechlorethamine, melphalan, meperidine, metaraminol, methicillin, methotrexate, methoxamine, methyl dopate, methylPREDNISolone, metoclopramide, metoprolol, metroNIDAZOLE, mezlocillin, miconazole, midazolam, milrinone, minocycline, mitoXANtrone, morphine, moxalactam, multiple vitamins injection, mycophenolate mofetil, nafcillin, nalbuphine, naloxone, nesiritide, netilmicin, nitroglycerin, nitroprusside, norepinephrine, octreotide, ondansetron, oxacillin, oxaliplatin, oxytocin, palonosetron, pamidronate, pancuronium, papaverine, PEMEtrexed, penicillin G potassium/sodium, pentamidine, pentazocine, phenylephrine, phytonadione, piperacillin, piperacillin-tazobactam, polymyxin B, potassium chloride, procainamide, prochlorperazine, promethazine, propofol, propranolol, protamine, pyridoxine, quiNIDine, ranitidine, remifentanyl, Ringer's injection, ritodrine, riTUXimab, rocuronium, sodium acetate, succinylcholine, SUFentanyl, tacrolimus, teniposide, theophylline, thiamine, thiotepa, ticarcillin, ticarcillin-clavulanate, tigecycline, tirofiban, TNA (3-in-1), tobramycin, tolazoline, TPN, trastuzumab, trimetaphan, urokinase, vancomycin, vasopressin, vecuronium, verapamil, vinCRISTine, vinorelbine, voriconazole

SIDE EFFECTS

CNS: *Drowsiness, dizziness, confusion, headache, sedation, euphoria, increased intracranial pressure, amnesia*

CV: Palpitations, bradycardia, change in B/P, tachycardia

EENT: Tinnitus, blurred vision, *miosis*, diplopia

GI: *Nausea*, vomiting, anorexia, constipation, cramps, dry mouth

GU: Dysuria, urinary retention

INTEG: *Rash*, urticaria, bruising, flushing, diaphoresis, pruritus

RESP: Respiratory depression, dyspnea, hypo/hyperventilation

PHARMACOKINETICS

Metabolized in liver by CYP3A4, excreted by kidneys and in feces, crosses placenta, excreted in breast milk, half-life 2½-3½ hr, 96% bound to plasma proteins

IM: Onset 15 min, peak 1/2 hr, duration 6 hr

SL: Onset, peak, duration unknown, half-life 37 hr

IV: Onset 1 min, peak 5 min, duration 6 hr, half-life 2.2 hr

INTERACTIONS

Increase: effect with other CNS depressants—alcohol, opioids, sedative/hypnotics, antipsychotics, skeletal muscle relaxants, MAOIs

Increase: buprenorphine effect—CYP3A4 inhibitors (erythromycin, indinavir, ketoconazole, ritonavir, saquinavir)

Increase: QT prolongation—class IA, III antidysrhythmics

Decrease: buprenorphine effect—CYP3A4 inducers (carbamazepine, phenobarbital, phenytoin, rifampin)

Drug/Herb

Increase: CNS depression—St. John's wort

NURSING CONSIDERATIONS

Assess:

- **Pain:** intensity, location, type before treatment, after 5 min (IV); need for pain medication, tolerance
- I&O ratio; check for decreasing output; may indicate urinary retention
- Bowel pattern; severe constipation can occur
- CNS changes, dizziness, drowsiness, hallucinations, euphoria, LOC, pupil reaction; withdrawal in opioid-dependent persons; if dependence occurs, within 2 wk of discontinuing product **withdrawal symptoms** will occur
- Allergic reactions: rash, urticaria
- Respiratory dysfunction: respiratory depression, character, rate, rhythm; notify prescriber if respirations are <12/min

Black Box Warning:

Potential for overdose may occur from chewing, swallowing, snorting, or injecting extracted product from TD formulation

Black Box Warning:

QT prolongation: in those taking class Ia, III antidysrhythmics; patients with hypokalemia, cardiac instability (TD), max TD 20 mcg/hr q7day

Evaluate:

- Therapeutic response: decrease in pain, absence of grimacing

Teach patient/family:

- To report any symptoms of CNS changes, allergic reactions

Black Box Warning:

That psychologic dependence leading to substance abuse may result when used for extended periods; that long-term use not recommended

- To avoid hazardous activities such as driving unless reaction known

TREATMENT OF OVERDOSE:

Naloxone 0.4 mg ampule diluted in 10 ml 0.9% NaCl given by direct IV push
0.02 mg q2min (adult)

☼ Canada only Side effects: *italics* = common; **bold** = life-threatening ⚠
Nurse Alert

buPROPion (Rx)

(byoo-proe'pee-on)

Aplenzin, Budeprion SR, Budeprion XL, Buproban, Wellbutrin, Wellbutrin SR, Wellbutrin XL, Zyban

Func. class.: Antidepressant—miscellaneous smoking deterrent *Chem. class.:* Aminoketone

Do not confuse: buPROPion/busPIRone

Zyban/Diovan/Zagam

ACTION:

Inhibits reuptake of DOPamine, norepinephrine, serotonin

USES:

Depression (Wellbutrin), smoking cessation (Zyban); seasonal affective disorder

Unlabeled uses: Neuropathic pain, enhancement of weight loss, ADHD (attention-deficit/hyperactivity disorder)

CONTRAINDICATIONS:

Hypersensitivity, eating disorders, seizure disorders

Precautions: Pregnancy (C), breastfeeding, geriatric patients, renal/hepatic disease, recent MI, cranial trauma, seizure disorder

Black Box Warning:

Children <18 yr, suicidal thinking/behavior (young adults)

DOSAGE AND ROUTES

Calculator

Depression

- **Adult: PO** 100 mg bid initially then increase after 3 days to 100 mg tid if needed, max 150 mg single dose; **ER/SR** initially 150 mg AM, increase to 300 mg/day if initial dose is tolerated, after no less than 4 days; after several wk, titrate to 200 mg bid; Aplenzin 174 mg q AM, may increase to 348 mg q AM on day 4, may increase to 522 mg after several weeks if needed

- **Geriatric: PO** 50-100 mg/day, may increase by 50-100 mg q3-4days

Smoking cessation (Zyban)

- **Adult: SR** 150 mg q day × 3 days then 150 mg bid for remainder of treatment, initiate 1-2 wk before targeted “quit day,” continue for 7-12 wk; in combination with nicotine TD, 150 mg q day × 3 days then 150 mg bid for remainder of treatment, give ≥8 hr apart, max 300 mg/day, initiate 1-2 wk before targeted

“quit day,” continue for 7-12 wk, may be continued for 8-20 wk

ADHD (unlabeled) (Wellbutrin)

• **Adult: PO** 100 mg bid, after ≥ 3 days titrate to 100 mg tid; SR 300 mg/day, 200 mg 8 AM, 100 mg 4 PM

Diabetic neuropathy/postherpetic neuralgia (unlabeled)(Wellbutrin SR)

• **Adult: PO** SR 150-300 mg/day

Available forms: Tabs 75, 100 mg; sus rel tabs (SR) 150; ext rel tab (XL) 100, 150, 300 mg; (SR-12 hr, XL-24 hr); tab ext rel (Aplenzin) 174, 348, 522 mg

Administer:

PO route

 When switching to Aplenzin from Wellbutrin, Wellbutrin SR or XL, use these equivalents: 174 mg buPROPion HBr = 150 mg buPROPion HCl; 348 mg buPROPion HBr = 300 mg buPROPion HCl; 522 mg buPROPion HBr = 450 mg buPROPion HCl • **Wellbutrin immediate rel**, separate by ≥ 6 hr, give in 3 divided doses; **Wellbutrin SR**, if multiple doses are used, separate by ≥ 8 hr; **Wellbutrin XL**, give daily in AM; **Zyban SR**, give in 2 divided doses, ≥ 8 hr apart; **Aplenzin ER**, give daily in AM, a larger dose of Aplenzin is needed because these products are not equivalent • Do not break, crush, chew sus rel, ext rel tab

- At evenly spaced times to prevent seizures; seizure risk increases with high doses
- Increase fluids, bulk in diet if constipation occurs
- With food, milk for GI symptoms
- Sugarless gum, hard candy, frequent sips of water for dry mouth
- Avoid giving at night to prevent insomnia

SIDE EFFECTS

CNS: Headache, agitation, dizziness, akinesia, bradykinesia, confusion, seizures, delusions, insomnia, sedation, tremors, suicidal ideation

CV: Dysrhythmias, hypertension, palpitations, tachycardia, hypotension, complete AV block; QRS prolongation (overdose)

EENT: Blurred vision, auditory disturbance

GI: Nausea, vomiting, anorexia, diarrhea, dry mouth, increased appetite, constipation, altered taste

GU: Impotence, urinary frequency, retention, menstrual irregularities

INTEG: *Rash, pruritus, sweating, Stevens-Johnson syndrome*

MISC: *Weight loss or gain*

PHARMACOKINETICS

Onset 2-4 wk, half-life 14 hr, extensively metabolized by liver, some conversion to active metabolites, steady state 5-8 days, protein binding 84%, excreted in urine and feces

INTERACTIONS

⚠ Increase: adverse reactions, seizures —levodopa, MAOIs, phenothiazines, antidepressants, benzodiazepines, alcohol, theophylline, systemic steroids

Increase: buPROPion toxicity—ritonavir

Increase: buPROPion level—cimetidine

Increase: buPROPion effect—CYP2D6/CYP2B6 inhibitors

Decrease: effect of tamoxifen

Decrease: buPROPion effect—carbamazepine, cimetidine, phenobarbital, phenytoin or other products (CYP2D6); CYP2B6 inducers

Drug/Herb

Increase: CNS depression—kava, valerian

NURSING CONSIDERATIONS

Assess:

- Hepatic/renal function in patients with hepatic, kidney impairment
- For increased risk of seizures; if patient has excessively used CNS depressants and OTC stimulants, dosage of buPROPion should not be exceeded
- For smoking cessation after 7-12 wk; if progress has not been made, product should be discontinued

Black Box Warning:

Mental status: mood, sensorium, affect, suicidal tendencies, increase in psychiatric symptoms

Perform/provide:

- Assistance with ambulation during beginning therapy because sedation occurs
- Safety measures, primarily for geriatric patients

Evaluate:

- Therapeutic response: decreased depression, ability to perform daily activities, ability to sleep throughout the night, smoking cessation

Teach patient/family:

- That therapeutic effects may take 2-4 wk; not to increase dose without prescriber's approval; that treatment for smoking cessation lasts 7-12 wk • To use caution when driving, performing other activities that require alertness; sedation, blurred vision may occur • To avoid alcohol, other CNS depressants; alcohol may increase risk of seizures
- Not to use with nicotine patches unless directed by prescriber; may increase B/P
- To notify prescriber immediately if urinary retention occurs
- That risk of seizures increased when dose exceeded, if patient has seizure disorder

Black Box Warning:

That suicidal ideas, behaviors, hostility, depression may occur in children or young adults

- To notify prescriber if pregnancy is suspected, planned

TREATMENT OF OVERDOSE:

ECG monitoring; lavage, activated charcoal; administer anticonvulsant

🍁 Canada only Side effects: *italics* = common; **bold** = life-threatening ⚠️
Nurse Alert

busPIRone (Rx)

(byoo-spye'rone)

BuSpar, BuSpar Dividose

Func. class.: Antianxiety, sedative

Chem. class.: Azaspirodecanedione

Do not confuse: busPIRone/buPROPion

ACTION:

Acts by inhibiting the action of serotonin (5-HT); has shown little potential for abuse; a good choice with substance abuse

USES:

Management and short-term relief of generalized anxiety disorders

Unlabeled uses: Autism

CONTRAINDICATIONS:

Children <18 yr, hypersensitivity

Precautions: Pregnancy (B), breastfeeding, geriatric patients, impaired hepatic/renal function

DOSAGE AND ROUTES

Calculator

• **Adult: PO** 7.5 mg bid; may increase by 5 mg/day q2-3days, max 60 mg/day
Autism with anxiety (unlabeled)

• **Adult: PO** 5-15 mg tid after titration, max 60 mg/day

• **Child ≥5 yr: PO** 0.2-0.6 mg/kg/day, max 60 mg/day; titrate to higher dose

Hepatic/renal dose

• **Adult: PO** reduce by 25%-50% for mild-moderate hepatic disease; do not use for severe hepatic disease; CCr 11-70 ml/min reduce by 25%-50%, CCr <10 ml/min do not use

Available forms: Tabs 5, 7.5, 10, 15, 30 mg

Administer:

• With food, milk for GI symptoms; avoid grapefruit juice; give drug at same time of day, with/without food consistently • Crushed if patient unable to swallow medication whole

- Sugarless gum, hard candy, frequent sips of water for dry mouth

SIDE EFFECTS

CNS: *Dizziness, headache, depression, stimulation, insomnia, nervousness, lightheadedness, numbness, paresthesia, incoordination, nightmares, tremors, excitement, involuntary movements, confusion, akathisia, hostility*

CV: *Tachycardia, palpitations, hypo/hypertension, CVA, CHF, MI*

EENT: *Sore throat, tinnitus, blurred vision, nasal congestion; red, itching eyes; change in taste, smell*

GI: *Nausea, dry mouth, diarrhea, constipation, flatulence, increased appetite, rectal bleeding*

GU: *Frequency, hesitancy, menstrual irregularity, change in libido*

INTEG: *Rash, edema, pruritus, alopecia, dry skin*

MISC: *Sweating, fatigue, weight gain, fever, serotonin syndrome*

MS: *Pain, weakness, muscle cramps, spasms*

RESP: *Hyperventilation, chest congestion, shortness of breath*

PHARMACOKINETICS

Peak 40-90 min, half-life 2-3 hr, rapidly absorbed, metabolized by liver (CYP3A4), excreted in feces, protein binding 86%

INTERACTIONS

Increase: busPIRone—product metabolized by CYP3A4 (erythromycin, itraconazole, nefazodone, ketoconazole, ritonavir, several other protease inhibitors)

Increase: B/P—procarbazine, MAOIs; do not use together

Increase: CNS depression—psychotropic products, alcohol (avoid use)

Increase: serotonin syndrome—SSRIs, SNRIs, serotonin receptor agonists

Decrease: busPIRone effects—rifampin

Decrease: busPIRone action—products induced by CYP3A4 (rifampin, phenytoin, PHENobarbital, carbamazepine, dexamethasone)

Drug/Food

Increase: peak concentration of busPIRone—grapefruit juice

NURSING CONSIDERATIONS

Assess:

- B/P lying, standing; pulse; if systolic B/P drops 20 mm Hg, hold product, notify prescriber • CNS reactions because some may be unpredictable
- Mental status: mood, sensorium, affect, sleeping pattern, drowsiness, dizziness; withdrawal symptoms when dose reduced, product discontinued

Perform/provide:

- Safety measures if drowsiness, dizziness occurs

Evaluate:

- Therapeutic response: decreased anxiety, restlessness, sleeplessness

Teach patient/family:

- That product may be taken consistently with/without food
- To avoid OTC preparations, alcohol ingestion, other psychotropic medications unless approved by prescriber; to avoid large amounts of grapefruit juice • To avoid activities that require alertness because drowsiness may occur
- Not to discontinue medication abruptly after long-term use; if dose missed, do not double • To rise slowly because fainting may occur, especially among geriatric patients
- That drowsiness may worsen at beginning of treatment; that 1-2 wk of therapy may be required before therapeutic effects occur • **Serotonin syndrome: to report immediately (fever, tremor, sweating, diarrhea, delirium)**

☼ Canada only Side effects: *italics* = common; **bold** = life-threatening ⚠
Nurse Alert

HIGH ALERT

busulfan (Rx)

(byoo-sul'fan)

Busulfex, Myleran

Func. class.: Antineoplastic alkylating agent

Chem. class.: Bifunctional alkylating agent

Do not confuse: Myleran/Leukeran

ACTION:

Changes essential cellular ions to covalent bonding with resultant alkylation; this interferes with the normal biological function of DNA; activity is not phase-specific; action is due to myelosuppression

USES:

Chronic myelocytic leukemia, bone marrow ablation, stem cell transplant preparation with CML

CONTRAINDICATIONS:

Pregnancy (D) 3rd trimester, breastfeeding, radiation, chemotherapy, blastic phase of chronic myelocytic leukemia, hypersensitivity

Precautions: Women of childbearing age, leukopenia, anemia, hepatotoxicity, renal toxicity, seizures, tumor lysis syndrome, hyperkalemia, hyperphosphatemia, hypocalcemia, hyperuricemia

Black Box Warning:

Thrombocytopenia, neutropenia, secondary malignancy

DOSAGE AND ROUTES

Calculator

Chronic myelocytic leukemia

- **Adult: PO** 4-8 mg/day or 1.8-4 mg/m²/day initially, reduce dose if WBC reaches 30,000-40,000/mm³, discontinue if WBC ≤20,000/mm³, maintenance 1-3 mg/day
- **Child: PO** 0.06-0.12 mg/kg/day or 1.8-4.6 mg/m²/day; reduce if WBC reaches 30,000-40,000/mm³, discontinue if WBC ≤20,000/mm³

Allogenic hemopoietic stem cell transplantation with chronic myelogenous

leukemia

- **Adult: IV** 0.8 mg/kg over 2 hr, q6hr × 4 days (total 16 doses); give cyclophosphamide **IV** 60 mg/kg over 1 hr daily for 2 days starting after 16th dose of busulfan; **PO** (unlabeled) 1 mg/kg q6hr × 16 doses
- **Adolescent and child (unlabeled) >12 kg: IV** 0.8 mg/kg over 2 hr q6hr × 16 doses (4 days) then high-dose cyclophosphamide 50 mg/kg/day × 4 days
- **Infant/child ≤12 kg (unlabeled): IV** 1.1 mg/kg over 2 hr q6hr × 16 doses (4 days) then high-dose cyclophosphamide 50 mg/kg/day × 4 days

Available forms: Tabs 2 mg; inj 6 mg/ml

Administer:

PO route

- Give at same time daily on empty stomach

Intermittent IV INF route

- Prepare in biologic cabinet while wearing gloves, gown, mask; **dilute** with 10 times volume of product with D₅W, 0.9% NaCl, (0.5 mg/ml); when withdrawing product, use needle with 5-micron filter provided, remove amount needed, remove filter, and **inject** product into diluent; always add product to diluent (not vice versa); stable for 8 hr at room temp (using D₅W) or 12 hr refrigerated; **give** by central venous catheter over 2 hr q6hr × 4 days, use inf pump, do not admix
- Give antiemetics before IV route on schedule
- In those with history of seizures, give phenytoin before IV drug to prevent seizures (using 0.9% NaCl)

Y-site compatibilities: Acyclovir, amphotericin B lipid complex, amphotericin B liposome, anidulafungin, atenolol, bivalirudin, bleomycin, caspofungin, codeine, DAPTOmycin, dexmedetomidine, diltiazem, DOCEtaxel, ertapenem, fenoldopam, gatifloxacin, granisetron, HYDROmorphine, levofloxacin, linezolid, LORazepam, meperidine, metroNIDAZOLE, milrinone, nesiritide, octreotide acetate, ondansetron, palonosetron, pancuronium, piperacillin-tazobactam, riTUXimab, sodium acetate, tacrolimus, tigecycline, tirofiban, trastuzumab, vasopressin

SIDE EFFECTS

PO route

CV: Hypotension, thrombosis, chest pain, tachycardia, atrial fibrillation, heart

block, pericardial effusion, cardiac tamponade (high dose with cyclophosphamide)

GI: Anorexia, constipation, diarrhea, dry mouth, nausea, vomiting

RESP: Alveolar hemorrhage, atelectasis, cough, hemoptysis, hypoxia, pleural effusion, pneumonia, sinusitis, pulmonary fibrosis

IV route

CNS: Cerebral hemorrhage, coma, seizures, anxiety, depression, dizziness, headache, encephalopathy, weakness, mental changes

EENT: Pharyngitis, epistaxis, cataracts

GI: Nausea, vomiting, diarrhea, weight loss

GU: Impotence, sterility, amenorrhea, gynecomastia, renal toxicity, hyperuremia, adrenal-insufficiency–like syndrome

HEMA: Thrombocytopenia, leukopenia, pancytopenia, severe bone marrow depression

INTEG: Dermatitis, hyperpigmentation, alopecia

OTHER: Chromosomal aberrations

RESP: Irreversible pulmonary fibrosis, pneumonitis

PHARMACOKINETICS

Well absorbed orally, excreted in urine, crosses placenta, excreted in breast milk, half-life 2.5 hr

INTERACTIONS

Increase: hepatotoxicity—thioguanine

Increase: cardiac tamponade—cyclophosphamide

Increase: toxicity—other antineoplastics, radiation

Increase: risk for bleeding—anticoagulants, salicylates

Increase: antibody response—live virus vaccines

Decrease: busulfan level—phenytoin

Decrease: busulfan clearance—acetaminophen, itraconazole

Drug/Lab Test

False positive: breast, bladder, cervix, lung cytology tests

NURSING CONSIDERATIONS

Assess:

Black Box Warning:

CBC, differential, platelet count weekly; withhold product if WBC is $<15,000/\text{mm}^3$ or platelet count is $<150,000/\text{mm}^3$; notify prescriber of results; institute thrombocytopenia precautions; levels for withholding product will be different for children

Black Box Warning:

Bone marrow status before chemotherapy; seizure history; bone marrow suppression may be prolonged (up to 2 mo)

• **Pulmonary fibrosis:** pulmonary function tests, chest x-ray films before, during therapy; chest film should be obtained q2wk during treatment; pulmonary fibrosis may occur up to 10 yr after treatment with busulfan • **Renal studies:** BUN, serum uric acid, urine CCr before, during therapy; monitor ALT, alk phos, bilirubin, uric acid before and during treatment; I&O ratio; report fall in urine output of $<30 \text{ ml/hr}$; hyperuricemia

Black Box Warning:

For secondary malignancy within 5-8 yr of chronic oral therapy, long-term follow-up may be required

- Monitor for cold, fever, sore throat (may indicate beginning infection)
- Bleeding: hematuria, guaiac, bruising, petechiae; mucosa, orifices q8hr; no rectal temps • Dyspnea, crackles, nonproductive cough, chest pain, tachypnea
- Inflammation of mucosa, breaks in skin; use viscous xylocaine for oral pain

Perform/provide:

- Comprehensive oral hygiene
- Strict medical asepsis, protective isolation if WBC levels low
- Increased fluid intake to 2-3 L/day to prevent urate deposits, calculi formation
- Storage in tight container

Evaluate:

- Therapeutic response: decreased exacerbations of chronic myelocytic leukemia

Teach patient/family:

- To avoid use of products that contain aspirin, ibuprofen; razors; commercial mouthwash
- To use effective contraception during and for at least 3 mo after treatment; to avoid breastfeeding; may cause infertility, discuss family planning before initiating therapy, pregnancy (D) • To report signs of **anemia** (fatigue, headache, irritability, faintness, shortness of breath); symptoms of **infection**; jaundice; persistent cough, congestion, skin pigmentation, darkening of skin; sudden weakness, weight loss (may resemble adrenal insufficiency) • To report symptoms of bleeding (hematuria, tarry stools)

- To avoid vaccinations, crowds, persons with known infections
 - That impotence, amenorrhea can occur; that these are reversible after discontinuing treatment
-

🍁 Canada only Side effects: *italics* = common; **bold** = life-threatening ⚠️
Nurse Alert

butoconazole vaginal antifungal

See [Appendix B](#)

butorphanol (Rx)

(byoo-tor'fa-nole)

Func. class.: Opioid analgesic

Chem. class.: Mixed opioid antagonist, partial agonist

Controlled Substance Schedule IV

ACTION:

Depresses pain impulse transmission at the spinal cord level by interacting with opioid receptors

USES:

Moderate to severe pain, general anesthesia induction/maintenance, headache, migraine, preanesthesia

Unlabeled uses: Pruritus

CONTRAINDICATIONS:

Hypersensitivity to product, preservative; addiction (opioid)

Precautions: Pregnancy (C), breastfeeding, children <18 yr, addictive personality, increased intracranial pressure, respiratory depression, renal/hepatic disease, bowel impaction, CHF, MI

DOSAGE AND ROUTES

Calculator

Moderate-severe pain

- **Adult:** **IM** 1-4 mg q3-4hr prn; **IV** 0.5-2 mg q3-4hr prn; **INTRANASAL** 1 spray in 1 nostril, may give another dose 1-1½ hr later; repeat if needed 3-4hr after last dose
- **Geriatric:** **IV** 1/2 adult dose at 2× the interval; **INTRANASAL** if no relief after 90-120 min, may repeat with 1 spray

Renal/hepatic dose

- **Adult: INTRANASAL** max 1 mg followed by 1 mg after 90-120 min; **IM/IV** give 50% of dose (0.5 mg **IV**, 1 mg **IM**), do not repeat within 6 hr

Opioid-induced pruritus (unlabeled)

- **Adult: INTRANASAL** 1 mg (1 spray) in each nostril q4-6hr

Intractable pruritus with inflammatory skin or systemic disease (unlabeled)

- **Adult: INTRANASAL** 1-4 mg/day

Available forms: Inj 1, 2 mg/ml; nasal spray 10 mg/ml

Administer:

- With antiemetic if nausea, vomiting occur
- When pain beginning to return; determine dosage interval according to patient response

Nasal route

- Prime before first use, point sprayer away from the face, pump activator 7 times until a fine, wide spray occurs if not used for 48 hr, reprime by pumping 1-2 ×
- If more than 1 spray is needed, use other nostril
- Do not share with others
- Nasal congestion/irritation may occur

IM route

- Deeply in large muscle mass

IV direct route

- Undiluted at a rate of <2 mg/>3-5 min, titrate to patient response; inject directly in vein or tubing of free-flowing compatible IV inf

Syringe compatibilities: Atropine, chlorproMAZINE, cimetidine, diphenhydrAMINE, droperidol, fentaNYL, hydrOXYzine, meperidine, methotrimeprazine, metoclopramide, midazolam, morphine, pentazocine, perphenazine, prochlorperazine, promethazine, scopolamine, thiethylperazine

Y-site compatibilities: Acyclovir, alfentanil, allopurinol, amifostine, amikacin, aminocaproic acid, aminophylline, amphotericin B liposome (AmBisome), anidulafungin, ascorbic acid injection, atenolol, atracurium, atropine, aztreonam, benztropine, bivalirudin, bleomycin, bumetanide, buprenorphine, calcium chloride/gluconate, CARBOplatin, caspofungin, cefamandole, ceFAZolin, cefepime, cefmetazole, cefonicid, cefoperazone, cefotaxime, cefoTEtan, cefOXitin, cefTAZidime, ceftizoxime, cefTRIAxone, cefuroxime, cephalothin,

chlorproMAZINE, cimetidine, cisatracurium, CISplatin, cladribine, clindamycin, cyanocobalamin, cyclophosphamide, cycloSPORINE, cytarabine, DACTINomycin, DAPTOmycin, dexamethasone phosphate, dexmedetomidine, digoxin, diltiazem, diphenhydrAMINE, DOBUTamine, DOCEtaxel, DOPamine, doxacurium, DOXOrubicin, DOXOrubicin liposomal, doxycycline, enalaprilat, ePHEDrine, EPINEPHrine, epirubicin, epoetin alfa, eptifibatide, ertapenem, erythromycin, esmolol, etoposide, famotidine, fenoldopam, fentaNYL, filgrastim, fluconazole, fludarabine, fluorouracil, gatifloxacin, gemcitabine, gentamicin, glycopyrrolate, granisetron, heparin, hydrocortisone, hydrOXYzine, IDArubicin, ifosfamide, imipenem-cilastatin, irinotecan, isoproterenol, ketorolac, labetalol, lactated Ringer's injection, levofloxacin, lidocaine, linezolid injection, LORazepam, magnesium, mannitol, mechlorethamine, melphalan, meperidine, metaraminol, methicillin, methotrexate, methoxamine, methyl dopate, methylPREDNISolone, metoclopramide, metoprolol, metroNIDAZOLE, mezlocillin, miconazole, milrinone, minocycline, mitoXANtrone, morphine, moxalactam, multiple vitamins injection, mycophenolate mofetil, nafcillin, nalbuphine, naloxone, nesiritide, netilmicin, niCARdipine, nitroglycerin, nitroprusside, norepinephrine, octreotide, ondansetron, oxacillin, oxaliplatin, oxytocin, palonosetron, pamidronate, pancuronium, papaverine, PEMEtrexed, penicillin G potassium/sodium, pentazocine, PHENobarbital, phenylephrine, phytonadione, piperacillin, piperacillin-tazobactam, polymyxin B, potassium chloride, procainamide, prochlorperazine, promethazine, propofol, propranolol, protamine, pyridoxine, quiNIDine, ranitidine, remifentanyl, Ringer's injection, ritodrine, riTUXimab, rocuronium, sargramostim, sodium acetate, succinylcholine, SUFentanyl, tacrolimus, teniposide, theophylline, thiamine, thiotepa, ticarcillin, ticarcillin-clavulanate, tigecycline, tirofiban, TNA, tobramycin, tolazoline, TPN, trastuzumab, trimetaphan, urokinase, vancomycin, vasopressin, vecuronium, verapamil, vinCRISTine, vinorelbine, voriconazole

SIDE EFFECTS

CNS: *Drowsiness, dizziness, confusion, headache, sedation, euphoria, weakness, hallucinations, insomnia (nasal)*

CV: Palpitations, bradycardia, hypotension

EENT: Tinnitus, blurred vision, miosis, diplopia, nasal congestion, unpleasant

taste

GI: Nausea, vomiting, anorexia, constipation, cramps

GU: Dysuria, urinary retention

INTEG: Rash, urticaria, bruising, flushing, diaphoresis, pruritus

RESP: Respiratory depression, URI, sinusitis

PHARMACOKINETICS

Metabolized by liver, excreted by kidneys, crosses placenta, excreted in breast milk, half-life 2-9 hr, protein binding 80%

IM: Onset 5-15 min, peak 30-60 min, duration 3-4 hr

INTRANASAL: Onset within 15 min, peak 1-2 hr, duration 4-5 hr

IV: Onset 1 min, peak 4-5 min, duration 2-4 hr

INTERACTIONS

 **Increase:** Severe, fatal reactions: MAOIs

Increase: CNS effects—alcohol, opioids, sedative/hypnotics, antipsychotics, skeletal muscle relaxants, other CNS depressants

NURSING CONSIDERATIONS

Assess:

- For decreasing output; may indicate urinary retention

 **For withdrawal symptoms in opioid-dependent patients; PE, vascular occlusion, abscesses, ulcerations** • CNS changes: dizziness, drowsiness, hallucinations, euphoria, LOC, pupil reaction

- Allergic reactions: rash, urticaria
- Respiratory dysfunction: respiratory depression, character, rate, rhythm; notify prescriber if respirations are <10/min • Need for pain medication, physical dependence

Perform/provide:

- Storage in light-resistant container at room temp
- Safety measures: night-light, call bell within easy reach, assistance with ambulation, especially for geriatric patients

Evaluate:

- Therapeutic response: decrease in pain

Teach patient/family:

- To report any symptoms of CNS changes, allergic reactions

- That physical dependency may result when used for extended periods
- That withdrawal symptoms may occur: nausea, vomiting, cramps, fever, faintness, anorexia • How to use nasal product
- To avoid hazardous activities

TREATMENT OF OVERDOSE:

Naloxone HCl (Narcan) 0.2-0.8 mg IV, O₂, IV fluids, vasopressors

🍁 Canada only Side effects: *italics* = common; **bold** = life-threatening ⚠️
Nurse Alert

calcitonin (rDNA) (Rx)

(kal-sih-toh'nin)

Fortical

calcitonin (salmon) (Rx)

Miacalcin

Func. class.: Parathyroid agents (calcium regulator)

Chem. class.: Polypeptide hormone

ACTION:

Decreases bone resorption, blood calcium levels; increases deposits of calcium in bones; opposes parathyroid hormone

USES:

Paget's disease, postmenopausal osteoporosis, hypercalcemia

Unlabeled uses: Bone/neuropathic pain, diabetic neuropathy, osteolytic metastases, osteoporosis prophylaxis, phantom limb pain

CONTRAINDICATIONS:

Hypersensitivity to this product, fish

Precautions: Pregnancy (C), breastfeeding, children, renal disease, osteogenic sarcoma, pernicious anemia

DOSAGE AND ROUTES

Calculator

rDNA

Paget's disease

- **Adult:** SUBCUT 0.5 mg/day initially; may require 0.5 mg bid × 6 mo, then decrease until symptoms reappear

Salmon

Postmenopausal osteoporosis

- **Adult:** SUBCUT/IM 100 international units every other day; INTRANASAL 200 international units (1 spray) daily alternating nostrils daily, activate pump before 1st dose

Paget's disease

- **Adult: SUBCUT/IM** 100 international units/day, maintenance 50 international units daily, every other day or 3 × per wk

Hypercalcemia

- **Adult: SUBCUT/IM** 4 international units/kg q12hr, increase to 8 international units/kg q12hr if response is unsatisfactory

Neuropathic pain/phantom limb pain/diabetic neuropathy (unlabeled)

- **Adult: IV/SUBCUT** 100-200 international units/day for phantom limb pain **IV** 200 international units over 20 min and 2nd inf given

Bone pain due to osteoporosis, osteolytic metastases (unlabeled)

- **Adult: SUBCUT** 50-100 international units/day or **INTRANASAL** 200 international units in 1 nostril/day

Available forms: Inj 200 international units/ml; nasal spray 200 international units/actuation

Administer:

SUBCUT route (rDNA)

- By SUBCUT route only; rotate inj sites; use within 6 hr of reconstitution; **give** at bedtime to minimize nausea, vomiting, rotate sites

IM route (Salmon)

- After test dose of 10 international units/ml, 0.1 ml intradermally; watch for 15 min; **give** only with epinephrine, emergency meds available • IM inj slowly into deep muscle mass; rotate sites; preferred route if volume is >2 ml

SIDE EFFECTS

CNS: Headache, tetany, chills, weakness, dizziness, fever, tremors

CV: Chest pressure

EENT: Nasal congestion, eye pain

GI: Nausea, diarrhea, vomiting, anorexia, abdominal pain, salty taste, epigastric pain

GU: Diuresis, nocturia, urine sediment, frequency

INTEG: Rash, flushing, pruritus of earlobes, edema of feet, reaction at inj site

MS: Swelling, tingling of hands, backache

RESP: Dyspnea

SYST: Anaphylaxis

PHARMACOKINETICS

IM/SUBCUT: Onset 15 min, peak 4 hr, duration 8-24 hr, metabolized by kidneys, excreted as inactive metabolites via kidneys

INTERACTIONS

Decrease: lithium effect

Decrease: effect of nasal spray—biphosphonates (Paget's disease)

NURSING CONSIDERATIONS

Assess:

 **Anaphylaxis, hypersensitivity reaction** (rash, fever, inability to breathe); emergency equipment should be nearby • GI symptoms, polyuria, flushing, head swelling, tingling, headache; may indicate hypercalcemia • Nutritional status; diet for sources of vit D (milk, some seafood), calcium (dairy products, dark green vegetables), phosphates • Urinalysis (calcium should be kept at 9-10 mg/dl, vit D 50-135 international units/dl), alk phos baseline, q3-6mo; monitor urine hydroproline with Paget's disease, biochemical markers of bone formation/absorption, radiologic evidence of fracture; bone density (osteoporosis) • **Toxicity (can occur rapidly)**, increased drug level; have parenteral calcium on hand if calcium level drops too low; check for tetany (irritability, paresthesia, nervousness, muscle twitching, seizures, tetanic spasms)

Perform/provide:

- Storage at <77° F (25° C); protect from light

Evaluate:

- Therapeutic response: calcium levels 9-10 mg/dl, decreasing symptoms of Paget's disease

Teach patient/family:

- About the method of inj if patient will be responsible for self-medication
- To report difficulty swallowing, any changes in side effects to prescriber immediately

Nasal

- To use alternating nostrils for nasal spray; use after allowing to warm to room temp; prime to get full spray

☼ Canada only Side effects: *italics* = common; **bold** = life-threatening 
Nurse Alert

calcitriol vitamin D₃ (Rx)

(kal-sih-try'ole)

Calcijex, Rocaltrol, Vectical

Func. class.: Parathyroid agent (calcium regulator)

Chem. class.: Vit D hormone

Do not confuse: **calcitriol**/Calciferol

ACTION:

Increases intestinal absorption of calcium, provides calcium for bones, increases renal tubular resorption of phosphate

USES:

Hypocalcemia with chronic renal disease, hyperparathyroidism
pseudohypoparathyroidism

Unlabeled uses: Osteopetrosis, osteoporosis, osteoporosis prophylaxis, rickets, familial hypophosphatemia

CONTRAINDICATIONS:

Hypersensitivity, hyperphosphatemia, hypercalcemia, vit D toxicity

Precautions: Pregnancy (C), breastfeeding, renal calculi, CV disease

DOSAGE AND ROUTES

Calculator

Hypocalcemia (stage 5 chronic kidney disease, on dialysis)

- **Adult and child ≥6 yr: PO** 0.25 mcg/day **IV** 0.5 mcg tid initially; may increase by 0.25 every other day q4-8wk
- **Child 1-5 yr: PO** 0.25-2 mcg/day

Renal osteodystrophy

- **Adult and child ≥3 yr: PO** 0.25 mcg/day, may increase to 0.5 mcg/day
- **Child <3 yr: PO** 0.01-0.015 mcg/kg/day

Hypoparathyroidism

- **Adult and child ≥6 yr: PO** 0.25 mcg/day, may increase q2-4wk, maintenance 0.5-2 mcg/day
- **Child 1-5 yr: PO** 0.25-0.75 mcg daily

- **Child <1 yr: PO** 0.04-0.08 mcg/kg/day

Rickets (unlabeled)

- **Adult and child: PO** 1 mcg/day

Familial hypophosphatemia (unlabeled)

- **Adult: PO** 2 mcg/day
- **Child: PO** 0.015-0.02 mcg/kg/day, maintenance 0.03-0.06 mcg/kg/day; max 2 mcg/day

Postmenopausal osteoporosis (unlabeled)

- **Adult: PO** 0.25 mcg bid, adjust to serum calcium levels

Osteopetrosis (unlabeled)

- **Child: PO** high-dose calcitriol 1-2 mcg/kg/day given in 4-6 divided doses

Osteoporosis prophylaxis in corticosteroid therapy (unlabeled)

- **Adult: PO** 0.5-1 mcg/day

Available forms: Caps 0.25, 0.5 mcg; inj 1 mcg/ml, 2 mcg/ml; oral sol 1 mcg/ml; top 3 mcg/g

Administer:

PO route

- Do not break, crush, chew caps
- Give without regard to meals

IV route

- Give by direct IV over 1 min

SIDE EFFECTS

CNS: Drowsiness, headache, vertigo, fever, lethargy, hallucinations

CV: Palpitations, hypertension

EENT: Blurred vision, photophobia

GI: Nausea, diarrhea, vomiting, jaundice, anorexia, dry mouth, constipation, cramps, metallic taste

GU: Polyuria, hypercalciuria, hyperphosphatemia, hematuria, thirst

MS: Myalgia, arthralgia, decreased bone development, weakness

SYST: Anaphylaxis

PHARMACOKINETICS

PO: Absorbed readily from GI tract, peak 10-12 hr, duration 3-5 days, half-life 3-6 hr, undergoes hepatic recycling, excreted in bile

INTERACTIONS

- Hypercalcemia: thiazide diuretics, calcium supplements
- Cardiac dysrhythmias: cardiac glycosides, verapamil
- Hypermagnesemia: magnesium antacids
- Toxicity: other vit D products

Increase: metabolism of vit D—phenytoin

Decrease: absorption of calcitriol—cholestyramine, mineral oil, fat-soluble vitamins

Drug/Food

- Large amounts of high-calcium foods may cause hypercalcemia

Drug/Lab Test

False increase: cholesterol

Interference: alk phos, electrolytes

NURSING CONSIDERATIONS

Assess:

- BUN, urinary calcium, PTH, creatinine, chloride, magnesium, electrolytes, phosphate; may increase calcium; should be kept at 9-10 mg/dl, vit D 50-135 international units/dl, phosphate 70 mg/dl; toxic reactions may occur rapidly
- **Hypercalcemia:** dry mouth, metallic taste, polyuria, bone pain, muscle weakness, headache, fatigue, change in level of consciousness, dysrhythmias, increased respirations, anorexia, nausea, vomiting, cramps, diarrhea, constipation; paresthesia, twitching, dysrhythmias, Chvostek's sign, Trousseau's sign (**hypocalcemia**)
- Renal status: decreased urinary output (oliguria, anuria), edema in extremities, weight gain 5-7 lb, periorbital edema
- Nutritional status, diet for sources of vit D (milk, some seafood); calcium (dairy products, dark green vegetables), phosphates (dairy products) must be avoided

Perform/provide:

- Storage protected from light, heat, moisture
- Restriction of sodium, potassium if required; restriction of fluids if required for chronic renal failure

Evaluate:

- Therapeutic response: calcium 9-10 mg/dl; decreasing symptoms of

hypocalcemia, hypoparathyroidism

Teach patient/family:

- About symptoms of hypercalcemia: renal stones, nausea, vomiting, anorexia, lethargy, thirst, bone or flank pain
 - To avoid products with sodium: cured meats, dairy products, cold cuts, olives, beets, pickles, soups, meat tenderizers with chronic renal failure; products with potassium: oranges, bananas, dried fruit, peas, dark green leafy vegetables, milk, melons, beans
 - To avoid OTC products that contain calcium, potassium, sodium with chronic renal failure
 - To monitor weight weekly; to maintain fluid intake
-

🍁 Canada only Side effects: *italics* = common; **bold** = life-threatening ⚠️

calcium carbonate

(PO-OTC)

AcidFree, Alka-Mints, Amitone, Apo-Cal , Calcarb, Calci-Chew, Calci-Mix, Calcite , Cal-Gest, Caltrate, Equaline Calcium, Leader Calcium, Maalox Antacid, Os-Cal 500, Roloids Extra Strength Softchew, Tums, Tums E-X, Walgreens Calcium

calcium acetate (OTC)

(kal'see-um ass'e-tate)

Calphron, Eliphos, PhosLo

Func. class.: Antacid, calcium supplement

Chem. class.: Calcium product

Do not confuse: **Os-Cal**/Asacol

ACTION:

Neutralizes gastric acidity

USES:

Antacid, calcium supplement; not suitable for chronic therapy, hyperphosphatemia, hypertension during pregnancy, osteoporosis, prevention, treatment of hypocalcemia, hypoparathyroidism

Unlabeled uses: Duodenal ulcer, PMS, stress gastritis

CONTRAINDICATIONS:

Hypersensitivity, hypercalcemia, hyperparathyroidism, bone tumors

Precautions: Pregnancy (C), breastfeeding, geriatric patients, fluid restriction, decreased GI motility, GI obstruction, dehydration, renal disease

DOSAGE AND ROUTES

Calculator

Nutritional supplement including osteoporosis prophylaxis

- **Adult ≥51 yr: PO** 1000-1500 mg/day elemental calcium (2500-3750 mg/day calcium carbonate)
- **Adult 19-50 yr: PO** 1000 mg/day elemental calcium (2500 mg/day calcium carbonate)

Chronic hypocalcemia

- **Adult: PO** 2-4 g/day elemental calcium (5-10 g/day calcium carbonate) in 3-4 divided doses
- **Child: PO** 45-65 mg/kg/day elemental calcium (112.5-162.5 mg/kg/day calcium carbonate) in 4 divided doses
- **Neonate: PO** 50-150 mg/kg/day elemental calcium (125-375 mg/kg/day in 4-6 divided doses, max 1 g/day)

Supplementation

- **Adolescent and child 9-18 yr: PO** 1300 mg elemental calcium (3250 mg calcium carbonate)
- **Child 4-8 yr: PO** 800 mg/day elemental calcium (2000 mg/day calcium carbonate)
- **Child 1-3 yr: PO** 500 mg/day elemental calcium (1250 mg/day calcium carbonate)
- **Infant 6-12 mo: PO** 270 mg/day elemental calcium based on total intake
- **Neonates and infants <6 mo: PO** 210 mg/day elemental calcium based on total intake

Hyperphosphatemia

- **Adult: PO** Individualized on response

Heartburn, dyspepsia, hyperacidity (OTC)

- **Adult: PO** 1-2 tabs q2hr, max 9 tabs/24 hr (Alka-mints); chew 2-4 tab q1hr prn, max 16 tabs (Tums regular strength); chew 2-4 tab q1hr prn, max 10 tabs (Tums E-X); chew 2-3 tabs q1hr prn, max 10 tabs/24 hr (Tums Ultra); chew 2 tabs q2-3hr, max 19 tabs/24 hr (Titralac Extra Strength)

Duodenal ulcer/stress gastritis (unlabeled)

- **Adult: PO** 80-140 mEq q1-3hr

PMS (unlabeled)

- **Adult: PO** (Tums EX, Tums Calcium for Life PMS) Chew 2 tabs bid

Available forms: Calcium carbonate: chewable tabs 350, 420, 450, 500, 750, 1000, 1250 mg; tabs 500, 600, 650, 667, 1000, 1250, 1500 mg; gum 300, 450, 500 mg; susp 1250 mg/5 ml; caps 1250 mg; powder 6.5 g/packet; **calcium acetate:** tabs 250 mg (65 mg Ca), 667 mg (169 mg Ca), 668 mg (169 mg Ca), 1 g (250 mg Ca); caps 500 mg (125 mg Ca)

Administer:

PO route

- Do not give enteric-coated within 1 hr of calcium carbonate
- For ulcer treatment (adjunct): give 1 and 3 hr after meals and at bedtime
- For a phosphate binder: give 1 hr after each meal or snack and at bedtime
- For supplement: give 1-1½ hr after meals; avoid oxalic acid foods (spinach, rhubarb), phytic acid (brans, cereals) or phosphorus (milk, dairy), may decrease calcium absorption • Suspension: shake well, use calibrated measuring device
- Laxatives or stool softeners if constipation occurs

SIDE EFFECTS

GI: *Constipation*, anorexia, nausea, vomiting, flatulence, diarrhea, rebound hyperacidity, eructation

GU: Calculi, hypercalciuria

PHARMACOKINETICS

1/3 of dose absorbed by small intestine, onset 20 min, duration 20-180 min, excreted in feces and urine, crosses placenta, must have adequate vit D for absorption

INTERACTIONS

Increase: digoxin toxicity—hypercalcemia

Increase: plasma levels of quinine, amphetamines

Increase: hypercalcemia—thiazide diuretics

Decrease: levels of salicylates, calcium channel blockers, ketoconazole, iron salts, tetracyclines, fluoroquinolones, phenytoin, etidronate, risedronate, atenolol

Drug/Lab Test

False increase: chloride

False positive: benzodiazepines

False decrease: magnesium, oxylate, lipase

NURSING CONSIDERATIONS

Assess:

- Calcium (serum, urine), calcium should be 8.5-10.5 mg/dl, urine calcium should be 150 mg/day, monitor weekly; serum phosphate  **Milk-alkali syndrome:** nausea, vomiting, disorientation, headache • Constipation; increase bulk in the diet if needed

- **Hypercalcemia:** headache, nausea, vomiting, confusion; hypocalcemia: paresthesia, twitching colic, dysrhythmias, Chvostek's sign, Trousseau's sign
- Those taking digoxin for toxicity
- Antacid—for abdominal pain, heartburn, indigestion before, after administration

Evaluate:

- Therapeutic response: absence of pain, decreased acidity; decreased hyperphosphatemia with renal failure

Teach patient/family:

- To increase fluids to 2 L unless contraindicated; to add bulk to diet for constipation; to notify prescriber of constipation • Not to switch antacids unless directed by prescriber; not to use as antacid for >2 wk without approval by prescriber • That therapeutic dose recommendations are figured as elemental calcium
- To avoid excessive use of alcohol, caffeine, tobacco
- To avoid spinach, cereals, dairy products in large amounts

🍁 Canada only Side effects: *italics* = common; **bold** = life-threatening ⚠️
Nurse Alert

CALCIUM SALTS

calcium chloride (Rx)

calcium gluceptate (Rx)

calcium gluconate (Rx)

calcium lactate (Rx)

Func. class.: Electrolyte replacement—calcium product

ACTION:

Caution needed for maintenance of nervous, muscular, skeletal function; enzyme reactions; normal cardiac contractility; coagulation of blood; affects secretory activity of endocrine, exocrine glands

USES:

Prevention and treatment of hypocalcemia, hypermagnesemia, hypoparathyroidism, neonatal tetany, cardiac toxicity caused by hyperkalemia, lead colic, hyperphosphatemia, vit D deficiency, osteoporosis prophylaxis, calcium antagonist toxicity (calcium channel blocker toxicity)

Unlabeled uses: Electrolyte abnormalities in cardiac arrest, CPR

CONTRAINDICATIONS:

Hypercalcemia, digoxin toxicity, ventricular fibrillation, renal calculi

Precautions: Pregnancy (C), breastfeeding, children, respiratory/renal disease, cor pulmonale, digitalized patient, respiratory failure, diarrhea, dehydration

DOSAGE AND ROUTES

Calculator

Calcium chloride

- **Adult:** **IV** 500 mg-1 g q1-3days as indicated by serum calcium levels, give at <1 ml/min; **IV** 200-800 mg injected in ventricle of heart

Calcium gluceptate

- **Adult:** **IV** 5-20 ml; **IM** 2-5 ml

Calcium gluconate

- **Adult: PO** 0.5-2 g bid-qid; **IV** 0.5-2 g at 0.5 ml/min (10% solution); max **IV** dose 3 g

- **Child: PO/IV** 500 mg/kg/day in divided doses

Calcium lactate

- **Adult: PO** 325 mg-1.3 g tid with meals

- **Child: PO** 500 mg/kg/day in divided doses

Available forms: Many; check product listings

Administer:

PO route (only acetate, carbonate, citrate, glubionate, lactate, phosphate)

- Give in 3-4 divided doses with or 1 hr after meals, follow with full glass of water; if using as phosphate binder in renal dialysis, do not follow with water, do not give oral medications within 1 hr of oral calcium; *chew tab*: chew thoroughly; *effervescent tab*: dissolve in full glass of water; *oral powder*: mix and give with food; *oral solution*: give before meals; *oral suspension*: shake well

IM route

- Glycerophosphate, lactate may be given IM
- **Do not give chloride, gluconate IM**
- Use only if IV is not feasible
- Inject into gluteal region (adult), lateral thigh (child)
- Aspirate before inj
- Do not give chloride subcut

IV route

- Undiluted or diluted with equal amounts of NS to a 5% sol for inj, give 0.5-1 ml/min
- Through small-bore needle into large vein; if extravasation occurs, necrosis will result (IV)
- Remain recumbent 1/2 hr after IV dose

Calcium chloride

Additive compatibilities: Amikacin, amphotericin B, ampicillin, ascorbic acid, cefTRIAXone, cephalirin, chloramphenicol, DOPamine, hydrocortisone, isoproterenol, lidocaine, methicillin, norepinephrine, penicillin G potassium, penicillin G sodium, pentobarbital, PHENobarbital, verapamil, vit B/C

Syringe compatibilities: Milrinone

Y-site compatibilities: Inamrinone, DOBUTamine, EPINEPHrine, esmolol, morphine, PACLitaxel

Calcium gluceptate

Additive compatibilities: Ascorbic acid inj, isoproterenol, lidocaine, norepinephrine, phytonadione, sodium bicarbonate

Calcium gluconate

Additive compatibilities: Amikacin, aminophylline, ascorbic acid inj, cephapirin, chloramphenicol, cisatracurium, corticotropin, dimenhydrinate, DOXOrubicin liposome, erythromycin, furosemide, heparin, hydrocortisone, lidocaine, magnesium sulfate, methicillin, norepinephrine, penicillin G potassium, penicillin G sodium, PHENobarbital, potassium chloride, remifentanyl, tobramycin, vancomycin, verapamil, vit B/C

Syringe compatibilities: Aldesleukin, allopurinol, amifostine, aztreonam, ceFAZolin, cefepime, ciprofloxacin, cladribine, DOBUTamine, enalaprilat, EPINEPHrine, famotidine, filgrastim, granisetron, heparin/hydrocortisone, labetalol, melphalan, midazolam, netilmicin, piperacillin/tazobactam, potassium chloride, prochlorperazine, propofol, sargramostim, tacrolimus, teniposide, thiotepa, tolazoline, vinorelbine, vit B/C

SIDE EFFECTS

CV: Shortened QT, heart block, hypotension, bradycardia, dysrhythmias; cardiac arrest (IV)

GI: Vomiting, nausea, constipation

HYPERCALCEMIA: Drowsiness, lethargy, muscle weakness, headache, constipation, coma, anorexia, nausea, vomiting, polyuria, thirst

INTEG: Pain, burning at IV site, severe venous thrombosis, necrosis, extravasation

PHARMACOKINETICS

Crosses placenta, enters breast milk, excreted via urine and feces, half-life unknown, protein binding 40%-50%

PO: Onset, peak, duration unknown, absorption from GI tract

IV: Onset immediate, duration 1/2-2 hr

INTERACTIONS

Increase: milk-alkali syndrome—antacids

Increase: dysrhythmias—digoxin glycosides

Increase: toxicity—verapamil

Increase: hypercalcemia—thiazide diuretics

Decrease: absorption of fluoroquinolones, tetracyclines, iron salts, phenytoin, thyroid hormones when calcium is taken PO

Decrease: effects of atenolol, verapamil

Drug/Herb

Increase: action/side effects—lily of the valley, pheasant's eye, shark cartilage, squill

Drug/Lab Test

Increase: calcium

NURSING CONSIDERATIONS

Assess:

• **ECG for decreased QT and T wave inversion:** hypercalcemia, product should be reduced or discontinued, consider cardiac monitoring • Calcium levels during treatment (8.5-11.5 g/dl is normal level); urine calcium if hypercaluria occurs • Cardiac status: rate, rhythm, CVP (PWP, PAWP if being monitored directly)

• **Hypocalcemia:** muscle twitching, paresthesia, dysrhythmias, laryngospasm

• Digitalized patients frequently; an increase in calcium increases digoxin toxicity risk

Perform/provide:

• **Seizure precautions:** padded side rails, decreased stimuli (noise, light); place airway suction equipment, padded mouth gag if calcium levels are low • Store at room temp

Evaluate:

• Therapeutic response: decreased twitching, paresthesias, muscle spasms; absence of tremors, seizures, dysrhythmias, dyspnea, laryngospasm; negative Chvostek's sign, negative Trousseau's sign

Teach patient/family:

• To add foods high in vit D

• To add calcium-rich foods to diet: dairy products, shellfish, dark green leafy vegetables; to decrease oxalate-and zinc-rich foods: nuts, legumes, chocolate, spinach, soy • To prevent injuries; to avoid immobilization

🍁 Canada only Side effects: *italics* = common; **bold** = life-threatening ⚠️
Nurse Alert

RARELY USED

calfactant (Rx)

(cal-fak'tant)

Infasurf

Func. class.: Natural lung surfactant extract

USES:

Prevention and treatment (rescue) of respiratory distress syndrome in premature infants

DOSAGE AND ROUTES

Calculator

- **Newborn: INTRATRACHEAL INSTILL:** 3 ml/kg of birth weight given as 2 doses of 1.5 ml/kg; repeat doses of 3 ml/kg of birth wt until up to 3 doses 12 hr apart have been given

🍁 Canada only Side effects: *italics* = common; **bold** = life-threatening ⚠️
Nurse Alert

candesartan (Rx)

(can-deh-sar'tan)

Atacand

Func. class.: Antihypertensive

Chem. class.: Angiotensin II receptor (type AT₁) antagonist

ACTION:

Blocks the vasoconstrictor and aldosterone-secreting effects of angiotensin II; selectively blocks the binding of angiotensin II to the AT₁ receptor found in tissues

USES:

Hypertension, alone or in combination; CHF NYHA Class II-IV and ejection fraction $\leq 40\%$

CONTRAINDICATIONS:

Hypersensitivity

Black Box Warning:

Pregnancy (D) 2nd/3rd trimesters

Precautions: Pregnancy (C) 1st trimester, breastfeeding, children, geriatric patients, hypersensitivity to ACE inhibitors, volume depletion, renal/hepatic impairment

DOSAGE AND ROUTES

Calculator

Hypertension

- **Adult: PO** single agent 16 mg/day initially in patients who are not volume depleted, range 8-32 mg/day; with diuretic or volume depletion 2-32 mg/day as single dose or divided bid
- **Adolescent and child ≥ 6 yr and weight > 50 kg: PO** 8-16 mg/day or divided bid, adjust to B/P; usual range 4-32 mg/day, max 32 mg/day
- **Child ≥ 6 yr, weight < 50 kg: PO** 4-8 mg/day or divided bid, adjust to B/P
- **Child ≥ 1 yr and < 6 yr: PO** 0.2 mg/kg/day in 1 dose or in 2 divided doses, adjust to B/P, max 0.4 mg/kg/day

Heart failure

- **Adult: PO** 4 mg/day, may be doubled ≥ 2 wk, target dose 32 mg/day

Renal/hepatic disease

- **Adult: PO** ≤ 8 mg/day for severe renal disease/moderate hepatic disease, adjust dose as needed

Available forms: Tabs 4, 8, 16, 32 mg

Administer:

- Without regard to meals
- Oral liquid: shake well, do not freeze

SIDE EFFECTS

CNS: *Dizziness*, fatigue, headache

CV: Chest pain, peripheral edema, hypotension

EENT: Sinusitis, rhinitis, pharyngitis

GI: *Diarrhea*, nausea, abdominal pain, vomiting

GU: Renal failure

MS: Arthralgia, pain

RESP: *Cough*, upper respiratory infection

SYST: Angioedema

PHARMACOKINETICS

Peak 3-4 hr, protein binding 99%, half-life 9-12 hr, extensively metabolized, excreted in urine (33%) and feces (67%)

INTERACTIONS

Increase: lithium level—lithium

Increase: hyperkalemia—potassium, potassium-sparing diuretics

Increase: hypotension—ACE inhibitors, β -blockers, calcium channel blockers, α -blockers

Decrease: effect—salicylates, NSAIDs

Drug/Herb

Increase: antihypertensive effect—hawthorn

Decrease: antihypertensive effect—ephedra

NURSING CONSIDERATIONS

Assess:

 **Serious hypersensitivity reaction:** angioedema, anaphylaxis: facial swelling, difficulty breathing (rare)

Black Box Warning:

For pregnancy; this product can cause fetal death when given during pregnancy (D), 2nd/3rd trimester

- Response and adverse reactions, especially with renal disease
- B/P, pulse q4hr; note rate, rhythm, quality; electrolytes: potassium, sodium, calcium; baselines of renal/hepatic studies before therapy begins • **Heart failure:** jugular venous distention, weight, edema, dyspnea, crackles

Evaluate:

- Therapeutic response: decreased B/P

Teach patient/family:

- To comply with dosage schedule, even if feeling better
- To notify prescriber of mouth sores, fever, swelling of hands or feet, irregular heartbeat, chest pain • That excessive perspiration, dehydration, vomiting, diarrhea may lead to fall in B/P; to consult prescriber if these occur • To rise slowly to sitting or standing position to minimize orthostatic hypotension; that product may cause dizziness, fainting, lightheadedness

Black Box Warning:

To notify prescriber immediately if pregnant; not to use if breastfeeding

- To avoid all OTC medications unless approved by prescriber; to inform all health care providers of medication use • To use proper technique for obtaining B/P; to understand acceptable parameters

🍁 Canada only Side effects: *italics* = common; **bold** = life-threatening 
Nurse Alert

capecitabine (Rx)

(cap-eh-sit'ah-bean)

Xeloda

Func. class.: Antineoplastic, antimetabolite

Chem. class.: Fluoropyrimidine carbamate

Do not confuse: Xeloda/Xenical

ACTION:

Competes with physiologic substrate of DNA synthesis, thereby interfering with cell replication in the S phase of cell cycle (before mitosis); also interferes with RNA and protein synthesis; product is converted to 5-FU

USES:

Monotherapy for PACLitaxel; anthracycline-resistant, metastatic breast, colorectal cancer when 5-FU monotherapy is preferred; treatment of colorectal cancer patients who have undergone complete resection of their primary tumors

Unlabeled uses: Biliary tract, ovarian cancer

CONTRAINDICATIONS:

Pregnancy (D), hypersensitivity to 5-FU, infants, severe renal impairment (CCr <30 ml/min), DPD deficiency

Precautions: Breastfeeding, children, geriatric patients, renal/hepatic disease

DOSAGE AND ROUTES

Calculator

Metastatic breast cancer resistant to both PACLitaxel and anthracycline or resistant to PACLitaxel and when further anthracycline therapy is not indicated

- **Adult: PO** 2500 mg/m²/day divided q12hr after a meal × 2 wk, repeat q3wk

Breast cancer (locally advanced/metastatic) with DOCETaxel, previously treated with anthracycline

- **Adult: PO** 2500 mg/m²/day divided q12hr after a meal on days 1-14, with docetaxel 75 mg/m² IV on day 1

Advanced/metastatic breast cancer (HER2 positive) previously treated with anthracycline, taxane, and trastuzumab

- **Adult: PO** 2000 mg/m²/day divided q12hr after a meal on days 1-14 with lapatinib 1250 mg/day on days 1-21, repeat q21days

Metastatic/locally advanced breast cancer resistant to anthracycline, previously treated with a taxane or taxane resistant, and when further anthracycline is contraindicated

- **Adult: PO** 2000 mg/m²/day divided q12hr on days 1-14 with ixabepilone 40 mg/m² IV over 3 hr, repeat q3wk

As an adjuvant for Dukes C colorectal cancer with a complete resection when fluoropyrimidine alone is preferred

- **Adult: PO** 2500 mg/m²/day divided q12hr within 30 min of a meal × 2 wk, repeat q3wk for 8 cycles

First-line treatment of metastatic colorectal cancer when fluoropyrimidine alone is preferred

- **Adult: PO** 2500 mg/m²/day divided q12hr after a meal × 2 wk, repeat q3wk

First-line treatment of metastatic colorectal cancer with oxaliplatin with or without bevacizumab (unlabeled)

- **Adult: PO** 2000 mg/m²/day divided q12hr after a meal on days 1-14 with oxaliplatin on day 1, repeat q3wk

First-/second-line treatment of advanced colorectal cancer with oxaliplatin (unlabeled)

- **Adult: PO** 2000 mg/m²/day divided q12hr on days 1-14 and oxaliplatin 130 mg/m² IV on day 1, repeat q3wk

Unresectable advanced/metastatic biliary tract cancer (unlabeled)

- **Adult: PO** 2500 mg/m² divided q12hr on days 1-14, then 7-day rest period; given with CISplatin 60 mg/m² IV over 1 hr on day 1, repeat q21days

Renal dose

- **Adult: PO** CCr 30-50 ml/min, decrease initial dose to 75% of usual dose; CCr <30 ml/min, contraindicated

Available forms: Tabs 150, 500 mg

Administer:

- **Dosage adjustments of capecitabine monotherapy based on most severe toxicity OR when used in combination with ixabepilone based on nonhematologic toxicity: Grade 1 toxicity:** maintain current dosage; **Grade 2 toxicity (1st appearance):** interrupt therapy until toxicity is resolved to grade 0–1; do not replace missed doses, begin the next cycle with 100% of the starting

dose; **Grade 2 toxicity (2nd appearance):** interrupt therapy until toxicity is resolved to grade 0–1; do not replace missed doses, begin the next cycle with 75% of the starting dose; **Grade 2 toxicity (3rd appearance):** interrupt therapy until toxicity is resolved to grade 0–1; do not replace missed doses, begin the next cycle with 50% of the starting dose; **Grade 2 toxicity (4th appearance):** discontinue treatment permanently; **Grade 3 toxicity (1st appearance):** interrupt therapy until toxicity is resolved to grade 0–1

SIDE EFFECTS

CNS: Dizziness, *headache, paresthesia, fatigue*, insomnia

CV: *Venous thrombosis*

GI: *Nausea, vomiting, anorexia, diarrhea, stomatitis, abdominal pain, constipation, dyspepsia, intestinal obstruction, necrotizing enterocolitis, hyperbilirubinemia, hepatic failure*

HEMA: *Neutropenia, lymphopenia, thrombocytopenia, anemia*

INTEG: *Hand and foot syndrome, dermatitis, nail disorders*

OTHER: *Eye irritation, edema, myalgia, limb pain, pyrexia, dehydration*

RESP: *Cough, dyspnea, pulmonary embolism*

PHARMACOKINETICS

Readily absorbed, peak 1½ hr, food decreases absorption, extensively metabolized in the liver, elimination half-life 45 min

INTERACTIONS

Increase: toxicity—leucovorin

Increase: capecitabine levels—antacids (aluminum, magnesium)

Increase: phenytoin level—phenytoin

Black Box Warning:

Increase: bleeding risk—anticoagulants

Drug/Food

Increase: absorption; give within 30 min of a meal

Drug/Lab Test

Increase: bilirubin

Decrease: Hgb/HcT/RBC, neutrophils, platelets, WBC

NURSING CONSIDERATIONS

Assess:

- **Bone marrow suppression**, CBC (RBC, Hct, Hgb), differential, platelet count weekly; withhold product if WBC is $<4000/\text{mm}^3$, platelet count is $<75,000/\text{mm}^3$, or RBC, Hct, Hgb low; notify prescriber of these results; frequently monitor INR in those receiving warfarin concurrently • Renal studies: BUN, serum uric acid, urine CCr, electrolytes before, during therapy
- Monitor temp q4hr; fever may indicate beginning infection; no rectal temps
- Hepatic studies before, during therapy: bilirubin, ALT, AST, alk phos as needed or monthly

Black Box Warning:

Bleeding: hematuria, heme-positive stools, bruising or petechiae of mucosa or orifices q8hr, monitor INR and PT in those taking anticoagulants

- Dyspnea, crackles, unproductive cough, chest pain, tachypnea, fatigue, increased pulse, pallor, lethargy; personality changes with high doses • **Hand and foot syndrome:** paresthesia, tingling, painful/painless swelling, blistering, erythema with severe pain of hands or feet • **Toxicity:** severe diarrhea (multiple times/day or at night), nausea, vomiting, stomatitis, fever • Buccal cavity q8hr for dryness, sores, ulceration, white patches, oral pain, bleeding, dysphagia • **GI symptoms:** frequency of stools, cramping; if severe diarrhea occurs, fluid, electrolytes may need to be given

Perform/provide:

- Rinsing of mouth tid-qid with water, club soda; brushing of teeth bid-tid with soft brush or cotton-tipped applicators for stomatitis; use unwaxed dental floss

Evaluate:

- Therapeutic response: decreased tumor size, spread of malignancy

Teach patient/family:

- To avoid foods with citric acid, hot or rough texture if stomatitis is present; take with water within 30 min of end of meal • To notify prescriber if pregnancy is planned or suspected, pregnancy (D); to avoid pregnancy while taking this product; not to breastfeed • Not to double dose if dose is missed

⚠ To immediately report severe diarrhea, vomiting, stomatitis, fever of more than 100°F (37.8°C), hand and foot syndrome, anorexia • To report signs of **infection:** increased temp, sore throat, flulike symptoms; signs of **anemia:** fatigue, headache, faintness, shortness of breath, irritability; **bleeding:** to avoid use of razors, commercial mouthwash • OTC antidiarrheals for mild diarrhea (4-6 stools/day or diarrhea at night)

🍁 Canada only Side effects: *italics* = common; **bold** = life-threatening ⚠️
Nurse Alert

captopril (Rx)

(kap'toe-pril)

Apo-Capto , Capoten

Func. class.: Antihypertensive

Chem. class.: Angiotensin-converting enzyme (ACE) inhibitor

Do not confuse: **captopril**/Capitrol/carvedilol

ACTION:

Selectively suppresses renin-angiotensin-aldosterone system; inhibits ACE; prevents conversion of angiotensin I to angiotensin II

USES:

Hypertension, CHF, left ventricular dysfunction after MI, diabetic nephropathy

Unlabeled uses: Acute MI, hypertensive emergency/urgency, scleroderma renal crisis (SRC)

CONTRAINDICATIONS:

Breastfeeding, children, hypersensitivity, heart block, potassium-sparing diuretics, bilateral renal artery stenosis, angioedema

Black Box Warning:

Pregnancy (D)

Precautions: Dialysis patients, hypovolemia, leukemia, scleroderma, SLE, blood dyscrasias, CHF, diabetes mellitus, thyroid/renal/hepatic disease, COPD, asthma

DOSAGE AND ROUTES

Calculator

Hypertension

- **Adult: PO** initial dose: 12.5-25 mg bid-tid; may increase to 50 mg bid-tid at 1-2 wk intervals; usual range: 25-150 mg bid-tid; max 450 mg/day
- **Child: PO** 0.3-0.5 mg/kg/dose, titrate up to 6 mg/kg/day in 2-4 divided doses
- **Neonate: PO** 0.01-0.1 mg/kg/dose, may increase as needed

CHF

- **Adult: PO** 25 mg bid; may increase to 50 mg tid; after 14 days, may increase to 150 mg tid if needed

Diabetic nephropathy

- **Adult: PO** 25 mg tid

Renal dose

- **Adult: PO** CCr >50 ml/min, no change; CCr 10-50 ml/min, decrease dose by 25%; CCr <10 ml/min, decrease dose by 50%

Acute MI (unlabeled) or Post-MI

- **Adult: PO** 6.25-12.5 mg tid, increase to 25 mg tid gradually

Hypertensive emergency/urgency (unlabeled)

- **Adult: PO** 25 mg, may repeat q30min

Available forms: Tabs 12.5, 25, 50, 100 mg

Administer:

- 1 hr before or 2 hr after meals
- **Oral sol:** may crush tab, dissolve in water; give within 1/2 hr; make sure tab completely dissolved

SIDE EFFECTS

CNS: Fever, chills

CV: *Hypotension*, postural hypotension, *tachycardia*, angina

GI: Loss of taste, increased LFTs

GU: Impotence, dysuria, nocturia, proteinuria, *nephrotic syndrome*, *acute reversible renal failure*, polyuria, oliguria, urinary frequency

HEMA: *Neutropenia*, *agranulocytosis*, *pancytopenia*, *thrombocytopenia*, anemia

INTEG: Rash, pruritus

MISC: *Angioedema*, hyperkalemia

RESP: *Bronchospasm*, *dyspnea*, *cough*

PHARMACOKINETICS

Peak 1 hr; duration 2-6 hr; half-life <2 hr, increased in renal disease; metabolized by liver (metabolites); excreted in urine; crosses placenta; excreted in breast milk, small amounts; protein binding 25%-30%

INTERACTIONS

- Do not use with potassium-sparing diuretics, sympathomimetics, potassium supplements

Increase: possible toxicity—lithium, digoxin

Increase: hypoglycemia—insulin, oral antidiabetics

Increase: hypotension—diuretics, other antihypertensives, phenothiazines, nitrates, acute alcohol ingestion

Decrease: captopril effect—antacids, NSAIDs, salicylates

Drug/Herb

Increase: antihypertensive effect—hawthorn

Decrease: antihypertensive effect—ephedra

Drug/Food

Decrease: absorption of captopril

Drug/Lab Test

Increase: AST, ALT, alk phos, bilirubin, uric acid, potassium

Decrease: platelets, WBC, RBC, Hgb/HcT

False positive: urine acetone, ANA titer

NURSING CONSIDERATIONS

Assess:

- **Blood dyscrasias:** blood studies: decreased platelets; WBC with differential at baseline and periodically q3mo; if neutrophils $<1000/\text{mm}^3$, discontinue treatment (recommended with collagen-vascular or renal disease)
- **Hypertension:** B/P, pulse rates at baseline, frequently
- Renal studies: protein, BUN, creatinine; watch for raised levels, may indicate nephrotic syndrome; increased LFTs, uric acid; glucose may be increased
- **Allergic reaction:** rash, fever, pruritus, urticaria; discontinue product if antihistamines fail to help
- **CHF:** edema, dyspnea, wet crackles, increased B/P, weight gain

Perform/provide:

- Storage in tight container at 86° F (30° C) or less

Evaluate:

- Therapeutic response: decrease in B/P with hypertension; edema, moist crackles (CHF)

Teach patient/family:

- To take 1 hr before or 2 hr after meals; not to discontinue product abruptly; if dose is missed, take as soon as remembered but not if almost time for next dose; not to double doses
- Not to use OTC products (cough, cold, or allergy) unless directed by prescriber; avoid salt substitutes, high-potassium or high-sodium foods
- To adhere to dosage schedule, even if feeling better

- To rise slowly to sitting or standing position to minimize orthostatic hypotension
- To notify prescriber of mouth sores, sore throat, fever, swelling of hands or feet, irregular heartbeat, chest pain, signs of angioedema • That excessive perspiration, dehydration, vomiting, diarrhea may lead to fall in B/P; to consult prescriber if these occur
- That dizziness, fainting, lightheadedness may occur during first few days of therapy
- That skin rash or impaired perspiration may occur
- How to take B/P and when to notify prescriber

Black Box Warning:

To report if pregnancy is suspected or planned, pregnancy (D)

TREATMENT OF OVERDOSE:

0.9% NaCl IV/INF; hemodialysis

☼ Canada only Side effects: *italics* = common; **bold** = life-threatening ⚠
Nurse Alert

carbachol ophthalmic

See [Appendix B](#)

carBAMazepine (Rx)

(kar-ba-maz'e-peen)

Carbatrol, Epitol, Equetro, Tegretol, Tegretol-XR

Func. class.: Anticonvulsant

Chem. class.: Iminostilbene derivative

Do not confuse: **TEGretol**/Toradol

ACTION:

Exact mechanism unknown; appears to decrease polysynaptic responses and block posttetanic potentiation

USES:

Tonic-clonic, complex-partial, mixed seizures; trigeminal neuralgia; bipolar disorder

Unlabeled uses: Neurogenic pain, psychotic behavior with dementia, diabetic neuropathy, agitation, hiccups

CONTRAINDICATIONS:

Pregnancy (D), hypersensitivity to carBAMazepine or tricyclics, AV or bundle branch block

Black Box Warning:

Bone marrow depression

Precautions: Breastfeeding, children <6 yr, glaucoma, cardiac/renal/hepatic disease, psychosis, alcoholism, hepatic porphyria

Black Box Warning:

Hematologic disease, Asian patients, agranulocytosis, leukopenia, neutropenia, thrombocytopenia

DOSAGE AND ROUTES

Calculator

Seizures

- **Adult and child >12 yr: PO** 200 mg bid, may be increased by 200 mg/day in weekly intervals, give in divided doses q6-8hr; maintenance 800-1200 mg/day,

max 1600 mg/day (adult); max child 12-15 yr 1000 mg/day; max child >15 yr 1200 mg/day; adjust to minimum dose to control seizures; **EXT REL** give bid; rectal administration of **ORAL SUSP** 200 mg/10 ml or 6 mg/kg as a single dose

- **Child 6-12 yr: PO** tabs 100 mg bid or susp 50 mg qid; may increase by <100 mg q wk; max 1000 mg/day **EXT REL** tabs daily-bid
- **Child <6 yr: PO** 10-20 mg/kg/day in 2-3 divided doses, may increase every wk

Trigeminal neuralgia

- **Adult: PO** 100 mg bid with meals; may increase 100 mg q12hr until pain subsides, max 1200 mg/day; maintenance 200-400 mg bid

Diabetic neuropathy (unlabeled)

- **Adult: PO** 100 mg bid or 50 mg qid, titrate to 600-800 mg/day

Bipolar disorder

- **Adult: PO** (Equetro only) 200 mg bid, may adjust dose by 200 mg/day to desired response, max 1600 mg/day

Agitation due to dementia (unlabeled)

- **Adult: PO** 100 mg bid, may increase to 250-300 mg/day

Hiccups (unlabeled)

- **Adult: PO** 200 mg tid

Available forms: Chewable tabs 100, 200 mg; tabs 200 mg; ext rel tabs (XR) 100, 200, 400 mg; oral susp 100 mg/5 ml; ext rel caps 100, 200, 300 mg

Administer:

PO route

- Do not crush, chew ext rel tab; ext rel cap may be opened and beads sprinkled over food; patient should chew chewable tab, not swallow it whole • With food, milk to decrease GI symptoms; shake oral susp before use
- Mix an equal amount of water, D₅W, 0.9% NaCl when giving by NG tube; flush tube with 100 ml of above sol

SIDE EFFECTS

CNS: *Drowsiness*, dizziness, unsteadiness, confusion, fatigue, **paralysis**, headache, hallucinations, **worsening of seizures**, speech disturbance, **suicidal thoughts/behaviors**

CV: **Hypertension**, **CHF**, **dysrhythmias**, **AV block**, hypotension, aggravation of cardiac artery disease

EENT: Tinnitus, dry mouth, blurred vision, diplopia, nystagmus, conjunctivitis

ENDO: SIADH (geriatric patients)

GI: *Nausea, constipation, diarrhea*, anorexia, vomiting, abdominal pain, stomatitis, glossitis, increased hepatic enzymes, **hepatitis, hepatic porphyria**

GU: Frequency, retention, albuminuria, glycosuria, impotence, increased BUN, **renal failure**

HEMA: **Thrombocytopenia, leukopenia, agranulocytosis, leukocytosis, aplastic anemia, eosinophilia**, increased PT

INTEG: *Rash*, **Stevens-Johnson syndrome**, urticaria, photosensitivity, **toxic epidermal necrolysis**

RESP: Pulmonary hypersensitivity (fever, dyspnea, pneumonitis)

PHARMACOKINETICS

Onset slow; peak 4-5 hr; metabolized by liver; excreted in urine, feces; crosses placenta, blood-brain barrier; excreted in breast milk; half-life 18-65 hr then 8-29 hr after 1st month; protein binding 76%; metabolized by CYP3A4

INTERACTIONS

- CNS toxicity: lithium

⚠️ Fatal reaction: MAOIs

Increase: carBAMazepine levels—CYP3A inhibitors (cimetidine, clarithromycin, danazol, diltiazem, erythromycin, FLUoxetine, fluvoxamine, isoniazid, propoxyphene, valproic acid, verapamil, voriconazole)

Increase: effects of desmopressin, lithium, lypressin, vasopressin

Decrease: carBAMazepine effect—CYP1A2, CYP2C9 substrates

Decrease: effect of CYP3A inducers

Decrease: effects of benzodiazepines, doxycycline, felbamate, haloperidol, oral contraceptives, PHENobarbital, phenytoin, primidone, theophylline, thyroid hormones, warfarin

Decrease: carBAMazepine levels—CYP3A4 inducers (CISplatin, darunavir, delavirdine, DOXOrubicin, felbamate, nefazodone, OXcarbazepine, PHENobarbital, phenytoin, primidone, rifampin, theophylline)

Drug/Herb

Decrease: carBAMazepine metabolism, increased levels—echinacea

Decrease: anticonvulsant effect—St. John's wort

Drug/Food

Increase: peak concentration of carbamazepine—grapefruit juice

NURSING CONSIDERATIONS

Assess:

Black Box Warning:

Asian patients for serious skin reaction; genetic test before administration

- **Seizures:** character, location, duration, intensity, frequency, presence of aura
- **Trigeminal neuralgia:** facial pain including location, duration, intensity, character, activity that stimulates pain
- **Renal studies:** urinalysis, BUN, urine creatinine q3mo

Black Box Warning:

Bone marrow depression: blood studies: RBC, Hct, Hgb, reticulocyte counts every wk for 4 wk then q3-6mo if on long-term therapy; if myelosuppression occurs, product should be discontinued; blood dyscrasias: fever, sore throat, bruising, rash, jaundice

- **Hepatic studies:** ALT, AST, bilirubin
- **Product levels** during initial treatment or when changing dose; should remain at 4-12 mcg/ml; anorexia may indicate increased blood levels ⚠ **Mental status:** mood, sensorium, affect, behavioral changes, **suicidal thoughts/behaviors;** if mental status changes, notify prescriber
- **Eye problems:** need for ophthalmic examinations before, during, after treatment (slit lamp, funduscopy, tonometry)
- **Allergic reaction:** purpura, red, raised rash; if these occur, product should be discontinued ⚠ **Toxicity:** bone marrow depression, nausea, vomiting, ataxia, diplopia, CV collapse, Stevens-Johnson syndrome

Perform/provide:

- Storage at room temp
- Hard candy, gum, frequent rinsing for dry mouth

Evaluate:

- **Therapeutic response:** decreased seizure activity; document on patient's chart

Teach patient/family:

- To carry emergency ID stating patient's name, products taken, condition, prescriber's name and phone number
- To avoid driving, other activities that require alertness usually for the first 3 days of treatment
- Not to discontinue medication quickly after long-term use
- To immediately report chills, rash, light-colored stools, dark urine, yellowing of skin and eyes, abdominal pain, sore throat, mouth ulcers, bruising, blurred vision, dizziness
- That urine may turn pink to brown

- To notify if pregnancy is planned or suspected, pregnancy (D), avoid breastfeeding

TREATMENT OF OVERDOSE:

Lavage, VS

☼ Canada only Side effects: *italics* = common; **bold** = life-threatening ⚠

Nurse Alert

HIGH ALERT

CARBOplatin (Rx)

(kar-boe-pla'-tin)

Func. class.: Antineoplastic alkylating agent

Chem. class.: Platinum coordination compound

Do not confuse: CARBOplatin/CISplatin

ACTION:

Produces interstrand DNA cross-links and, to a lesser extent, DNA-protein cross-links; activity is not cell-cycle–phase specific

USES:

Initial treatment of advanced ovarian cancer in combination with other agents; palliative treatment of ovarian carcinoma recurrent after treatment with other antineoplastic agents

Unlabeled uses: Acute lymphocytic leukemia (ALL), acute myelogenous leukemia (AML), bladder/breast/head/neck/lung/testicular cancer, bone marrow ablation, malignant glioma, neuroblastoma, non-Hodgkin's lymphoma, osteogenic sarcoma, soft-tissue sarcoma, stem-cell transplant preparation, Wilms' tumor, stage I seminoma

CONTRAINDICATIONS:

Pregnancy (D), breastfeeding, hypersensitivity, significant bleeding, aluminum products used to prepare or administer CARBOplatin

Black Box Warning:

Severe bone marrow depression, platinum compound hypersensitivity

Precautions: Geriatric patients, radiation therapy within 1 mo, other cancer chemotherapy within 1 mo, renal/hepatic disease

Black Box Warning:

Anemia, infection

DOSAGE AND ROUTES

Calculator

Dosing with the Calvert equation

- **Adult:** The total CARBOplatin dose in mg for adults may be calculated using

the Calvert equation: Total dose (mg) = target AUC $\times$ (GFR + 25)

- **Children:** Calculate CARBOplatin dosage (mg/m²) in children:

Total dose (mg/m²) = target AUC $\times$ [(0.93 $\times$ GFR) + 15]

Advanced ovarian cancer

- **Adult (single agent): IV INF** initially 300 mg/m² on day 1 with cyclophosphamide, 600 mg/m² **IV** on day 1, repeat q4wk $\times$ 6 cycles; refractory tumors 360 mg/m² single dose, may repeat q4wk as needed, do not repeat until neutrophils $>2000/\text{mm}^3$ and platelets $>100,000/\text{mm}^3$

Renal dose

- **Adult (single agent): IV INF** CCr 41-59 ml/min, 250 mg/m², CCr 16-40 ml/min, 200 mg/m², do not use if CCr <15 ml/min

All (unlabeled)

- **Adult <21 yr/adolescent/child: IV** 635 mg/m² on day 3 with ifosfamide, mesna, etoposide

Relapsed Wilms' tumor (unlabeled)

- **Child: IV** 400 mg/m² $\times$ 2 days with etoposide, ifosfamide

Osteogenic sarcoma (unlabeled)

- **Adult/adolescent/child: IV** 560 mg/m² on day 1 with ifosfamide 2.65 g/m²/day **IV** on days 1-3

Neuroblastoma/soft-tissue sarcoma (unlabeled)

- **Child: IV** 300-600 mg/m² q4wk or 400 mg/m²/day for 2 days q4wk or 160 mg/m²/day $\times$ 5 days q4wk

Available forms: Lyophilized powder for inj 50-, 150-, 450-mg vials; aqueous sol for inj 50 mg/5-ml vial, 150 mg/15-ml vial, 450 mg/45-ml vial, 600 mg/60-ml vial

Administer:

- Antiemetic 30-60 min before product and prn for vomiting

IV route

- Do not use needles or IV administration sets that contain aluminum; may cause precipitate or loss of potency • Use cytotoxic handling procedures
- Storage protected from light at room temp; reconstituted vials stable for 24 hr at room temp, Paraplatin multidose (10 mg/ml) vials stable for up to 14 days after entry into vial • **Reconstitute** CARBOplatin 50, 150, or 450 mg with 5, 15, or 45 ml, respectively, of sterile water for inj, D₅W, or NaCl (10

mg/ml); then further **dilute** with the same sol to 0.5-4 mg/ml; **give** over 15 min or more (intermittent INF) • **Continuous IV INF** over 24 hr; max dose based on (GFR=125 mg/ml)

Solution compatibilities: D₅/0.2% NaCl, D₅/0.45% NaCl, D₅/0.9% NaCl, 0.9% NaCl, D₅W, sterile water for inj

Y-site compatibilities: Acyclovir, alfentanil, allopurinol, amifostine, amikacin, aminocaproic acid, aminophylline, amiodarone, amphotericin B lipid complex, amphotericin B liposome, ampicillin, ampicillin-sulbactam, anidulafungin, atenolol, atracurium, azithromycin, aztreonam, bivalirudin, bleomycin, bumetanide, buprenorphine, butorphanol, calcium chloride/gluconate, caspofungin, ceFAZolin, cefepime, cefoperazone, cefotaxime, cefoTEtan, cefOXitin, cefTAZidime, ceftizoxime, cefTRIAxone, cefuroxime, cimetidine, ciprofloxacin, cisatracurium, CISplatin, cladribine, clindamycin, codeine, cyclophosphamide, cycloSPORINE, cytarabine, DAPTOmycin, DAUNOrubicin, dexamethasone, dexmedetomidine, dexrazoxane, digoxin, diltiazem, diphenhydrAMINE, DOBUTamine, DOCEtaxel, DOPamine, doripenem, doxacurium, DOXOrubicin, DOXOrubicin liposomal, doxycycline, droperidol, enalaprilat, ePHEDrine, EPINEPHrine, epirubicin, ertapenem, erythromycin, esmolol, etoposide, famotidine, fenoldopam, fentaNYL, filgrastim, fluconazole, fludarabine, fluorouracil, foscarnet, fosphenytoin, furosemide, ganciclovir, gatifloxacin, gemcitabine, gentamicin, granisetron, haloperidol, heparin, hydrocortisone, HYDROmorphone, hydrOXYzine, IDArubicin, ifosfamide, imipenem-cilastatin, inamrinone, insulin (regular), irinotecan, isoproterenol, ketorolac, labetalol, levofloxacin, levorphanol, lidocaine, linezolid injection, LORazepam, magnesium sulfate, mannitol, melphalan, meperidine, meropenem, mesna, methohexital, methotrexate, methylPREDNISolone, metoclopramide, metoprolol, metroNIDAZOLE, micafungin, midazolam, milrinone, minocycline, mitoXANtrone, mivacurium, morphine, nafcillin, nalbuphine, naloxone, nesiritide, niCARdipine, nitroglycerin, nitroprusside, norepinephrine, octreotide, ofloxacin, ondansetron, oxaliplatin, PACLitaxel, palonosetron, pamidronate, pancuronium, pantoprazole, PEMEtrexed, pentamidine, PENTobarbital, PHENobarbital, phenylephrine, piperacillin, piperacillin-tazobactam, potassium chloride, potassium phosphates, prochlorperazine, promethazine, propofol, propranolol, ranitidine, remifentanil, riTUXimab, rocuronium, sargramostim,

sodium acetate, sodium bicarbonate, sodium phosphates, succinylcholine, SUFentanil, sulfamethoxazole-trimethoprim, tacrolimus, teniposide, theophylline, thiotepa, ticarcillin, ticarcillin-clavulanate, tigecycline, tirofiban, TNA, tobramycin, topotecan, TPN, trastuzumab, trimethobenzamide, vancomycin, vasopressin, vecuronium, verapamil, vinBLAStine, vinCRISStine, vinorelbine, voriconazole, zidovudine

SIDE EFFECTS

CNS: Seizures, central neurotoxicity, peripheral neuropathy, dizziness, confusion

CV: Cardiac abnormalities (fatal CV events), stroke

EENT: Tinnitus, hearing loss, vestibular toxicity, visual changes

GI: Severe nausea, vomiting, diarrhea, weight loss, mucositis, anorexia, constipation, taste change

HEMA: Thrombocytopenia, leukopenia, pancytopenia, neutropenia, anemia, bleeding

INTEG: Alopecia, dermatitis, rash, erythema, pruritus, urticaria

META: Hypomagnesemia, hypocalcemia, hypokalemia, hyponatremia, hyperuremia

SYST: Anaphylaxis

PHARMACOKINETICS

Initial half-life 1-2 hr, postdistribution half-life 2½-6 hr, not bound to plasma proteins, excreted by the kidneys

INTERACTIONS

Increase: nephrotoxicity or ototoxicity—aminoglycosides, amphotericin B

Increase: bleeding risk—aspirin, NSAIDs, thrombolytics, anticoagulants, platelet inhibitors

Increase: toxicity—radiation, bone marrow suppressants

Increase: myelosuppression—myelosuppressives

Decrease: phenytoin levels, monitor levels

Drug/Lab Test

Increase: AST, BUN, alk phos, bilirubin, creatinine

Decrease: platelets, neutrophils, WBC, RBC, Hgb/HCT, calcium, potassium,

magnesium, phosphate

NURSING CONSIDERATIONS

Assess:

Black Box Warning:

To only be used by person experienced in the use of Chemotherapeutic products, in a specialized care setting

Black Box Warning:

Bone marrow depression: CBC, differential, platelet count weekly; withhold product if neutrophil count is $<2000/\text{mm}^3$ or platelet count is $<100,000/\text{mm}^3$; notify prescriber of results; calcium, magnesium, phosphate, potassium, sodium, uric acid, CCR, bilirubin; CCR <60 ml/min may be responsible for increased bone marrow suppression; assess frequently for infection

- Renal studies: BUN, creatinine, serum uric acid; urine CCR before, during therapy; I&O ratio; report fall in urine output to <30 ml/hr • Monitor temp q4hr (may indicate beginning infection)
- Hepatic studies before, during therapy (bilirubin, AST, ALT, LDH) as needed or monthly; jaundice of skin, sclera; dark urine, clay-colored stools, itchy skin, abdominal pain, fever, diarrhea **⚠️Anaphylaxis:** hypotension, rash, pruritus, wheezing, tachycardia may occur within a few mins of use; notify prescriber after discontinuing product; resuscitation equipment should be available • Delay dental work until blood counts have returned to normal; regular toothbrushes, dental floss, and toothpicks should not be used, use soft bristle toothbrush
- **Peripheral neuropathy:** may be increased in geriatric patients
- **Bleeding;** hematuria, stool guaiac, bruising, petechiae, mucosa or orifices; avoid all IM injections if platelets $<50,000/\text{mm}^3$
- Effects of alopecia on body image; discuss feelings about body changes

Evaluate:

- Therapeutic response: decreasing size of tumor, spread of malignancy

Teach patient/family:

- To report ringing/roaring in the ears; numbness, tingling in face, extremities; weight gain • That impotence or amenorrhea can occur; that this is reversible after treatment is discontinued; to notify prescriber if pregnancy is suspected or planned; pregnancy (D), that contraception should be used if patient is fertile
- Not to breastfeed during treatment
- To avoid OTC products with aspirin, NSAIDs, alcohol; not to receive vaccinations during treatment **⚠️**To notify prescriber immediately of fever,

fatigue, sore throat, bleeding, bruising, chills, back pain, blood in stools, dyspnea

- That hair may be lost during treatment; that a wig or hairpiece may make the patient feel better; that new hair may be different in color, texture
- To avoid crowds, persons with known infections; to avoid the use of razors, stiff-bristle toothbrushes

🍁 Canada only Side effects: *italics* = common; **bold** = life-threatening ⚠️

Nurse Alert

carboprost (Rx)

(kar'boe-prost)

Hemabate

Func. class.: Oxytocic, abortifacient

Chem. class.: Prostaglandin

ACTION:

Stimulates uterine contractions, causes complete abortion in approximately 16 hr

USES:

Abortion at 13-20 wk gestation, postpartum hemorrhage caused by uterine atony not controlled by other methods

Unlabeled uses: Hemorrhagic cystitis

CONTRAINDICATIONS:

Hypersensitivity to this product or benzyl alcohol, severe CV/respiratory/renal/hepatic disease, PID

Precautions: Pregnancy (C), asthma, anemia, jaundice, diabetes mellitus, hypo/hypertension, seizure disorders, past uterine surgery

DOSAGE AND ROUTES

Calculator

Pregnancy termination between 13-20 wk gestation

- **Adult: IM** 100 mcg (0.4 ml) test dose, then 250 mcg, then 250 mcg q11/2-31/2hr; may increase to 500 mcg if no response, max 12 mg total dose

Postpartum hemorrhage

- **Adult: IM** 250 mcg, repeat at 15-to 90-min intervals; max total dosage 2 mg

Hemorrhagic cystitis (unlabeled)

- **Adult: INTRAVESICULAR** 0.8 mg/dl in 50 ml of saline instilled into the bladder for 60 min, q6hr × 4 doses

Available forms: Inj 250 mcg/ml

Administer:

- Only by trained personnel in a hospital that can provide emergency services
- Incomplete abortion may occur in 20% of patients
- Give antiemetics to prevent nausea/vomiting

- In deep muscle mass; aspirate before inj, rotate inj sites if additional doses given

SIDE EFFECTS

CNS: *Fever, chills*, headache

GI: *Nausea, vomiting, diarrhea*

PHARMACOKINETICS

Peak 15-60 min, excreted in urine (major metabolites)

INTERACTIONS

Increase: action—other oxytocics

NURSING CONSIDERATIONS

Assess:

- B/P, pulse; watch for change that may indicate hemorrhage
- For length, duration of contractions; notify prescriber of contractions that last more than 1 min or absence of contractions; watch for signs of uterine rupture
- For incomplete abortion, pregnancy must be terminated by another method; product is teratogenic

Perform/provide:

- Storage in refrigerator

Evaluate:

- Therapeutic response: expulsion of fetus, control of bleeding

Teach patient/family:

- To report increased blood loss, abdominal cramps, increased temp, foul-smelling lochia

☼ Canada only Side effects: *italics* = common; **bold** = life-threatening ⚠
Nurse Alert

carglumic acid

(kar-gloo'mik)

Carbaglu

Func. class.: Antihyperammonemic agent

ACTION:

The enzyme *N*-acetylglutamate synthase (NAGS) produces *N*-acetylglutamate (NAG), which is an essential activator of carbamoyl phosphate synthetase 1 (CPS 1). CPS 1 is the first enzyme of the urea cycle, and the enzyme converts ammonia to urea. Patients with NAGS deficiency do not produce enough NAG, resulting in hyperammonemia. Carglumic acid is a synthetic structural analog of NAG that works to activate CPS 1 and thus convert ammonia to urea.

USES:

Acute or chronic hyperammonemia in persons with *N*-acetylglutamate synthetase deficiency

Precautions: Breastfeeding, pregnancy (C), geriatric patients

DOSAGE AND ROUTES

Calculator

- **Adult/child:** PO 100-250 mg/kg/day (rounded to the nearest 100 mg) initially, divided; bid-qid, given immediately before meals, titrate to ammonia level; usual maintenance dose <100 mg/kg/day

Available forms: Tabs 200 mg

Administer

- Do not give whole or crushed tablets, disperse each tablet in ≥ 2.5 ml of water immediately before use. The tablets do not dissolve completely in water, and undissolved tablet particles can remain; rinse the mixing container with water and give to the patient, do not mix with foods or other fluids

Nasogastric tube

- Mix each tablet in ≥ 2.5 ml of water (80 mg/ml), shake gently, give the correct volume immediately through the NG tube, flush with additional water, discard any unused portion

Oral syringe

- Mix each tablet in ≥ 2.5 ml of water (80 mg/ml), shake gently, draw up the appropriate volume in an oral syringe and give immediately, refill syringe with ≥ 1 -2 ml and give immediately, discard any unused portion

SIDE EFFECTS

CNS: Headache, fever, asthenia

EENT: Tonsillitis, ear infections

GI: Abdominal pain, vomiting, taste change, anorexia, diarrhea

OTHER: Infection, anemia, weight loss, rash

PHARMACOKINETICS

Peak 3 hr, half-life 5.6 hr

INTERACTIONS

Drug/Lab Test

Decrease: Hgb level

NURSING CONSIDERATIONS

Assess:

Neurologic symptoms and ammonia levels: Headache, fever, change in level of consciousness

Infection: Assess for upper respiratory infections, influenza, pneumonia

Evaluate:

- Decreasing ammonia levels

Teach patient/family:

- Not to swallow whole or crush, but disperse in water
 - That blood for lab tests will be drawn regularly
 - To advise prescriber if pregnancy is planned or suspected, not to breastfeed
 - That a high-calorie, low-protein diet is necessary when ammonia levels are elevated
 - To report adverse reactions of vomiting, infection, ear pain, headache
 - Store unopened containers in refrigerator; opened bottle may be stored at room temperature for up to 1 mo; product stored at controlled room temperature should not be returned to a refrigerator; protect from moisture; discard opened bottle after 30 days
-

🍁 Canada only Side effects: *italics* = common; **bold** = life-threatening ⚠️
Nurse Alert

carisoprodol (Rx)

(kar-eye-soe-proe'dole)

Soma

Func. class.: Skeletal muscle relaxant, central acting

Chem. class.: Meprobamate congener

Do not confuse: Soma/Soma Compound

ACTION:

Depresses CNS by blocking interneuronal activity in descending reticular formation, spinal cord, thereby producing sedation

USES:

Relieving pain, stiffness with musculoskeletal disorders

CONTRAINDICATIONS:

Hypersensitivity, intermittent porphyria

Precautions: Pregnancy (C), breastfeeding, geriatric patients, Asian patients, renal/hepatic disease, addictive personality

DOSAGE AND ROUTES

Calculator

• **Adult/adolescent ≥16 yr: PO** 250-350 mg tid and at bedtime, max 3 wk of use

Available forms: Tabs 350 mg

Administer:

- With meals for GI symptoms
- For short term (2-3 wk), potential for habituation
- Storage in tight container at room temp

SIDE EFFECTS

CNS: Dizziness, weakness, drowsiness, headache, tremor, depression, insomnia, ataxia, irritability, seizures

CV: Postural hypotension, tachycardia

EENT: Diplopia, temporary loss of vision

GI: Nausea, vomiting, hiccups, epigastric discomfort

HEMA: Eosinophilia

INTEG: Rash, pruritus, fever, facial flushing, **erythema multiforme**

RESP: Asthmatic attacks

SYST: **Angioedema, anaphylaxis**

PHARMACOKINETICS

PO: Onset 1/2 hr; peak 4 hr; duration 4-6 hr; extensively metabolized by liver, substrate of CYP2C19; excreted in urine; crosses placenta; excreted in breast milk (large amounts); half-life 8 hr

INTERACTIONS

- **Do not use together with meprobamate**

Increase: CNS depression—alcohol, tricyclics, opioids, barbiturates, sedatives, hypnotics

Increase: carisoprodol effect—CYP2C19 inhibitors (FLUoxetine, fluvoxamine, isoniazid, modafinil)

Decrease: carisoprodol effect—CYP219 inducers (rifampin)

Drug/Herb

Increase: CNS depression—kava, valerian

Increase: metabolism of carisoprodol—St. John's wort

Drug/Lab Test

Increase: eosinophils

Increase: RBC, WBC, platelets

NURSING CONSIDERATIONS

Assess:

- **Pain**, stiffness, mobility, activities of daily living at baseline and throughout treatment
- **ECG in seizure patients:** poor seizure control has occurred among patients taking this product
- BUN, creatinine at baseline and periodically

- **Idiosyncratic reaction:** (weakness, dizziness, blurred vision, confusion, euphoria), anaphylaxis within a few minutes or hours of 1st to 4th dose, withhold and notify prescriber
- **Allergic reactions:** rash, fever, respiratory distress, anaphylaxis, angioedema
- **CNS depression:** dizziness, drowsiness, psychiatric symptoms, abuse potential
- **Abrupt discontinuation:** withdrawal reactions do occur but may be mild, dependence may occur

Perform/provide:

- Assistance with ambulation if dizziness, drowsiness occurs, especially for geriatric patients

Evaluate:

- Therapeutic response: decreased pain, spasticity; increased ROM

Teach patient/family:

- To avoid hazardous activities if drowsiness, dizziness occur; not to drive while taking product, to avoid rapid position changes, postural hypotension occurs • To avoid using OTC medications (cough preparations, antihistamines) unless directed by prescriber; not to take with alcohol, other CNS depressants • To report allergic reaction immediately: rash, swelling of tongue/lips, hives, dyspnea
- To take with food for GI symptoms

TREATMENT OF OVERDOSE:

Activated charcoal, dialysis, lavage

☼ Canada only Side effects: *italics* = common; **bold** = life-threatening ⚠
Nurse Alert

HIGH ALERT

carmustine (Rx)

(kar-mus'teen)

BiCNU, Gliadel

Func. class.: Antineoplastic alkylating agent

Chem. class.: Nitrosourea

ACTION:

Alkylates DNA, RNA; able to inhibit enzymes that allow for the synthesis of amino acids in proteins; activity is not cell-cycle–phase specific

USES:

Brain tumors such as glioblastoma, medulloblastoma, brain stem glioma, astrocytoma, ependymoma, metastatic brain tumors; multiple myeloma (with predniSONE), non-Hodgkin's disease, Hodgkin's disease, other lymphomas; GI, breast, bronchogenic, renal carcinomas; wafer, as adjunct to surgery/radiation for patients newly diagnosed with high-grade malignant glioma

Unlabeled uses: Ablation, mycosis fungoides, stem cell transplant preparation

CONTRAINDICATIONS:

Pregnancy (D), breastfeeding, hypersensitivity, leukopenia, thrombocytopenia

Precautions: Dental disease, extravasation, females, infection, leukopenia, neutropenia, secondary malignancy, thrombocytopenia

Black Box Warning:

Bone marrow suppression, pulmonary fibrosis

DOSAGE AND ROUTES

Calculator

Brain tumors, Hodgkin's disease, malignant lymphoma, multiple myeloma

• **Adult:** **IV** 75-100 mg/m² over 1-2 hr × 2 days or 150-200 mg/m² × 1 dose q6-8wk or 40 mg/m²/day × 5 days q6wk or 150-200 mg/m² q6wk;

INTRACAVITARY up to 8 wafers inserted into resection cavity

• **Child (unlabeled):** **IV** 200-250 mg/m² as a single dose q4-6wks

Stem cell transplant/bone marrow ablation (unlabeled)

- **Adult: IV** 450-600 mg/m² as a single dose or 2 divided doses q12hr at a rate of no more than 3 mg/m²/min

Available forms: Powder for inj 100 mg; wafer 7.7 mg (intracavitary)

Administer:

- Storage of reconstituted sol in refrigerator for 24 hr or at room temp for 8 hr; protect from light
- Blood transfusions, RBC colony-stimulating factors to counter anemia
- Antiemetic, serotonin antagonists, dexamethasone, nausea, vomiting can begin 2 hr after a dose and last ≤6 hr and may be severe
- All medications PO, if possible; avoid IM inj if platelets are <100,000/mm³

Black Box Warning:

Carmustine should not be given until platelets >100,000/mm³ and WBC >4000/mm²

Wafer route

- If wafers are broken into several pieces, they should not be used
- Foil pouches may be kept at room temp for 6 hr if unopened

Intermittent IV INF route

- Use cytotoxic handling procedures; do not use if an oil film appears on vial (decomposition)
- Do not use with PVC IV tubing, do not admix
- After **diluting** 100 mg product/3 ml ethyl alcohol (provided), **further dilute** with 27 ml sterile water for inj; **then dilute** with 100-500 ml 0.9% NaCl or D₅W, **give** over 1 hr or more, reduce rate if discomfort is felt; use only glass containers, protect from light
- **Flush** IV line after carmustine with 10 ml 0.9% NaCl to prevent irritation at site

Y-site compatibilities: Amifostine, amphotericin B lipid complex, amphotericin B liposome, anidulafungin, aztreonam, bivalirudin, bleomycin, caspofungin, cefepime, codeine, DAPTOMycin, dexmedetomidine, DOCEtaxel, ertapenem, etoposide, fenoldopam, filgrastim, fludarabine, gemcitabine, granisetron, levofloxacin, melphalan, meperidine, mitoXANtrone, nesiritide, octreotide, ondansetron, PACLitaxel, palonosetron, pamidronate, pantoprazole, PEMEtrexed, piperacillin-tazobactam, riTUXimab, sargramostim, sodium acetate, tacrolimus, teniposide, thiotepa, tigecycline, tirofiban, trastuzumab, vinCRISTine, vinorelbine, voriconazole

SIDE EFFECTS

GI: Nausea, vomiting, anorexia, stomatitis, **hepatotoxicity**

GU: Azotemia, **renal failure**

HEMA: **Thrombocytopenia, leukopenia, myelosuppression, anemia**

INTEG: Pain, burning, hyperpigmentation at inj site, alopecia

RESP: **Fibrosis, pulmonary infiltrate**

SYST: **Secondary malignant neoplastic disease**

PHARMACOKINETICS

Degraded within 15 min; crosses blood-brain barrier; 70% excreted in urine within 96 hr; 10% excreted as CO₂, fate of 20% is unknown

INTERACTIONS

Increase: bleeding risk—**aspirin, anticoagulants**

Increase: **myelosuppression—myelosuppressive agents**

Increase: **toxicity: other antineoplastics, radiation, cimetidine**

Increase: adverse reactions, decreased antibody reaction—**live vaccines**

Decrease: effects of digoxin, phenytoins

Drug/Lab Test

Increase: bilirubin, prolactin, uric acid, LFTs

Decrease: platelets, WBC, neutrophils, HCT

NURSING CONSIDERATIONS

Assess:

Black Box Warning:

Bone marrow suppression: CBC, differential, platelet count weekly; withhold product if WBC is <4000 or platelet count is <100,000; notify prescriber of results

- Hepatic studies: AST, ALT, bilirubin, monitor regularly, hepatotoxicity occurs rarely

Black Box Warning:

Pulmonary fibrosis/infiltrate: pulmonary function tests, chest x-ray films before, during therapy; chest film should be obtained q2wk during treatment; monitor for dyspnea, cough, pulmonary fibrosis; infiltrate occurs after high doses or several low-dose courses (>1400 mg/m² cumulative dose), may occur months or years after treatment

Black Box Warning:

Only to be used by an experienced clinician in use of cancer, immune suppression

- Renal studies: BUN, serum uric acid, urine CCr before, during therapy; I&O

ratio; report fall in urine output of 30 ml/hr, may use allopurinol for hyperuricemia with increased fluids • Monitor for cold, cough, fever (may indicate beginning infection)

- **Bleeding:** hematuria, guaiac, bruising, petechiae, mucosa, orifices q8hr

Perform/provide:

- Rinsing of mouth tid-qid with water or club soda; use of sponge brush for stomatitis

- Warm compresses at inj site for inflammation; reduce flow rate if patient complains of burning at inf site

Evaluate:

- Therapeutic response: decreasing size of tumor, spread of malignancy

Teach patient/family:

Black Box Warning:

To report any changes in breathing or coughing, to avoid smoking

- To avoid foods with citric acid, hot or rough texture if stomatitis is present; to report any bleeding, white spots, ulceration in mouth to prescriber; to examine mouth daily • To avoid aspirin, ibuprofen, razors, commercial mouthwash

- To report signs of anemia (fatigue, irritability, shortness of breath, faintness); to report signs of infection (sore throat, fever); pulmonary toxicity can occur up to 15 yr after treatment • To use contraception during treatment; to avoid breastfeeding, pregnancy (D)

- Not to receive live vaccines during treatment

☼ Canada only Side effects: *italics* = common; **bold** = life-threatening ⚠
Nurse Alert

carteolol (ophthalmic)

(kar'tee-oh-lol)

Func. class.: Antiglaucoma

Chem. class.: Beta-blocker

ACTION:

May decrease aqueous humor and increase outflows

USES:

Treatment of chronic open-angle glaucoma and ocular hypertension

CONTRAINDICATIONS:

Hypersensitivity, AV block, heart failure, bradycardia, sick sinus syndrome

Precautions: Abrupt discontinuation, children, pregnancy, breastfeeding, COPD, depression, diabetes mellitus, myasthenia gravis, hyperthyroidism, pulmonary disease, angle-closure glaucoma

DOSAGE AND ROUTES

Calculator

- **Adult:** Instill 1 drop in the affected eye(s) bid.

Available forms: Ophthalmic solution 1%

Administer

- For ophthalmic use only. Shake the ophthalmic suspension well before use
- Do not touch the tip of the dropper to the eye, fingertips, or other surface to prevent contamination
- Wash hands before and after use. Tilt head back slightly and pull the lower eyelid down with the index finger to form a pouch. Squeeze the prescribed number of drops into the pouch. Close eyes to spread drops. To avoid excessive systemic absorption, apply finger pressure on the lacrimal sac for 1-2 min after use
- If more than one topical ophthalmic drug product is being used, the drugs should be administered at least 5 min apart
- To avoid contamination or the spread of infection, do not use dropper for more than one person, do not touch the eyelids or surrounding areas with the dropper tip of the bottle
- Decreased intraocular pressure can take several weeks, monitor IOP after a month

SIDE EFFECTS

CNS: Insomnia, headache, dizziness

CV: Palpitations

EENT: Eye stinging/burning, tearing, photophobia

PHARMACOKINETICS

Onset 30 min, peak 2 hr, duration ≥ 12 hr

INTERACTIONS

Increase: beta blocking effect—oral beta blockers

Increased: intraocular pressure reduction—topical miotics, dipivefrin, EPINEPHrine, carbonic anhydrase inhibitors, this may be beneficial

Increase: B/P, severe—when abruptly stopping cloNIDine

Increase: depression of AV nodal conduction, bradycardia, or hypotension—adenosine, cardiac glycosides, disopyramide, other antiarrhythmics, class 1C antiarrhythmic drugs (flecainide, propafenone, moricizine, encainide, quinidine or drugs that significantly depress AV nodal conduction)

Increase: AV block nodal conduction, induce AV block—high doses of procainamide

Increase: antihypertensive effect—other antihypertensives

NURSING CONSIDERATIONS

Assess:

• **Systemic absorption:** When used in the eye, systemic absorption is common with the same adverse reactions and interactions • **Glaucoma:** Monitor intraocular pressure

Evaluate:

• Decreasing intraocular pressure

Teach patient/family:

• For ophthalmic use only. Shake the ophthalmic suspension well before use
• Not to touch the tip of the dropper to the eye, fingertips, or other surface to prevent contamination • Wash hands before and after use. Tilt the head back slightly and pull the lower eyelid down with the index finger to form a pouch. Squeeze the prescribed number of drops into the pouch. Close eyes to spread drops. To avoid excessive systemic absorption, apply finger pressure on the

lacrimal sac for 1-2 min following use • If more than one topical ophthalmic drug product is being used, the drugs should be administered at least 5 min apart

- To avoid contamination or the spread of infection, do not use dropper for more than one person, do not touch the eyelids or surrounding areas with the dropper tip of the bottle

🍁 Canada only Side effects: *italics* = common; **bold** = life-threatening ⚠️
Nurse Alert

carvedilol (Rx)

(kar-ved'i-lole)

Coreg, Coreg CR

Func. class.: Antihypertensive, α -/ β -adrenergic blocker

Do not confuse: carvedilol/captopril/carteolol

ACTION:

A mixture of nonselective α -/ β -adrenergic blocking activity; decreases cardiac output, exercise-induced tachycardia, reflex orthostatic tachycardia; causes vasodilation, reduction in peripheral vascular resistance

USES:

Essential hypertension alone or in combination with other antihypertensives, CHF, LV dysfunction after MI, cardiomyopathy

Unlabeled uses: Angina, pediatric patients

CONTRAINDICATIONS:

Hypersensitivity, asthma, class IV decompensated cardiac failure, 2nd-or 3rd-degree heart block, cardiogenic shock, severe bradycardia, pulmonary edema

Precautions: Pregnancy (C), breastfeeding, children, geriatric patients, cardiac failure, hepatic injury, peripheral vascular disease, anesthesia, major surgery, diabetes mellitus, thyrotoxicosis, emphysema, chronic bronchitis, renal disease

Black Box Warning:

Abrupt discontinuation

DOSAGE AND ROUTES

Calculator

Essential hypertension

• **Adult: PO** 6.25 mg bid $\times$ 7-14 days; if tolerated well, then increase to 12.5 mg bid $\times$ 7-14 days; if tolerated well, may be increased (if needed) to 25 mg bid; not to exceed 50 mg/day; **EXT REL** cap 20 mg/day, may increase after 7-14 days to 40 mg/day

Congestive heart failure

• **Adult: PO** 3.125 mg bid $\times$ 2 wk; if tolerated well, give 6.25 mg bid $\times$ 2 wk, then double q2wk to max dose of 25 mg bid <85 kg or 50 mg bid >85 kg; **EXT**

REL caps (Coreg CR) 10 mg/day × 2 wk, increase to 20, 40, 80 mg/day over successive intervals of 2 wk

Postmyocardial infarction

• **Adult: PO** 6.25 mg bid with food × 3-10 days, lower starting dose may be used if indicated; titrate upward as tolerated; may increase to 12.5 mg bid then titrate to 25 mg bid; **PO EXT REL** 20 mg daily with food, lower starting dose of 10 mg/day may be used, titrate upward after 3-10 days, increase to 40 mg daily as required

Angina (unlabeled)

• **Adult: PO** 25-50 mg bid

Available forms: Tabs 3.125, 6.25, 12.5, 25 mg; ext rel cap 10, 20, 40, 80 mg

Administer:

• With food in morning; tabs may be crushed or swallowed whole; give ext rel every AM with food; do not break, crush, chew ext rel cap; separate alcohol (including OTC products that contain ethanol) by ≥2 hr; caps may be opened and sprinkled over applesauce

Black Box Warning:

Do not discontinue before surgery

SIDE EFFECTS

CNS: *Dizziness*, fatigue, weakness, somnolence, insomnia, ataxia, hyperesthesia, paresthesia, vertigo, depression, headache

CV: *Bradycardia*, *postural hypotension*, dependent edema, peripheral edema, *AV block*, extrasystoles, hypo/hypertension, palpitations, peripheral ischemia, *CHF*, *pulmonary edema*

GI: *Diarrhea*, abdominal pain, increased alk phos, ALT, AST

GU: Decreased libido, *impotence*, UTI

INTEG: Rash

MISC: Injury, back pain, viral infection, hypertriglyceridemia, *thrombocytopenia*, *hyperglycemia*

RESP: Rhinitis, pharyngitis, dyspnea, *bronchospasm*, cough, *lung edema*

PHARMACOKINETICS

Peak 1-2 hr; readily and extensively absorbed PO; >98% protein binding; extensively metabolized by liver; excreted through bile into feces; terminal half-

life 7-10 hr with increases in geriatric patients, hepatic disease

INTERACTIONS

Increase: conduction disturbances—calcium channel blockers

Increase: bradycardia, hypotension—levodopa, MAOIs, reserpine

Increase: hypoglycemia—antidiabetic agents

Increase: concentrations of digoxin, cycloSPORINE, CYP2D6 inhibitors (FLUoxetine, quiNIDine)

Increase: toxicity of carvedilol—cimetidine, other antihypertensives, nitrates, acute alcohol ingestion

Decrease: heart rate, B/P—cloNIDine

Decrease: carvedilol levels—rifampin, NSAIDs, thyroid medications

Drug/Herb

Increase: antihypertensive effect—hawthorn

Decrease: antihypertensive effect—ephedra (ma huang)

Drug/Lab Test

Increase: blood glucose, BUN, potassium, triglycerides, uric acid, bilirubin, cholesterol, creatinine

Decrease: sodium, HDL

NURSING CONSIDERATIONS

Assess:

- **Hypertension:** B/P when beginning treatment, periodically thereafter; pulse: note rate, rhythm, quality; apical/radial pulse before administration; notify prescriber of significant changes
- **CHF:** edema in feet, legs daily; fluid overload: dyspnea, weight gain, jugular venous distention, fatigue, crackles

Evaluate:

- Therapeutic response: decreased B/P with hypertension

Teach patient/family:

- To comply with dosage schedule even if feeling better; that improvement may take several weeks
- To rise slowly to sitting or standing position to minimize orthostatic hypotension
- To report bradycardia, dizziness, confusion, depression, fever, weight gain, SOB, cold extremities, rash, sore throat, bleeding, bruising
- To weigh, take pulse, B/P at home; to advise if weight gain of >2 lb/day or 5 lb/wk and when to notify prescriber

Black Box Warning:

Not to discontinue product abruptly; to taper over 1-2 wk; life-threatening dysrhythmias may occur

- To avoid hazardous activities until stabilized on medication; dizziness may occur
- To avoid all OTC medications unless approved by prescriber
- To carry emergency ID with product name, prescriber information at all times
- To inform all health care providers of products, supplements taken
- To report if pregnancy is planned or suspected, pregnancy (C) avoid breastfeeding

🍁 Canada only Side effects: *italics* = common; **bold** = life-threatening ⚠️
Nurse Alert

casposfungin (Rx)

(cas-po-fun'gin)

Cancidas

Func. class.: Antifungal, systemic

Chem. class.: Echinocandin

ACTION:

Inhibits an essential component in fungal cell walls; causes direct damage to fungal cell wall

USES:

Treatment of invasive aspergillosis and candidemia that has not responded to other treatment, including peritonitis, intraabdominal abscesses; susceptible species: *Aspergillus flavus*, *A. fumigatus*, *A. terreus*, *Candida albicans*, *C. glabrata*, *C. krusei*, *C. lusitaniae*, *C. parapsilosis*, *C. tropicalis*, esophageal candidiasis; empirical therapy for presumed fungal infection in febrile, neutropenic patients

Unlabeled uses: *Aspergillus niger*, fungal infections in premature neonates, neonates, infants, children <2 yr

CONTRAINDICATIONS:

Hypersensitivity to this product, other echinocandins, including mannitol

Precautions: Pregnancy (C), breastfeeding, children, geriatric patients, severe hepatic disease

DOSAGE AND ROUTES

Calculator

- **Adult:** IV loading dose 50-70 mg on day 1 then 50 mg/day maintenance dose, depending on condition; max 70 mg/day
- **Adolescent/child/infant ≥3 mo:** IV INF 70 mg/m² loading dose then 50 mg/m²/day; max 70 mg/day
- **Neonate and infant <3 mo (unlabeled):** IV 25 mg/m²/day

Esophageal candidiasis

- **Adult:** IV 50 mg × 7-14 days over 1 hr

- **Child: 3 mo-17 yr: IV** 70 mg/m² may increase to max 70 mg/m²

Available forms: Powder for inj 50, 70 mg

Administer:

- Do not mix or coinfuse with other medications, do not use dextrose-containing products to dilute, do not give as bolus

Intermittent IV INF route

- Allow to warm to room temp
- May administer loading dose on day 1
- **Reconstitute** 50-mg vial or 70-mg vial with 10.8 ml 0.9% NaCl, sterile water for inj or bacteriostatic water for inj (5 mg/ml or 7 mg/ml); **swirl** to dissolve, withdraw 10 ml reconstituted sol, and **further dilute** with 250 ml 0.9% NaCl, 0.45% NaCl, 0.225% NaCl, RL; **run** over 1 hr or more

SIDE EFFECTS

CNS: Dizziness, *headache*

CV: Sinus tachycardia

GI: Abdominal pain, *nausea, anorexia, vomiting, diarrhea, increased AST/ALT, alk phos*

HEMA: *Thrombophlebitis*, vasculitis, *anemia*

INTEG: *Rash, pruritus, inj site pain*

META: Hypokalemia

MS: Myalgia

RESP: *Acute respiratory distress syndrome (ARDS)*

SYST: *Anaphylaxis*

PHARMACOKINETICS

Metabolized in liver to inactive metabolites; excretion in feces, urine; phase II terminal half-life 9-11 hr; phase III terminal half-life 40-50 hr; protein binding 97%

INTERACTIONS

Increase: caspofungin levels—cycloSPORINE; may need dosage reduction

Decrease: levels of tacrolimus, sirolimus

Decrease: caspofungin levels—carBAMazepine, dexamethasone, efavirenz, nelfinavir, nevirapine, phenytoin, rifampin

Drug/Lab Test

Increase: AST, ALT, RBC, eosinophils

Decrease: HCT/Hgb, WBC, potassium

NURSING CONSIDERATIONS

Assess:

- **Infection;** clearing of cultures during treatment; obtain culture at baseline, throughout treatment; product may be started as soon as culture is taken (esophageal candidiasis); monitor cultures during HSCT for prevention of *Candida* infections • Hepatic studies before, during treatment: bilirubin, AST, ALT, alk phos, as needed; obtain baseline renal studies • **Hypersensitivity:** rash, pruritus, facial swelling; also for phlebitis
- GI symptoms: frequency of stools, cramping; if severe diarrhea occurs, electrolytes may need to be given

Perform/provide:

- Storage at room temp for up to 24 hr or refrigerated for 48 hr; store reconstituted sol at room temp for 1 hr before preparation of sol for administration

Evaluate:

- Therapeutic response: decreased symptoms of *Candida*, *Aspergillus* infections

Teach patient/family:

- To notify prescriber if pregnancy is suspected or planned
- To inform prescriber of renal/hepatic disease
- To report bleeding, facial swelling, wheezing, difficulty breathing, itching, rash, hives, increasing warmth, flushing; anaphylaxis can occur

☼ Canada only Side effects: *italics* = common; **bold** = life-threatening ⚠

ceftaroline (Rx)

(sef-tar'oh-leen)

Teflaro

Func. class.: Cephalosporin action: Inhibits cell wall synthesis through binding to essential penicillin-binding protein (PBPs)

USES:

Acute bacterial skin/skin structure infections (ABSSI), bacterial community-acquired pneumonia

CONTRAINDICATIONS:

Cephalosporin hypersensitivity

Precautions: Child/infant/neonate, breastfeeding, elderly patients, antimicrobial resistance, carbapenem/penicillin hypersensitivity, coagulopathy, colitis, dialysis, diarrhea, GI disease, hypoprothrombinemia, IBS, pregnancy (B), pseudomembranous colitis, renal disease, ulcerative colitis, viral infection, vit K deficiency

DOSAGE AND ROUTES

Calculator

• **Adult: IV** 600 mg q12hr × 5-14 days (skin/skin-structure infections) or × 5-7 days (bacterial community-acquired pneumonia)

Renal dose

• **Adult: IV** CCr >30-≤50 ml/min, 400 mg q12hr; CCr ≥15-≤30 ml/min, 300 mg q12hr, CCr ≤15 ml/min, 200 mg q12hr

Available forms: Powder for inj 400 mg, 600 mg

Administer:

• Obtain C&S before use

Intermittent IV INF route

- Visually inspect for particulate matter, discoloration if sol or container permits
- **Reconstitute:** add 20 ml of sterile water to 400-or 600-mg vial (20 ml/ml)

for 400 mg; 30 mg/ml for 600 mg), mix gently until dissolved; **dilute** in 250 ml of 0.9% NaCl, 0.45% NaCl, LR, D₅, D2.5, **give** over 1 hr, do not admix, use within 6 hr at room temp or 24 hr refrigerated

SIDE EFFECTS

CV: Phlebitis

ENDO: Hypokalemia

GI: Diarrhea, nausea, vomiting, constipation, abdominal pain, pseudomembranous colitis (rare)

INTEG: Rash, anaphylaxis

PHARMACOKINETICS

Protein binding 20%; excreted in urine 88%, feces 6%; half-life 2.66 hr; not hepatically metabolized

INTERACTIONS

Increase: prothrombin time risk—anticoagulants

Drug/Lab Test

Increase: LFTs

Decrease: potassium, eosinophils

NURSING CONSIDERATIONS

Assess:

- **Infection:** vital signs, sputum, WBC before, during therapy
- **Hypersensitivity:** before use, obtain a history of hypersensitivity reactions to cephalosporins, carbapenems, penicillins; cross-sensitivity may occur
- **Anaphylaxis (rare):** rash, pruritus, laryngeal edema, dyspnea, wheezing; discontinue product, notify health care provider immediately, keep emergency equipment nearby
- **Pseudomembranous colitis:** diarrhea, abdominal pain, fever, bloody stools; report immediately if these occur; may occur several weeks after terminating therapy
- Monitor BUN, creatinine baseline, periodically; elderly and those with renal disease are at greater risk of renal dysfunction

Evaluate:

- Therapeutic response: negative C&S, resolution of symptoms of infection

Teach patient/family:

- About the reason for treatment and expected result

- To immediately report rash, itching, difficulty breathing, bloody diarrhea, fever, abdominal pain

🍁 Canada only Side effects: *italics* = common; **bold** = life-threatening ⚠️

Nurse Alert

HIGH ALERT

celecoxib (Rx)

(sel-eh-cox'ib)

CeleBREX

Func. class.: Nonsteroidal antiinflammatory, antirheumatic *Chem. class.:* COX-2 inhibitor

Do not confuse: CeleBREX/CeleXA/Cerebra/Cerebyx

ACTION:

Inhibits prostaglandin synthesis by selectively inhibiting cyclooxygenase-2 (COX-2), an enzyme needed for biosynthesis

USES:

Acute, chronic rheumatoid arthritis, osteoarthritis, acute pain, primary dysmenorrhea, ankylosing spondylitis, juvenile rheumatoid arthritis (JRA)

Unlabeled uses: Colorectal adenoma prophylaxis

CONTRAINDICATIONS:

Pregnancy (D) 3rd trimester; hypersensitivity to salicylates, iodides, other NSAIDs, sulfonamides

Black Box Warning:

CABG

Precautions: Pregnancy (C) 1st/2nd trimesters, breastfeeding, children <18 yr, geriatric patients, bleeding, GI/renal/hepatic/cardiac disorders, PVD, hypertension, severe dehydration, asthma

Black Box Warning:

GI bleeding/perforation, peptic ulcer disease, MI, stroke

DOSAGE AND ROUTES

Calculator

Do not exceed recommended dose; deaths have occurred

Acute pain/primary dysmenorrhea

- **Adult: PO** 400 mg initially, then 200 mg if needed on 1st day, then 200 mg bid prn on subsequent days; start with 1/2 dose for poor CYP2C9 metabolizers

Osteoarthritis

- **Adult: PO** 200 mg/day as a single dose or 100 mg bid; start with 1/2 dose for poor CYP2C9 metabolizers

- **Geriatric: PO** use lowest possible dose

Rheumatoid arthritis

- **Adult: PO** 100-200 mg bid; start with 1/2 dose for poor CYP2C9 metabolizers

Ankylosing spondylitis

- **Adult: PO** 200 mg/day or in divided doses (bid); start with 1/2 dose for poor CYP2C9 metabolizers

Juvenile rheumatoid arthritis (JRA)

- **Adolescent and child ≥ 2 yr (>25 kg): PO** 100 mg bid; start with 1/2 dose for poor CYP2C9 metabolizers

- **Child ≥ 2 yr (10-25 kg): PO** 50 mg bid; start with 1/2 dose for poor CYP2C9 metabolizers

Hepatic disease

- **Adult: PO (Child-Pugh B) reduce dose by 50%**

Colorectal adenoma prophylaxis (unlabeled)

- **Adult: PO** 400 mg bid $\times$ 6 mo

Available forms: Caps 50, 100, 200, 400 mg

Administer:

- Do not break, crush, chew, or dissolve caps with a full glass of water to enhance absorption; caps may be opened into applesauce or soft food, ingest immediately with water • With food, milk to decrease gastric symptoms (with higher doses [400 mg bid]); do not increase dose

SIDE EFFECTS

CNS: *Fatigue, anxiety, depression, nervousness, paresthesia, dizziness, insomnia*

CV: *Stroke, MI, tachycardia, CHF, angina, palpitations, dysrhythmias, hypertension, fluid retention*

EENT: *Tinnitus, hearing loss, blurred vision, glaucoma, cataract, conjunctivitis, eye pain*

GI: *Nausea, anorexia, vomiting, constipation, dry mouth, diverticulitis, gastritis, gastroenteritis, hemorrhoids, hiatal hernia, stomatitis, GI bleeding/ulceration*

GU: *Nephrotoxicity: dysuria, hematuria, oliguria, azotemia, cystitis, UTI, renal papillary necrosis*

HEMA: Blood dyscrasias, epistaxis, bruising, anemia, platelet aggregation
INTEG: Serious (sometimes fatal) Stevens-Johnson syndrome, toxic epidermal necrolysis, purpura, rash, pruritus, sweating, erythema, petechiae, photosensitivity, alopecia
RESP: Pharyngitis, SOB, pneumonia, coughing

PHARMACOKINETICS

Well absorbed, crosses placenta, bound to plasma proteins, metabolized by CYP2C9 in liver, very little excreted by kidneys/in feces, peak 3 hr, half-life 11 hr, protein binding ~97%

INTERACTIONS

Increase: bleeding risk—anticoagulants, SSRIs, antiplatelets, thrombolytics, salicylates, alcohol

Increase: adverse reactions—glucocorticoids, NSAIDs, aspirin

Increase: toxicity—lithium, antineoplastics, bisphosphonates

Increase: celecoxib blood level—fluconazole

Decrease: effect of aspirin, ACE inhibitors, thiazide diuretics, furosemide

Drug/Herb

Decrease: effect of feverfew

Increase: bleeding risk—garlic, ginger, ginkgo

Drug/Lab Test

Increase: ALT, AST, BUN, cholesterol, glucose, potassium, sodium

Decrease: glucose, sodium, WBC, platelets

NURSING CONSIDERATIONS

Assess:

- **Pain** of rheumatoid arthritis, osteoarthritis; check ROM, inflammation of joints, characteristics of pain

Black Box Warning:

For cardiac disease that may be worse after taking product; MI, stroke; do not use with coronary artery bypass graft (CABG)

- CBC during therapy; watch for decreasing platelets; if low, therapy may need to be discontinued, restarted after hematologic recovery; LFTs, serum creatinine/BUN, stool guaiac

Black Box Warning:

For blood dyscrasias (thrombocytopenia): bruising, fatigue, bleeding, poor healing

- **GI toxicity:** black, tarry stools; abdominal pain

⚠️ Serious skin disorders: Stevens-Johnson syndrome, toxic epidermal necrolysis; may be fatal

Evaluate:

- Therapeutic response: decreased pain, inflammation in arthritic conditions; decreased number of polyps

Teach patient/family:

Black Box Warning:

Not to exceed recommended dose; to notify prescriber immediately of chest pain, skin eruptions; to stop product if these occur

- To check with prescriber to determine when product should be discontinued prior to surgery • That product must be continued for prescribed time to be effective; to avoid other NSAIDs, aspirin, sulfonamides

Black Box Warning:

To notify prescriber of GI symptoms: black, tarry stools; cramping or rash; edema of extremities; weight gain

Black Box Warning:

To report bleeding, bruising, fatigue, malaise because blood abnormalities do occur

- To report possible respiratory infection: fever, SOB, coughing, painful swallowing
- To report if pregnancy is planned or suspected, pregnancy (C) before 3 wk, (D) after 30 wk

🌿 Canada only Side effects: *italics* = common; **bold** = life-threatening ⚠️

cephalexin

See cephalosporins—1st generation

CEPHALOSPORINS— 1ST GENERATION

cefadroxil (Rx)

(sef-a-drox'ill)

Apo-Cefadroxil 

ceFAZolin (Rx)

(sef-a'zoe-lin)

cephalexin (Rx)

(sef-a-lex'in)

Keflex, Panixine

Func. class.: Antiinfective

Chem. class.: Cephalosporin (1st generation)

Do not confuse: **cephalexin**/cefaclor

ACTION:

Inhibits bacterial cell wall synthesis; renders cell wall osmotically unstable, leads to cell death; lysis mediated by cell wall autolytic enzymes

USES:

cefadroxil: Gram-negative bacilli: *Escherichia coli*, *Proteus mirabilis*, *Klebsiella* (UTI only); gram-positive organisms: *Streptococcus pneumoniae*, *Streptococcus pyogenes*, *Staphylococcus aureus*; upper, lower respiratory tract, urinary tract, skin infections; otitis media; tonsillitis; UTIs

ceFAZolin: Gram-negative bacilli: *Haemophilus influenzae*, *Escherichia coli*, *Proteus mirabilis*, *Klebsiella*; gram-positive organisms: *Staphylococcus aureus*; upper, lower respiratory tract, urinary tract, skin infections; bone, joint, biliary, genital infections; endocarditis, surgical prophylaxis, septicemia

cephalexin: Gram-negative bacilli: *Haemophilus influenzae*, *Escherichia coli*, *Proteus mirabilis*, *Klebsiella*; gram-positive organisms: *Streptococcus*

pneumoniae, Streptococcus pyogenes, Staphylococcus aureus; upper, lower respiratory tract, urinary tract, skin, bone infections; otitis media

CONTRAINDICATIONS:

Hypersensitivity to cephalosporins, infants <1 mo

Precautions: Pregnancy (B), breastfeeding, hypersensitivity to penicillins, renal disease

DOSAGE AND ROUTES

Calculator

cefadroxil

- **Adult: PO** 1-2 g/day or divided q12hr; loading dose of 1 g initially
- **Child: PO** 30 mg/kg/day in divided doses bid, max 2 g/day

Renal dose

- **Adult: PO** CCr 25-50 ml/min, 500 mg q12hr; CCr 10-24 ml/min, 500 mg q24hr; CCr <10 ml/min, 500 mg q36hr

Available forms: Caps 500 mg; tabs 1 g; oral susp 250, 500 mg/5 ml

cefazolin

Life-threatening infections

- **Adult: IM/IV** 1-2 g q6-8hr; max 12 g/day
- **Child >1 mo: IM/IV** 75-100 mg/kg in 3-4 divided doses; max 6 g/day

Mild/moderate infections

- **Adult: IM/IV** 250 mg-1 g q8hr, max 12 g/day
- **Child >1 mo: IM/IV** 25-50 mg/kg in 3-4 equal doses, max 6 g/day, or 2 g as a single dose

Renal dose

- **Adult: IM/IV** after loading dose, CCr 35-54 ml/min, dose q8hr; CCr 10-34 ml/min, 50% of dose q12hr; CCr <10 ml/min, 50% of dose q18-24hr
- **Child: IM/IV** CCr >70 ml/min, no dosage adjustment; CCr 40-70 ml/min after loading dose, reduce dose to 7.5-30 mg/kg q12hr; CCr 20-39 ml/min, give 3.125-12.5 mg/kg after loading dose q12hr; CCr 5-19 ml/min, 2.5-10 mg/kg after loading dose q24hr

Available forms: Inj 250, 500 mg, 1, 5, 10, 20 g; inf 500 mg, 1 g/50-ml vial

cephalexin

Moderate infections

- **Adult: PO** 250-500 mg q6hr, max 4 g/day
- **Child: PO** 25-50 mg/kg/day in 4 equal doses, max 4 g/day

Moderate skin infections

- **Adult: PO** 500 mg q12hr

Endocarditis prophylaxis

- 2 g 1 hr before procedure

Severe infections

- **Adult: PO** 500 mg-1 g q6hr
- **Child: PO** 50-100 mg/kg/day in 4 equal doses, max 4 g/day

Renal dose

- **Adult: PO** CCr 10-40 ml/min, 250-500 mg then 250-500 mg q8-12hr; CCr <10 ml/min, 250-500 mg then 250-500 mg q12-24hr

Available forms: Caps 250, 500 mg; tabs 250, 500 mg, 1 g; oral susp 125 mg, 250 mg/5 ml

Administer:

cefadroxil

- For 10-14 days to ensure organism death, prevent superinfection
- With food if needed for GI symptoms
- Shake susp, refrigerate, discard after 2 wk
- After C&S completed

ceFAZolin

IV route

- Check for irritation, extravasation often; dilute in 10 ml sterile water for inj, run over 3-5 min; may be further diluted with 50-100 ml of NS, D₅W sol, run over 1/2-1 hr by Y-tube or 3-way stopcock
- For 10-14 days to ensure organism death, prevent superinfection
- After C&S completed

Syringe compatibilities: DimenhyDRINATE, heparin, vit B complex

Y-site compatibilities: Acyclovir, alfentanil, allopurinol, alprostadil, amifostine, amikacin, aminocaproic acid, aminophylline, amphotericin B liposome, anidulafungin, ascorbic acid injection, atenolol, atracurium, atropine, aztreonam, benzotropine, bivalirudin, bleomycin, bumetanide, buprenorphine, butorphanol, calcium gluconate, CARBOplatin, cefamandole, cefmetazole, cefonicid, cefoperazone, cefoTEtan, cefOXitin, cefpirome, cefTAZidime, ceftizoxime,

cefTRIAxone, cefuroxime, cephalothin, cephapirin, chloramphenicol, cimetidine, CISplatin, clindamycin, codeine, cyanocobalamin, cyclophosphamide, cycloSPORINE, cytarabine, DACTINomycin, DAPTOmycin, dexamethasone, dexmedetomidine, digoxin, diltiazem, DOCEtaxel, doxacurium, doxapram, DOXOrubicin liposomal, enalaprilat, ePHEDrine, EPINEPHrine, epirubicin, epoetin alfa, eptifibatide, esmolol, etoposide, fenoldopam, fentaNYL, filgrastim, fluconazole, fludarabine, fluorouracil, folic acid (as sodium salt), foscarnet, furosemide, gallium, gatifloxacin, gemcitabine, gentamicin, glycopyrrolate, granisetron, heparin, hydrocortisone, hydrOXYzine, IDArubicin, ifosfamide, imipenem-cilastatin, indomethacin, insulin (regular), irinotecan, isoproterenol, ketorolac, lidocaine, linezolid, LORazepam, LR's injection, mannitol, mechlorethamine, melphalan, meperidine, metaraminol, methicillin, methotrexate, methoxamine, methyl dopate, methylPREDNISolone, metoclopramide, metoprolol, metroNIDAZOLE, mezlocillin, miconazole, midazolam, milrinone, morphine, moxalactam, multiple vitamins injection, nafcillin, nalbuphine, naloxone, nesiritide, niCARdipine, nitroglycerin, nitroprusside, norepinephrine, octreotide, ondansetron, oxacillin, oxaliplatin, oxytocin, PACLitaxel, palonosetron, pamidronate, pancuronium, pantoprazole, penicillin G potassium/sodium, peritoneal dialysis solution, perphenazine, PHENobarbital, phenylephrine, phytonadione, piperacillin, Plasma-Lyte M in dextrose 5%, polymyxin B, potassium chloride, procainamide, propofol, propranolol, ranitidine, remifentanyl, Ringer's injection, ritodrine, riTUXimab, sargramostim, sodium acetate, sodium bicarbonate, succinylcholine, SUFentanyl, tacrolimus, teniposide, tenoxicam, theophylline, thiamine, thiotepa, ticarcillin, ticarcillin-clavulanate, tigecycline, tirofiban, TNA, tolazoline, trastuzumab, trimetaphan, urokinase, vasopressin, vecuronium, verapamil, vinCRISTine, vitamin B complex with C, voriconazole, warfarin

cephalexin

- Shake susp, refrigerate, discard after 2 wk
- For 10-14 days to ensure organism death, prevent superinfection
- With food if needed for GI symptoms
- After C&S

SIDE EFFECTS

CNS: Headache, dizziness, weakness, paresthesia, fever, chills, **seizures** (with high doses)

GI: Nausea, vomiting, *diarrhea, anorexia*, pain, glossitis, bleeding; increased AST, ALT, bilirubin, LDH, alk phos; abdominal pain, **pseudomembranous colitis**

GU: Proteinuria, vaginitis, pruritus, candidiasis, increased BUN, **nephrotoxicity, renal failure**

HEMA: **Leukopenia, thrombocytopenia, agranulocytosis, anemia, neutropenia, lymphocytosis, eosinophilia, pancytopenia, hemolytic anemia**

INTEG: Rash, urticaria, dermatitis

RESP: Dyspnea

SYST: **Anaphylaxis, serum sickness, superinfection, Stevens-Johnson syndrome**

PHARMACOKINETICS

cefadroxil: Peak 1-1½ hr, duration 12-24 hr, half-life 1-2 hr, 20% bound by plasma proteins, crosses placenta, excreted in breast milk

cefazolin

IM: Peak 1/2-2 hr, duration 6-12 hr, half-life 1½-2¼ hr

IM: Peak 10 min, duration 6-12 hr, eliminated unchanged in urine, 75%-85% protein bound

cephalexin: Peak 1 hr, duration 6-12 hr, half-life 30-72 min, 5%-15% bound by plasma proteins, 80%-100% eliminated unchanged in urine, crosses placenta, excreted in breast milk

INTERACTIONS

Increase: prothrombin time—anticoagulants; use cautiously

Increase: toxicity—aminoglycosides, loop diuretics, probenecid

Drug/Lab Test

Increase: AST, ALT, alk phos, LDH, BUN, creatinine, bilirubin

False positive: urinary protein, direct Coombs' test, urine glucose

Interference: cross-matching

NURSING CONSIDERATIONS

Assess:

- Sensitivity to penicillin and other cephalosporins

⚠ Nephrotoxicity: increased BUN, creatinine; urine output: if decreasing,

notify prescriber • I&O daily

- Blood studies: AST, ALT, CBC, Hct, bilirubin, LDH, alk phos, Coombs' test monthly if patient is on long-term therapy • Electrolytes: potassium, sodium, chlorine monthly if patient is on long-term therapy

- **Pseudomembranous colitis:** bowel pattern daily; if severe diarrhea occurs, product should be discontinued ⚠️ **Anaphylaxis:** rash, urticaria, pruritus, chills, fever, joint pain; angioedema; may occur a few days after therapy begins; discontinue product, notify prescriber immediately, keep emergency equipment nearby • Bleeding: ecchymosis, bleeding gums, hematuria, stool guaiac daily ⚠️ **Overgrowth of infection:** perineal itching, fever, malaise, redness, pain, swelling, drainage, rash, diarrhea, change in cough, sputum

Evaluate:

- Therapeutic response: decreased symptoms of infection, negative C&S

Teach patient/family:

- To use yogurt or buttermilk to maintain intestinal flora, decrease diarrhea
- To take all medication prescribed for length of time ordered

⚠️ To report sore throat, bruising, bleeding, joint pain (may indicate **blood dyscrasias** [rare]); diarrhea with mucus, blood (may indicate **pseudomembranous colitis**)

TREATMENT OF ANAPHYLAXIS:

EPINEPHrine, antihistamines; resuscitate if needed

🇨🇦 Canada only Side effects: *italics* = common; **bold** = life-threatening ⚠️

Do not confuse: **cefaclor**/cephalexin

Cefotan/Ceftin

cefprozil/ceFAZolin/cefuroxime

Cefzil/Ceftin

ACTION:

Inhibits bacterial cell wall synthesis, renders cell wall osmotically unstable, leads to cell death by binding to cell wall membrane

USES:

cefaclor: Gram-negative bacilli: *Haemophilus influenzae*, *Escherichia coli*, *Proteus mirabilis*, *Klebsiella*; gram-positive organisms: *Streptococcus pneumoniae*, *Streptococcus pyogenes*, *Staphylococcus aureus*; respiratory tract, urinary tract, skin, bone, joint infections; otitis media

cefOTetan: Gram-negative organisms: *Haemophilus influenzae*, *Escherichia coli*, *Enterobacter aerogenes*, *Proteus mirabilis*, *Klebsiella*, *Citrobacter*, *Salmonella*, *Shigella*, *Acinetobacter*, *Bacteroides fragilis*, *Neisseria*, *Serratia*; gram-positive organisms: *Streptococcus pneumoniae*, *Streptococcus pyogenes*, *Staphylococcus aureus*; upper and lower, serious respiratory tract, urinary tract, skin, bone, joint, gynecologic, gonococcal, intraabdominal infections

cefOXitin: Gram-negative bacilli: *Haemophilus influenzae*, *Escherichia coli*, *Proteus*, *Klebsiella*, *Bacteroides fragilis*, *Neisseria gonorrhoeae*; gram-positive organisms: *Streptococcus pneumoniae*, *Streptococcus pyogenes*, *Staphylococcus aureus*; anaerobes including *Clostridium*; lower respiratory tract, urinary tract, skin, bone, gynecologic, gonococcal infections; septicemia, peritonitis

cefprozil: Pharyngitis/tonsillitis; otitis media; secondary bacterial infection of acute bronchitis; acute bacterial exacerbation of chronic bronchitis; uncomplicated skin and skin-structure infections; acute sinusitis

cefuroxime: Gram-negative bacilli: *Haemophilus influenzae*, *Escherichia coli*, *Neisseria*, *Proteus mirabilis*, *Klebsiella*; gram-positive organisms: *Streptococcus pneumoniae*, *Streptococcus pyogenes*, *Staphylococcus aureus*; serious lower respiratory tract, urinary tract, skin, bone, joint, gonococcal infections; septicemia, meningitis

CONTRAINDICATIONS:

Hypersensitivity to cephalosporins or related antibiotics; seizures

Precautions: Pregnancy (B), breastfeeding, children, GI/renal disease

DOSAGE AND ROUTES

Calculator

cefaclor

- **Adult: PO** 250-500 mg q8hr, max 4 g/day
- **Child >1 mo: PO** 20-40 mg/kg/day in divided doses q8hr or total daily dose may be divided and given q12hr, max 1 g/day

Available forms: Caps 250, 500 mg; oral susp 125, 187, 250, 375 mg/5 ml; chew tabs (Raniclor) 250, 375 mg

cefOTetan

- **Adult: IM/IV** 1-2 g q12hr × 5-10 days

Renal dose

- **Adult: IM/IV** CCr 10-30 ml/min, give dose q24hr or 1/2 dose q12hr; CCr <10 ml/min, give dose q48hr or 1/2 dose q24hr

Perioperative prophylaxis

- **Adult: IV** 1-2 g 1/2-1 hr before surgery

Available forms: Inj 1, 2, 10 g

cefOXitin

- **Adult: IM/IV** 1-2 g q6-8hr

Renal dose

- **Adult: IM/IV** after loading dose, CCr 30-50 ml/min, 1-2 g q8-12hr; CCr 10-29 ml/min, 1-2 g q12-24hr; CCr <10 ml/min, 0.5-1 g q12-24hr

Uncomplicated gonorrhea (outpatient)

- **Adult/adolescent/child ≥45 kg: IM** 2 g as single dose with 1 g **PO** probenecid at same time

Severe infections

- **Adult: IM/IV** 2 g q4hr
- **Child ≥3 mo: IM/IV** 80-160 mg/kg/day divided q4-6hr; max 12 g/day

Available forms: Powder for inj 1, 2, 10 g

cefprozil

Renal dose

- CCr <30 ml/min, 50% of dose

Upper respiratory infections

- **Adult: PO** 500 mg q24hr × 10 days

Otitis media

- **Child 6 mo-12 yr: PO** 15 mg/kg q12hr × 10 days

Lower respiratory infections

- **Adult: PO** 500 mg q12hr × 10 days

Skin/skin-structure infections

- **Adult: PO** 250-500 mg q12hr × 10 days

Available forms: Tabs 250, 500 mg; susp 125, 250 mg/5 ml

cefuroxime

- **Adult and child: PO** 250 mg q12hr; may increase to 500 mg q12hr for serious infections

- **Adult: IM/IV** 750 mg-1.5 g q8hr for 5-10 days

Urinary tract infections

- **Adult: PO** 125 mg q12hr; may increase to 250 mg q12hr if needed

Otitis media

- **Child <2 yr: PO** 125 mg bid
- **Child >2 yr: PO** 250 mg bid

Surgical prophylaxis

- **Adult: IV** 1.5 g 1/2-1 hr before surgery

Severe infections

- **Adult: IM/IV** 1.5 g q6hr; may give up to 3 g q8hr for bacterial meningitis
- **Child >3 mo: IM/IV** 50-100 mg/kg/day or IM in divided doses q6-8hr

Uncomplicated gonorrhea

- **Adult: IM** 1.5 g as single dose in 2 separate sites with oral probenecid

Renal dose

- **Dosage reduction indicated with severe renal impairment (CCr <20 ml/min)**

Available forms: Tabs 125, 250, 500 mg; inj 150, 750 mg, 1.5, 7.5 g; inj 750 mg; 1.5 g powder; susp 125, 250 mg/5 ml

Administer:

- Do not break, crush, or chew ext rel tabs or caps
- On an empty stomach 1 hr before or 2 hr after a meal

cefaclor

- Shake susp, refrigerate, discard after 2 wk
- For 10-14 days to ensure organism death, prevent superinfection
- With food if needed for GI symptoms
- After C&S completed

cefOTetan

- IV direct after diluting 1 g/10 ml sterile water for inj, give over 3-5 min; may be diluted further with 50-100 ml NS or D₅W; shake; run over 1/2-1 hr by Y-tube or 3-way stopcock; discontinue primary inf during administration • May be stored 96 hr refrigerated or 24 hr at room temp

Y-site compatibilities: Allopurinol, amifostine, aztreonam, diltiazem, famotidine, filgrastim, fluconazole, fludarabine, heparin, insulin (regular), melphalan, meperidine, morphine, PACLitaxel, remifentanyl, sargramostim, tacrolimus, teniposide, theophylline, thiotepa

cefOXitin

IV route

- After diluting 1 g or less/10 ml or more D₅W, NS and give over 3-5 min; may be diluted further with 50-100 ml NS or D₅W; run over 1/2-1 hr by Y-tube or 3-way stopcock; discontinue primary inf during administration; give by cont inf at prescribed rate; may store 96 hr refrigerated or 24 hr at room temp • For 10-14 days to ensure organism death, prevent superinfection
- After C&S completed

Syringe compatibilities: Heparin, insulin

Y-site compatibilities: Acyclovir, amifostine, amphotericin B cholesteryl sulfate complex, aztreonam, cyclophosphamide, diltiazem, DOXOrubicin liposome, famotidine, fluconazole, foscarnet, HYDROmorphone, magnesium sulfate, meperidine, morphine, ondansetron, perphenazine, remifentanyl, teniposide, thiotepa

cefprozil

- For 10-14 days to ensure organism death, prevent superinfection
- After C&S
- Refrigerate/shake susp before use

cefuroxime

- For 10-14 days to ensure organism death, prevent superinfection
- With food if needed for GI symptoms
- After C&S obtained

Y-site compatibilities: Acyclovir, allopurinol, amifostine, atracurium, aztreonam, cyclophosphamide, diltiazem, famotidine, fludarabine, foscarnet, HYDROmorphone, melphalan, meperidine, morphine, ondansetron, pancuronium, perphenazine, remifentanyl, sargramostim, tacrolimus, teniposide, thiotepa, vecuronium

SIDE EFFECTS

CNS: Dizziness, headache, fatigue, paresthesia, fever, chills, confusion

GI: *Diarrhea*, nausea, vomiting, anorexia, dysgeusia, glossitis, bleeding; increased AST, ALT, bilirubin, LDH, alk phos; abdominal pain, loose stools, flatulence, heartburn, stomach cramps, colitis, jaundice, **pseudomembranous colitis**

GU: Vaginitis, pruritus, candidiasis, increased BUN, **nephrotoxicity, renal failure**, pyuria, dysuria, reversible interstitial nephritis

HEMA: Leukopenia, thrombocytopenia, agranulocytosis, anemia, neutropenia, lymphocytosis, eosinophilia, pancytopenia, hemolytic anemia, leukocytosis, granulocytopenia

INTEG: Rash, urticaria, dermatitis, Stevens-Johnson syndrome

RESP: Dyspnea

SYST: Anaphylaxis, serum sickness, superinfection

PHARMACOKINETICS

cefaclor

PO: Peak 1/2-1 hr, half-life 36-54 min, 25% bound by plasma proteins, 60%-85% eliminated unchanged in urine in 8 hr, crosses placenta, excreted in breast milk (low concentrations)

cefotetan

IM/IV: Peak 1½-3 hr, half-life 3-5 hr, 75%-90% bound by plasma proteins, 50%-80% eliminated unchanged in urine, crosses placenta, excreted in breast milk

cefotaxime

Half-life 0.75-1 hr; 65%-80% bound by plasma proteins; 90%-100% eliminated unchanged in urine; crosses placenta, blood-brain barrier; eliminated in breast milk; not metabolized

IM: Peak 15-60 min

IV: Peak 3 min

cefprozil

PO: Peak 1.5 hr, protein binding 36%, elimination half-life 1.3 hr (normal renal function), 2 hr (hepatic disease), 5½-6 hr (end-stage renal disease), extensively metabolized to an active metabolite, eliminated in urine 60%

cefuroxime

Peak PO 2 hr, IM 45 min, IV 2-3 min, 66% excreted unchanged in urine, half-life 1-2 hr in normal renal function

INTERACTIONS

Increase: effect/toxicity—aminoglycosides, furosemide, probenecid

Increase: bleeding risk (cefotetan)—anticoagulants, thrombolytics, NSAIDs, antiplatelets, plicamycin, valproic acid

Decrease: absorption of cephalosporin —antacids

Decrease: effect of cephalosporin—H₂-blockers

Drug/Lab Test

False increase: creatinine (serum urine), urinary 17-KS

False positive: urinary protein, direct Coombs' test, urine glucose testing (Clinitest)

Interference: cross-matching

NURSING CONSIDERATIONS

Assess:

⚠ **Nephrotoxicity:** increased BUN, creatinine • I&O ratio

- Blood studies: AST, ALT, CBC, Hct, bilirubin, LDH, alk phos, Coombs' test monthly if patient is on long-term therapy • Electrolytes: potassium, sodium, chlorine monthly if patient is on long-term therapy

- Bowel pattern daily; if severe diarrhea occurs, product should be discontinued; may indicate pseudomembranous colitis • Urine output; if decreasing, notify prescriber (may indicate nephrotoxicity)

⚠ **Anaphylaxis:** rash, flushing, urticaria, pruritus, dyspnea; discontinue product, notify prescriber, have emergency equipment available • **Bleeding:** ecchymosis, bleeding gums, hematuria, stool guaiac daily

⚠ **Overgrowth of infection:** perineal itching, fever, malaise, redness, pain, swelling, drainage, rash, diarrhea, change in cough, sputum

Evaluate:

- Therapeutic response: negative C&S

Teach patient/family:

- If diabetic, to use blood glucose testing
- To complete full course of product therapy; to report persistent diarrhea
- To use yogurt, buttermilk to maintain intestinal flora, decrease diarrhea
- To notify prescriber if breastfeeding or of any side effects

⚠ To report sore throat, bruising, bleeding, joint pain (may indicate blood dyscrasias [rare]); diarrhea with mucus, blood (pseudomembranous colitis)

TREATMENT OF ANAPHYLAXIS:

EPINEPHrine, antihistamines; resuscitate if needed

✳ Canada only Side effects: *italics* = common; **bold** = life-threatening ⚠

Func. class.: Broad-spectrum antibiotic

Chem. class.: Cephalosporin (3rd generation)

Do not confuse: **cefTAZidime**/ceftizoxime

Vantin/Ventolin

ACTION:

Inhibits bacterial cell wall synthesis, renders cell wall osmotically unstable, leads to cell death

USES:

cefдинир: Community-acquired pneumonia, otitis media, sinusitis, pharyngitis, skin and skin-structure infections, acute exacerbations of chronic bronchitis, gram-negative bacilli: *Haemophilus influenzae*, *Haemophilus parainfluenzae*, *Moraxella catarrhalis*; gram-positive organisms: *Streptococcus pneumoniae*, *Streptococcus pyogenes*, *Staphylococcus aureus* (MSSA)

cefдиторен pivoxil: Acute bacterial exacerbations of chronic bronchitis caused by *Haemophilus influenzae*, *Haemophilus parainfluenzae*, *Streptococcus pneumoniae*, *Moraxella catarrhalis*; pharyngitis/tonsillitis caused by *Streptococcus pyogenes*; uncomplicated skin and skin-structure infections caused by *Staphylococcus aureus*, *Streptococcus pyogenes*; community-acquired pneumonia

cefепиме: Gram-negative bacilli: *Escherichia coli*, *Proteus*, *Klebsiella*; gram-positive organisms: *Streptococcus pneumoniae*, *Streptococcus pyogenes*, *Staphylococcus aureus*; lower respiratory tract, urinary tract, skin, bone infections; febrile neutropenia intraabdominal infection

цефихиме: Uncomplicated UTI (*Escherichia coli*, *Proteus mirabilis*), pharyngitis and tonsillitis (*Streptococcus pyogenes*), otitis media (*Haemophilus influenzae*), *Moraxella catarrhalis*, acute bronchitis and acute exacerbations of chronic bronchitis (*Streptococcus pneumoniae*, *H. influenzae*), uncomplicated gonorrhea

цефотаксиме: Gram-negative organisms: *Haemophilus influenzae*, *Haemophilus parainfluenzae*, *Escherichia coli*, *Enterococcus faecalis*, *Neisseria gonorrhoeae*, *Neisseria meningitidis*, *Proteus mirabilis*, *Klebsiella*, *Citrobacter*, *Serratia*, *Salmonella*, *Shigella* *Pseudomonas*; gram-positive organisms: *Streptococcus pneumoniae*, *Streptococcus pyogenes*, *Staphylococcus aureus*; serious lower respiratory tract, urinary tract, skin, bone, gonococcal infections; bacteremia, septicemia, meningitis, skin, skin-structure infections; CNS infections;

perioperative prophylaxis

cefpodoxime: Gram-negative bacilli: *Neisseria gonorrhoeae*, *Haemophilus influenzae*, *Escherichia coli*, *Proteus mirabilis*, *Klebsiella*; gram-positive organisms: *Streptococcus pneumoniae*, *Streptococcus pyogenes*, *Staphylococcus aureus*; upper and lower respiratory tract, urinary tract, skin infections; otitis media; sexually transmitted diseases

cefTAZidime: Gram-negative organisms: *Haemophilus influenzae*, *Escherichia coli*, *Enterobacter aerogenes*, *Pseudomonas aeruginosa*, *Proteus mirabilis*, *Klebsiella*, *Citrobacter*, *Enterobacter*, *Salmonella*, *Shigella*, *Acinetobacter*, *Bacteroides fragilis*, *Neisseria*, *Serratia*; gram-positive organisms: *Streptococcus pneumoniae*, *Streptococcus pyogenes*, *Staphylococcus aureus*; serious upper/lower respiratory tract, urinary tract, skin, gynecologic, bone, joint, intraabdominal infections; septicemia, meningitis, febrile neutropenia

ceftibuten: Pharyngitis/tonsillitis, otitis media, secondary bacterial infection of acute bronchitis

ceftizoxime: Gram-negative bacilli: *Haemophilus influenzae*, *Escherichia coli*, *Enterobacter aerogenes*, *Proteus mirabilis*, *Klebsiella*, *Enterobacter*; gram-positive organisms: *Streptococcus pneumoniae*, *Streptococcus pyogenes*, *Staphylococcus aureus*; serious lower respiratory tract, urinary tract, skin, intraabdominal infections; septicemia, meningitis, bone, joint infections; PID caused by *Neisseria gonorrhoeae*

cefTRIAXone: Gram-negative bacilli: *Haemophilus influenzae*, *Escherichia coli*, *Enterobacter aerogenes*, *Proteus mirabilis*, *Klebsiella*, *Citrobacter*, *Enterobacter*, *Salmonella*, *Shigella*, *Acinetobacter*, *Bacteroides fragilis*, *Neisseria*, *Serratia*; gram-positive organisms: *Streptococcus pneumoniae*, *Streptococcus pyogenes*, *Staphylococcus aureus*; serious lower respiratory tract, urinary tract, skin, gonococcal, intraabdominal infections; septicemia, meningitis, bone, joint infections; otitis media; PID

CONTRAINDICATIONS:

Hypersensitivity to cephalosporins, infants <1 mo

Precautions: Pregnancy (B), breastfeeding, children, hypersensitivity to penicillins, GI/renal disease

DOSAGE AND ROUTES

Calculator

cefdinir

Uncomplicated skin and skin-structure infections/community-acquired pneumonia

- **Adult and child ≥ 13 yr: PO 300 mg q12hr $\times$ 10 days**
- **Child 6 mo-12 yr: PO 7 mg/kg q12hr or 14 mg/kg q24hr $\times$ 10 days**

Acute exacerbations of chronic bronchitis/acute maxillary sinusitis

- **Adult and child ≥ 13 yr: PO 300 mg q12hr or 600 mg q24hr $\times$ 10 days or 300 mg bid $\times$ 5 days for some infections**

Pharyngitis/tonsillitis

- **Adult and child ≥ 13 yr: PO 300 mg q12hr or 600 mg q24hr $\times$ 10 days**
- **Child 6 mo-12 yr: PO 7 mg/kg q12hr $\times$ 5-10 days or 14 mg/kg q24hr $\times$ 10 days**

Renal dose

- **CCr < 30 ml/min, 300 mg/day (adult); 7 mg/kg/day (child)**

Available forms: Caps 300 mg; susp 125 mg, 250 mg/5 ml

cefditoren pivoxil

- **Adult: PO 200-400 mg bid $\times$ 10 days**

Renal dose

- **Adult: PO CCr 30-50 ml/min, max 200 mg bid; CCr < 30 ml/min, max 200 mg daily**

Available forms: Tabs 200 mg

cefepime

Febrile neutropenia

- **Adult/adolescent > 16 yrs/child ≥ 40 kg: IV 2 g q8hr $\times$ 7 days or until neutropenia resolves**
- **Infant ≥ 2 mo/child/adolescent ≤ 16 yr and ≤ 40 kg: IV 50 mg/kg/dose q8hr $\times$ 7-10 days or until neutropenia resolves**

Urinary tract infections (mild to moderate)

- **Adult: IV/IM 0.5-1 g q12hr $\times$ 7-10 days**

Urinary tract infections (severe)

- **Adult/adolescent > 16 yr/child ≥ 40 kg: IV 2 g q12hr $\times$ 10 days**

Pneumonia (moderate to severe)

- **Adult: IV 1-2 g q12hr $\times$ 10 days**
- **Dosage reduction indicated with renal impairment (CCr < 50 ml/min)**

Uncomplicated gonorrhea

- **IM** 2 g as a single dose with 1 g **PO** probenecid at the same time

Available forms: Powder for inj 500 mg, 1, 2 g; 1 g/50 ml, 2 g/100 ml

cefixime

- **Adult: PO** 400 mg/day as a single dose or 200 mg q12hr
- **Child >50 kg or >12 yr: PO** use adult dosage
- **Child <50 kg or <12 yr: PO** 8 mg/kg/day as a single dose or 4 mg/kg q12hr

Renal dose

- **CCr 21-60 ml/min, give 75% of dose; CCr <20 ml/min, give 50% of dose**

Available forms: Tabs 400 mg; powder for oral susp 100 mg/5 ml, chew tabs 100, 200 mg, 200 mg/5 ml

cefotaxime

- **Adult: IM/IV** 1-2 g q12hr
- **Child 1 mo-12 yr: IM/IV** 50-180 mg/kg/day divided q6hr

Severe infections

- **Adult: IM/IV** 2 g q4hr not to exceed 12 g/day
- **Child 1 mo-12 yr: IM/IV** 50-180 mg/kg/day in 4-6 divided doses

Uncomplicated gonorrhea

- **Adult: IM** 1 g
 - Dosage reduction indicated for severe renal impairment (CCr <30 ml/min)
- Available forms:** Powder for inj 500 mg, 1, 2, 10 g; inj 1, 2 g premixed frozen

cefpodoxime

Pneumonia

- **Adult >13 yr: PO** 200 mg q12hr × 14 days

Uncomplicated gonorrhea

- **Adult >13 yr: PO** 200 mg as a single dose

Skin and skin structure

- **Adult >13 yr: PO** 400 mg q12hr × 7-14 days

Pharyngitis and tonsillitis

- **Adult >13 yr: PO** 100 mg q12hr × 10 days
- **Child 5 mo-12 yr: PO** 5 mg/kg q12hr (max 100 mg/dose or 200 mg/day) × 5-10 days

Uncomplicated UTI

- **Adult >13 yr: PO** 100 mg q12hr × 7 days; dosing interval increased with severe renal impairment

Acute otitis media

- **Child 5 mo-12 yr: PO** 5 mg/kg q12hr × 10 days

Available forms: Tabs 100, 200 mg; granules for susp 50 mg, 100 mg/5 ml

cefTAZidime

- **Adult: IV/IM** 1-2 g q8-12hr × 5-10 days
- **Child: IV** 30-50 mg/kg q8hr, max 6 g/day
- **Neonate: IV** 30-50 mg/kg q12hr

Renal dose

- **Adult: IM/IV CCr <50 ml/min, give q12hr; CCr 10-30 ml/min, give q24hr; CCr <10 ml/min, give q48-72hr**

Available forms: Inj 250, 500 mg, 1, 2, 6 g

ceftibuten

- **Adult: PO** 400 mg/day × 10 days
- **Child 6 mo-12 yr: PO** 9 mg/kg/day × 10 days

Renal dose

- **Adult: PO CCr 30-49 ml/min, give 200 mg q24hr; CCr 5-29 ml/min, give 100 mg q24hr**

Available forms: Caps 400 mg; susp 90 mg, 180 mg/5 ml

ceftizoxime

- **Adult: IM/IV** 1-2 g q8-12hr, may give up to 4 g q8hr in life-threatening infections
- **Child >6 mo: IM/IV** 50 mg/kg q6-8hr

Renal dose

- **Adult: IM/IV CCr <50-80 ml/min, give 500-1500 mg q8hr; CCr 5-49 ml/min, give 250-1000 mg q12hr**

PID

- **Adult: IV** 2 g q8hr, may increase to 4 g q8hr in severe infections

Available forms: Powder for inj 500 mg, 1, 2, 10 g; premixed 1 g, 2 g/50 ml

cefTRIAXone

- **Adult: IM/IV** 1-2 g/day, max 2 g q12-24hr
- **Child: IM/IV** 50-75 mg/kg/day in equal doses q12hr

Uncomplicated gonorrhea

- **Adult: 250 mg IM** as single dose
- Reduce dosage in severe renal impairment (CCr <10 ml/min)

Meningitis

- **Adult and child: IM/IV** 100 mg/kg/day in equal doses q12hr, max 4 g/day

Surgical prophylaxis

- **Adult: IV** 1 g 1/2-2 hr before surgery

Available forms: Inj 250, 500 mg, 1, 2, 10 g

Administer:

- Change IV site q72hr

cefdinir

- Oral susp after adding 39 ml water to the 60-ml bottle or 65 ml water to the 120-ml bottle; discard unused portion after 10 days; give without regard to food, do not give within 2 hr of antacids, iron supplements • After C&S completed

cefditoren pivoxil

- For 10 days to ensure organism death, prevent superinfection
- With food for GI symptoms, do not give with antacids
- After C&S completed

cefepime

Intermittent IV INF route

- IV after diluting in 50-100 ml or more D₅, NS; give over 30 min
- For 7-10 days to ensure organism death, prevent superinfection

Solution compatibilities: 0.9% NaCl, D₅, D₅W, 0.5%, 10% lidocaine, bacteriostatic water for inj with parabens/benzyl alcohol

Y-site compatibilities: DOXOrubicin liposome

cefixime

- For 10-14 days to ensure organism death, prevent superinfection
- Do not break, crush, or chew tab
- Without regard to food

cefotaxime

IV route

- IV after **diluting** 1 g/10 ml D₅W, NS, sterile water for inj, **give** over 3-5 min by Y-tube or 3-way stopcock; may be **diluted further** with 50-100 ml NS or D₅W; **run** over 1/2-1 hr; discontinue primary inf during administration; may be **diluted** in larger vol of sol, given as a cont inf over 6-24 hr • For 10-14 days to ensure organism death, prevent superinfection
- Thaw frozen container at room temp or refrigeration; do not force thaw by immersion or microwave; visually inspect container for leaks

Syringe compatibilities: Caffeine, diphenhydramine, heparin, ofloxacin

Y-site compatibilities: Acyclovir, alfentanil, alprostadil, amifostine, amikacin, aminocaproic acid, aminophylline, anidulafungin, ascorbic acid injection, atenolol, atracurium, atropine, aztreonam, benztropine, bivalirudin, bleomycin, bumetanide, buprenorphine, butorphanol, caffeine, calcium chloride/gluconate, CARBOplatin, cefamandole, cefmetazole, cefonicid, cefoperazone, cefotetan, cefoxitin, ceftazidime (L-arginine), ceftriaxone sodium, cefuroxime, cimetidine, cisplatin, clindamycin, codeine, cyanocobalamin, cyclophosphamide, cyclosporine, cytarabine, dactinomycin, daptomycin, dexamethasone, dexmedetomidine, digoxin, diltiazem, docetaxel, dopamine, doxacurium, doxycycline, enalaprilat, ephedrine, epinephrine, epirubicin, epoetin alfa, eptifibatide, erythromycin, esmolol, etoposide, famotidine, fenoldopam, fentanyl, fludarabine, fluorouracil, folic acid, furosemide, gatifloxacin, gentamicin, glycopyrrolate, granisetron, heparin, hydrocortisone, hydromorphone, ifosfamide, imipenem-cilastatin, insulin (regular), isoproterenol, ketorolac, lidocaine, linezolid, lorazepam, LR, magnesium sulfate, mannitol, mechlorethamine, melphalan, meperidine, metaraminol, methicillin, methotrexate, methoxamine, methyl dopamine, metoclopramide, metoprolol, metronidazole, mezlocillin, miconazole, midazolam, milrinone, minocycline, mitoxantrone, morphine, moxalactam, multiple vitamins, mycophenolate, nafcillin, nalbuphine, naloxone, nesiritide, netilmicin, nitroglycerin, nitroprusside, norepinephrine, normal saline, octreotide, ofloxacin, ondansetron, ornidazole, oxacillin, oxaliplatin, oxytocin, PACLitaxel, palonosetron, pamidronate, pancuronium, pantoprazole, papaverine, pefloxacin, pemetrexed, penicillin G potassium/sodium, pentamidine, pentazocine, pentobarbital, peritoneal dialysis solution, perphenazine, phenobarbital, phenylephrine, phenytoin, phytonadione, piperacillin, polymyxin B, potassium chloride, procainamide, prochlorperazine, promethazine, propofol, propranolol, protamine, pyridoxine, quinidine, quinupristin, ranitidine, remifentanyl, Ringer's injection, ritodrine, rituximab, rocuronium, sargramostim, sodium acetate/bicarbonate, sodium fusidate, sodium lactate, succinylcholine, sufentanyl, sulfamethoxazole-trimethoprim, tacrolimus, teniposide, theophylline, thiamine, thiopental, ticarcillin, ticarcillin-clavulanate, tigecycline, tirofiban, TNA, tobramycin, tolazoline, TPN,

trastuzumab, trimetaphan, urokinase, vancomycin, vasopressin, vecuronium, verapamil, vinorelbine, voriconazole

cefpodoxime

- Do not break, crush, or chew tabs due to taste
- For 10-14 days to ensure organism death, prevent superinfection
- With food for better absorption; do not give within 2 hr of antacids, H₂-receptor antagonists

cefTAZidime

IM route

• **Fortaz, Tazidime vials:** Reconstitute 500 mg or 1 g with 1.5 or 3 ml, respectively, of sterile or bacteriostatic water for inj or 0.5-1% lidocaine (approx 280 mg/ml) • **Tazicef vials:** Reconstitute 1 g/3 ml sterile water for inj (approx 280 mg/ml) • **Ceptaz vials:** Reconstitute 1 g/3 ml sterile or bacteriostatic water for inj or 0.5-1% lidocaine (approx 250 mg/ml) • **Withdraw** dose while making sure needle remains in vial; **ensure** no CO₂ bubbles present; **inject** deeply in large muscle mass, **aspirate** before injection

IV route

- Visually inspect for particulate matter, discoloration, if possible
- **Fortaz, Tazicef, Tazidime packs: Reconstitute** 1 or 2 g/100 ml sterile water for inj or other compatible IV sol (10 or 20 mg/ml, respectively); reconstitution is done in two stages: first, **inject** 10 ml of the diluent into the pack and **shake** well to dissolve and become clear; CO₂ pressure inside container will occur, **insert** vent needle to release pressure; **add** remaining diluents, **remove** vent needle • **Fortaz, Tazicef, Tazidime vials: Reconstitute** 500 mg, 1 g, 2 g with 5, 10, 10 ml, respectively, of sterile water for inj or other compatible IV solution (100, 95-100, or 170-180 mg/ml, respectively); **shake** well to dissolve • **Fortaz, Tazidime ADD-Vantage vials (for IV only): Reconstitute** 1 or 2 g with NS, ½ NS, D₅W in either 50-or 100-ml flexible diluent container; to release CO₂ pressure, **insert** vent needle after dissolving, **remove** vent before using • **Ceptaz packs: Reconstitute** 1 or 2 g/100 ml sterile water for inj or compatible IV sol (10 or 20 mg/ml, respectively); reconstitution is done in two stages: first, **inject** 10 ml of the diluent into the pack and **shake** well to dissolve, **add** the remaining diluent, **insert** vent needle before giving • **Ceptaz vials: Reconstitute** 1 or 2 g/10 ml

of sterile water for inj or compatible IV sol (90-95, or 170-180 mg/ml, respectively) • **Ceptaz ADD-Vantage vials (for IV only): Reconstitute** 1 or 2 g with NS, ½ NS, or D₅W in either 50-or 100-ml diluent container

Direct intermittent IV INF route

• **Vials: withdraw** dose while making sure needle remains in sol; make sure there are no CO₂ bubbles in syringe before inj; **inject** directly over 3-5 min or slowly into tubing of a free-flowing compatible IV solution

Intermittent IV INF route

• **Vials: withdraw** dose while making sure needle opening remains in sol; make sure there are no CO₂ bubbles in syringe before inj; infusion packs and ADD-Vantage systems ready for inf after reconstitution, **infuse** over 15-30 min

Syringe compatibilities: Cimetidine, dimenhyDRINATE, HYDROmorphone

Y-site compatibilities: Acyclovir, alfentanil, allopurinol, amifostine, amikacin, aminocaproic acid, aminophylline, amphotericin B lipid complex, anakinra, anidulafungin, atenolol, atropine sulfate, aztreonam, benzotropine, bivalirudin, bleomycin, bumetanide, buprenorphine, butorphanol, calcium gluconate, CARBOplatin, cefamandole, ceFAZolin, cefonicid, cefoperazone, cefoTEtan, cefOXitin, cefTAZidime, ceftizoxime, cefTRIAxone, cefuroxime, cephalothin, cephapirin, cimetidine, ciprofloxacin, CISplatin, clindamycin, codeine, cyanocobalamin, cyclophosphamide, cycloSPORINE, cytarabine, DACTINomycin, DAPTOmycin, dexamethasone, dexmedetomidine, digoxin, diltiazem, DOCEtaxel, DOPamine, doxacurium, doxapram, enalaprilat, ePHEDrine, EPINEPHrine, epoetin alfa, eptifibatide, esmolol, etoposide, famotidine, fenoldopam, fentaNYL, filgrastim, fludarabine, fluorouracil, folic acid, foscarnet, furosemide, gallium, gatifloxacin, gemcitabine, gentamicin, glycopyrrolate, granisetron, heparin, HYDROmorphone, ifosfamide, imipenem-cilastatin, indomethacin, insulin (regular), irinotecan, isepamicin, isoproterenol, isosorbide, ketamine, ketorolac, labetalol, levofloxacin, lidocaine, linezolid, LORazepam, LR, magnesium sulfate, mannitol, mechlorethamine, melphalan, meperidine, metaraminol, methicillin, methotrexate, methoxamine, methyl dopate, methylPREDNISolone, metoclopramide, metoprolol, metroNIDAZOLE, miconazole, milrinone, morphine, moxalactam, multiple vitamin inj, nafcillin, nalbuphine, PACLitaxel, ranitidine, remifentanil, tacrolimus, teniposide, theophylline, thiotepa, vinorelbine, zidovudine

ceftibuten

- For 10 days to ensure organism death, prevent superinfection
- Without regard to food

ceftizoxime

IV route

- IV after **diluting** 1 g/10 ml sterile water, shake and **give** over 3-5 min; may be **diluted further** with 50-100 ml NS or D₅W; give through **Y**-tube or 3-way stopcock; **run** over 1/2-1 hr • For 10-14 days to ensure organism death, prevent superinfection

Y-site compatibilities: Acyclovir, alfentanil, allopurinol, amifostine, amikacin, aminocaproic acid, aminophylline, amiodarone, amphotericin B cholesteryl, amphotericin B liposome, anidulafungin, ascorbic acid injection, atenolol, atracurium, atropine, aztreonam, benztropine, bivalirudin, bleomycin, bumetanide, buprenorphine, butorphanol, calcium chloride/gluconate, CARBOplatin, caspofungin, cefamandole, ceFAZolin, cefmetazole, cefoperazone, cefoTEtan, cefTAZidime, cefTRIAxone, cefuroxime, cephalothin, cephapirin, cimetidine, CISplatin, clindamycin, codeine, cyanocobalamin, cyclophosphamide, cycloSPORINE, cytarabine, DACTINomycin, DAPTOmycin, dexamethasone, dexmedetomidine, digoxin, diltiazem, diphenhydrAMINE, DOCEtaxel, DOPamine, doxacurium, DOXOrubicin, DOXOrubicin liposomal, enalaprilat, ePHEDrine, EPINEPHrine, epirubicin, epoetin alfa, eptifibatide, esmolol, etoposide, fenoldopam, fentaNYL, fluconazole, fludarabine, fluorouracil, folic acid, foscarnet, furosemide, gatifloxacin, gemcitabine, gentamicin, glycopyrrolate, granisetron, heparin, hydrocortisone, HYDROmorphine, IDArubicin, ifosfamide, imipenem-cilastatin, insulin (regular), irinotecan, isoproterenol, ketorolac, labetalol, levofloxacin, lidocaine, linezolid, LORazepam, LR, magnesium sulfate, mannitol, mechlorethamine, melphalan, meperidine, methotrexate, methoxamine, methyldopate, metoclopramide, metoprolol, metroNIDAZOLE, mezlocillin, midazolam, milrinone, mitoXANtrone, morphine, multiple vitamins injection, mycophenolate mofetil, nafcillin, naloxone, nesiritide, netilmicin, niCARdipine, nitroglycerin, nitroprusside, norepinephrine, octreotide, ondansetron, oxaliplatin, oxytocin, PACLitaxel, palonosetron, pamidronate, pancuronium, pantoprazole, PEMEtrexed, penicillin G potassium/sodium,

PHENobarbital, phenylephrine, phytonadione, piperacillin, polymyxin B, potassium chloride, propofol, propranolol, ranitidine, remifentanyl, Ringer's, ritodrine, riTUXimab, rocuronium, sargramostim, sodium acetate/bicarbonate, succinylcholine, SUFentanyl, tacrolimus, teniposide, theophylline, thiotepa, ticarcillin-clavulanate, tigecycline, tirofiban, TNA, tobramycin, TPN, trastuzumab, trimetaphan, vasopressin, verapamil, vinCRISTine, vinorelbine, voriconazole

cefTRIAXone

- For 10-14 days to ensure organism death, prevent superinfection
- **IM** inj deeply in large muscle mass

IV route

- **IV** after **diluting** 250 mg/2.4 ml D₅W, water for inj, 0.9% NaCl; may be **further diluted** with 50-100 ml NS, D₅W, D₁₀W; shake; **run** over 1/2-1 hr
- Do not mix with calcium salts

Y-site compatibilities: Acyclovir, alfentanil, allopurinol, amifostine, amikacin, aminocaproic acid, aminophylline, amiodarone, amphotericin B liposome, anidulafungin, atenolol, atracurium, atropine, aztreonam, benztropine, bivalirudin, bleomycin, bumetanide, buprenorphine, butorphanol, CARBOplatin, cefamandole, ceFAZolin, cefmetazole, cefonicid, cefoperazone, cefoTAXime, cefoTetan, cefOXitin, cefTAZidime, ceftizoxime, cefuroxime, cephalothin, cephapirin, cimetidine, cisatracurium, CISplatin, codeine, cyanocobalamin, cyclophosphamide, cycloSPORINE, cytarabine, DACTINomycin, DAPTOmycin, dexamethasone, dexmedetomidine, digoxin, diltiazem, DOCEtaxel, DOPamine, doxacurium, DOXOrubicin liposomal, doxycycline, drotrecogin alfa, enalaprilat, ePHEDrine, EPINEPHrine, epoetin alfa, eptifibatide, erythromycin, esmolol, etoposide, fenoldopam, fludarabine, fluorouracil, folic acid, foscarnet, furosemide, gallium, gatifloxacin, gemcitabine, gentamicin, glycopyrrolate, granisetron, heparin, hydrocortisone, HYDROmorphine, ifosfamide, indomethacin, insulin (regular), isoproterenol, ketorolac, lansoprazole, levofloxacin, lidocaine, linezolid, LORazepam, mannitol, mechlorethamine, melphalan, meperidine, metaraminol, methicillin, methotrexate, methoxamine, methyl dopate, methylPREDNISolone, metoclopramide, metoprolol, metroNIDAZOLE, mezlocillin, miconazole, midazolam, milrinone, morphine, moxalactam, multiple vitamins injection,

nafcillin, nalbuphine, naloxone, nesiritide, netilmicin, nitroglycerin, nitroprusside, norepinephrine, octreotide, oxacillin, oxaliplatin, oxytocin, PACLitaxel, palonosetron, pamidronate, pancuronium, pantoprazole, PEMEtrexed, penicillin G potassium/sodium, PHENobarbital, phenylephrine, phytonadione, piperacillin, polymyxin B, potassium chloride, procainamide, propofol, propranolol, pyridoxine, ranitidine, remifentanyl, ritodrine, riTUXimab, rocuronium, sargramostim, sodium acetate/bicarbonate, succinylcholine, SUFentanyl, tacrolimus, teniposide, theophylline, thiamine, thiotepa, ticarcillin, ticarcillin-clavulanate, tigecycline, tirofiban, tolazoline, trastuzumab, trimetaphan, urokinase, vasopressin, vecuronium, verapamil, vinCRIStine, voriconazole, warfarin, zidovudine

SIDE EFFECTS

CNS: Headache, dizziness, weakness, paresthesia, fever, chills, **seizures**, dyskinesia (cefdinir); **neurotoxicity (renal disease) cefepime**

CV: **Heart failure**, syncope (cefdinir)

EENT: *Oral candidiasis*

GI: *Nausea, vomiting, diarrhea, anorexia*, pain, glossitis, **bleeding**; increased AST, ALT, bilirubin, LDH, alk phos; abdominal pain, **pseudomembranous colitis**; cholestasis (cefotaxime)

GU: **Proteinuria**, vaginitis, pruritus, *candidiasis*, increased BUN, **nephrotoxicity**, renal failure

HEMA: **Leukopenia, thrombocytopenia, agranulocytosis**, anemia, **neutropenia, lymphocytosis, eosinophilia, pancytopenia, hemolytic anemia**

INTEG: Rash, urticaria, dermatitis

MS: Arthralgia (cefditoren)

RESP: Dyspnea

SYST: **Anaphylaxis, serum sickness, Stevens-Johnson syndrome, toxic epidermal necrolysis**

PHARMACOKINETICS

cefdinir

Unchanged in urine; crosses placenta, blood-brain barrier; eliminated in breast milk, not metabolized; 60%-70% protein binding, half-life 1.7 h

cefditoren pivoxil

Well absorbed when broken down (prodrug), wide distribution, half-life 100 min, onset rapid, peak 0.5-3 hr, duration 12 hr, 88% protein binding

cefepime

Peak 79 min; half-life 2 hr; 20% bound by plasma proteins; 90% excreted unchanged in urine; crosses placenta, blood-brain barrier; excreted in breast milk, not metabolized

cefixime

PO: Peak 1-2 hr, half-life 3-4 hr, 65% bound by plasma proteins, 50% eliminated unchanged in urine, crosses placenta, excreted in breast milk

cefotaxime

Half-life 1 hr, 35%-65% is bound by plasma proteins, 40%-65% is eliminated unchanged in urine in 24 hr, 25% metabolized in the liver to active metabolites, excreted in breast milk (small amounts)

IM: Onset 30 min

IV: Onset 5 min

cefpodoxime

Half-life 3 hr, 21%-29% bound by plasma proteins, 30% eliminated unchanged in urine in 8 hr, crosses placenta, excreted in breast milk

cefTAZidime

IM/IV: Peak 1 hr, half-life 1-1½ hr, 90% bound by plasma proteins, 80% eliminated unchanged in urine, crosses placenta, excreted in breast milk

ceftibuten

PO: Peak 2-3 hr; plasma protein binding 65%, elimination half-life 2 hr, extensively metabolized to an active metabolite

ceftizoxime

Half-life 1.6 hr, 30% bound by plasma proteins, 36%-60% eliminated unchanged in urine, crosses placenta, excreted in breast milk

IM: Peak 1 hr

IV: Onset 5 min

cefTRIAXone

Half-life 6-9 hr, 90% protein binding 58%-96%, eliminated unchanged in urine, crosses placenta, excreted in breast milk

IM: Peak 2-3 hr

IV: Onset 5 min

INTERACTIONS

Increase: bleeding—anticoagulants, thrombolytics, plicamycin, valproic acid, NSAIDs

Increase: toxicity—aminoglycosides, furosemide, probenecid

Decrease: absorption of cefdinir—iron

Drug/Food

Decrease: absorption—iron-rich cereal, infant formula

Drug/Lab Test

Increase: ALT, AST, alk phos, LDH, bilirubin, BUN, creatinine

False increase: creatinine (serum urine), urinary 17-KS

False positive: urinary protein, direct Coombs' test, urine glucose

Interference: cross-matching

NURSING CONSIDERATIONS

Assess:

- Sensitivity to penicillin, other cephalosporins

⚠ **Nephrotoxicity:** increased BUN, creatinine; urine output: if decreasing, notify prescriber • **Blood studies:** AST, ALT, CBC, Hct, bilirubin, LDH, alk phos, Coombs' test monthly if patient is on long-term therapy • **Electrolytes:** potassium, sodium, chloride monthly if patient is on long-term therapy

• **Pseudomembranous colitis:** bowel pattern daily; if severe diarrhea occurs, product should be discontinued • **IV site for extravasation, phlebitis**

⚠ **Anaphylaxis:** rash, urticaria, pruritus, chills, fever, joint pain, angioedema; may occur a few days after therapy begins • **Bleeding:** ecchymosis, bleeding gums, hematuria, stool guaiac

⚠ **Overgrowth of infection:** perineal itching, fever, malaise, redness, pain, swelling, drainage, rash, diarrhea, change in cough, sputum

Evaluate:

- Therapeutic response: decreased symptoms of infection; negative C&S

Teach patient/family:

- If diabetic, to check blood glucose

⚠ To report sore throat, bruising, bleeding, joint pain, may indicate **blood dyscrasias (rare)**; diarrhea with mucus, blood, may indicate **pseudomembranous colitis**

- That cefditoren can be taken with oral contraceptives

TREATMENT OF ANAPHYLAXIS:

EPINEPHrine, antihistamines; resuscitate if needed

🍁 Canada only Side effects: *italics* = common; **bold** = life-threatening ⚠️
Nurse Alert

cephradine

See cephalosporins—1st generation

certolizumab pegol (Rx)

(ser'tue-liz'oo-mab pegh'ol)

Cimzia

Func. class.: Biologic response modifier

Chem. class: Anti-tissue necrosis factor (anti-TNF) agent

ACTION:

Monoclonal antibody that neutralizes the activity of tumor necrosis factor α (TNF- α) found in Crohn's disease; decreases infiltration of inflammatory cells

USES:

Crohn's disease (moderate to severe) that has not responded to conventional therapy, rheumatoid arthritis (moderate to severe)

Unlabeled uses: Moderate to severe chronic plaque psoriasis, fistulizing Crohn's disease

CONTRAINDICATIONS:

Influenza, IV administration, sepsis, hypersensitivity

Black Box Warning:

Infection, neoplastic disease

Precautions: Pregnancy (B), breastfeeding, children, geriatric patients, AIDS, coagulopathy, diabetes, fungal infection, heart failure, hepatitis, human antichimeric antibody, immunosuppression, leukopenia, MS, cancer, neurologic/renal disease, surgery, thrombocytopenia, TB, vaccinations

DOSAGE AND ROUTES

Calculator

Crohn's disease (moderate to severe)

- **Adult:** SUBCUT 400 mg given as 2 inj at wk 0, 2, 4; if clinical response occurs, give 400 mg q4wk

Rheumatoid arthritis (moderate to severe)

- **Adult:** SUBCUT 400 mg q2wk × 3 doses then 200 mg q2wk; given with methotrexate

Crohn's disease (fistulizing)/intolerant to infliximab (unlabeled)

- **Adult:** SUBCUT 400 mg wk 0, 2, 4 then 400 mg q4wk

Available forms: Powder for inj 400-mg kit

Administer:

SUBCUT route

- Give by subcut inj only
- Reconstitution: allow to warm to room temp; add 1 ml sterile water for inj to each vial; 2 vials will be needed for patients with Crohn's disease • Gently swirl; do not shake; full reconstitution may take up to 30 min; reconstituted product may remain at room temp for up to 2 hr or refrigerated up to 24 hr • If reconstituted product has been refrigerated, allow to warm to room temp
- Use 2 syringes and two 20G needles
- Withdraw reconstituted sol from each vial into separate syringes; each will contain 200 mg; switch 20G to 23G needle; inject into 2 separate sites in abdomen or thigh • Store in refrigerator; do not freeze

SIDE EFFECTS

CNS: *Dizziness*, syncope, peripheral neuropathy, fever, **seizures, demyelinating disease of CNS**

CV: Hypotension, **heart failure, MI, cardiac dysrhythmia**

EENT: Optic neuritis, retinal hemorrhage, uveitis

GI: Increased LFTs, **hepatitis, bowel obstruction**

GU: UTI, renal disease

HEMA: **Anemia, aplastic anemia, pancytopenia, thrombocytopenia**

INTEG: *Rash, urticaria*, **angioedema**

MISC: **Anaphylaxis**, antibody formation, arthralgia, bleeding, infection, lupuslike symptoms, lymphadenopathy, **malignancies, serum sickness, suicidal ideation**

RESP: Dyspnea, upper respiratory tract infection

PHARMACOKINETICS

Peak 54-171 hr, terminal half-life 14 days

INTERACTIONS

- Do not administer live vaccines, toxoids concurrently

Increase: possible infections—abatacept, adalimumab, anakinra, etanercept, immunosuppressive agents, infliximab, rilonacept; do not use concurrently

Increase: possible malignancies—adalimumab, etanercept, infliximab

NURSING CONSIDERATIONS

Assess:

- Antinuclear antibody test (ANA), hepatitis B serology, CBC
- For rheumatoid arthritis, ROM, pain
- GI symptoms: nausea, vomiting, abdominal pain, hepatitis, increased LFTs
- Periodic blood counts (CBC)
- CV status: B/P, pulse, chest pain

⚠ Allergic reaction, anaphylaxis: rash, dermatitis, urticaria, dyspnea, hypotension, fever, chills; discontinue if severe; administer EPINEPHrine, corticosteroids, antihistamines; assess for allergies to murine proteins before starting therapy

Black Box Warning:

Infection: discontinue if infection occurs; do not administer to patients with active infection

Black Box Warning:

Identify TB, risk for HBV before beginning treatment; TB test should be obtained; if present, TB should be treated prior to certolizumab treatment

Evaluate:

- Therapeutic response: absence of fever, mucus in stools

Teach patient/family:

- Not to breastfeed while taking this product

Black Box Warning:

To notify prescriber of GI symptoms, hypersensitivity reactions, infections, fluid retention; redness, pain, swelling at inj site

Black Box Warning:

Not to operate machinery, drive if dizziness, vertigo occur

☼ Canada only Side effects: *italics* = common; **bold** = life-threatening ⚠
Nurse Alert

cetirizine (Rx, OTC)

(se-teer'i-zeen)

All Day Allergy, All Day Allergy Children's, GNP All Day Allergy, GNP Children's All Day Allergy, Good Sense All Day Allergy, Good Sense Children's All Day Allergy, Publix Allergy Children's, Reactine , Top Care Children's All Day Allergy, Zyrtec, Zyrtec Children's *Func. class.:* Antihistamine (2nd generation, peripherally selective) *Chem. class.:* Piperazine, H₁-histamine antagonist

Do not confuse: ZyrTEC/Xanax/Zantac

ACTION:

Acts on blood vessels, GI, respiratory system by competing with histamine for H₁-receptor site; decreases allergic response by blocking pharmacologic effects of histamine; minimal anticholinergic, sedative action

USES:

Rhinitis, allergy symptoms, chronic idiopathic urticaria

Unlabeled uses: Asthma, atopic dermatitis

CONTRAINDICATIONS:

Breastfeeding, newborn or premature infants, hypersensitivity to this product or hydrOXYzine, severe hepatic disease

Precautions: Pregnancy (B), children, geriatric patients, respiratory disease, angle-closure glaucoma, prostatic hypertrophy, bladder neck obstruction, asthma

DOSAGE AND ROUTES

Calculator

Perennial/seasonal allergic rhinitis or idiopathic urticaria

- **Adult and child ≥6 yr:** PO 5-10 mg/day
- **Child 2-5 yr:** PO 2.5 mg/day, may increase to 5 mg/day or 2.5 mg bid
- **Child 1-2 yr:** PO 2.5 mg/day, may increase to 2.5 mg q12hr
- **Geriatric:** PO 5 mg/day, may increase to 10 mg/day

Self-treatment of hay fever/other respiratory allergies

- **Adult/adolescent/child ≥6 yr:** PO 10 mg/day; **ORAL SOL** 5-10 mg/day

Renal dose/hemodialysis/hepatic dose

- **Adult:** PO CCr 11-31 ml/min, 5 mg/day

Atopic dermatitis (unlabeled)

- **Child 6-12 yr: PO** 5-10 mg/day
- **Child 1-2 yr: PO** 0.25 mg/kg bid

Available forms: Tabs 5, 10 mg; syr 5 mg/5 ml, prefilled spoons 1 mg/ml; oral sol 5 mg/ml; liquid-filled caps 10 mg; chew tabs 5, 10 mg

Administer:

- Without regard to meals
- **Caps:** swallow whole, do not break, cut, chew, crush
- **Chew tabs:** chew before swallowing, may use with or without water
- **Oral liquid:** use calibrated measuring device

SIDE EFFECTS

CNS: *Headache*, stimulation, *drowsiness*, sedation, *fatigue*, confusion, blurred vision, tinnitus, restlessness, tremors; paradoxical excitation in children, geriatric patients

GI: *Dry mouth*, increased LFTs, constipation

INTEG: Rash, eczema, photosensitivity, urticaria

RESP: *Thickening of bronchial secretions*, dry nose, throat

PHARMACOKINETICS

Absorption rapid; onset 1/2 hr; peak 1-2 hr; duration 24 hr; protein binding 93%; half-life decreased in children, increased in renal/hepatic disease

INTERACTIONS

Increase: CNS depression—alcohol, opiates, sedative/hypnotics, other CNS depressants

Increase: anticholinergic/sedative effect—MAOIs

Increase: cetirizine effect—ritonavir

Drug/Food

- Food prolongs absorption by 1.7 hr

Drug/Lab Test

False negative: skin allergy tests

NURSING CONSIDERATIONS

Assess:

- **Allergy symptoms:** pruritus, urticaria, watering eyes at baseline and during

treatment • Respiratory status: rate, rhythm, increase in bronchial secretions, wheezing, chest tightness • Blood studies: LFTs, BUN, creatinine at baseline, periodically

Perform/provide:

- Hard candy, gum, frequent rinsing of mouth for dryness
- Storage in tight, light-resistant container

Evaluate:

- Therapeutic response: absence of running or congested nose, rashes

Teach patient/family:

- About all aspects of product use; to notify prescriber if confusion, sedation, hypotension occur • To avoid driving, other hazardous activity if drowsiness occurs
- To avoid alcohol, other CNS depressants, OTC antihistamines
- To avoid exposure to sunlight; burns may occur
- To use sugarless gum, candy, frequent sips of water to minimize dry mouth
- Not to breastfeed

TREATMENT OF OVERDOSE:

Administer diazepam, vasopressors, phenytoin IV

☼ Canada only Side effects: *italics* = common; **bold** = life-threatening ⚠
Nurse Alert

cetrorelix (Rx)

(set-roe-ree'lix)

Cetrotide

Func. class.: Gonadotropin-releasing hormone antagonist

Chem. class.: Synthetic decapeptide

ACTION:

Inhibitor of pituitary gonadotropin secretion; initially increases LH and FSH, induces a rapid suppression of gonadotropin secretion

USES:

For inhibition of premature LH surges in women undergoing controlled ovarian hyperstimulation

Unlabeled uses: Benign prostatic hyperplasia (BPH), endometriosis

CONTRAINDICATIONS:

Pregnancy (X), breastfeeding, hypersensitivity, latex allergy, renal disease

Precautions: Geriatric patients

DOSAGE AND ROUTES

Calculator

Single-dose regimen

- **Adult:** SUBCUT 3 mg when serum estradiol level at appropriate stimulation response, usually on stimulation day 7; if hCG not given within 4 days after inj of 3 mg cetrorelix, give 0.25 mg daily until day of hCG administration

Multiple-dose regimen

- **Adult:** SUBCUT 0.25 mg given on stimulation day 5 (either morning or evening) or 6 (morning) and continued daily until day hCG is given

BPH (unlabeled)

- **Adult (male):** SUBCUT 5 mg bid $\times$ 2 days then 1 mg/day

Endometriosis (unlabeled)

- **Adult (female):** SUBCUT 3 mg weekly

Available forms: Inj 0.25, 3 mg

Administer:

SUBCUT route

- Attach yellow-marked needle to diluent syringe, dilute powder by injecting liquid from syringe into vial, leaving syringe on vial; gently swirl until clear, avoid bubbles; withdraw contents of vial back into syringe, replace yellow-marked needle with gray-marked needle • SUBCUT using abdomen, 1 inch away from navel or upper thigh; swab inj area with disinfectant; clean a 2-inch circle and allow to dry; pinch up area between thumb and finger; insert needle 45-90 degrees to surface; if positioned correctly, no blood will be drawn back into syringe; reposition needle without removing it; rotate inj sites • Protect from light

SIDE EFFECTS

CNS: Headache

CV: Edema

ENDO: Ovarian hyperstimulation syndrome, abdominal pain (gyn)

GI: Nausea, vomiting, diarrhea

INTEG: Pain on inj; local site reactions, bruising, pruritus

OTHER: Rapid weight gain

RESP: Shortness of breath

SYST: Fetal death, anaphylaxis

PHARMACOKINETICS

Excreted in feces/urine, half-life depends on dosage, metabolized to metabolites, protein binding 86%

NURSING CONSIDERATIONS

Assess:

- Serum progesterone, LH; ovarian ultrasound day 7-14; pelvic exam, serum estradiol/gonadotropin; weight • For suspected pregnancy; product should not be used, pregnancy (X)

- For latex allergy, product should not be used

- ⚠ For anaphylaxis during first inf

Evaluate:

- Therapeutic response: pregnancy

Teach patient/family:

- To report abdominal pain, vaginal bleeding, nausea, vomiting, diarrhea, SOB,

peripheral edema • How to perform self-administration technique if needed

🍁 Canada only Side effects: *italics* = common; **bold** = life-threatening ⚠️
Nurse Alert

cetuximab (Rx)

(se-tux'i-mab)

Erbitux

Func. class.: Antineoplastic—miscellaneous, monoclonal antibody *Chem. class.:* Epidermal growth factor receptor inhibitor

ACTION:

Not fully understood; binds to epidermal growth factor receptors (EGFRs); inhibits phosphorylation and activation of receptor-associated kinase, thereby resulting in inhibition of cell growth

USES:

Alone or in combination with irinotecan for EGFRs expressing metastatic colorectal carcinoma, head/neck cancer

Unlabeled uses: Front-line use for non–small-cell lung cancer in combination with CISplatin and vinorelbine

CONTRAINDICATIONS:

Hypersensitivity to this product, murine proteins

Precautions: Pregnancy (C), breastfeeding, children, geriatric patients;

CV/renal/hepatic disease; ocular, pulmonary disorders

Black Box Warning:

Arrhythmias, CAD, infusion-related reactions, radiation, cardiac, respiratory arrest

DOSAGE AND ROUTES

Calculator

• **Adult: IV INF** 400 mg/m² loading dose given over 120 min, max inf rate 5 ml/min; weekly maintenance dose (all other inf) is 250 mg/m² given over 60 min, max inf rate 5 ml/min (10 mg/min); premedicate with an H₁-antagonist (diphenhydrAMINE 50 mg IV); dosage adjustments made for inf reactions or dermatologic toxicity; other protocols used

Non–small-cell lung cancer (NSCLC) (unlabeled)

• **Adult: IV** 400 mg/m² over 120 min (max 5 ml/min) week 1 with weekly inf of 250 mg/m² over 60 min (max 5 ml/min) with CISplatin 80 mg/m² on day 1 and vinorelbine 25 mg/m² on days 1, 8

Available forms: Sol for inj 100 mg/50 ml, 200 mg/100 ml

Administer:

Intermittent IV INF route

- Use cytotoxic handling procedures
- By IV inf only; do not give by IV push or bolus; do not shake or dilute
- Do not dilute with other products
- Storage refrigerated at 36° F-46° F, discard unused portions
- **Inf pump:** draw up volume of vial using appropriate syringe/needle (vented spike or other appropriate transfer device); fill Erbitux into sterile evacuated container/bag, repeat until calculated volume put into the container; use new needle for each vial; give through in-line filter (low protein binding 0.22 micrometer); affix inf line and prime before starting inf, max rate 5 ml/min; flush line at end of inf with 0.9% NaCl, use a low protein binding 0.22-micrometer in-line filter
- **Syringe pump:** draw up volume of vial using appropriate syringe/needle (vented spike); place syringe into syringe driver of syringe pump and set rate; use in-line filter (low protein binding 0.22-micrometer); connect inf line, start inf after priming; repeat until calculated volume given
- Use new needle and filter for each vial, max 5 ml/min rate; use 0.9% NaCl to flush line after inf
- Do not piggyback to patient inf line
- Observe patient for adverse reactions for 1 hr after inf

Black Box Warning:

Inf reactions: if mild (grade 1 or 2), reduce all doses by 50%; if severe (grade 3 or 4), permanently discontinue

SIDE EFFECTS

CNS: Headache, insomnia, depression, aseptic meningitis

CV: Cardiac arrest

GI: Nausea, diarrhea, vomiting, anorexia, mouth ulceration, dehydration, constipation, abdominal pain

HEMA: Leukopenia, anemia

INTEG: Rash, pruritus, acne, dry skin, toxic epidermal necrolysis, angioedema, blepharitis, cheilitis, cellulitis, cysts, alopecia, skin/nail disorder, acute infusion reactions, other skin toxicities

MISC: Conjunctivitis, asthma, malaise, fever, renal failure, hypomagnesemia

MS: *Back pain*

RESP: *Interstitial lung disease, cough, dyspnea, pulmonary embolus, peripheral edema, respiratory arrest*

SYST: *Anaphylaxis, sepsis, infection*

PHARMACOKINETICS

Half-life 114 hr, steady state by 3rd wkly inf, peak 168-235 g/ml, trough 41-85 g/ml

INTERACTIONS

Drug/Lab:

Increase: LFTs

NURSING CONSIDERATIONS

Assess:

Black Box Warning:

Pulmonary changes: lung sounds, cough, dyspnea; interstitial lung disease may occur, may be fatal; discontinue therapy if confirmed

- Cardiac arrest: monitor electrolytes, in those undergoing radiation therapy, electrolytes may be decreased

⚠️ Serious hypersensitivity reactions: toxic epidermal necrosis, angioedema, anaphylaxis • **GI symptoms:** frequency of stools, dehydration, abdominal pain, stomatitis

- **K-RAS mutations** with metastatic colorectal carcinoma; if K-RAS mutation on codon 12 or 13 detected, patient should not receive anti-EGFR antibody therapy

Evaluate:

- Therapeutic response: decreased growth, spread of EGFR-expressing metastatic colorectal, head/neck carcinoma

Teach patient/family:

Black Box Warning:

To report adverse reactions immediately: shortness of breath, severe abdominal pain, skin eruptions

- About the reason for treatment, expected results

Black Box Warning:

To use contraception during treatment (pregnancy [C]), not to breastfeed

- To wear sunscreen and hats to limit sun exposure; sun exposure can exacerbate any skin reactions
 - To avoid crowds, persons with known infections
-

🍁 Canada only Side effects: *italics* = common; **bold** = life-threatening ⚠️
Nurse Alert

chlordiazepOXIDE (Rx)

(klor-dye-az-e-pox'ide)

Librium

Func. class.: Antianxiety

Chem. class.: Benzodiazepine, long-acting

Controlled Substance Schedule IV

Do not confuse: **Librium**/Librax

ACTION:

Potentiates the actions of GABA, especially in the limbic system, reticular formation

USES:

Short-term management of anxiety, acute alcohol withdrawal, preoperatively for relaxation

CONTRAINDICATIONS:

Pregnancy (D), breastfeeding, children <6 yr, hypersensitivity to benzodiazepines, closed-angle glaucoma, psychosis

Precautions: Geriatric patients, debilitated, renal/hepatic disease, suicidal ideation, abrupt discontinuation

DOSAGE AND ROUTES

Calculator

Mild anxiety

- **Adult: PO** 5-10 mg tid-qid
- **Geriatric: PO** 5 mg bid initially, increase as needed
- **Child >6 yr: PO** 5 mg bid-qid, max 10 mg bid-tid

Severe anxiety

- **Adult: PO** 25-50 mg tid-qid

Preoperatively

- **Adult: PO** 5-10 mg tid-qid on day before surgery

Alcohol withdrawal

- **Adult: PO** 50-100 mg q4-6hr prn, max 300 mg/day

Renal disease

- **Adult: PO** CCr <10 ml/min, give 50% dose

Available forms: Caps 5, 10, 25 mg

Administer:

PO route

- With food or milk for GI symptoms

SIDE EFFECTS

CNS: *Dizziness, drowsiness, confusion, headache, anxiety, tremors, stimulation, fatigue, depression, insomnia, hallucinations*

CV: *Orthostatic hypotension, edema, ECG changes, tachycardia, hypotension*

EENT: *Blurred vision, tinnitus, mydriasis*

GI: *Constipation, dry mouth, nausea, vomiting, anorexia, diarrhea*

GU: *Irregular periods, decreased libido*

HEMA: *Agranulocytosis*

INTEG: *Rash, dermatitis, itching*

PHARMACOKINETICS

PO: Onset 30 min, peak within 2 hr, duration 4-6 hr, metabolized by liver, excreted by kidneys, crosses placenta, excreted in breast milk, half-life 5-30 hr (increased in geriatric patients)

INTERACTIONS

Increase: CNS depression—CNS depressants, alcohol

Increase: chlordiazePOXIDE—cimetidine, disulfiram, FLUoxetine, isoniazid, ketoconazole, metoprolol, oral contraceptives, propranolol, valproic acid

Decrease: action of levodopa

Decrease: action of chlordiazePOXIDE—CYP3A4 inhibitors (protease inhibitors, barbiturates, rifamycins)

Drug/Lab Test

Increase: LFTs

False increase: 17-OHCS

False positive: pregnancy test (some methods)

NURSING CONSIDERATIONS

Assess:

- B/P (lying, standing), pulse; if systolic B/P drops 20 mm Hg, hold product, notify prescriber • Blood studies: CBC during long-term therapy; **blood dyscrasias** have occurred rarely • Hepatic studies: AST, ALT, bilirubin, creatinine, LDH, alk phos during long-term therapy
- For ataxia, oversedation of geriatric patients, debilitated patients
- Physical dependency, withdrawal symptoms: headache, nausea, vomiting, muscle pain, weakness after long-term use • Mental status: mood, sensorium, affect, sleeping pattern, drowsiness, dizziness; suicidal tendencies; paradoxical reactions such as excitement, stimulation, acute rage • For pregnancy; product should not be used during pregnancy (D)

Perform/provide:

- Assistance with ambulation during beginning therapy because drowsiness, dizziness occur
- Check to confirm that PO medication has been swallowed if patient is depressed, suicidal
- Sugarless gum, hard candy, frequent sips of water for dry mouth

Evaluate:

- Therapeutic response: decreased anxiety, restlessness, sleeplessness

Teach patient/family:

- That product may be taken with food
- Not to use product for everyday stress or use for more than 4 mo unless directed by prescriber • Not to take more than prescribed amount; may be habit forming
- To avoid OTC preparations unless approved by prescriber
- To avoid driving, activities that require alertness because drowsiness may occur
- To avoid alcohol ingestion, other psychotropic medications unless directed by prescriber
- **Not to discontinue medication abruptly after long-term use because this may precipitate seizures • To rise slowly because fainting may occur, especially among geriatric patients**
- That drowsiness may be worse at beginning of treatment
- **To notify prescriber if pregnancy is suspected or planned**
- **To immediately report suicidal thoughts/behaviors**

TREATMENT OF OVERDOSE:

Lavage, VS, supportive care, give flumazenil

✳ Canada only Side effects: *italics* = common; **bold** = life-threatening ⚠

Nurse Alert

chloroquine (Rx)

(klor'oh-kwin)

Aralen

Func. class.: Antimalarial

Chem. class.: Synthetic 4-amino-quinoline derivative

ACTION:

Inhibits parasite replication, transcription of DNA to RNA by forming complexes with DNA of parasite

USES:

Malaria of *Plasmodium vivax*, *P. malariae*, *P. ovale*, *P. falciparum* (some strains); amebiasis

Unlabeled uses: Discoid lupus erythematosus, polymorphous light eruption, rheumatoid arthritis, ulcerative colitis

CONTRAINDICATIONS:

Hypersensitivity, retinal field changes

Precautions: Pregnancy (C), breastfeeding, children, blood dyscrasias, severe GI disease, neurologic disease, alcoholism, hepatic disease, G6PD deficiency, psoriasis, eczema, seizures, preexisting auditory damage, torsades de pointes

Black Box Warning:

Infection

DOSAGE AND ROUTES

Calculator

Acute malaria attacks

- **Adult: PO** 1000 mg (600-mg base), then 500 mg (300-mg base) in 6-8 hr, then 500 mg (300-mg base) daily × 2 days for a total of 2.5 g (1.5-g base) in 3 days
- **Adult/adolescent of low body weight, child/infant: PO** 16.5 mg (10-mg base)/kg, max 600-mg base; then 8.3 mg (5-mg base)/kg, max 300-mg base 6 hr after 1st dose; then 8.3 mg (5-mg base)/kg, max 300-mg base 24 hr after 1st dose; then 8.3 mg (5-mg base)/kg, max 300-mg base 36 hr after 1st dose

Malaria prophylaxis (in areas with chloroquine-sensitive *P. falciparum*)

- **Adult: PO** 500 mg (300-mg base) weekly on same day of each wk starting

2 wk before travel and for 8 wk after leaving

Extraintestinal amebiasis

- **Adult: PO** 1 g (600-mg base) daily × 2 days, then 500 mg (300-mg base) for ≥2-3 wk
- **Child (unlabeled): PO** 16.6 mg (10-mg base)/kg (max 300-mg base) daily × 2-3 wk

Rheumatoid arthritis/discoid lupus erythematosus (unlabeled)

- **Adult: PO** 250 mg (150-mg base) daily

Available forms: Tabs 250 mg (150-mg base), 500 mg (300-mg base) phosphate

Administer:

- Product in mg or base; they are different

PO route

- Before or after meals at same time each day to maintain product level

SIDE EFFECTS

CNS: Headache, stimulation, fatigue, **seizures**, psychosis, hallucinations, insomnia

CV: Hypotension, **heart block, asystole with syncope**, ECG changes, cardiomyopathy

EENT: *Blurred vision, corneal changes, retinal changes, difficulty focusing, tinnitus, vertigo, deafness, photophobia, corneal edema*

GI: *Nausea, vomiting, anorexia, diarrhea, cramps*

HEMA: **Thrombocytopenia, agranulocytosis, hemolytic anemia, leukopenia**

INTEG: Pruritus, pigmentary changes, skin eruptions, lichen-planus-like eruptions, eczema, **exfoliative dermatitis**

PHARMACOKINETICS

Metabolized in liver; excreted in urine, feces, breast milk; crosses placenta

PO: Peak 1-3 hr, half-life 3-5 days

INTERACTIONS

- Reduced oral clearance and metabolism of chloroquine: cimetidine

Increase: **QT prolongation, torsades de pointes**—class IA, III antidysrhythmics

Increase: effects—2D6 inhibitors (amiodarone, chlorpheniramine, FLUoxetine, haloperidol, ritonavir, PARoxetine, terbinafine, ticlopidine); CYP3A4 inhibitors

(diltiazem, verapamil, itraconazole, ketoconazole, erythromycin, doxycycline, clarithromycin)

Decrease: action of chloroquine—magnesium, aluminum compounds, kaolin; do not use concurrently

Decrease: effects of ampicillin, rabies vaccine (ID)

Drug/Lab Test

Decrease: Hgb, platelets, WBC

NURSING CONSIDERATIONS

Assess:

Black Box Warning:

Infection: resistance is common, not to be used for *P. falciparum* acquired in areas of resistance or where prophylaxis has failed

- Ophthalmic test if long-term treatment or dosage of >150 mg/day, baseline and periodically
- Blood studies: CBC, since blood dyscrasias occur

- **ECG** during therapy; watch for depression of T waves, widening of QRS complex
- **Allergic reactions:** pruritus, rash, urticaria

- **Blood dyscrasias:** malaise, fever, bruising, bleeding (rare)

- **For ototoxicity** (tinnitus, vertigo, change in hearing); audiometric testing should be done before, after treatment
- **For toxicity:** blurring vision; difficulty focusing; headache; dizziness; decreased knee, ankle reflexes; seizures, CV collapse; product should be discontinued immediately and IV fluids given

Perform/provide:

- Storage in tight, light-resistant container at room temp; keep inj in cool environment

Evaluate:

- Therapeutic response: decreased symptoms of infection

Teach patient/family:

- To take with meals or immediately after meals
- To use sunglasses in bright sunlight to decrease photophobia
- That urine may turn rust or brown color
- To report hearing, visual problems; fever, fatigue, bruising, bleeding; may indicate blood dyscrasias

TREATMENT OF OVERDOSE:

Administer barbiturate (ultrashort-acting), vasopressor; tracheostomy may be

necessary

- Keep away from pets, children, overdose is fatal
-

✳ Canada only Side effects: *italics* = common; **bold** = life-threatening ⚠

Nurse Alert

chlorpheniramine

(OTC, Rx)

(klor-fen-ir'a-meen)

AHIST, Aller-Chlor, Allergy, Chlor-Pheniton, Chlor-Trimeton, Diabetic Tussin Allergy Relief, ED-Chlor-Tann, Equaline Allergy, Equate Chlortabs Allergy, Good Sense Allergy, Leader Allergy, P-Tann, Tana Hist-PD, Teldrin, Top Care Allergy, Wal-finate Allergy *Func. class.:* Antihistamine (1st generation, nonselective) *Chem. class.:* Alkylamine, H₁-receptor antagonist

Do not confuse: Teldrin/Tedral

ACTION:

Acts on blood vessels, GI system, respiratory system by competing with histamine for H₁-receptor site; decreases allergic response by blocking histamine

USES:

Allergy symptoms, rhinitis, conjunctivitis (allergic)

Unlabeled uses: Nausea, vomiting due to motion sickness, pruritus, urticaria

CONTRAINDICATIONS:

Newborns/neonates

Precautions: Pregnancy (B), breastfeeding, children, geriatric patients, increased intraocular pressure, cardiac/renal disease, hypertension, asthma, seizure disorder, hyperthyroidism, prostatic hypertrophy, GI obstruction, peptic ulcer disease, emphysema, hypersensitivity to H₁-receptor antagonists, lower respiratory tract disease, stenosed peptic ulcers, bladder neck obstruction, closed-angle glaucoma

DOSAGE AND ROUTES

Calculator

• **Adult and child ≥12 yr:** PO 4 mg tid-qid, max 24 mg/day; **EXT REL** 8-12 mg bid-tid, max 24 mg/day

• **Child 6-12 yr:** PO 2 mg q4-6hr, max 12 mg/day; **EXT REL** 8 mg bedtime or daily, **EXT REL** not recommended for child <6 yr

Available forms: Chewable tabs 2 mg; tabs 4, 8, 12 mg; ext rel tabs 8, 12 mg; ext rel caps 8, 12 mg; syr 1 mg/5 ml, 2 mg/5 ml, 2.5 mg/5 ml

Administer:

- Avoid concurrent use with other CNS depressants
- Do not break, crush, or chew ext rel forms
- Without regard to meal
- Avoid use in children <6 yr
- **Syrup:** Use dosing utensil to measure correct dose

SIDE EFFECTS

CNS: *Dizziness, drowsiness*, poor coordination, fatigue, anxiety, euphoria, confusion, paresthesia, neuritis

EENT: Blurred vision; dilated pupils; tinnitus; nasal stuffiness; dry nose, throat, mouth

GI: Nausea, anorexia, diarrhea

GU: *Retention*, dysuria, urinary frequency

HEMA: *Thrombocytopenia, agranulocytosis, hemolytic anemia*

INTEG: Photosensitivity

RESP: Increased thick secretions, wheezing, chest tightness

PHARMACOKINETICS

Detoxified in liver, excreted by kidneys (metabolites/free drug), half-life 12-15 hr

PO: Onset 1/2 hr, duration 4-12 hr

PO-ER: Duration 8-24 hr

INTERACTIONS

Increase: CNS depression—barbiturates, opiates, hypnotics, tricyclics, alcohol

Increase: effect of chlorpheniramine—MAOIs

Increase: anticholinergic action—atropine, phenothiazines, quiniDine, haloperidol

Drug/Lab Test

False negative: skin allergy tests

NURSING CONSIDERATIONS**Assess:**

- Be alert for urinary retention, frequency, dysuria; product should be

discontinued

- Respiratory status: rate, rhythm, increase in bronchial secretions, wheezing, chest tightness

Perform/provide:

- Hard candy, gum, frequent rinsing of mouth for dryness
- Storage in tight container at room temp

Evaluate:

- Therapeutic response: absence of running, congested nose, rashes, conjunctivitis

Teach patient/family:

- About all aspects of product use; to notify prescriber of confusion, sedation, hypotension, difficulty voiding • To avoid driving, other hazardous activity if drowsiness occurs, especially geriatric patients • To avoid concurrent use of alcohol

TREATMENT OF OVERDOSE:

Administer diazepam, vasopressors, phenytoin IV

☼ Canada only Side effects: *italics* = common; **bold** = life-threatening ⚠
Nurse Alert

chlorproMAZINE (Rx)

(klor-proe'ma-zeen)

Func. class.: Antipsychotic/antiemetic

Chem. class.: Phenothiazine-aliphatic

Do not confuse: chlorproMAZINE/chlorproPAMIDE/prochlorperazine

ACTION:

Depresses cerebral cortex, hypothalamus, limbic system, which control activity aggression; blocks neurotransmission produced by dopamine at synapse; exhibits a strong α -adrenergic, anticholinergic blocking action; mechanism for antipsychotic effects is unclear

USES:

Psychotic disorders, mania, schizophrenia, anxiety, intractable hiccups in adults, nausea, vomiting; preoperatively for relaxation; acute intermittent porphyria, behavioral problems in children, nonpsychotic, demented patients, Tourette's syndrome

Unlabeled uses: Vascular headache, agitation, dementia, neonatal abstinence syndrome

CONTRAINDICATIONS:

Children <6 mo, hypersensitivity, circulatory collapse, liver damage, cerebral arteriosclerosis, coronary disease, severe hypo/hypertension, blood dyscrasias, coma, brain damage, bone marrow depression, alcohol/barbiturate withdrawal, closed-angle glaucoma

Precautions: Pregnancy (C), breastfeeding, geriatric patients, seizure disorders, hypertension, hepatic/cardiac disease, prostatic enlargement, Parkinson's disease, pulmonary disease

Black Box Warning:

Dementia. Increased mortality in geriatric patients with dementia-related psychosis

DOSAGE AND ROUTES

Calculator

Psychosis

- **Adult: PO** 10-50 mg q1-4hr initially then increase up to 2 g/day if necessary;

IM 10-50 mg q1-4hr, usual dose 300-800 mg/day

- **Geriatric:** 10-25 mg daily-bid, increase by 10-25 mg/day q4-7days, max 800 mg/day

- **Child >6 mo:** **PO** 0.55 mg/kg q4-6hr; **IM** 0.5 mg/kg q6-8hr

Nausea and vomiting

- **Adult:** **PO** 10-25 mg q4-6hr prn; **IM** 12.5-25 mg then 25-50 mg if no hypotension q3hr prn; q6-8hr prn, max 400 mg/day; **IV** 25-50 mg daily-qid

- **Child ≥6 mo:** **PO** 0.55 mg/kg q4-6hr; **IM** q6-8hr; **IM** ≤5 yr or ≤22.7 kg, 40 mg; max **IM** 5-10 yr or 22.7-45.5 kg, 75 mg

Intractable hiccups/Acute intermittent porphyria

- **Adult:** **PO** 25-50 mg tid-qid; **IM** 25-50 mg (only if PO dose does not work); **IV** 25-50 mg in 500-1000 ml **NS** (only for severe hiccups)

Available forms: Tabs 10, 25, 50, 100, 200 mg; inj 25 mg/ml

Administer:

- Anticholinergic agent for EPS if ordered

PO route

- With full glass of water, milk or with food to decrease GI upset
- Periodically attempt dosage reduction in those with behavioral problems

IM route

- Use gloves to prepare product, if product touches skin, wash with soap and water to prevent contact dermatitis • **IM**, inject in deep muscle mass, do not give SUBCUT, no dilution needed; if irritation occurs, may dilute in NS or procaine 2%
- Avoid skin contact with injection solution—may cause contact dermatitis

IV route

Direct IV: After **diluting** 1 mg/1 ml with NS, **give** 1 mg or less/2 min or more, never give undiluted

Intermittent IV INF: **Dilute** 25-50 mg/500-1000 NS or other compatible large IV sol, **give** over 1/2 hour, protect from light

Syringe compatibilities: Atropine, benztropine, butorphanol, diphenhydramine, doxapram, droperidol, fentanyl, glycopyrrolate, hydromorphone, hydroxyzine, meperidine, metoclopramide, midazolam, morphine, pentazocine, perphenazine, prochlorperazine, promazine, promethazine, scopolamine

Y-site compatibilities: Alfentanil, amikacin, amphotericin B lipid complex,

amsacrine, anidulafungin, ascorbic acid injection, atenolol, atracurium, atropine, benztropine, bleomycin sulfate, buprenorphine, butorphanol, calcium chloride/gluconate, caspofungin, cimetidine, cisatracurium, CISplatin, cladribine, codeine, cyanocobalamin, cyclophosphamide, cycloSPORINE, cytarabine, DACTINomycin, DAPTOMycin, dexmedetomidine, digoxin, diltiazem, diphenhydrAMINE, DOBUTamine, DOCEtaxel, DOPamine, doxacurium, DOXOrubicin, DOXOrubicin liposomal, doxycycline, enalaprilat, ePHEDrine, EPINEPHrine, epirubicin, erythromycin, esmolol, etoposide, famotidine, fenoldopam, fentaNYL, filgrastim, fluconazole, gatifloxacin, gemcitabine, gentamicin, glycopyrrolate, granisetron, hydrocortisone, HYDROmorphone, hydrOXYzine, IDArubicin, ifosfamide, isoproterenol, labetalol, levofloxacin, lidocaine, LORazepam, LR, magnesium sulfate, mannitol, mechlorethamine, meperidine, methicillin, methoxamine, methyldopate, methylPREDNISolone, metoclopramide, metoprolol, metroNIDAZOLE, miconazole, midazolam, milrinone, minocycline, mitoXANtrone, morphine, multiple vitamins injection, mycophenolate mofetil, nafcillin, nalbuphine, naloxone, netilmicin, nitroglycerin, norepinephrine, octreotide, ondansetron, oxacillin, oxaliplatin, palonosetron, pamidronate, pancuronium, papaverine, penicillin G potassium, pentamidine, pentazocine, phytonadione, polymyxin B, potassium chloride, procainamide, prochlorperazine, promethazine, propofol, propranolol, protamine sulfate, pyridoxine, quiNIDine, quinupristin-dalfopristin, ranitidine, Ringer's injection, ritodrine, riTUXimab, rocuronium, sodium acetate, succinylcholine, SUFentanil, tacrolimus, teniposide, theophylline, thiamine, thiotepa, tirofiban, TNA, tolazoline, TPN, trimetaphan, vancomycin, vasopressin, vecuronium, verapamil, vinCRISTine, vinorelbine, vitamin B complex with C, voriconazole, zoledronic acid

SIDE EFFECTS

CNS: *EPS: pseudoparkinsonism, akathisia, dystonia, tardive dyskinesia, seizures, headache, neuroleptic malignant syndrome, dizziness*

CV: *Orthostatic hypotension, hypertension, cardiac arrest, ECG changes, tachycardia*

EENT: Blurred vision, glaucoma, dry eyes

ENDO: SIADH

GI: *Dry mouth, nausea, vomiting, anorexia, constipation, diarrhea, cholestatic jaundice, weight gain*

GU: Urinary retention, enuresis, impotence, amenorrhea, gynecomastia, breast engorgement

HEMA: Anemia, leukopenia, leukocytosis, agranulocytosis

INTEG: *Rash, photosensitivity, dermatitis*

RESP: Laryngospasm, dyspnea, respiratory depression

SYST: Death in geriatric patients with dementia

PHARMACOKINETICS

Metabolized by liver, excreted in urine (metabolites), crosses placenta, enters breast milk, 95% bound to plasma proteins, elimination half-life 10-30 hr

PO: Absorption variable, widely distributed, onset erratic 30-60 min, duration 4-6 hr

PO-ER: Onset 30-60 min, peak unknown, duration 10-12 hr

IM: Well absorbed, peak 15-20 min, duration 4-8 hr

IV: Onset 5 min, peak 10 min, duration unknown

INTERACTIONS

Increase: CNS depression—other CNS depressants, alcohol, barbiturate anesthetics, antihistamines, sedatives/hypnotics, antidepressants

Increase: toxicity—EPINEPHrine

Increase: agranulocytosis—antithyroid agents

Increase: effects of both products— β -adrenergic blockers, alcohol

Increase: anticholinergic effects—anticholinergics, antidepressants, antiparkinsonian agents

Increase: valproic acid level

Decrease: seizure threshold—anticonvulsants

Decrease: absorption—aluminum hydroxide, magnesium hydroxide antacids

Decrease: antiparkinson activity—levodopa, bromocriptine

Decrease: serum chlorproMAZINE—lithium, barbiturates

Decrease: anticoagulant effect—warfarin

Drug/Lab Test

Increase: hepatic studies

Decrease: WBC, platelets, Hgb/HcT

False positive: pregnancy tests, PKU

False negative: urinary steroids, 17-OHCS

NURSING CONSIDERATIONS

Assess:

- Mental status: orientation, mood, behavior, presence and type of hallucinations before initial administration and monthly
- Any potentially reversible causes of behavior problems in geriatric patients before and during therapy
- Swallowing of PO medication; check for hoarding or giving of medication to other patients
- I&O ratio; palpate bladder if low urinary output occurs, especially in geriatric patients
- Bilirubin, CBC, LFTs, ocular exam; agranulocytosis, glaucoma, cholestatic jaundice may occur
- Respirations q4hr during initial treatment; establish baseline before starting treatment; report drops of 30 mm Hg; obtain baseline ECG; Q-wave and T-wave changes
- Dizziness, faintness, palpitations, tachycardia on rising

⚠️ Neuroleptic malignant syndrome: hyperpyrexia, muscle rigidity, increased CPK, altered mental status, for acute dystonia (check chewing, swallowing, eyes, pill rolling) • **EPS:** akathisia (inability to sit still, no pattern to movements), tardive dyskinesia (bizarre movements of the jaw, mouth, tongue, extremities), pseudoparkinsonism (rigidity, tremors, pill rolling, shuffling gait) • Constipation, urinary retention daily; increase bulk, water in diet

Perform/provide:

- Supervised ambulation until stabilized on medication; do not involve in strenuous exercise program because fainting is possible; patient should not stand still for long periods
- Increased fluids, roughage to prevent constipation
- Candy, gum, sips of water for dry mouth
- Storage in tight, light-resistant container, oral sol in amber bottle

Evaluate:

- Therapeutic response: decrease in emotional excitement, hallucinations, delusions, paranoia; reorganization of patterns of thought, speech; increase in target behaviors

Teach patient/family:

- To use good oral hygiene; to use frequent rinsing of mouth, sugarless gum, candy, ice chips for dry mouth
- To avoid hazardous activities until product

response is determined

- That orthostatic hypotension occurs often; to rise gradually from sitting or lying position
- To remain lying down for at least 30 min after IM inj
- To avoid hot tubs, hot showers, tub baths because hypotension may occur; that, during hot weather, heat stroke may occur; to take extra precautions to stay cool
- To avoid abrupt withdrawal of product or EPS may result; product should be withdrawn slowly
- To avoid OTC preparations (cough, hay fever, cold) unless approved by prescriber since serious product interactions may occur; avoid use with alcohol, increased drowsiness may occur
- To use a sunscreen and sunglasses to prevent burns
- To take antacids 2 hr before or after this product
- To report sore throat, malaise, fever, bleeding, mouth sores; CBC should be drawn and product discontinued
- To employ contraceptive measures
- That urine may turn pink or reddish brown

TREATMENT OF OVERDOSE:

Lavage if orally ingested; provide airway; *do not induce vomiting or use EPINEPHrine*

🍁 Canada only Side effects: *italics* = common; **bold** = life-threatening ⚠️
Nurse Alert

cholestyramine (Rx)

(koe-less-tir'a-meen)

Prevalite, Questran, Questran Light

Func. class.: Antilipemic

Chem. class.: Bile acid sequestrant

Do not confuse: Questran/Quarzan

ACTION:

Adsorbs, combines with bile acids to form insoluble complex that is excreted through feces; loss of bile acids lowers LDL, cholesterol levels

USES:

Primary hypercholesterolemia (esp. type IIa/IIb hyperlipoproteinemia), pruritus associated with biliary obstruction

Unlabeled uses: Diarrhea caused by excess bile acid

CONTRAINDICATIONS:

Hypersensitivity; complete biliary obstruction; hyperlipidemia III, IV, V

Precautions: Pregnancy (C), breastfeeding, children, PKU

DOSAGE AND ROUTES

Calculator

- **Adult: PO** 4 g/day or bid, max 24 g/day
- **Child: PO** 240 mg/kg/day in 3 divided doses with food or drink, max 8 g/day titrated up over several weeks to decrease GI effects

Available forms: Powder for susp 4 g cholestyramine/packet or scoop; tab 1 g

Administer:

- Product daily or bid; give all other medications 1 hr before or 4-6 hr after cholestyramine to avoid poor absorption
- Product mixed with applesauce or stirred into beverage (2-6 oz), let stand for 2 min; do not take dry, avoid inhaling powder, avoid GI tube administration, take with food
- Supplemental doses of vit A, D, K if levels are low
- Doses are expressed in anhydrous cholestyramine resin, amount of resin varies with each product

SIDE EFFECTS

CNS: Headache, dizziness, drowsiness, vertigo, tinnitus, anxiety

GI: *Constipation, abdominal pain, nausea*, fecal impaction, hemorrhoids, flatulence, vomiting, steatorrhea, peptic ulcer

HEMA: **Bleeding**, increased PT

INTEG: Rash, irritation of perianal area, tongue, skin

META: Decreased vit A, D, K, red cell folate content; **hyperchloremic acidosis**

MS: Muscle, joint pain

PHARMACOKINETICS

PO: Excreted in feces, LDL lowered within 4-7 days, serum cholesterol lowered within 1 mo, duration 2-4 wk

INTERACTIONS

Decrease: absorption of warfarin; thiazides; cardiac glycosides; propranolol; corticosteroids; iron; thyroid hormones; acetaminophen; amiodarone; penicillin G; tetracyclines; clofibrate; gemfibrozil; oral vancomycin, glipiZIDE; vit A, D, E, K

Drug/Lab Test

Increase: AST, ALT, alk phos

Decrease: sodium, potassium

NURSING CONSIDERATIONS

Assess:

- Cardiac glycoside level if both products administered, may need to adjust dose of cardiac glycoside, if this product is increased or decreased • For signs of vit A, D, K deficiency
- **Hypercholesterolemia:** fasting LDL, HDL, total cholesterol, triglyceride levels, electrolytes if receiving extended therapy; diet history • **Pruritus:** for signs of itching
- Bowel pattern daily; increase bulk, water in diet for constipation; diarrhea may also occur

Evaluate:

- Therapeutic response: decreased LDL, cholesterol level (hyperlipidemia); diarrhea, pruritus (excess bile acids)

Teach patient/family:

⚠ About the symptoms of hypoprothrombinemia: bleeding mucous membranes, dark tarry stools, hematuria, petechiae; report immediately • To take with food, never use dry

• That PKU patients should avoid Questran Light (contains aspartame and phenylalanine)

• About the importance of compliance

• That risk factors should be decreased: high-fat diet, smoking, alcohol consumption, absence of exercise • That GI side effects will resolve with continued use

🍁 Canada only Side effects: *italics* = common; **bold** = life-threatening ⚠
Nurse Alert

cidofovir (Rx)

(si-doh-foh'veer)

Vistide

Func. class.: Antiviral

Chem. class.: Nucleotide analog

ACTION:

Suppresses cytomegalovirus (CMV) replication by selective inhibition of viral DNA synthesis

USES:

CMV retinitis in patients with HIV; used with probenecid

Unlabeled uses: Adenovirus, condylomata acuminata, eczema vaccination, Epstein-Barr virus, generalized vaccinia, herpes genitalis/simplex, HPV, molluscum contagiosum, vaccinia necrosum, vaccinia, varicella-zoster, variola

CONTRAINDICATIONS:

Hypersensitivity to this product, probenecid, sulfa products; direct intraocular injection

Black Box Warning:

Proteinuria, renal disease/failure

Precautions: Pregnancy (C), breastfeeding, children <6 mo, geriatric patients, preexisting cytopenias, renal function impairment, platelet count <25,000/mm³

Black Box Warning:

Neutropenia, infertility, secondary malignancy

DOSAGE AND ROUTES

Calculator

• **Adult:** IV 5 mg/kg q wk × 2 wk then 3 mg/kg q2wk, give with probenecid

Renal dose

• **Adult:** IV CCr <55 ml/min, do not use; SCr increase of 0.3-0.4 mg/dl above baseline, decrease dose to 3 mg/kg; SCr increase of ≥0.5 mg/dl above baseline or ≥21 proteinuria, discontinue

Available forms: Inj 75 mg/ml

Administer:

Black Box Warning:

Use cytotoxic handling procedures

- Allow to warm to room temperature
- If product comes in contact with skin, wash with soap and water immediately
- If zidovudine is used, reduce dose to 50% on cidofovir treatment days

Intermittent IV INF route

- **Dilute** in 100 ml 0.9% saline sol before administration; probenecid must be given PO 2 g 3 hr before the cidofovir inf and 1 g at 2 and 8 hr after ending the cidofovir inf; **give** 1 L of 0.9% saline sol IV with each INF of cidofovir, give saline INF over 1-2 hr period immediately before cidofovir; patient should be given a 2nd L if the patient can tolerate the fluid load (2nd L given at time of cidofovir or immediately afterward, should be given over 1-3 hr)
- **Give** slowly; do not give by bolus IV, SUBCUT inj
- Use diluted sol within 24 hr, do not freeze; do not use sol with particulate matter or discoloration • Do not admix

SIDE EFFECTS

CNS: *Fever, chills, coma, confusion, abnormal thoughts, dizziness, bizarre dreams, headache, psychosis, tremors, somnolence, paresthesia, amnesia, anxiety, insomnia, seizures*

CV: Dysrhythmias, hypo/hypertension

EENT: Retinal detachment with CMV retinitis

GI: Abnormal LFTs, *nausea, vomiting, anorexia, diarrhea*, abdominal pain, *hemorrhage*

GU: *Hematuria*, increased creatinine, BUN, *nephrotoxicity*

HEMA: *Granulocytopenia, thrombocytopenia, irreversible neutropenia, anemia, eosinophilia*

INTEG: *Rash, alopecia, pruritus, acne, urticaria*, pain at inj site, phlebitis

RESP: Dyspnea

PHARMACOKINETICS

Terminal half-life 2.6 hr

INTERACTIONS

Black Box Warning:

Nephrotoxicity: amphotericin B, foscarnet, aminoglycosides, pentamidine IV, NSAIDs, salicylates; wait 7 days after use to begin cidofovir

NURSING CONSIDERATIONS

Assess:

- Culture before treatment is initiated; cultures of blood, urine, and throat may all be taken; CMV not confirmed by this method; diagnosis made by ophthalmic exam

Black Box Warning:

Renal, hepatic, increased hemopoietic studies, BUN; serum creatinine, AST, ALT, creatinine, CCr, A-G ratio, baseline and drip treatment, blood counts should be done q2wk; watch for decreasing granulocytes, Hgb; if low, therapy may have to be discontinued and restarted after hematologic recovery; blood transfusions may be required, renal failure can occur also, Fancom syndrome

- For GI symptoms: severe nausea, vomiting, diarrhea; severe symptoms may necessitate discontinuing product • Electrolytes and minerals: calcium, phosphorus, magnesium, sodium, potassium; watch closely for tetany during 1st administration

Black Box Warning:

Blood dyscrasias (anemia, granulocytopenia); bruising, fatigue, bleeding, poor healing; leukopenia, neutropenia, thrombocytopenia: WBCs, platelets q2days during 2 ×/day dosing and every wk thereafter; check for leukopenias with daily WBC count in patients with prior leukopenia, with other nucleoside analogs, or for whom leukopenia counts are $<1000 \text{ cells/mm}^3$ at start of treatment

- Allergic reactions: flushing, rash, urticaria, pruritus
- Monitor serum creatinine or CCr at least q2wk; give only to those with creatinine levels $\leq 1.5 \text{ mg/dl}$, CCr $>55 \text{ ml/min}$, urine protein $<100 \text{ mg/dl}$

Evaluate:

- Therapeutic response: decreased symptoms of CMV

Teach patient/family:

- To notify prescriber if sore throat, swollen lymph nodes, malaise, fever occur; may indicate other infections • To report perioral tingling, numbness in extremities, paresthesias; report rash immediately • That serious product interactions may occur if OTC products are ingested; check with prescriber
- That product is not a cure but will control symptoms
- That regular ophthalmic exams, renal studies must be continued
- That major toxicities may necessitate discontinuing product

- To use contraception during treatment; that infertility may occur; and that men should use barrier contraception for 90 days after treatment

TREATMENT OF OVERDOSE:

Discontinue product; use hemodialysis, increase hydration

☼ Canada only Side effects: *italics* = common; **bold** = life-threatening ⚠

Nurse Alert

cilostazol (Rx)

(sih-los'tah-zol)

Pletal

Func. class.: Platelet aggregation inhibitor

Chem. class.: Quinolinone derivative

Do not confuse: **Pletal**/Plendil

ACTION:

Reversibly inhibits cellular phosphodiesterase; inhibits platelet aggregation induced by thrombin, ADP, collagen, arachidonic acid, EPINEPHrine, stress

USES:

Intermittent claudication

Unlabeled uses: Buerger's disease, percutaneous coronary intervention (PCI)

CONTRAINDICATIONS:

Hypersensitivity, acute MI, active bleeding conditions, hemostatic conditions

Black Box Warning:

CHF

Precautions: Pregnancy (C), breastfeeding, children, geriatric patients, previous hepatic disease, cardiac/renal disease, increased bleeding risk, low platelet count, platelet dysfunction

DOSAGE AND ROUTES

Calculator

• **Adult: PO** 100 mg bid taken ≥ 30 min before or 2 hr after breakfast and dinner or 50 mg bid if using products that inhibit CYP3A4 and CYP2C19; 12 wk of treatment may be needed for beneficial effect

PCI to prevent acute coronary thrombosis/Buerger's disease (unlabeled)

• **Adult: PO** 100 mg bid

Available forms: Tabs 50, 100 mg

Administer:

• Give bid 30 min before or 2 hr after meals; do not give with grapefruit juice

SIDE EFFECTS

CNS: *Dizziness*, headache

CV: *Palpitations*, *tachycardia*, nodal dysrhythmia, postural hypotension

EENT: Blindness, diplopia, ear pain, tinnitus, retinal hemorrhage

GI: *Nausea*, vomiting, *diarrhea*, GI discomfort, colitis, cholelithiasis, ulcer, esophagitis, gastritis, anorexia, *flatulence*, *dyspepsia*

GU: Cystitis, frequency, vaginitis, **vaginal hemorrhage**, hematuria

HEMA: **Bleeding (epistaxis, hematuria, retinal hemorrhage, GI bleeding), thrombocytopenia**, anemia, **polycythemia**, aplastic anemia

INTEG: *Rash*, urticaria, dry skin, **Stevens-Johnson syndrome**

MISC: *Back pain*, *headache*, *infection*, *myalgia*, *peripheral edema*, chills, fever, malaise, diabetes mellitus

RESP: *Cough*, *pharyngitis*, *rhinitis*, asthma, pneumonia

PHARMACOKINETICS

95%-98% protein binding; metabolism: hepatic extensively by CYP3A4, 2C19 enzymes; excreted in urine (74%), feces (20%); half-life 11-13 hr

INTERACTIONS

Increase: bleeding tendencies—anticoagulants, NSAIDs, thrombolytics, abciximab, eptifibatide, tirofiban, ticlopidine

Increase: cilostazol levels—CYP3A4, CYP2C19 inhibitors; diltiazem, erythromycin, clarithromycin, verapamil, protease inhibitors, omeprazole; exercise caution when coadministering with fluvoxamine, FLUoxetine, ketoconazole, isoniazid, gemfibrozil, omeprazole, itraconazole, voriconazole, fluconazole; reduce dose to 50 mg bid

Decrease: cilostazol levels—CYP3A4 inducers

Drug/Herb

Decrease: action—chamomile, coenzyme Q10, flax, goldenseal, St. John's wort

Drug/Food

- Do not use with grapefruit juice, toxicity may occur

NURSING CONSIDERATIONS

Assess:

Black Box Warning

For underlying CV disease because CV risk is great; for CV lesions with repeated oral administration; do not administer to patients with CHF of any severity; for severe headache, signs of toxicity

- Blood studies: CBC q2wk, Hct, Hgb, PT

Evaluate:

- Therapeutic response: improved walking distance, duration; decreased pain

Teach patient/family:

- To avoid hazardous activities until effect is known
 - To report any unusual bleeding
 - To report side effects such as diarrhea, skin rashes, subcutaneous bleeding
 - That effects may take 2-4 wk; treatment of up to 12 wk may be required for necessary effect
 - That reading the patient package insert is necessary
 - That it is best to discontinue tobacco use, not to use grapefruit juice
 - **That there are many drug and herb interactions; obtain approval from prescriber before use**
-

🍁 Canada only Side effects: *italics* = common; **bold** = life-threatening ⚠️
Nurse Alert

cimetidine (OTC, Rx)

(syé-met'i-deen)

Acid Reducer, Equaline Acid Reducer, Good Sense Heartburn Relief, Nu-Cimet , Tagamet, Tagamet HB

Func. class.: H₂-histamine receptor antagonist *Chem. class.:* Imidazole derivative

ACTION:

Inhibits histamine at H₂-receptor site in the gastric parietal cells, which inhibits gastric acid secretion

USES:

Short-term treatment of duodenal and gastric ulcers and maintenance; management of GERD (PO) and Zollinger-Ellison syndrome; prevention of upper GI bleeding; prevent, relieve heartburn, acid indigestion, upper GI bleeding

Unlabeled uses: Prevention of aspiration pneumonitis, stress ulcers, angioedema, molluscum contagiosum, NSAID-induced ulcer prophylaxis, verruca vulgaris

CONTRAINDICATIONS:

Hypersensitivity

Precautions: Pregnancy (B), breastfeeding, children <16 yr, geriatric patients, organic brain syndrome, renal/hepatic disease

DOSAGE AND ROUTES

Calculator

Short-term treatment of active ulcers

- **Adult/adolescents ≥16 yr:** **PO** 300 mg qid with meals, at bedtime × 8 wk or 400 mg bid, 800 mg at bedtime; after 8 wk, give bedtime dose only; **IV BOL** 300 mg/20 ml 0.9% NaCl over 1-2 min q6hr; **IV INF** 300 mg/50 ml D₅W over 15-20 min; **IM** 300 mg q6hr, max 2400 mg/day
- **Child:** **PO** 20-40 mg/kg/day; **IM/IV** 5-10 mg/kg q6-8hr

Prophylaxis of duodenal ulcer

- **Adult and child >16 yr:** 400 mg at bedtime or 300 mg bid

GERD

- **Adult: PO** 800-1600 mg/day in divided doses × up to 12 wk

Hypersecretory conditions (Zollinger-Ellison syndrome)

- **Adult: PO/IM/IV** 300-600 mg q6hr; may increase to 12 g/day if needed; OTC use ≤200 mg daily or bid, max 2×/wk

Upper GI bleeding prophylaxis

- **Adult: IV** 50 mg/hr; lowered in renal disease

Heartburn

- **Adult/child ≥12 yrs: PO** 200 mg Tagamet Hb up to BID, may use before eating, max 400 mg/day, max daily use up to 2 wk

Renal disease

- **Adult: PO/IV** CCr <30 ml/min, 300 mg q12hr

Verruca vulgaris (unlabeled)

- **Child: PO** 30-40 mg/kg/day × 2 mo

Available forms: Tabs 100, 200, 300, 400, 800 mg; liq 200, 300 mg/5 ml; inj 300 mg/2 ml, 300 mg/50 ml 0.9% NaCl

Administer:

PO route

- With meals for prolonged product effect; antacids 1 hr before or 1 hr after cimetidine

IM route

- May give undiluted
- Give at end of dialysis
- Inject deeply in large muscle mass, aspirate

IV route

- After **diluting** 300 mg/20 ml of 0.9% NaCl for inj; give by **direct IV over** ≥5 min; **Intermittent IV INF** may be **diluted** 300 mg/50 ml of D₅W; **run** ≥30 min; or total daily dose (900 mg) diluted in 100-1000 ml D₅W given over 24 hr

Continuous IV INF

- Storage of diluted sol at room temp up to 48 hr

Y-site compatibilities: Acyclovir, alfentanil, amifostine, amikacin, aminocaproic acid, aminophylline, amphotericin B lipid complex/liposome, anakinra, anidulafungin, ascorbic acid injection, atenolol, atracurium, atropine,

aztreonam, benztropine, bivalirudin, bleomycin, bumetanide, buprenorphine, butorphanol, calcium chloride/gluconate, CARBOplatin, caspofungin, cefamandole, ceFAZolin, cefmetazole, cefonicid, cefotaxime, cefoTEtan, cefOXitin, cefTAZidime, ceftizoxime, cefTRIAxone, cefuroxime, cephalothin, cephapirin, chlorproMAZINE, cisatracurium, CISplatin, cladribine, clarithromycin, clindamycin, codeine, cyanocobalamin, cyclophosphamide, cycloSPORINE, cytarabine, DACTINomycin, DAPTOmycin, dexamethasone, dexmedetomidine, digoxin, diltiazem, diphenhydrAMINE, DOBUTamine, DOCEtaxel, DOPamine, doripenem, doxacurium, doxapram, DOXOrubicin, DOXOrubicin liposome, enalaprilat, ePHEDrine, EPINEPHrine, epirubicin, epoetin alfa, eptifibatide, ertapenem, erythromycin, esmolol, etoposide, famotidine, fenoldopam, fentaNYL, filgrastim, fluconazole, fludarabine, fluorouracil, folic acid, foscarnet, gallium, gatifloxacin, gemcitabine, gentamicin, gycopyrrolate, granisetron, heparin, hydrocortisone, HYDROmorphine, hydrOXYzine, IDArubicin, ifosfamide, imipenem-cilastatin, irinotecan, isoproterenol, ketorolac, labetalol, levofloxacin, lidocaine, linezolid, LORazepam, LR, magnesium sulfate, mannitol, mechlorethamine, melphalan, meperidine, metaraminol, meropenem, methicillin, methotrexate, methoxamine, methyldopate, methylPREDNISolone, metoclopramide, metoprolol, metroNIDAZOLE, mezlocillin, miconazole, midazolam, milrinone, minocycline, mitoXANtrone, morphine, moxalactum, multiple vitamin injection, mycophenolate, nafcillin, nalbuphine, naloxone, nesiritide, netilmicin, niCARdipine, nitroglycerin, nitroprusside, norepinephrine, octreotide, ondansetron, oxacillin, oxaliplatin, oxytocin, PACLitaxel, palonosetron, pamidronate, pancuronium, pantoprazole, papaverine, PEMEtrexed, penicillin G sodium/potassium, pentamidine, pentazocine, phenylephrine, phytonadione, piperacillin, piperacillin/tazobactam, polymyxin B, potassium chloride, procainamide, prochlorperazine, promethazine, propofol, propranolol, protamine, pyridoxine, quiNIDine, quinupristin-dalfopristin, ranitidine, remifentanyl, Ringers' ritodrine, riTUXimab, rocuronium, sargramostim, sodium acetate/bicarbonate, succinylcholine, SUFentanyl, tacrolimus, teniposide, theophylline, thiamine, thiotepa, ticarcillin, ticarcillin-clavulanate, tigecycline, tirofiban, TNA, tobramycin, tolazoline, topotecan, TPN, trastuzumab, trimetaphan, urokinase, vancomycin, vasopressin, vecuronium, verapamil,

vinCRIStine, vinorelbine, voriconazole, zidovudine, zoledronic acid

SIDE EFFECTS

CNS: *Confusion, headache*, depression, dizziness, anxiety, weakness, psychosis, tremors, **seizures**

CV: Bradycardia, tachycardia, **dysrhythmias**

GI: *Diarrhea*, abdominal cramps, **paralytic ileus, jaundice**

GU: Gynecomastia, galactorrhea, impotence, increase in BUN, creatinine

HEMA: **Agranulocytosis, thrombocytopenia, neutropenia, aplastic anemia, increase in PT**

INTEG: Urticaria, rash, alopecia, sweating, flushing, **exfoliative dermatitis**

RESP: **Pneumonia**

PHARMACOKINETICS

Half-life 1½-2 hr; 30%-40% metabolized by liver, excreted in urine (unchanged), crosses placenta, enters breast milk

PO: Onset 30 min, peak 45-90 min; duration 4-5 hr, well absorbed

IM/IV: Onset 10 min, peak 1/2 hr, duration 4-5 hr, well absorbed (IM)

INTERACTIONS

Increase: toxicity due to CYP450 pathway—benzodiazepines, β-blockers, calcium channel blockers, carbamazepine, chloroquine, lidocaine, metronidazole, moricizine, phenytoin, quinidine, quinine, sulfonylureas, theophylline, tricyclics, valproic acid, warfarin

Increase: bone marrow suppression—carmustine

Decrease: absorption of cimetidine—antacids, sucralfate

Decrease: absorption—ketoconazole, itraconazole

Drug/Lab Test

Increase: alk phos, AST, creatinine, prolactin

False positive: gastroculti, hemoculti tests

False negative: TB skin tests

NURSING CONSIDERATIONS

Assess:

- **Ulcer symptoms:** epigastric pain, duration, intensity; aggravating,

ameliorating factors

Evaluate:

- Therapeutic response: decreased pain in abdomen; healing of ulcers; absence of gastroesophageal reflux, gastric pH of 5

Teach patient/family:

- That gynecomastia, impotence may occur, are reversible
 - To avoid driving, other hazardous activities until stabilized on this medication; drowsiness or dizziness may occur
 - To avoid OTC preparations: aspirin; cough, cold preparations; condition may worsen
 - That smoking decreases effectiveness of product
 - That product must be taken exactly as prescribed and continued for prescribed time to be effective; not to double dose
 - To report bruising, fatigue, malaise; blood dyscrasias may occur
 - To report diarrhea, black tarry stools, sore throat, rash to prescriber
-

🍁 Canada only Side effects: *italics* = common; **bold** = life-threatening ⚠️
Nurse Alert

cinacalcet (Rx)

(sin-a-kal'set)

Sensipar

Func. class.: Calcium receptor agonist

Chem. class.: Polypeptide hormone

ACTION:

Directly lowers PTH levels by increasing sensitivity of calcium-sensing receptors to extracellular calcium

USES:

Hypercalcemia with parathyroid carcinoma, secondary hyperparathyroidism with chronic kidney disease for patient on dialysis, primary hyperparathyroidism

CONTRAINDICATIONS:

Hypersensitivity, hypocalcemia

Precautions: Pregnancy (C), breastfeeding, children, seizure disorders, hepatic disease

DOSAGE AND ROUTES

Calculator

Parathyroid carcinoma

- **Adult: PO** 30 mg bid, titrate q2-4wk, with sequential doses of 30 mg bid, 60 mg bid, 90 mg bid, 90 mg tid-qid to normalize calcium levels

Secondary hyperparathyroidism

- **Adult: PO** 30 mg/day, titrate no more frequently than q2-4wk with sequential doses of 30, 60, 90, 120, 180 mg/day

Available forms: Tabs 30, 60, 90 mg

Administer:

- Swallow tabs whole; do not break, crush, or chew; use with food or right after a meal
- Can be used alone or in combination with vit D sterols, phosphate binders
- Storage at <77° F (25° C)

Secondary hyperthyroidism

- Titrate q2-4wk to target iPTH consistent with National Kidney Foundation—

Kidney Disease Outcomes Quality Initiative (NKF-K/DOQI) for chronic kidney disease patient on dialysis of 150-300 pg/ml; if iPTH <150-300 pg/ml, reduce dose of cinacalcet and/or vit D sterols or discontinue treatment

SIDE EFFECTS

CNS: Dizziness, asthenia, **seizures**, tetany, hallucinations, depression

CV: Hypertension, dysrhythmia exacerbation

GI: Nausea, diarrhea, vomiting, anorexia

MISC: Access infection, noncardiac chest pain, hypocalcemia

MS: Myalgia

PHARMACOKINETICS

93%-97% bound to plasma; proteins metabolized by CYP3A4, 2D6, 1A2; half-life 30-40 hr; renal excretion of metabolites (80% renal, 15% in feces)

INTERACTIONS

Increase: cinacalcet levels: CYP3A4 inhibitors (ketoconazole, erythromycin, itraconazole)

Increase: levels of CYP2D6 inhibitors (flecainide, vinBLAStine, thioridazine, tricyclics)

Drug/Food

Increase: action by high-fat meal

NURSING CONSIDERATIONS

Assess:

- **Hypocalcemia:** cramping, seizures, tetany, myalgia, paresthesia; calcium, phosphorous within 1 wk and iPTH 1-4 wk after initiation or dosage adjustment when maintenance established; measure calcium, phosphorus monthly; iPTH q1-3mo, target range 150-300 pg/ml for iPTH level; biochemical markers of bone formation/resorption; radiologic evidence of fracture; serum testosterone
- **Renal disease (without dialysis): These patients should not receive treatment with this product, high risk of hypocalcemia**
- **If calcium <8.4 mg/dl, do not start therapy**

Evaluate:

- Therapeutic response: calcium levels 9-10 mg/dl, decreasing symptoms of hypercalcemia

Teach patient/family:

- To take with food or shortly after a meal, to take tabs whole
 - To report cramping, seizures, muscle pain, tingling, tetany immediately
-

🍁 Canada only Side effects: *italics* = common; **bold** = life-threatening ⚠️
Nurse Alert

ciprofloxacin (Rx)

(sip-ro-floks'a-sin)

Cipro, Cipro XR

Func. class.: Antiinfective—broad spectrum

Chem. class.: Fluoroquinolone

Do not confuse: **ciprofloxacin**/cephalexin

ACTION:

Interferes with conversion of intermediate DNA fragments into high-molecular-weight DNA in bacteria; DNA gyrase inhibitor

USES:

Infection caused by susceptible *Escherichia coli*, *Enterobacter cloacae*, *Proteus mirabilis*, *Klebsiella pneumoniae*, *Proteus vulgaris*, *Citrobacter freundii*, *Serratia marcescens*, *Pseudomonas aeruginosa*, *Staphylococcus aureus*, *Staphylococcus epidermidis*, *Enterobacter*, *Campylobacter jejuni*, *Salmonella*; chronic bacterial prostatitis, acute sinusitis, postexposure inhalation anthrax, infectious diarrhea, typhoid fever, complicated intraabdominal infections, nosocomial pneumonia, urinary tract infections

Unlabeled uses: *Acinetobacter/woffii*, *Aeromonas hydrophila*, brucellosis, *Burkholderia*, *pseudomallei*, chancroid, cholera, dental infection, *Edwardsiella tarda*, endocarditis, *Enterobacter aerogenes*, granuloma inguinale, *Klebsiella oxytoca*, Legionnaire's disease, melioidosis, meningococcal infection prophylaxis, *Pasteurella multocida*, PID, periodontitis, pharyngitis, *Salmonella* sp., *Stenotrophomonas maltophilia*, tularemia, *Vibrio cholerae/parahaemolyticus/vulnificus*, *Yersinia enterocolitica*

CONTRAINDICATIONS:

Hypersensitivity to quinolones

Precautions: Pregnancy (C), breastfeeding, children, geriatric patients, renal disease, epilepsy, QT prolongation, hypokalemia

Black Box Warning:

Tendon pain/rupture, tendinitis

DOSAGE AND ROUTES

Calculator

Uncomplicated urinary tract infections

- **Adult: PO** 250 mg q12hr × 3 days or 500 mg q24hr × 3 days

Complicated/severe urinary tract infections

- **Adult: PO** 500 mg q12hr or 1000 mg q24hr × 7-14 days; **IV** 400 mg q12hr

Pyelonephritis, acute uncomplicated

- **Adult: PO** 1000 mg q24hr × 7-14 days q4-6wk

Respiratory, bone, skin, joint infections

- **Adult: PO** 500-750 mg q12hr × 7-14 days; **IV** 400 mg q12hr

Nosocomial pneumonia

- **Adult: IV** 400 mg q8hr × 10-14 days

Intraabdominal infections, complicated

- **Adult: PO** 500 mg q12hr × 7-14 days; **IV** 400 mg q12hr × 7-14 days, usually given with metroNIDAZOLE

Acute sinusitis, mild/moderate

- **Adult: PO** 500 mg q12hr × 10 days; **IV** 400 mg q12hr × 10 days

Inhalational anthrax (postexposure)

- **Adult: PO** 500 mg q12hr × 60 days; **IV** 400 mg q12hr × 60 days
- **Child: PO** 15 mg/kg/dose q12hr × 60 days, max 500 mg/dose; **IV** 10 mg/kg q12hr, max 400 mg/dose

Infectious diarrhea

- **Adult: PO** 500 mg q12hr × 5-7 days

Chronic bacterial prostatitis

- **Adult: PO** 500 mg q12hr × 28 days; **IV** 400 mg q12hr × 28 days

Renal disease

- **Adult: CCr** 30-50 ml/min, **PO** 250-500 mg q12hr; **CCr** 5-29 ml/min, **PO** 250-500 mg q18hr; **IV** 200-400 mg q18-24hr

Available forms: Tabs 100, 250, 500, 750 mg; ext rel tabs (XR) 500, 1000 mg; inj 200 mg/20 ml, 400 mg/40 ml, 200 mg/100 ml D₅, 400 mg/200 ml D₅; oral susp 250 mg, 500 mg/5 ml

Administer:

- Obtain C&S before use
- Do not use theophylline with this product, will cause toxicity
- Use caution when giving with antidysrhythmics IA, III

PO route

- Do not break, crush, chew XR (ext rel) product, use adequate fluids to prevent

crystalluria • 2 hr before or 2 hr after antacids, zinc, iron, calcium

- Do not give oral susp by GI tube

IV route

- Over 1 hr as an inf, comes in premixed plastic inf container or diluted 20-or 40-ml vial to a final conc of 0.5-2 mg/ml of NS or D₅W; give through Y-tube or 3-way stopcock

Y-site compatibilities: Amifostine, anakinra, anidulafungin, atenolol, aztreonam, bivalirudin, bleomycin, calcium gluconate, CARBOplatin, caspofungin, cefTAZidime, cisatracurium, CISplatin, clarithromycin, codeine, cytarabine, DACTINomycin, DAPTOmycin, dexmedetomidine, digoxin, diltiazem, diphenhydrAMINE, DOBUTamine, DOCEtaxel, doripenem, DOPamine, doxacurium, DOXOrubicin, epirubicin, eptifibatide, ertapenem, etoposide, fenoldopam, fludarabine, gallium, gemcitabine, gentamicin, granisetron, HYDROmorphone, hydrOXYzine, IDArubicin, ifosfamide, irinotecan, lidocaine, linezolid, LORazepam, LR, mechlorethamine, meperidine, methotrexate, metoclopramide, metroNIDAZOLE, midazolam, midodrine, milrinone, mitoXANtrone, mycophenolate, nesiritide, octreotide, ondansetron, oxaliplatin, oxytocin, PACLitaxel, palonosetron, pamidronate, pancuronium, piperacillin, potassium acetate/chloride, promethazine, ranitidine, remifentanyl, rocuronium, sodium chloride, tacrolimus, teniposide, thiotepa, tigecycline, tirofiban, TNA, tobramycin, trastuzumab, vasopressin, vecuronium, verapamil, vinCRISTine, vinorelbine, voriconazole

SIDE EFFECTS

CNS: *Headache*, dizziness, fatigue, insomnia, depression, *restlessness*, **seizures**, confusion

GI: *Nausea, diarrhea*, increased ALT/AST, dry mouth, flatulence, heartburn, *vomiting*, oral candidiasis, dysphagia, **pseudomembranous colitis**

GU: Crystalluria, interstitial neuritis

HEMA: **Bone marrow depression**

INTEG: *Rash*, pruritus, urticaria, photosensitivity, flushing, fever, chills, **toxic epidermal necrolysis**

MISC: **Anaphylaxis, Stevens-Johnson syndrome**, visual impairment, **QT prolongation, pseudotumor cerebri**

MS: Tremor, arthralgia, tendinitis, tendon rupture

PHARMACOKINETICS

PO: Peak 1 hr; half-life 3-4 hr; excreted in urine as active product, metabolites 35%-40%, 20%-40% protein binding

INTERACTIONS

Black Box Warning:

Increase: tendonitis, tendon rupture—Corticosteroids

Increase: nephrotoxicity—cycloSPORINE

Increase: ciprofloxacin levels—probenecid; monitor for toxicity

Increase: levels of theophylline, warfarin, monitor blood levels, reduce dose

Increase: QT prolongation—astemizole, droperidol, class IA/III

antidysrhythmics, tricyclics, tetracyclines, local anesthetics, phenothiazines, haloperidol, risperiDONE, sertindole, ziprasidone, alfuzosin, arsenic trioxide, b-agonists, chloroquine, cloZAPine, cyclobenzapine, dasatinib, dolasetron, droperidol, flecainide, halogenated anesthetics, lapatinib, levomethadyl, macrolides, methadone, octreotide, ondansetron, paliperidone, palonosetron, pentamidine, propafenone, ranolazine, SUNItinib, tacrolimus, terfenadine, vardenafil, vorinostat; less likely than other quinolones

Decrease: ciprofloxacin absorption—antacids that contain magnesium, aluminum; zinc, iron, sucralfate, enteral feedings, calcium

Drug/Food

Increase: effect of caffeine

Decrease: absorption—dairy products, food

Drug/Lab Test

Increase: AST, ALT, BUN, creatinine, LDH, bilirubin, alk phos, glucose, proteinuria, albuminuria

Decrease: WBC, glucose

NURSING CONSIDERATIONS

Assess:

- **Infection:** WBC, temperature before treatment, periodically

Black Box Warning:

Myasthenia gravis: Avoid use in these patients, increases muscle weakness

- **CNS symptoms:** headache, dizziness, fatigue, insomnia, depression
- Renal, hepatic studies: BUN, creatinine, AST, ALT
- I&O ratio, urine pH <5.5 is ideal

Black Box Warning:

Tendonitis, tendon rupture: Discontinue as first sign of tendon pain, inflammation; increased in those >60 yr, those taking corticosteroids, organ transplants

 **Anaphylaxis:** fever, flushing, rash, urticaria, pruritus, dyspnea

• **Pseudomotor Cerebri:** May occur at excessive doses

Perform/provide:

- Limited intake of alkaline foods, products: milk, dairy products, alkaline antacids, sodium bicarbonate; caffeine intake if excessive cardiac or CNS stimulation
- Increase in fluids to 3 L/day to avoid crystallization in kidneys

Evaluate:

- Therapeutic response: decreased pain, frequency, urgency, C&S; absence of infection

Teach patient/family:

- Not to take any products that contain magnesium, calcium (such as antacids), iron, aluminum with this product or within 2 hr of product, to drink fluids to prevent crystals in urine

Black Box Warning:

To report tendon pain, chest pain, palpitations

- To ambulate, perform activities with assistance if dizziness occurs
- To complete full course of product therapy; not to double or miss doses
- **To notify prescriber if rash occurs, discontinue product**
- To notify prescriber if pregnancy is planned or suspected pregnancy (C), do not breastfeed
- To frequently rinse mouth; use sugarless candy, gum for dry mouth
- To contact prescriber if taking theophylline

☛ Canada only Side effects: *italics* = common; **bold** = life-threatening 
Nurse Alert

ciprofloxacin (ophthalmic)

(sip-roe-flox'a-sin)

Ciloxan

Func. class.: ophthalmic antiinfective

Chem. class.: fluoroquinolone

Do not confuse: ciprofloxacin/gatifloxacin/levofloxacin/moxifloxacin/ofloxacin

ACTION:

Inhibits DNA gyrase, thereby decreasing bacterial replication

USES:

Corneal ulcers, bacterial conjunctivitis

CONTRAINDICATIONS:

Hypersensitivity to this product or fluoroquinolones

Precautions: Pregnancy (C), breastfeeding

DOSAGE AND ROUTES

Calculator

Bacterial conjunctivitis

- **Adult/adolescent/child ≥ 1 yr:** Ophthalmic (sol): 1-2 drops in affected eye(s) every 2 hr while awake $\times$ 2 days, then every 4 hr while awake for the next 5 days
- **Adult/adolescent/child ≥ 2 yr:** Ophthalmic (ointment): 1/2-inch ribbon to conjunctival sac tid $\times$ 2 days, then 1/2 inch bid for next 5 days

Ophthalmic infection associated with corneal ulcer

- **Adult/adolescent/child ≥ 1 yr:** Ophthalmic (solution): 2 drops in affected eye(s) every 15 min $\times$ 6 hr, then every 30 min for the remainder of the first day; for the second day, 2 drops every hr; for days 3-14, 2 drops every 4 hr

Available forms: Ophthalmic ointment, solution 0.3%

Administer

- Commercially available ophthalmic solutions are not for injection subconjunctivally or into the anterior chamber of the eye

Ophthalmic route

- Apply topically to the eye, taking care to avoid contamination
- Do not touch the tip of the dropper to the eye, fingertips, or other surface
- Apply pressure to lacrimal sac for 1 min after instillation
- Avoid wearing contact lens(es) while treating eye infection

SIDE EFFECTS

EENT: Burning, hypersensitivity, pruritus, precipitate in those with corneal ulcers

NURSING CONSIDERATIONS

Assess:

Allergic reaction:

- Assess for hypersensitivity, discontinue product

Evaluate:

- Decreased ophthalmic infection

Teach patient/family:

Ophthalmic route:

- To apply topically to the eye, taking care to avoid contamination; for ophthalmic use only
- Not to touch the tip of the dropper to the eye, fingertips, or other surface
- To apply pressure to lacrimal sac for 1 min after instillation
- To avoid wearing contact lens(es) while treating eye infection

🍁 Canada only Side effects: *italics* = common; **bold** = life-threatening ⚠️
Nurse Alert

cisatracurium

(sis-ah-trah-kyoo'ree-um)

Nimbex

Func. class.: skeletal muscle relaxant

Chem. class.: nondepolarizing neuromuscular blocker

ACTION:

Antagonizes acetylcholine by binding to cholinergic receptors on the motor end plate, resulting in neuromuscular blockade

USES:

To maintain neuromuscular blockade during mechanical ventilation and as an adjunct to general anesthesia

CONTRAINDICATIONS:

Hypersensitivity

Precautions: Pregnancy (B), breastfeeding, children, benzyl alcohol hypersensitivity, electrolyte imbalances, long-term use in ICU, trauma or burns

DOSAGE AND ROUTES

Calculator

For neuromuscular blockade, as an adjunct to general anesthesia, to facilitate endotracheal intubation and to provide skeletal muscle relaxation during surgery or mechanical ventilation in the ICU

Endotracheal intubation

- **Adult/adolescent (healthy): IV** 0.15-0.2 mg/kg, one time
- **Adult with myasthenia gravis: IV** Use peripheral nerve stimulator monitoring and an initial dose ≤ 0.02 mg/kg
- **Child 2-12 yr: IV** 0.1-0.15 mg/kg over 5-10 sec during either halothane or opioid anesthesia
- **Infant/child ≤ 23 mo: IV** 0.15 mg/kg over 5-10 sec during either halothane or opioid anesthesia

To maintain neuromuscular blockade during prolonged surgical procedures:

- **Adult/adolescent/child ≥ 2 yr (healthy): IV** Maintenance dose 0.03 mg/kg;

maintenance dosing is generally required 40-50 min after an initial dose of 0.15 mg/kg IV or 50-60 min after an initial dose of 0.2 mg/kg; the need for maintenance doses should be determined by clinical criteria

Available forms: Injection solution 2, 10 mg/ml

Administer

IV route

- Visually inspect for particulate matter and discoloration before use
- Only experienced clinicians, familiar with the use of neuromuscular blocking drugs, should administer or supervise the use of this product
- Use by rapid IV injection or by continuous IV infusion

IV INJ route

- Inject IV over 5-10 sec

Continuous IV INF route

- Dilute with NS, D₅W, or D₅NS (0.1-0.4 mg/ml); adjust the rate of infusion according to peripheral nerve stimulation
- The amount of inf sol required per minute depends on the concentration of cisatracurium in the inf sol, the desired dose of cisatracurium, and the patient's weight
- Store Nimblex injection diluted to 0.1 mg/ml either under refrigeration or at room temperature for 24 hr; dilutions to 0.1 mg/ml or 0.2 mg/ml in D₅W/LR injection may be stored under refrigeration for 24 hr

SIDE EFFECTS

CV: Bradycardia, flushing, hypotension

RESP: Apnea, bronchospasm, prolonged neuromuscular block

PHARMACOKINETICS

Onset 2 min, peak 3-5 min, duration 25-44 min, half-life 22-30 min

INTERACTIONS

Increase: neuromuscular blockade—aminoglycosides, clindamycin, lithium, local anesthetics, magnesium salts, colistin, colistimethate, procainamide, quinine, tetracyclines, bacitracin, capreomycin, polymyxin B, vancomycin; amphotericin B, cisplatin, corticosteroids, loop/thiazide diuretics (if hypokalemia is present)

Decrease: neuromuscular blockade—carbamazepine, phenytoin

NURSING CONSIDERATIONS

Assess:

Neuromuscular Function:

- Use nerve stimulator to monitor neuromuscular function; if no response, stop until response; **not to be used for rapid-sequence endotracheal intubation**

Electrolyte:

- Electrolytes and acid-base balance may be altered

Malignant hyperthermia:

Assess for malignant hyperthermia; those with a family history of this condition should not receive this product or it should be used cautiously

Evaluate:

- Maintenance of neuromuscular blockade

Teach patient/family:

- Reason for product and expected results

🍁 Canada only Side effects: *italics* = common; **bold** = life-threatening ⚠️
Nurse Alert

HIGH ALERT

CISplatin (Rx)

(sis'pla-tin)

Func. class.: Antineoplastic alkylating agent

Chem. class.: Platinum complex

Do not confuse: CISplatin/CARBOplatin

ACTION:

Alkylates DNA, RNA; inhibits enzymes that allow for the synthesis of amino acids in proteins; activity not cell-cycle–phase specific

USES:

Advanced bladder cancer; adjunct in metastatic testicular cancer; osteosarcoma; soft-tissue sarcomas; adjunct in metastatic ovarian cancer; head, neck cancer; esophagus, prostate, lung, cervical cancer; lymphoma

Unlabeled uses: Astrocytoma; breast, gastric, head, neck, hepatocellular, lung, penile cancer; carcinoid, desmoid tumor; Hodgkin's disease, malignant glioma, malignant melanoma, neuroblastoma, non-Hodgkin's lymphoma (NHL), osteogenic sarcoma

CONTRAINDICATIONS:

Pregnancy (D), breastfeeding

Black Box Warning:

Preexisting hearing impairment, bone marrow suppression, platinum compound hypersensitivity, renal disease/failure

Precautions: Geriatric patients, vaccination

DOSAGE AND ROUTES

Calculator

Dosage protocols may vary

Metastatic testicular cancer

- **Adult:** IV 20 mg/m²/day × 5 days, repeat q3wk for 2 cycles or more, depending on response

Advanced bladder cancer

- **Adult:** IV 50-70 mg/m² q3-4wk

Metastatic ovarian cancer

- **Adult:** IV 100 mg/m² q4wk or 75-100 mg/m² q3wk with cyclophosphamide

Hodgkin's/non-Hodgkin's lymphoma (unlabeled)

- **Adult and child:** IV INF 100 mg/m² 24 hr continuous inf day 1 of 4-day regimen with cytarabine/dexamethasone q3-4wk

Gastric cancer (unlabeled)

- **Adult:** IV 75 mg/m² on day 1 with docetaxel 75 mg/m² and fluorouracil 750 mg/m² on days 1-5, q21days

Available forms: Inj 0.5 mg, 1 mg/ml

Administer:

IV route

- Do not use aluminum equipment during any preparation or administration, will form precipitate; do not refrigerate unopened powder or solution; protect from sunlight • Prepare in biologic cabinet using gown, gloves, mask; do not allow product to come in contact with skin; use soap and water if contact occurs; use cytotoxic handling procedures • Hydrate patient with 0.9% NaCl over 8-12 hr before treatment
- EPINEPHrine, antihistamines, corticosteroids for hypersensitivity reaction
- Antiemetic 30-60 min before product and prn; allopurinol to maintain uric acid levels, alkalization of urine; diuretic (furosemide 40 mg IV) or mannitol after INF

Intermittent IV INF route

- **Dilute** 10 mg/10 ml or 50 mg/50 ml sterile water for inj, withdraw prescribed dose; **dilute** 1/2 dose with 1000 ml D₅ 0.2 NaCl, D₅ 0.45 NaCl with 37.5 g mannitol; IV INF is **given** over 3-4 hr; use a 0.45-μm filter; total dose 2 L over 6-8 hr; check site for irritation, phlebitis

Continuous IV INF route

- **Give** over 24 hr × 5 days

Additive compatibilities: CARBOplatin, cyclophosphamide, floxuridine, hydrOXYzine, ifosfamide, leucovorin, magnesium sulfate, mannitol, ondansetron, potassium chloride

Solution compatibilities: D₅/0.225% NaCl, D₅/0.45% NaCl, D₅/0.9% NaCl, D₅/0.45% NaCl with mannitol 1.875%, D₅/0.33% NaCl with KCl 20 mEq and

mannitol 1.875%, 0.9% NaCl, 0.45% NaCl, 0.3% NaCl, 0.225% NaCl

Syringe compatibilities: Bleomycin, cyclophosphamide, doxapram, droperidol, fluorouracil, furosemide, heparin, leucovorin, methotrexate, metoclopramide, vinBLASTine, vinCRISTine

Y-site compatibilities: Acyclovir, alfentanil, allopurinol, amikacin, aminophylline, amiodarone, ampicillin, ampicillin-sulbactam, anidulafungin, atenolol, atracurium, azithromycin, aztreonam, bivalirudin, bleomycin, bumetanide, buprenorphine, butorphanol, calcium chloride/gluconate, carmustine, caspofungin, ceFAZolin, cefoperazone, cefotaxime, cefoTETan, cefOXitin, cefTAZidime, ceftizoxime, cefTRIAXone, cefuroxime, chlorproMAZINE, cimetidine, ciprofloxacin, cisatracurium, cladribine, clindamycin, codeine, cyclophosphamide, cycloSPORINE, cytarabine, DACTINomycin, DAPTOmycin, DAUNOrubicin, dexamethasone, dexmedetomidine, dexrazoxane, digoxin, diltiazem, diphenhydrAMINE, DOBUTamine, docetaxel, DOPamine, doripenem, doxacurium, DOXOrubicin, DOXOrubicin liposomal, doxycycline, droperidol, enalaprilat, ePHEDrine, EPINEPHrine, epirubicin, ertapenem, erythromycin, esmolol, etoposide, famotidine, fenoldopam, fentaNYL, filgrastim, fluconazole, fludarabine, fluorouracil, foscarnet, fosphenytoin, furosemide, ganciclovir, gatifloxacin, gemcitabine, gentamicin, glycopyrrolate, granisetron, haloperidol, heparin, hydrocortisone, HYDROmorphone, IDArubicin, ifosfamide, imipenem-cilastatin, inamrinone, indomethacin, irinotecan, isoproterenol, ketorolac, labetalol, leucovorin, levofloxacin, levorphanol, lidocaine, linezolid, LORazepam, magnesium sulfate, mannitol, melphalan, meperidine, meropenem, methohexital, methotrexate, methylPREDNISolone, metoclopramide, metoprolol, metroNIDAZOLE, midazolam, milrinone, minocycline, mitoMYcin, mitoXANtrone, mivacurium, nafcillin, naloxone, nesiritide, niCARDipine, nitroglycerin, nitroprusside, norepinephrine, octreotide, ofloxacin, ondansetron, oxaliplatin, PACLitaxel, palonosetron, pamidronate, pancuronium, PEMEtrexed, pentamidine, pentazocine, PENTobarbital, PHENobarbital, phenylephrine, phenytoin, piperacillin, polymyxin B, potassium chloride/phosphates, procainamide, prochlorperazine, promethazine, propofol, propranolol, quiNIDine, quinupristin-dalfopristin, ranitidine, remifentanil, riTUXimab, sargramostim, sodium acetate/bicarbonate/phosphates, succinylcholine,

SUFentanil, sulfamethoxazole-trimethoprim, tacrolimus, teniposide, theophylline, thiopental, ticarcillin, ticarcillin-clavulanate, tigecycline, tirofiban, TNA, tobramycin, topotecan, trastuzumab, vancomycin, vasopressin, vecuronium, verapamil, vinBLAStine, vinCRISStine, vinorelbine, voriconazole, zidovudine, zoledronic acid

SIDE EFFECTS

CNS: *Seizures, peripheral neuropathy*

CV: Cardiac abnormalities

EENT: *Tinnitus, hearing loss, vestibular toxicity, blurred vision, altered color perception*

GI: *Severe nausea, vomiting, diarrhea, weight loss*

GU: *Renal tubular damage, renal insufficiency, impotence, sterility, amenorrhea, gynecomastia, hyperuremia*

HEMA: *Thrombocytopenia, leukopenia, pancytopenia*

INTEG: *Alopecia, dermatitis*

META: *Hypomagnesemia, hypocalcemia, hypokalemia, hypophosphatemia*

RESP: *Fibrosis*

SYST: *Anaphylaxis*

PHARMACOKINETICS

Absorption complete, metabolized in liver, excreted in urine, half-life 20 min first phase, 48-70 min second phase, 24 hr terminal phase, accumulates in body tissues for several months, enters breast milk

INTERACTIONS

Increase: bleeding risk—*aspirin, NSAIDs, alcohol*

Increase: ototoxicity—*bumetanide, ethacrynic acid, furosemide*

Increase: myelosuppression—*myelosuppressive agents, radiation*

Increase: nephrotoxicity—*aminoglycosides, loop diuretics, salicylates*

Decrease: effects of phenytoin

Decrease: antibody response—*live virus vaccines*

Drug/Lab Test

Increase: uric acid, BUN, creatinine

Decrease: CCr, calcium, phosphate, potassium, magnesium

Positive: Coombs' test

NURSING CONSIDERATIONS

Assess:

Black Box Warning

Bone marrow depression: CBC, differential, platelet count weekly; withhold product if WBC is <4000 or platelet count is <100,000; notify prescriber of results

Black Box Warning:

Renal toxicity: BUN, creatinine, serum uric acid, urine CCr before, electrolytes during therapy; dose should not be given if BUN <25 mg/dl; creatinine <1.5 mg/dl; I&O ratio; report fall in urine output of <30 ml/hr

 **Anaphylaxis:** wheezing, tachycardia, facial swelling, fainting; discontinue product, report to prescriber; resuscitation equipment should be nearby, may occur within minutes; often EPINEPHrine, corticosteroids, antihistamines may alleviate symptoms • Monitor temp q4hr; may indicate beginning infection

• Hepatic studies before, during therapy (bilirubin, AST, ALT, LDH) as needed

 **Bleeding:** hematuria, guaiac, bruising, petechiae, mucosa or orifices q8hr; obtain prescription for viscous lidocaine (Xylocaine)

Black Box Warning:

Ototoxicity: More common in genetic variants TPMT 3B and 3C in children, use audiometric testing baseline and before each dose

• Effects of alopecia on body image; discuss feelings about body changes

Perform/provide:

• Comprehensive oral hygiene

• All medications PO, if possible; avoid IM inj when platelets <100,000/mm³

• **Hyperuricemia:** Increase fluid intake to 2-3 L/day to prevent urate deposits, calculi formation; promote elimination of product, usually occurs between 3-5 days after a dose, may use allopurinol

Evaluate:

• Therapeutic response: decreased tumor size, spread of malignancy

Teach patient/family:

• To report signs of infection: increased temp, sore throat, flulike symptoms

• To report signs of anemia: fatigue, headache, faintness, SOB, irritability

• To report bleeding, bruising, petechiae; to avoid use of razors, commercial mouthwash; to avoid aspirin, ibuprofen, NSAIDs, alcohol; may cause GI bleeding • That impotence or amenorrhea can occur but is reversible after

discontinuing treatment

Black Box Warning:

Ototoxicity: To report loss of hearing, ringing or roaring in the ears

- To maintain adequate fluids; report decreased urine output, flank pain
 - That hair may be lost during treatment; a wig or hairpiece may make patient feel better; new hair may be different in color, texture
 - To report numbness, tingling in face or extremities; poor hearing; joint pain, swelling
 - Not to receive vaccinations during treatment
 - To use contraception during treatment and for 4 mo after (pregnancy D); product may cause infertility; to avoid breastfeeding
-

🍁 Canada only Side effects: *italics* = common; **bold** = life-threatening ⚠️
Nurse Alert

citalopram (Rx)

(sigh-tal'oh-pram)

Celexa

Func. class.: Antidepressant

Chem. class.: Selective serotonin reuptake inhibitor (SSRI)

Do not confuse: CeleXA/CeleBREX/Cerebyx/Cerebra/Zyprexa

ACTION:

Inhibits CNS neuron uptake of serotonin but not of norepinephrine; weak inhibitor of CYP450 enzyme system, thus making it more appealing than other products

USES:

Major depressive disorder

Unlabeled uses: Premenstrual disorders, panic disorder, social phobia, impulsive aggression in children, obsessive-compulsive disorder in adolescents; treatment of psychotic symptoms in nondepressed demented patients; anxiety, hot flashes, menopause; adjunct in schizophrenia, PTSD

CONTRAINDICATIONS:

Hypersensitivity

Precautions: Pregnancy (C), breastfeeding, geriatric patients, renal/hepatic disease, seizure disorder, hypersensitivity to escitalopram

Black Box Warning:

Children, suicidal ideation

DOSAGE AND ROUTES

Calculator

Depression

- **Adult: PO** 20 mg/day AM or PM, may increase if needed to 40 mg/day after 1 wk; maintenance: after 6-8 wk of initial treatment, continue for 24 wk (32 wk total), reevaluate long-term usefulness (max 40 mg/day)

Hepatic dose/geriatric

- **Adult: PO** 20 mg/day

Panic disorder (unlabeled)

- **Adult: PO** 20-40 mg/day

Premenstrual dysphoria/social phobia (unlabeled)

- **Adult: PO** 10-30 mg/day, used intermittently in premenstrual dysphoria

Available forms: Tabs 10, 20, 40 mg; oral sol 10 mg/5 ml

Administer:

- With food or milk for GI symptoms
- Crushed if patient is unable to swallow medication whole
- Dosages at bedtime if oversedation occurs during the day; may take entire dose at bedtime
- **Do not give within 14 days of MAOIs**

SIDE EFFECTS

CNS: *Headache, nervousness, insomnia, drowsiness, anxiety, tremor, dizziness, fatigue, sedation, poor concentration, abnormal dreams, agitation, seizures, apathy, euphoria, hallucinations, delusions, psychosis, suicidal attempts, neuroleptic malignant-like syndrome reactions*

CV: *Hot flashes, palpitations, angina pectoris, hemorrhage, hypertension, tachycardia, 1st-degree AV block, bradycardia, MI, thrombophlebitis*

EENT: *Visual changes, ear/eye pain, photophobia, tinnitus*

GI: *Nausea, diarrhea, dry mouth, anorexia, dyspepsia, constipation, cramps, vomiting, taste changes, flatulence, decreased appetite*

GU: *Dysmenorrhea, decreased libido, urinary frequency, UTI, amenorrhea, cystitis, impotence, urine retention*

INTEG: *Sweating, rash, pruritus, acne, alopecia, urticaria*

MS: *Pain, arthritis, twitching*

RESP: *Infection, pharyngitis, nasal congestion, sinus headache, sinusitis, cough, dyspnea, bronchitis, asthma, hyperventilation, pneumonia*

SYST: *Asthenia, viral infection, fever, allergy, chills; hyponatremia (geriatric patients), serotonin syndrome*

PHARMACOKINETICS

Metabolized in liver by CYP3A4, CYP2C19; excreted in urine; steady state 1 wk; peak 4 hr; half-life 35 hr

INTERACTIONS

⚠️ **Fatal reactions:** do not use with MAOIs

⚠️ **Increase:** QTc interval—dofetilide, halofantrine, probucol, pimoside, quinolones, ziprasidone; do not use together

Increase: effect of tricyclics; use cautiously

Increase: serotonin syndrome—serotonin receptor agonists, SSRIs, tramadol, lithium, MAOIs, trazodone, SNRIs (venlafaxine, duloxetine)

Increase: bleeding risk—NSAIDs, salicylates, thrombolytics, anticoagulants, antiplatelets

Increase: CNS effects—barbiturates, sedative/hypnotics, other CNS depressants

Increase: citalopram levels—macrolides, azole antifungals

Increase: plasma levels of β -blockers

Decrease: citalopram levels—carbamazepine, clonidine

Drug/Herb

⚠️ **Increase:** serotonin syndrome—St. John's wort, SAM-e; fatal reaction may occur; do not use concurrently

Increase: CNS stimulation—yohimbe

Drug/Lab Test

Increase: serum bilirubin, blood glucose, alk phos

Decrease: VMA, 5-HIAA

False increase: urinary catecholamines

NURSING CONSIDERATIONS

Assess:

Black Box Warning

Mental status: mood, sensorium, affect, suicidal tendencies, increase in psychiatric symptoms, depression, panic

⚠️ **Serotonin syndrome:** increased heart rate, sweating, dilated pupils, tremors, twitching, hyperthermia, agitation • B/P lying, standing, pulse q4hr; if systolic B/P drops 20 mm Hg, hold product, notify prescriber; take vital signs q4hr in patients with CV disease • Weight weekly; appetite may decrease or increase with product

• **Torsades de pointes, QT prolongation:** is dose-dependent, ECG for flattening of T wave, bundle branch, AV block, dysrhythmias in cardiac patients • Alcohol consumption; if alcohol is consumed, hold dose until AM

• Sexual dysfunction: erectile dysfunction, decreased libido

Perform/provide:

- Storage at room temp; do not freeze
- Assistance with ambulation during therapy, since drowsiness, dizziness occur
- Safety measures, primarily for geriatric patients
- Check to confirm PO medication swallowed
- Sugarless gum, hard candy, frequent sips of water for dry mouth

Evaluate:

- Therapeutic response: decreased depression

Teach patient/family:

- That therapeutic effect may take 4-6 wk, that patient may have increased anxiety 1st 5-7 days of therapy • To use caution when driving, performing other activities that require alertness because of drowsiness, dizziness, blurred vision; to report signs, symptoms of bleeding • To avoid alcohol, other CNS depressants

Black Box Warning:

That suicidal ideas, behavior may occur in children or young adults

- To notify prescriber if pregnant, planning to become pregnant, or breastfeeding

 **About the effects of serotonin syndrome: nausea/vomiting, tremors; if symptoms occur, to discontinue immediately, notify prescriber**

🌿 Canada only Side effects: *italics* = common; **bold** = life-threatening 
Nurse Alert

clarithromycin (Rx)

(klare-ith'row-my-sin)

Biaxin, Biaxin Filmtab, Biaxin XL

Func. class.: Antiinfective

Chem. class.: Macrolide

ACTION:

Binds to 50S ribosomal subunits of susceptible bacteria and suppresses protein synthesis

USES:

Mild to moderate infections of the upper and lower respiratory tract, uncomplicated skin and skin-structure infections caused by *Streptococcus pneumoniae*, *Mycoplasma pneumoniae*, *Legionella pneumophila*, *Moraxella catarrhalis*, *Neisseria gonorrhoeae*, *Corynebacterium diphtheriae*, *Listeria monocytogenes*, *Haemophilus influenzae*, *Streptococcus pyogenes*, *Staphylococcus aureus*, *Mycobacterium avium* complex (MAC); complex infection in AIDS patients; *Mycobacterium avium intracellulare*, *Helicobacter pylori* in combination with omeprazole, *H. parainfluenzae*

Unlabeled uses: Endocarditis prophylaxis, dyspepsia, gastric ulcer, Legionnaire's disease, pertussis, SARS

CONTRAINDICATIONS:

Hypersensitivity to this product or macrolide antibiotics, torsades de pointes, QT prolongation

Precautions: Pregnancy (C), breastfeeding, geriatric patients, renal/hepatic disease

DOSAGE AND ROUTES

Calculator

Acute exacerbation of chronic bronchitis

- **Adult:** PO 250-500 mg q12hr × 7-14 days or 1000 mg/day × 7 days (XL)

Pharyngitis/tonsillitis

- **Adult:** PO 250 mg q12hr × 10 days

Community-acquired pneumonia

- **Adult: PO** 250 mg q12hr × 7-14 days or 1000 mg/day × 7 days (XL)

MAC prophylaxis/treatment

- **Adult: PO** 500 mg bid; will require an additional antiinfective for active infection

***H. pylori* infection**

- **Adult: PO** 500 mg bid plus omeprazole 2 × 20 mg every AM (days 1-14), then omeprazole 20 mg every AM (days 15-28)

Acute maxillary sinusitis

- **Adult: PO** 500 mg q12hr × 14 days

Most infections

- **Child: PO** 7.5 mg/kg q12hr × 10 days, max 500 mg/dose for MAC

Renal dose

- **Adult and child: PO** CCr <30 ml/min, reduce dose by 50%, if used with ritonavir reduce by 75%

Legionnaire's disease/SARS/whooping cough/gastric ulcer/dyspepsia (*H. pylori*) (unlabeled)

- **Adult: PO** 500 mg q12hr; may be used in combination for some of these conditions

Endocarditis prophylaxis (unlabeled)

- **Adult: PO** 500 mg 1 hr before procedure

Available forms: Tabs 250, 500 mg; oral susp 125 mg/5 ml, 250 mg/5 ml; ext rel tab (XL) 500 mg

Administer:

- Do not break, crush, or chew tabs
- Adequate intake of fluids (2 L) during diarrhea episodes
- q12hr to maintain serum levels

SIDE EFFECTS

CV: Ventricular dysrhythmias, QT prolongation

GI: Nausea, vomiting, diarrhea, hepatotoxicity, abdominal pain, stomatitis, heartburn, anorexia, abnormal taste, pseudomembranous colitis

GU: Vaginitis, moniliasis

HEMA: Leukopenia, thrombocytopenia, increased INR

INTEG: Rash, urticaria, pruritus, Stevens-Johnson syndrome, toxic epidermal necrolysis

MISC: *Headache*, hearing loss

PHARMACOKINETICS

Peak 2-2.5 hr; duration 12 hr; half-life 3-4 hr; metabolized by liver; excreted in bile, feces; possible inhibition of P-glycoprotein

INTERACTIONS

Increase: dysrhythmias—cisapride, pimozide

Increase: levels, increase toxicity—ALPRAZolam, busPIRone, carBAMazepine, cycloSPORINE, digoxin, disopyramide, ergots, felodipine, fluconazole, omeprazole, tacrolimus, theophylline

Increase: oral anticoagulants effect—digoxin, theophylline, carBAMazepine

Increase: levels of HMG-CoA reductase inhibitors

Increase: action, risk for toxicity—all products metabolized by CYP3A enzyme system

Increase: effect of calcium channel blockers, midazolam, benzodiazepines, tacrolimus

Increase: QT prolongation—class IA, III antidysrhythmics

Increase or decrease action: zidovudine

Decrease: levels—rifampin, rifabutin

Drug/Lab Test

Increase: 17-OHCS/17-KS, AST, ALT, BUN, creatinine, LDH, total bilirubin

Decrease: folate assay, WBC

NURSING CONSIDERATIONS

Assess:

- **Infection:** wound characteristics, urine, stool, sputum, WBC, temp; C&S before product therapy; product may be given as soon as culture is taken; C&S may be repeated after treatment
- For ulcers: abdominal pain, bleeding in stools, emesis
- Renal, hepatic studies; report hematuria, oliguria
- Bowel pattern before, during treatment
- Respiratory status: rate, character, wheezing, tightness in chest; discontinue product
- Allergies before treatment, reaction to each medication

• **QT prolongation, ventricular dysrhythmias:** monitor ECG, cardiac status in those with underlying cardiac abnormalities • **Serious skin reaction:** Stevens-Johnson syndrome, toxic epidermal necrolysis; product should be discontinued immediately

Perform/provide:

- Storage at room temp

Evaluate:

- Therapeutic response: C&S negative for infection

Teach patient/family:

- To take with full glass of water; may give with food to decrease GI symptoms
- ⚠ To report sore throat, fever, fatigue; may indicate superinfection ⚠ To notify prescriber of diarrhea, dark urine, pale stools, yellow discoloration of eyes or skin, severe abdominal pain
- To take at evenly spaced intervals; to complete dosage regimen
- To notify prescriber if pregnancy is suspected or planned

TREATMENT OF HYPERSENSITIVITY:

Withdraw product, maintain airway, administer EPINEPHrine, aminophylline, O₂, IV corticosteroids

🌿 Canada only Side effects: *italics* = common; **bold** = life-threatening ⚠
Nurse Alert

clevidipine (Rx)

(klev-id'i-peen)

Cleviprex

Func. class.: Calcium channel blocker (L-type)

Chem. class.: Dihydropyridine

ACTION:

L-type calcium channels mediate the influx of calcium during depolarization in arterial smooth muscle; reduces mean arterial B/P by decreasing systemic vascular resistance

USES:

Reduction of B/P when oral therapy not feasible

CONTRAINDICATIONS:

Hypersensitivity to this product, eggs, soya lecithin; defective lipid metabolism; severe aortic stenosis, pancreatitis

Precautions: Pregnancy (C), labor, breastfeeding, children <18 yr, heart failure, hyperlipidemia, chronic hypertension, pheochromocytoma

DOSAGE AND ROUTES

Calculator

• **Adult: CONT IV** 1-2 mg/hr; dose may be doubled q90sec initially; as B/P reaches goal, adjust dose less frequently (q5-10min) with smaller increases in dose; most patients require 4-6 mg/hr, max 32 mg/hr; no more than 1000 ml should be infused per 24-hr period due to lipid load restrictions

Available forms: Single-dose vial 50, 100 ml (0.5 mg/ml); IV emulsion

Administer:

Intermittent IV INF route

- Do not give through same line as other medications, do not dilute
- Gently invert several times before use; do not use if discolored or if particulate matter is present
- Give through central or peripheral line at 1-2 mg/hr, use infusion device

SIDE EFFECTS

CNS: Headache

CV: **MI**, **sinus tachycardia**, syncope, **reflex tachycardia**, **atrial fibrillation**

GI: Nausea, vomiting

PHARMACOKINETICS

Onset 2-4 min; half-life initially 1 min, terminal 15 min; metabolized via esterases in blood, extravascular tissues; excreted in urine 63%-74%, feces 7%-22%; protein binding >99%

NURSING CONSIDERATIONS

Assess:

- Cardiac status: B/P, pulse, respiration, ECG; some patients have developed severe angina, acute MI after calcium channel blockers if obstructive CAD is severe; if not transitioned to other antihypertensive therapies after clevidipine inf, patients should be monitored ≥ 8 hr for rebound hypertension; monitor for rebound hypertension after product stoppage

Perform/provide:

- Storage of vials in refrigerator, do not freeze; leave vials in carton until use; product is photosensitive but protection from light during administration is not required

Evaluate:

- Therapeutic response: decreased B/P

Teach patient/family:

- **To notify prescriber immediately if neurological symptoms, visual changes, or symptoms of CHF occur**
- **To continue follow-up for hypertension**
- To notify prescriber if pregnancy is planned, suspected, or if breastfeeding

☼ Canada only Side effects: *italics* = common; **bold** = life-threatening ⚠
Nurse Alert

clindamycin HCl (Rx)

(klin-da-my'sin)

Cleocin HCl, Dalacin C 

clindamycin palmitate (Rx)

Cleocin Pediatric, Dalacin C Flavored Granules 

clindamycin phosphate (Rx)

Cleocin Phosphate, Dalacin C Phosphate Sterile Solution 

Func. class.: Antiinfective—miscellaneous

Chem. class.: Lincomycin derivative

ACTION:

Binds to 50S subunit of bacterial ribosomes, suppresses protein synthesis

USES:

Infections caused by staphylococci, streptococci, *Rickettsia*, *Fusobacterium*, *Actinomyces*, *Peptococcus*, *Bacteroides*, *Pneumocystis jiroveci*

Unlabeled uses: Acne rosacea, *Bacillus anthracis*, dental infections, folliculitis, malaria, pemphigus, periodontitis, *Pneumocystis jiroveci* pneumonia (PCP), toxoplasmosis

CONTRAINDICATIONS:

Hypersensitivity to this product or lincomycin, tartrazine dye; ulcerative colitis/enteritis

Black Box Warning:

Pseudomembranous colitis

Precautions: Pregnancy (B), breastfeeding, geriatric patients, GI/renal/hepatic disease, asthma, allergy

Black Box Warning:

Diarrhea

DOSAGE AND ROUTES

Calculator

- **Adult: PO** 150-450 mg q6-8hr, max 1.8 g/day; **IM/IV** 1.2-2.7 g/day in 2-4 divided doses, max 4800 mg/day
- **Child >1 mo: PO** 8-25 mg/kg/day in divided doses q6-8hr; **IM/IV** 20-40 mg/kg/day in 3-4 equal divided doses q6-8hr
- **Neonate: IM/IV** 15-20 mg/kg/day divided doses q6-8hr

PID

- **Adult: IV** 900 mg q8hr plus gentamicin

Bacterial endocarditis prophylaxis (unlabeled)

- **Adult:** 600 mg 1 hr before procedure

P. jiroveci pneumonia (unlabeled)

- **Adult: PO** 1200-1800 mg/day in divided doses with 15-30 mg primaquine/day × 21 days

Acne Vulgaris

- **Adult/adolescent:** Top gel, lotion, sol, apply a thin film to affected areas bid for up to 12 wk
- **Adult/adolescents/child ≥2 yr:** Top (foam), apply to affected areas daily, if no improvement in 8 wk, discontinue

Bacteria vaginosis nonpregnant

- **Adult/adolescent females:** Intravaginal 1 applicator full (100 mg clindamycin/5 g cream) at bedtime × 7 days (CDC)

Available forms: **HCl:** caps 75, 150, 300 mg; **palmitate:** oral sol 75 mg/5 ml; **phosphate:** inj 150, 300, 600 mg base/4 ml; 900 mg base/ml; inj inf in D₅ 300 mg, 600 mg, 900 mg; top pledget/foam/gel/lotion/solution/1%; Vag cream 2%; Vag suppository 100 mg

Administer:

- In equal intervals around the clock to maintain blood levels
- Obtain C&S before use
- EPINEPHrine, suction, tracheostomy set, endotracheal intubation equipment on unit available

PO route

- Do not break, crush, chew caps
- Orally with at least 8 oz of water

Oral solution

- Do not refrigerate reconstituted product, store at room temperature ≤2 wk

- Reconstitute granules with most of 75 ml of water, shake well, add remaining water, shake well (75 mg/5 ml)

IM route

- IM deep inj; rotate sites; do not give >600 mg in single IM inj

Intermittent IV INF route

- By inf only; do not administer bolus dose; **dilute** 300-mg or 600-mg doses/50 ml of D₅W, NS; **give** over 10 or 20 min, respectively; 900-mg and 1200-mg doses/100 ml of compatible diluent and **give** over 30 or 40 min, respectively; final conc ≤12 mg/ml; if using ADD-Vantage vials, dilute containers with NS, D₅W, give over 10-60 min, rate max 30 mg/min, max 1.2 g/h

Rapid IV inj route

- Dilute as above, administer as rapid 1st dose only, then give at **cont inf** rate based on clindamycin levels

Syringe compatibilities: Amikacin, aztreonam, gentamicin, heparin

Y-site compatibilities: Acyclovir, alfentanil, amifostine, amikacin, aminocaproic acid, aminophylline, amiodarone, amphotericin B cholesteryl, amphotericin B lipid complex, amsacrine, anakinra, anidulafungin, ascorbic acid injection, atenolol, atracurium, atropine, aztreonam, benztrapine, bivalirudin, bleomycin, bumetanide, buprenorphine, butorphanol, calcium chloride/gluconate, CARBOplatin, cefamandole, ceFAZolin, cefmetazole, cefonicid, cefoperazone, cefotaxime, cefoTEtan, cefOXitin, cefpirome, cefTAZidime, ceftizoxime, ceftobiprole, cefuroxime, cephalothin, cephapirin, chloramphenicol, cimetidine, cisatracurium, CISplatin, codeine, cyanocobalamin, cyclophosphamide, cycloSPORINE, cytarabine, DACTINomycin, DAPTOmycin, dexamethasone, dexmedetomidine, digoxin, diltiazem, diphenhydrAMINE, DOCEtaxel, DOPamine, doxacurium, DOXOrubicin, DOXOrubicin liposomal, doxycycline, enalaprilat, ePHEDrine, EPINEPHrine, epirubicin, epoetin alfa, eptifibatide, esmolol, etoposide, famotidine, fenoldopam, fentaNYL, fludarabine, fluorouracil, folic acid, foscarnet, furosemide, gatifloxacin, gemcitabine, gemtuzumab, gentamicin, glycopyrrolate, granisetron, heparin, hydrocortisone, HYDROmorphine, ifosfamide, imipenem-cilastatin, indomethacin, insulin (regular), irinotecan, isoproterenol, ketorolac, levofloxacin, lidocaine, linezolid, LORazepam, LR,

magnesium sulfate, mannitol, mechlorethamine, melphalan, meperidine, metaraminol, methicillin, methotrexate, methoxamine, methyldopate, methylPREDNISolone, metoclopramide, metoprolol, metroNIDAZOLE, mezlocillin, miconazole, milrinone, morphine, moxalactam, multiple vitamins injection, nafcillin, nalbuphine, naloxone, nesiritide, netilmicin, niCARDipine, nitroglycerin, nitroprusside, norepinephrine, octreotide, ondansetron, oxacillin, oxaliplatin, oxytocin, PACLitaxel, palonosetron, pamidronate, pancuronium, pantoprazole, PEMEtrexed, penicillin G potassium/sodium, pentazocine, perphenazine, PHENobarbital, phenylephrine, phytonadione, piperacillin, piperacillin-tazobactam, potassium chloride, procainamide, propofol, propranolol, protamine, pyridoxine, ranitidine, remifentanyl, Ringer's, ritodrine, riTUXimab, rocuronium, sargramostim, sodium acetate/bicarbonate, succinylcholine, SUFentanyl, tacrolimus, teniposide, theophylline, thiamine, thiotepa, ticarcillin, ticarcillin-clavulanate, tigecycline, tirofiban, TNA, tobramycin, tolazoline, TPN, trimetaphan, urokinase, vancomycin, vasopressin, vecuronium, verapamil, vinCRISTine, vinorelbine, vitamin B complex/C, voriconazole, zidovudine, zoledronic acid

SIDE EFFECTS

GI: Nausea, vomiting, abdominal pain, diarrhea, **pseudomembranous colitis**, anorexia, weight loss, increased AST/ALT, bilirubin, alk phos; jaundice

GU: Vaginitis, urinary frequency

INTEG: Rash, urticaria, pruritus, erythema, pain, abscess at inj site

SYST: **Stevens-Johnson syndrome, exfoliative dermatitis**

PHARMACOKINETICS

PO: Peak 45 min, duration 6 hr

IM: Peak 3 hr (adult), 1 hr (child); duration 8-12 hr; half-life 2 1/2 hr; metabolized in liver; excreted in urine, bile, feces as inactive metabolites; crosses placenta; excreted in breast milk

INTERACTIONS

- May block clindamycin effect: erythromycin, chloramphenicol

Increase: neuromuscular blockade—neuromuscular blockers

Decrease: absorption—kaolin

Drug/Lab Test

Increase: alk phos, bilirubin, CPK, AST, ALT

NURSING CONSIDERATIONS

Assess:

- **Infection:** C&S before product therapy; product may be given as soon as culture is taken • VS, urine, stools, sputum
- Hepatic studies: AST, ALT if on long-term therapy
- B/P, pulse in patient receiving product parenterally

Black Box Warning:

Pseudomembranous colitis: bowel pattern before, during treatment; if severe diarrhea occurs, product should be discontinued, may occur several wk after therapy is terminated

- Respiratory status: rate, character, wheezing, tightness in chest
- **Serious skin reactions:** Stevens-Johnson syndrome, exfoliative dermatitis

Evaluate:

- Therapeutic response: decreased temp, negative C&S

Teach patient/family:

- To take oral product with full glass of water; that antiperistaltic products may worsen diarrhea • About all aspects of product therapy; to complete entire course of medication to ensure organism death (10-14 days); culture may be taken after medication course completed ⚠️ To report sore throat, fever, fatigue; may indicate

superinfection

- To take with food to reduce GI symptoms
- To notify nurse or prescriber of diarrhea with pus, mucous

TREATMENT OF HYPERSENSITIVITY:

- Withdraw product; maintain airway; administer EPINEPHrine, aminophylline, O₂, IV corticosteroids

☼ Canada only Side effects: *italics* = common; **bold** = life-threatening ⚠️
Nurse Alert

clindamycin (topical, vaginal)

(klin-da-mye'sin)

Cleocin, Cleocin-T, Clindacin-P, Clindagel, ClindaMax, Clindasol , Clinda-T , Clindesse, Clindets, Dalacin , Evoclin *Func. class.:* topical antiinfective

Chem. class.: lincosamide derivative

ACTION:

Antibacterial activity results from inhibition of protein synthesis; bacteriostatic

USES:

For the treatment of acne vulgaris; treatment of bacterial vaginosis and anaerobic bacteria

CONTRAINDICATIONS:

Hypersensitivity to this product or lincomycin, history of antibiotic-associated colitis or ulcerative colitis

Precautions: Breastfeeding, children younger than 12 yr

DOSAGE AND ROUTES

Calculator

Acne vulgaris

- **Adult/adolescent: TOP** (gel, lotion, solution) Apply a thin film of 1% to affected areas bid
- **Adult/adolescent/child ≥ 12 yr: TOP (foam)** Apply 1% topical foam to affected areas once daily. If there is no improvement after 6-8 weeks, or if the condition worsens, discontinue treatment
- **TOP** (medicated pledgets) Use a pledget to apply a thin film to the affected area bid; more than one pledget may be used, but each pledget should be used only once and then discarded

Bacterial vaginosis and anaerobic bacteria

Nonpregnant adult/adolescent/postmenarchal females:

- **Intravaginal cream** One applicatorful (100 mg clindamycin/5 g cream) intravaginally, preferably at bedtime, for 3 or 7 consecutive days in nonpregnant women and for 7 consecutive days in pregnant women. Clindesse is

administered as a single dose at any time of the day • **Intravaginal ovules/suppositories** As an alternative to first-line therapies, the CDC recommends one ovule (100 mg clindamycin) inserted intravaginally at bedtime for 3 days

Available forms: Topical gel, foam, lotion, pledget, solution 1%; vaginal cream 2%, vaginal suppositories 100 mg

Administer:

Topical route:

- Improvement occurs after 6 wk but can require 8-12 wk
- Topical skin products are not for intravaginal therapy and are for external use only; do not use skin products near the eyes, nose, or mouth
- Wash hands before and after use. Wash affected area and gently pat dry

Cream/ointment/lotion:

- Shake well before use (Lotion). Apply a thin film to the cleansed affected area. Massage gently into affected areas

Foam formulations:

- Do not dispense foam directly onto hands or face; the warmth of the skin will cause the foam to melt. Instead, dispense desired amount directly into the cap or onto a cool surface. Make sure enough foam is dispensed to cover the affected area(s). If the can feels warm or the foam seems runny, run the can under cold water. To apply, pick up small amounts of the foam with the fingertips and gently massage into the affected areas until the foam disappears

Solution formulations:

- Shake well before use. Apply a thin film to the cleansed affected area. Massage gently into affected areas; if using a solution-soaked pledget, patient may use more than 1 pledget per application as needed to treat affected areas, but each pledget should be used only once and then discarded

Intravaginal route:

- Only use dosage formulations specified for intravaginal use. Intravaginal dosage forms are not for topical therapy; do not ingest

Suppository:

- Unwrap vaginal ovule (suppository) before insertion; use applicator(s) supplied by the manufacturer

Cream:

- Use applicator(s) supplied by the manufacturer

SIDE EFFECTS

GU: Colitis, diarrhea, overgrowth, vaginitis, vaginal moniliasis, UTI

INTEG: Redness, burning, dermatitis, rash, pruritus

INTERACTIONS

Decrease: clindamycin effect—erythromycin

Increase: effect of—neuromuscular blockers

Drug/Lab Test

Increase: LFTs

NURSING CONSIDERATIONS

Assess:

Allergic reaction: Assess for hypersensitivity, product may need to be discontinued

- Contact prescriber immediately if severe diarrhea, stomach cramps/pain, or bloody stools occur

Infection: Assess for number of lesions, severity in acne, itching in vaginosis

Evaluate:

- Decreased lesions in acne, infection in vaginosis

Teach patient/family:

Topical route:

- Improvement occurs after 6 wk but can require 8-12 wk
- Topical skin products are not for intravaginal therapy and are for external use only; do not use skin products near the eyes, nose, or mouth • Wash hands before and after use. Wash affected area and gently pat dry

Cream/ointment/lotion:

- Shake well before use. **Lotion** Apply a thin film to the cleansed affected area. Massage gently into affected areas

Foam formulations:

- Do not dispense foam directly onto hands or face; the warmth of the skin will cause the foam to melt. Instead, dispense desired amount directly into the cap or onto a cool surface. Make sure enough foam is dispensed to cover the affected area(s). If the can feels warm or the foam seems runny, run the can under cold

water. To apply, pick up small amounts of the foam with the fingertips and gently massage into the affected areas until the foam disappears

Solution formulations:

- Shake well before use. Apply a thin film to the cleansed affected area. Massage gently into affected areas; if using a solution-soaked pledget; patient may use more than one pledget per application as needed to treat affected areas, but each pledget should be used only once and then discarded

Intravaginal route:

- Only use dosage formulations specified for intravaginal use. Intravaginal dosage forms are not for topical therapy; do not ingest

Suppository:

- Unwrap vaginal ovule (suppository) before insertion; use applicator(s) supplied by the manufacturer

Cream:

- Use applicator(s) supplied by the manufacturer

🍁 Canada only Side effects: *italics* = common; **bold** = life-threatening ⚠️
Nurse Alert

clobetasol

(kloe-bay'ta-sol)

Clobex, Cormax, Olux, Olux-E, Temovate, Temovate-E

Func. class.: Corticosteroid, topical

ACTION:

Crosses cell membrane to attach to receptors to decrease inflammation, itching

USES:

Inflammation/itching in corticosteroid-responsive dermatoses on the skin/scalp

CONTRAINDICATIONS:

Hypersensitivity, use of some preparations on face, axilla, groin; monotherapy for primary bacterial infections

Precautions: Pregnancy (C), breastfeeding, children

DOSAGE AND ROUTES

Calculator

• **Adult: TOP** Apply to infected areas bid (shampoo: daily up to 4 times a week)

Available forms: Gel, lotion, ointment, cream, shampoo, solution, spray, foam
0.05%

Administer

Topical route

⚠ Do not use with occlusive dressings

⚠ Treatment should be limited to 2 wk

• **Cream/Ointment/Lotion:** Using gloves, apply sparingly in a thin film and rub gently into the cleansed, slightly moist affected area • **Gel:** Using gloves, apply sparingly in a thin film and rub gently into the cleansed, slightly moist affected area • **Scalp foam:** Invert can and dispense a small amount of foam onto a saucer or other cool surface. Do not dispense directly onto hands. Pick up small amounts of foam with fingers and gently massage into affected area until foam disappears. Repeat until entire affected scalp area is treated • **Shampoo:** Apply onto dry scalp in thin film, leave lather on scalp for 15 min, rinse off

SIDE EFFECTS

INTEG: Burning, folliculitis, pruritus, dermatitis, irritation, erythema, hypertrichosis, acne

MISC: Hyperglycemia

NURSING CONSIDERATIONS

Assess:

- Skin reactions: burning, pruritus, folliculitis, dermatitis

Evaluate:

- Decreasing itching, inflammation on the skin, scalp

Teach patient/family:

Topical route

⚠️ Do not use with occlusive dressings

⚠️ Treatment should be limited to 2 wk

- **Cream/Ointment/Lotion:** To apply sparingly in a thin film and rub gently into the cleansed, affected area
- **Gel:** To apply sparingly in a thin film and rub gently into the cleansed, slightly moist affected area
- **Scalp foam:** To invert can and dispense a small amount of foam onto a saucer or other cool surface. Do not dispense directly onto hands. Pick up small amounts of foam with fingers and gently massage into affected area until foam disappears. Repeat until entire affected scalp area is treated

🇨🇦 Canada only Side effects: *italics* = common; **bold** = life-threatening ⚠️

clomiPHENE (Rx)

(kloe'mi-feen)

Clomid, Serophene

Func. class.: Ovulation stimulant

Chem. class.: Nonsteroidal antiestrogenic

Do not confuse: clomiPHENE/clomiPRAMINE

Serophen/Sarafem

ACTION:

Increases LH, FSH release from the pituitary, which increases the maturation of the ovarian follicle, ovulation, and the development of the corpus luteum

USES:

Female infertility (ovulatory failure)

Unlabeled uses: Oligospermia

CONTRAINDICATIONS:

Pregnancy (X), hypersensitivity, hepatic disease, undiagnosed uterine bleeding, uncontrolled thyroid or adrenal dysfunction, intracranial lesion, ovarian cysts, endometrial carcinoma

Precautions: Hypertension, depression, seizures, diabetes mellitus, abnormal ovarian enlargement, ovarian hyperstimulation

DOSAGE AND ROUTES

Calculator

• **Adult: PO** 50 mg/day × 5 days or 50 mg/day beginning on day 5 of menstrual cycle, may increase to 100 mg daily × 5 days with next cycle; may be repeated until conception occurs or max 6 cycles of therapy

Oligospermia (unlabeled)

• **Adult (men): PO** 25 mg/day × 25 days then 5 days off cycle each mo

Available forms: Tabs 50 mg

Administer:

- After discontinuing estrogen therapy
- At same time daily to maintain product level, without regard to food

- Avoid heat, moisture, light, store at room temperature

SIDE EFFECTS

CNS: *Headache, depression, restlessness, anxiety, nervousness, fatigue, insomnia, dizziness, flushing*

CV: Vasomotor flushing, phlebitis, **deep venous thrombosis**

EENT: Blurred vision, diplopia, photophobia

GI: *Nausea, vomiting, constipation, abdominal pain, bloating, hepatitis*

GU: Polyuria, urinary frequency, **birth defects, spontaneous abortions**, multiple ovulation, breast pain, oliguria, abnormal uterine bleeding, ovarian cyst, hypertrophy of ovary

INTEG: *Rash, dermatitis, urticaria, alopecia*

PHARMACOKINETICS

Metabolized in liver, excreted in feces

INTERACTIONS

Drug/Herb

Decrease: clomiPHENE effect—DHEA, black cohosh, chaste tree fruit

Drug/Food

Decrease: clomiPHENE effect—soy

Drug/Lab Test

Increase: LFTs

NURSING CONSIDERATIONS

Assess:

- LFTs before therapy: AST, ALT, alk phos
- Serum progesterone, urinary excretion of pregnanediol to identify occurrence of ovulation
- Ovarian size, cervical condition by pelvic examination
- Rule out endometrial carcinoma in women >35 yr by endometrial biopsy

Evaluate:

- Therapeutic response: fertility

Teach patient/family:

- That multiple births are common
- **To notify prescriber immediately if low abdominal pain occurs; may indicate**

ovarian cyst, cyst rupture • To notify prescriber of photophobia, blurred vision, diplopia, abnormal bleeding

- That, if dose is missed, to double it next time; if more than one dose is missed, to call prescriber • That response usually occurs 4-10 days after last day of treatment

- About the method for taking, recording basal body temp to determine whether ovulation has occurred • If ovulation can be determined (there is a slight decrease in temp then a sharp increase with ovulation), to attempt coitus 3 days before and every other day until after ovulation • If pregnancy is suspected, to notify prescriber immediately (X)

🍁 Canada only Side effects: *italics* = common; **bold** = life-threatening ⚠️
Nurse Alert

clomiPRAMINE (Rx)

(kloe-mip'ra-meen)

Anafranil

Func. class.: Antidepressant, tricyclic

Chem. class.: Tertiary amine

Do not confuse:

clomiPRAMINE/clomiPHENE/chlorproMAZINE/desipramine/Norpramin

ACTION:

Potentiates serotonin and norepinephrine; moderate anticholinergic effect

USES:

Obsessive-compulsive disorder

Unlabeled uses: Panic disorder, autism, depression, premature ejaculation, dysphoria, phobias, anxiety, agoraphobia

CONTRAINDICATIONS:

Hypersensitivity, immediate post-MI

Precautions: Pregnancy (C), breastfeeding, geriatric patients, seizures, cardiac disease, glaucoma, prostatic hypertrophy, urinary retention

Black Box Warning:

Children, suicidal ideation

DOSAGE AND ROUTES

Calculator

Obsessive-compulsive disorder

- **Adult: PO** 25 mg at bedtime, increase gradually over 4 wk to 75-250 mg/day in divided doses
- **Child 10-18 yr: PO** 25 mg/day gradually increase over 2 wk; max 3 mg/kg/day or 200 mg/day, whichever is smaller

Autism (unlabeled)

- **Adult: PO** 25 mg/day, may increase to 75-100 mg/day, max 250 mg/day
- **Child: PO** 25 mg/day, may increase if needed

Premature ejaculation (unlabeled)

- **Adult: PO** 25-50 mg/day

Depression (unlabeled)

- **Adult: PO** 25 mg at bedtime and increase gradually over 4 wk to 75-250 mg/day in divided doses
- **Child 10-18 yr: PO** 25-50 mg/day gradually increased; max 3 mg/kg/day or 200 mg/day, whichever is smaller

Available forms: Caps 25, 50, 75 mg

Administer:

- Do not break, crush, or chew caps
- Increased fluids, bulk in diet for constipation, especially for geriatric patients
- Without regard to food, during initial dosing and titration give with meals
- After titration, may be given as a single dose at bedtime to reduce daytime sedation

SIDE EFFECTS

CNS: *Dizziness, tremors, mania, seizures*, aggressiveness, EPS, drowsiness, headache, *neuroleptic malignant syndrome*, insomnia, agitation

CV: Hypotension, tachycardia, *cardiac arrest*

EENT: Blurred vision

ENDO: Galactorrhea, hyperprolactinemia

GI: *Constipation, dry mouth, nausea, dyspepsia*, weight gain, *hepatic toxicity*

GU: *Delayed ejaculation, anorgasmia*, urinary retention, decreased libido

HEMA: *Agranulocytosis, neutropenia, pancytopenia*

INTEG: Diaphoresis, photosensitivity

META: Hyponatremia

SYST: *Suicide in children, adolescents*

PHARMACOKINETICS

Onset ≥ 2 wk (depression), 4-10 wk (OCD); peak 2-6 hr; extensively bound to tissue and plasma proteins; demethylated in liver; active metabolites excreted in urine (50%-60%), feces (24%-32%); half-life 20-30 hr; steady state 1-2 wk

INTERACTIONS

Increase: hypertensive crisis, seizures, hypertensive episode—MAOIs

Increase: Serotonin syndrome—SSRIs, SNRIs serotonin syndrome, linezolid, methylene blue IV

Increase: clomiPRAMINE levels—cimetidine, FLUoxetine, fluvoxamine, sertraline; do not use together

Increase: hypertensive effect—cloNIDine, EPINEPHrine, norepinephrine

Increase: clomiPRAMINE level—CYP1A2, CYP2D6

Increase: CNS depression—alcohol, CNS depressants, general anesthetics

Increase: QT prolongation—other tricyclics, phenothiazines, quinolones

Decrease: effect of cloNIDine, levodopa, skeletal muscle relaxants, haloperidol, opiates

Decrease: clomiPRAMINE levels—barbiturates, carBAMazepine, phenytoin

Drug/Herb

Increase: serotonin syndrome—St. John's wort; do not use concurrently

Increase: CNS depression—hops, kava, valerian

Drug/Lab Test

Increase: prolactin, TBG, AST, ALT, blood glucose

Decrease: serum thyroid hormone (T₃, T₄)

NURSING CONSIDERATIONS

Assess:

- B/P lying, standing; pulse q4hr; if systolic B/P drops 20 mm Hg, withhold product, notify prescriber; take VS q4hr in patients with CV disease
- **Serotonin syndrome:** hyperpyrexia, rigidity, irregular pulse, diaphoresis
- **ECG** for flattening of T wave, QTc prolongation, bundle branch block, AV block, dysrhythmias in cardiac patients, may lead to cardiac collapse
- Blood studies: CBC, leukocytes, differential, cardiac enzymes if patient is receiving long-term therapy and signs of blood dyscrasias
- Hepatic studies: AST, ALT, bilirubin

Black Box Warning:

Mental status: mood, sensorium, affect, suicidal tendencies; increase in psychiatric symptoms: depression, panic, frequency of obsessive-compulsive behaviors; watch closely for evidence of suicidal thoughts in children, adolescents; seizure disorders

- Urinary retention, constipation; constipation more likely in children
- **Withdrawal symptoms:** headache, nausea, vomiting, muscle pain, weakness; not usual unless product discontinued abruptly
- Alcohol consumption; if alcohol consumed, withhold dose until AM

Perform/provide:

- Storage in tight container at room temp; do not freeze

- Assistance with ambulation during beginning therapy, since drowsiness, dizziness occurs

- Gum, hard candy, or frequent sips of water for dry mouth

Evaluate:

- Therapeutic response: decreased anxiety, depression

Teach patient/family:

- That the effects may take 4-6 wk to appear

- About risk for seizures

- To use caution when driving, performing other activities that require alertness because drowsiness, dizziness, blurred vision may occur
- To avoid alcohol, other CNS depressants

- Not to discontinue medication quickly after long-term use because this may cause nausea, headache, malaise

Black Box Warning:

That suicidal thoughts/behaviors may occur in children, young adults, report immediately

- To wear sunscreen, protective clothing to prevent photosensitivity

- To notify prescriber if pregnancy is planned, suspected

- That men may experience a high incidence of sexual dysfunction

- **Serotonin syndrome:** report immediately sweating, diarrhea, twitching

- **Abrupt discontinuation:** do not stop abruptly

TREATMENT OF OVERDOSE:

ECG monitoring; induce emesis; lavage, activated charcoal; anticonvulsant; diazepam IV

☼ Canada only Side effects: *italics* = common; **bold** = life-threatening ⚠
Nurse Alert

clonazePAM (Rx)

(kloe-na'zi-pam)

Klonopin

Func. class.: Anticonvulsant

Chem. class.: Benzodiazepine derivative

Controlled Substance Schedule IV

Do not confuse: clonazePAM/LORazepam/clorazepate/cloNIDine
KlonoPIN/cloNIDine

ACTION:

Inhibits spike, wave formation during absence seizures (petit mal); decreases amplitude, frequency, duration, spread of discharge during minor motor seizures

USES:

Absence, atypical absence, akinetic, myoclonic seizures; Lennox-Gastaut syndrome, panic disorder

Unlabeled uses: Anxiety, insomnia, nystagmus, restless leg syndrome

CONTRAINDICATIONS:

Pregnancy (D), hypersensitivity to benzodiazepines, acute closed-angle glaucoma, psychosis, severe hepatic disease

Precautions: Breastfeeding, geriatric patients, open-angle glaucoma, chronic respiratory disease, renal/hepatic disease

DOSAGE AND ROUTES

Calculator

Lennox-Gastaut syndrome/atypical absence seizures/akinetic and myoclonic seizures

- **Adult: PO** up to 1.5 mg/day in 3 divided doses; may be increased 0.5-1 mg q3days until desired response, max 20 mg/day
- **Geriatric: PO** 0.25 daily-bid initially, increase by 0.25/day q7-14days as needed
- **Child <10 yr or <30 kg: PO** 0.01-0.03 mg/kg/day in divided doses q8hr, max

0.05 mg/kg/day; may be increased 0.25-0.5 mg q3days until desired response, max 0.1-0.2 mg/kg/day

Panic disorder

- **Adult: PO** 0.25 mg bid increase to 1 m daily after 3 days, max 4 mg/day

Restless leg syndrome (RLS) (unlabeled)

- **Adult: PO** 0.5 mg tid or 0.5 mg in the evening and 30 min before bedtime

Insomnia/anxiety (unlabeled)

- **Adult: PO** 0.125-0.25 mg at bedtime, titrate up q3-4days as needed

Available forms: Tabs 0.5, 1, 2 mg; orally disintegrating tabs 0.125, 0.25, 0.5, 1, 2 mg

Administer:

PO route

- With food, milk for GI symptoms
- **Orally disintegrating tablets:** open pouch by peeling back foil on blister pack (do not push tab through foil), place on tongue, allow to dissolve; may be swallowed with/without water
- Store at room temperature

SIDE EFFECTS

CNS: *Drowsiness*, dizziness, confusion, behavioral changes, tremors, insomnia, headache, **suicidal tendencies**, slurred speech, anterograde amnesia

CV: Palpitations, bradycardia, tachycardia

EENT: *Increased salivation, nystagmus, diplopia*, abnormal eye movements

GI: *Nausea, constipation*, polyphagia, anorexia, xerostomia, diarrhea, gastritis, sore gums

GU: Dysuria, enuresis, nocturia, retention, libido changes

HEMA: **Thrombocytopenia, leukocytosis, eosinophilia**

INTEG: Rash, alopecia, hirsutism

RESP: **Respiratory depression**, dyspnea, congestion

PHARMACOKINETICS

PO: Peak 1-2 hr, metabolized by liver, excreted in urine, half-life 18-50 hr, duration 6-12 hr, protein binding 85%

INTERACTIONS

Increase: clonazepam effects—CYP3A4 inhibitors (azoles, cimetidine,

clarithromycin, diltiazem, erythromycin, FLUoxetine), oral contraceptives

Increase: CNS depression—alcohol, barbiturates, opiates, antidepressants, other anticonvulsants, general anesthetics, hypnotics, sedatives

Decrease: clonazepam effect—CYP3A4 inducers (carbamazepine, phenobarbital, phenytoin)

Drug/Herb

Increase: CNS depression—kava, chamomile, valerian

Increase: clonazepam effect—ginkgo, melatonin

Decrease: clonazepam effect—ginseng, St. John's wort

Drug/Lab Test

Increase: AST, alk phos, bilirubin

Decrease: Platelets, WBC

NURSING CONSIDERATIONS

Assess:

- **Seizures:** duration, type, intensity, with/without aura
- Blood studies: RBC, Hct, Hgb, reticulocyte counts every wk for 4 wk then monthly
- Hepatic studies: ALT, AST, bilirubin, creatinine
- **Abrupt discontinuation:** Do not discontinue abruptly, seizures may increase
- Signs of physical withdrawal if medication suddenly discontinued

⚠ **Mental status:** mood, sensorium, affect, oversedation, behavioral changes, **suicidal thoughts/behaviors**; if mental status changes, notify prescriber • Eye problems: need for ophthalmic exam before, during, after treatment (slit lamp, funduscopy, tonometry) • Allergic reaction: red, raised rash; product should be discontinued

⚠ **Blood dyscrasias:** fever, sore throat, bruising, rash, jaundice • **Toxicity:** bone marrow depression, nausea, vomiting, ataxia, diplopia, CV collapse; drug levels during initial treatment (therapeutic 20-80 ng/ml)

Perform/provide:

- Assistance with ambulation during early part of treatment; dizziness occurs, especially among geriatric patients

Evaluate:

- Therapeutic response: decreased seizure activity

Teach patient/family:

- To carry emergency ID bracelet stating name, products taken, condition;

prescriber's name, phone number • To avoid driving, other activities that require alertness

- To avoid alcohol, other CNS depressants; increased sedation may occur
- Not to discontinue medication quickly after long-term use; to taper off over several wk
- To notify prescriber of yellowing of skin/eyes, clay-colored stools, bleeding, fever, extreme fatigue, sore throat, suicidal thoughts/behaviors • To notify prescriber immediately if suicidal thoughts, behaviors occur

TREATMENT OF OVERDOSE:

Lavage, activated charcoal, flumazenil, monitor electrolytes, VS, administer vasopressors

🌿 Canada only Side effects: *italics* = common; **bold** = life-threatening ⚠️
Nurse Alert

cloNIDine (Rx)

(klon'i-deen)

Catapres, Catapres-TTS, Duraclon, Kapvay, Nexiclon

Func. class.: Antihypertensive

Chem. class.: Central α -adrenergic agonist

Do not confuse: cloNIDine/KlonoPIN/clonazepam

Catapres/Cataflam/Catarase

ACTION:

Inhibits sympathetic vasomotor center in CNS, which reduces impulses in sympathetic nervous system; blood pressure, pulse rate, cardiac output decrease, prevents pain signal transmission in CNS by α -adrenergic receptor stimulation of the spinal cord

USES:

Mild to moderate hypertension, used alone or in combination; severe pain in cancer patients (epidural)

Unlabeled uses: Opioid withdrawal, prevention of vascular headaches, treatment of menopausal symptoms, dysmenorrhea, attention-deficit/hyperactivity disorder (ADHD), autism, cycloSPORINE nephrotoxicity prophylaxis, diabetic neuropathy, ethanol withdrawal, Tourette's syndrome, hypertensive emergency

CONTRAINDICATIONS:

Hypersensitivity; (epidural) bleeding disorders, anticoagulants

Precautions: Pregnancy (C), breastfeeding, children <12 yr (transdermal), geriatric patients, noncompliant patients, MI (recent), diabetes mellitus, chronic renal failure, Raynaud's disease, thyroid disease, depression, COPD, asthma, pheochromocytoma

Black Box Warning:

Labor

DOSAGE AND ROUTES

Calculator

Hypertension

- **Adult: PO/TRANSDERMAL** 0.1 mg bid then increase by 0.1-0.2 mg/day at weekly intervals until desired response; range 0.2-0.6 mg/day in divided doses
- **Geriatric: PO** 0.1 mg at bedtime, may increase gradually
- **Child: PO** 5-10 mcg/kg/day in divided doses q8-12hr, max 0.9 mg/day

Severe pain

- **Adult: CONT EPIDURAL INF** 30 mcg/hr
- **Child: CONT EPIDURAL INF** 0.5 mcg/kg/hr then titrate to response

Opioid withdrawal (unlabeled)

- **Adult: PO** 0.3-1.2 mg/day; may decrease by 50% × 3 days then decrease by 0.1-0.2 mg/day or discontinue

ADHD

- **Adolescent/child ≥6 yr: PO** 0.05 mg/kg/day in 3-4 divided doses × 8 wk, max 0.4 mg/day (unlabeled); ext rel 0.1 mg at bedtime, increase dose by 0.1 mg/day up to 0.4 mg/day

Menopausal symptoms (unlabeled)

- **Adult: TRANSDERMAL** 0.1-mg patch q1wk; **PO** 0.05-0.4 mg/day

Tourette's syndrome (unlabeled)

- **Adult: PO** 0.15-0.2 mg/day

Hypertensive emergency (unlabeled)

- **Adult: PO** 0.1-0.2 mg q1hr to a total of 0.6 mg

Available forms: Tabs 0.025 , 0.1, 0.2, 0.3 mg; transdermal 2.5, 5, 7.5 mg delivering 0.1, 0.2, 0.3 mg/24 hr, respectively; inj 100, 500 mcg/ml; ext rel tab 0.1 mg (Kapvay), 0.17 mg (Nexiclon)

Administer:

- Store patches in cool environment, tablets in tight container

PO route

- Give last dose at bedtime
- Do not crush, cut, chew, or break ext rel tabs

Transdermal route

- Once weekly; apply to site without hair; best absorption over chest or upper arm; rotate sites with each application; clean site before application; apply firmly, especially around edges

Epidural route

- Used for severe cancer pain
- May be used with opiates

- Use only if familiar with epidural inf devices

SIDE EFFECTS

CNS: *Drowsiness, sedation, headache, fatigue, nightmares, insomnia, mental changes, anxiety, depression, hallucinations, delirium*

CV: *Orthostatic hypotension, palpitations, CHF, ECG abnormalities, sinus tachycardia*

EENT: Taste change, parotid pain

ENDO: Hyperglycemia

GI: *Nausea, vomiting, malaise, constipation, dry mouth*

GU: Impotence, dysuria, nocturia, gynecomastia

INTEG: *Rash, alopecia, facial pallor, pruritus, hives, edema, burning papules, excoriation (transdermal patches)*

MISC: Withdrawal symptoms

MS: Muscle, joint pain; leg cramps

PHARMACOKINETICS

Absorbed well

PO: Onset 1/2 to 1 hr, peak 2-4 hr, duration 8-12 hr, half-life 6-12 hr

TRANSDERMAL: Onset 3 days; duration 1 wk; metabolized by liver (metabolites); excreted in urine (30% unchanged, inactive metabolites), feces; crosses blood-brain barrier; excreted in breast milk

INTERACTIONS

- AV block: verapamil

⚠ Life-threatening elevations of B/P: tricyclics, β -blockers

Increase: CNS depression—opiates, sedatives, hypnotics, anesthetics, alcohol

Increase: hypotensive effects—diuretics, other antihypertensive nitrates

Decrease: hypotensive effects—tricyclics, MAOIs, appetite suppressants, amphetamines, prazosin, antipsychotics

Decrease: effect of levodopa

Drug/Herb

Increase: antihypertensive effect—hawthorn

Decrease: antihypertensive effect—ephedra, ginseng

Drug/Lab Test

Increase: blood glucose

Decrease: VMA, urinary catecholamines, aldosterone

NURSING CONSIDERATIONS

Assess:

- **Hypertension:** B/P, pulse; report significant changes
- **Opiate withdrawal (unlabeled):** fever, diarrhea, nausea, vomiting, cramps, insomnia, shivering, dilated pupils
- **Cancer pain:** location, intensity, character; alleviating, aggravating factors at baseline and frequently
- **Edema** in feet, legs daily; monitor I&O; check for falling output
- **Allergic reaction:** rash, fever, pruritus, urticaria; product should be discontinued if antihistamines fail to help
- **CHF:** edema, dyspnea, wet crackles, B/P, more common in geriatric patients
- Renal symptoms: polyuria, oliguria, frequency

Evaluate:

- Therapeutic response: decrease in B/P with hypertension, decrease in withdrawal symptoms (opioid), decrease in pain

Teach patient/family:

- To avoid hazardous activities, since product may cause drowsiness
- To notify all health care providers of medication use
- **Not to discontinue product abruptly or withdrawal symptoms may occur:** anxiety, increased B/P, headache, insomnia, increased pulse, tremors, nausea, sweating; to comply with dosage schedule even if feeling better
- **Not to use OTC (cough, cold, or allergy) products unless directed by prescriber**
- To rise slowly to sitting or standing position to minimize orthostatic hypotension, especially among geriatric patients
- **To notify prescriber of mouth sores, sore throat, fever, swelling of hands or feet, irregular heartbeat, chest pain, signs of angioedema**
- About excessive perspiration, dehydration, vomiting; diarrhea may lead to fall in B/P; consult prescriber if these occur; that product may cause dizziness, fainting; that lightheadedness may occur during first few days of therapy
- That product may cause dry mouth; to use hard candy, saliva product, sugarless gum, or frequent rinsing of mouth
- That compliance is necessary; not to skip or stop product unless directed by prescriber; tolerance may develop with long-term use
- **Transdermal:** How to use patch; that patch comes in two parts: product patch

and overlay to keep patch in place; not to trim or cut patch; that response may take 2-3 days if product is given transdermally; on administration of patch, if switching from tabs to patch, to taper tabs to avoid withdrawal

TREATMENT OF OVERDOSE:

Supportive treatment; administer tolazoline, atropine, DOPamine prn

☼ Canada only Side effects: *italics* = common; **bold** = life-threatening ⚠
Nurse Alert

clopidogrel (Rx)

(klo-pid'oh-grel)

Plavix

Func. class.: Platelet aggregation inhibitor

Chem. class.: Thienopyridine derivative

Do not confuse: **Plavix**/Paxil/Elavil

ACTION:

Inhibits ADP-induced platelet aggregation

USES:

Reducing the risk of stroke, MI, vascular death, peripheral arterial disease in high-risk patients, acute coronary syndrome, transient ischemic attack (TIA), unstable angina

Unlabeled uses: Cardiac surgery (infant and child), Kawasaki disease

CONTRAINDICATIONS:

Hypersensitivity, active bleeding

Precautions: Pregnancy (B), breastfeeding, children, previous hepatic disease, increased bleeding risk, neutropenia, agranulocytosis, renal disease,

Asian/Black/Caucasian patients

Black Box Warning:

CYP2C19 allele (poor metabolizers)

DOSAGE AND ROUTES

Calculator

Recent MI, stroke, peripheral arterial disease

- **Adult: PO** 75 mg/day with/without aspirin

Acute coronary syndrome

- **Adult: PO** loading dose 300 mg then 75 mg/day with aspirin

Cardiac surgery/other cardiac conditions (unlabeled)

- **Child ≤ 2 yr, infant, neonate: PO** 0.2 mg/kg/day for platelet inhibition

Available forms: Tabs 75, 300 mg

Administer:

- Without regard to food

- Should be discontinued 5 days before elective surgery if an antiplatelet action is not desired

SIDE EFFECTS

CNS: Headache, dizziness, depression, syncope, hypesthesia, neuralgia

CV: Edema, hypertension, chest pain

GI: Nausea, vomiting, diarrhea, constipation, GI discomfort, **GI bleeding, pancreatitis, hepatic failure**

GU: **Glomerulonephritis**

HEMA: Epistaxis, purpura, **bleeding, neutropenia, aplastic anemia, agranulocytosis, thrombotic thrombocytopenic purpura**

INTEG: Rash, pruritus, **anaphylaxis**

MISC: UTI, hypercholesterolemia, chest pain, fatigue, **intracranial hemorrhage, toxic epidermal necrolysis, Stevens-Johnson syndrome, flulike syndrome**

MS: Arthralgia, back pain

RESP: Upper respiratory tract infection, dyspnea, rhinitis, bronchitis, cough, **bronchospasm**

PHARMACOKINETICS

Rapidly absorbed; peak 1-3 hr; metabolized by liver (CYP3A4); excreted in urine, feces; half-life 8 hr; plasma protein binding 95%; effect on platelets after 3-7 days

INTERACTIONS

Black Box Warning:

Avoid use with CYP2C19 inhibitors (omeprazole, esomeprazole)

Increase: bleeding risk—anticoagulants, aspirin, NSAIDs, abciximab, eptifibatide, tirofiban, thrombolytics, ticlopidine, SSRIs, treprostinil, rifampin

Increase: action of some NSAIDs, phenytoin, TOLBUTamide, tamoxifen, tosemide, fluvastatin, warfarin

Decrease: clopidogrel effect—proton pump inhibitor (PPIs)

Decrease: CYP3A4 inhibitors/substrates —atorvastatin, simvastatin, cerivastatin

Drug/Herb

Increase: clopidogrel effect—feverfew, fish oil, omega-3 fatty acid, garlic, ginger, ginkgo biloba, green tea, horse chestnut

Decrease: clopidogrel effect—bilberry, saw palmetto

Drug/Lab Test

Increase: AST, ALT, bilirubin, uric acid, total cholesterol, nonprotein nitrogen (NPN)

NURSING CONSIDERATIONS

Assess:

 **Thrombotic/thrombocytic purpura, fever, thrombocytopenia, neurolytic anemia**

Black Box Warning:

CYP2C19 Allele (poor metabolizers): Consider using another antiplatelet product, higher CV reaction occurs after acute coronary syndrome or PCI, tests are available to determine CYP2C19 allele

- Symptoms of stroke, MI during treatment
- Hepatic studies: AST, ALT, bilirubin, creatinine (long-term therapy)
- Blood studies: CBC, differential, Hct, Hgb, PT, cholesterol (long-term therapy)

Evaluate:

- Therapeutic response: absence of stroke, MI

Teach patient/family:

- That blood work will be necessary during treatment
- **To report any unusual bruising, bleeding to prescriber; that it may take longer to stop bleeding • To take without regard to food**
- **To report diarrhea, skin rashes, subcutaneous bleeding, chills, fever, sore throat**
- To tell all health care providers that clopidogrel is being used; may be held for 5 days before surgery

☼ Canada only Side effects: *italics* = common; **bold** = life-threatening 
Nurse Alert

clotrimazole (topical, vaginal, oral)

(kloe-trim'a-zole)

Cruex, Gyne-Lotrimin, Lotrimin, Lotrimin AF, MyCelex, MyCelex-7, Trivagizole 3, Desenex

Func. class.: Topical antifungal

Chem. class.: Imidazole derivative

Do not confuse: clotrimazole/miconazole/clobetasol

ACTION:

Antifungal activity results from altering cell wall permeability

USES:

Vulvovaginal, oropharyngeal candidiasis; topical fungal infections

CONTRAINDICATIONS:

Hypersensitivity, ophthalmic use

Precautions: Hepatic impairment (oral)

DOSAGE AND ROUTES

Calculator

Tinea corporis, cruris, pedis, versicolor; candidiasis

- **Adult/child ≥ 2 yr:** Apply to affected area and rub into area AM/PM $\times$ 2-4 wk

Vulvovaginal candidiasis

- **Adult/child ≥ 12 yr: Vag cream** 1 applicator at bedtime $\times$ 3 days (2%) or 7 days (1%)

Oropharyngeal candidiasis

- **Adult/child ≥ 3 yr: Lozenge** 1 PO dissolved 5 $\times$ /day $\times$ 2 wk or adults 1 lozenge dissolved tid (prevention)

Available forms: Topical cream, solution, 1%; vaginal cream 1%, 2%;

Lozenges, troches 10 mg

Administer:

Topical route

- Topical skin products are not for intravaginal therapy and are for external use only; do not use skin products near the eyes, nose, or mouth • Wash hands before and after use; wash affected area and gently pat dry

• **Cream/solution:** Apply to the cleansed affected area; massage gently into affected areas • **Troches:** Allow to dissolve, do not chew or swallow whole

Intravaginal route

• Only use dosage formulations specified for intravaginal use; intravaginal dosage forms are not for topical therapy; do not ingest • **Cream:** Use applicator(s) supplied by the manufacturer

SIDE EFFECTS

GI: Nausea, vomiting

GU: Vaginal burning, irritation

INTEG: Burning, peeling, rash, pruritus

PHARMACOKINETICS

PO duration 3 hr

INTERACTIONS

Drug/Lab Test

Increase: LFTs

NURSING CONSIDERATIONS

Assess:

• **Allergic reaction:** Assess for hypersensitivity, product might need to be discontinued • **Infection:** Assess for severity of infection, itching

Evaluate:

• Decreased infection, itching

Teach patient/family:

Topical route:

• That topical skin products are not for intravaginal therapy and are for external use only; do not use skin products near the eyes, nose, or mouth • To wash hands before and after use; wash affected area and gently pat dry

• **Cream:** To shake well before use, apply a thin film to the cleansed affected area, massage gently into affected areas

PO route:

• **Troches:** Allow to dissolve, do not chew or swallow whole

Intravaginal route: To use only dosage formulations specified for intravaginal

use; intravaginal dosage forms are not for topical therapy; do not ingest

- **Cream:** To use applicator(s) supplied by the manufacturer

🍁 Canada only Side effects: *italics* = common; **bold** = life-threatening ⚠️

Nurse Alert

cloZAPine (Rx)

(kloz'a-peen)

Clozaril, FazaClo

Func. class.: Antipsychotic

Chem. class.: Tricyclic dibenzodiazepine derivative

Do not confuse: **Clozaril**/Clinoril/Colazal

ACTION:

Interferes with dopamine receptor binding with lack of EPS; also acts as an adrenergic, cholinergic, histaminergic, serotonergic antagonist

USES:

Management of psychotic symptoms for schizophrenic patients for whom other antipsychotics have failed; recurrent suicidal behavior

Unlabeled uses: Agitation, bipolar disorder, psychosis in dementia, psychosis in Parkinson's disease

CONTRAINDICATIONS:

Hypersensitivity, severe granulocytopenia (WBC <3500 before therapy), coma

Black Box Warning:

Myeloproliferative disorders, severe CNS depression, agranulocytosis, leukopenia, neutropenia, seizure disorder

Precautions: Pregnancy (B), breastfeeding, children <16 yr, geriatric patients; CV, pulmonary, cardiac, renal, hepatic disease; seizures, prostatic enlargement, closed-angle glaucoma, stroke

Black Box Warning:

Bone marrow suppression, hypotension, myocarditis, orthostatic hypotension, seizures, geriatric patients with dementia-related psychosis

DOSAGE AND ROUTES

Calculator

Schizophrenia

- **Adult: PO** 12.5 mg daily or bid; may increase by 25-50 mg/day; normal range 300-450 mg/day after 2 wk; do not increase dose more than 2×/wk; max 900 mg/day; use lowest dose to control symptoms

Dementia with multiple behavioral disturbances (unlabeled)

• **Geriatric:** PO 12.5 mg daily at bedtime, may increase by 12.5 mg every other day, max 50 mg/day

Available forms: Tabs 25, 50, 100, 200 mg; orally disintegrating tabs 25, 100 mg (Fazaclo: 12.5, 25, 100, 150, 200 mg)

Administer:

- May be taken with or without food
- Patient-specific registration required before administration; if WBC <3500 cells/mm³ or ANC <2000 cells/mm³, therapy should not be started
- Check to confirm PO medication swallowed; monitor for hoarding or giving of medication to other patients, if hospitalized; avoid giving patient >7 days' worth of medication if outpatient
- **Orally disintegrating tab:** do not push through foil; leave in foil blister until ready to take, peel back foil, place tab in mouth; allow to dissolve, swallow; water is not needed

SIDE EFFECTS

CNS: *Neuroleptic malignant syndrome, sedation, salivation, dizziness, headache, tremors, sleep problems, akinesia, fever, seizures, sweating, akathisia, confusion, fatigue, insomnia, depression, slurred speech, anxiety, agitation, dystonia, obsessive-compulsive symptoms*

CV: *Tachycardia, hypo/hypertension, chest pain, ECG changes, orthostatic hypotension*

EENT: *Blurred vision*

GI: *Drooling or excessive salivation, constipation, nausea, abdominal discomfort, vomiting, diarrhea, anorexia, weight gain, dry mouth, heartburn, dyspepsia, gastroesophageal reflux*

GU: *Urinary abnormalities, incontinence, ejaculation dysfunction; frequency, urgency, retention, dysuria*

HEMA: *Leukopenia, agranulocytosis, eosinophilia*

MS: *Weakness; pain in back, neck, legs; spasm, rigidity*

OTHER: *Diaphoresis*

RESP: *Dyspnea, nasal congestion, lower respiratory tract infection*

SYST: *Death among geriatric patients with dementia, aggravation of diabetes mellitus*

PHARMACOKINETICS

Bioavailability 27%-47%; 97% protein bound; completely metabolized by liver enzymes involved in metabolism CYP1A2, 2D6, 3A4; excreted in urine (50%), feces (30%) (metabolites); half-life 8-12 hr

INTERACTIONS

Increase: CNS depression—CNS depressants, psychoactives, alcohol

Increase: cloZAPine level—caffeine, citalopram, FLUoxetine, sertraline, ritonavir, risperiDONE, CYP1A2 inhibitors (fluvoxamine), CYP3A4 inhibitors (ketoconazole, erythromycin)

Increase: plasma concentration—warfarin, digoxin, other highly protein-bound products

Increase: QT prolongation— β blockers, class IA/III antidysrhythmias, and other drugs that increase QT

Increase: hypotension, respiratory, cardiac arrest, collapse—benzodiazepines

Decrease: cloZAPine level—CYP1A2 inducers (carbamazepine, omeprazole, rifampin); PHENobarbital

Drug/Lab Test

Increase: LFTs, cardiac enzymes, cholesterol, blood glucose, bilirubin, PBI, cholinesterase, ^{131}I

False positive: pregnancy tests, PKU

False negative: urinary steroids, 17-OHCS

NURSING CONSIDERATIONS

Assess:

Black Box Warning

Myocarditis; if suspected, discontinue use; myocarditis usually occurs during 1st month of treatment

Black Box Warning:

Seizures; usually occur with higher doses >600 mg/day or dosage change >100 mg/day; do not use in uncontrolled seizure disorder, use cautiously in those with a predisposition to seizures

- I&O ratio; obtain baseline before treatment begins; palpate bladder if low urinary output occurs

Black Box Warning:

Bone marrow depression: bilirubin, CBC, LFTs monthly; discontinue treatment if WBC <3000/mm³ or ANC <1500/mm³; test weekly; may resume when normal; if WBC <2000/mm³ or ANC <1000/mm³, discontinue

- Urinalysis recommended before, during prolonged therapy
- Affect, orientation, LOC, reflexes, gait, coordination, sleep pattern disturbances

Black Box Warning:

Hypotension: B/P standing and lying; take pulse, respirations q4hr during initial treatment; establish baseline before starting treatment; report drops of 30 mm Hg

- Dizziness, faintness, palpitations, tachycardia on rising
- **EPS** including akathisia (inability to sit still, no pattern to movements), tardive dyskinesia (bizarre movements of the jaw, mouth, tongue, extremities), pseudoparkinsonism (rigidity, tremors, pill rolling, shuffling gait)  **Neuroleptic malignant syndrome:** tachycardia, seizures, fever, dyspnea, diaphoresis, increased/decreased B/P; notify prescriber immediately
- Constipation, urinary retention daily; if these occur, increase bulk, water in diet, especially for geriatric patients; stool softeners, laxatives may be needed
- If diabetic, check blood glucose levels

Perform/provide:

- Supervised ambulation until stabilized on medication; do not involve patient in strenuous exercise program because fainting is possible; patient should not stand still for long periods
- Storage in tight, light-resistant container

Evaluate:

- Therapeutic response: decrease in emotional excitement, hallucinations, delusions, paranoia, reorganization of patterns of thought, speech

Teach patient/family:

- About symptoms of agranulocytosis and need for blood tests weekly for 6 mo, then q2wk; to report flulike symptoms
- That orthostatic hypotension often occurs; to rise gradually from sitting or lying position; to avoid hot tubs, hot showers, tub baths; hypotension may occur
- To avoid abrupt withdrawal of this product because EPS may result; that product should be withdrawn over 1-2 wk
- To avoid OTC preparations (cough, hay fever, cold) unless approved by prescriber, since serious product interactions may occur; to avoid use with alcohol or CNS depressants, increased drowsiness may occur
- About compliance with product regimen
- About EPS and necessity for meticulous oral hygiene, since oral candidiasis may occur

Black Box Warning:

To report sore throat, malaise, fever, bleeding, mouth sores; if these occur, CBC should be drawn and product discontinued

- That heat stroke may occur in hot weather; to take extra precautions to stay cool
- To avoid driving, other hazardous activities; seizures may occur
- To notify prescriber if pregnant or if pregnancy is intended; not to breastfeed

TREATMENT OF OVERDOSE:

Lavage, activated charcoal; provide an airway; do not induce vomiting

☼ Canada only Side effects: *italics* = common; **bold** = life-threatening ⚠
Nurse Alert

codeine (Rx)

(koe'deen)

Func. class.: Opiate analgesic, antitussive

Chem. class.: Opiate, phenanthrene derivative

Controlled Substance Schedule II, III, IV, V (depends on content)

Do not confuse: **codeine**/Lodine/iodine/Cardene

ACTION:

Depresses pain impulse transmission at the spinal cord level by interacting with opioid receptors; decreases cough reflex, GI motility

USES:

Moderate to severe pain

Unlabeled uses: Diarrhea, arthralgia, bone/dental pain, headache, migraine, myalgia, nonproductive cough

CONTRAINDICATIONS:

Breastfeeding, hypersensitivity to opiates, respiratory depression, increased intracranial pressure, seizure disorders, severe respiratory disorders

Precautions: Pregnancy (C), geriatric patients, cardiac dysrhythmias, prostatic hypertrophy, bowel impaction

DOSAGE AND ROUTES

Calculator

Pain

- **Adult: PO** 15-60 mg q4hr prn
- **Child 6-17 yr: PO** 3 mg/kg/day in divided doses q4hr prn

Cough

- **Adult: PO** 10-20 mg q4-6hr, max 120 mg/day

Renal disease

- **Adult: PO** CCr 10-50 ml/min, 75% of dose; CCr <10 ml/min, 50% of dose

Diarrhea (unlabeled)

- **Adult: PO** 30 mg; may repeat qid prn

Arthralgia/bone pain/back pain/dental pain/headache/migraine/myalgia (unlabeled)

- **Adult: PO** 15-60 mg q4-6hr

- **Child ≥ 3 yr: PO** 0.5-1 mg/kg or 15 mg/m² (max 60 mg/dose) q4-6hr

Available forms: Tabs 15, 30, 60 mg; inj 15, 30 mg/ml; oral sol 30 mg/5 ml, 30 mg/5 ml sol

Administer:

Discontinue gradually after long-term us

SIDE EFFECTS

CNS: *Drowsiness, sedation, dizziness, agitation, dependency, lethargy, restlessness, euphoria, seizures, hallucinations, headache, confusion*

CV: Bradycardia, palpitations, orthostatic hypotension, tachycardia, **circulatory collapse**

GI: *Nausea, vomiting, anorexia, constipation, dry mouth*

GU: Urinary retention

INTEG: Flushing, rash, urticaria, pruritus

RESP: **Respiratory depression, respiratory paralysis, dyspnea**

SYST: **Anaphylaxis**

PHARMACOKINETICS

Bioavailability 60%-90%; peak 1/2-1 hr; duration 4-6 hr; metabolized by liver (CYP3A4 to morphine); excreted by kidneys, in breast milk; crosses placenta; half-life 3 hr; protein binding 7%; altered codeine metabolism occurs in different ethnic groups

PO: Onset 30-60 min

INTERACTIONS

Increase: CNS depression—CYP2D6, alcohol, opiates, sedative/hypnotics, antipsychotics, skeletal muscle relaxants

⚠ Increase: toxicity—MAOIs; use cautiously

Drug/Lab Test

Increase: lipase, amylase

NURSING CONSIDERATIONS

Assess:

- **Pain:** intensity, type, location, aggravating, alleviating factors; need for pain medication, tolerance; use pain scoring • I&O ratio; check for decreasing output; may indicate urinary retention, especially among geriatric patients • GI function: nausea, vomiting, constipation

- **Cough:** type, duration, ability to raise secretion for productive cough; do not use to suppress productive cough • CNS changes, dizziness, drowsiness, hallucinations, euphoria, LOC, pupil reaction

- Allergic reactions: rash, urticaria

⚠ Respiratory dysfunction: respiratory depression, character, rate, rhythm; notify prescriber if respirations are <10/min, shallow; obstructive sleep apnea (children) (tonsillectomy/adenoidectomy)

Perform/provide:

- Storage in light-resistant container at room temp

Evaluate:

- Therapeutic response: decrease in pain, absence of grimacing, decreased cough, decreased diarrhea

Teach patient/family:

- Not to breastfeed
- To report any symptoms of CNS changes, allergic reactions
- That physical dependency may result after extended periods
- To decrease dry mouth use sugarless gum, rinse mouth often
- To change position slowly; orthostatic hypotension may occur
- To avoid hazardous activities if drowsiness, dizziness occurs
- To avoid alcohol, other CNS depressants unless directed by prescriber

TREATMENT OF OVERDOSE:

Naloxone 0.4-mg ampule diluted in 10 ml 0.9% NaCl and given by direct IV push, 0.02 mg q2min (adult)

☼ Canada only Side effects: *italics* = common; **bold** = life-threatening ⚠
Nurse Alert

colchicine (Rx)

(kol'chih-seen)

Colcrys

Func. class.: Antigout agent

Chem. class.: *Colchicum autumnale* alkaloid

ACTION:

Inhibits microtubule formation of lactic acid in leukocytes, which decreases phagocytosis and inflammation in joints

USES:

Gout, gouty arthritis (prevention, treatment); to arrest the progression of neurologic disability in those with MS, Mediterranean fever

Unlabeled uses: Hepatic cirrhosis, pericarditis, amyloidosis, Behçet's syndrome, biliary cirrhosis, dermatitis herpetiformis, idiopathic thrombocytopenic purpura, Paget's disease, pseudogout, pulmonary fibrosis

CONTRAINDICATIONS:

Pregnancy (D) (injectable), serious GI, severe cardiac/renal/hepatic disorders, hypersensitivity

Precautions: Pregnancy (C) (PO), breastfeeding, children, geriatric patients, blood dyscrasias, hepatic disease

DOSAGE AND ROUTES

Calculator

Gout prevention

- **Adult: PO** 0.6-1.2 mg/day, depending on severity

Gout treatment

- **Adult: PO** 1.2 mg initially, then 0.6 mg 1 hr later (1.8 mg); for those on strong CYP3A4 inhibitor (during past 14 days), 0.6 mg initially, then 0.3 mg 1 hr later

Renal dose

- **Adult: PO** CCr <30 ml/min, for acute gout, do not repeat course for 2 wk; for familial Mediterranean fever, 0.3 mg daily, increase cautiously

Mediterranean fever (unlabeled)

- **Adult on no interacting products: PO** 1.2-2.4 mg/day in 1-2 divided doses;

strong CYP3A4 inhibitor; P-glycoprotein inhibitors within 14 day: max 0.6 mg/day in 1-2 divided doses; moderate CYP3A4 inhibitors with 14 day: max 1.2 mg/day in 1-2 divided doses

- **Adolescent: PO** 1.2-2.4 mg/day in 1-2 divided doses, titrate by 0.3 mg/day
- **Child > 6-12 yr: PO** 0.9-1.8 mg/day in 1-2 divided doses
- **Child 4-6 yr: PO** 0.3-1.8 mg/day in 1-2 divided doses

Amyloidosis/biliary cirrhosis/dermatitis herpetiformis/Paget's disease/Behçet's syndrome/chronic idiopathic thrombocytopenic purpura/pulmonary fibrosis (unlabeled)

- **Adult: PO** 0.5-0.6 mg bid-tid

Available forms: Tabs 0.5, 0.6, 1  mg

Administer:

PO route

- Without regard to food
- **Cumulative doses ≤ 4 mg, renal patients ≤ 2 mg; when reached, administer only for 3 wk**

SIDE EFFECTS

GI: Nausea, vomiting, anorexia, malaise, metallic taste, cramps, peptic ulcer, diarrhea

GU: Hematuria, **oliguria, renal damage**

HEMA: **Agranulocytosis, thrombocytopenia, aplastic anemia, pancytopenia**

INTEG: Chills, dermatitis, pruritus, purpura, erythema

MISC: Myopathy, alopecia, reversible azoospermia, peripheral neuritis

PHARMACOKINETICS

PO: Peak 1/2-2 hr, half-life 4.4 hr, deacetylates in liver, excreted in feces (metabolites/active product)

INTERACTIONS

Increase: colchicine level/toxicity—moderate/strong CYP3A4 inhibitors, reduce dose

Increase: GI effects—NSAIDs, ethanol

Increase: bone marrow depression—radiation, bone marrow depressants, cycloSPORINE

Decrease: action of vit B₁₂; may cause reversible malabsorption

Drug/Food

Increase: colchicine level—grapefruit juice

Drug/Lab Test

Increase: alk phos, AST

Decrease: platelets, WBC, granulocytes

False positive: urine Hgb

Interference: urinary 17-hydroxycorticosteroids

NURSING CONSIDERATIONS

Assess:

- Relief of pain, uric acid levels returning to normal
- I&O ratio; observe for decrease in urinary output

 **CBC, platelets, reticulocytes before, during therapy (q3mo); may cause aplastic anemia, agranulocytosis, decreased platelets • Toxicity:** weakness, abdominal pain, nausea, vomiting, diarrhea; product should be discontinued, report symptoms immediately

Evaluate:

- Therapeutic response: decreased stone formation, decreased pain in kidney region, absence of hematuria, decreased pain in joints

Teach patient/family:

- To avoid alcohol, OTC preparations that contain alcohol
- To report any pain, redness, hard areas, usually in legs; rash, sore throat, fever, bleeding, bruising, weakness, numbness, tingling, nausea, vomiting, abdominal pain • About the importance of complying with medical regimen (diet, weight loss, product therapy); about the possibility of bone marrow depression occurring • Advise all providers of product use; surgery may increase possibility of acute gout symptoms

TREATMENT OF OVERDOSE:

D/C medication; may need opioids to treat diarrhea

☛ Canada only Side effects: *italics* = common; **bold** = life-threatening 

Nurse Alert

colesevelam (Rx)

(koe-leh-seve'eh-lam)

WelChol

Func. class.: Antilipemic

Chem. class.: Bile acid sequestrant

ACTION:

Adsorbs, combines with bile acids to form insoluble complex excreted through feces; loss of bile acids lowers cholesterol levels

USES:

Elevated LDL cholesterol, alone or in combination with HMG-CoA reductase inhibitor; type 2 diabetes (adjunct)

CONTRAINDICATIONS:

Hypersensitivity, biliary obstruction, dysphagia, bowel disease, primary biliary cirrhosis, triglycerides >300 mg/dl, fat-soluble vitamin deficiency, bowel obstruction pancreatitis

Precautions: Pregnancy (B), breastfeeding, children

DOSAGE AND ROUTES

Calculator

Monotherapy

- **Adult: PO** 3 625-mg tabs bid with meals or 6 tabs daily with meal; may increase to 7 tabs if needed

Combination therapy

- **Adult: PO** 3 tabs bid with meals or 6 tabs daily with meal given with an HMG-CoA reductase inhibitor

Type 2 diabetes, adjunct (to improve glycemic control)

- **Adult and geriatric: PO** Approx 3.8 g (6 tabs)/day or approx 1.9 g (3 tabs) bid

Heterozygous familial hypercholesterolemia

- **Females (postmenarchal and >10 yr) and males ≥10 yr: PO** 1.875-g packet bid or 3.75-g packet daily dissolved in 4-8 oz of water with meal

Available forms: Tabs 625 mg; powder for oral susp 3.75 g/packet

Administer:

- Swallow tabs whole; do not break, crush, or chew
- Drug daily or bid with meals; give all other medications 1 hr before or 4 hr after colesevelam; with liquid to avoid poor absorption

SIDE EFFECTS

CNS: Headache, dizziness, drowsiness, vertigo, tinnitus

GI: *Constipation, abdominal pain, nausea*, fecal impaction, hemorrhoids, flatulence, vomiting, GI obstruction

INTEG: Rash, irritation of perianal area, tongue, skin

MISC: Hypertriglycerides, hypoglycemia

MS: Muscle, joint pain

PHARMACOKINETICS

Excreted in feces, peak response 2 wk

INTERACTIONS

Decrease: absorption of diltiazem, gemfibrozil, mycophenolate, phenytoin, propranolol, warfarin, thiazides, digoxin, penicillin G, tetracyclines, corticosteroids, iron, thyroid, fat-soluble vitamins, glyburide

Decrease: action of—oral contraceptives

Drug/Lab Test

Increase: LFTs

NURSING CONSIDERATIONS**Assess:**

- Cardiac glycoside level, if both products administered
- Fasting LDL, HDL, total cholesterol, triglyceride levels, electrolytes if on extended therapy
- Bowel pattern daily; increase bulk, water in diet for constipation

Evaluate:

- Therapeutic response: decreased total cholesterol level, LDL cholesterol, apolipoproteins

Teach patient/family:

- About the importance of compliance; toxicity may result if doses missed

- That risk factors should be decreased: high-fat diet, smoking, alcohol consumption, absence of exercise
-

🍁 Canada only Side effects: *italics* = common; **bold** = life-threatening ⚠️
Nurse Alert

conivaptan (Rx)

(kon-ih-vap'tan)

Vaprisol

Func. class.: Vasopressin receptor antagonist

ACTION:

Dual arginine vasopressin (AVP) antagonist with affinity for V_{1A} , V_2 receptors; level of AVP in circulating blood is critical for regulation of water, electrolyte balance and is usually elevated in euvolemic/hypervolemic hyponatremia

USES:

Euvolemia hyponatremia in hospitalized patients; not indicated for CHF, hypervolemic hyponatremia

CONTRAINDICATIONS:

Hypersensitivity, hypovolemia

Precautions: Pregnancy (C), breastfeeding, orthostatic disease, renal disease, heart failure, rapid correction of serum sodium

DOSAGE AND ROUTES

Calculator

- **Adult: IV INF** loading dose 20 mg given over 30 min then **CONT IV** over 24 hr; after 1 day, give for an additional 1-3 days as a **CONT INF** of 20 mg/day total; can be titrated up to 40 mg/day if serum sodium is not rising at desired rate; max time 4 days

Hepatic/renal dose

- **Adult: IV Child-Pugh A-C or CCr 30-60 ml/min:** give IV loading dose over 10 min then **CONT IV INF** 10 mg over 24 hr $\times$ 2-4 days

Available forms: 5 mg/ml (20 mg/4 ml) in single-use ampule; 20 mg/100 ml in D_5 for inj

Administer:

IV route

- Withdraw 4 ml (20 mg), add to 100 ml D_5W , gently invert several times to mix, give over 30 min; in large vein, change site every 24 hr to minimize

vascular irritation

Continuous IV INF route

- Withdraw 4 ml (20 mg), add to 250 ml D₅W, gently invert several times to mix, give over 24 hr; or give 40 mg in 250 ml D₅W, gently invert several times to mix, give over 24 hr

SIDE EFFECTS

CNS: Headache, confusion, insomnia

CV: **Atrial fibrillation**, hypo/hypertension, *orthostatic hypotension*, phlebitis

GI: Nausea, vomiting, constipation, dry mouth

GU: Hematuria, polyuria, UTI, pollakiuria

HEMA: Anemia

INTEG: Erythema, inj site reaction

META: Dehydration, hypo/hyperglycemia, hypokalemia, hypomagnesia, hyponatremia

MISC: Oral candidiasis, pain, peripheral edema, pneumonia

PHARMACOKINETICS

Protein binding 99%, metabolized by CYP3A4, terminal half-life 5 hr

INTERACTIONS

Increase: effect of—CYP3A4 substrates (alfuzosin, ARIPiprazole, bexarolene, bortezomib, bosentan, bupivacaine, buprenorphine, carBAMazepine, cevimeline, cilostazol, cinacalcet, clopidogrel, colchicine, cyclobenzaprine, dapsone, darifenacin, disopyramide, DOCEtaxel, donepezil, DOXOrubicin, dutasteride, eletriptan, eplerenone, ergots, erlotinib, eszopiclone, ethinyl estradiol, ethosuximide, etoposide, fentaNYL, galantamine, gefitinib, halofantrine, ifosfamide, irinotecan, levobupivacaine, levomethadyl, lidocaine, loperimide, loratadine, mefloquine, methadone, modafinil, PACLitaxel, paricalcitol, pimozide, praziquantel, quiNIDine, quiNINE, ramelteon, reboxetine, repaglinide, rifabutin, sibutramine, sildenafil, sirolimus, SUFentanil, sunitinib, tacrolimus, tamoxifen, teniposide, testosterone, tiagabine, tinidazole, trimetrexate, vardenafil, vinca alkaloids, ziprasidone, zolpidem, zonisamide); do not use concurrently

NURSING CONSIDERATIONS

Assess:

- Renal, hepatic function
- Frequent sodium volume status; overly rapid correction of sodium concentration (>12 mEq/L per 24 hr) may result in osmotic demyelination syndrome
- Neurologic status: confusion, headache
- CV status: atrial fibrillation, hypo/hypertension, orthostatic hypotension; monitor B/P, pulse
- Monitor other electrolytes (magnesium and potassium)

Evaluate:

- Therapeutic response: correction of serum sodium levels

Teach patient/family:

- To report neurologic changes: headache, insomnia, confusion
- About administration procedure and expected results
- To report inj site pain, redness, swelling

ACTION:

Prevents ovulation by suppressing FSH and LH; *monophasic*: estrogen/progestin (fixed dose) used during a 21-day cycle; ovulation is inhibited by suppression of FSH and LH; thickness of cervical mucus and endometrial lining prevents pregnancy; *biphasic*: ovulation is inhibited by suppression of FSH and LH; alteration of cervical mucus, endometrial lining prevents pregnancy; *triphasic*: ovulation is inhibited by suppression of FSH and LH; change of cervical mucus,

endometrial lining prevents pregnancy; variable doses of estrogen/progestin combinations may be similar to natural hormonal fluctuations; *extended cycle*: estrogen/progestin continuous for 84 days, off for 7 days, results in 4 menstrual periods/yr; *progressive estrogen*: constant progestin with 3 progressive doses of estrogen; *progestin-only pill, implant, intrauterine*: change of cervical mucus and endometrial lining prevents pregnancy; ovulation may be suppressed

USES:

To prevent pregnancy, regulation of menstrual cycle, treatment of acne in women >14 yr for whom other treatment has failed, emergency contraception; *injection*: inhibits gonadotropin secretion, ovulation, follicular maturation; *emergency*: inhibits ovulation and fertilization, decreases transport of sperm and egg from fallopian tube to uterus; *vaginal ring, transdermal*: inhibits ovulation, prevents sperm entry into uterus; *antiacne*: may decrease sex hormone binding globulin, results in decreased testosterone

CONTRAINDICATIONS:

Pregnancy (X), breastfeeding, women ≥ 40 yr, reproductive cancer, thrombophlebitis, MI, hepatic tumors, hepatic disease, CAD, CVA, breast cancer, jaundice, stroke, vaginal bleeding

Precautions: Depression, hypertension, renal disease, seizure disorders, lupus erythematosus, rheumatic disease, migraine headache, amenorrhea, irregular menses, gallbladder disease, diabetes mellitus, heavy smoking, acute mononucleosis, sickle cell disease

Black Box Warning:

Tobacco smoking

DOSAGE AND ROUTES

Calculator

Monophasic

- **Adult: PO** Take first tab on Sunday after start of menses $\times$ 21 days; skip 7 days, then repeat cycle; start on 1st day of menses $\times$ 21 days; skip 7 days, then repeat cycle; may contain 7 placebo tabs when 1 tab is taken daily

Biphasic

- **Adult: PO** Take 10 days of small progestin, then large progestin; estrogen is

the same during cycle; skip 7 days, then repeat cycle; may contain 7 placebo tabs when 1 tab is taken daily

Triphasic

- **Adult: PO** Estrogen dose remains constant, progestin changes throughout 21-day cycle, some products contain 28 tabs per month

Extended cycle

- **Adult: PO** Start taking on 1st day of menses; continue for 84 days of active tab, then 7 days of placebo; repeat cycle

Progestin

- **Adult: PO** Start on 1st day of menses, then daily and continuously

Progressive estrogen

- **Adult: PO** Progestin dose remains constant, estrogen increases q7days throughout 21-day cycle, may include 7 placebo tabs for 28-day cycle

Emergency

- **Adult/adolescent:** Give within 72 hr of intercourse, repeat 12 hr later; **Plan B** 1 tab, then 1 tab 12 hr later; **Preven** 2 tab, then 2 tab 12 hr later; **Ovral (unlabeled)** 2 white tabs; **Lo/Ovral (unlabeled)** 4 white tabs; **Levlen (unlabeled)**, **Nordette (unlabeled)** 4 orange tabs; **Triphasil (unlabeled)**, **Tri-Levlen (unlabeled)** 4 yellow tabs

Injectable

- **Adult: IM (Depo-Provera)** 150 mg within 5 days of start of menses or within 5 days postpartum (must not be breastfeeding); if breastfeeding, give 6 wk postpartum, repeat q3mo

Intrauterine

- **Adult:** To be inserted using the levonorgestrel-releasing intrauterine system (LRIS) by those trained in procedure; inserted into uterine cavity within 7 days of the onset of menstruation; use should not exceed 5 yr per implant

Vaginal ring

- **Adult: VAG** Insert 1 ring on or prior to day 5 of cycle, leave in place 3 wk; remove for 1 wk, then repeat

Transdermal

- **Adult: TD** Apply patch within 7 days of menses, change weekly × 3 wk; no patch wk 4, repeat cycle

Implant

- **Adult: SUBDERMAL** In inner side of upper arm on days 1-5 of menses,

replace q3yr

Acne

- **Adult: PO (Ortho Tri-Cyclen)** Take daily × 21 days, off 7 days

Administer:

- PO with food for GI symptoms; give at same time each day
- Subdermal implant of 6 caps effective for 5 yr, then should be removed
- IM inj deep in large muscle mass after shaking suspension; ensure patient not pregnant if inj are 2 wk or more apart

SIDE EFFECTS

CNS: Depression, fatigue, dizziness, nervousness, anxiety, headache

CV: Increased B/P, **cerebral hemorrhage, thrombosis, pulmonary embolism**, fluid retention, edema, MI

EENT: Optic neuritis, retinal thrombosis, cataracts

ENDO: Decreased glucose tolerance, increased TBG, PBI, T₄, T₃, temporary infertility

GI: *Nausea*, vomiting, cramps, diarrhea, bloating, constipation, change in appetite, **cholestatic jaundice**, weight change

GU: Breakthrough bleeding, amenorrhea, spotting, dysmenorrhea, galactorrhea, endocervical hyperplasia, vaginitis, cystitis-like syndrome, breast changes

HEMA: Increased fibrinogen, clotting factor

INTEG: *Chloasma, melasma*, acne, rash, urticaria, erythema, pruritus, hirsutism, alopecia, photosensitivity

PHARMACOKINETICS

Excreted in breast milk

INTERACTIONS

Decrease: oral contraceptives effectiveness—anticonvulsants, rifampin, analgesics, antibiotics, antihistamines, griseofulvin

Decrease: oral anticoagulants action

Drug/Herb

- Altered action: black cohosh

Decrease: oral contraceptives effect—saw palmetto, St. John's wort

Drug/Food

Increase: peak level—grapefruit juice

Drug/Lab Test

Increase: PT; clotting factors VII, VIII, IX, X; TBG, PBI, T₄, platelet aggregability, BSP, triglycerides, bilirubin, AST, ALT

Decrease: T₃, antithrombin III, folate, metyrapone test, GTT, 17-OHCS

NURSING CONSIDERATIONS

Assess:

- Glucose, thyroid function, LFTs, BP
- Reproductive changes: changes in breasts, tumors; positive Pap smear; product should be discontinued

Evaluate:

- Therapeutic response: absence of pregnancy, endometriosis, hypermenorrhea

Teach patient/family:

- About detection of clots using Homan's sign
- To use sunscreen or avoid sunlight; photosensitivity can occur
- To take at same time each day to ensure equal product level
- To report GI symptoms that occur after 4 mo
- **To use another birth control method during 1st week of oral contraceptive use**
- To take another tablet as soon as possible if one is missed
- That, after product is discontinued, pregnancy may not occur for several months
- **To report abdominal pain, change in vision, shortness of breath, change in menstrual flow, spotting, breakthrough bleeding, breast lumps, swelling, headache, severe leg pain • That continuing medical care is needed: Pap smear and gynecologic examinations q6mo**
- To notify health care providers and dentists of oral contraceptive use

Black Box Warning:

Do not smoke, increased risk of CV side effects

☛ Canada only Side effects: *italics* = common; **bold** = life-threatening ⚠
Nurse Alert

HIGH ALERT

crizotinib

(kriz-oh'ti-nib)

XALKORI

Func. class.: Antineoplastic; biologic response modifiers

Chem. class.: Signal transduction inhibitors (STIs)

ACTION:

Inhibits receptor tyrosine kinases (anaplastic lymphoma kinase (ALK), Hepatocyte Growth Factor Receptor (HGFR, c-Met), Recepteur d'Origine Nantais (RON))

USES:

Locally advanced or metastatic non-small-cell lung cancer (NSCLC) that is anaplastic lymphoma kinase (ALK)-positive as detected by an FDA-approved test

CONTRAINDICATIONS:

Pregnancy (D), breastfeeding, hypersensitivity

Precautions: Neonates, infants, children, adolescents, pneumonitis, severe hepatic disease, congenital long QT syndrome, severe renal impairment, end-stage renal disease, vision disorders

DOSAGE AND ROUTES

Calculator

- **Adult:** PO 250 mg bid, continue as long beneficial

Dose adjustments for hematologic toxicities

- **For Grade 1-2:** no dosage adjustment needed; **Grade 3:** interrupt treatment until toxicity resolves to grade ≤ 2 , then continue with the same dosage schedule. In case of recurrence after a grade 4 event with dose reduction, interrupt treatment until toxicity resolves to grade ≤ 2 ; when resuming treatment, reduce dosage to 250 mg PO daily; **Grade 4:** interrupt treatment until toxicity resolves to grade ≤ 2 ; when resuming treatment, reduce dosage to 200 mg PO bid. In case of grade 4 recurrence, permanently discontinue treatment

Dose adjustments for hepatic laboratory abnormalities

• **For Grade 1:** No dosage adjustment necessary; **Grade 2 ALT/AST elevations with grade ≤ 1 total bilirubin elevations:** no dosage adjustment necessary; **Grade 3-4 ALT/AST elevations with grade ≤ 1 total bilirubin elevations:** interrupt treatment until toxicity resolves to grade ≤ 1 or baseline; when resuming treatment, reduce dosage to 200 mg PO bid; in case of recurrence, interrupt treatment until toxicity resolves to grade ≤ 1 , and when resuming treatment, reduce dosage to 250 mg PO daily; permanently discontinue treatment in case of further recurrence; **Grade 2-4 ALT/AST elevations with concurrent Grade 2-4 total bilirubin elevations (in the absence of cholestasis or hemolysis):** permanently discontinue treatment

Dose adjustments for pneumonitis not attributable to NSCLC progression, other pulmonary disease, infection, or radiation effect

• **For any grade pneumonitis:** permanently discontinue

Dose adjustment for QTc prolongation:

• **For Grade 1-2 QTc prolongation:** no dosage adjustment necessary; **For Grade 3 QTc prolongation:** interrupt treatment until toxicity resolves to grade ≤ 1 ; when resuming treatment, reduce dosage to 200 mg PO bid; in case of recurrence, interrupt treatment until toxicity resolves to grade ≤ 1 and when resuming treatment, reduce dosage to 250 mg PO daily; permanently discontinue in case of further recurrence; **For Grade 4 QTc prolongation:** permanently discontinue

Available forms: Cap 200, 250 mg

Administer:

- May be taken orally with or without food
- Have the patient swallow capsule whole; do not crush or chew
- If a dose is missed, it can be taken up to 6 hr before the next dose is due to maintain the twice daily regimen. Do not take both doses at the same time

SIDE EFFECTS

CNS: Dizziness, balance disorder, presyncope, neuropathy (motor and sensory), burning sensation, dysesthesia, hyperesthesia, hypoesthesia, neuralgia, paresthesias, peripheral neuropathy (motor and sensory), headache, insomnia

CV: QT prolongation, disseminated intravascular coagulation (DIC), septic shock, bradycardia

EENT: *Diplopia, photopsia*, photophobia, *blurred vision*, visual field defect, *vitreous floaters*, visual brightness, reduced *visual acuity*; esophageal disorders

GI: Nausea, diarrhea, vomiting, constipation, decreased appetite, dysgeusia,

abdominal pain, abdominal discomfort/pain, stomatitis, oral ulceration, glossodynia, glossitis, cheilitis, mucosal inflammation, oropharyngeal pain/discomfort, oral pain, esophageal disorder, elevated hepatic enzymes and hyperbilirubinemia, **hepatotoxicity**, dyspepsia, dysphagia, epigastric discomfort/pain, burning, esophagitis, esophageal obstruction/pain/spasm, esophageal ulceration, gastroesophageal reflux, odynophagia, and reflux esophagitis

HEMA: **Grade 3/4 neutropenia, thrombocytopenia, lymphopenia**

MISC: Fatigue, fever, *edema*, localized/peripheral edema, chest pain (unspecified), chest discomfort, musculoskeletal chest pain, arthralgia, back pain, *rash*

RESP: **Severe, life-threatening pneumonitis, pneumonia, hypoxia, acute respiratory distress syndrome (ARDS)**, dyspnea, empyema, pulmonary hemorrhage, **pulmonary embolism**, upper respiratory tract infection (nasopharyngitis, pharyngitis, rhinitis), cough

PHARMACOKINETICS

Protein binding 91%; distribution into the tissues and plasma; metabolized by the CYP3A4/5; primary metabolic pathways are oxidation to metabolites; terminal half-life 42 hr; excreted 63% feces, 22% urine; unchanged drug 53% feces, 2.3% urine; absolute bioavailability is 43%; peak is 4-6 hr; steady state is reached within 15 days; dosage adjustments may need to be made in hepatic/renal disease and Asian patients

INTERACTIONS

Increase: CYP3A4 inhibitors (ketoconazole, atazanavir, indinavir, itraconazole, nefazodone, nelfinavir, ritonavir, voriconazole, boceprevir, delavirdine, isoniazid, dalfopristin; quinupristin, tipranavir)

Decrease: CYP3A4 inducers (rifampin, carbamazepine, phenobarbital, phenytoin, rifabutin); antacids, H₂-blockers, proton pump inhibitors (PPIs)

Increase: action of—midazolam

Avoid use with CYP3A4 substrates (alfentanil, cycloSPORINE, ergotamine, dihydroergotamine fentanyl, sirolimus, colchicine)

Increase: QT prolongation, torsades de pointes—arsenic trioxide, certain phenothiazines (chlorpromazine, mesoridazine, thioridazine), grepafloxacin,

levomethadyl, pentamidine, probucol, sparfloxacin, troleandomycin, class IA antiarrhythmics (disopyramide, procainamide, quinidine), class III antiarrhythmics (amiodarone, dofetilide, ibutilide, sotalol), clarithromycin, ziprasidone, pimozide, haloperidol, halofantrine, quinidine, chloroquine, dronedarone, droperidol, erythromycin, methadone, posaconazole, propafenone, saquinavir, abarelix, amoxapine, apomorphine, asenapine, β -agonists, ofloxacin, eribulin, ezogabine, flecainide, gatifloxacin, gemifloxacin, halogenated anesthetics, iloperidone, levofloxacin, local anesthetics, magnesium sulfate, potassium sulfate, sodium, maprotiline, moxifloxacin, nilotinib, norfloxacin, ciprofloxacin, olanzapine, paliperidone, some phenothiazines (fluphenazine, perphenazine, prochlorperazine, trifluoperazine), telavancin, tetrabenazine, tricyclic antidepressants, venlafaxine, vorinostat, citalopram, alfuzosin, clozapine, cyclobenzaprine, dolasetron, palonosetron, quetiapine, rilpivirine, sunitinib, tacrolimus, tacrolimus, vardenafil, indacaterol, dasatinib, fluconazole, lapatinib, lopinavir/ritonavir, mefloquine, octreotide, ondansetron, ranolazine, risperidone, telithromycin, vemurafenib

Drug/Herb

Do not use with St. John's wort

Drug/Food

Do not use with grapefruit juice

NURSING CONSIDERATIONS

Assess:

- **Severe, life-threatening, or fatal treatment-related** pneumonitis: all cases occurred within 2 mo of treatment initiation; monitor for pulmonary symptoms that may indicate pneumonitis, other causes of pneumonitis should be excluded; permanently discontinue in patients with treatment-related pneumonitis
- **Hepatic disease:** liver function test (LFT) abnormalities, altered bilirubin levels may occur during treatment; monitor LFTs and bilirubin levels prior to treatment, then monthly; more frequent testing is needed in those presenting with grade 2 or greater toxicities; laboratory alterations should be managed with dose reduction, treatment interruption, or discontinuation
- **QT prolongation** has been reported with use of product; therefore, avoid crizotinib use in those patients; monitor ECG and electrolytes in patients with congestive heart failure, bradycardia, electrolyte imbalance (hypokalemia, hypomagnesemia), or in patients taking concomitant medications known to prolong the QT interval;

treatment interruption, dosage adjustment, treatment discontinuation may be needed in patients who develop QT prolongation • **Vision disorders**, generally start within 2 wk of the start of therapy; ophthalmological evaluation should be considered, particularly if patients experience photopsia or new or increased vitreous floaters; caution should be used when driving or operating machinery by patients who experience vision disorders • **Pregnancy/breastfeeding:** identify if pregnancy is planned or suspected (pregnancy category D), do not breastfeed • CBC with differential; BUN/creatinine

Perform/provide:

- Storage of capsules at room temperature

Evaluate:

- Decreasing spread of malignancy

Teach patient/family:

- That missed doses can be taken up to 6 hr before the next dose is due to maintain the twice daily regimen • To use reliable contraception; both women and men of childbearing age should use adequate contraceptive methods during therapy and for at least 90 days after completing treatment, pregnancy category D

- To report immediately shortness of breath, cough, fatigue, visual changes
- Not to take with grapefruit juice
- To avoid activities requiring mental alertness until effects are known
- To report signs of QT prolongation (abnormal heartbeats, dizziness, syncope)
- To swallow caps whole and avoid contact with broken cap

☼ Canada only Side effects: *italics* = common; **bold** = life-threatening ⚠

Nurse Alert

cromolyn (OTC, Rx)

(kroe'moe-lin)

Gastrocrom, Nasalcrom

Func. class.: Antiasthmatic

Chem. class.: Mast cell stabilizer

Do not confuse: **Nasalcrom**/Nasalide

ACTION:

Stabilizes the membrane of the sensitized mast cell, thus preventing the release of chemical mediators after an antigen-IgE interaction

USES:

Severe perennial bronchial asthma; prevention of exercise-induced bronchospasm; acute bronchospasm induced by environmental pollutants, mastocytosis, allergic rhinitis

Unlabeled uses: Food allergy, ulcerative colitis

CONTRAINDICATIONS:

Hypersensitivity to this product or lactose; status asthmaticus, acute asthma

Precautions: Pregnancy (B), breastfeeding, children <5 yr (aerosol); <2 yr (nebulizer); <2 yr (nasal sol); oral <2 yr; renal/hepatic disease, safety not established; cardiac dysrhythmias, CAD

DOSAGE AND ROUTES

Calculator

Allergic rhinitis

- **Adult and child >2 yr: NASAL SOL** 1 spray in each nostril tid-qid, max 6 doses/day

To prevent exercise-induced bronchospasm

- **Adult and child >5 yr: INH** 2 metered sprays inhaled ≤ 1 hr prior to exercise

Bronchial asthma

- **Adult and child >5 yr: INH** 2 metered sprays using inhaler qid; **NEB** 20 mg qid by nebulization

Systemic mastocytosis

- **Adult and child >12 yr: PO** 200 mg qid 1/2 hr before meals and at bedtime
- **Child 2-12 yr: PO** 100 mg qid 1/2 before meals and at bedtime

Ulcerative colitis (unlabeled)

- **Adult: PO** (Gastrocrom) 200 mg qid 20 min before meals and at bedtime, may double dose after 2 wk
- **Child 2-14 yr: PO** (Gastrocrom) 100 mg qid 20 min before meals and at bedtime, may double dose after 2-3 wk

Available forms: Nasal sol 5.2 mg/metered spray (40 mg/ml); neb sol 20 mg/2 ml; aerosol 800 mcg/actuation; oral conc 100 mg/5 ml

Administer:

- For oral conc: break open ampule, squeeze contents into glass of water, stir, drink

SIDE EFFECTS

CNS: *Headache, dizziness, neuritis, confusion, drowsiness*

EENT: Throat irritation, cough, nasal congestion, burning eyes, nasal stinging/irritation, sneezing

GI: Nausea, vomiting, anorexia, dry mouth, bitter taste

GU: Urinary frequency, dysuria

INTEG: Rash, urticaria, angioedema

MS: Joint pain/swelling

Oral conc:

CNS: Dizziness, headache, paresthesia, migraine, **seizures**, psychosis, anxiety, depression, hallucinations, insomnia

CV: Tachycardia, PVCs, palpitations

GI: Diarrhea, nausea, abdominal pain, constipation, dyspepsia, stomatitis, vomiting

HEMA: Polycythemia, neutropenia, pancytopenia

INTEG: Pruritus, rash, flushing, photosensitivity

PHARMACOKINETICS

Excreted unchanged in feces, half-life 80 min, 63%-76% protein binding

NURSING CONSIDERATIONS

Assess:

- Eosinophil count during treatment
- Respiratory status: rate, rhythm, characteristics, cough, wheezing, dyspnea

Perform/provide:

- Gargle, sip of water to decrease irritation in throat (INH/Neb)

Evaluate:

- Therapeutic response: decrease in asthmatic symptoms; congested, runny nose

Teach patient/family:

Nasal sol: Blow nose, hold pump between fingers; if 1st use, spray in air until fine mist occurs, insert nozzle in nostril, spray and breathe in through nose, repeat in other nostril

Aerosol (not for acute asthma): Take cover off mouthpiece, shake gently, breathe out slowly, place mouthpiece in mouth, close mouth around it, tilt head back, breathe in as the inhaler is depressed, remove, hold breath, then breathe out slowly

Inhalation: Do not swallow sol, empty ampule into power-driven nebulizer as directed; do not combine different meds

Oral: Take 1/2 hr before meals and at bedtime

☼ Canada only Side effects: *italics* = common; **bold** = life-threatening ⚠
Nurse Alert

crotamiton

(kroe-tam'-ih-tuhn)

Eurax

Func. class.: Scabicide/pediculicide

ACTION:

Scabicial and antipruritic properties; the mechanisms of these actions are not known, but the drug is toxic to the scabies mite; antipruritic effect may be due to counterirritation mechanisms

USES:

Infestations of scabies, lice

CONTRAINDICATIONS:

Hypersensitivity; raw, inflamed skin

Precautions: Pregnancy (C), children

DOSAGE AND ROUTES

Calculator

- **Adult: TOP** After routine bath, apply over the entire body from the chin to the soles; do not apply to the face or head; repeat in 24 hr. Patient may take a cleansing bath 48 hr after the second dose

Treatment of pruritus

- **Adult: TOP** Apply topically by massaging gently into affected area until medication is completely absorbed; repeat if needed

Available forms: Lotion, cream 10%

Administer:

- The cream and lotion are for topical use only to the skin; shake lotion well before use; do not apply in the eyes or mouth; do not apply to raw, weeping, or inflamed skin until acute inflammation has subsided

Scabies: After taking a bath or shower, apply by massaging into the skin from the chin to the toes, including folds and creases; ensure use under fingernails (they should be trimmed short), because scabies are likely to remain under nails; a toothbrush may be used to apply under fingernails; if a toothbrush is used to

apply, wrap it in paper and discard immediately after use; accidental use of the same toothbrush in the mouth could cause poisoning; a second application 24 hr later is recommended; a 60-g tube of cream or bottle of lotion is sufficient for 2 applications for most patients; clothing and bed linen should be changed the next morning. Contaminated clothing and bed linen may be washed in the hot cycle of the washing machine or dry cleaned; a cleansing bath should be taken 48 hours after the last application

Pruritus: Massage cream or lotion into affected areas until the medication is absorbed; repeat as needed

SIDE EFFECTS

INTEG: Irritation, rash

NURSING CONSIDERATIONS

Assess:

Scabies/Lice: Area of infestation, irritation, scales; itching, raw, peeling, inflamed skin; contamination of other family members

Evaluate:

- Decreasing infestation, itching

Teach patient/family:

- To stop using if irritation, rash occurs, wash off completely; not to use on raw, inflamed skin
- How to use (see dosage and routes)

☼ Canada only Side effects: *italics* = common; **bold** = life-threatening ⚠

Nurse Alert

cyanocobalamin (vit B₁₂)

(OTC, Rx)

(syé-an-oh-koe-bal'a-min)

Anacobin , Bedoz , Cyanabin , Cyanoject, Cyomin, Ener-B

hydroxocobalamin (OTC, Rx)

LA-12, Nascobal, NeuroforteR, Vitamin B₁₂

Func. class.: Vit B₁₂, water-soluble vitamin

ACTION:

Needed for adequate nerve functioning, protein and carbohydrate metabolism, normal growth, RBC development, cell reproduction

USES:

Vit B₁₂ deficiency, pernicious anemia, vit B₁₂ malabsorption syndrome, Schilling test, increased requirements with pregnancy, thyrotoxicosis, hemolytic anemia, hemorrhage, renal/hepatic disease, nutritional supplementation

CONTRAINDICATIONS:

Hypersensitivity, optic nerve atrophy

Precautions: Pregnancy (A), breastfeeding, children

DOSAGE AND ROUTES

Calculator

Cyanocobalamin

- **Adult: PO** Up to 1000 mcg/day **SUBCUT/IM** 30-100 mcg/day × 1 wk, then 100-200 mcg/mo

Schilling test

- **Adult and child: IM** 1000 mcg in 1 dose
- **Child: PO** Up to 1000 mcg/day **SUBCUT/IM** 30-50 mcg/day × 2 wk, then 100 mcg/mo; **NASAL** 500 mcg q wk

Hydroxocobalamin

- **Adult: SUBCUT/IM** 30-50 mcg/day × 5-10 days then 100-200 mcg/mo
- **Child: SUBCUT/IM** 30-50 mcg/day × 5-10 days then 30-50 mcg/mo

Available forms: *Cyanocobalamin*: tabs 25, 50, 100, 250, 500, 1000, 5000 mcg; ext rel tabs 100, 200, 500, 1000 mcg; lozenges 100, 250, 500 mcg; nasal jel 500 mcg/spray; inj 100, 1000 mcg/ml; *hydroxocobalamin*: inj 1000 mcg/ml

Administer:

PO route

- With fruit juice to disguise taste; immediately after mixing
- With meals if possible for better absorption; large doses should not be used because most is excreted

IM route

- By IM inj for pernicious anemia for life unless contraindicated

Intranasal route

- Avoid use within 1 hr of hot fluids, food

IV route

- IV route not recommended but may be admixed in TPN solution

Additive compatibilities: Ascorbic acid, chloramphenicol, hydrocortisone, metaraminol, vit B/C

Solution compatibilities: Dextrose/Ringer's or LR combinations, dextrose/saline combinations, D₅W, D₁₀W, 0.45% NaCl, Ringer's or LR sol

Y-site compatibilities: Alfentanil, amikacin, aminophylline, ascorbic acid, atracurium, atropine, azaTHIOprine, aztreonam, benztropine, bretylium, bumetanide, buprenorphine, butorphanol, calcium chloride/gluconate, cefamandole, ceFAZolin, cefmetazole, cefonicid, cefoperazone, cefotaxime, cefoTEtan, cefOXitin, cefTAZidime, ceftizoxime, cefTRIAxone, cefuroxime, cephalothin, cephapirin, chloramphenicol, chlorproMAZINE, cimetidine, clindamycin, dexamethasone, digoxin, diphenhydrAMINE, DOBUTamine, DOPamine, doxycycline, enalaprilat, ePHEDrine, EPINEPHrine, epoetin alfa, erythromycin, esmolol, famotidine, fentaNYL, fluconazole, folic acid, furosemide, ganciclovir, gentamicin, glycopyrrolate, heparin, hydrocortisone, hydrOXYzine, imipenem-cilastatin, indomethacin, insulin (regular), isoproterenol hydrochloride, ketorolac, labetalol, lidocaine, magnesium, mannitol, meperidine, metaraminol, methicillin, methoxamine, methylDopate, methylPREDNISolone, metoclopramide, metoprolol, mezlocillin, miconazole, midazolam, minocycline, morphine, moxalactam, multiple vitamins injection, nafcillin, nalbuphine, naloxone, netilmicin, nitroglycerin, nitroprusside,

norepinephrine, ondansetron, oxacillin, oxytocin, papaverine, penicillin G potassium/sodium, pentamidine, pentazocine, PENTobarbital, PHENobarbital, phentolamine, phenylephrine, phytonadione, piperacillin, polymyxin B, potassium chloride, procainamide, prochlorperazine, promethazine, propranolol, protamine, pyridoxine, quiniDine, ranitidine, ritodrine, sodium bicarbonate, succinylcholine, SUFentanil, theophylline, thiamine, ticarcillin, ticarcillin-clavulanate, tobramycin, tolazoline, trimetaphan, urokinase, vancomycin, vasopressin, verapamil, vitamin B complex with C

SIDE EFFECTS

CNS: Flushing, optic nerve atrophy

CV: CHF, peripheral vascular thrombosis, pulmonary edema

GI: *Diarrhea*

INTEG: Itching, rash, pain at inj site

META: Hypokalemia

SYST: Anaphylactic shock

PHARMACOKINETICS

Gastric intrinsic factor must be present for absorption to occur; stored in liver, kidneys, stomach; 50%-90% excreted in urine; crosses placenta; excreted in breast milk

INTERACTIONS

Increase: absorption—prednisONE

Decrease: absorption—aminoglycosides, anticonvulsants, colchicine, chloramphenicol, aminosalicic acid, potassium preparations, cimetidine

Drug/Herb

Decrease: vit B₁₂ absorption—goldenseal

Drug/Lab Test

False positive: intrinsic factor

NURSING CONSIDERATIONS

Assess:

- For vit B₁₂ deficiency: red, beefy tongue; psychosis; pallor; neuropathy
- GI function: diarrhea, constipation

- Potassium levels during beginning treatment in megaloblastic anemia; q6mo in pernicious anemia; folic acid, plasma vit B₁₂ (after 1 wk), reticulocyte counts
- Nutritional status: egg yolks, fish, organ meats, dairy products, clams, oysters: good sources of vit B₁₂

- For pulmonary edema, worsening of CHF in cardiac patients

Perform/provide:

- Protection from light, heat

Evaluate:

- Therapeutic response: decreased anorexia, dyspnea on exertion, palpitations, paresthesias, psychosis, visual disturbances

Teach patient/family:

- That treatment must continue for life for pernicious anemia
- To eat a well-balanced diet
- To avoid contact with persons with infection; that infections are common

TREATMENT OF OVERDOSE:

Discontinue product

☼ Canada only Side effects: *italics* = common; **bold** = life-threatening ⚠

Nurse Alert

cyclobenzaprine (Rx)

(syeh-kloe-ben'za-preen)

Amrix, Fexmid, Flexeril

Func. class.: Skeletal muscle relaxant, central acting

Chem. class.: Tricyclic amine salt

Do not confuse: cyclobenzaprine/cyproheptadine

ACTION:

Reduces tonic muscle activity at the brain stem; may be related to antidepressant effects

USES:

Adjunct for relief of muscle spasm and pain in musculoskeletal conditions

Unlabeled uses: Fibromyalgia

CONTRAINDICATIONS:

Children <12 yr, acute recovery phase of MI, dysrhythmias, heart block, CHF, hypersensitivity, intermittent porphyria, thyroid disease, QT prolongation

Precautions: Pregnancy (B), breastfeeding, geriatric patients, renal/hepatic disease, addictive personality

DOSAGE AND ROUTES

Calculator

Musculoskeletal disorders

- **Adult/adolescent ≥15 yr:** PO 5 mg tid × 1 wk, max 30 mg/day × 3 wk
- **Adult:** EXT REL 15 mg/day, max 30 mg/day × 3 wk
- **Geriatric:** PO 5 mg tid

Hepatic dose

- **Adult (mild hepatic disease):** PO 5 mg, titrate slowly

Fibromyalgia (unlabeled)

- **Adult:** PO 10 mg at bedtime, titrated up

Available forms: Tabs 5, 10 mg; ext rel tab 15, 30 mg

Administer:

- Without regard to meals, give with food for GI symptoms

- Do not crush, break, chew ext rel cap

SIDE EFFECTS

CNS: *Dizziness, weakness, drowsiness*, headache, tremor, depression, insomnia, confusion, paresthesia, nervousness

CV: Postural hypotension, tachycardia, **dysrhythmias**

EENT: Diplopia, temporary loss of vision

GI: *Nausea*, vomiting, hiccups, dry mouth, constipation, hepatitis

GU: Urinary retention, frequency, change in libido

INTEG: Rash, pruritus, fever, facial flushing, sweating

PHARMACOKINETICS

PO: Onset 1 hr, peak 3-8 hr, duration 12-24 hr, half-life 1-3 days, metabolized by liver, excreted in urine, crosses placenta, excreted in breast milk

INTERACTIONS

- Do not use within 14 days of MAOIs, tramadol

Increase: QT interval—Class IA/III antidysrhythmics, and other products that increase QT interval

Increase: CNS depression—alcohol, tricyclics, opiates, barbiturates, sedatives, hypnotics

Drug/Herb

Increase: CNS depression—kava

NURSING CONSIDERATIONS

Assess:

- **Pain:** location, duration, mobility, stiffness at baseline, periodically
- **Allergic reactions:** rash, fever, respiratory distress
- Severe weakness, numbness in extremities

Perform/provide:

- Storage in tight container at room temp
- Assistance with ambulation if dizziness, drowsiness occur, especially for geriatric patients

Evaluate:

- Therapeutic response: decreased pain, spasticity; muscle spasms of acute, painful musculoskeletal conditions generally short term; long-term therapy

seldom warranted

Teach patient/family:

- Not to discontinue medication abruptly; that insomnia, nausea, headache, spasticity, tachycardia will occur; that product should be tapered off over 1-2 wk
- Not to take with alcohol, other CNS depressants
- To avoid hazardous activities if drowsiness, dizziness occur
- To avoid using OTC medication (cough preparations, antihistamines) unless directed by prescriber
- To use gum, frequent sips of water for dry mouth

TREATMENT OF OVERDOSE:

Administer activated charcoal; use anticonvulsants if indicated; monitor cardiac function

☼ Canada only Side effects: *italics* = common; **bold** = life-threatening ⚠
Nurse Alert

cyclopentolate ophthalmic

See Appendix B

HIGH ALERT

cyclophosphamide (Rx)

(syeh-kloeh-foss'fa-mide)

Cytoxan, Procytox 

Func. class.: Antineoplastic alkylating agent

Chem. class.: Nitrogen mustard

Do not confuse: **cyclophosphamide**/cycloSPORINE

Cytoxan/Cytosar/Cytotec/cytarabine

ACTION:

Alkylates DNA is responsible for cross-linking DNA strands; activity is not cell-cycle–phase specific

USES:

Hodgkin's disease, lymphomas, leukemia; cancer of female reproductive tract, breast, lung, prostate; multiple myeloma; neuroblastoma; retinoblastoma; Ewing's sarcoma; disseminated neuroblastoma, nephrotic syndrome

Unlabeled uses: Aplastic anemia, chronic idiopathic thrombocytopenic purpura, dermatomyositis, pneumonitis, polymyositis, SLE, scleroderma, RA, Behçet's syndrome, Churg-Strauss syndrome, polyarteritis nodosa, Wegener's granulomatosis, idiopathic pulmonary fibrosis, localized neuroblastoma, CLL

CONTRAINDICATIONS:

Pregnancy (D), breastfeeding, severely depressed bone marrow function, hypersensitivity, prostatic hypertrophy, bladder neck obstruction

Precautions: Radiation therapy, cardiac disease

DOSAGE AND ROUTES

Calculator

- **Adult: PO** Initially 1-5 mg/kg over 2-5 days, maintenance is 1-5 mg/kg; **IV** initially 40-50 mg/kg in divided doses over 2-5 days, maintenance 10-15 mg/kg q7-10 days or 3-5 mg/kg q3days
- **Child: PO/IV** 2-8 mg/kg or 60-250 mg/m² in divided doses for 6 or more days; maintenance 10-15 mg/kg q7-10 days or 30 mg/kg q3-4wk; dose should be reduced by half when bone marrow depression occurs

Neuroblastoma

- **Child and infant: PO** 150 mg/m²/day, days 1-7 with DOXOrubicin (**IV** 35 mg/m² on day 8) q21days × 5 cycles
- **Child: IV** 70 mg/kg/day with hydration on days 1, 2 with DOXOrubicin and vinCRIStine q21days for courses 1, 2, 4, 6 alternating with CISplatin and etoposide q21days for courses 3, 5, 7

Breast cancer

- **Adult: PO** 100-200 mg/m²/day or 2 mg/kg/day × 4-14 days; **IV** 500-1000 mg/m² on day 1 in combination with fluorouracil and methotrexate or DOXOrubicin or DOXOrubicin alone, also cyclophosphamide 600 mg/m²; may be given dose-dense on day 1 of q14days with DOXOrubicin (60 mg/m²) with growth-factor support

Operable node-positive breast cancer IV (TAC regimen)

- **Adult: IV** 500 mg/m² with DOXOrubicin (50 mg/m² **IV**) then docetaxel (75 mg/m²) **IV** given 1 hr later q3wk × 6 cycles

Nephrotic syndrome

- **Adult: PO** 2-3 mg/kg/day for up to 12 wk when corticosteroids are unsuccessful

Aplastic anemia (unlabeled)

- **Adult: IV** 45-50 mg/kg divided over 4 days

Behçet's syndrome/Churg-strauss syndrome/polyarteritis nodosa/uveitis/Wegener's granulomatosis (unlabeled)

- **Adult: PO** 1-2 mg/kg/day, **IV** 0.5-1 g/m²

Rheumatoid arthritis (unlabeled)

- **Adult and child: PO** 1.5-2.5 mg/kg/day

CLL (unlabeled)

- **Adult: IV** 250 mg/m²/day on days 1-3 with fludarabine 30 mg/m²/day on days 1-3

Available forms: Inj 100, 200, 500 mg, 1, 2 g; tabs 25, 50 mg

Administer:

- Use cytotoxic handling procedures
- In AM so product can be eliminated before bedtime
- Fluids IV or PO before chemotherapy to hydrate patient
- Antacid before oral agent; give after evening meal, before bedtime
- Antiemetic 30-60 min before product and prn
- Allopurinol or sodium bicarbonate to maintain uric acid levels, alkalization of urine

PO route

- Take on empty stomach; do not crush, break, chew tabs
- May be taken as a single dose or divided doses
- Take in AM or afternoon, avoid evening

Direct IV route

- Reconstitute with NS only

Intermittent IV INF route

- Use cytotoxic handling procedures
- IV after diluting 100 mg/5 ml of sterile water or bacteriostatic water; shake; let stand until clear; may be further diluted in ≤ 250 ml D₅ or NS; give 100 mg or less/min through 3-way stopcock of glucose or saline inf • Use 21, 23, 25G needle; check site for irritation, phlebitis

Solution compatibilities: Amino acids 4.25%/D₂₅, D₅/0.9% NaCl, D₅W, 0.9% NaCl

Syringe compatibilities: Bleomycin, CISplatin, doxapram, DOXOrubicin, droperidol, fluorouracil, furosemide, heparin, leucovorin, methotrexate, metoclopramide, mitomycin, vinBLASTine, vinCRISTine

Y-site compatibilities: Acyclovir, alfentanil, allopurinol, amifostine, amikacin, aminocaproic acid, aminophylline, amiodarone, amphotericin B lipid complex, amphotericin B liposome, ampicillin, ampicillin-sulbactam, anidulafungin, atenolol, atracurium, azlocillin, aztreonam, bivalirudin, bleomycin, bumetanide, buprenorphine, butorphanol, calcium chloride/gluconate, CARBOplatin, caspofungin, cefamandole, ceFAZolin, cefepime, cefoperazone, cefotaxime, cefoTEtan, cefOXitin, cefTAZidime, ceftizoxime, cefTRIAxone, cefuroxime, chloramphenicol, chlorproMAZINE, cimetidine, ciprofloxacin, cisatracurium,

CISplatin, cladribine, clindamycin, codeine, cycloSPORINE, cytarabine, DACTINomycin, DAPTOmycin, DAUNOrubicin, dexamethasone, dexmedetomidine, dexrazoxane, digoxin, diltiazem, diphenhydrAMINE, DOBUTamine, DOCEtaxel, dolasetron, DOPamine, doripenem, doxacurium, DOXOrubicin, DOXOrubicin liposomal, doxycycline, droperidol, enalaprilat, ePHEDrine, EPINEPHrine, epirubicin, ertapenem, erythromycin, esmolol, etoposide, famotidine, fenoldopam, fentaNYL, filgrastim, fluconazole, fludarabine, fluorouracil, foscarnet, fosphenytoin, furosemide, gallium, ganciclovir, gatifloxacin, gemcitabine, gentamicin, granisetron, haloperidol, heparin, hydrocortisone, HYDROmorphine, hydrOXYzine, IDArubicin, imipenem-cilastatin, inamrinone, insulin (regular), irinotecan, isoproterenol, kanamycin, ketorolac, labetalol, leucovorin, levofloxacin, levorphanol, lidocaine, linezolid, LORazepam, magnesium sulfate, mannitol, melphalan, meperidine, meropenem, mesna, methohexital, methotrexate, methylPREDNISolone, metoclopramide, metoprolol, metroNIDAZOLE, midazolam, milrinone, minocycline, mitoMYcin, mitoXANtrone, mivacurium, morphine, nafcillin, nalbuphine, naloxone, nesiritide, nitroglycerin, nitroprusside, norepinephrine, octreotide, ondansetron, oxacillin, oxaliplatin, PACLitaxel, palonosetron, pamidronate, pancuronium, pantoprazole, PEMEtrexed, penicillin G potassium, pentamidine, PENTobarbital, PHENobarbital, phenylephrine, piperacillin, piperacillin-tazobactam, potassium chloride/phosphates, procainamide, prochlorperazine, promethazine, propofol, propranolol, quinupristin-dalfopristin, ranitidine, rapacurium, remifentanyl, riTUXimab, rocuronium, sargramostim, sodium acetate/bicarbonate/phosphates, succinylcholine, SUFentanyl, sulfamethoxazole-trimethoprim, tacrolimus, teniposide, theophylline, thiopental, thiotepa, ticarcillin, ticarcillin-clavulanate, tigecycline, tirofiban, TNA, tobramycin, topotecan, TPN, trastuzumab, vancomycin, vasopressin, vecuronium, verapamil, vinBLASTine, vinCRISTine, vinorelbine, voriconazole, zidovudine, zoledronic acid

SIDE EFFECTS

CNS: Headache, dizziness

CV: Cardiotoxicity (high doses), myocardial fibrosis, congestive heart failure, pericarditis

ENDO: SIADH, gonadal suppression

GI: Nausea, vomiting, diarrhea, weight loss, colitis, **hepatotoxicity**

GU: **Hemorrhagic cystitis**, hematuria, neoplasms, amenorrhea, azoospermia, sterility, ovarian fibrosis, **renal tubular fibrosis**

HEMA: **Thrombocytopenia**, leukopenia, pancytopenia; myelosuppression

INTEG: Alopecia, dermatitis

META: Hyperuricemia

MISC: Secondary neoplasms, **anaphylaxis**

RESP: **Pulmonary fibrosis**, **interstitial pneumonia**

PHARMACOKINETICS

Metabolized by liver, excreted in urine, half-life 4-6½ hr, 50% bound to plasma proteins

INTERACTIONS

Increase: neuromuscular blockade—succinylcholine

Increase: cyclophosphamide toxicity—barbiturates

Increase: action of warfarin

Increase: bone marrow depression—allopurinol, thiazides

Increase: hypoglycemia—insulin

Decrease: digoxin levels—digoxin

Decrease: cyclophosphamide effect—chloramphenicol, corticosteroids

Decrease: antibody response—live virus vaccines

Drug/Herb

• **Toxicity:** St. John's wort

Drug/Lab Test

Increase: uric acid

False positive: Pap smear

False negative: PPD, mumps, trichophyton, *Candida*, *Trichophyton*, Pap smear

NURSING CONSIDERATIONS

Assess:

• **Hemorrhagic cystitis;** renal studies: BUN, serum uric acid, urine CCr before, during therapy; I&O ratio; report fall in urine output <30 ml/hr • **Bone marrow depression:** CBC, differential, platelet count baseline, weekly; withhold product if WBC is <2500 or platelet count is <75,000; notify prescriber of results

- Pulmonary function tests, chest x-ray films before, during therapy; chest film should be obtained q2wk during treatment • Monitor temp q4hr; elevated temp may indicate beginning infection
 - **Hepatotoxicity:** hepatic studies before, during therapy (bilirubin, AST, ALT, LDH), as needed; jaundice of skin, sclera; dark urine, clay-colored stools; itchy skin; abdominal pain; fever; diarrhea • **Bleeding:** hematuria, guaiac, bruising or petechiae, mucosa or orifices q8hr
 - Dyspnea, crackles, unproductive cough, chest pain, tachypnea
 - Effects of alopecia on body image, discuss feelings about body changes
 - Buccal cavity q8hr for dryness, sores or ulceration, white patches, oral pain, bleeding, dysphagia; obtain prescription for viscous lidocaine (Xylocaine) ⚠
- Symptoms that indicate severe allergic reaction: rash, pruritus, urticaria, purpuric skin lesions, itching, flushing

Perform/provide:

- Storage in tight container at room temp
- Increase fluid intake to 2-3 L/day to prevent urate deposits, calculi formation, reduce incidence of hemorrhagic cystitis • Diet low in purines: organ meats (kidney, liver), dried beans, peas to maintain alkaline urine • Rinsing of mouth tid-qid with water, club soda; brushing of teeth bid-tid with soft brush or cotton-tipped applicators for stomatitis; use unwaxed dental floss • Warm compresses at inj site for inflammation

Evaluate:

- To take adequate fluids to eliminate product
- Therapeutic response: decreased tumor size, spread of malignancy

Teach patient/family:

- That amenorrhea can occur and may last up to 1 yr after therapy but is reversible after stopping treatment • To report any changes in breathing or coughing
- That hair may be lost during treatment; a wig or hairpiece may make patient feel better; new hair may be different in color, texture • To avoid foods with citric acid, hot or rough texture
- To report signs of infection: increased temp, sore throat, flulike symptoms
- To report signs of anemia: fatigue, headache, faintness, SOB, irritability
- To report bleeding (bruising, hematuria, petechiae); to avoid use of razors, commercial mouthwash • To use reliable contraception during and for 4 mo after treatment; not to breastfeed

- To avoid use of aspirin products, ibuprofen
 - To avoid vaccinations during therapy
 - Advise patient on proper handling and disposal of chemotherapy drugs
-

✳ Canada only Side effects: *italics* = common; **bold** = life-threatening ⚠
Nurse Alert

cycloSPORINE (Rx)

(sy'e'kloe-spor-een)

Cyclosporine, modified Gengraf, Neoral, Pulminiq, Sandimmune

Func. class.: Immunosuppressant

Chem. class.: Fungus-derived peptide

Do not confuse: cycloSPORINE/cycloSERINE/cyclophosphamide
SandIMMUNE/SandoSTATIN

ACTION:

Produces immunosuppression by inhibiting lymphocytes (T)

USES:

Organ transplants (liver, kidney, heart) to prevent rejection, rheumatoid arthritis, psoriasis

Unlabeled uses: Recalcitrant ulcerative colitis, aplastic anemia, Crohn's disease, GVHD, thrombocytopenia purpura, lupus, nephritis, myasthenia gravis, psoriatic arthritis, atopic dermatitis

CONTRAINDICATIONS:

Breastfeeding, hypersensitivity to polyxyethylated castor oil (inj only); psoriasis or RA in renal disease (Neoral/Gengraf); Gengraf/Neoral used with PUVA/UVB, methotrexate, coal tar; ocular infections

Black Box Warning:

Uncontrolled, malignant hypertension; radiation in psoriasis, neoplastic disease, sunlight (UV) exposure, renal disease/failure

Precautions: Pregnancy (C), geriatric patients, severe hepatic disease

DOSAGE AND ROUTES

Calculator

Prevention of transplant rejection (nonmodified)

- **Adult and child:** PO 15 mg/kg several hr before surgery, daily for 2 wk, reduce dosage by 2.5 mg/kg/wk to 5-10 mg/kg/day; IV 5-6 mg/kg several hr before surgery, daily, switch to PO form as soon as possible

Prevention of transplant rejection (modified)

- **Adult and child:** PO 4-12 mg/kg/day divided q12hr, depends on organ

transplanted

Rheumatoid arthritis (Neoral/Gengraf)

- **Adult: PO** 2.5 mg/kg/day divided bid, may increase 0.5-0.75 mg/kg/day after 8-12 wk, max 4 mg/kg/day

Psoriasis (neoral/gengraf)

- **Adult: PO** 2.5 mg/kg/day divided bid, × 4 wk, then increase by 0.5 mg/kg/day q2wk, max 4 mg/kg/day

Idiopathic thrombocytopenia purpura (unlabeled)

- **Adult: PO** 1.25-2.5 mg/kg bid

Severe aplastic anemia (unlabeled)

- **Adult and child: PO** 12 mg/kg/day or 15 mg/kg/day (child) with antithymocyte globulin (ATG)

Atopic dermatitis (unlabeled)

- **Adult/adolescent/child ≥2 yr: PO** 5 mg/kg/day

Crohn's disease that is resistant to/intolerant of corticosteroids (unlabeled)

- **Adult: PO** 2.5-15 mg/kg/day (nonmodified)

Available forms: Oral sol 100 mg/ml; soft gel cap 25, 50, 100 mg; inj 50 mg/ml; sol for inh 300 mg/4.8 ml

Administer:

PO route

- Do not break, crush, or chew caps
- Use pipette provided to draw up oral sol; may mix with milk or juice; wipe pipette, do not wash (Neoral)
- For several days before transplant surgery; give at same time of day
- With corticosteroids
- With meals for GI upset or in chocolate milk, milk, or orange juice (SandIMMUNE)
- With oral antifungal for candida infections

Rheumatoid arthritis

- Give Neoral or Gengraf 2.5 mg/kg/day divided bid; may use with salicylates, NSAIDs, PO corticosteroids
- Always give the daily dose of Neoral/Gengraf in 2 divided doses on consistent schedule
- Give initial SandIMMUNE PO dose 4-12 hr prior to transplantation as a single dose of 15 mg/kg, continue the single daily dose for 1-2 wk, then taper 5%/wk to

a maintenance dose of 5-10 mg/kg/day

Intermittent IV INF route

- After diluting each 50 mg/20-100 ml of 0.9% NaCl or D₅W; run over 2-6 hr, use an inf pump, glass inf bottles only

Continuous IV INF route

- May run over 24 hr
- **For SandIMMUNE parenteral**, give 1/3 of PO dose, initial dose 4-12 hr before transplantation as a single IV dose 5-6 mg/kg/day, continue the single daily dose until PO can be used

Solution compatibilities: D₅W, NaCl 0.9%

Y-site compatibilities: Abciximab, alatrofloxacin, alfentanil, amikacin, aminocaproic acid, aminophylline, amphotericin B lipid complex, anidulafungin, argatroban, ascorbic acid injection, atenolol, atracurium, atropine, azaTHIOprine, aztreonam, benzotropine, bivalirudin, bleomycin, bretylium, bumetanide, buprenorphine, butorphanol, calcium chloride/gluconate, CARBOplatin, carmustine, caspofungin, cefamandole, ceFAZolin, cefmetazole, cefonicid, cefoperazone, cefotaxime, cefoTETan, cefOXitin, ceftaroline, cefTAZidime, ceftizoxime, ceftobiprole, cefTRIAXone, cefuroxime, cephalothin, cephapirin, chloramphenicol, chlorproMAZINE, cimetidine, ciprofloxacin, CISplatin, clindamycin, codeine, cyanocobalamin, cyclophosphamide, cytarabine, DACTINomycin, DAPTOmycin, DAUNOrubicin, dexamethasone, dexmedetomidine, digoxin, diltiazem, diphenhydrAMINE, DOBUTamine, DOCEtaxel, DOPamine, doripenem, doxacurium, DOXOrubicin, doxycycline, enalaprilat, ePHEDrine, EPINEPHrine, epirubicin, epoetin alfa, eptifibatide, ertapenem, erythromycin, esmolol, etoposide, famotidine, fenoldopam, fentaNYL, fluconazole, fludarabine, fluorouracil, folic acid, furosemide, gallium, ganciclovir, gatifloxacin, gemcitabine, gentamicin, glycopyrrolate, granisetron, heparin, hydrocortisone, HYDROmorphine, hydrOXYzine, ifosfamide, imipenem-cilastatin, indomethacin, irinotecan, isoproterenol, ketorolac, labetalol, lansoprazole, levofloxacin, lidocaine, linezolid, LORazepam, mannitol, mechlorethamine, meperidine, meropenem, methicillin, methotrexate, methoxamine, methyl dopate, methylPREDNISolone, metoclopramide, metoprolol, metroNIDAZOLE, mezlocillin, micafungin, miconazole,

midazolam, milrinone, minocycline, mitoXANtrone, morphine, moxalactam, multiple vitamins injection, nafcillin, naloxone, nesiritide, netilmicin, nitroglycerin, nitroprusside, norepinephrine, octreotide, ondansetron, oxacillin, oxaliplatin, oxytocin, PACLitaxel, palonosetron, pamidronate, pancuronium, pantoprazole, papaverine, PEMEtrexed, penicillin G potassium/sodium, pentamidine, pentazocine, phentolamine, phenylephrine, phytonadione, piperacillin, piperacillin-tazobactam, polymyxin B, potassium acetate/chloride, procainamide, prochlorperazine, promethazine, propofol, propranolol, protamine, pyridoxine, quiNIDine, quinupristin-dalfopristin, ranitidine, ritodrine, sargramostim, sodium acetate/bicarbonate, succinylcholine, SUFentanil, tacrolimus, teniposide, theophylline, thiamine, thiotepa, ticarcillin, ticarcillin-clavulanate, tigecycline, tirofiban, tobramycin, trimetaphan, urokinase, vancomycin, vasopressin, vecuronium, verapamil, vinCRISTine, vinorelbine, zoledronic acid

SIDE EFFECTS

CNS: Tremors, headache, seizures, confusion, encephalopathy, migraine

GI: Nausea, vomiting, diarrhea, oral candida, gum hyperplasia, hepatotoxicity, pancreatitis

GU: Albuminuria, hematuria, proteinuria, renal failure, hemolytic uremic syndrome, nephrotoxicity

INTEG: Rash, acne, hirsutism, pruritus

META: Hyperkalemia, hypomagnesemia, hyperlipidemia, hyperuricemia

MISC: Infection, hypertension

PHARMACOKINETICS

Peak 4 hr; highly protein bound; half-life (biphasic) 1.2 hr, 25 hr; metabolized in liver; excreted in feces, 6% in urine; crosses placenta; excreted in breast milk

INTERACTIONS

Increase: action, toxicity of cycloSPORINE—allopurinol, amiodarone, amphotericin B, androgens, azole antifungals, β -blockers, bromocriptine, calcium channel blockers, carvedilol, cimetidine, colchicine, corticosteroids, fluoroquinolones, foscarnet, imipenem-cilastatin, macrolides, metoclopramide, oral contraceptives, NSAIDs, melphalan, SSRIs

Increase: effects of aliskiren, digoxin, etoposide, HMG-CoA reductase inhibitors, methotrexate, potassium-sparing diuretics, sirolimus, tacrolimus

Increase: action toxicity of—digoxin, colchicine

Decrease: cycloSPORINE action—anticonvulsants, nafcillin, orlistat, PHENobarbital, phenytoin, rifamycins, sulfamethoxazole-trimethoprim, terbinafine, ticlopidine

Decrease: antibody reaction—live virus vaccines

Drug/Food

- Slowed metabolism of product: grapefruit juice, food

NURSING CONSIDERATIONS

Assess:

- Renal studies: BUN, creatinine at least monthly during treatment, 3 mo after treatment

- Product blood level during treatment 12 hr after dose, toxic >400 ng/ml

- Hepatic studies: alk phos, AST, ALT, bilirubin; hepatotoxicity: **dark urine, jaundice, itching, light-colored stools; product should be discontinued** • Serum lipids, magnesium, potassium, cycloSPORINE blood concentrations

⚠ Encephalopathy: impaired cognition, seizures, visual changes including blindness, loss of motor function, movement disorders and psychiatric changes; dosage reduction or discontinuation may be needed in severe cases ⚠

Nephrotoxicity: 6 wk after surgery, acute tubular necrosis, CyA trough level >200 ng/ml, gradual rise in creatinine (0.15 mg/dl/day), creatinine plateau <25% above baseline, intracapsular pressure <40 mm Hg ⚠ **Signs/symptoms of encephalopathy, lymphoma**

Evaluate:

- Therapeutic response: absence of rejection

Teach patient/family:

- **To report fever, chills, sore throat, fatigue, since serious infections may occur; tremors, bleeding gums, increased B/P**

- To use contraceptive measures during treatment, for 12 wk after ending therapy; to notify prescriber if pregnancy is planned or suspected • To take at same time of day, every day; not to skip doses or double dose; not to use with grapefruit juice or receive vaccines; that there are many drug interactions; not to add new or discontinued products without approval of prescriber

Black Box Warning:

To limit UV exposure

- That treatment is lifelong to prevent rejection; to identify signs of rejection
- To report severe diarrhea because drug loss may result
- About the signs of nephrotoxicity: increased B/P, tremors of the hands, changes in gums, increased hair on body, face • To continue with all lab work and follow-up appointments
- That types of products are not interchangeable
- Not to wash syringe/container with water, variation in dose may result

🍁 Canada only Side effects: *italics* = common; **bold** = life-threatening ⚠️
Nurse Alert

HIGH ALERT

cytarabine (Rx)

(syeh-tare'a-been)

Ara-C, Cytosar 

cytarabine liposomal (Rx)

DepoCyt

Func. class.: Antineoplastic, antimetabolite

Chem. class.: Pyrimidine nucleoside analog

Do not confuse: Cytosar/Cytosan/Cytovene

ACTION:

Competes with physiologic substrate of DNA synthesis, thus interfering with cell replication in the S phase of the cell cycle (before mitosis)

USES:

Acute myelocytic leukemia, acute nonlymphocytic leukemia, chronic myelocytic leukemia; lymphomatous meningitis (intrathecal/intraventricular)

Unlabeled uses: Hodgkin's/non-Hodgkin's lymphoma, malignant meningitis, mantle cell lymphoma

CONTRAINDICATIONS:

Pregnancy (D), hypersensitivity

Precautions: Breastfeeding, children, renal/hepatic disease, tumor lysis syndrome, infection, hyperkalemia, hyperphosphatemia, hyperuricemia, hypocalcemia

Black Box Warning:

Bone marrow suppression

DOSAGE AND ROUTES

Calculator

Acute myelogenous leukemia (AML)

- **Adult:** CONT IV INF 100 mg/m²/day × 7 days q2wk as single agent or 2-6 mg/kg/day (100-200 mg/m²/day) as a single dose or 2-3 divided doses for 5-10 days until remission, used in combination; maintenance 70-200 mg/m²/day for 2-

5 days monthly; **SUBCUT/IM** maintenance 100 mg/m²/day × 5 days q28days
Meningeal leukemia

- **Adult/child: INTRATHECAL** 5-70 mg/m² variable daily × 4 days to q2-7days

Refractory acute Hodgkin's/refractory non-Hodgkin's lymphoma (unlabeled)

- **Adult/child: IV** 2 g/m²/day; on day 5 q21days, with etoposide, methylPREDNISolone, and CISplatin

Carcinomatous meningitis (liposoma)

- **Adult: IT** 50 mg over 1-5 min q14days, during induction and consolidation wk 1, 3, 5, 7, 9, give another 50 mg **IT** wk 13; maintenance 50 mg q28days on wk 17, 21, 25, 29 use with dexamethasone 4 mg **PO/IV** × 5 day on each day of cytarabine

Renal dose

- **Adult CCR ≤60 ml/min, serum creatinine 1.5-1.9 mg/dl or increase of 0.5-1.2 mg/dl from baseline during treatment:** reduce to 1 g/m²/dose; **serum creatinine ≥2 mg/dl or change from baseline serum creatinine was 1.2 mg/dl:** reduce to 100 mg/m²/day

Available forms: Powder for inj 100, 500 mg, 1, 2 g; sus rel, (DepoCyt) liposomal for intrathecal use 10 mg/ml

Administer:

- Antiemetic 30-60 min before product and prn
- Allopurinol to maintain uric acid levels and alkalinization of the urine
- Topical or systemic analgesics for pain

IT route

- Use preservative-free NS, add 5 ml/100-mg vial or 10 ml/500-mg vial; use immediately, discard unused product
- Use dexamethasone with IT administration

IV route

- **Use cytotoxic handling precautions**

Direct IV route

- After diluting 100 mg/5 ml of sterile water for inj; given by direct IV over 1-3 min through free-flowing tubing (IV)

Intermittent IV INF route

- May be further diluted in 50-100 ml NS or D₅W, given over 30 min to 24 hr,

depending on dose

Continuous IV INF route

- May also be given by continuous inf

Additive compatibilities: Corticotropin, DAUNOrubicin with etoposide, etoposide, hydrOXYzine, lincomycin, mitoXANtrone, ondansetron, potassium chloride, prednisoLONE, sodium bicarbonate, vinCRISine

Solution compatibilities: Amino acids, D₅/LR, D₅/0.2% NaCl, D₅/0.9% NaCl, D₁₀/0.9% NaCl, D₅W, invert sugar 10% in electrolyte #1, Ringer's, LR, 0.9% NaCl, sodium lactate 1/6 mol/L, TPN #57

Syringe compatibilities: Metoclopramide

Y-site compatibilities: Acyclovir, alfentanil, amifostine, amikacin, aminocaproic acid, aminophylline, amphotericin B lipid complex, amphotericin B liposome, ampicillin, ampicillin-sulbactam, amsacrine, anidulafungin, atenolol, atracurium, azithromycin, aztreonam, bivalirudin, bleomycin, bumetanide, buprenorphine, butorphanol, calcium chloride/gluconate, CARBOplatin, ceFAZolin, cefepime, cefoperazone, cefotaxime, cefoTEtan, cefOXitin, cefTAZidime, ceftizoxime, cefTRIAxone, cefuroxime, chlorproMAZINE, cimetidine, ciprofloxacin, cisatracurium, CISplatin, cladribine, clindamycin, codeine, cyclophosphamide, cycloSPORINE, DAUNOrubicin, dexamethasone, dexmedetomidine, dexrazoxane, digoxin, diltiazem, diphenhydrAMINE, DOBUtamine, DOCEtaxel, dolasetron, DOPamine, doxacurium, DOXOrubicin, DOXOrubicin liposomal, doxycycline, droperidol, enalaprilat, ePHEDrine, EPINEPHrine, ertapenem, erythromycin, esmolol, etoposide, famotidine, fenoldopam, fentaNYL, filgrastim, fluconazole, fludarabine, foscarnet, fosphenytoin, furosemide, gatifloxacin, gemcitabine, gemtuzumab, gentamicin, granisetron, haloperidol, heparin, hydrocortisone, HYDROmorphine, hydrOXYzine, IDArubicin, ifosfamide, imipenem-cilastatin, inamrinone, insulin (regular), irinotecan, isoproterenol, ketorolac, labetalol, leucovorin, levofloxacin, levorphanol, lidocaine, linezolid, LORazepam, magnesium sulfate, mannitol, melphalan, meperidine, meropenem, mesna, methohexital, methotrexate, methylPREDNISolone, metoclopramide, metoprolol, metroNIDAZOLE, midazolam, milrinone, minocycline, mitoXANtrone, mivacurium, morphine, nalbuphine, naloxone, nesiritide, niCARdipine, nitroglycerin, nitroprusside, norepinephrine, octreotide, ofloxacin,

ondansetron, oxaliplatin, PACLitaxel, palonosetron, pamidronate, pancuronium, pantoprazole, PEMEtrexed, pentamidine, PENTobarbital, PHENobarbital, phenylephrine, piperacillin, piperacillin-tazobactam, potassium chloride/phosphates, procainamide, prochlorperazine, promethazine, propofol, propranolol, quinupristin-dalfopristin, ranitidine, rapacuronium, remifentanyl, riTUXimab, rocuronium, sargramostim, sodium acetate/bicarbonate/phosphates, succinylcholine, SUFentanyl, sulfamethoxazole-trimethoprim, tacrolimus, teniposide, theophylline, thiopental, thiotepa, ticarcillin, ticarcillin-clavulanate, tigecycline, tirofiban, TNA, tobramycin, trastuzumab, trimethobenzamide, vancomycin, vasopressin, vecuronium, verapamil, vinCRISTine, vinorelbine, voriconazole, zidovudine, zoledronic acid

SIDE EFFECTS

CNS: Neuritis, dizziness, headache, **cerebellar syndrome**, personality changes, ataxia, mechanical dysphasia, **coma; chemical arachnoiditis (IT)**

CV: Chest pain, **cardiopathy**

CYTARABINE SYNDROME:

Fever, myalgia, bone pain, chest pain, rash, conjunctivitis, malaise (6-12 hr after administration)

EENT: Sore throat, conjunctivitis

GI: *Nausea, vomiting, anorexia, diarrhea, stomatitis, hepatotoxicity*, abdominal pain, hematemesis, **GI hemorrhage**

GU: Urinary retention, **renal failure, hyperuricemia**

HEMA: **Thrombophlebitis, bleeding, thrombocytopenia, leukopenia, myelosuppression, anemia**

INTEG: *Rash, fever, freckling, cellulitis*

META: Hyperuricemia

RESP: **Pneumonia**, dyspnea, **pulmonary edema** (high doses)

SYST: **Anaphylaxis, tumor lysis syndrome**

PHARMACOKINETICS

INTRATHECAL: Half-life 100-236 hr; metabolized in liver; excreted in urine (primarily inactive metabolite); crosses blood-brain barrier, placenta

IV/SUBCUT: Distribution half-life 10 min, elimination half-life 1-3 hr

INTERACTIONS

- Do not use with live virus vaccines
- Do not use within 24 hr of chemotherapy—sargramostim, GM-CSF, filgrastim, G-CSF

Increase: toxicity—immunosuppressants, methotrexate, flucytosine, radiation, or other antineoplastics

Increase: bleeding risk—anticoagulants, platelet inhibitors, salicylates, thrombolytics, NSAIDs

Decrease: effects of oral digoxin, gentamicin

NURSING CONSIDERATIONS

Assess:

Black Box Warning:

Bone marrow suppression: CBC (RBC, Hct, Hgb), differential, platelet count weekly; withhold product if WBC is $<1000/\text{mm}^3$, platelet count is $<50,000/\text{mm}^3$, or RBC, Hct, Hgb low; notify prescriber of these results

- Renal studies: BUN, serum uric acid, urine CCr, electrolytes before and during therapy
- I&O ratio; report fall in urine output to <30 ml/hr
- Monitor temp, fever may indicate beginning infection; no rectal temps
- **Hepatotoxicity:** hepatic studies before and during therapy: bilirubin, ALT, AST, alk phos, as needed or monthly; check for jaundice of skin, sclera; dark urine; clay-colored stools; pruritus; abdominal pain; fever; diarrhea • Blood uric acid during therapy
- ⚠ **For anaphylaxis:** rash, pruritus, facial swelling, dyspnea; resuscitation equipment should be nearby ⚠ **Chemical arachnoiditis (IT):** headache, nausea, vomiting, fever; neck rigidity pain, meningism, CSF pleocytosis; may be decreased by dexamethasone • Cytarabine syndrome 6-12 hr after inf: fever, myalgia, bone pain, chest pain, rash, conjunctivitis, malaise; corticosteroids may be ordered • Bleeding: hematuria, heme-positive stools, bruising or petechiae, mucosa or orifices q8hr
- ⚠ **Dyspnea,** crackles, unproductive cough, chest pain, tachypnea, fatigue, increased pulse, pallor, lethargy; personality changes, with high doses; pulmonary edema may be fatal (rare) • Buccal cavity q8hr for dryness, sores or ulceration, white patches, oral pain, bleeding, dysphagia • Local irritation, pain, burning, discoloration at inj site
- GI symptoms: frequency of stools, cramping; antispasmodic may be used

- Acidosis, signs of dehydration: rapid respirations, poor skin turgor, decreased urine output, dry skin, restlessness, weakness

Perform/provide:

- Increased fluid intake to 2-3 L/day to prevent urate deposits and calculi formation unless contraindicated • Diet low in purines: absence of organ meats (kidney, liver), dried beans, peas to prevent increased urate deposits • Rinsing of mouth tid-qid with water, club soda; brushing of teeth bid-tid with soft brush or cotton-tipped applicators for stomatitis; use unwaxed dental floss

Evaluate:

- Therapeutic response: improvement of hematologic parameters

Teach patient/family:

- To report any coughing, chest pain, changes in breathing; may indicate beginning **pneumonia, pulmonary edema**
- To avoid foods with citric acid, spicy or rough texture if stomatitis is present, use sponge brush and rinse with water after each meal; to report stomatitis: any bleeding, white spots, ulcerations in mouth; to examine mouth daily, report any symptoms • To report signs of **infection**: increased temp, sore throat, flulike symptoms; to avoid crowds, persons with infections • To report signs of **anemia**: fatigue, headache, faintness, SOB, irritability • To report bleeding; to avoid use of razors, commercial mouthwash, salicylates, NSAIDs, anticoagulants • To use thrombocytopenia precautions
- To take fluids to 3 L/day to prevent renal damage
- To use reliable contraception during treatment and for 4 mo thereafter; not to breastfeed
- To avoid receiving vaccines during treatment
- That fever, headache, nausea, vomiting likely to occur

🍁 Canada only Side effects: *italics* = common; **bold** = life-threatening ⚠️
Nurse Alert

dabigatran

(da-bye-gat'ran)

Pradaxa

Func. class.: Anticoagulant-thrombin inhibitor

ACTION:

Direct thrombin inhibitor that inhibits both free and clot-bound thrombin, prevents thrombin-induced platelet aggregation and thrombus formation by preventing conversion of fibrinogen to fibrin

USES:

Stroke/systemic embolism prophylaxis with nonvalvular atrial fibrillation

Unlabeled uses: Deep venous thrombus (DVT), pulmonary embolism prophylaxis

CONTRAINDICATIONS:

Hypersensitivity, bleeding, prosthetic heart valves

Precautions: Pregnancy (C), labor, obstetric delivery, breastfeeding, children, geriatric patients, abrupt discontinuation, anticoagulant therapy, renal disease, surgery

DOSAGE AND ROUTES

Calculator

Stroke prophylaxis

- **Adult: PO** 150 mg bid

For conversion from an alternative anticoagulant to dabigatran

- When converting from warfarin to dabigatran, discontinue warfarin and initiate dabigatran therapy when the INR is <2.0 ; when converting from a parenteral anticoagulant to dabigatran, initiate dabigatran 0-2 hr before the time of the next scheduled anticoagulant dose or at the time of discontinuation of a continuously administered anticoagulant (e.g., intravenous unfractionated heparin)

For conversion from dabigatran to warfarin

- **Adult:** CCr >50 ml/min, start warfarin 3 days before discontinuing dabigatran; CCr 31-50 ml/min, start warfarin 2 days before discontinuing dabigatran; CCr 15-30 ml/min, start warfarin 1 day before discontinuing dabigatran

For conversion from dabigatran to parenteral anticoagulants

- **Adult: PO** discontinue dabigatran, start parenteral anticoagulant 12 hr (CCr ≥ 30 ml/min) or 24 hr (CCr < 30 ml/min) after the last dabigatran dose

Renal dose

- **Adult: PO** CCr 15-30 ml/min, 75 mg bid

Deep venous thrombus (DVT)/pulmonary embolism prophylaxis (unlabeled)

- **Adult: PO** 220 mg or 150 mg/day $\times$ 28-35 days, starting with 1/2 dose 1-4 hr after surgery

Available forms: Caps 75, 100 mg

Administer:

- Do not crush, break, chew, or empty contents of capsule
- If dose is missed, take as soon as remembered if on the same day; do not administer if < 6 hr before next dose • Without regard to food
- Store in original package at room temp until time of use; discard after 30 days, protect from moisture

SIDE EFFECTS

CNS: Intracranial bleeding

CV: Myocardial infarction

GI: Abdominal pain, dyspepsia, peptic ulcer, esophagitis, GERD, gastritis, GI bleeding

HEMA: Bleeding, hemorrhagic erosive gastritis

INTEG: Rash, pruritus

SYST: Anaphylaxis (rare)

PHARMACOKINETICS

Protein binding 35%, half-life 12-17 hr (extended in renal disease), peak 1 hr, high-fat meal delays peak

INTERACTIONS

Increase: bleeding risk—amiodarone, other anticoagulants, clopidogrel, ketoconazole, quinine, thrombolytics, verapamil

Decrease: dabigatran effect—rifampin

Decrease: dabigatran effect—P-glycoprotein inducers (carbamazepine, rifampin, tipranavir)

Drug/Lab Test

Increase: thrombin time, aPTT

NURSING CONSIDERATIONS

Assess:

• **Bleeding:** blood in urine or emesis, dark tarry stools, lower back pain; caution with arterial/venous punctures, catheters, NG tubes; monitor vital signs frequently; elderly patients more prone to serious bleeding, monitor aPTT, ecarin clotting time baseline and during treatment • **Thrombosis/MI/emboli:** swelling, pain, redness, difficulty breathing, chest pain, tachypnea, cough, coughing up blood, cyanosis • **Postthrombotic syndrome:** pain, heaviness, itching/tingling, swelling, varicose veins, brownish/reddish skin discoloration, ulcers; use of ambulation, compression stockings, adequate anticoagulation can prevent this syndrome • **Surgery:** discontinue 24-48 hr before surgery in those with CCr ≥ 50 ml/min, 72-96 hr in those with CCr < 50 ml/min; longer times may be needed in major surgery

Evaluate:

• Therapeutic response: decreased thrombus formation/extension, absence of emboli, post-thrombotic effects

Teach patient/family:

- About the purpose and expected results of this product, to take at same time of day, not to skip or double doses • To take without regard to food, swallow cap whole
- To avoid all other products unless approved by prescriber
- To notify all providers that this product is being used
- To report any bleeding including blood in stool, emesis, urine; nosebleeds

HIGH ALERT

dacarbazine (Rx)

(da-kar'ba-zeen)

DTIC , DTIC-Dome

Func. class.: Antineoplastic alkylating agent

Chem. class.: Cytotoxic triazine

ACTION:

Alkylates DNA, RNA; inhibits DNA, RNA synthesis; also responsible for breakage, cross-linking of DNA strands; activity is not cell-cycle–phase specific

USES:

Hodgkin's disease, malignant melanoma

Unlabeled uses: Malignant pheochromocytoma in combination with cyclophosphamide and vinCRISTine, metastatic soft-tissue sarcoma in combination with other agents, carcinoma meningitis, neuroblastoma

CONTRAINDICATIONS:

Breastfeeding, hypersensitivity

Precautions: Renal disease

Black Box Warning:

Pregnancy (C) 1st trimester, radiation therapy, hepatic disease, bone marrow suppression, secondary malignancy

DOSAGE AND ROUTES

Calculator

Metastatic malignant melanoma

- **Adult:** IV 2-4.5 mg/kg/day × 10 days or 100-250 mg/m²/day × 5 days; repeat q3-4wk depending on response

Hodgkin's disease

- **Adult:** IV 150 mg/m²/day × 5 days with other agents, repeat q4wk; or 375 mg/m² on days 1 and 15 when given in combination, repeat q28days

Osteogenic sarcoma (unlabeled)

- **Adult and child:** IV 250 mg/m²/day as continuous inf × 4 days q28days

Soft-tissue sarcoma (unlabeled)

- **Adult and child:** IV 250-300 mg/m²/day as continuous inf × 3 days q21-28days

Carcinoma meningitis (unlabeled)

- **Adult:** INTRATHECAL 5-30 mg in a fixed dose 2-3 ×/wk until disease controlled

Available forms: Powder for inj 10, 100, 200 mg

Administer:

- Antiemetic 30-60 min before giving product to prevent vomiting, nausea;

vomiting may subside after several doses • Antibiotics for prophylaxis of infection

IV route

- Use cytotoxic handling precautions

Direct IV route

- After diluting 100 mg/9.9 or 200 mg/19.7 ml of sterile water for inj (10 mg/ml), give by direct IV over 1 min through Y-tube or 3-way stopcock

Intermittent IV INF route

- May be further diluted in 50-250 ml D₅W or NS for inj, given as an inf over 1/2 hr
- Watch for extravasation; stop infusion, apply ice to area

Y-site compatibilities: Amifostine, anidulafungin, atenolol, aztreonam, bivalirudin, bleomycin, caspofungin, DAPTOmycin, dexmedetomidine, DOCEtaxel, DOXOrubicin, ertapenem, etoposide, fenoldopam, filgrastim, fludarabine, gemtuzumab, granisetron, levofloxacin, mechlorethamine, melphalan, nesiritide, octreotide, ondansetron, oxaliplatin, PACLitaxel, palonosetron, pamidronate, quinupristin-dalfopristin, sargramostim, teniposide, thiotepa, tigecycline, tirofiban, vinorelbine, voriconazole, zoledronic acid

SIDE EFFECTS

CNS: Facial paresthesia, flushing, fever, malaise; confusion, headache, **seizures, cerebral hemorrhage**, blurred vision (high doses)

GI: Nausea, anorexia, vomiting, **hepatotoxicity** (rare)

HEMA: **Thrombocytopenia, leukopenia**, anemia

INTEG: Alopecia, dermatitis, pain at inj site, photosensitivity; severe sun reactions (high doses)

MISC: Flulike symptoms, malaise, fever, myalgia, hypotension

SYST: **Anaphylaxis**

PHARMACOKINETICS

Metabolized by liver; excreted in urine; half-life 35 min, terminal 5 hr, 5% protein bound

INTERACTIONS

Black Box Warning:

Toxicity, bone marrow suppression: bone marrow suppressants, radiation, other antineoplastics

- Bleeding: salicylates, anticoagulants

Increase: adverse reaction; decrease antibody reaction—live virus vaccines

Increase: nephrotoxicity—aminoglycosides

Increase: ototoxicity—loop diuretics

Decrease: dacarbazine effect—phenytoin, PHENobarbital

NURSING CONSIDERATIONS

Assess:

Black Box Warning:

Bone marrow suppression: CBC, differential, platelet count weekly; notify prescriber of results

- Monitor temp; may indicate beginning infection

Black Box Warning:

Secondary malignancy: assess for secondary malignancy that may occur with this product

- Bleeding: hematuria, guaiac, bruising, petechiae of mucosa or orifices q8hr
- Effects of alopecia on body image, discuss feelings about body changes

Black Box Warning:

Hepatic disease: jaundice of skin, sclera; dark urine; clay-colored stools; itchy skin; abdominal pain; fever; diarrhea; hepatic studies before, during therapy (bilirubin, AST, ALT, LDH) as needed or monthly

- Inflammation of mucosa, breaks in skin

⚠ Hypersensitivity reactions, anaphylaxis, discontinue product, administer meds for anaphylaxis

Perform/provide:

- Storage in light-resistant container in a dry area
- Increased fluid intake to 2-3 L/day to prevent urate deposits, calculi formation
- Warm compresses at inf site for inflammation

Evaluate:

- Therapeutic response: decreased tumor size, spread of malignancy

Teach patient/family:

- That patient should avoid prolonged exposure to sun, wear sunscreen
- That hair may be lost during treatment; that a wig or hairpiece may make the patient feel better; that new hair may be different in color, texture
- **To report signs of infection:** fever, sore throat, flulike symptoms
- **To report signs of anemia:** fatigue, headache, faintness, SOB, irritability
- To report bleeding; to avoid use of razors, commercial mouthwash

- **Pregnancy:** to notify prescriber if pregnancy is planned or suspected

pregnancy (D) • To avoid aspirin products or ibuprofen

Black Box Warning:

To use reliable contraceptives during and for several months after therapy; not to breastfeed

☼ Canada only Side effects: *italics* = common; **bold** = life-threatening ⚠
Nurse Alert

dalfampridine (Rx)

(dal-fam'pri-deen)

Ampyra

Func. class.: Neurological agent—MS

Chem. class.: Broad spectrum potassium channel blocker

ACTION:

Mechanism of action is not fully understood; a broad-spectrum potassium channel blocker that inhibits potassium channels and increased action potential conduction in demyelinated axons

USES:

For improved walking in patients with multiple sclerosis

CONTRAINDICATIONS:

Renal failure (CCr <50 ml/min), seizures

Precautions: Pregnancy (C), breastfeeding, geriatric patients, renal disease

DOSAGE AND ROUTES

Calculator

- **Adult: PO** 10 mg q12hr

Renal dose

- **Adult: PO** CCr 51-80 ml/min, no dosage adjustment needed but seizure risk unknown; CCr ≤50 ml/min, do not use

Available forms: Ext rel tab 10 mg

Administer:

- Do not break, crush, or chew; give without regard to meals
- Do not give closer together than q12hr; seizures may occur
- Do not double doses; if a dose is missed, skip it

SIDE EFFECTS

CNS: Seizures, paresthesias, headache, dizziness, asthenia, insomnia

GI: Nausea, constipation, dyspepsia

GU: Urinary tract infection

MS: Back pain

PHARMACOKINETICS

Bioavailability 96%; peak 3-4 hr (fasting), longer if taken with food; largely unbound to plasma proteins; 96% recovered in urine

INTERACTIONS

- Do not use with fampridine, other 4-aminopyridine (4-AP)–containing products

NURSING CONSIDERATIONS

Assess:

- **Multiple sclerosis:** improved walking, including speed
- **Seizures:** more common in those with previous seizure disorder

Evaluate:

- Therapeutic response: ability to walk at improved speed in MS

Teach patient/family:

- To notify prescriber if pregnancy is planned or suspected; not to breastfeed
- Expected results; side effects, including seizures

🍁 Canada only Side effects: *italics* = common; **bold** = life-threatening ⚠️

Nurse Alert

HIGH ALERT

dalteparin (Rx)

(dahl'ta-pear-in)

Fragmin

Func. class.: Anticoagulant

Chem. class.: Low-molecular-weight heparin

ACTION:

Inhibits factor Xa/IIa (thrombin), resulting in anticoagulation

USES:

Unstable angina/non-Q-wave MI; prevention of deep venous thrombosis in abdominal surgery, hip replacement, or in those with restricted mobility during acute illness, PE

Unlabeled uses: Antiphospholipid antibody, arterial thromboembolism (after heart valve surgery), cerebral thromboembolism

CONTRAINDICATIONS:

Hypersensitivity to this product, heparin, or pork products, benzyl alcohol; active major bleeding, hemophilia, leukemia with bleeding, thrombocytopenic purpura, cerebrovascular hemorrhage, cerebral aneurysm; those undergoing regional anesthesia for unstable angina, non-Q-wave MI, dalteparin-induced thrombocytopenia

Precautions: Pregnancy (B), breastfeeding, children, recent childbirth, geriatric patients; hepatic disease; severe renal disease; blood dyscrasias; bacterial endocarditis; acute nephritis; uncontrolled hypertension; recent brain, spine, eye surgery; congenital or acquired disorders; severe cardiac disease; peptic ulcer disease; hemorrhagic stroke; history of HIT; pericarditis; pericardial effusion; recent lumbar puncture; vasculitis; other diseases in which bleeding is possible

Black Box Warning:

Epidural anesthesia

DOSAGE AND ROUTES

Calculator

Hip replacement surgery/DVT prophylaxis

- **Adult:** SUBCUT 2500 international units 2 hr before surgery and 2nd dose in the evening on the day of surgery (4-8 hr postop), then 5000 international units SUBCUT 1st postop day and daily × 5-10 days

Unstable angina/non-Q-wave MI

- **Adult:** SUBCUT 120 international units/kg q12hr × 5-8 days, max 10,000 international units q12hr × 5-8 days with concurrent aspirin; continue until stable

DVT, prophylaxis for abdominal surgery

- **Adult:** SUBCUT 2500 international units 1-2 hr before surgery; repeat daily × 5-10 days; for high-risk patients, 5000 international units should be used

DVT/pulmonary embolism in cancer patients

- **Adult:** SUBCUT 200 international units/kg daily during 1st month (max single dose 18,000 international units), then 150 international units/kg daily for months 2-6 (max single dose 18,000 international units), use prefilled syringe that is closest to calculated dose; if platelets are 50,000-100,000/mm³, reduce dose by 2500 international units until platelets ≥100,000 mm³; if platelets <50,000/mm³, discontinue until >50,000/mm³

Renal dose

- **Adult:** SUBCUT cancer patient with CCr <30 ml/min, monitor anti-factor Xa during extended treatment

APLA (unlabeled)

- **Adult (female):** SUBCUT Antepartum 5000 international units/day with aspirin; maintain anti-factor Xa of 0.2-0.6 international units/ml

Arterial thromboembolism prophylaxis (unlabeled)

- **Adult:** SUBCUT LMWH in combination with oral anticoagulants until INR is in therapeutic range × 2 consecutive days

Available forms: Prefilled syringes, 2500, 5000 international units/0.2 ml; 7500 international units/0.3 ml; 10,000, 25,000 international units/ml

Administer:

- Cannot be used interchangeably (unit for unit) with unfractionated heparin or other LMWHs
- Do not give IM or IV product route; approved is SUBCUT only; do not mix with other inj or sol
- Have patient sit or lie down; SUBCUT inj may be 2 inches from umbilicus in a

U-shape, upper outer side of thigh, around navel, or upper outer quadrangle of the buttocks; rotate inj sites • Changing needles not recommended; change inj site daily; use at same time of day

SIDE EFFECTS

CNS: Intracranial bleeding

HEMA: Thrombocytopenia

INTEG: Pruritus, superficial wound infection, skin necrosis, inj site reaction

SYST: Hypersensitivity, hemorrhage, anaphylaxis possible, hematoma

PHARMACOKINETICS

87% absorbed, excreted by kidneys, elimination half-life 3-5 hr, peak 4 hr, onset 1-2 hr, duration >12 hr

INTERACTIONS

Increase: bleeding risk—aspirin, oral anticoagulants, platelet inhibitors, NSAIDs, salicylates, thrombolytics

Drug/Lab Test

Increase: AST, ALT

NURSING CONSIDERATIONS

Assess:

- Blood studies (Hct/Hgb, CBC, platelets, anti-Xa, stool guaiac) during treatment because bleeding can occur **Bleeding:** Bleeding gums, petechiae, ecchymosis, black tarry stools, hematuria, epistaxis, decrease in Hct, B/P; may indicate bleeding, possible hemorrhage; notify prescriber immediately, product should be discontinued

Black Box Warning:

Epidural anesthesia: Neurologic impairment frequently in those when neuraxial anesthesia has been used, spinal/epidural hematomas can occur, with paralysis

- **Hypersensitivity:** fever, skin rash, urticaria; notify prescriber immediately
- Needed dosage change q1-2wk; dose may need to be decreased if bleeding occurs

Evaluate:

- Therapeutic response: absence of DVT

Teach patient/family:

- To avoid OTC preparations that contain aspirin; other anticoagulants, serious

product interaction may occur unless approved by prescriber • To use soft-bristle toothbrush to avoid bleeding gums; to avoid contact sports; use electric razor; to avoid IM inj • To report any signs of bleeding (gums, under skin, urine, stools), unusual bruising

TREATMENT OF OVERDOSE:

Protamine sulfate 1% given IV; 1 mg protamine/100 anti-Xa international units of dalteparin given

🍁 Canada only Side effects: *italics* = common; **bold** = life-threatening ⚠️
Nurse Alert

dantrolene (Rx)

(dan'troe-leen)

Dantrium, Revonto

Func. class.: Skeletal muscle relaxant, direct acting

Chem. class.: Hydantoin

Do not confuse: Dantrium/danazol

ACTION:

Interferes with intracellular release of calcium from the sarcoplasmic reticulum necessary to initiate contraction; slows catabolism in malignant hyperthermia

USES:

Spasticity in multiple sclerosis, stroke, spinal cord injury, cerebral palsy, malignant hyperthermia

Unlabeled uses: Neuroleptic malignant syndrome

CONTRAINDICATIONS:

Hypersensitivity, compromised pulmonary function, impaired myocardial function

Black Box Warning:

Active hepatic disease

Precautions: Pregnancy (C), breastfeeding, geriatric patients, peptic ulcer disease, cardiac/renal/hepatic disease, stroke, seizure disorder, diabetes mellitus, ALS, COPD, MS, mannitol/gelatin hypersensitivity, labor, lactase deficiency, extravasation

Black Box Warning:

Females >35 yr, with MS, or taking estrogens

DOSAGE AND ROUTES

Calculator

Spasticity

- **Adult: PO** 25 mg/day; may increase to 25-100 mg bid-qid, max 400 mg/day
- **Child: PO** 0.5 mg/kg/day given in divided doses bid; dosage may increase gradually, max 400 mg/day

Prevention of malignant hyperthermia

- **Adult and child: PO** 4-8 mg/kg/day in 3-4 divided doses × 1-2 days prior to

procedure, give last dose 4 hr preop; **IV** 2.5 mg/kg before anesthesia

Malignant hyperthermia

- **Adult and child:** **IV** 1-2.5 mg/kg, may repeat to total dose of 10 mg/kg; **PO** 4-8 mg/kg/day in 4 divided doses × 1-3 days

Neuroleptic malignant syndrome (unlabeled)

- **Adult:** **PO** 100-300 mg/day in divided doses; **IV** 1.25-1.5 mg/kg

Available forms: Caps 25, 50, 100 mg; powder for inj 20 mg/vial

Administer:

- Avoid use with other CNS depressants

PO route

- Do not crush or chew caps
- Caps may be opened, mixed with juice and swallowed
- With meals for GI symptoms

IV route

- IV after diluting 20 mg/60 ml sterile water for inj without bacteriostatic agent (333 mcg/ml); shake until clear; give by rapid IV push through **Y**-tube or 3-way stopcock; follow with prescribed doses immediately; may also give by intermittent inf over 1 hr before anesthesia • Considered incompatible in sol or syringe; compatibility unknown
- Storage in tight container at room temp; protect diluted sol from light, use reconstituted sol within 6 hr

SIDE EFFECTS

CNS: *Dizziness, weakness, fatigue, drowsiness, headache, disorientation, insomnia, paresthesias, tremors, seizures*

CV: Hypotension, chest pain, palpitations

EENT: Nasal congestion, blurred vision, mydriasis

GI: *Hepatic injury, nausea, constipation, vomiting, increased AST, alk phos, abdominal pain, dry mouth, anorexia, hepatitis, dyspepsia*

GU: Urinary frequency, nocturia, impotence, crystalluria, *hepatitis*

HEMA: *Eosinophilia, aplastic anemia, leukopenia, thrombocytopenia/lymphoma*

INTEG: Rash, pruritus, photosensitivity, extravasation (tissue necrosis)

RESP: Pleural effusion, *pulmonary edema*

PHARMACOKINETICS

PO: Peak 5 hr, highly protein bound, half-life 8 hr, metabolized in liver, excreted in urine (metabolites), absorption poor (35%)

INTERACTIONS

Increase: dysrhythmias—verapamil

Increase: hepatotoxicity—estrogens, other hepatotoxics

Increase: CNS depression—alcohol, tricyclics, opiates, barbiturates, sedatives, hypnotics, antihistamines

NURSING CONSIDERATIONS

Assess:

- **Seizures:** increased seizure activity, ECG in epilepsy patient; poor seizure control has occurred
- I&O ratio; check for urinary retention, frequency, hesitancy, especially geriatric patients

Black Box Warning:

Active hepatic disease: hepatic function by frequent determination of AST, ALT, bilirubin, alk phos, GGTP; renal function studies, BUN, creatinine, CBC

- **Allergic reactions:** rash, fever, respiratory distress
- Severe weakness, numbness in extremities; prescriber should be notified and product discontinued
- Tolerance: increased need/more frequent requests for medication, increased pain
- CNS depression: dizziness, drowsiness, insomnia, psychiatric symptoms
- **Signs of hepatotoxicity:** jaundice, yellow sclera, pain in abdomen, nausea, fever; prescriber should be notified, product discontinued

Evaluate:

- Therapeutic response: decreased pain, spasticity

Teach patient/family:

- Not to discontinue medication quickly because hallucinations, spasticity, tachycardia will occur; product should be tapered off over 1-2 wk; to notify prescriber of abdominal pain, jaundiced sclera, clay-colored stools, change in color of urine
- That if improvement does not occur within 6 wk, prescriber may discontinue product
- To avoid hazardous activities if drowsiness, dizziness occurs
- To avoid using OTC medications: cough preparations, antihistamines, other

CNS depressants, alcohol unless directed by prescriber • To use sunscreen or stay out of the sun to prevent burns

TREATMENT OF OVERDOSE:

Activated charcoal, supportive care

☼ Canada only Side effects: *italics* = common; **bold** = life-threatening ⚠

Nurse Alert

dapiprazole ophthalmic

See [Appendix B](#)

DAPTOMycin (Rx)

(dap'toe-mye-sin)

[Cubicin](#)

Func. class.: Antiinfective—miscellaneous

Chem. class.: Lipopeptides

ACTION:

A new class of antiinfective; it binds to the bacterial membrane and results in a rapid depolarization of the membrane potential, thereby leading to inhibition of DNA, RNA, and protein synthesis

USES:

Complicated skin, skin-structure infections caused by *Staphylococcus aureus* including methicillin-resistant strains, *Streptococcus pyogenes*, *Streptococcus agalactiae*, *Streptococcus dysgalactiae*, *Enterococcus faecalis* (vancomycin-susceptible strains)

Unlabeled uses: Bacteremia, endocarditis, UTI, vancomycin-resistant enterococci (VRE), *Corynebacterium jeikeium*, *Staphylococcus haemolyticus*, *Enterococcus faecium*

CONTRAINDICATIONS:

Hypersensitivity

Precautions: Pregnancy (B), breastfeeding, children, geriatric patients, GI/renal disease, myopathy, ulcerative/pseudomembranous colitis, rhabdomyolysis, eosinophilic pneumonia

DOSAGE AND ROUTES

Calculator

- **Adult:** IV INF 4 mg/kg over 1/2 hr diluted in 0.9% NaCl, give q24hr × 7-14 days; some indications may use up to 6 mg/kg
- **Adolescent/child/infant ≥5 mo (unlabeled):** IV 4-6 mg/kg/day

Renal dose

• **Adult: IV INF CCr <30 ml/min, hemodialysis, CAPD 4 mg/kg q48hr**

Bacteremia, endocarditis, UTI (unlabeled)

• **Adult: IV 6 mg/kg/day**

VRE (unlabeled)

• **Adult: IV 4 mg/kg/day**

Available forms: Lyophilized powder for inj 500 mg

Administer:

IV route

• After reconstitution with 5 ml 0.9% NaCl (250 mg/5 ml) or 10 ml 0.9% NaCl (500 mg/10 ml); further dilution is needed with 0.9 NaCl; infuse over 1/2 hr or give reconstituted sol (50 mg/ml) by IV inj over 2 min, do not use dextrose-containing solutions

Y-site compatibilities: Alfentanil, amifostine, amikacin, aminocaproic acid, aminophylline, amiodarone, amphotericin B liposome, ampicillin, ampicillin-sulbactam, argatroban, arsenic trioxide, atenolol, atracurium, azithromycin, aztreonam, bivalirudin, bleomycin, bumetanide, buprenorphine, busulfan, butorphanol, calcium chloride/gluconate, CARBOplatin, carmustine, caspofungin, ceFAZolin, cefepime, cefotaxime, cefoTEtan, cefOXitin, cefTAZidime, ceftizoxime, cefTRIAxone, cefuroxime, chloramphenicol, chlorproMAZINE, cimetidine, ciprofloxacin, cisatracurium, CISplatin, clindamycin, cyclophosphamide, cycloSPORINE, dacarbazine, DACTINomycin, DAUNOrubicin, dexamethasone, dexmedetomidine, dexrazoxane, diazepam, digoxin, diltiazem, diphenhydrAMINE, DOBUtamine, DOCEtaxel, dolasetron, DOPamine, doripenem, doxacurium, DOXOrubicin, DOXOrubicin liposomal, doxycycline, droperidol, enalaprilat, ePHEDrine, EPINEPHrine, epirubicin, eptifibatide, ertapenem, erythromycin, esmolol, etoposide, famotidine, fenoldopam, fentaNYL, fluconazole, fludarabine, fluorouracil, foscarnet, fosphenytoin, furosemide, ganciclovir, gentamicin, glycopyrrolate, granisetron, haloperidol, heparin, hydrALAZINE, hydrocortisone, HYDROmorphone, hydrOXYzine, IDArubicin, ifosfamide, inamrinone, insulin (regular), irinotecan, isoproterenol, ketorolac, labetalol, leucovorin, levofloxacin, lidocaine, linezolid, LORazepam, magnesium sulfate, mannitol, mechlorethamine, melphalan, meperidine, meropenem, mesna, metaraminol, methyl Dopate, methylPREDNISolone, metoclopramide,

metoprolol, midazolam, milrinone, mitoXANtrone, mivacurium, morphine, moxifloxacin, mycophenolate mofetil, nafcillin, nalbuphine, naloxone, niCARdipine, nitroprusside, norepinephrine, octreotide, ondansetron, oxaliplatin, oxytocin, PACLitaxel, palonosetron, pamidronate, pancuronium, PEMEtrexed, pentamidine, PHENobarbital, phenylephrine, piperacillin-tazobactam, polymyxin B, potassium acetate/chloride/phosphates, procainamide, prochlorperazine, promethazine, propranolol, quinupristin-dalfopristin, ranitidine, rocuronium, sodium acetate/bicarbonate/citrate/phosphates, succinylcholine, sulfamethoxazole-trimethoprim, tacrolimus, teniposide, theophylline, thiotepa, ticarcillin, ticarcillin-clavulanate, tigecycline, tirofiban, tobramycin, topotecan, trimethobenzamide, vasopressin, vecuronium, verapamil, vinBLAStine, vinCRISStine, vinorelbine, voriconazole, zidovudine, zoledronic acid

Solution compatibilities: 0.9% NaCl, LR

SIDE EFFECTS

CNS: Headache, insomnia, dizziness, confusion, anxiety, fatigue, fever

CV: Hypo/hypertension, **heart failure**, chest pain

GI: Nausea, constipation, diarrhea, vomiting, dyspepsia, **pseudomembranous colitis**, abdominal pain

GU: **Nephrotoxicity**

HEMA: **Leukocytosis, anemia, thrombocytopenia**

INTEG: Rash, pruritus

MISC: Fungal infections, UTI, anemia, hypoglycemia

MS: Muscle pain or weakness, arthralgia, pain, myopathy

RESP: Cough, **eosinophilic pneumonia**

SYST: **Anaphylaxis**

PHARMACOKINETICS

Site of metabolism unknown, protein binding 92%, terminal half-life 8-9 hr, 78% excreted unchanged (urine), breast milk

INTERACTIONS

Increase: myopathy—HMG-CoA reductase inhibitors

Drug/Lab Test

Increase: CPK, AST, ALT, BUN, creatinine, albumin

Increase/Decrease: glucose

NURSING CONSIDERATIONS

Assess:

- **Eosinophilic pneumonia:** dyspnea, fever, cough, shortness of breath; if left untreated, can lead to respiratory failure and death  **Nephrotoxicity:** any patient with compromised renal system, toxicity may occur; BUN, creatinine
- I&O ratio: report hematuria, oliguria, nephrotoxicity may occur
- Blood studies: CBC, CPK
- C&S; product may be given as soon as culture taken
- B/P during administration; hypo/hypertension may occur
- Signs of infection
- Allergies before treatment, reaction of each medication

Evaluate:

- **Myopathy:** assess for muscle pain, weakness; CPK >10× ULN; symptoms resolve after 3 days and CPK return to normal within 7-10 days after stopping product
- **Pseudomembranous colitis:** assess for diarrhea with mucous, pus, product should be discontinued; if moderate to severe, provide fluids, electrolytes, protein supplements, and an antibacterial
- Therapeutic response: negative culture

Teach patient/family:

- About allergies before treatment, reaction to each medication
- To report sore throat, fever, fatigue; could indicate superinfection; diarrhea; muscle weakness, pain
- Avoid breastfeeding

☼ Canada only Side effects: *italics* = common; **bold** = life-threatening 
Nurse Alert

darbepoetin (Rx)

(dar'bee-poh'eh-tin)

Aranesp

Func. class.: Hematopoietic agent

Chem. class.: Recombinant human erythropoietin

ACTION:

Stimulates erythropoiesis by the same mechanism as endogenous erythropoietin; in response to hypoxia, erythropoietin is produced in the kidney and released into the bloodstream, where it interacts with progenitor stem cells to increase red-cell production

USES:

Anemia associated with chronic renal failure, in patients on and not on dialysis, and anemia in nonmyeloid malignancies for patients receiving coadministered chemotherapy

CONTRAINDICATIONS:

Hypersensitivity to mammalian-cell-derived products, human albumin, polysorbate 80; uncontrolled hypertension; red-cell aplasia

Precautions: Pregnancy (C), breastfeeding, children, seizure disorder, porphyria, hypertension, sickle cell disease; vit B₁₂, folate deficiency; chronic renal failure, dialysis; latex hypersensitivity, CABG, angina, anemia

Black Box Warning:

Hgb >12 g/dl, neoplastic disease

DOSAGE AND ROUTES

Calculator

Correction of anemia in chronic renal failure

- **Adult:** SUBCUT/IV 0.45 mcg/kg as a single inj; every week, titrate max target Hgb of 12 g/dl

Chemotherapy treatment

- **Adult:** SUBCUT 2.25 mcg/kg/wk or 500 mcg q3wk

Epoetin alfa to darbepoetin conversion

- **Adult:** SUBCUT/IV (epoetin alfa <2500 units/wk) 6.25 mcg/wk; (epoetin alfa 2500-4999 units/wk) 12.5 mcg/wk; (epoetin alfa 5000-10,999 units/wk) 25

mcg/wk; (epoetin alfa 11,000-17,999 units/wk) 40 mcg/wk; (epoetin alfa 18,000-33,999 units/wk) 60 mcg/wk; (epoetin alfa 34,000-89,999 units/wk) 100 mcg/wk; (epoetin alfa >90,000 units/wk) 200 mcg/wk

Available forms: Sol for inj 25, 40, 60, 100, 150, 200, 300, 500 mcg/ml

Administer:

SUBCUT/IV route

- Without shaking; check for discoloration, particulate matter, do not use if present; do not dilute, do not mix with other products or sol, discard unused portion, do not pool unused portions • Subcut typically used for those not requiring dialysis
- IV given direct undiluted or bolus into IV tubing or venous line after completion of dialysis; watch for clotting of line • Adjust dosage every month or more
- Store refrigerated, do not freeze; protect from light

SIDE EFFECTS

CNS: Seizures, sweating, headache, dizziness, stroke

CV: Hypo/hypertension, cardiac arrest, angina pectoris, thrombosis, CHF, acute MI, dysrhythmias, chest pain, transient ischemic attacks, edema

GI: Diarrhea, vomiting, nausea, abdominal pain, constipation

HEMA: Red-cell aplasia

MISC: Infection, fatigue, fever, death, fluid overload, vascular access hemorrhage, dehydration, sepsis

MS: Bone pain, myalgia, limb pain, back pain

RESP: URI, dyspnea, cough, bronchitis, PE

SYST: Allergic reactions, anaphylaxis

PHARMACOKINETICS

IV: Onset of increased reticulocyte count 2-6 wk; distributed to vascular space; absorption slow and rate limiting; terminal half-life 49 hr (SUBCUT), 21 hr (IV); peak concentration at 34 hr; increased Hgb levels not generally observed until 2-6 wk after treatment initiated

INTERACTIONS

 Do not use epoetin alfa with product

Increase: darbepoetin-alfa effect—androgens

Drug/Lab Test

Increase: WBC, platelets

Decrease: bleeding time

NURSING CONSIDERATIONS

Assess:

- Symptoms of anemia: fatigue, dyspnea, pallor

⚠️ Serious allergic reactions: rash, urticaria; if anaphylaxis occurs, stop product, administer emergency treatment (rare) • Renal studies: urinalysis, protein, blood, BUN, creatinine; monitor dialysis shunts; during dialysis, heparin may need to be increased

Black Box Warning:

Blood studies: ferritin, transferrin monthly; transferrin saturation $\geq 20\%$, ferritin ≥ 100 ng/ml; Hgb 2 $\times$ /wk until stabilized in target range (30%-33%) then at regular intervals; those with endogenous erythropoietin levels of <500 units/L respond to this agent; iron stores should be corrected before beginning therapy, if there is lack of response, obtain folic acid, iron, B₁₂ levels

Black Box Warning:

Neoplastic disease: breast, non-small cell lung, head and neck, lymphoid, or cervical cancers, increased tumor progression, use lowest dose to avoid RBC transfusion

- B/P: check for rising B/P as Hgb rises; antihypertensives may be needed

⚠️ CV status: hypertension may occur rapidly, leading to **hypertensive encephalopathy**; Hgb >12 g/dl may lead to death, do not administer • I&O; report drop in output to <50 ml/hr

- **Seizures:** if Hgb is increased by 4 pts within 2 wk, institute seizure precautions
- **CNS symptoms:** sweating, pain in long bones
- **Dialysis patients:** thrill, bruit of shunts, monitor for circulation impairment

Evaluate:

- Therapeutic response: increase in reticulocyte count, Hgb/Hct; increased appetite, enhanced sense of well-being

Teach patient/family:

- To avoid driving or hazardous activity during beginning of treatment
- To monitor B/P, Hgb
- To take iron supplements, vit B₁₂, folic acid as directed
- To report side effects to prescriber; to comply with treatment regimen
- That menses and fertility may return; to use contraception
- About home administration procedures, if appropriate

🍁 Canada only Side effects: *italics* = common; **bold** = life-threatening ⚠️
Nurse Alert

darifenacin

(da-ree-fen'ah-sin)

Enablex

Func. class.: Antispasmodic/Quaternary anticholinergic

ACTION:

Bladder smooth muscle relaxation by decreasing the action of muscarinic receptors, thereby relieving overactive bladder

USES:

Urge incontinence, frequency, urgency in overactive bladder

CONTRAINDICATIONS:

Hypersensitivity, urinary retention, narrow-angle glaucoma (uncontrolled)

Precautions: Severe hepatic disease (Child-Pugh C), GI/GU obstruction, controlled narrow-angle glaucoma, ulcerative colitis, myasthenia gravis, moderate hepatic disease (Child-Pugh B), elderly

DOSAGE AND ROUTES

Calculator

- **Adult: PO** 7.5 mg/day, initially, may increase to 15 mg/day after 14 days if needed

Those taking a CYP3A4 inhibitor

- **Adult: PO** max 7.5 mg/day

Hepatic dosage

- **Adult: PO (Child-Pugh B)** max 7.5 mg/day

Available forms: Tabs, ext rel 7.5, 15 mg

Administer:

- Without regard to meals, do not crush, break, chew extended-release tabs
- Store at room temperature

SIDE EFFECTS

CNS: Dizziness, headache

EENT: Blurred vision, drying eyes, sinusitis, rhinitis

GI: Constipation, dry mouth, abdominal pain, nausea, vomiting, dyspepsia

GU: UTI, urine retention, vaginosis

INTEG: rash, pruritus, skin drying

MISC: Bronchitis, flulike symptoms

PHARMACOKINETICS

Peak 7 hr, half-life 12-19 hr

INTERACTIONS

Increase: level of—digoxin

Increase: anticholinergic effect—anticholinergics

Increase: darifenacin level—CYP3A4 inhibitors

Increase: levels of—drugs metabolized by CYP2D6

NURSING CONSIDERATIONS

Assess:

- Urinary function: urgency, frequency, retention in bladder-outflow obstruction
- Constipation, may add bulk in the diet

Evaluate:

- Decreasing urgency, frequency of urination

Teach patient/family:

- To take without regard to meals; do not crush, break, chew extended-release tabs
- To store at room temperature
- To avoid breastfeeding; to notify prescriber if pregnancy (C) is planned or suspected
- About anticholinergic symptoms (dry mouth, constipation, dry eyes, heat prostration), not to become overheated • To avoid hazardous activities until reaction is known, dizziness, blurred vision can occur

☼ Canada only Side effects: *italics* = common; **bold** = life-threatening ⚠

Nurse Alert

darunavir (Rx)

(dar-ue'na-vir)

Prezista

Func. class.: Antiretroviral

Chem. class.: Protease inhibitor

ACTION:

Inhibits human immunodeficiency virus (HIV-1) protease; this prevents maturation of the virus

USES:

HIV-1 in combination with ritonavir and other antiretrovirals

CONTRAINDICATIONS:

Hypersensitivity

Precautions: Pregnancy (B), breastfeeding, children, geriatric patients, renal/hepatic disease, history of renal stones, diabetes, hypercholesterolemia, sulfonamide hypersensitivity, antimicrobial resistance, bleeding, immune reconstitution syndrome, pancreatitis

DOSAGE AND ROUTES

Calculator

Treatment-naïve patients

- **Adult: PO** 800 mg with ritonavir 100 mg daily

Treatment-experienced patients

- **Adult/adolescent >40 kg/child ≥6 yr: PO** 600 mg bid; with ritonavir 100 mg bid with food; 800 mg daily with ritonavir 100 mg with food (without darunavir resistance)
- **Adolescent ≥30 kg, <40 kg and child ≥6 yr: PO** 450 mg bid with ritonavir 60 mg bid
- **Adolescent ≥20 kg, <30 kg and child ≥6 yr: PO** 375 mg bid with ritonavir 50 mg bid
- **Child 3 to <6 yr (14 kg to <15 kg: PO** 280 mg (with ritonavir 48 mg) bid with food
- **Child 3 to <6 yr (13 kg to <14 kg: PO** 260 mg (with ritonavir 40 mg) bid with

food

- **Child 3 to <6 yr (12 kg to <13 kg: PO 240 mg (with ritonavir 40 mg) bid with food**

- **Child 3 to <6 yr (11 kg to <12 kg: PO 220 mg (with ritonavir 32 mg) bid with food**

- **Child 3 to <6 yr (10 kg to <11 kg: PO 200 mg (with ritonavir 32 mg) bid with food**

Available forms: Tabs 75, 150, 400, 600 mg

Administer:

- With food and ritonavir
- Tab should be swallowed whole

SIDE EFFECTS

CNS: Headache, insomnia, dizziness, somnolence

GI: Diarrhea, abdominal pain, nausea, vomiting, anorexia, dry mouth, hepatitis, hepatotoxicity

GU: Nephrolithiasis

INTEG: Rash, angioedema, Stevens-Johnson syndrome, toxic epidermal necrolysis, exanthematous pustulosis

MS: Pain

OTHER: Asthenia, insulin-resistant hyperglycemia, hyperlipidemia, ketoacidosis, lipodystrophy

PHARMACOKINETICS

95% protein binding; metabolized by CYP3A; peak 2.5-4 hr; terminal half-life 15 hr; excreted in feces 79.5%, urine 13.9%

INTERACTIONS

 **Life-threatening dysrhythmias:** ergots, midazolam, rifampin, pimozide, triazolam; do not use concurrently

Increase: myopathy, rhabdomyolysis—HMG-CoA reductase inhibitors (atorvastatin, lovastatin, simvastatin)

Increase: darunavir levels—CYP3A4 inhibitors: (ketoconazole, itraconazole)

Increase: levels of both products—clarithromycin, zidovudine

Increase: levels of telaprevir, rilpivavirine, monitor for adverse reactions

Decrease: darunavir levels—CYP3A4 inducers (carbamazepine, phenytoin,

fosphenytoin, PHENobarbital), rifamycins, fluconazole, nevirapine, efavirenz

Decrease: levels of oral contraceptives

Decrease: levels of both products—tenofovir, avoid concurrent use

Drug/Herb

Decrease: darunavir levels—St. John's wort; avoid concurrent use

Increase: myopathy, rhabdomyolysis risk—red yeast rice

Drug/Food

Increase: darunavir absorption

Drug/Lab Test

Increase: LFTs, bilirubin, uric acid

Decrease: WBC, neutrophils, platelets

NURSING CONSIDERATIONS

Assess:

- Complaints of lower back, flank pain; indicates kidney stones
- Signs of infection, anemia, the presence of other sexually transmitted diseases
- **Serious skin reactions:** angioedema, Stevens-Johnson syndrome, toxic epidermal necrolysis; discontinue immediately, notify prescriber
- **Hepatotoxicity:** hepatic studies (ALT, AST, bilirubin, amylase); all may be elevated in those with underlying liver disease, product should be discontinued in those with increased LFTs
- Viral load, CD4, HIV RNA during treatment
- Bowel pattern before, during treatment; if severe abdominal pain with bleeding occurs, product should be discontinued; monitor hydration
- **Hyperlipidemia:** cholesterol, triglycerides, LDL may be elevated; monitor serum cholesterol, lipid panel throughout treatment

Evaluate:

- Therapeutic response: decreased viral load, increased CD4 count

Teach patient/family:

- To use nonhormonal birth control; not to breastfeed
- To take as prescribed; if dose is missed, to take as soon as remembered up to 1 hr before next dose; not to double dose
- That product must be taken at same time of day to maintain blood levels for duration of therapy ⚠️ That **hyperglycemia** may occur; watch for increased thirst, weight loss, hunger, dry, itchy skin; to notify prescriber if these occur
- To increase fluids to prevent kidney stones; if stone formation occurs, that treatment may need to be

interrupted • That product does not cure AIDS, only controls symptoms; not to donate blood; not to share; to notify all health care providers of use; not to use with any other products without prescriber's approval

🍁 Canada only Side effects: *italics* = common; **bold** = life-threatening ⚠️
Nurse Alert

dasatinib (Rx)

(da-si'ti-nib)

Sprycel

Func. class.: Antineoplastic—miscellaneous

Chem. class.: Protein-tyrosine kinase inhibitor

ACTION:

Inhibits a tyrosine kinase enzyme, thereby reducing cell growth in leukemia

USES:

Treatment of accelerated, chronic blast phase CML or acute lymphoblastic leukemia (ALL); chronic phase CML with resistance or intolerance to prior therapy; Philadelphia chromosome–positive CML in chronic phase

CONTRAINDICATIONS:

Pregnancy (D), hypersensitivity

Precautions: Breastfeeding, children, geriatric patients, QT prolongation, infection, thrombocytopenia, accidental exposure, edema, infertility, lactase deficiency, neutropenia, anemia, autoimmune disease with immune reconstitution syndrome

DOSAGE AND ROUTES

Calculator

Accelerated or myeloid/lymphoid blast phase CML with resistance/intolerance to prior therapy

- **Adult: PO** 140 mg daily titrated up to 180 mg daily in those resistant to therapy

Chronic phase CML with resistance/intolerance to prior therapy

- **Adult: PO** 100 mg daily either AM or PM

Dosage reduction for those taking a strong CYP3A4 inhibitor

- **Adult: PO** 20-40 mg daily

Available forms: Tabs 20, 50, 70, 80, 100 mg

Administer:

- Do not break, crush, or chew tab
- After meal and with large glass of water

SIDE EFFECTS

CNS: CNS hemorrhage, headache, dizziness, insomnia, neuropathy, asthenia

CV: Dysrhythmias, chest pain, CHF, pericardial effusion, congestive cardiomyopathy, decreased injection fraction, QT prolongation

GI: Nausea, vomiting, anorexia, abdominal pain, constipation, diarrhea, GI bleeding, mucositis, stomatitis

HEMA: Neutropenia, thrombocytopenia, bleeding

INTEG: Rash, pruritus, alopecia

META: Fluid retention, edema, hypocalcemia, hypophosphatemia

MISC: Increased/decreased weight

MS: Pain, arthralgia, myalgia

RESP: Cough, dyspnea, pulmonary edema/hypertension, pneumonia, upper respiratory tract infection, pleural effusion

PHARMACOKINETICS

Metabolized by CYP3A4; 96% protein bound; peak 0.5-6 hr; excreted in feces (85%), small amount in urine (4%); terminal half-life 1.3-5 hr

INTERACTIONS

- Altered action of CYP3A4 substrates: alfentanil, cycloSPORINE, ergots, fentaNYL, pimozide, quiNIDine, sirolimus, tacrolimus

Increase: dasatinib concentrations—CYP3A4 inhibitors: ketoconazole, itraconazole, erythromycin, clarithromycin, nefazodone, protease inhibitors, telithromycin

Increase: myopathy, rhabdomyolysis-HMG-CoA reductase inhibitors (rare)

Increase: plasma concentrations of simvastatin

Increase: QT prolongation—class IA/III antidysrhythmics and other products that increase QT prolongation

Decrease: dasatinib concentrations—CYP3A4 inducers (dexamethasone, phenytoin, carBAMazepine, rifampin, PHENobarbital), H₂ blockers (famotidine), proton pump inhibitors (omeprazole)

Drug/Food

- Grapefruit: do not use

Drug/Herb

Decrease: dasatinib concentration—St. John's wort

NURSING CONSIDERATIONS

Assess:

- **Myelosuppression:** ANC, platelets; in chronic phase, if ANC $<1 \times 10^9/L$ and/or platelets $<50 \times 10^9/L$, stop until ANC $>1.5 \times 10^9/L$ and platelets $>75 \times 10^9/L$; in accelerated phase/blast crisis, if ANC $<0.5 \times 10^9/L$ and/or platelets $<10 \times 10^9/L$, determine whether cytopenia is related to biopsy/aspirate, if not, reduce dose by 200 mg, if cytopenia continues, reduce dose by another 100 mg; if cytopenia continues for 4 wk, stop product until ANC $\geq 1 \times 10^9/L$, monitor CBC weekly $\times 8$ wk, then monthly
- **Hepatotoxicity:** monitor LFTs before treatment and monthly; if liver transaminases $>5 \times IULN$, withhold until transaminase levels return to $<2.5 \times IULN$
- **Signs of fluid retention, edema:** weigh, monitor lung sounds, assess for edema; some fluid retention is dose dependent, may result in CHF, congestive cardiomyopathy, decreased injection failure
- **QT Prolongation:** more common in those with hypokalemia, hypomagnesemia, congenital long QT syndrome, those taking products that prolong QT; correct electrolyte imbalances before use

Evaluate:

- Therapeutic response: decrease in leukemic cells or size of tumor

Teach patient/family:

- To report adverse reactions immediately: SOB, swelling of extremities, bleeding, bruising
- About reason for treatment, expected results
- To use contraception (pregnancy category D), to avoid breastfeeding; men should use condoms
- To take at same time of day, not to crush or chew, do not use grapefruit juice

✳ Canada only Side effects: *italics* = common; **bold** = life-threatening ⚠

Nurse Alert

HIGH ALERT

DAUNOrubicin (Rx)

(daw-noe-roo'bi-sin)

Cerubidine

DAUNOrubicin citrate liposomal (Rx)

DaunoXome

Func. class.: Antineoplastic, antibiotic

Chem. class.: Anthracycline glycoside

Do not confuse: DAUNOrubicin/DOXOrubicin

ACTION:

Inhibits DNA synthesis, primarily; derived from *Streptomyces coerulorubidus*; replication is decreased by binding to DNA, which causes strand splitting; cell-cycle specific (S phase); a vesicant

USES:

Acute lymphocytic leukemia (ALL), acute myelogenous leukemia (AML);
liposomal: Kaposi's sarcoma

Unlabeled uses: *Liposomal:* multiple myeloma, AML, breast cancer, non-Hodgkin's lymphoma

CONTRAINDICATIONS:

Pregnancy (D), breastfeeding, hypersensitivity, systemic infections, cardiac disease, bone marrow depression

Black Box Warning:

IM/SUBCUT use

Precautions: Tumor lysis syndrome, MI, infection, thrombocytopenia, renal/hepatic disease; gout

Black Box Warning:

Bone marrow suppression, cardiac disease, extravasation, renal failure, hepatic disease; requires a specialized care setting and an experienced clinician

DOSAGE AND ROUTES

Calculator

Use decreased dose for those >60 yr

DAUNOrubicin

- **Adult:** IV 45-60 mg/m²/day × 3 days then 2 days of subsequent courses in combination, max 400-600 mg/m² total cumulative dose
- **Child:** IV 30-40 mg/m²/day depending on cycle (AML); ≤2 yr or <0.5 m²: 1 mg/kg on day 1 weekly in combination with vinCRISTine and predniSONE, base dose on body weight not surface area (ALL); >2 yr or 0.5 m²: 25 mg/m² day 1 weekly in combination with vinCRISTine and predniSONE (ALL)

DAUNOrubicin citrate liposomal

- **Adult:** IV 40 mg/m² q2wk (Kaposi's sarcoma); 100 mg/m² q3wk (multiple myeloma, unlabeled); IV 100-140 mg/m² q3wk (non-Hodgkin's lymphoma, unlabeled; metastatic breast cancer, unlabeled); IV escalating doses of 75, 100, 125, 135, 150 mg/m²/day × 3 days (AML, unlabeled)

Renal dose

- **Adult:** IV serum CCr >3 mg/dl, reduce dose by 50%

Hepatic dose

- **Adult:** IV serum bilirubin 1.2-3 mg/dl, reduce dose by 50%; bilirubin >3 mg/dl, reduce dose by 75%; bilirubin >5 mg/dl, omit dose

Available forms: Inj 20 mg powder/vial, *liposomal*: solution for inj 2 mg/ml

Administer:

- Antiemetic 30-60 min before giving product and 6-10 hr after treatment to prevent vomiting

Black Box Warning:

To be used in a care setting with emergency equipment available

Black Box Warning:

To be used by a clinician knowledgeable in cytotoxic therapy

Black Box Warning:

Do not give by IM/subcut injection

IV route (Cerubidine)

Do not confuse with liposome

- Use cytotoxic handling precautions
- After diluting 20 mg/4 ml sterile water for inj (5 mg/ml), rotate, further dilute in 10-15 ml 0.9% NaCl; give over 3-5 min by direct IV through Y-tube

or 3-way stopcock of inf of D₅ or 0.9% NaCl; or dilute in 50 ml 0.9% NaCl and give over 10-15 min; or dilute in 100 ml and give over 30 min

- Hydrocortisone for extravasation; apply ice compress after stopping inf

Solution compatibilities: D_{3.3}%/0.3% NaCl, D₅W, Normosol R, LR, 0.9% NaCl

Y-site compatibilities: Amifostine, anidulafungin, atenolol, bivalirudin, bleomycin, CARBOplatin, caspofungin, CISplatin, codeine, cyclophosphamide, cytarabine, DACTINomycin, DAPTOmycin, dexmedetomidine, etoposide, fenoldopam, filgrastim, gemcitabine, gemtuzumab, granisetron, melphalan, meperidine, methotrexate, nesiritide, octreotide, ondansetron, oxaliplatin, PACLitaxel, palonosetron, quinupristin-dalfopristin, riTUXimab, sodium acetate/bicarbonate, teniposide, thiotepa, tigecycline, trastuzumab, vinCRISTine, vinorelbine, voriconazole, zoledronic acid

IV route (DaunoXome)

- Dilute with D₅W to (1 mg/ml), give over 1-2 hr, do not use in-line filter, reconstituted sol may be stored ≤6 hr refrigerated; do not admix

IV compatibilities: Anidulafungin, bivalirudin, meperidine, octreotide, sodium acetate, tirofiban, trastuzumab

SIDE EFFECTS

DAUNOrubicin

CNS: Fever, chills

CV: CHF, pericarditis, myocarditis, peripheral edema, fatal myocarditis, left ventricular failure, QT prolongation, ST-T wave changes, QRS voltage changes, tachycardia, SVT, PVCs

GI: Nausea, vomiting, anorexia, mucositis, hepatotoxicity

GU: Impotence, sterility, amenorrhea, gynecomastia

HEMA: Thrombocytopenia, leukopenia, anemia

INTEG: Rash, extravasation, dermatitis, reversible alopecia, cellulitis, thrombophlebitis at inj site

SYST: Anaphylaxis, tumor lysis syndrome

DAUNOrubicin citrate liposomal

CNS: Fatigue, headache, depression, insomnia, dizziness, malaise, neuropathy

CV: Chest pain, edema

GI: Abdominal pain, stomatitis, nausea, vomiting, diarrhea, constipation

INTEG: Alopecia, pruritus, sweating

MISC: Allergic reactions, chest pain, fever, edema, flulike symptoms

MS: Rigors, arthralgia, back pain

RESP: Cough, dyspnea, rhinitis, sinusitis

PHARMACOKINETICS

Half-life 18½ hr, liposome 55½ hr; metabolized by liver; crosses placenta; excreted in breast milk, urine, bile

INTERACTIONS

Increase: QT prolongation, torsades de pointes—arsenic trioxide, chloroquine, clarithromycin, class IA, class III antidysrhythmics, dasatinib, dolasetron, droperidol, erythromycin, flecainide, halofantrine, haloperidol, levomethadyl, methadone, ondansetron, palonosetron, pentamidine, some phenothiazines, propafenone, risperidone, sparfloxacin; tricyclic antidepressants (high doses); vorinostat, ziprasidone

Increase: bleeding risk—NSAIDs, salicylates, anticoagulants, platelet inhibitors, thrombolytics

Increase: toxicity—other antineoplastics, radiation, cyclophosphamide

Decrease: DAUNOrubicin effects—hematopoietic progenitor cells given within 24 hr

Decrease: antibody reaction—live virus vaccines

Drug/Lab Test

Increase: uric acid

NURSING CONSIDERATIONS

Assess:

Black Box Warning:

Bone marrow suppression: CBC, differential, platelet count weekly, leukocyte nadir within 2 wk after administration, recovery within 3 wk; do not administer if absolute granulocyte count is $<750/\text{mm}^3$ (liposome)

• **Acute renal failure, uric acid nephropathy:** renal studies: BUN, urine CCr, electrolytes, uric acid baseline before each dose; I&O ratio; report fall in urine output to <30 ml/hr; provide aggressive alkalization of urine and use of allopurinol; can prevent urate nephropathy • Monitor temp q4hr; fever may indicate beginning infection

- **Hepatotoxicity:** monitor hepatic studies baseline before each dose: bilirubin, AST, ALT, alk phos; check for jaundice of skin, sclera; dark urine, clay-colored stools; itchy skin, abdominal pain, fever; diarrhea

Black Box Warning:

Cardiac toxicity: chest x-ray, echocardiography, radionuclide angiography, MUGA, ECG; watch for ST-T wave changes, low QRS and QT prolongation, possible dysrhythmias (sinus tachycardia, heart block, PVCs); watch for CHF (jugular vein distention, weight gain, edema, crackles), may occur after 2-6 mo of treatment, cumulative dose (400-550 mg/m²), 450 mg/m² if used in combination with radiation, cyclophosphamide

- Bleeding: hematuria, guaiac stools, bruising, petechiae, mucosa or orifices q8hr
- Effects of alopecia on body image; discuss feelings about body changes
- Buccal cavity q8hr for dryness, sores, ulceration, white patches, oral pain, bleeding, dysphagia, rinse mouth tid-qid with water, club soda; brush teeth bid-qid with soft brush or cotton-tipped applicators for stomatitis; use unwaxed dental floss
- **Tumor lysis syndrome:** hyperkalemia, hyperphosphatemia, hyperuricemia, hypocalcemia

Black Box Warning:

Extravasation: swelling, pain, decreased blood return; if extravasation occurs, stop infusion, remove tubing, attempt to aspirate the drug prior to removing the needle, elevate area, treat with ice pack

- GI symptoms: frequency of stools, cramping

Perform/provide:

- Increased fluid intake to 2-3 L/day to prevent urate and calculi formation

Evaluate:

- Therapeutic response: decreased tumor size, spread of malignancy

Teach patient/family:

- To report signs of infection, bleeding, bruising, SOB, swelling, change in heart rate
 - That hair may be lost during treatment; that wig or hairpiece may make patient feel better; that new hair may be different in color, texture
 - To avoid pregnancy (D) while taking product and for 4 mo thereafter; not to breastfeed
 - To avoid foods with citric acid, hot or rough texture if stomatitis is present
 - To report any bleeding, white spots, ulcerations in mouth; to examine mouth daily
 - That urine and other body fluids may be red-orange for 48 hr
 - To avoid vaccines, alcohol, aspirin, NSAIDs while taking this product
 - To avoid crowds, those with known infections
-

RARELY USED

deferasirox (Rx)

(def-a'sir-ox)

Exjade

Func. class.: Heavy metal chelating agent

USES:

Chronic iron overload, transfusion hemosiderosis

CONTRAINDICATIONS:

Breastfeeding, children, hypersensitivity, severe renal/hepatic disease, GI hemorrhage

DOSAGE AND ROUTES

Calculator

• **Adult and child >2 yr: PO** 20-30 mg/kg/day; oral dispersion tablet is dissolved in water <1 g in 3.5 oz; >1 g in 7 oz or more; give on empty stomach at least 30 min before meals

🇨🇦 Canada only Side effects: *italics* = common; **bold** = life-threatening ⚠️
Nurse Alert

degarelix

(day-gah-rel'iks)

Firmagon

Func. class.: Antineoplastic

Chem. class.: GnRH-receptor antagonist

ACTION:

Reduces gonadotropins release and testicular steroidogenesis by reversibly binding to GnRH receptors

USES:

Advanced prostate cancer

CONTRAINDICATIONS:

Hypersensitivity

Precautions: Hypersensitivity

DOSAGE AND ROUTES

Calculator

• **Adult (male): SUBCUT** 240 mg given as two 120 mg injections; (40 mg/ml concentration) maintenance 80 mg (20 mg/ml concentration) every 28 days, starting 28 days after first dose

Available forms: Injection 80, 120 mg vial

Administer:

• Do not give IV, subcut only

General reconstitution information:

- Use gloves, aseptic technique during preparation and administration
- Keep vials vertical at all times; do *not* shake the vials; give reconstituted drug within 1 hr after addition of sterile water for injection

Reconstitution of 120-mg vial (240 mg dose *only*):

• To achieve a 240-mg dose, two 120-mg vials of degarelix must be used. Repeat for each 120 mg vial: draw up exactly 3 ml of sterile water for injection with a 2-inch, 21-G needle; do not use bacteriostatic water for injection; inject the sterile water slowly into vial containing 120 mg; to maintain sterility, do not remove the syringe or the needle from the vial; keep the vial in an upright position and swirl

gently until clear; avoid shaking; reconstitution can take up to 15 min; tilt the vial slightly and withdraw 3 ml (40 mg/ml), avoid turning the vial upside down; repeat with a new vial, needle, and syringe for the second 120-mg dose (total dose = 240 mg)

Reconstitution of 80-mg vial:

- Draw up 4.2 ml of sterile water for injection with a 2-inch, 21-G needle; do not use bacteriostatic water for injection; inject the sterile water slowly into vial containing 80 mg; do not remove the syringe or the needle from the vial; keep the vial upright, swirl gently until clear; avoid shaking; reconstitution can take up to 15 min; tilt vial slightly and withdraw 4 ml (20 mg/ml); avoid turning upside down during withdrawal

Subcut injection:

- Exchange the reconstitution needle with a 1.25-inch, 27-G needle; remove air bubbles; give in the abdominal region; rotate injection site periodically; use area not exposed to pressure; grasp the skin of abdomen, elevate the subcutaneous tissue, and insert the needle deeply at an angle ≥ 45 degrees; aspirate before injection; inject the dose subcut; when giving the loading dose of two 120 mg doses, the second dose should be injected at a different site

SIDE EFFECTS

CNS: Chills, dizziness, fatigue, fever, headache, insomnia

CV: Increased QT prolongation, hypotension, hot flashes

GI: Diarrhea, constipation, nausea

GU: ED, UTI, gynecomastia

INTEG: Injection site reactions, pain at site, redness, swelling

MS: Back pain, decreased bone density

PHARMACOKINETICS

Peak 2 days, duration 50 days, half-life 53 days

INTERACTIONS

Increase: QT prolongation—Class IA/III antidysrhythmics

Drug/Lab Test

Increase: PSA, LFTs

Decrease: bone density test

NURSING CONSIDERATIONS

Assess:

QT prolongation: More common in those taking Class IA/III antidysrhythmics, heart failure, congenital long QT syndrome; monitor cardiac status at baseline and often thereafter

- Liver function studies, PSA, GGT that may be elevated; bone density that may be decreased; electrolytes

Evaluate:

- Decreasing spread, size of tumor

Teach patient/family:

- To notify all prescribers of cardiac disease or use of cardiac products
- Injection technique if patient/family will be giving product (provide patient information)

🍁 Canada only Side effects: *italics* = common; **bold** = life-threatening ⚠️
Nurse Alert

delavirdine (Rx)

(de-la-veer'deen)

Rescriptor

Func. class.: Antiretroviral

Chem. class.: Nonnucleoside reverse transcriptase inhibitor (NNRTI)

ACTION:

Binds directly to reverse transcriptase; blocks RNA-, DNA-dependent polymerase activities, causing a disruption of the enzyme's site

USES:

HIV-1 in combination with at least 2 other antiretrovirals

CONTRAINDICATIONS:

Hypersensitivity

Precautions: Pregnancy (C), breastfeeding, children, hepatic disease, achlorhydria, antimicrobial resistance, exfoliative dermatitis, hepatitis, immune reconstitution syndrome

DOSAGE AND ROUTES

Calculator

• **Adult and adolescent ≥ 16 yr:** PO 400 mg tid, max 1200 mg/day

Available forms: Tabs 100, 200 mg

Administer:

- 100-mg tab: dispersion by adding 4 tab/3-4 oz water, let stand, stir, swallow, rinse glass, swallow; use only 100-mg tabs for dispersion; 200-mg tab take as intact tab
- Do not give within 1 hr of antacids or didanosine
- Always use as combination therapy; this product is not recommended for initial treatment; due to inferior, virologic effect, it is no longer listed as part of any preferred regimens

SIDE EFFECTS

CNS: Headache, fatigue, anxiety, insomnia, fever

GI: Diarrhea, abdominal pain, nausea, anorexia, vomiting, dyspepsia,

hepatotoxicity

GU: Nephrotoxicity

HEMA: Neutropenia, leukopenia, thrombocytopenia, anemia, granulocytopenia

INTEG: Rash, pruritus

MISC: Cough

MS: Pain, myalgia

SYST: Stevens-Johnson syndrome; immune reconstitution syndrome
(combination therapy)

PHARMOCOKINETICS

98% protein bound, half-life 5.8 hr, peak 1 hr, duration 8 hr, extensively metabolized by CYP3A4, excreted in urine, feces

INTERACTIONS

Do not coadminister with nevirapine, efavirenz, rilpivirine, combined use not beneficial

⚠️ Serious life-threatening adverse reaction: amphetamines, ergots, benzodiazepines, calcium channel blockers, sedative/hypnotics, antidysrhythmics, sildenafil, pimozide, cisapride, ALPRAZolam, astemizole, midazolam, terfenadine, opiates, triazolam

Increase: levels of ALPRAZolam, clarithromycin, dapsone, ergots, felodipine, midazolam, NIFEdipine, indinavir, saquinavir, lovastatin, simvastatin, atorvastatin, other CYP3A4, 2D6 inhibitors

Increase: delavirdine levels—FLUoxetine, ketoconazole

Increase: levels of both products—quiNIDine, warfarin, clarithromycin

Decrease: delavirdine levels—antacids, anticonvulsants, rifamycins, protease inhibitors, didanosine

Decrease: action of oral contraceptives, didanosine

Drug/Herb

Decrease: delavirdine level—St. John's wort

NURSING CONSIDERATIONS

Assess:

- **HIV:** obtain hepatitis B virus (HBV) screening to ensure proper treatment, if coinfecting, a fully suppressive antiretroviral regimen with products against both; CBC, blood chemistry, plasma HIV RNA, absolute CD41/CD81/cell counts/%, serum β -2 microglobulin, serum ICD124 antigen levels • **Immune**

reconstitution syndrome: when treated with combination therapy; development

of opportunistic infections (*Mycobacterium avium complex* [MAC], cytomegalovirus [CMV], *Pneumocystis carinii* pneumonia [PCP], TB) • Signs of infection, anemia

- Hepatic studies: ALT, AST; renal studies
- Bowel pattern before, during treatment; if severe abdominal pain with bleeding occurs, product should be discontinued; monitor hydration • Allergies before treatment, reaction to each medication; place allergies on chart
- Plasma delavirdine concentrations (trough 10 micromolar)
- **Toxicity:** severe nausea/vomiting, maculopapular rash • **Serious skin reactions:** Stevens-Johnson syndrome; rash may occur within 1-3 wk of beginning treatment; if rash is not severe, manage with diphenhydramine, hydroxyzine, topical corticosteroids

Evaluate:

- Therapeutic response: increased CD4 cell count, decreased viral load, improvement in symptoms of HIV

Teach patient/family:

- To take as prescribed; if dose is missed, to take as soon as remembered up to 1 hr before next dose; not to double dose • That tabs may be dissolved in 1/2 cup of water; to stir; when dissolved, drink right away; to rinse cup with water and drink to get all medication • To make sure health care provider knows about all medications being taken
- That if severe rash, mouth sores, swelling, aching muscles/joints, or eye redness occur, to notify health care provider • **Not to breastfeed if taking this product**
- That this product is not a cure, only controls symptoms

☼ Canada only Side effects: *italics* = common; **bold** = life-threatening ⚠

demecarium ophthalmic

See [Appendix B](#)

denosumab (Rx)

(den-oh'sue-mab)

Prolia, Xgeva

Func. class.: Bone resorption inhibitor

Chem. class.: Monoclonal antibody, bone resorption

ACTION:

Neutralizes activity of receptor activator nuclear factor kappa-B ligand (RANKL) by binding to it and blocking its interaction with cell-surface receptors; use of a RANKL inhibitor may reduce bone turnover and decrease tumor burden

USES:

Osteoporosis in postmenopausal women or men at high risk for fractures; increase bone mass in men who are receiving androgen deprivation therapy for prostate cancer and women receiving aromatase inhibitor therapy for breast cancer at high risk for fractures; prevention of skeletal-related events in bone metastases from solid tumors (Xgeva)

CONTRAINDICATIONS:

Hypersensitivity, hypocalcemia

Precautions: Pregnancy (C), breastfeeding, child/infant/neonate, anemia, coagulopathy, diabetes mellitus, dialysis, eczema, hypoparathyroidism, immunosuppression, latex hypersensitivity, malabsorption syndrome, neoplastic disease, pancreatitis, parathyroid disease, dental/renal/thyroid disease, TB, vit D deficiency

DOSAGE AND ROUTES

Calculator

Postmenopausal osteoporosis

- **Adult female:** SUBCUT 60 mg q6mo with 1000 mg calcium and 400 international units vitamin D, max 60 mg q6mo

Bone metastases from solid tumors (Xgeva)

- **Adult: SUBCUT** 120 mg q4wk, max 120 mg q4wk; administer with calcium and vitamin D as necessary to prevent hypocalcemia

Prevention of skeletal-related events with bone metastases from solid tumors

- **Adult: SUBCUT** (Xgeva): 120 mg q4wk

Available forms: Sol for inj 60 mg/ml (Prolia); 120 mg/1.7 ml (Xgeva)

Administer:

SUBCUT route

- Give acetaminophen before and for 72 hr after to decrease pain
- Do not use if particulate matter or discoloration is present; sol is clear and colorless to slightly yellow with small white/opalescent particles; remove from refrigerator and allow to warm to room temp (15-30 min)
- **Use of prefilled syringe with needle safety guard:** leave green guard in original position until after administration, remove and discard needle cap immediately before inj, give by subcut inj in upper arm/thigh or abdomen; after inj, point needle away from people and slide green guard over needle
- **Use of single-use vials:** use 27G needle, give in upper arm/thigh or abdomen, do not reinsert needle in vial, discard supplies as appropriate
- Store and use out of direct sunlight/heat; do not freeze, use within 14 days after removal from refrigerator, store unopened containers in refrigerator

SIDE EFFECTS

CNS: Chills, fever, flushing, headache, vertigo, neuropathic pain

CV: Angina, **atrial fibrillation**

GI: Abdominal pain, constipation, *diarrhea*, flatulence, GERD, *vomiting*, *nausea*

GU: Cystitis, lactation suppression

HEMA: **Anemia, neutropenia**

INTEG: Atopic dermatitis, pruritus

META: Hypercholesterolemia, hypocalcemia, hypophosphatemia

MS: Back, bone pain; MS pain, myalgia, **osteonecrosis of the jaw**, atypical low trauma femoral fractures

RESP: Cough, *dyspnea*

SYST: **Infection, secondary malignancy**

PHARMACOKINETICS

Terminal half-life 25.4 days, bioavailability 62%, max serum concentration 3-21 days, steady state 6 mo

INTERACTIONS

Increase: infection, possible—immunosuppressives, corticosteroids

Increase: osteonecrosis of the jaw, possible—antineoplastics, corticosteroids

NURSING CONSIDERATIONS

Assess:

- **Acute acute-phase reaction:** fever, myalgia, headache, flulike symptoms for 72 hr after inj, usually resolves after 72 hr
- **Blood tests:** serum calcium, creatinine, BUN, magnesium, phosphate
- **Hypocalcemia:** paresthesia, twitching, laryngospasm, Chvostek's and Trousseau's signs; preexisting hypocalcemia should be corrected before treatment; patient with vit D deficiency may require higher doses of vit D
- **Hypercalcemia:** nausea, vomiting, anorexia, weakness, thirst, constipation, dysrhythmias
- **Dental status:** correct dental complications before product use; good oral hygiene should be maintained; if dental work is to be performed, antiinfectives should be given to prevent osteonecrosis of the jaw
- **Infection:** do not start treatment in patients with active infections; infections should be resolved first

Evaluate:

- Therapeutic response: increased/maintained bone density, decreased calcium levels

Teach patient/family:

- To report hypercalcemic relapse: nausea, vomiting, bone pain, thirst
- To continue with dietary recommendations, including additional calcium and vit D
- To avoid use during pregnancy and breastfeeding; to notify prescriber if pregnancy is planned, suspected
- To use acetaminophen before and for 72 hr after inj to lessen bone pain
- About the purpose of this product and its expected results
- To avoid OTC, Rx medications and herbs and supplements unless approved by prescriber

- To exercise regularly, stop smoking, and avoid alcohol to maintain bone health
 - To inform all health care providers of product use; to avoid dental procedures/surgery if possible; to practice good oral hygiene
 - That lab tests and follow-up exams will be required
-

🍁 Canada only Side effects: *italics* = common; **bold** = life-threatening ⚠️
Nurse Alert

desipramine (Rx)

(dess-ip'ra-meen)

Norpramin

Func. class.: Antidepressant, tricyclic

Chem. class.: Dibenzazepine, secondary amine

ACTION:

Blocks reuptake of norepinephrine, serotonin into nerve endings, thereby increasing action of norepinephrine, serotonin in nerve cells

USES:

Depression

Unlabeled uses: Chronic pain, postherpetic neuralgia, ADHD, bulimia, diabetic neuropathy, panic disorder, social phobia

CONTRAINDICATIONS:

Hypersensitivity to tricyclics, closed-angle glaucoma, acute MI

Precautions: Pregnancy (C), breastfeeding, geriatric patients, severe depression, increased intraocular pressure, seizure disorder, CV disease, urinary retention, cardiac dysrhythmias, cardiac conduction disturbances, family history of sudden death, prostatic hypertrophy, thyroid disease

Black Box Warning:

Children <18 yr, suicidal patients

DOSAGE AND ROUTES

Calculator

Major depression

- **Adult: PO** 50-75 mg/day in 1-4 divided doses, titrate by 25-50 mg weekly up to 300 mg/day in single or divided doses
- **Geriatric: PO** 25 mg/day at bedtime, titrate weekly, may increase to 150 mg/day
- **Adolescent: PO** 25-50 mg/day in divided doses, max 150 mg/day
- **Child 6-12 yr: PO** 1-3 mg/kg/day in divided doses; give >3 mg/kg/day with close medical monitoring; max 5 mg/kg/day

Bulimia nervosa (unlabeled)

- **Adult: PO** 25 mg tid, may titrate to 200 mg/day by 25-50 mg/day at weekly

intervals

ADHA (unlabeled)

- **Child ≥ 5 yr:** PO up to 3.5 mg/kg/day divided BID

Neuropathic pain/postherpetic neuralgia (unlabeled)

- **Adult:** PO 10-25 mg at bedtime, titrate to relief

Diabetic neuropathy (unlabeled)

- **Adult:** PO 75-150 mg

Available forms: Tabs 10, 25, 50, 75, 100, 150 mg

Administer:

- Increased fluids, bulk in diet for constipation, especially in geriatric patients; with food or milk for GI symptoms; crushed if patient is unable to swallow medication whole
- Dosage at bedtime if oversedation occurs during day; may take entire dose at bedtime; geriatric patients may not tolerate once-daily dosing

SIDE EFFECTS

CNS: *Dizziness, drowsiness, confusion, headache, anxiety, tremors, stimulation, weakness, insomnia, nightmares, EPS (geriatric patients), increased psychiatric symptoms, paresthenia, suicidal ideation*

CV: *Orthostatic hypotension, ECG changes, tachycardia, hypertension, palpitations*

EENT: *Blurred vision, tinnitus, mydriasis, ophthalmoplegia*

GI: *Diarrhea, dry mouth, nausea, vomiting, paralytic ileus, increased appetite, cramps, epigastric distress, jaundice, hepatitis, stomatitis, constipation, weight gain*

GU: *Retention, acute renal failure*

HEMA: *Agranulocytosis, thrombocytopenia, eosinophilia, leukopenia*

INTEG: *Rash, urticaria, sweating, pruritus, photosensitivity*

PHARMACOKINETICS

Well absorbed, widely distributed, protein binding 92%, extensively metabolized in the liver to active metabolite of imipramine, half-life 7-60 hr

INTERACTIONS

Increase: *serotonin syndrome, neuroleptic malignant syndrome—SSRIs, SNRIs, serotonin-receptor agonists, other tricyclic antidepressants*

Increase: *CNS depression—alcohol, barbiturates, opioids, CNS depressants*

Increase: desipramine level—cimetidine, diltiazem, fluvoxamine, fluoxetine, paroxetine, sertraline, verapamil

Increase: life-threatening B/P elevations, do not use concurrently—clonidine

Increase: hypertension—epinephrine, norepinephrine

Increase: hyperpyrexia, seizures, excitation; do not use within 14 days of MAOIs

Increase: QT interval—tricyclics, sunitinib, vorinostat, ziprasidone, gatifloxacin, levofloxacin, moxifloxacin, sparfloxacin, class IA/III antidysrhythmics

Drug/Herb

Increase: serotonin syndrome, avoid concurrent use—St. John's wort

Increase: CNS depression—kava, valerian

Drug/Lab Test

Increase: serum bilirubin, blood glucose, alk phos

NURSING CONSIDERATIONS

Assess:

- B/P (lying, standing), pulse q4hr; if systolic B/P drops 20 mm Hg, hold product, notify prescriber; take VS q4hr in patients with cardiovascular disease
- Hepatic studies: AST, ALT, bilirubin; thyroid function studies
- Weight weekly; appetite may increase with product
- **ECG** for flattening T wave, bundle branch block, AV block, dysrhythmias in cardiac patients
- **EPS** primarily in geriatric patients: rigidity, dystonia, akathisia
- **Seizure activity** in those with a history of seizures

Black Box Warning:

Mental status: mood, sensorium, affect, **suicidal tendencies**, increase in psychiatric symptoms (depression, panic); this product is not indicated for children

- Urinary retention, constipation; constipation most likely in children
- **Withdrawal symptoms:** headache, nausea, vomiting, muscle pain, weakness; not usual unless product discontinued abruptly
- Alcohol consumption; if consumed, hold dose until morning
- Check to confirm that PO medication is swallowed

Evaluate:

- Therapeutic response: decreased depression

Teach patient/family:

- That therapeutic effects may take 2-3 wk

Black Box Warning:

That suicidal thoughts/behaviors may occur; to notify prescriber immediately

- To use caution when driving, performing other activities requiring alertness because of drowsiness, dizziness, blurred vision • To avoid alcohol, other CNS depressants
- Not to discontinue medication abruptly after long-term use because this may cause nausea, headache, malaise • To wear sunscreen or large hat because photosensitivity occurs

TREATMENT OF OVERDOSE:

ECG monitoring; lavage, activated charcoal; administer anticonvulsant

☼ Canada only Side effects: *italics* = common; **bold** = life-threatening ⚠
Nurse Alert

desirudin

(deh-sihr'uh-din)

Iprivask

Func. class.: Anticoagulant

Chem. class.: Thrombin inhibitor

ACTION:

Selectively inhibits free and clot-bound thrombin, prevents activation of clotting factors

USES:

Prevents DVT in hip-replacement surgery

CONTRAINDICATIONS:

Hypersensitivity to this product, mannitol (diluent), hirudin, active bleeding, coagulation disorders

Precautions: Renal disease (CCr <60 ml/min), hepatic disease, GI/respiratory bleeding ≤3 mo, severe uncontrolled hypertension, spinal/epidural anesthesia, bacterial endocarditis children

Black Box Warning:

Epidural anesthesia

DOSAGE AND ROUTES

Calculator

• **Adult: SUBCUT** 15 mg every 12 hr × 9-12 days; give first dose 5-15 min before surgery and after induction if a regional block is used

Renal dose

• **Adult: SUBCUT** CCr 31-60 ml/min 5 mg q12hr; CCr < 31 ml/min 1.7 mg q12hr

Available forms: INJ 15 mg and mannitol 3% in water

Administer:

• Visually inspect particulate matter and discoloration prior to use, do not use sols that are cloudy or contain particles • Do not use IM

Subcut route

• Do not mix with other injections, solvents, or parenteral fluids
• **Reconstitute** each vial with 0.5 ml of provided diluent, shake gently until the

drug is fully reconstituted; the injection should be clear, colorless; once reconstituted, each 0.5 ml contains 15.75 mg desirudin; use immediately; however, it remains stable ≤ 24 hr at room temperature and protected from light. Discard any unused solution • **Subcut injection:** Have patient sit or lie down; using a syringe with a 26-or 27-G needle, which is approximately 0.5-inch long, withdraw the entire reconstituted sol into the syringe; inject total volume subcut; alternate between the left and right anterolateral and left and right posterolateral thigh or abdominal wall; insert whole length of the needle in a skin fold held between the thumb and forefinger; the skin fold should be held throughout the injection; to minimize bruising, do not rub the site

SIDE EFFECTS

CNS: Dizziness, fever

CV: Thrombosis, thrombophlebitis, hypotension

EENT: Nosebleeds

GI: Hematemesis, nausea, vomiting

GU: Hematuria

HEMA: Hemorrhage, anemia

MISC: Anaphylaxis, impaired healing, edema

PHARMACOKINETICS

Onset $\frac{1}{2}$ hr, 1-1½ hr, half-life 2 hr (12 hr in severe renal disease)

INTERACTIONS

Increase: bleeding risk—other anticoagulants, salicylates, NSAIDs, thrombolytics, glycoprotein IIb/IIIa antagonists, corticosteroids, dextran 40

Drug/Lab Test

Decrease: Hct/Hgb

NURSING CONSIDERATIONS

Assess:

Bleeding:

- Gums, black tarry stools, hematuria, epistaxis, decreased Hct/Hgb, guaiac-positive stools, bleeding from hip-replacement site, notify prescriber if these occur; observe for thrombosis, ecchymosis
- Monitor aPTT daily in those with bleeding risk, CCr < 60 ml/min, aPTT should not be $> 2\times$ control

Black Box Warning:

Epidural/spinal anesthesia sites for hematomas; can result in irreversible paralysis

- CCr baseline and qd if CCr >60 ml/min

Evaluate:

- Decreased occurrence of DVT in hip-replacement surgery

Teach patient/family:

- To report any signs of bleeding
- To use a soft-bristle toothbrush to avoid bleeding gums, to use an electric razor

☼ Canada only Side effects: *italics* = common; **bold** = life-threatening ⚠

Nurse Alert

desloratadine (Rx)

(des'lor-at'ah-deen)

Clarinet, Clarinet RediTabs

Func. class.: Antihistamine, 2nd generation

Chem. class.: Selective histamine (H₁)-receptor antagonist

ACTION:

Binds to peripheral histamine receptors, thus providing antihistamine action without sedation

USES:

Seasonal/perennial allergic rhinitis, chronic idiopathic urticaria, pruritus

CONTRAINDICATIONS:

Hypersensitivity, infants/neonates

Precautions: Pregnancy (C), breastfeeding, child, asthma, renal/hepatic impairment

DOSAGE AND ROUTES

Calculator

- **Adult and child ≥12 yr: PO** 5 mg/day
- **Child 6-11 yr: PO** 2.5 mg/day
- **Child 2-5 yr: PO** 1.25 mg/day
- **Child 6-11 mo: PO** 1 mg/day (urticaria, only)

Hepatic/renal dose

- **Adult: PO** 5 mg every other day

Available form: Tabs 5 mg; orally disintegrating tabs 2.5, 5 mg (Reditabs); syr 0.5 mg/ml

Administer:

- Without regard to meals
- Do not remove RediTabs from blister until ready to use
- RediTabs directly on tongue; may take with or without water

SIDE EFFECTS

CNS: Sedation (more common with increased doses), headache, psychomotor hyperactivity, **seizures**, fatigue

GI: **Hepatitis**, nausea, dry mouth

MISC: Flulike symptoms

PHARMACOKINETICS

Onset antihistamine effect 1 hr, relief as early as 1 day, duration up to 24 hr, peak 1½ hr, elimination half-life 8½-28 hr, metabolized in liver to active metabolites, excreted in urine

INTERACTIONS

Increase: CNS depression (rare)—alcohol, opiates, sedative/hypnotics, H₁ blockers, antipsychotics, tricyclic antidepressants, anxiolytics

Increase: desloratadine—nilotinib, etravirine

NURSING CONSIDERATIONS

Assess:

- **Allergy:** hives, rash, rhinitis; monitor respiratory status; stop product 4 days before antigen skin test

Evaluate:

- Therapeutic response: absence of running or congested nose, other allergy symptoms

Teach patient/family:

- To avoid driving, other hazardous activities if drowsiness occurs; to use caution until product's effects are known
- That product may cause photosensitivity; to use sunscreen or stay out of the sun to prevent burns
- Not to exceed max dose

☼ Canada only Side effects: *italics* = common; **bold** = life-threatening ⚠
Nurse Alert

desmopressin (Rx)

(des-moe-press'in)

DDAVP, Minirin, Octostim , Stimate

Func. class.: Pituitary hormone

Chem. class.: Synthetic antidiuretic hormone

ACTION:

Promotes reabsorption of water by action on renal tubular epithelium; causes smooth muscle constriction, increase in plasma factor VIII levels, which increases platelet aggregation, thereby resulting in vasopressor effect; similar to vasopressin

USES:

Hemophilia A, von Willebrand's disease type 1, nonnephrogenic diabetes insipidus, symptoms of polyuria/polydipsia caused by pituitary dysfunction, nocturnal enuresis

Unlabeled uses: Cardiopulmonary bypass, sickle cell disease, uremic bleeding

CONTRAINDICATIONS:

Hypersensitivity, nephrogenic diabetes insipidus, severe renal disease

Precautions: Pregnancy (B), breastfeeding, coronary artery disease, hypertension, cystic fibrosis, thrombus

DOSAGE AND ROUTES

Calculator

Primary nocturnal enuresis

- **Adult and child ≥ 6 yr:** PO 0.2 mg at bedtime, max 0.6 mg at bedtime; intranasal 0.2 ml at bedtime, half in each nostril

Diabetes insipidus

- **Adult:** INTRANASAL 0.1-0.4 ml/day in divided doses (1-4 sprays with pump); IV/SUBCUT 2-4 micromcg/day in 2 divided doses
- **Child 3 mo to 12 yr:** INTRANASAL 0.05-0.3 ml/day in divided doses

Hemophilia/von Willebrand's disease

- **Adult and child > 3 mo:** IV 0.3 mcg/kg in 0.9% NaCl over 15-30 min; may repeat if needed

Antihemorrhagic

- **Adult and child >3 mo: IV** 0.3 mcg/kg
- **Adult and child <50 kg: INTRANASAL** 1 spray in 1 nostril
- **Adult and child >50 kg:** 1 spray in each nostril

Cardiopulmonary bypass (unlabeled)

- **Adult: IV** 0.3 mcg/kg with aminocaproic acid given as a single postop dose

Sickle cell disease (unlabeled)

- **Adult: SUBCUT/IV** 0.3 mcg/kg with a high fluid intake

Uremic bleeding (unlabeled)

- **Adult: SUBCUT/IV** 0.3-0.4 mg/kg as a single inj

Available forms: Inj 4, 15 mg/ml; Rhinal tube delivery 2.5 mg/vial (0.1 mg/ml); tabs 0.1, 0.2 mg; nasal spray pump 10 mcg/spray (0.1 mg/ml); nasal sol 1.5 mg/ml (150 mcg/dose)

Administer:

PO route

- Store at room temperature

Direct IV route

- Undiluted over 1 min for diabetes insipidus

Intermittent IV INF route

- Diluted single dose/50 ml of 0.9% NaCl (adult and child >10 kg), single dose/10 ml as IV inf over 15-30 min for von Willebrand's disease or hemophilia A
- Store in refrigerator

SIDE EFFECTS

CNS: Drowsiness, headache, lethargy, flushing, **seizures**

CV: Increased B/P, palpitations, tachycardia

EENT: Nasal irritation, congestion, rhinitis

GI: Nausea, heartburn, cramps

GU: Vulval pain

META: Hyponatremia, hyponatremia-induced seizures

SYST: **Anaphylaxis (IV)**

PHARMACOKINETICS

PO: Onset 1 hr, peak 4-7 hr

INTRANASAL: Onset 1 hr; peak 1-4 hr; duration 8-20 hr; half-life 8 min, 76

min (terminal)

IV: Onset 1 min, peak 1/2 hr, duration >3 hr

INTERACTIONS

Increase: antidiuretic action—carbamazepine, chlorpropamide, clofibrate

Increase: pressor effect—pressor products

Decrease: antidiuretic action—lithium, alcohol, demeclocycline, heparin, large doses of epinephrine

NURSING CONSIDERATIONS

Assess:

- Pulse, B/P when giving IV or SUBCUT
- I&O ratio, weight daily; check for edema in extremities; if water retention severe, diuretic may be prescribed • **Water intoxication:** lethargy, behavioral changes, disorientation, neuromuscular excitability • Intranasal use: nausea, congestion, cramps, headache; usually decreased with decreased dose; for nasal mucosa changes: congestion, edema, discharge, scarring (nasal route) ⚠️ **For severe allergic reaction, including anaphylaxis (IV route)**
- Urine volume/osmolality and plasma osmolality (diabetes insipidus)
- Factor VIII coagulant activity, bleeding time before using for hemostasis
- **Nocturnal enuresis:** frequency of enuresis before and during treatment

Evaluate:

- Therapeutic response: absence of severe thirst, decreased urine output, decreased osmolality

Teach patient/family:

- About the proper technique for nasal instillation: to insert tube into nostril to instill product • To avoid OTC products (cough, hay fever) because these preparations may contain epinephrine, decrease product response; not to use with alcohol because adverse reactions may occur • To wear emergency ID specifying therapy
- That, if dose is missed, to take when remembered up to 1 hr before next dose; not to double dose; to avoid fluids from 1 hr to up to 8 hr after PO dose • To report upper respiratory infection, nasal congestion to prescriber

☼ Canada only Side effects: *italics* = common; **bold** = life-threatening ⚠️

Nurse Alert

desonide topical

See [Appendix B](#)

desoximetasone

(dess-ox'ee-met'ah-sone)

[Topicort](#)

Func. class.: Corticosteroid, topical

ACTION:

Crosses cell membrane to attach to receptors to decrease inflammation, itching; inhibits multiple inflammatory cytokines

USES:

Inflammation/itching of corticosteroid-responsive dermatoses on the skin

CONTRAINDICATIONS:

Hypersensitivity, use of some preparations on face, axilla, groin, intertriginous areas; monotherapy in primary bacterial infection

Precautions: Pregnancy (C), breastfeeding, children, skin infections

DOSAGE AND ROUTES

Calculator

Adult/child >10 yr:

- Apply to affected areas 2 times/day

Available forms: Cream 0.05%, 0.25%; ointment 0.05%, 0.25%; gel 0.05%

Administer:

Topical route

 **Do not use with occlusive dressings** • **Cream/ointment/lotion:** apply sparingly in a thin film and rub gently into the cleansed, affected area • **Gel:** apply sparingly in a thin film and rub gently into the cleansed, affected area

SIDE EFFECTS

INTEG: Burning, folliculitis, pruritus, dermatitis, maceration

MISC: Hyperglycemia, glycosuria, systemic absorption, HPA axis suppression, **Cushing syndrome**

NURSING CONSIDERATIONS

Assess:

- Skin reactions: burning pruritus, folliculitis, dermatitis

Evaluate:

- Decreasing itching, inflammation on the skin

Teach patient/family:

Topical route

 **Not to use with occlusive dressings** • **Cream/ointment/lotion:** apply sparingly in a thin film and rub gently into the cleansed, affected area • **Gel:** apply sparingly in a thin film and rub gently into the cleansed, affected area

☼ Canada only Side effects: *italics* = common; **bold** = life-threatening 

Nurse Alert

desoxyephedrine nasal agent

See [Appendix B](#)

desvenlafaxine

Pristiq

Func. class.: Antidepressant, serotonin-receptor norepinephrine reuptake inhibitor (SNRI)

ACTION:

May work by blocking the central presynaptic reuptake of 5-HT and NE, resulting in an increased sustained level of these neurotransmitters.

USES:

Major depressive disorder

Unlabeled uses: Vasomotor symptoms (hot flashes) associated with menopause

CONTRAINDICATIONS:

Hypersensitivity to this product or *venlafaxine*, *MAOI therapy*

Precautions: CNS depression, abrupt discontinuation, hypertension, hepatic/renal disease, hyponatremia, geriatric patients, pregnancy (C), labor and delivery, breastfeeding, angina, bleeding, cardiac dysrhythmias, MI, stroke, mania, hypovolemia, dehydration

Black Box Warning:

Children, suicidal ideation

DOSAGE AND ROUTES

Calculator

• **Adult: PO** Initially, 50 mg/day; max 400 mg/day with adjustments as needed

Renal dose

• **Adult: PO** CCr 30-50 ml/min 50 mg q day; CCr < 30 ml/min or end stage renal disease 50 mg q other day

Vasopastic effects of menopause (unlabeled)

• **Adult: PO** 100-150 mg/day

Available forms: Extended release tabs 50, 100 mg

Administer:

- Without regard to food, food may minimize GI symptoms
- Extended release tab: do not crush, break, or chew
- Store at room temperature

SIDE EFFECTS

CNS: *Dizziness*, drowsiness, *headache*, tremor, paresthesias, asthenia, worsening of depression, **suicidal thoughts/behaviors**, **seizures**, fatigue, chills, yawning, hot flashes, flushing, *irritability*, *insomnia*, *anxiety*, *abnormal dreams*, *fatigue*

CV: Palpitations, sinus tachycardia, increased blood pressure, orthostatic hypotension

EENT: Blurred vision, mydriasis, tinnitus, bruxism

GI: *Nausea*, xerostomia, *diarrhea*, constipation, vomiting, anorexia, weight loss, dysgeusia, hypercholesterolemia, hypertriglyceridemia

GU: Urinary retention/hesitancy, orgasm dysfunction, decreased libido, impotence, proteinuria

HEMA: Impaired platelet aggregation

INTEG: Photosensitivity, hyperhidrosis, diaphoresis, rash

SYST: Serotonin syndrome, neuroleptic malignant syndrome–like symptoms, toxic epidermal necrolysis, Stevens-Johnson syndrome, erythema multiforme, angioedema; neonatal abstinence syndrome (fetal exposure)

PHARMACOKINETICS

Protein binding 30%, elimination half-life 11 hrs; elimination half-life is increased (hepatic/renal disease)

INTERACTIONS

Increase: serotonin syndrome, neuroleptic malignant syndrome–like reactions—SSRIs, other SNRIs, serotonin receptor agonists (almotriptan, eletriptan, frovatriptan, naratriptan, rizatriptan, sumatriptan, zolmitriptan), TCAs, traZADone, sibutramine, SUMAtriptan, ergots, dexfenfluramine, fenfluramine, lithium, nefazodone, meperidine, phentermine, MAOIs, dextromethorphan, linezolid, promethazine, methylphenidate, dexmethylphenidate, mirtazapine, pentazocine, tryptophan; do not administer concurrently

Increase: bleeding risk—salicylates, thrombolytics, NSAIDs, platelet inhibitors, anticoagulants

Increase: CNS depression—alcohol, opioids, antihistamines, sedatives/hypnotics

Increase: hallucinations, delusions, disorientation—zolpidem

Drug/Herb

Increase: desvenlafaxine action—kava, valerian

Drug/Lab Test

Increase: sodium, cholesterol, triglycerides

NURSING CONSIDERATIONS

Assess:

Black Box Warning:

Suicidal thoughts/behaviors: mental status and mood, identify suicidal ideation

• **Serotonin syndrome, neuroleptic malignant syndrome–like symptoms:** assess for nausea/vomiting, sedation, dizziness, diaphoresis (sweating), facial flush, hallucinations, mental status changes, myoclonia, restlessness, shivering, elevated blood pressure, hyperthermia, muscle rigidity, autonomic instability, mental status changes; if serotonin syndrome occurs discontinue desvenlafaxine, and any other serotonergic agents • Monitor B/P baseline and periodically during treatment

• Appetite and nutritional intake, weight loss is common, change diet as need to support weight

Evaluate:

• Decreased depression; increased sense of well-being, renewed interest in activities

Teach patient/family:

• To take as directed, not to double or skip doses; if a dose is missed, take as soon as remembered unless close to next dose; do not discontinue abruptly, decreased gradually

Black Box Warning:

To report immediately suicidal thoughts/behaviors, have family members look for symptoms of suicidal ideation

• Not to operate machinery or engage in hazardous activities until reaction is known, may cause dizziness, drowsiness • To avoid all other products unless approval by prescriber

• To report if pregnancy is planned or suspected (pregnancy category C) or if

breastfeeding

- To report immediately allergic reactions, including rash, hives, difficulty breathing, or swelling of face, lips
 - That continuing follow-up exams will be needed
-

🍁 Canada only Side effects: *italics* = common; **bold** = life-threatening ⚠️
Nurse Alert

dexamethasone (Rx)

(dex-ah-meth'a-sone)

Baycadron, Decadron, Dexasone , DexPak, Maxidex 

dexamethasone sodium phosphate (Rx)

Func. class.: Corticosteroid, synthetic

Chem. class.: Glucocorticoid, long acting

Do not confuse: **Decadron**/Percodan

ACTION:

Decreases inflammation by suppression of migration of polymorphonuclear leukocytes, fibroblasts, reversal of increased capillary permeability and lysosomal stabilization, suppresses normal immune response, no mineralocorticoid effects

USES:

Inflammation, allergies, neoplasms, cerebral edema, septic shock, collagen disorders, dexamethasone suppression test for Cushing Syndrome, adrenocortical insufficiency, TB, meningitis, acute exacerbations of MS

CONTRAINDICATIONS:

Hypersensitivity to corticosteroids, sulfites or benzyl alcohol; fungal infections, abrupt discontinuation, coagulopathy, ulcerative colitis, seizure disorders

Precautions: Pregnancy (C), breastfeeding, diabetes mellitus, osteoporosis, seizure disorders, ulcerative colitis, CHF, myasthenia gravis, renal disease, peptic ulcer, esophagitis, recent MI, hypertension, TB, active hepatitis, psychosis, sulfite hypersensitivity, thromboembolic disorders

DOSAGE AND ROUTES

Calculator

Inflammation

- **Adult:** **PO** 0.75-9 mg/day in divided doses q6-12hr or phosphate **IM** 0.5-9

mg/day divided q6-12hr

- **Child: PO** 0.024-0.34 mg/kg/day in divided doses q6-12hr

Anaphylactic shock

- **Adult: IV** (Phosphate) single dose 1-6 mg/kg or **IV** 40 mg q2-6hr as needed up to 72 hr

Cerebral edema

- **Adult: IV** (Phosphate) 10 mg, then 4-6 mg **IM** q6hr × 2-4 days, then taper over 1 wk
- **Child:** Loading dose 1-2 mg/kg (**PO/IM/IV**) then 1-1.5 mg/kg/day, max 16 mg/day divided q4-6hr for 2-4 days, then taper down weekly

Adrenocortical insufficiency

- **Adult: PO** 0.75-9 mg/day in divided doses
- **Child: PO** 0.03-0.3 mg/kg/day in 2-4 divided doses

Suppression test

- **Adult: PO** 1 mg at 11 PM or 0.5 mg q6hr × 48 hr

ARDS (unlabeled)

- **Adult: IM/IV** (phosphate) 0.5-9 mg/day in 2-4 divided doses
- **Child: IM/IV** 0.06-0.3 mg/kg/day or 1.2-10 mg/m² in divided doses q6-12hr

Bone pain (unlabeled)

- **Adult: PO/IV** 12-20 mg/day in divided doses

Pediatric bacterial meningitis (unlabeled)

- **Child and infant >2 mo: IV** 0.15 mg/kg qid × first 2 days of antibiotics

Available forms: Dexamethasone: tabs 0.5, 0.75, 1, 1.5, 2, 4, 6 mg; elix 0.5 mg/5 ml; oral sol 0.5 mg/5 ml, 1 mg/1 ml; **sodium phosphate:** 4, 10 mg/ml; ophth implant 0.7 mg; ophth susp drops/solution 0.1%

Administer:

PO route

- Titrated dose; use lowest effective dose
- With food or milk to decrease GI symptoms

IM route

- IM inj deeply in large muscle mass; rotate sites; avoid deltoid; use 21G needle
- In 1 dose in AM to prevent adrenal suppression; avoid SUBCUT administration, may damage tissue

Direct IV route (sodium phosphate)

- Undiluted direct over ≤ 1 min

Intermittent IV INF route

- Diluted with 0.9% NaCl or D₅W, give as IV inf at prescribed rate

Dexamethasone sodium phosphate

Syringe compatibilities:

Acetaminophen, caffeine, dimenhydrAMINE, furosemide, granisetron, hyaluronidase, ketamine, metoclopramide, octreotide, oxyCODONE, palonosetron, ranitidine, salbutamol, SUFentanil, traMADol

Y-site compatibilities: Acetaminophen, acyclovir, alfentanil, allopurinol, amifostine, amikacin, aminocaproic acid, aminophylline, amphotericin B cholesteryl, amphotericin B lipid complex, amphotericin B liposome, amsacrine, anidulafungin, argatroban, ascorbic acid injection, atenolol, atracurium, atropine, aztreonam, benztropine, bivalirudin, bleomycin, bumetanide, buprenorphine, butorphanol, caffeine, CARBOplatin, carmustine, cefamandole, ceFAZolin, cefepime, cefmetazole, cefonicid, cefoperazone, cefotaxime, cefoTETan, cefOXitin, cefpirome, ceftaroline, ceftAZidime, ceftizoxime, ceftobiprole, cefTRIAXone, chloramphenicol, cimetidine, cisatracurium, CISplatin, cladribine, clindamycin, codeine, cyanocobalamin, cyclophosphamide, cycloSPORINE, cytarabine, DACTINomycin, DAPTOMycin, DAUNOrubicin, dexmedetomidine, digoxin, diltiazem, DOCEtaxel, DOPamine, doripenem, doxacurium, DOXOrubicin, DOXOrubicin liposomal, enalaprilat, ePHEDrine, EPINEPHrine, epoetin alfa, eptifibatide, ertapenem, etoposide, etoposide phosphate, famotidine, fentaNYL, filgrastim, fluconazole, fludarabine, fluorouracil, folic acid, fosaprepitant, foscarnet, furosemide, ganciclovir, gatifloxacin, gemcitabine, glycopyrrolate, granisetron, heparin, hydrocortisone, HYDROmorphine, ifosfamide, imipenem-cilastatin, indomethacin, insulin (regular), irinotecan, isoproterenol, ketorolac, lansoprazole, leucovorin, levofloxacin, lidocaine, linezolid, liposome, LORazepam, LR, mannitol, mechlorethamine, melphalan, meropenem, metaraminol, methadone, methicillin, methoxamine, methyl dopate, methylPREDNISolone, metoclopramide, metoprolol, metroNIDAZOLE, mezlocillin, miconazole, milrinone, morphine, moxalactam, multiple vitamins injection, nafcillin, nalbuphine, naloxone, nitroglycerin, nitroprusside, norepinephrine, octreotide, ondansetron, oxacillin, oxaliplatin, oxyCODONE, oxytocin, PACLitaxel, palonosetron, pamidronate,

pancuronium, PEMEtrexed, penicillin G potassium/sodium, PENTobarbital, PHENobarbital, phenylephrine, phytonadione, piperacillin, piperacillin-tazobactam, potassium chloride, procainamide, propofol, propranolol, pyridoxine, ranitidine, remifentanyl, Ringer's, ritodrine, riTUXimab, sargramostim, sodium acetate/bicarbonate, succinylcholine, SUFentanyl, tacrolimus, telavancin, teniposide, theophylline, thiamine, thiotepa, ticarcillin, ticarcillin-clavulanate, tigecycline, tirofiban, TNA, tolazoline, topotecan, trastuzumab, trimetaphan, urokinase, vancomycin, vasopressin, vecuronium, verapamil, vinCRIStine, vinorelbine, vitamin B complex/C, voriconazole, zidovudine, zoledronic acid

SIDE EFFECTS

CNS: *Depression, flushing, sweating, headache, mood changes, euphoria, psychosis, seizures, insomnia, pseudotumor cerebri*

CV: *Hypertension, circulatory collapse, tachycardia, edema, cardiomyopathy, thromboembolism, heart failure, dysrhythmias*

EENT: *Fungal infections, increased intraocular pressure, blurred vision, cataracts, glaucoma*

ENDO: *HPA suppression, hyperglycemia, sodium, fluid retention*

GI: *Diarrhea, nausea, abdominal distention, GI hemorrhage, increased appetite, pancreatitis*

HEMA: *Thrombocytopenia, transient leukocytosis, thromboembolism*

INTEG: *Acne, poor wound healing, ecchymosis, petechiae, hirsutism, angioedema*

META: *Hypokalemia*

MS: *Fractures, osteoporosis, weakness, arthralgia, myopathy*

PHARMACOKINETICS

Half-life 1-2 days

PO: Onset 1 hr, peak 1-2 hr, duration 2½ days

IM: Duration 2 days-3 wk

INTERACTIONS

Increase: toxicity—cycloSPORINE

Increase: side effects—alcohol, salicylates, amphotericin B, digoxin, cycloSPORINE, diuretics, NSAIDs

Increase: dexamethasone action—salicylates, estrogens, indomethacin, hormonal contraceptives, ketoconazole, macrolide antiinfectives, NSAIDs

Increase: tendinitis tendon rupture risk—quinolones

Increase: effect of—antidiabetics

Decrease: dexamethasone action—cholestyramine, colestipol, barbiturates, rifampin, ePHEDrine, phenytoin, theophylline, antacids, bosentan, carbamazepine, ethotoin

Decrease: anticoagulant effect—anticonvulsants, antidiabetics, ambenonium, neostigmine, isoniazid, toxoids, vaccines, anticholinesterases, salicylates, somatrem

Decrease: potassium levels—thiazide diuretics

Drug/Lab Test

Increase: cholesterol, sodium, blood glucose, uric acid, calcium

Decrease: calcium, potassium, T₄, T₃, thyroid ¹³¹I uptake test, urine 17-OHCS, 17-KS, PBI

False negative: skin allergy tests

NURSING CONSIDERATIONS

Assess:

- Potassium, blood, urine glucose while receiving long-term therapy; hypo/hyperglycemia
- Weight daily; notify prescriber of weekly gain >5 lb
- B/P, pulse; notify prescriber of chest pain
- I&O ratio; be alert for decreasing urinary output, increasing edema
- **Cushingoid symptoms:** Assess for buffalo hump, moon face, increased B/P; monitor; plasma cortisol levels during long-term therapy (normal: 138-635 nmol/L SI units when drawn at 8 AM); prolonged use can cause cushingoid symptoms
- **Infection:** fever, WBC even after withdrawal of medication; product masks infection
- **Potassium depletion:** paresthesias, fatigue, nausea, vomiting, depression, polyuria, dysrhythmias, weakness
- Edema, hypertension, cardiac symptoms
- **Mental status:** affect, mood, behavioral changes, aggression
- **Abrupt withdrawal:** acute adrenal insufficiency and death may occur following abrupt discontinuation of systemic therapy; withdraw gradually

Evaluate:

- Therapeutic response: decreased inflammation

Teach patient/family:

- That ID as corticosteroid user should be carried
 - To contact prescriber if surgery, trauma, stress occurs because dose may need to be adjusted
 - To notify prescriber if therapeutic response decreases because dosage adjustment may be needed
 - To take with food or milk
 - That bruising may occur easily
 - That if on long-term therapy a high protein diet may be needed
 - ⚠ Not to discontinue abruptly because **adrenal crisis** can result
 - About symptoms of adrenal insufficiency: nausea, anorexia, fatigue, dizziness, dyspnea, weakness, joint pain
 - To avoid OTC products: salicylates, alcohol in cough products, cold preparations unless directed by prescriber
 - About all aspects of product usage, including cushingoid symptoms; to notify health care provider of infection
 - To avoid exposure to chickenpox or measles, persons with infection
-

🍁 Canada only Side effects: *italics* = common; **bold** = life-threatening ⚠
Nurse Alert

dexamethasone (ophthalmic)

(dex-a-meth'a-sone)

Maxidex

Func. class.: Ophthalmic antiinflammatory

Chem. class.: Corticosteroid

Do not confuse: dexamethasone/desoximetasone

ACTION:

Exact mechanism of antiinflammatory action unknown; inhibits multiple inflammatory cytokines; decreases inflammation, collagen deposits, capillary dilation, edema

USES:

Treatment of corticosteroid-responsive ophthalmic disorders

CONTRAINDICATIONS:

Hypersensitivity to this product or sulfites, ocular TB, acute herpes simplex (superficial), fungal/viral infections of the eye, posterior lens capsule rupture

Precautions: Corneal infected abrasions, glaucoma, pregnancy (C), breastfeeding, migration of intravitreal implant risk, children

DOSAGE AND ROUTES

Calculator

Treatment of corticosteroid-responsive ophthalmic disorders including allergic conjunctivitis (not controlled topically), allergic marginal corneal ulcer, anterior segment inflammation, chorioretinitis, cyclitis, Graves' ophthalmopathy, giant papillary conjunctivitis (GPC), ophthalmic herpes zoster (herpes zoster ophthalmicus, herpes zoster keratitis), iritis, keratitis, superficial punctate keratitis, postoperative ocular inflammation, optic neuritis, diffuse choroiditis, sympathetic ophthalmia, vernal keratoconjunctivitis, corneal injury (corneal abrasion):

- **Adult:** Instill 1 or 2 drops of 0.1% ophthalmic sol or susp every hour during the day and every 2 hr at night; reduce application to every 4 hr after response occurs

Available forms: Ophthalmic solution, suspension 0.1%

Administer:

- For ophthalmic use only
- Instruct patient on proper instillation of eye ointment or solution. Do not touch the tip of the dropper to the eye, fingertips, or other surface, wait ≥ 15 min before inserting soft contact lens

SIDE EFFECTS

EENT: Burning, stinging, poor vision, corneal ulcerations, increased IOP, optic nerve damage

NURSING CONSIDERATIONS**Assess:**

- **Corneal effects:** ulcerations, infections can worsen with this product

Evaluate:

- Decreased corneal inflammation

Teach patient/family:

- How to use products
- Not to share with others or use for other conditions
- **To notify prescriber immediately if vision changes or if condition worsens** • To take as prescribed

🍁 Canada only Side effects: *italics* = common; **bold** = life-threatening ⚠️

Nurse Alert

dexamethasone topical

See [Appendix B](#)

dexlansoprazole (Rx)

(dex-lan-so-prey'zole)

[Dexilant](#)

Func. class.: Antiulcer, proton-pump inhibitor

Chem. class.: Benzimidazole

ACTION:

Suppresses gastric secretion by inhibiting hydrogen/potassium ATPase enzyme system in gastric parietal cell; characterized as gastric acid pump inhibitor because it blocks final step of acid production

USES:

Gastroesophageal reflux disease (GERD), severe erosive esophagitis, heartburn

CONTRAINDICATIONS:

Hypersensitivity

Precautions: Pregnancy (B), breastfeeding, children, proton-pump hypersensitivity, gastric cancer, hepatic disease, vit B₁₂ deficiency

DOSAGE AND ROUTES

Calculator

Erosive esophagitis

- **Adult: PO** 60 mg daily for up to 8 wk; maintenance: **PO** 30 mg daily for up to 6 mo

GERD

- **Adult: PO** 30 mg daily × 4 wk

Hepatic disease

- **Adult: PO (Child-Pugh B): max 30 mg/day**

Available forms: Del rel caps 30, 60 mg

Administer:

- Swallow caps whole; do not crush, chew caps; caps may be opened, contents sprinkled on food, use immediately; do not chew contents of capsule, give

without regard to food

SIDE EFFECTS

CNS: Headache, dizziness, confusion, agitation, amnesia, depression, **anxiety, seizures**, insomnia, migraine

CV: Chest pain, angina, bradycardia, palpitations, **CVA**, hypertension, **MI**

EENT: Tinnitus

GI: Diarrhea, abdominal pain, vomiting, nausea, constipation, flatulence, colitis, dysgeusia

HEMA: Anemia, **neutropenia, thrombocytopenia, pernicious anemia, thrombosis**

INTEG: Rash, urticaria, pruritus

META: Gout

MS: Arthralgia, myalgia

RESP: Upper respiratory infections, cough, epistaxis, dyspnea, **pneumonia**

SYST: **Anaphylaxis, Stevens-Johnson syndrome, toxic epidermal necrolysis, exfoliative dermatitis**

PHARMACOKINETICS

Absorption 57%-64%; plasma half-life 1-2 hr; protein binding 96.1%-98.8%; extensively metabolized in liver; excreted in urine, feces; clearance decreased in geriatric patients, renal/hepatic impairment; peak dual 1-2 hr, 4-5 hr

INTERACTIONS

Increase: dexlansoprazole effect—CYP2C19, 3A4 inhibitors (fluvoxamine, voriconazole)

- Dexlansoprazole absorption: sucralfate

Decrease: absorption of ketoconazole, itraconazole, iron, delavirdine, ampicillin, calcium carbonate

Drug/Lab Test

Increase: LFTs, bilirubin, creatinine, glucose, lipids

Decrease: platelets, magnesium

NURSING CONSIDERATIONS

Assess:

- GI system: bowel sounds q8hr, abdomen for pain, swelling, anorexia, monitor

serum magnesium

• **Hepatotoxicity (rare):** hepatitis, jaundice, monitor hepatic studies (AST, ALT, alk phos) if hepatic adverse reactions occur • **Hypomagnesemia:** usually 3 mo to 1 yr after beginning therapy; monitor magnesium level, assess for irregular heart beats, muscle spasms; in children, fatigue, upset stomach, dizziness; magnesium supplement may be used • **Anaphylaxis (rare), serious skin disorders:** require emergency intervention

Evaluate:

• Therapeutic response: absence of epigastric pain, swelling, fullness

Teach patient/family:

- To report severe diarrhea; product may have to be discontinued
- That diabetic patient should know that hypoglycemia may occur
- To avoid hazardous activities; dizziness may occur
- To avoid alcohol, salicylates, ibuprofen; may cause GI irritation
- To report allergic reactions, symptoms of low magnesium levels
- **To notify prescriber if pregnancy is planned or suspected, not to breastfeed** • To swallow cap whole, not to chew, crush

☼ Canada only Side effects: *italics* = common; **bold** = life-threatening ⚠
Nurse Alert

dexmethylphenidate (Rx)

(dex'meth-ul-fen'ih-dayt)

Focalin, Focalin XR

Func. class.: Central nervous system (CNS) stimulant, psychostimulant

Controlled Substance Schedule II

Do not confuse: dexmethylphenidate/methylphenidate

ACTION:

Increases release of norepinephrine and dopamine into the extraneuronal space, also blocks the reuptake of norepinephrine and dopamine into the presynaptic neuron; mode of action for treating attention-deficit/hyperactivity disorder (ADHD) is unknown

USES:

ADHD

CONTRAINDICATIONS:

Breastfeeding, children <6 yr, hypersensitivity to methylphenidate, anxiety, history of Gilles de la Tourette's syndrome, tics, psychosis, glaucoma, concurrent treatment with MAOIs or within 14 days of discontinuing treatment with MAOIs

Precautions: Pregnancy (C), hypertension, depression, seizures, CV disorders, alcoholism

Black Box Warning:

Substance abuse

DOSAGE AND ROUTES

Calculator

- **Adult/adolescent/child >6 yr: PO** 2.5 mg bid with doses at least 4 hr apart, gradually increase to a maximum of 20 mg/day (10 mg bid); for those taking methylphenidate, use 1/2 of methylphenidate dose initially then increase as needed to a max of 20 mg/day
- **Adolescent and child ≥6 yr: EXT REL** 5 mg/day, may adjust to 20 mg/day in 5-mg increments, max 30 mg/day
- **Adult: PO EXT REL** 10 mg/day, may adjust to 20 mg/day in 10-mg

increments, max 40 mg/day

Available forms: Tabs 2.5, 5, 10 mg; ext rel caps 5, 10, 15, 20, 25, 30, 35, 40 mg (Focalin XR)

Administer:

- Twice daily at least 4 hr apart; ext rel once a day; in the morning, ext rel cap may be opened and contents sprinkled onto applesauce and consumed without chewing
- Without regard to meals
- Do not break, crush, or chew ext rel product
- Med guide should be provided by dispenser

SIDE EFFECTS

CNS: Dizziness, headache, drowsiness, nervousness, insomnia, **toxic psychosis, neuroleptic malignant syndrome (rare)**, Tourette's syndrome

CV: Palpitations, B/P changes, angina, **dysrhythmias, tachycardia, MI, stroke**

GI: *Nausea, anorexia*, abnormal hepatic function, **hepatic coma, abdominal pain**

HEMA: **Leukopenia, anemia, thrombocytopenic purpura**

INTEG: **Exfoliative dermatitis**, urticaria, rash, erythema multiforme

MISC: *Fever*, arthralgia, scalp hair loss

PHARMACOKINETICS

Readily absorbed, elimination half-life 2.2 hr, metabolized by liver, excreted by kidneys

PO: Peak 1½ hr, onset 1/2-1 hr, duration 4 hr

PO-ER: Onset unknown, peak 4 hr, duration 8 hr

INTERACTIONS

⚠ Increase: hypertensive crisis—MAOIs or within 14 days of MAOIs, vasopressors

Increase: sympathomimetic effect—decongestants, vasoconstrictors

Increase: effects of anticonvulsants, tricyclics, SSRIs, coumarin

Decrease: effects of antihypertensives

Drug/Herb

- Synergistic effect: melatonin

NURSING CONSIDERATIONS

Assess:

Black Box Warning:

Substance abuse, past or current; psychotic episodes may occur, especially with parental abuse

- VS, B/P; may reverse antihypertensives; check patients with cardiac disease more often for increased B/P
- CBC, differential platelet counts during long-term therapy, urinalysis; with diabetes: blood glucose, urine glucose; insulin changes may have to be made because eating will decrease; platelets • Height, growth rate q3mo in children; growth rate may be decreased
- Mental status: mood, sensorium, affect, stimulation, insomnia, aggressiveness, hostility

 **Withdrawal symptoms: headache, nausea, vomiting, muscle pain, weakness**

- Appetite, sleep, speech patterns
- For attention span, decreased hyperactivity in persons with ADHD

Evaluate:

- Therapeutic response: decreased hyperactivity or ability to stay awake

Teach patient/family:

- To decrease caffeine consumption (coffee, tea, cola, chocolate); may increase irritability, stimulation • To take early in day to prevent insomnia
- To avoid OTC preparations unless approved by prescriber; to avoid alcohol ingestion
- To taper off product over several wk to avoid depression, increased sleeping, lethargy
- To avoid hazardous activities until stabilized on medication
- To get needed rest; patients will feel more tired at end of day
- To notify all health care workers, including school nurse, of medication and schedule
- About information, instructions provided in patient information section
- To notify prescriber if pregnancy is planned or suspected, avoid breastfeeding

TREATMENT OF OVERDOSE:

Administer fluids; hemodialysis or peritoneal dialysis; antihypertensive for increased B/P; administer short-acting barbiturate before lavage

☛ Canada only Side effects: *italics* = common; **bold** = life-threatening 
Nurse Alert

dextroamphetamine (Rx)

(dex-troe-am-fet'a-meen)

Dexedrine, ProCentra

Func. class.: Cerebral stimulant

Chem. class.: Amphetamine

Controlled Substance Schedule II

ACTION:

Increases release of norepinephrine, dopamine in cerebral cortex to reticular activating system

USES:

Narcolepsy, attention-deficit/hyperactivity disorder (ADHD)

Unlabeled uses: Obesity

CONTRAINDICATIONS:

Hypersensitivity to sympathomimetic amines, hyperthyroidism, hypertension, glaucoma, severe arteriosclerosis, anxiety, anorexia nervosa, tartrazine dye hypersensitivity

Black Box Warning:

Symptomatic CV disease, substance abuse

Precautions: Pregnancy (C), breastfeeding, children <3 yr, depression, Gilles de la Tourette's disorder, cardiomyopathy, bipolar disorder, abrupt discontinuation, acute MI; benzyl alcohol, salicylate hypersensitivity; hypercortisolism, obesity, psychosis, seizure disorder

DOSAGE AND ROUTES

Calculator

Narcolepsy

- **Adult: PO** 5 mg bid, titrate daily dose by no more than 10 mg/wk, max 60 mg/day
- **Child 6-12 yr: PO** 5 mg/day, titrate daily dose by no more than 5 mg/day at weekly intervals

ADHD

- **Adult: PO** 5-60 mg/day in divided doses
 - **Child 3-5 yr: PO** 2.5 mg/day increasing by 2.5 mg/day at weekly intervals, max 40 mg/day
 - **Child >6-12 yr: PO** 5 mg daily-bid increasing by 5 mg/day at weekly intervals
- Obesity, exogenous (unlabeled)**
- **Adult and adolescent: PO** 5-30 mg/dose given 30-60 min before meals, use for 3-6 wk only

Available forms: Tabs 5, 10 mg; oral sol 5 mg/5 ml

Administer:

- At least 6 hr before bedtime to avoid sleeplessness
- Use calibrated measuring device for oral sol
- Store all forms at room temperature

SIDE EFFECTS

CNS: *Hyperactivity, insomnia, restlessness, talkativeness*, dizziness, headache, chills, stimulation, dysphoria, irritability, aggressiveness, tremor, dependence, addiction

CV: *Palpitations, tachycardia*, hypertension, decrease in heart rate, **dysrhythmias**

GI: *Anorexia*, dry mouth, diarrhea, constipation, weight loss, metallic taste

GU: Impotence, change in libido

INTEG: Urticaria

PHARMACOKINETICS

Onset 1 hr; peak 2 hr; duration 4-20 hr; ext rel onset 1 hr, peak 2 hr, duration 8 hr; metabolized by liver; urine excretion pH dependent; crosses placenta, breast milk; half-life 6-8 hr (child), 10-12 hr (adult)

INTERACTIONS

⚠ Hypertensive crisis: MAOIs or within 14 days of MAOIs

Increase: serotonin syndrome, neuroleptic malignant syndrome: SSRIs, SNRIs, serotonin-receptor agonists; **do not use concurrently**

Increase: dextroamphetamine effect—acetaZOLAMIDE, antacids, sodium bicarbonate

Increase: CNS effect—haloperidol, tricyclics, phenothiazines

Decrease: absorption of barbiturates, phenytoin

Decrease: dextroamphetamine effect—ascorbic acid, ammonium chloride, guanethidine

Decrease: effect of adrenergic blockers, antidiabetics, antihypertensives, antihistamines

Drug/Herb

- **Serotonin syndrome:** St. John's wort

Decrease: stimulant effect—eucalyptus

Drug/Food

Increase: amine effect—caffeine (cola, coffee, tea [green/black])

Drug/Lab Test

Increase: plasma corticosteroids, urinary steroids

NURSING CONSIDERATIONS

Assess:

Black Box Warning:

Cardiac disease: VS, B/P; product may reverse antihypertensives; check patients with cardiac disease often

Black Box Warning:

Substance abuse: use for prolonged periods may lead to dependence; sudden death or serious CV events can occur from misuse; chronic intoxication (insomnia, irritability, personality changes)

- CBC, urinalysis; with diabetes: blood glucose, urine glucose; insulin changes may be required because eating will decrease
- Height, growth rate in children; growth rate may be decreased, weight
- Mental status: mood, sensorium, affect, stimulation, insomnia, irritability
- Tolerance or dependency: increased amount may be used to get same effect; will develop after long-term use
- **Overdose:** pain, fever, dehydration, insomnia, hyperactivity

Evaluate:

- Therapeutic response: increased CNS stimulation, decreased drowsiness

Teach patient/family:

- To take before meals (obesity)
- To decrease caffeine consumption (coffee, tea, cola, chocolate); may increase irritability, stimulation
- To avoid OTC preparations unless approved by prescriber

- To taper product over several wk; depression, increased sleeping, lethargy may occur
- To avoid alcohol ingestion
- To avoid hazardous activities until stabilized on medication
- To get needed rest; patient will feel more tired at end of day

TREATMENT OF OVERDOSE:

Administer fluids, hemodialysis, or peritoneal dialysis; antihypertensive for increased B/P, ammonium Cl for increased excretion

🍁 Canada only Side effects: *italics* = common; **bold** = life-threatening ⚠️
Nurse Alert

dextromethorphan (OTC)

(dex-troe-meth-or'fan)

Balminil , Benylin , Buckley's DM, Buckley's Mixture, Delsym 12-Hour, ElixSure Cough, Koffex , Robitussin, Robitussin Cough with honey, Robitussin Long Acting Strength, Scot-Tussin Diabetes CF, Silphen-DM, Top Care Day Time Cough, Top Care Tussin Cough Suppressant Long-Acting, Triaminic Long Acting Cough, Tylenol Children's Simply Cough, Vicks DayQuil Cough, Vicks Formula 44, Wal-Tussin *Func. class.:* Antitussive, nonopioid
Chem. class.: Levorphanol derivative

ACTION:

Depresses cough center in medulla by direct effect

USES:

Nonproductive cough caused by colds or inhaled irritants

CONTRAINDICATIONS:

Hypersensitivity

Precautions: Pregnancy (C), fever, hepatic disease, asthma/emphysema, chronic cough

DOSAGE AND ROUTES

Calculator

- **Adult and child ≥ 12 yr:** **PO** 10-20 mg q4hr or 30 mg q6-8hr, max 120 mg/day; **SUS-REL LIQ** 60 mg q12hr, max 120 mg/day
- **Child 6-12 yr:** **PO** 5-10 mg q4hr; **SUS REL LIQ** 30 mg bid, **LOZ** 5-10 mg q1-4hr; max 60 mg/day
- **Child 4-6 yr:** **PO** 2.5-7.5 mg q4-8hr, max 30 mg/day; **SUS REL LIQ** 15 mg bid
- **Child < 2 -5 yr:** 2.5-5 mg q4hr or 7.5 mg q6-8hr, max 30 mg/day; **EXT REL** not recommended

Available forms: Liq 7.5, 15 mg/5 ml; syr 10 mg/5 ml, 15 mg/5 ml, 30 mg/15 ml; gel caps 15 mg; caps 15 mg; ext rel susp: 30 mg/5 ml

Administer:

- **Chew tabs:** chew well; **syrup:** use calibrated measuring device; **ext rel susp:** shake well, use calibrated measuring device • Decreased dose for geriatric patients; metabolism may be slowed

SIDE EFFECTS

CNS: *Dizziness*, sedation, confusion, ataxia, fatigue

GI: *Nausea*

PHARMACOKINETICS

PO: Onset 15-30 min, duration 3-6 hr

SUS: Duration 12 hr, terminal half-life 11 hr, metabolized by the liver, excreted via kidneys

INTERACTIONS

- Do not give with MAOIs or within 2 wk of MAOIs; avoid furazolidone, linezolid, procarbazine (MAOI activity)

Increase: CNS depression—alcohol, antidepressants, antihistamines, opioids, sedative/hypnotics

Increase: adverse reactions—amiodarone, quinidine, serotonin receptor agonist, sibutramine, SSRI

NURSING CONSIDERATIONS

Assess:

- **Cough:** type, frequency, character, including sputum
- Increase fluids to liquify secretions

Evaluate:

- Therapeutic response: absence of cough

Teach patient/family:

- To avoid driving, other hazardous activities until stabilized on medication
- To avoid smoking, smoke-filled rooms, perfumes, dust, environmental pollutants, cleaners that increase cough
- To avoid alcohol, CNS depressants
- To notify prescriber if cough persists over a few days

☼ Canada only Side effects: *italics* = common; **bold** = life-threatening ⚠
Nurse Alert

dextrose (D-glucose) (Rx)

Func. class.: Caloric, parenteral solution

ACTION:

Needed for adequate utilization of amino acids; decreases protein, nitrogen loss; prevents ketosis

USES:

Increases intake of calories; increases fluids in patients unable to take adequate fluids, calories orally; acute hypoglycemia

CONTRAINDICATIONS:

Hyperglycemia, delirium tremens, hemorrhage (cranial/spinal), CHF, anuria, allergy to corn products (concentrated products)

Precautions: Cardiac/renal/hepatic disease, diabetes mellitus, carbohydrate intolerance

DOSAGE AND ROUTES

Calculator

Hypoglycemia

- **Adult: PO/IV** 10-25 mg g/dose (20-50 ml of a 50% sol), may need subsequent continuous IV infusion of 10% dextrose

Acute symptomatic hypoglycemia (infants/neonates)

- **Neonate/infant: IV** 250-500 mg/kg/dose (25% sol)

Available forms: Inj 2.5%, 5%, 10%, 20%, 25%, 30%, 38.5%, 40%, 50%, 60%, 70%; oral gel 40%; chew tab 5 g

Administer:

- **Do not use concentrated solutions IM/IV; 25%, 50% may be used IV**
- Only (4%) protein and dextrose (up to 12.5%) via peripheral vein; stronger sol: central IV administration • May be given undiluted via prepared sol; give 10% sol, 5 ml/15 sec; 10% sol, 1000 ml/3 hr or more; 20% sol, 500 ml/1/2-1 hr; 50% sol, 10 ml/min; control rate, rapid inf may cause fluid shifts, do not use same inf set as used for blood, **never discontinue hypertonic products abruptly** • To reduce contamination, all IV sets should be replaced ≤ 24 hr

- Oral glucose preparations (gel, chew tabs) to be used in conscious patients only; check serum blood glucose 10 min after 1st dose

SIDE EFFECTS

CNS: Confusion, **loss of consciousness**, dizziness

CV: Hypertension, **CHF**, **pulmonary edema**, **intracranial hemorrhage**

ENDO: Hyperglycemia, rebound hypoglycemia, hyperosmolar syndrome, hyperglycemic nonketotic syndrome, aluminum toxicity, hypokalemia, hypomagnesium

GI: Nausea

GU: Glycosuria, osmotic diuresis

INTEG: Chills, flushing, warm feeling, rash, urticaria, extravasation necrosis

RESP: Pulmonary edema

INTERACTIONS

Increase: fluid retention/electrolyte excretion—corticosteroids

Drug/Lab Test

Increase: glucose

NURSING CONSIDERATIONS

Assess:

- Electrolytes (potassium, sodium, calcium, chlorine, magnesium), blood glucose, ammonia, phosphate
- Inj site for extravasation: redness along vein, edema at site, necrosis, pain; hard, tender area; site should be changed immediately
- Monitor temp for increased fever, indicating infection; if infection suspected, discontinue inf, culture tubing, bottle, catheter tip cultured
- Monitor glucose level, I&O, weight, fluid overload
- Nutritional status: calorie count by dietitian

Evaluate:

- Therapeutic response: increased weight

Teach patient/family:

- About the reason for dextrose inf
- To review hypoglycemia/hyperglycemia symptoms
- To review blood glucose monitoring procedures

Nurse Alert

diazepam (Rx)

(dye-az'-e-pam)

Diazemuls , Diastat, Valium

Func. class.: Antianxiety, anticonvulsant, skeletal muscle relaxant, central acting *Chem. class.:*

Benzodiazepine, long-acting

Controlled Substance Schedule IV

Do not confuse: **diazepam**/Ditropan/LORazepam

ACTION:

Potentiates the actions of GABA, especially in the limbic system, reticular formation; enhances presympathetic inhibition, inhibits spinal polysynaptic afferent paths

USES:

Anxiety, acute alcohol withdrawal, adjunct for seizure disorders; preoperatively as a relaxant for skeletal muscle relaxation; rectally for acute repetitive seizures

Unlabeled uses: Agitation, benzodiazepine withdrawal, chloroquine overdose, insomnia, seizure prophylaxis

CONTRAINDICATIONS:

Pregnancy (D), hypersensitivity to benzodiazepines, closed-angle glaucoma, coma, myasthenia gravis, ethanol intoxication, hepatic disease, sleep apnea

Precautions: Breastfeeding, children <6 mo, geriatric patients, debilitation, renal disease, asthma, bipolar disorder, COPD, CNS depression, labor, Parkinson's disease, neutropenia, psychosis, seizures, substance abuse, smoking

DOSAGE AND ROUTES

Calculator

Anxiety/seizure disorders

- **Adult:** PO 2-10 mg bid-qid; IM/IV 2-5 mg q3-4hr
- **Geriatric:** PO 1-2 mg daily-bid, increase slowly as needed
- **Child >6 mo:** PO 1-2.5 mg tid/qid; IM/IV 0.04-0.3 mg/kg/dose q2-4hr, max 0.6 mg/kg in an 8-hr period

Precardioversion

- **Adult:** IV 5-15 mg 5-10 min precardioversion

Preendoscopy

- **Adult:** IV 2.5-20 mg; **IM** 5-10 mg 1/2 hr preendoscopy

Muscle relaxation

- **Adult:** PO 2-10 mg tid-qid or **EXT REL** 15-30 mg/day; **IV/IM** 5-10 mg, repeat in 2-4 hr
- **Geriatric:** PO 2-5 mg bid-qid; **IV/IM** 2-5 mg, may repeat in 2-4 hr

Tetanic muscle spasms

- **Child >5 yr:** **IM/IV** 5-10 mg q3-4hr prn
- **Infant >30 days:** **IM/IV** 1-2 mg q3-4hr prn

Status epilepticus

- **Adult:** **IV/IM** 5-10 mg, 2 mg/min, may repeat q10-15min, max 30 mg; may repeat in 2-4 hr if seizures reappear
- **Child >5 yr:** **IM** 1 mg q2-5min; **IV** 1 mg slowly
- **Child 1 mo-5 yr:** **IV** 0.2-0.5 mg slowly; **IM** 0.2-0.5 mg slowly q2-5min up to 5 mg, may repeat in 2-4 hr prn

Seizures other than status epilepticus

- **Adult:** **RECT** 0.2 mg/kg, may repeat in 4-12 hr
- **Child 6-11 yr:** **RECT** 0.3 mg/kg, may repeat in 4-12 hr
- **Child 2-5 yr:** **RECT** 0.5 mg/kg, may repeat in 4-12 hr

Alcohol withdrawal

- **Adult:** **IV** 10 mg initially then 5-10 mg q3-4hr prn

Benzodiazepine withdrawal (unlabeled)

- **Adult:** **PO** Taper 0.5-2 mg over 4-16 wk

Febrile seizure prophylaxis (unlabeled)

- **Child 6 mo-5 yr:** **PO** 0.33 mg/kg q8hr until afebrile for ≥ 24 hr

Available forms: Tabs 2, 5, 10 mg; inj 5 mg/ml; oral sol 5 mg/5 ml, rectal 2.5 (pediatric), 10, 20 mg, twin packs; ext rel cap 15 mg

Administer:

- With food or milk for GI symptoms; crushed if patient is unable to swallow medication whole
- Reduced opioid dose by 1/3 if given concomitantly with diazepam
- **Concentrate:** use calibrated dropper only; mix with water, juice, pudding, applesauce; to be consumed immediately

Rectal route

- Do not use more than 5×/mo or for an episode q5days (Diastat)

Direct IV route

- Into large vein; give IV 5 mg or less/1 min or total dose over 3 min or more (children, infants); continuous inf is not recommended; inject as close to vein insertion as possible; **do not dilute or mix with other products**

SIDE EFFECTS

CNS: *Dizziness, drowsiness, confusion, headache, anxiety, tremors, stimulation, fatigue, depression, insomnia, hallucinations, ataxia, fatigue*

CV: *Orthostatic hypotension, ECG changes, tachycardia, hypotension*

EENT: *Blurred vision, tinnitus, mydriasis, nystagmus*

GI: *Constipation, dry mouth, nausea, vomiting, anorexia, diarrhea*

HEMA: **Neutropenia**

INTEG: *Rash, dermatitis, itching*

RESP: **Respiratory depression**

PHARMACOKINETICS

Metabolized by liver via CYP2C19, CYP3A4; excreted by kidneys; crosses placenta; excreted in breast milk; crosses the blood-brain barrier; half-life 20-50 hr; more reliable by mouth; 99% protein binding

PO: Rapidly absorbed, onset 1/2 hr, duration 2-3 hr

IM: Onset 15-30 min, duration 1-1½ hr, absorption slow and erratic

RECT: Peak 1.5 hr

IV: Onset immediate, duration 15 min-1 hr

INTERACTIONS

Increase: diazepam effect—amiodarone, protease inhibitors, diltiazem, cimetidine, clarithromycin, dalfopristin, quinupristin, delavirdine, disulfiram, efavirenz, erythromycin, fluconazole, fluvoxamine, imatinib, itraconazole, ketoconazole, IV miconazole, nefazodone, nicardipine, ranolazine, troleandomycin, verapamil, voriconazole, zafirlukast, zileuton, valproic acid

Increase: toxicity—barbiturates, SSRIs, cimetidine, CNS depressants, valproic acid, CYP3A4 inhibitors

Increase: CNS depression—CNS depressants, alcohol

Decrease: diazepam metabolism—oral contraceptives, valproic acid, disulfiram, isoniazid, propranolol

Decrease: diazepam effect—CYP3A4 inducers (rifampin, barbiturates, carbamazepine, ethotoin, phenytoin, fosphenytoin), smoking

Drug/Lab Test

Increase: AST/ALT, serum bilirubin

NURSING CONSIDERATIONS

Assess:

- B/P (lying, standing), pulse; respiratory rate; if systolic B/P drops 20 mm Hg, hold product, notify prescriber; respirations q5-15min if given IV
- Blood studies: CBC during long-term therapy; blood dyscrasias (rare); hepatic studies: AST, ALT, bilirubin, creatinine, LDH, alk phos
- **Degree of anxiety;** what precipitates anxiety and whether product controls symptoms
- **Alcohol withdrawal symptoms,** including hallucinations (visual, auditory), delirium, irritability, agitation, fine to coarse tremors
- **Seizure control and type, duration, intensity of seizures**
- For muscle spasms; pain relief
- **IV site for thrombosis or phlebitis, which may occur rapidly**
- Mental status: mood, sensorium, affect, sleeping pattern, drowsiness, dizziness, suicidal tendencies
- **Physical dependency, withdrawal symptoms:** headache, nausea, vomiting, muscle pain, weakness after long-term use

Evaluate:

- Therapeutic response: decreased anxiety, restlessness, insomnia

Teach patient/family:

- That product may be taken with food
- That product not to be used for everyday stress or for >4 mo unless directed by prescriber; to take no more than prescribed amount; that product may be habit forming
- To avoid OTC preparations unless approved by prescriber
- To avoid driving, activities that require alertness; drowsiness may occur
- To avoid alcohol, other psychotropic medications unless directed by prescriber; that smoking may decrease diazepam effect by increasing diazepam metabolism
- **Not to discontinue medication abruptly after long-term use; to gradually taper**
- To rise slowly or fainting may occur, especially in geriatric patients
- That drowsiness may worsen at beginning of treatment
- **To notify prescriber if pregnancy is planned or suspected (D), avoid breastfeeding**

TREATMENT OF OVERDOSE:

Lavage, VS, supportive care, flumazenil

🍁 Canada only Side effects: *italics* = common; **bold** = life-threatening ⚠️

Nurse Alert

dibucaine topical

See [Appendix B](#)

diclofenac epolamine (Rx)

(dye-kloe'fen-ak)

Flector

diclofenac potassium (Rx)

Cambia, Cataflam, Rapide , Zipsor

diclofenac sodium (Rx)

Apo-Dilo , Novo-Difenac , Nu-Diclo , PENNSAID, Sandoz Diclofenac , Solaraze Topical Gel, Voltaren, Voltaren Topical Gel, Voltaren XR

Func. class.: Nonsteroidal antiinflammatory products (NSAIDs), nonopioid analgesic *Chem. class.:* Phenylacetic acid

Do not confuse: **Cataflam**/Catapres

ACTION:

Inhibits COX-1, COX-2 by blocking arachidonate resulting in analgesic, antiinflammatory, antipyretic effects

USES:

Acute, chronic RA; osteoarthritis; ankylosing spondylitis; analgesia; primary dysmenorrhea; patch: mild to moderate pain

Unlabeled uses: Arthralgia, headache, migraine, bone pain, myalgia

CONTRAINDICATIONS:

Hypersensitivity to aspirin, iodides, other NSAIDs, bovine protein, asthma, serious CV disease; eczema, exfoliative dermatitis, skin abrasions (gel, patch)

Black Box Warning:

Treatment of perioperative pain (CABG), surgery

Precautions: Pregnancy (C) (tabs, del rel tab, ext rel tab, top gel), (volteren, ophthalmic sol); pregnancy (B) (top gel)(solaraze); top patch, top sol, cap, powder for oral sol (C <30 wk, D >30 wk); breastfeeding, children, bleeding disorders, GI disorders, cardiac disorders, hypersensitivity to other

antiinflammatory agents, CCr <30 ml/min, accidental exposure, acute bronchospasm, hypersensitivity to benzyl alcohol

Black Box Warning:

GI bleeding, MI, stroke

DOSAGE AND ROUTES

Calculator

Osteoarthritis

- **Adult: PO** (Cataflam) 50 mg bid-tid, max 150 mg/day; **DEL REL** (Voltaren) 50 mg bid-tid or 75 mg bid, max 150 mg/day; **EXT REL** (Voltaren-XR) 100 mg daily, max 150 mg/day; **TOP GEL** 1% (Voltaren gel) 4 g for each of lower extremities qid, max 16 g/day; 2 g for each of upper extremities qid, max 8 g/day; **TOP SOL** (Pennsaid) apply 40 drops to each affected knee qid; apply 10 drops at a time, spread over entire knee

Rheumatoid arthritis

- **Adult: PO** (Cataflam) 50 mg tid-qid, max 200 mg/day; **DEL REL** (Voltaren) 50 mg tid-qid or 75 mg bid, max 200 mg/day; **EXT REL** (Voltaren-XR) 100 mg daily, may increase to 200 mg/day, max 200 mg/day

Ankylosing spondylitis

- **Adult: PO DEL REL** (Voltaren) 25 mg qid and 25 mg at bedtime, max 125 mg/day

Acute migraine with/without aura

- **Adult: PO** (powder for oral sol) (Cambia) 50 mg as a single dose, mix contents of packet in 1-2 oz water

Mild to moderate pain

- **Adult: PO** (Zipsor) 25 mg qid

Dysmenorrhea or nonrheumatic inflammatory conditions

- **Adult: PO** (Cataflam) 50 mg tid or 100 mg initially then 50 mg tid, max 200 mg 1st day then 150 mg/day

Pain of strains/sprains

- **Adult: TOP PATCH** (Flector) apply patch to area bid

Actinic keratosis

- **Adult: TOP GEL** (Solaraze) apply to area bid

Prevention of heterotopic ossification (unlabeled)

- **Adult: PO** 50 mg tid × 3 wk

Renal dose

- **Avoid:** Use of topical gel, patch, sol, potassium oral tab for advanced renal disease

Available forms: **Epolamine:** topical patch 1.3%; **potassium:** tabs 50 mg; tabs liquid filled 25 mg; oral powder for sol 50 mg; **sodium:** delayed rel tabs (enteric-coated) 25, 50, 75, 100 mg; Pennsaid: top sol 1.5%, ext rel 100 mg; topical gel 1%, 3%

Administer:

PO route

- Do not break, crush, or chew enteric products
- Take with a full glass of water to enhance absorption, remain upright for 1/2 hr; if dose missed, take as soon as remembered within 2 hr if taking 1-2×/day; do not double doses
- Store at room temperature

Topical patch route (Flector)

- Wash hands before handling patch
- Remove and release liner before administration
- Use only on normal, intact skin
- Remove before bath, shower, swimming
- Discard removed patch in trash away from children, pets
- Store at room temperature

Topical gel route

- Apply to intact skin
- Use only for osteoarthritis, mild to moderate pain
- Store at room temperature, avoid heat, do not freeze

Topical solution route

- Apply to clean, dry skin
- Wait until dry before applying clothing, other creams/lotions
- Wait ≥30 min after use before bathing, swimming
- Store at room temperature

SIDE EFFECTS

CNS: *Dizziness, headache, drowsiness, fatigue, tremors, confusion, insomnia, anxiety, depression, nervousness, paresthesia, muscle weakness*

CV: **CHF**, tachycardia, peripheral edema, palpitations, **dysrhythmias**, hypo/hypertension, fluid retention, **MI, stroke**

EENT: Tinnitus, hearing loss, blurred vision, laryngeal edema

GI: Nausea, anorexia, vomiting, diarrhea, jaundice, cholestatic hepatitis, constipation, flatulence, cramps, dry mouth, peptic ulcer, GI bleeding, hepatotoxicity

GU: Nephrotoxicity: dysuria, hematuria, oliguria, azotemia, cystitis, UTI

HEMA: Blood dyscrasias, epistaxis, bruising

INTEG: Purpura, rash, pruritus, sweating, erythema, petechiae, photosensitivity, alopecia

META: Hyperglycemia, hypoglycemia

RESP: Dyspnea, hemoptysis, pharyngitis, bronchospasm, rhinitis, SOB

SYST: Anaphylaxis

PHARMACOKINETICS

PO: Peak 2-3 hr; **TOP Patch:** peak 12 hr; elimination half-life 2.5 hr, 99% bound to plasma proteins, metabolized in liver to metabolite, excreted in urine

INTERACTIONS

- Need for dosage adjustment: antidiabetics

Increase: hyperkalemia—potassium-sparing diuretics

Increase: anticoagulant effect—anticoagulants, NSAIDs, platelet inhibitors, salicylates, thrombolytics, SSRIs

Increase: toxicity—phenytoin, lithium, cycloSPORINE, methotrexate, digoxin, lithium

Increase: GI side effects—aspirin, other NSAIDs, bisphosphonates, corticosteroids

Decrease: antihypertensive effect— β -blockers, diuretics, ACE inhibitors

Decrease: effect of diuretics

Drug/Herb

Increase: bleeding risk—garlic, ginger, ginkgo; monitor for bleeding

NURSING CONSIDERATIONS

Assess:

Black Box Warning:

CABG: do not use oral, top, gel, patch, in perioperative pain in coronary artery bypass graft surgery for 10-14 days

Black Box Warning:

Stroke/MI: may increase CHF and hypertension, increased CV thrombotic events that may be fatal; those with CV disease may be at greater risk

- **Pain:** location, character, aggravating/alleviating factors, ROM before and 1 hr after dose
- Patients with asthma, aspirin hypersensitivity, nasal polyps; may develop hypersensitivity

- LFTs (may be elevated), uric acid (may be decreased—serum; increased—urine) periodically; also BUN, creatinine, electrolytes (may be elevated) ⚠

Blood dyscrasias (thrombocytopenia): bruising, fatigue, bleeding, poor healing; blood counts during therapy; watch for decreasing platelets; if low, therapy may need to be discontinued, restarted after hematologic recovery; stool guaiac

Evaluate:

- Therapeutic response: decreased inflammation in joints, after cataract surgery

Teach patient/family:

- That product must be continued for prescribed time to be effective; to contact prescriber before surgery regarding when to discontinue this product
- **To report bleeding, bruising, fatigue, malaise; blood dyscrasias do occur**
- To avoid aspirin, alcoholic beverages, NSAIDs, or other OTC medications unless approved by prescriber
- To take with food, milk, or antacids to avoid GI upset; to swallow whole

- To use caution when driving; drowsiness, dizziness may occur

- **To report hepatotoxicity:** flulike symptoms, nausea, vomiting, jaundice, pruritus, lethargy
- To use sunscreen to prevent photosensitivity

- To notify all providers of product use

- **To notify prescriber if pregnancy is planned or suspected (C, tabs) (C, <30 wk, D, >30 wk caps, topical patch/solution, powder for oral solution)**

☼ Canada only Side effects: *italics* = common; **bold** = life-threatening ⚠
Nurse Alert

diclofenac ophthalmic

See [Appendix B](#)

RARELY USED

dicyclomine (Rx)

(dye-sye'kloe-meen)

Bentyl, Bentylol , Formulex , Lomine 

Func. class.: Gastrointestinal anticholinergic

USES:

Treatment of peptic ulcer disease in combination with other products; infant colic, urinary incontinence, IBS

CONTRAINDICATIONS:

Hypersensitivity to anticholinergics, closed-angle glaucoma, GI obstruction, myasthenia gravis, paralytic ileus, GI atony, toxic megacolon, dementia

DOSAGE AND ROUTES

Calculator

- **Adult:** **PO** 10-20 mg tid-qid; **IM** 20 mg q4-6hr; max 160 mg/day
- **Child >2 yr:** **PO** 10 mg tid-qid
- **Child 6 mo-2 yr:** **PO** 5 mg tid-qid

 Canada only Side effects: *italics* = common; **bold** = life-threatening 
Nurse Alert

didanosine (Rx)

(dye-dan'oh-seen)

ddl, Videx Pediatric Powder, Videx EC

Func. class.: Antiretroviral

Chem. class.: Nucleoside reverse transcriptase inhibitor (NRTI)

ACTION:

Nucleoside analog incorporating into cellular DNA by viral reverse transcriptase, thereby terminating the cellular DNA chain

USES:

HIV-1 infection in combination with at least 2 other antiretrovirals

Unlabeled uses: HIV prophylaxis

CONTRAINDICATIONS:

Hypersensitivity, lactic acidosis, pancreatitis, phenylketonuria

Precautions: Pregnancy (B), breastfeeding, children, renal disease, sodium-restricted diets, elevated amylase, preexisting peripheral neuropathy, hyperuricemia, gout, CHF, noncirrhotic portal hypertension

Black Box Warning:

Hepatic disease, lactic acidosis, pancreatitis

DOSAGE AND ROUTES

Calculator

- **Adult/adolescent/child ≥ 6 yr and ≥ 60 kg: PO EXT REL CAP** 400 mg/day; if used with tenofovir, reduce to 250 mg/day
- **Adult/adolescent/child ≥ 6 yr and 25 kg to < 60 kg: PO EXT REL CAP** 250 mg/day; if used with tenofovir, reduce to 200 mg/day
- **Adolescent 20 kg to < 25 kg: PO EXT REL CAP** 200 mg/day
- **Adult ≥ 60 kg: PO ORAL SOL** 200 mg bid or 400 mg/day; if used with tenofovir, reduce to 250 mg/day
- **Adult < 60 kg: PO ORAL SOL** 125 mg bid or 250 mg/day; if used with tenofovir, reduce to 200 mg/day
- **Adolescent/child/infant > 8 mo: PO ORAL SOL** 120 mg/m² every 12 hr, max adult dosing
- **Infant < 8 mo/neonate ≥ 2 wk: PO ORAL SOL** 100 mg/m² every 12 hr

Renal dose

- **Adult: PO** CrCl ≥ 60 ml/min: No change
- **Adult/adolescent ≥ 60 kg: PO** CCr 30–59 ml/min: reduce oral sol to 100 mg every 12 hr or 200 mg every 24 hr; reduce EXT-REL caps to 200 mg/day; CCr 10–29 ml/min: reduce oral sol to 150 mg every 24 hr; reduce EXT-REL caps to 125 mg/day; CCr < 10 ml/min: reduce oral sol to 100 mg every 24 hr; reduce EXT-REL caps to 125 mg/day
- **Adult/adolescent < 60 kg: PO** CCr 30–59 ml/min: reduce oral sol to 75 mg every 12 hr or to 150 mg every 24 hr; reduce EXT-REL caps to 125 mg/day; CCr 10–29 ml/min: reduce oral sol to 100 mg every 24 hr; reduce EXT-REL caps to 125 mg/day; CCr < 10 ml/min: reduce oral sol to 75 mg every 24 hr; EXT-REL caps are not recommended

Intermittent hemodialysis/continuous ambulatory peritoneal dialysis

- **Adult/adolescent > 60 kg:** Give 100 mg oral sol or 125 mg EXT-REL CAPS every 24 hrs
- **Adult/adolescent < 60 kg:** Give 75 mg oral sol every 24 hr, EXT-REL CAPS are not recommended

Available forms: Powder for oral sol 10 mg/ml; del rel caps 125, 200, 250, 400 mg

Administer:

- Pediatric powder for oral sol after preparation by pharmacist; dilution required using purified USP water then antacid (10 mg/ml), refrigerate, shake before use
- On an empty stomach ≥ 30 min before or 2 hr after meals
- Adjust dose with renal impairment

SIDE EFFECTS

CNS: *Peripheral neuropathy, seizures*, confusion, *anxiety*, hypertonia, abnormal thinking, asthenia, *insomnia*, *CNS depression*, pain, dizziness, chills, fever

CV: Hypertension, vasodilation, dysrhythmia, syncope, *CHF*, palpitation

EENT: Ear pain, otitis, photophobia, visual impairment, retinal depigmentation, optic neuritis

GI: *Pancreatitis, diarrhea, nausea, vomiting, abdominal pain*, constipation, stomatitis, dyspepsia, liver abnormalities, flatulence, taste perversion, dry mouth, oral thrush, melena, increased ALT/AST, alk phos, amylase, *hepatic failure*, noncirrhotic portal hypertension

GU: Increased bilirubin, uric acid

HEMA: Leukopenia, granulocytopenia, thrombocytopenia, anemia

INTEG: Rash, pruritus, alopecia, ecchymosis, hemorrhage, petechiae, sweating

MS: Myalgia, arthritis, myopathy, muscular atrophy

RESP: Cough, pneumonia, dyspnea, asthma, epistaxis, hypoventilation, sinusitis

SYST: Lactic acidosis, anaphylaxis

PHARMACOKINETICS

PO: Peak 0.67 hr, del rel 2 hr; elimination half-life 1.62 hr; extensive metabolism thought to occur; administration within 5 min of food will decrease absorption (50%); excreted urine, feces

INTERACTIONS

Increase: didanosine level—allopurinol, tenofovir

Increase: side effects from magnesium, aluminum antacids

Increase: pancreatitis risk—stavudine

Decrease: absorption—ketoconazole, dapsone

Decrease: concentrations of fluoroquinolones, other antiretrovirals, itraconazole, tetracyclines

Decrease: didanosine level—methadone

• Do not use with these products **PO:** gatifloxacin, gemifloxacin, grepafloxacin, levofloxacin, lomefloxacin, moxifloxacin, norfloxacin, sparfloxacin, trovafloxacin

Drug/Food

- Any food decreases rate of absorption 50%, do not use with food
- Do not use with acidic juices

NURSING CONSIDERATIONS

Assess:

Black Box Warning:

Pancreatitis: do not use in those with symptoms of pancreatitis; may be dose related in advanced HIV, alcoholism, history of pancreatitis

• **Peripheral neuropathy:** tingling or pain in hands and feet, distal numbness; onset usually occurs 2-6 mo after beginning treatment, may persist if product not discontinued

Black Box Warning:

Lactic acidosis, severe hepatomegaly, pancreatitis: abdominal pain, nausea, vomiting, elevated hepatic enzymes; product should be discontinued because condition can be fatal

- Children by dilated retinal exam q6mo to rule out retinal depigmentation
- CBC, differential, platelet count monthly; notify prescriber of results; alk phos, monitor amylase; viral load, CD4 count • Renal studies: BUN, serum uric acid, urine CCr before, during therapy
- Temp may indicate beginning infection
- Hepatic studies before, during therapy (bilirubin, AST, ALT) as needed, monthly

Perform/provide:

- Clean up of powdered products; use wet mop or damp sponge
- Storage of tabs, caps in tightly closed bottle at room temp; store oral sol after dissolving at room temp ≤ 4 hr

Evaluate:

- Therapeutic response: absence of infection; symptoms of HIV

Teach patient/family:

- To avoid use with alcohol, not to take with food
- To report numbness/tingling in extremities
- To take on an empty stomach; not to take dapsone at same time as ddI; not to mix powder with fruit juice; chew tab or crush and dissolve in water; to drink powder immediately after mixing • To report signs of **infection**: increased temp, sore throat, flulike symptoms • To report signs of **anemia**: fatigue, headache, faintness, SOB, irritability
- To report **bleeding**; to avoid use of razors, commercial mouthwash
- That hair may be lost during therapy (rare); that a wig or hairpiece may make patient feel better • That product does not cure, only controls symptoms

☼ Canada only Side effects: *italics* = common; **bold** = life-threatening ⚠
Nurse Alert

RARELY USED

diflunisal

(dye-floo'ni-sal)

Dolobid

Func. class.: Nonsteroidal antiinflammatory drug

USES:

Mild to moderate pain including osteoarthritis, rheumatoid arthritis

CONTRAINDICATIONS:

Hypersensitivity to this product, NSAIDs, salicylates, severe renal disease

Black Box Warning:

Perioperative pain after CABG

DOSAGE AND ROUTES

Calculator

Osteoarthritis, rheumatoid arthritis

- **Adult: PO** 500-1500 mg/day in 2 divided doses every 12 hr
- **Child ≥12 yr: PO** 250-1000 mg/day in 2 divided doses every 12 hr, max 1500 mg

Pain

- **Adult/child ≥12 yr: PO** 1000 mg, then 500 mg every 8-12 hr; a lower dose may be used

Available forms: Tab 500 mg

☼ Canada only Side effects: *italics* = common; **bold** = life-threatening ⚠
Nurse Alert

difluprednate (ophthalmic)

(die-flu'prednate)

Durezol

Func. class.: Ophthalmic antiinflammatory

Chem. class.: Corticosteroid

ACTION:

Exact mechanism of antiinflammatory action unknown; inhibits multiple inflammatory cytokines; decreases release of arachidonic acid, which increases in inflammation

USES:

For the treatment of postoperative ocular pain and postoperative ocular inflammation; for the treatment of endogenous anterior uveitis

CONTRAINDICATIONS:

Hypersensitivity to this product, glycerin, polysorbate, ocular TB, acute herpes simplex (superficial), fungal/viral infections of the eye

Precautions: Pregnancy (C), breastfeeding, children, corneal infected abrasions, glaucoma

DOSAGE AND ROUTES

Calculator

Postoperative ocular pain and postoperative ocular inflammation

- **Adult/geriatric patients: OPHTH** Instill 1 drop into the conjunctival sac of the affected eye(s) qid beginning 24 hr after surgery; continue giving 4 ×/day for the first 2 wk of the postoperative period, then administer bid × 1 wk. At the end of the third week, taper dosage based on response

Endogenous anterior uveitis:

- **Adult: OPHTH** Instill 1 drop into the conjunctival sac of the affected eye(s) qid × 14 days, followed by tapering based on response

Available forms: Ophthalmic emulsion 0.05%

Administer:

- Apply topically to the eye, shake well before use

- Do not touch the tip of the dropper to the eye, fingertips, or other surface
- Instruct patient on proper instillation of eye sol
- When using this product, the patient should not wear contact lenses

SIDE EFFECTS

EENT: Burning, stinging, poor vision, corneal ulcerations, increased IOP, optic nerve damage

NURSING CONSIDERATIONS

Assess:

- **Corneal effects:** ulcerations, infections can worsen with this product, monitor IOP used IO over ten days

Evaluate:

- **Therapeutic response:** Decreased corneal inflammation

Teach patient/family:

- How to use product
- Not to share with others or use for other conditions
- **To notify prescriber immediately if vision changes or if condition worsens** • To take as prescribed

🍁 Canada only Side effects: *italics* = common; **bold** = life-threatening ⚠️
Nurse Alert

HIGH ALERT

digoxin (Rx)

(di-jox'in)

APO-Digoxin , Lanoxin

Func. class.: Cardiac glycoside, inotropic, antidysrhythmic *Chem. class.:* Digoxin preparation

Do not confuse: **Lanoxin**/Lasix/Lonox/Lomotil/Xanax/Levoxine

ACTION:

Inhibits the sodium-potassium ATPase pump, which makes more calcium available for contractile proteins, thereby resulting in increased cardiac output (positive inotropic effect); increases force of contractions; decreases heart rate (negative chronotropic effect); decreases AV conduction speed

USES:

Heart failure, atrial fibrillation, atrial flutter, atrial tachycardia, cardiogenic shock, paroxysmal atrial tachycardia, rapid digitalization in these disorders

Unlabeled uses: Atrial flutter, paroxysmal supraventricular tachycardia (PSVT) treatment/prophylaxis

CONTRAINDICATIONS:

Hypersensitivity to digoxin, ventricular fibrillation, ventricular tachycardia, carotid sinus syndrome, 2nd-or 3rd-degree heart block

Precautions: Pregnancy (C), breastfeeding, geriatric patients, renal disease, acute MI, AV block, severe respiratory disease, hypothyroidism, sinus nodal disease, hypokalemia

DOSAGE AND ROUTES

Calculator

Loading dose, IV route

- **Adult:** IV 400–600 mcg as a single dose, effect in 5–30 min, max effect 1–4 hr, give subsequent doses of 100–300 mcg every 6–8 hr
- **Adolescent/child >10 yr:** IV 8–12 mcg/kg, divided into ≥ 3 doses, with the first dose equaling approximately one-half the total, give subsequent doses every 4–8 hr

- **Child 5–10 yr: IV** 15–30 mcg/kg divided into ≥ 3 doses, with the first dose equaling approximately one-half the total, give subsequent doses every 4–8 hr
- **Child 2–4 yr: IV** 25–35 mcg/kg, divided into ≥ 3 doses, with the first dose equaling approximately one-half the total, give subsequent doses every 4–8 hr
- **Infant/child <2 yr: IV** 30–50 mcg/kg, divided into ≥ 3 doses, with the first dose equaling approximately one-half the total, give subsequent doses every 4–8 hr
- **Full-term neonate: IV** 20–30 mcg/kg, divided into ≥ 3 doses, with the first dose equaling approximately one-half the total, give subsequent doses every 4–8 hr
- **Premature neonate: IV** 15–25 mcg/kg, divided into ≥ 3 doses, with the first dose equaling approximately one-half the total, give subsequent doses every 4–8 hr

Loading dose, PO (tablets): Tablets are 60%–80% bioavailable; oral elixir should be used to obtain the appropriate dose in infants, young pediatric patients, or patients with very low body weight

- **Adult/adolescent/child >10 yr: PO** Total dosage of 10–15 mcg/kg in 3 divided doses, give one-half the total loading dose initially, then one-fourth the loading dose every 4–8 hr $\times 2$ doses
- **Child 5–10 yr: PO** Total dosage of 20–45 mcg/kg in 3 divided doses, give one-half the total loading dose initially, then one-fourth the loading dose every 4–8 hr $\times 2$ doses

Loading dose, PO (elixir): Elixir is approximately 70%–85% bioavailable

- **Adult/adolescent/child >10 yr: PO** Total dosage of 10–15 mcg/kg, give one-half the total loading dose initially, then additional fractions of the planned total dose at 4–8 hr
- **Child 5–10 yr: PO** Total dosage of 20–35 mcg/kg, give one-half the total loading dose initially, then additional fractions of the planned total dose at 4–8 hr
- **Child 2–4 yr: PO** Total dosage of 30–45 mcg/kg, give one-half the total loading dose initially, then additional fractions of the planned total dose at 4–8 hr
- **Infant/child <2 yr: PO** Total dosage of 35–60 mcg/kg, give one-half the total loading dose initially then additional fractions of the planned total dose at 4–8 hr
- **Full-term neonate: PO** Total dosage of 25–35 mcg/kg, give one-half the total loading dose initially, then additional fractions of the planned total dose at 4–8 hr

• **Premature neonate: PO** Total dosage of 20–30 mcg/kg, give one-half the total loading dose initially, then additional fractions of the planned total dose at 4–8 hr
Maintenance dose, IV

• **Adult: IV** 125–350 mcg/day, depending on CrCl, usual daily maintenance dosage for CHF based on corrected CrCl (ml/min/70 kg) and lean body weight (LBW) are listed below

• LBW 50–59 kg: CrCl $\geq$ 100 ml/min: 175 mcg/day; CrCl 70–99 ml/min: 150 mcg/day; CrCl 60–69 ml/min: 125 mcg/day • LBW 60–69 kg: CrCl $\geq$ 90 ml/min: 200 mcg/day; CrCl 70–89 ml/min: 175 mcg/day; CrCl 60–69 ml/min: 150 mcg/day • LBW 70–79 kg: CrCl $\geq$ 100 ml/min: 250 mcg/day; CrCl 90–99 ml/min: 225 mcg/day; CrCl 70–89 ml/min: 200 mcg/day; CrCl 60–69 ml/min: 175 mcg/day • LBW 80–89 kg: CrCl $\geq$ 100 ml/min: 275 mcg/day; CrCl 80–99 ml/min: 250 mcg/day; CrCl 70–79 ml/min: 225 mcg/day; CrCl 60–69 ml/min: 200 mcg/day • LBW 90–99 kg: CrCl $\geq$ 90 ml/min: 300 mcg/day; CrCl 80–89 ml/min: 275 mcg/day; CrCl 70–79 ml/min: 250 mcg/day; CrCl 60–69 ml/min: 225 mcg/day • LBW $\geq$ 100 kg: CrCl $\geq$ 100 ml/min: 350 mcg/day; CrCl 90–99 ml/min: 325 mcg IV/day; CrCl 80–89 ml/min: 300 mcg/day; CrCl 70–79 ml/min: 275 mcg IV/day; CrCl 60–69 ml/min: 250 mcg/day

• **Child >10 yr:** 25%–35% of the IV digitalizing dose/day

• **Child 5–10 yr:** 25%–35% of the IV digitalizing dose bid

• **Children 2–4 yr:** 25%–35% of the IV digitalizing dose bid

• **Infant, child <2 yr:** 25%–35% of the IV digitalizing dose bid

• **Full term neonate:** 25%–35% of the IV digitalizing dose bid

• **Preterm neonate:** 20%–30% of the IV digitalizing dose bid

Maintenance dose, PO (tablets)

• **Adult/adolescent/child >10 yr: PO** 3.4–5.1 mcg/kg/day

• LBW 40–49 kg: CrCl $\geq$ 70 ml/min: 187.5 mcg/day; CrCl $\geq$ 60–69 ml/min: 125 mcg/day

• LBW 50–59 kg: CrCl $\geq$ 90 ml/min: 250 mcg/day; CrCl 60–89 ml/min: 187.5 mcg/day

• LBW 60–69 kg: CrCl $\geq$ 100 ml/min: 312.5 mcg/day; CrCl 60–99 ml/min: 250 mcg/day

• LBW 70–79 kg: CrCl $\geq$ 80 ml/min: 312.5 mcg/day; CrCl 60–79 ml/min: 250 mcg/day • LBW 80–89 kg: CrCl $\geq$ 90 ml/min: 375 mcg/day; CrCl 60–89 ml/min:

312.5 mcg/day

- LBW 90–99 kg: CrCl $\geq$ 90 ml/min: 437.5 mcg/day; CrCl 70–89 ml/min: 375 mcg/day; CrCl 60–69 ml/min: 312.5 mcg/day • LBW $\geq$ 100 kg: CrCl $\geq$ 100 ml/min: 500 mcg/day; CrCl 80–99 ml/min: 437.5 mcg/day; CrCl 60–79 ml/min: 375 mcg/day

- **Child 5–10 yr: PO** 6.4–12.9 mcg/kg/day in 2 divided doses is recommended starting maintenance dose

Maintenance dose, PO (elixir)

- **Adult/adolescent/child >10 yr: PO** 3–4.5 mcg/kg/day

- LBW 40–49 kg: CrCl $\geq$ 100 ml/min: 170 mcg/day; CrCl 90–99 ml/min: 160 mcg/day; CrCl 80–89 ml/min: 150 mcg/day; CrCl 70–79 ml/min: 140 mcg/day; CrCl 60–69 ml/min: 130 mcg/day • LBW 50–59 kg: CrCl $\geq$ 100 ml/min: 213 mcg/day; CrCl 90–99 ml/min: 200 mcg/day; CrCl 80–89 ml/min: 188 mcg/day; CrCl 70–79 ml/min: 175 mcg/day; CrCl 60–69 ml/min: 163 mcg/day • LBW 60–69 kg: CrCl $\geq$ 100 ml/min: 255 mcg/day; CrCl 90–99 ml/min: 240 mcg/day; CrCl 80–89 ml/min: 225 mcg/day; CrCl 70–79 ml/min: 210 mcg/day; CrCl 60–69 ml/min: 195 mcg/day • LBW 70–79 kg: CrCl $\geq$ 100 ml/min: 298 mcg/day; CrCl 90–99 ml/min: 280 mcg/day; CrCl 80–89 ml/min: 263 mcg/day; CrCl 70–79 ml/min: 245 mcg/day; CrCl 60–69 ml/min: 228 mcg/day • LBW 80–89 kg: CrCl $\geq$ 100 ml/min: 340 mcg/day; CrCl 90–99 ml/min: 320 mcg/day; CrCl 80–89 ml/min: 300 mcg/day; CrCl 70–79 ml/min: 280 mcg/day; CrCl 60–69 ml/min: 260 mcg/day • LBW 90–99 kg: CrCl $\geq$ 100 ml/min: 383 mcg/day; CrCl 90–99 ml/min: 360 mcg/day; CrCl 80–89 ml/min: 338 mcg/day; CrCl 70–79 ml/min: 315 mcg/day; CrCl 60–69 ml/min: 293 mcg/day • LBW $\geq$ 100 kg: CrCl $\geq$ 100 ml/min: 425 mcg/day; CrCl 90–99 ml/min: 400 mcg/day; CrCl 80–89 ml/min: 375 mcg/day; CrCl 70–79 ml/min: 350 mcg/day; CrCl 60–69 ml/min: 325 mcg/day

- **Child 5–10 yr: PO** 5.6–11.3 mcg/kg/day in 2 divided doses

- **Child 2–4 yr: PO** 9.4–13.1 mcg/kg/day in 2 divided doses

- **Infant/child <2 yr: PO** 11.3–18.8 mcg/kg/day in 2 divided doses

- **Full-term neonate: PO** 7.5–11.3 mcg/kg/day in 2 divided doses

- **Preterm neonate: PO** 4.7–7.8 mcg/kg/day in 2 divided doses

Renal dose, IV route

- **Crcl 50–59 ml/min:** LBW 50–59 kg: 125 mcg 1 $\times$ daily; LBW 60–69 kg: 150

mcg 1× daily; LBW 70–79 kg: 175 mcg 1× daily; LBW 80–89 kg: 200 mcg 1× daily; LBW 90–99 kg: 225 mcg 1× daily; LBW ≥100 kg: 250 mcg 1× daily

- **Crcl 40–49 ml/min:** LBW 50–59 kg: 100 mcg 1× daily; LBW 60–69 kg: 125 mcg 1× daily; LBW 70–79 kg: 150 mcg 1× daily; LBW 80–89 kg: 175 mcg 1× daily; LBW 90–99 kg: 200 mcg 1× daily; LBW ≥100 kg: 225 mcg 1× daily

- **Crcl 30–39 ml/min:** LBW 50–59 kg: 100 mcg 1× daily; LBW 60–69 kg: 125 mcg 1× daily; LBW 70–89 kg: 150 mcg 1× daily; LBW 90–99 kg: 175 mcg 1× daily; LBW ≥100 kg: 200 mcg 1× daily

- **Crcl 20–29 ml/min:** LBW 50–69 kg: 100 mcg 1× daily; LBW 70–79 kg: 125 mcg 1× daily; LBW 80–99 kg: 150 mcg 1× daily; LBW ≥100 kg: 175 mcg 1× daily

- **Crcl 10–19 ml/min:** LBW 50–59 kg: 75 mcg 1× daily; LBW 60–79 kg: 100 mcg 1× daily; LBW 80–89 kg: 125 mcg 1× daily; LBW ≥90 kg: 150 mcg 1× daily

- **Crcl <10 ml/min LBW 50–69 kg:** 75 mcg 1× daily; LBW 70–89 kg: 100 mcg 1× daily; LBW 90–99 kg: 125 mcg 1× daily; LBW ≥100 kg: 150 mcg 1× daily

Renal dose, PO (tablets)

- **Crcl 40–59 ml/min:** LBW 50–69 kg: 187.5 mcg 1× daily

- **Crcl 50–59 ml/min:** LBW 70–89 kg: 250 mcg 1× daily; LBW ≥90 kg: 312.5 mcg 1× daily

- **Crcl 30–39 ml/min:** LBW 50–59 kg: 125 mcg 1× daily; LBW 60–79 kg: 187.5 mcg 1× daily; LBW 80–99 kg: 250 mcg 1× daily; LBW ≥100 kg: 312.5 mcg 1× daily

- **Crcl 20–29 ml/min:** LBW 50–69 kg: 125 mcg 1× daily; LBW 70–89 kg: 187.5 mcg 1× daily; LBW ≥90 kg: 250 mcg 1× daily

- **Crcl <20 ml/min:** LBW 50–69 kg: 125 mcg 1× daily; LBW 70–99 kg: 187.5 mcg 1× daily; LBW ≥100 kg: 250 mcg 1× daily

Renal dose, PO (elixir)

- **Crcl 50–59 ml/min:** LBW 50–59 kg: 150 mcg 1× daily; LBW 60–69 kg: 180 mcg 1× daily; LBW 70–79 kg: 210 mcg 1× daily; LBW 80–89 kg: 240 mcg 1× daily; LBW 90–99 kg: 270 mcg 1× daily; LBW ≥100 kg: 300 mcg 1× daily

- **Crcl 40–49 ml/min:** LBW 50–59 kg: 138 mcg 1× daily; LBW 60–69 kg: 165 mcg 1× daily; LBW 70–79 kg: 193 mcg 1× daily; LBW 80–89 kg: 220 mcg 1× daily; LBW 90–99 kg: 248 mcg 1× daily; LBW ≥100 kg: 275 mcg 1× daily

• **Crcl 30–39 ml/min:** LBW 50–59 kg: 125 mcg 1× daily; LBW 60–69 kg: 150 mcg 1× daily; LBW 70–79 kg: 175 mcg PO 1× daily; LBW 80–89 kg: 200 mcg PO 1× daily; LBW 90–99 kg: 225 mcg 1× daily; LBW ≥100 kg: 250 mcg PO 1× daily

• **Crcl 20–29 ml/min:** LBW 50–59 kg: 113 mcg 1× daily; LBW 60–69 kg: 135 mcg 1× daily; LBW 70–79 kg: 158 mcg 1× daily; LBW 80–89 kg: 180 mcg PO 1× daily; LBW 90–99 kg: 203 mcg 1× daily; LBW ≥100 kg: 225 mcg PO 1× daily

• **Crcl <20 ml/min:** LBW 50–59 kg: 100 mcg 1× daily; LBW 60–69 kg: 120 mcg 1× daily; LBW 70–79 kg: 140 mcg 1× daily; LBW 80–89 kg: 160 mcg 1× daily; LBW 90–99 kg: 180 mcg 1× daily; LBW ≥100 kg: 200 mcg 1× daily

The daily maintenance dose can also be estimated using patient CrCl and loading dose (LD) according to the method of Jelliffe and Brooker: $\text{Daily \% loss} = 14 + \text{CrCl}/5$

Available forms: Caps 0.05, 0.1, 0.2 mg; elix 0.05 mg/ml; tabs 0.125, 0.25, 0.5 mg; inj 0.5 mg/ml, 0.25 mg/ml; pediatric inj 0.1 mg/ml

Administer:

PO route

⚠ Bioavailability varies among different oral dosage forms of digoxin and among different brands of the same dosage form. Changing from one preparation to another might require dosage adjustments.

- **All dosage forms:** May be administered without regard to meals
- **Tab:** May be crushed and administered with food or fluids
- **Pediatric elixir:** Administer using a calibrated measuring device

Injectable

- IV is preferred over IM because it is less painful
- PO should replace parenteral therapy as soon as possible
- Visually inspect parenteral products for particulate matter and discoloration before use

IM route

- Do not administer >2 ml at any one IM injection site.
- Inject deeply into gluteal muscle, then massage area

IV route

- May be given undiluted or each 1 ml may be diluted in 4 ml of sterile water

for injection, NS, D₅W, or LR. Diluent volumes <4 ml will cause precipitation. Use diluted solutions immediately • Inject over ≥5 min via Y-site or 3-way stopcock. In patients with pulmonary edema, administer over 10–15 min. To avoid inadvertent overdosage, do not flush the syringe following administration

Additive compatibilities: Cimetidine, floxacillin, furosemide, lidocaine, potassium chloride, ranitidine, verapamil

Syringe compatibilities: Heparin, milrinone

Y-site compatibilities: Acyclovir, alfentanil, amikacin, aminocaproic acid, aminophylline, amphotericin B lipid complex, anidulafungin, ascorbic acid injection, atenolol, atracurium, atropine, aztreonam, benztropine, bivalirudin, bleomycin, bumetanide, buprenorphine, butorphanol, calcium chloride/gluconate, CARBOplatin, cefamandole, ceFAZolin, cefmetazole, cefonicid, cefoperazone, cefotaxime, cefoTEtan, cefOXitin, cefTAZidime, ceftizoxime, ceftobiprole, cefTRIAxone, cefuroxime, cephalothin, cephapirin, chloramphenicol, chlorproMAZINE, cimetidine, ciprofloxacin, cisatracurium, CISplatin, clindamycin, codeine, cyanocobalamin, cyclophosphamide, cycloSPORINE, cytarabine, DACTINomycin, DAPTOMycin, dexamethasone, dexmedetomidine, diltiazem, diphenhydrAMINE, DOBUTamine, DOCEtaxel, DOPamine, doripenem, doxacurium, doxycycline, enalaprilat, ePHEDrine, EPINEPHrine, epirubicin, epoetin alfa, eptifibatide, ertapenem, erythromycin, esmolol, etoposide, famotidine, fenoldopam, fentaNYL, fludarabine, fluorouracil, folic acid, furosemide, ganciclovir, gatifloxacin, gemcitabine, gentamicin, glycopyrrolate, granisetron, heparin, hydrocortisone, HYDROmorphine, hydrOXYzine, ifosfamide, imipenem-cilastatin, indomethacin, irinotecan, isoproterenol, ketorolac, labetalol, levofloxacin, lidocaine, linezolid, LORazepam, LR, magnesium sulfate, mannitol, mechlorethamine, meperidine, meropenem, metaraminol, methicillin, methotrexate, methoxamine, methyldopate, methylPREDNISolone, metoclopramide, metoprolol, metroNIDAZOLE, mezlocillin, miconazole, midazolam, milrinone, morphine, moxalactam, multiple vitamins injection, mycophenolate mofetil, nafcillin, nalbuphine, naloxone, nesiritide, metilmicin, nitroglycerin, nitroprusside, norepinephrine, octreotide, ondansetron, oxacillin, oxaliplatin, oxytocin, palonosetron, pamidronate, pancuronium, pantoprazole,

papaverine, PEMEtrexed, penicillin G potassium/sodium, pentazocine, PENTobarbital, PHENobarbital, phenylephrine, phytonadione, piperacillin, piperacillin-tazobactam, polymyxin B, potassium chloride, procainamide, prochlorperazine, promethazine, propranolol, protamine, pyridoxine, quiNIDine, ranitidine, remifentanyl, Ringer's, ritodrine, riTUXimab, rocuronium, sodium acetate/bicarbonate, succinylcholine, SUFentanyl, tacrolimus, teniposide, theophylline, thiamine, thiotepa, ticarcillin, ticarcillin-clavulanate, tigecycline, tirofiban, TNA, tobramycin, tolazoline, TPN, trastuzumab, trimetaphan, urokinase, vancomycin, vasopressin, vecuronium, verapamil, vinCRiStine, vinorelbine, vitamin B complex, voriconazole, zoledronic acid

SIDE EFFECTS

CNS: *Headache*, drowsiness, apathy, confusion, disorientation, fatigue, depression, hallucinations

CV: *Dysrhythmias*, *hypotension*, bradycardia, *AV block*

EENT: Blurred vision, yellow-green halos, photophobia, diplopia

GI: Nausea, vomiting, anorexia, abdominal pain, diarrhea

PHARMACOKINETICS

Half-life 1.5 days, excreted in urine, protein binding 20%-30%

PO: Onset 1/2-2 hr, peak 6-8 hr, duration 3-4 days

IV: Onset 5-30 min, peak 1-5 hr, duration variable

INTERACTIONS

Increase: toxicity—azole antifungals, macrolides, tetracyclines, ritonavir

Increase: hypercalcemia, hypomagnesemia, digoxin toxicity—thiazides, parenteral calcium

Increase: hypokalemia, digoxin toxicity—diuretics, amphotericin B, carbenicillin, ticarcillin, corticosteroids

Increase: digoxin levels—propantheline, quiNIDine, verapamil, amiodarone, anticholinergics, diltiazem, NIFEdipine, indomethacin

Increase: bradycardia— β -adrenergic blockers, antidysrhythmics

Increase: cardiac dysrhythmia risk—sympathomimetics

Decrease: digoxin absorption—antacids, kaolin/pectin, cholestyramine, metoclopramide

Decrease: digoxin level—thyroid agents, cholestyramine, colestipol,

metoclopramide, aMILoride

Drug/Herb

Decrease: product effect—St. John's wort

Drug/Lab Test

Increase: CPK

NURSING CONSIDERATIONS

Assess:

- Apical pulse for 1 min before giving product; if pulse <60 in adult or <90 in infant, take again in 1 hr; if <60 in adult, call prescriber; note rate, rhythm, character; monitor ECG continuously during parenteral loading dose
- Electrolytes: potassium, sodium, chloride, magnesium, calcium; renal function studies: BUN, creatinine; blood studies: ALT, AST, bilirubin, Hct, Hgb before initiating treatment and periodically thereafter • Monitor product levels; therapeutic level 0.5-2 ng/ml

Evaluate:

- Therapeutic response: decreased weight, edema, pulse, respiration, crackles; increased urine output; serum digoxin level (0.5-2 ng/ml)

Teach patient/family:

- Not to stop product abruptly; about all aspects of product; to take exactly as ordered; how to monitor heart rate • To avoid OTC medications, herbal remedies because many adverse product interactions may occur; not to take antacid at same time • **To notify prescriber of loss of appetite, lower stomach pain, diarrhea, weakness, drowsiness, headache, blurred or yellow vision, rash, depression, toxicity** • About the toxic symptoms of this product; when to notify prescriber
- To maintain a sodium-restricted diet as ordered
- To use one brand consistently

TREATMENT OF OVERDOSE:

Discontinue product; give potassium; monitor ECG; give adrenergic-blocking agent, digoxin immune FAB

✳ Canada only Side effects: *italics* = common; **bold** = life-threatening 
Nurse Alert

digoxin immune FAB (ovine) (Rx)

(di-jox'in im-myoan' FAB)

DigiFab

Func. class.: Antidote—digoxin specific

ACTION:

Antibody fragments bind to free digoxin or digitoxin to reverse toxicity by not allowing digoxin or digitoxin to bind to sites of action

USES:

Life-threatening digoxin toxicity

CONTRAINDICATIONS:

Mild digoxin toxicity, hypersensitivity to this product, papain or ovine protein

Precautions: Pregnancy (C), breastfeeding, children, geriatric patients, renal/cardiac disease, allergy to ovine proteins, hypocalcemia, heart failure

DOSAGE AND ROUTES

Calculator

1 (38-mg) vial binds 0.5 mg digoxin; 1 (40 mg) DigiFab binds 0.5 mg digoxin

Digoxin toxicity (known amount) (tabs, oral sol, IM)

- **Adult and child:** IV dose (mg) = dose ingested (mg) $\times$ 0.8/1000 $\times$ 38-or 40-mg vial

Toxicity (known amount) (cap, IV)

- **Adult and child:** IV dose = dose ingested (mg)/0.5 $\times$ 38-or 40-mg vial

Toxicity (known amount) by serum digoxin concentrations (SDCs)

- **Adult and child:** IV SDC (ng/ml) $\times$ kg of weight/100 $\times$ 38-or 40-mg vial

Digoxin toxicity (unknown amount)

- **Adult and child >20 kg:** IV 228 mg (6 vials)

- **Infant and child <20 kg:** IV 38 mg (1 vial)

Acute ingestion

- **Adult:** IV 380 mg (10 vials)

Life-threatening ingestion

- **Adult:** IV 760 mg (20 vials)

Skin test

- **Adult: ID** 9.5 mcg

Available forms: Inj 38 mg/vial (binds 0.5 mg digoxin), 40 mg/vial (binds 0.5 mg digoxin)

Administer:

- Test doses proven to be ineffective in the general population; only use test dose in those with known allergies or those previously treated with digoxin immune FAB
- **For test dose** dilute 0.1 ml of reconstituted product (9.5 mg/ml) in 9.9 ml sterile isotonic saline, inj 0.1 ml (1:100 dilution) ID and observe for wheal with erythema; read in 20 min • **For scratch test**, place 1 gtt of sol on skin, make a scratch through the drop with a sterile needle; read in 20 min • After diluting 38 mg/4 ml of sterile water for inj 10 mg/ml mix; may be further diluted with normal saline; sol should be clear, colorless • By bolus if cardiac arrest is imminent or IV over 30 min using a 0.22-µm filter

SIDE EFFECTS

CV: CHF, ventricular rate increase, atrial fibrillation, low cardiac output, hypotension

INTEG: Hypersensitivity, allergic reactions, facial swelling, redness, phlebitis

META: Hypokalemia

MISC: Anaphylaxis (rare)

RESP: Impaired respiratory function, rapid respiratory rate

PHARMACOKINETICS

IV: Peaks after completion of inf; onset 30 min (variable); not known if crosses placenta, breast milk; half-life biphasic: 14-20 hr, prolonged with renal disease; excreted by kidneys

INTERACTIONS

- Considered incompatible with all products in syringe or sol

Drug/Lab Test

Interference: immunoassay digoxin

NURSING CONSIDERATIONS

Assess:

• **Hypokalemia:** ST depression, flat **T** waves, presence of **U** wave, ventricular dysrhythmia; potassium levels may decrease rapidly • **CHF:** dyspnea, crackles, peripheral edema, B/P, volume overload

Perform/provide:

- Storage of reconstituted sol for up to 4 hr in refrigerator
- **Do not freeze DigiFab**

Evaluate:

- Therapeutic response: correction of digoxin toxicity; check digoxin levels 0.5-2 ng/ml; digitoxin level 9-25 ng/ml

Teach patient/family:

- About the purpose of medication; to report delayed hypersensitivity: fever, chills, itching, swelling, dyspnea

🍁 Canada only Side effects: *italics* = common; **bold** = life-threatening ⚠️
Nurse Alert

HIGH ALERT

diltiazem (Rx)

(dil-tye'a-zem)

Cardizem, Cardizem CD, Cardizem LA, Cartia XT, Dilacor-XR, Dilt-CD, Diltia XR, Diltia XT, Diltzac, Taztia XT, Tiazac *Func. class.:* Calcium channel blocker, antiarrhythmic class IV, antihypertensive *Chem. class.:* Benzothiazepine

Do not confuse: **Cardizem**/Cardene

ACTION:

Inhibits calcium ion influx across cell membrane during cardiac depolarization; produces relaxation of coronary vascular smooth muscle, dilates coronary arteries, slows SA/AV node conduction times, dilates peripheral arteries

USES:

PO angina pectoris due to coronary artery spasm, hypertension, **IV** atrial fibrillation, flutter, paroxysmal supraventricular tachycardia

Unlabeled uses: Unstable angina, proteinuria, cardiomyopathy, diabetic neuropathy

CONTRAINDICATIONS:

Sick sinus syndrome, AV heart block, hypotension <90 mm Hg systolic, acute MI, pulmonary congestion, cardiogenic shock

Precautions: Pregnancy (C), breastfeeding, children, geriatric patients, CHF, aortic stenosis, bradycardia, GERD, hepatic disease, hiatal hernia, ventricular dysfunction

DOSAGE AND ROUTES

Calculator

Prinzmetal's or variant angina, chronic stable angina

- **Adult: PO** 30 mg qid, increasing dose gradually to 180-360 mg/day in divided doses or (SR) 60-120 mg bid; may increase to 240-360 mg/day or 120 or 180 mg **EXT REL** (LA, CD, XT, XR products) **PO** daily

Atrial fibrillation/flutter, paroxysmal supraventricular tachycardia

- **Adult: IV BOL** 0.25 mg/kg over 2 min initially then 0.35 mg/kg may be given

after 15 min; if no response, may give **CONT INF** 5-15 mg/hr for up to 24 hr

Hypertension

- **Adult: PO** or 120-240 mg (**EXT REL once-daily dosing**) daily or 60-120 mg bid (**SUS REL twice-daily dosing**)

Rapid ventricular rate secondary to dysrhythmias (unlabeled)

- **Adolescent/child/infant >7 mo: IV BOL** 0.25 mg/kg over 5 min then **CONT IV INF** 0.11 mg/kg/hr

Available forms: Tabs 30, 60, 90, 120 mg; ext rel tabs 120, 180, 240, 300, 360, 420 mg; ext rel caps 60, 90, 120, 180, 240, 300, 360, 420 mg; inj 5 mg/ml (5, 10 ml)

Administer:

PO route

- **Cardiazem LA** ext rel tab 24 hr: give daily, either AM or PM, without regard to meals
- **Dilacor XR/Diltia XT** ext rel cap 24 hr: give daily; take on empty stomach; swallow whole; do not cut, crush, chew, open
- **Tiazac, Tiztia XT:** give daily without regard to meals

- **Conventional regular-rel tab:** give before meals, at bedtime

- **Cardizem CD or equivalent (Cartia XT):** generic ext rel cap 24 hr: give daily, without regard to meals
- May crush, sprinkle regular tab on applesauce for administration

Oral suspension (unlabeled)

- Grind 16 90-mg diltiazem regular rel tab into fine powder
- In separate container, mix 60 ml Ora-Sweet and 60 ml Ora-Plus
- Add small amount of sol to powder to form paste, add geometric amounts of base to achieve desired vol, place in amber container

Direct IV route

- IV undiluted over 2 min

Continuous IV INF route

- Diluted 125 mg/100 ml, 250 mg/250 ml of D₅W, 0.9% NaCl, D₅/0.45% NaCl, give 10 mg/hr, may increase by 5 mg/hr to 15 mg/hr, continue inf up to 24 hr

Y-site compatibilities: Albumin, amikacin, amphotericin B, aztreonam, bumetanide, ceFAZolin, cefotaxime, cefoTEtan, cefOXitin, cefTAZidime, cefTRIAxone, cefuroxime, cimetidine, ciprofloxacin, clindamycin, digoxin,

DOBUtamine, DOPamine, doxycycline, EPINEPHrine, erythromycin, esmolol, fentaNYL, fluconazole, gentamicin, hetastarch, HYDROmorphine, imipenem-cilastatin, labetalol, lidocaine, LORazepam, meperidine, metoclopramide, metroNIDAZOLE, midazolam, milrinone, morphine, multivitamins, niCARdipine, nitroglycerin, norepinephrine, oxacillin, penicillin G potassium, pentamidine, piperacillin, potassium chloride, potassium phosphates, ranitidine, sodium nitroprusside, theophylline, ticarcillin, ticarcillin/clavulanate, tobramycin, trimethoprim-sulfamethoxazole, vancomycin, vecuronium

SIDE EFFECTS

CNS: *Headache, fatigue, drowsiness, dizziness, depression, weakness, insomnia, tremor, paresthesia*

CV: *Dysrhythmia, edema, CHF, bradycardia, hypotension, palpitations, heart block*

GI: *Nausea, vomiting, diarrhea, gastric upset, constipation, increased LFTs*

GU: *Nocturia, polyuria, acute renal failure*

INTEG: *Rash, flushing, photosensitivity, burning, pruritus at inj site*

RESP: *Rhinitis, dyspnea, pharyngitis*

PHARMACOKINETICS

Onset 30-60 min; peak 2-3 hr immediate rel, 10-14 hr ext rel, 6-11 hr sus rel; half-life 3½-9 hr; metabolized by liver; excreted in urine (96% as metabolites)

INTERACTIONS

Increase: effect, toxicity—theophylline

Increase: effects of β-blockers, digoxin, lithium, carbamazepine, cyclosporine, anesthetics, HMG-CoA reductase inhibitors, benzodiazepines, lovastatin, methylprednisolone

Increase: effects of diltiazem—cimetidine

NURSING CONSIDERATIONS

Assess:

- **CHF:** dyspnea, weight gain, edema, jugular venous distention, rales; monitor I&O ratios daily, weight
- **Angina:** location, duration, alleviating factors, activity when pain starts
- **Dysrhythmias:** cardiac status: B/P, pulse, respiration, ECG and intervals PR,

QRS, QT; if systolic B/P <90 mm Hg or HR <50 bpm, hold dose, notify prescriber

Perform/provide:

- Storage in tight container at room temp

Evaluate:

- Therapeutic response: decreased anginal pain, decreased B/P

Teach patient/family:

- How to take pulse, B/P before taking product; that a record or graph should be kept
- To avoid hazardous activities until stabilized on product, dizziness is no longer a problem
- To limit caffeine consumption; to avoid grapefruit juice
- To avoid OTC products unless directed by prescriber
- About the importance of complying with all areas of medical regimen: diet, exercise, stress reduction, product therapy • To change position slowly
- ⚠ To report dizziness, SOB, palpitations • Not to discontinue abruptly

TREATMENT OF OVERDOSE:

Atropine for AV block, vasopressor for hypotension

☼ Canada only Side effects: *italics* = common; **bold** = life-threatening ⚠
Nurse Alert

dimenhyDRINATE (OTC, Rx)

(dye-men-hye'drinate)

Apo-Dimenhydrinate , Dramamine, Driminate, Gravol 

Motion sickness

TripTone, Wal-Dram

Func. class.: Antiemetic, antihistamine, anticholinergic

Chem. class.: H₁-receptor antagonist, ethanolamine derivative

Do not confuse: **dimenhyDRINATE**/diphenhydrAMINE

ACTION:

Competes with histamine for H₁ receptors in GI tract, blood vessels, respiratory tract; central anticholinergic activity, which results in decreased vestibular stimulation and blockade of chemoreceptor trigger zone

USES:

Motion sickness, nausea, vomiting, vertigo

Unlabeled uses: Hyperemesis gravidarum, Ménière's syndrome

CONTRAINDICATIONS:

Hypersensitivity, infants, neonates, tartrazine dye hypersensitivity

Precautions: Pregnancy (B), breastfeeding, children, geriatric patients, cardiac dysrhythmias, asthma, prostatic hypertrophy, bladder-neck obstruction, closed-angle glaucoma, stenosing peptic ulcer, pyloroduodenal obstruction

DOSAGE AND ROUTES

Calculator

- **Adult:** PO 50-100 mg q4hr; IM/IV 50 mg q4hr as needed (Canada only)
- **Child 6-12 yr:** PO 25-50 mg q6-8hr prn, max 150 mg/day
- **Child 2-5 yr:** PO 12.5-25 mg q6-8hr, max 75 mg/day

Available forms: Tabs 50 mg; inj 50 mg/ml ; elixir 15 mg/5 ml ; chew tabs 50 mg

Administer:

- IM inj in large muscle mass; aspirate to avoid IV administration (Canada only)
- Tablets may be swallowed whole, chewed, or allowed to dissolve

IV route (Canada only)

- After diluting 50 mg/10 ml of NaCl inj, give ≤ 50 mg over 2 min

SIDE EFFECTS

CNS: *Drowsiness*, restlessness, headache, dizziness, insomnia, confusion, nervousness, tingling, vertigo

CV: Hypertension, *hypotension*, palpitation

EENT: *Dry mouth*, blurred vision, diplopia, nasal congestion, photosensitivity, xerostomia

GI: Nausea, anorexia, vomiting, *constipation*

INTEG: Rash, urticaria, fever, chills, flushing

MISC: **Anaphylaxis**

PHARMACOKINETICS

PO/IM: Onset 15-30 min, duration 4-6 hr

INTERACTIONS

Increase: effect—alcohol, anticholinergic, tricyclics, MAOIs, opiates, sedative/hypnotics, other CNS depressants

Drug/Lab Test

False negative: allergy skin testing

NURSING CONSIDERATIONS

Assess:

- VS, B/P; check patients with cardiac disease more often
- **Signs of toxicity of other products or masking of symptoms of disease: brain tumor, intestinal obstruction** • Observe for drowsiness, dizziness

Evaluate:

- Therapeutic response: absence of nausea, vomiting, or vertigo

Teach patient/family:

- To avoid hazardous activities, activities requiring alertness because dizziness may occur; to request assistance with ambulation • To avoid alcohol, other CNS depressants

✳ Canada only Side effects: *italics* = common; **bold** = life-threatening ⚠
Nurse Alert

dinoprostone (Rx)

(dye-noe-prost'one)

Cervidil, Prepidil, Prostin E-2

Func. class.: Oxytocic, abortifacient

Chem. class.: Prostaglandin E₂

Do not confuse: **Prepidil**/bepidil

ACTION:

Stimulates uterine contractions, causing abortion; acts within 30 hr for complete abortion

USES:

Abortion during 2nd trimester, benign hydatidiform mole, expulsion of uterine contents in fetal deaths to 28 wk, missed abortion, to efface and dilate the cervix in pregnancy at term

CONTRAINDICATIONS:

Hypersensitivity, C-section, surgery, fetal distress, multiparity, vaginal bleeding, cephalopelvic disproportion

Precautions: Pregnancy (C), cardiac/renal/hepatic disease, asthma, anemia, jaundice, diabetes mellitus, seizure disorders, hypertension, glaucoma, uterine fibrosis, cervical stenosis, pelvic surgery, pelvic inflammatory disease, respiratory disease

Black Box Warning:

Requires a specialized setting and an experienced clinician

DOSAGE AND ROUTES

Calculator

Abortifacient/2nd trimester/missed abortion/benign hydatidiform mole/intrauterine fetal death

• **Adult: VAG SUPP** 20 mg, repeat q3-5hr until abortion occurs, max dose is 240 mg

Cervical ripening

• **Adult: GEL** 0.5 mg vag gel placed in cervical canal, may repeat after 6 hr, max 1.5 mg/24 hr; vag insert 10 mg high in vagina, remove at onset of active labor or within 12 hr

Available forms: VAG SUPP 20 mg; gel 0.5 mg/3 g (prefilled syringe); vag insert 10 mg

Administer:

- **By gel:** after warming to room temp, remove seal from end of syringe, remove protective end cap and insert into plunger stopper assembly; make sure patient is in dorsal position; **insert:** must be kept frozen until use
- Antiemetic/antidiarrheal before administration of this product

SIDE EFFECTS

CNS: *Headache, dizziness, chills, fever, flushing*

CV: Hypotension, *dysrhythmias, DIC*

EENT: Blurred vision

SYST: *Anaphylactoid syndrome of pregnancy*

FETAL: *Bradycardia (i.e., deceleration)*

GI: *Nausea, vomiting, diarrhea*

GU: Vaginitis, vaginal pain, vulvitis, vaginismus

INTEG: Rash, skin color changes

MS: *Leg cramps, joint swelling, weakness*

GEL: Uterine contractile abnormality, GI side effects, back pain, fever

INSERT: Uterine hyperstimulation, fever, nausea, vomiting, diarrhea, abdominal pain

SUPPOSITORY: *Uterine rupture, anaphylaxis*

INTERACTIONS

Increase: effect—other oxytocics

Decrease: oxytocic effect—alcohol

PHARMACOKINETICS

Metabolized in spleen, kidney, lungs; excreted in urine

GEL: Onset 10 min, peak 30-45 min

SUPP: Onset 10 min, duration 2-3 hr

NURSING CONSIDERATIONS

Assess:

Black Box Warning:

Specialized setting, specialized clinician: use only with emergency equipment nearby, by a clinician experienced when used in pregnancy termination; complete abortion should result within 17 hr

- **Cervical ripening:** dilation, effacement of cervix and uterine contraction, fetal heart tones, check for contractions over 1 min • **For fever that occurs 1/2 hr after suppository insertion (abortion)** • Respiratory rate, rhythm, depth; notify prescriber of abnormalities, pulse, B/P, temp

- **Vaginal discharge:** check for itching, irritation; indicates vaginal infection

Evaluate:

- Therapeutic response: expulsion of fetus

Teach patient/family:

- To remain supine for 10-15 min after insertion of supp, 2 hr after insert, 15-30 min after gel • **To report excessive cramping, bleeding, chills, fever** • About some methods of pain, comfort control

- To avoid intercourse, tub baths, douches, tampon use for at least 2 wk

✳ Canada only Side effects: *italics* = common; **bold** = life-threatening ⚠
Nurse Alert

diphenhydrAMINE (OTC, Rx)

(dye-fen-hye'dra-meen)

Allerdryl , AllerMax , Altaryl, Banophen, Benadryl, Benadryl Allergy, Benadryl Allergy Dye Free, Benadryl Children's Allergy, Buckley's Bedtime, Diphedryl, Diphenhist, Dytan, ElixSure Allergy, Equaline Allergy, Equaline Children's Allergy, Equate Allergy, Equate Children's Allergy, Genahist, Good Sense Children's Allergy Relief, Good Sense Diphedryl, Leader Complete Allergy, Nytol, PediaCare Children's Allergy, PediaCare Nighttime Cough, Q-Dryl Allergy, Select Brand Allergy, Siladryl, Silphen, Simply Sleep, Sleepinal, Sleep Tabs, Sominex, Top Care Allergy, Top Care Children's Allergy, Unisom , Valu-Dryl, Wal-dryl Allergy, Wal-dryl Allergy Dye Free, Wal-dryl Children's Allergy, Walgreen's Sleep Aid, Walgreen's Sleep II, Wal-Som *Func. class.: Antihistamine (1st generation, nonselective)*

Chem. class.: Ethanolamine derivative, H₁-receptor antagonist

Do not confuse: diphenhydrAMINE/dicyclomine
diphenhydrAMINE/dimenhyDRINATE

ACTION:

Acts on blood vessels, GI, respiratory system by competing with histamine for H₁-receptor site; decreases allergic response by blocking histamine

USES:

Allergy symptoms, rhinitis, motion sickness, antiparkinsonism, nighttime sedation, infant colic, nonproductive cough, insomnia in children

Unlabeled uses: Nystagmus

CONTRAINDICATIONS:

Hypersensitivity to H₁-receptor antagonist, acute asthma attack, lower respiratory tract disease, neonates

Precautions: Pregnancy (B), breastfeeding, children <2 yr, increased intraocular pressure, cardiac/renal disease, hypertension, bronchial asthma, seizure disorder, stenosed peptic ulcers, hyperthyroidism, prostatic hypertrophy, bladder neck obstruction

DOSAGE AND ROUTES

Calculator

- **Adult and child >12 yr:** PO 25-50 mg q4-6hr, max 300 mg/day; IM/IV 10-50 mg, max 300 mg/day
- **Child 6-12 yr:** PO/IM/IV 5 mg/kg/day in 4 divided doses, max 300 mg/day

Nighttime sleep aid

- **Adult and child ≥ 12 yr:** PO 25-50 mg at bedtime

Antitussive (syrup only)

- **Adult and child ≥ 12 yr:** PO 25 mg q4hr, max 150 mg/24 hr
- **Child 6-12 yr:** PO 12.5 mg q4hr, max 75 mg/24 hr

Renal disease

- CCr > 50 ml/min, dose q6hr; CCr 10-50 ml/min, dose q6-12hr; CCr < 10 ml/min, dose q12-18hr

Peripheral vestibular nystagmus (unlabeled)

- **Adult:** PO 25-50 mg q4-6hr up to 48 hr

Available forms: Caps 25, 50 mg; tabs 25, 50 mg; chew tabs 12.5 mg; elix 12.5 mg/5 ml; syr 12.5 mg/5 ml; inj 10, 50 mg/ml; orally disintegrating tabs 12.5, 25 mg

Administer:

⚠️ Avoid use in children < 2 yr; death has occurred; overdose has occurred with topical gel taken orally (adult/child) • With meals for GI symptoms; absorption rate may slightly decrease

- At bedtime only if using for sleep aid

IM route

- Deep IM in large muscle; rotate site

Direct IV route

- Undiluted; give 25 mg/min or less

Intermittent IV INF route

- Dilute with 0.9% NaCl, 0.45% NaCl, D₅W, 0.9% NaCl, D₁₀W, LR, Ringer's

Syringe compatibilities: Atropine, butorphanol, chlorproMAZINE, cimetidine, dimenhyDRINATE, droperidol, fentaNYL, fluPHENAZine, glycopyrrolate, HYDROmorphine, hydrOXYzine, meperidine, metoclopramide, midazolam, morphine, nalbuphine, pentazocine, perphenazine, prochlorperazine, promazine, promethazine, ranitidine, scopolamine, SUFentanil

Y-site compatibilities: Abciximab, aldesleukin, alfentanil hydrochloride, amifostine, amikacin sulfate, aminocaproic acid, amphotericin B lipid complex (Abelcet), amphotericin B liposome (AmBisome), amsacrine, anidulafungin, argatroban, ascorbic acid injection, atenolol, atracurium besylate, atropine sulfate, azithromycin, benztropine mesylate, bivalirudin, bleomycin, bumetanide,

buprenorphine, butorphanol, calcium chloride/gluconate, CARBOplatin, caspofungin, cefTAZidime, ceftizoxime, chlorproMAZINE, cimetidine, ciprofloxacin, cisatracurium, CISplatin, cladribine, clindamycin, codeine, cyanocobalamin, cyclophosphamide, cycloSPORINE, cytarabine, DACTINomycin, DAPTOmycin, digoxin, diltiazem, DOBUTamine, docetaxel, DOPamine, doripenem, doxacurium, DOXOrubicin, DOXOrubicin liposomal, doxycycline, enalaprilat, ePHEDrine, EPINEPHrine, epirubicin, epoetin alfa, eptifibatide, ertapenem, erythromycin, esmolol, etoposide, famotidine, fenoldopam, fentaNYL, filgrastim, fluconazole, fludarabine, folic acid, gallium, gatifloxacin, gemcitabine, gemtuzumab, gentamicin, glycopyrrolate, granisetron, HYDROmorphine, hydrOXYzine, IDArubicin, ifosfamide, imipenem-cilastatin, irinotecan, isoproterenol, labetalol, levofloxacin, lidocaine, linezolid, LORazepam, LR, magnesium sulfate, mannitol, mechlorethamine, melphalan, meperidine, meropenem, metaraminol, methadone, methicillin, methotrexate, methoxamine, methyl dopate, metoclopramide, metoprolol, metroNIDAZOLE, miconazole, midazolam, minocycline, mitoXANtrone, morphine, multiple vitamins injection, mycophenolate, nalbuphine, naloxone, nesiritide, netilmicin, nitroglycerin, norepinephrine, octreotide, ondansetron, oxaliplatin, oxytocin, PACLitaxel, palonosetron, pamidronate, pancuronium, papaverine, PEMEtrexed, penicillin G potassium/sodium, pentamidine, pentazocine, phenylephrine, phytonadione, piperacillin, piperacillin-tazobactam, polymyxin B, potassium chloride, procainamide, prochlorperazine, promethazine, propofol, propranolol, protamine, pyridoxine, quiNIDine, quinupristin-dalfopristin, ranitidine, remifentanyl, Ringer's, ritodrine, riTUXimab, rocuronium, sargramostim, sodium acetate, succinylcholine, SUFentanyl, tacrolimus, teniposide, theophylline, thiamine, thiotepa, ticarcillin, ticarcillin-clavulanate, tigecycline, tirofiban, TNA, tobramycin, tolazoline, TPN, trastuzumab, trimetaphan, urokinase, vancomycin, vasopressin, vecuronium, verapamil, vinCRISTine, vinorelbine, vitamin B complex/C, voriconazole, zoledronic acid

SIDE EFFECTS

CNS: *Dizziness, drowsiness, poor coordination, fatigue, anxiety, euphoria, confusion, paresthesia, neuritis, seizures*

CV: Hypotension, palpitations

EENT: Blurred vision, dilated pupils, tinnitus, nasal stuffiness, dry nose, throat,

mouth

GI: Nausea, anorexia, diarrhea

GU: *Retention*, dysuria, frequency

HEMA: Thrombocytopenia, agranulocytosis, hemolytic anemia

INTEG: Photosensitivity

MISC: Anaphylaxis

RESP: Increased thick secretions, wheezing, chest tightness

PHARMACOKINETICS

Metabolized in liver, excreted by kidneys, crosses placenta, excreted in breast milk, half-life 2-7 hr

PO: Peak 1-3 hr, duration 4-7 hr

IM: Onset 1/2 hr, peak 1-4 hr, duration 4-7 hr

IV: Onset immediate, duration 4-7 hr

INTERACTIONS

Increase: CNS depression—barbiturates, opiates, hypnotics, tricyclics, alcohol

Increase: diphenhydrAMINE effect—MAOIs

Drug/Lab Test

False negative: skin allergy tests

NURSING CONSIDERATIONS

Assess:

- Urinary retention, frequency, dysuria; product should be discontinued
- CBC during long-term therapy; blood dyscrasias may occur
- Respiratory status: rate, rhythm, increase in bronchial secretions, wheezing, chest tightness • Product should be discontinued 4 days before skin allergy tests
- Storage in tight container at room temp

Evaluate:

- Therapeutic response: absence of running or congested nose or rashes, improved sleep

Teach patient/family:

- About all aspects of product use; to notify prescriber of confusion, sedation, hypotension
- To avoid driving, other hazardous activity if drowsiness occurs
- That photosensitivity may occur

- To avoid concurrent use of alcohol, other CNS depressants
- To avoid breastfeeding; **not to breastfeed (injectable)**
- To use hard candy, gum, frequent rinsing of mouth for dryness

TREATMENT OF OVERDOSE:

Administer diazepam, vasopressors, phenytoin IV

✳ Canada only Side effects: *italics* = common; **bold** = life-threatening ⚠
Nurse Alert

diphenoxylate/atropine (Rx)

(dye-fen-ox'ee-late/a'troe-peen)

Lomotil, Lonox

difenoxin/atropine (Rx)

(dye-fen-ox'in/a'troe-peen)

Motofen

Func. class.: Antidiarrheal

Chem. class.: Phenylpiperidine derivative opiate agonist

Controlled Substance Schedule V

diphenoxylate/atropine

Controlled Substance Schedule IV

difenoxin/atropine (US)

Do not confuse: **Lomotil**/LaMICtal/LamISIL/Lanoxin/Lasix/Ludomil

ACTION:

Inhibits gastric motility by acting on mucosal receptors responsible for peristalsis

USES:

Acute nonspecific and acute exacerbations of chronic functional diarrhea

CONTRAINDICATIONS:

Children <2 yr, hypersensitivity, pseudomembranous colitis, severe electrolyte imbalances, diarrhea associated with organisms that penetrate intestinal mucosa

Precautions: Pregnancy (C), breastfeeding, hepatic disease, ulcerative colitis, severe hepatic disease, substance abuse, dehydration

DOSAGE AND ROUTES

Calculator

Diphenoxylate/atropine

- **Adult:** PO 5 mg qid titrated to patient response needed, max 8 tabs/day
- **Child 2-12 yr:** PO (liquid only) 0.3-0.4 mg/kg/day in 4 divided doses

Difenoxin/atropine

• **Adult: PO** 2 tabs then 1 tab after each loose stool or q3-4hr prn, max 8 tabs/day

Available forms: Diphenoxylate/atropine: tabs 2.5 mg with atropine 0.025 mg; liquid 2.5 mg with atropine 0.025 mg/5 ml; **difenoxin/atropine:** tabs 1 mg difenoxin/0.025 atropine

Administer:

• For 48 hr only; if no response, product should be discontinued

SIDE EFFECTS

CNS: *Dizziness, drowsiness, light-headedness, headache, fatigue, nervousness, insomnia, confusion*

EENT: Burning eyes, blurred vision

GI: *Nausea, vomiting, dry mouth, epigastric distress, constipation, paralytic ileus, toxic megacolon*

MISC: *Anaphylaxis, angioedema*

RESP: *Respiratory depression*

PHARMACOKINETICS

PO: Onset 40-60 min, peak 2 hr, duration 3-4 hr, terminal half-life 12-14 hr, metabolized in liver to active metabolite; excreted in urine and feces

INTERACTIONS

• **Do not use with MAOIs; hypertensive crisis may occur**

Increase: action of alcohol, opioids, barbiturates, other CNS depressants, anticholinergics

Decrease: GI motility, possible toxic megacolon—amantadine, antimuscarinics, amoxapine, diphenhydramine, clozapine, clemastine, cyclobenzaprine, loperamide, maprotiline, phenothiazines, tricyclics, disopyramide, OLANzapine

NURSING CONSIDERATIONS

Assess:

- Electrolytes (potassium, sodium, chlorine) if receiving long-term therapy
- Bowel pattern before; for rebound constipation after termination of medication; bowel sounds
- Response after 48 hr; if none, product should be discontinued
- **Abdominal distention, toxic megacolon; may occur in ulcerative colitis**
- Hepatic studies if receiving long-term therapy

Evaluate:

- Therapeutic response: decreased diarrhea

Teach patient/family:

- To avoid OTC products unless directed by prescriber (may contain alcohol); not to use alcohol or CNS depressants • Not to exceed recommended dose
 - **That product may be habit forming**
 - Not to engage in hazardous activities; that drowsiness may occur; not to use for longer than 48 hr for acute diarrhea
-

🍁 Canada only Side effects: *italics* = common; **bold** = life-threatening ⚠️
Nurse Alert

dipivefrin ophthalmic

See [Appendix B](#)

dipyridamole (Rx)

(dye-peer-id'a-mole)

[Persantine](#)

Func. class.: Coronary vasodilator, antiplatelet agent

Chem. class.: Nonnitrate

ACTION:

Inhibits adenosine uptake, which produces coronary vasodilation; increases oxygen saturation in coronary tissues, coronary blood flow; acts on small resistance vessels with little effect on vascular resistance; may increase development of collateral circulation; decreases platelet aggregation by the inhibition of phosphodiesterase (an enzyme)

USES:

Prevention of transient ischemic attacks, inhibition of platelet adhesion to prevent myocardial reinfarction, thromboembolism, with warfarin in prosthetic heart valves, prevention of coronary bypass graft occlusion with aspirin; IV form used to evaluate CAD; used as alternative to exercise with thallium myocardial perfusion imaging to evaluate CAD

Unlabeled uses: Cardiomyopathy, MI prophylaxis, proteinuria, TIA, valvular heart disease

CONTRAINDICATIONS:

Hypersensitivity

Precautions: Pregnancy (B), breastfeeding, hypotension

DOSAGE AND ROUTES

Calculator

Inhibition of platelet adhesion

- **Adult:** PO 75-100 mg qid in combination with aspirin or warfarin

Thallium myocardial perfusion imaging

- **Adult:** IV 570 mcg/kg

TIA with aspirin (unlabeled)

- **Adult: PO** 225-400 mg/day max 400 mg/day

Available forms: Tabs 25, 50, 75 mg; inj 10 mg/2 ml

Administer:

PO route

- On empty stomach: 1 hr before meals or 2 hr after; give with 8 oz water for better absorption

IV route

- IV after diluting to at least 1:2 ratio using D₅W, 0.45% NaCl, or 0.9% NaCl to a total vol of 20-50 ml; give over 4 min; do not give undiluted

- Inject thallium 201 within 5 min after product infusion
- Do not admix

SIDE EFFECTS

CNS: Headache, dizziness, weakness, fainting, syncope; IV: transient cerebral ischemia, weakness

CV: Postural hypotension; IV: **MI**

GI: Nausea, vomiting, anorexia, diarrhea

INTEG: Rash, flushing

RESP: IV: **Bronchospasm**

PHARMACOKINETICS

PO: Peak 1.25 hr, duration 6 hr, therapeutic response may take several months, metabolized in liver, excreted in bile, undergoes enterohepatic recirculation, protein binding 91%-99%, terminal half-life 12 hr

INTERACTIONS

- Prevention of coronary vasodilation: theophylline

Increase: digoxin effect—digoxin

Increase: bleeding risk—NSAIDs, cefamandole, cefoTEtan, cefoperazone, plicamycin, valproic acid, salicylates, sulfinpyrazole, anticoagulants, thrombolytics

NURSING CONSIDERATIONS

Assess:

- B/P, pulse during treatment until stable; take B/P lying, standing; orthostatic

hypotension is common

- Cardiac status: chest pain; what aggravates, ameliorates condition

Perform/provide:

- Storage at room temp

Evaluate:

- Therapeutic response: decreased platelet adhesion

Teach patient/family:

- That medication is not a cure; may have to be taken continuously in evenly spaced doses only as directed
- To avoid hazardous activities until stabilized on medication; dizziness may occur
- To rise slowly from sitting or lying to prevent orthostatic hypotension
- Not to use alcohol or OTC medications unless approved by prescriber

🍁 Canada only Side effects: *italics* = common; **bold** = life-threatening ⚠️
Nurse Alert

DOBUtamine (Rx)

(doe-byoo'ta-meen)

Func. class.: Adrenergic direct-acting β_1 -agonist, cardiac stimulant

Chem. class.: Catecholamine

Do not confuse: DOBUtamine/DOPamine

ACTION:

Causes increased contractility, increased cardiac output without marked increase in heart rate by acting on β_1 -receptors in heart; minor α and β_2 effects

USES:

Cardiac decompensation due to organic heart disease or cardiac surgery

Unlabeled uses: Cardiogenic shock in children; congenital heart disease in children undergoing cardiac catheterization

CONTRAINDICATIONS:

Hypersensitivity, idiopathic hypertrophic subaortic stenosis

Precautions: Pregnancy (B), breastfeeding, children, hypertension, CAD, MI, hypovolemia, dysrhythmias, sulfite hypersensitivity, renal failure, geriatric patients

DOSAGE AND ROUTES

Calculator

• **Adult and child:** IV INF 0.5-1 mcg/kg/min; titrate to 2-20 mcg/kg/min may increase to 40 mcg/kg/min if needed

Available forms: Inj 12.5 mg/ml, 250 mg/20 ml

Administer:

Injectable

• Visually inspect parenteral products for particulate matter and discoloration before administration whenever solution and container permit

IV route

Note: Infusions ≤ 72 hr have been given without development of tolerance. However, beta-receptor desensitization can occur with prolonged infusions of any beta-adrenergic agonist, including DOBUtamine, or as a consequence of

sympathetic compensatory mechanisms associated with advanced congestive heart failure, resulting in alterations in DOBUTamine pharmacodynamics. Experience with intravenous DOBUTamine in controlled trials does not extend beyond 48 hr of repeated boluses and/or continuous infusions.

- Must be diluted before administration
- Infuse into a large vein

Dilution

- Concentrate for injection must be diluted with ≥ 50 ml of a compatible IV solution (strongly alkaline [e.g., sodium bicarbonate] solutions are incompatible). A common dilution is 500 mg (40 ml) in 210 ml D₅W or NS (withdraw 40 ml from a 250 ml bag) to produce a final concentration of 2000 mcg/ml; or 1000 mg (80 ml) in 170 ml D₅W or NS (withdraw 80 ml from a 250 ml bag) to produce a final concentration of 4000 mcg/ml. Maximum concentration should not exceed 5000 mcg/ml and should be adjusted according to the patient's fluid requirements.

Infusion

- Administer diluted solution by IV inf using a controlled-infusion device.
- Premixed bags of DOBUTamine in D₅W solutions can exhibit a pink color that increase with time. This color change is due to slight oxidation of the drug, but there is no significant loss of potency
- Do not administer DOBUTamine simultaneously with solutions containing sodium bicarbonate or strong alkaline solutions (incompatible)
- Infusion of DOBUTamine should be started at a low rate and titrated frequently to reach the optimal dosage (see Dosage). Dosage titration is guided by the patient's response, including systemic blood pressure, urine flow, frequency of ectopic activity, heart rate, and (whenever possible) measurements of cardiac output, central venous pressure, and/or pulmonary capillary wedge pressure

Y-site compatibilities: Alfentanil, alprostadil, amifostine, amikacin, aminocaproic acid, amiodarone, anidulafungin, argatroban, ascorbic acid injection, atenolol, atracurium, atropine, aztreonam, benztropine, bleomycin, bumetanide, buprenorphine, butorphanol, calcium chloride/gluconate, CARBOplatin, caspofungin, chlorproMAZINE, cimetidine, ciprofloxacin, cisatracurium, CISplatin, cladribine, clarithromycin, cloNIDine, codeine,

cyanocobalamin, cyclophosphamide, cycloSPORINE, cytarabine, DACTINomycin, DAPTOmycin, dexmedetomidine, digoxin, diltiazem, diphenhydrAMINE, DOCEtaxel, DOPamine, doripenem, doxacurium, DOXOrubicin, DOXOrubicin liposomal, doxycycline, enalaprilat, ePHEDrine, EPINEPHrine, epirubicin, epoetin alfa, eptifibatide, erythromycin, esmolol, etoposide, famotidine, fenoldopam, fentaNYL, fluconazole, fludarabine, gatifloxacin, gemcitabine, gentamicin, glycopyrrolate, granisetron, HYDROmorphine, hydrOXYzine, IDArubicin, ifosfamide, irinotecan, isoproterenol, labetalol, levofloxacin, lidocaine, linezolid, LORazepam, LR, magnesium sulfate, mannitol, mechlorethamine, meperidine, meropenem, metaraminol, methoxamine, methyl dopate, methylPREDNISolone, metoclopramide, metoprolol, metroNIDAZOLE, miconazole, milrinone, minocycline, mitoXANtrone, morphine, multiple vitamins injection, mycophenolate mofetil, nafcillin, nalbuphine, naloxone, netilmicin, niCARdipine, nitroglycerin, norepinephrine, octreotide, ondansetron, oxaliplatin, oxytocin, PACLitaxel, palonosetron, pamidronate, pancuronium, papaverine, pentamidine, pentazocine, phenylephrine, polymyxin B, potassium chloride, procainamide, prochlorperazine, promethazine, propofol, propranolol, protamine, pyridoxine, quiNIDine, ranitidine, remifentanyl, Ringer's, ritodrine, riTUXimab, rocuronium, sodium acetate, succinylcholine, SUFentanyl, tacrolimus, temocillin, teniposide, theophylline, thiamine, thiotepa, tigecycline, tirofiban, TNA, tobramycin, tolazoline, TPN, trastuzumab, trimetaphan, urokinase, vancomycin, vasopressin, vecuronium, verapamil, vinCRISTine, vinorelbine, voriconazole, zidovudine, zoledronic acid

SIDE EFFECTS

CNS: Anxiety, headache, dizziness, fatigue

CV: Palpitations, tachycardia, hyper/hypotension, PVCs, angina

ENDO: Hypokalemia

GI: Heartburn, nausea, vomiting

MS: Muscle cramps (leg)

RESP: Dyspnea

PHARMACOKINETICS

IV: Onset 1-2 min, peak 10 min, half-life 2 min, metabolized in liver (inactive

metabolites), excreted in urine

INTERACTIONS

Increase: severe hypertension—guanethidine

Increase: dysrhythmias—general anesthetics

Increase: pressor effect, dysrhythmias—atomoxetine, COMT inhibitors, tricyclics, MAOIs, oxytocics

Decrease: DOBUTamine action—other β -blockers

NURSING CONSIDERATIONS

Assess:

- **Hypovolemia;** if present, correct first; administer cardiac glycoside before DOBUTamine
- **Oxygenation/perfusion deficit:** check B/P, chest pain, dizziness, loss of consciousness
- **Heart failure:** S₃ gallop, dyspnea, neck venous distention, bibasilar crackles in patients with CHF, cardiomyopathy, palpate peripheral pulses; report if extremities become cold or mottled or if peripheral pulses decrease
- **ECG** during administration continuously; if B/P increases, product is decreased; CVP or PCWP, cardiac output during inf; report changes
- Serum electrolytes, urine output

 **Sulfite sensitivity**, which may be life threatening

Perform/provide:

- Storage of reconstituted sol for 24 hr if refrigerated

Evaluate:

- Therapeutic response: increased B/P with stabilization, increased urine output

Teach patient/family:

- About the reason for product administration; **to report dyspnea, chest pain, numbness of extremities, headache, IV site discomfort**

TREATMENT OF OVERDOSE:

Administer a β_1 -adrenergic blocker; reduce IV or discontinue, ensure oxygenation/ventilation; for severe tachydysrhythmias (ventricular), give lidocaine or propranolol

Nurse Alert

DOCEtaxel (Rx)

(doe-se-tax'el)

Taxotere

Func. class.: Antineoplastic—miscellaneous

Chem. class.: Taxane

Do not confuse: Taxotere/Taxol

ACTION:

Inhibits reorganization of microtubule network needed for interphase and mitotic cellular functions; also causes abnormal bundles of microtubules during cell cycle and multiple esters of microtubules during mitosis

USES:

Locally advanced or metastatic breast cancer, non–small-cell lung cancer, androgen-independent metastatic prostate cancer, postsurgery operable node-positive breast cancer, induction treatment of locally advanced squamous cell of the head and neck

Unlabeled uses: Malignant melanoma, ovarian cancer, front-line use with bevacizumab for metastatic breast cancer, adjuvant treatment of breast cancer with CARBOplatin and trastuzumab, gastric adenocarcinoma

CONTRAINDICATIONS:

Pregnancy (D), breastfeeding, hypersensitivity to this product, bilirubin exceeding upper normal limit

Black Box Warning:

Other products with polysorbate 80, neutropenia of $<1500/\text{mm}^3$

Precautions: Children, cardiovascular disease, pulmonary disorders, bone marrow depression, herpes zoster, pleural effusion

Black Box Warning:

Edema, hepatic disease, lung cancer, taxane hypersensitivity

DOSAGE AND ROUTES:

- Other regimens are used

Locally advanced or metastatic breast cancer after failure of other chemotherapy

- **Adult:** IV 60-100 mg/m² given over 1 hr q3wk; if neutrophil count is <500

cells/mm³ for >1 wk, reduce dose by 25%

Operable node-positive breast cancer, adjuvant postsurgery treatment of operable node-positive breast cancer

- **Adult: IV** (TAC regimen) 75 mg/m² 1 hr after DOXOrubicin 50 mg/m² and cyclophosphamide 500 mg/m² q3wk × 6 cycles

Adjuvant treatment of operable stage I-III invasive breast cancer in combination with cyclophosphamide

- **Adult: IV** (TAC regimen) docetaxel 75 mg/m² with cyclophosphamide 600 mg/m² q21days × 4 cycles

Locally advanced or metastatic non–small-cell lung cancer after failure of CISplatin chemotherapy

- **Adult: IV** 75 mg/m² over 1 hr q3wk; if neutrophil count is <500 cells/mm³ for >1 wk, reduce dose to 55 mg/m²; if patient develops grade 3 peripheral neuropathy, stop product

Unresectable, locally advanced, or metastatic non–small-cell lung cancer previously treated with chemotherapy

- **Adult: IV** 75 mg/m² over 1 hr then CISplatin 75 mg/m² **IV** given over 30-60 min q3wk; reduce dose to 65 mg/m² in those with hematologic or non-hematologic toxicities

Androgen-independent metastatic prostate cancer

- **Adult: IV** 75 mg/m² given over 1 hr q3wk with 5 mg predniSONE **PO** bid continuously; give dexamethasone 8 mg **PO** at 12 hr, 3 hr, and 1 hr prior to docetaxel; if neutrophil count is <500 cells/mm³ for more than 1 wk or other toxicities occur, reduce dose to 60 mg/m²

Squamous cell of head and neck

- **Adult: IV** 75 mg/m² over 1 hr, then CISplatin 100 mg/m² over 1 hr on day 1, then 5FU 1000 mg/m²/day **CONT INF** × 5 days, repeat cycle q3wk

Gastric adenocarcinoma

- **Adult: IV** 75 mg/m² q3wk, given with CISplatin, fluorouracil

Advanced ovarian cancer/metastatic melanoma (unlabeled)

- **Adult: IV** 100 mg/m² over 1 hr q3wk

Available forms: Inj 20 mg/0.5 ml, 20 mg/ml, 80 mg/2 ml, 80 mg/4 ml

Administer:

- Premedicate with dexamethasone 8 mg **PO** bid × 3 days starting 1 day prior to

treatment

- Antiemetic 30-60 min before product and prn

Intermittent IV INF route

- Use cytotoxic handling procedures
- Use non-PVC bag and use non-DEHP tubing
- Allow vials to warm to room temp; withdraw all diluent, inject in vial of docetaxel; rotate gently to mix; allow to stand to decrease foaming, then withdraw the required amount (10 mg/ml), inject in 250 ml of 0.9% NaCl, D₅W; mix gently; give over 1 hr

Y-site compatibilities: Acyclovir, alfentanil, allopurinol, amifostine, amikacin, aminocaproic acid, aminophylline, amiodarone, amphotericin B lipid complex, ampicillin, ampicillin-sulbactam, anidulafungin, atenolol, atracurium, azithromycin, aztreonam, bivalirudin, bleomycin, bumetanide, buprenorphine, busulfan, butorphanol, calcium chloride/gluconate, CARBOplatin, carmustine, caspofungin, ceFAZolin, cefepime, cefonicid, cefoperazone, cefotaxime, cefoTEtan, cefOXitin, cefTAZidime, ceftizoxime, cefTRIAxone, cefuroxime, cephapirin, chloramphenicol, chlorproMAZINE, cimetidine, ciprofloxacin, cisatracurium, CISplatin, clindamycin, codeine, cyclophosphamide, cycloSPORINE, cytarabine, dacarbazine, DACTINomycin, DAPTOmycin, dexamethasone, dexmedetomidine, dexrazoxane, diazepam, digoxin, diltiazem, diphenhydrAMINE, DOBUtamine, DOPamine, doripenem, doxacurium, DOXOrubicin HCL, doxycycline, droperidol, enalaprilat, ePHEDrine, EPINEPHrine, epirubicin, ertapenem, erythromycin, esmolol, etoposide, famotidine, fenoldopam, fentaNYL, fluconazole, fludarabine, fluorouracil, foscarnet, fosphenytoin, furosemide, ganciclovir, gatifloxacin, gemcitabine, gentamicin, glycopyrrolate, granisetron, haloperidol, heparin, hydrALAZINE, hydrocortisone, HYDROmorphone, hydrOXYzine, ifosfamide, imipenem-cilastatin, inamrinone, insulin (regular), irinotecan, isoproterenol, ketorolac, labetalol, leucovorin, levofloxacin, levorphanol, lidocaine, linezolid, LORazepam, LR, magnesium sulfate, mannitol, meperidine, meropenem, mesna, methotrexate, methyldopate, metoclopramide, metoprolol, metroNIDAZOLE, midazolam, milrinone, minocycline, mitoXANtrone, mivacurium, morphine, nafcillin, naloxone, nesiritide, netilmicin, niCARdipine, nitroglycerin, nitroprusside, norepinephrine, octreotide, ofloxacin, ondansetron, oxaliplatin,

palonosetron, pamidronate, pancuronium, pantoprazole, PEMEtrexed, pentamidine, pentazocine, PENTobarbital, PHENobarbital, phenylephrine, piperacillin, piperacillin-tazobactam, polymyxin B, potassium chloride/phosphates, procainamide, prochlorperazine, promethazine, propranolol, quiniDine, quinupristin-dalfopristin, ranitidine, remifentanyl, ritUXimab, rocuronium, sodium acetate/bicarbonate/phosphates, succinylcholine, SUFentanyl, sulfamethoxazole-trimethoprim, tacrolimus, teniposide, theophylline, thiopental, thiotepa, ticarcillin, ticarcillin-clavulanate, tigecycline, tirofiban, tobramycin, tolazoline, trastuzumab, trimethobenzamide, vancomycin, vasopressin, vecuronium, verapamil, vinCRISTine, vinorelbine, voriconazole, zidovudine, zoledronic acid

SIDE EFFECTS

CNS: Seizures

CV: Hypotension, fluid retention, peripheral edema, flushing, MI, sinus tachycardia

GI: Nausea, vomiting, diarrhea, hepatotoxicity, stomatitis, colitis

HEMA: Neutropenia, leukopenia, thrombocytopenia, anemia, bleeding, infections, myelosuppression

INTEG: Alopecia, nail pain, rash, skin eruptions

MISC: Amenorrhea, fever of unknown origin, secondary malignancy, Stevens-Johnson syndrome

MS: Arthralgia, myalgia, back pain, weakness

NEURO: Peripheral neuropathy

RESP: Dyspnea, pulmonary edema, fibrosis, embolism

SYST: Hypersensitivity reactions

PHARMACOKINETICS

Metabolized in liver, excreted in feces, terminal half-life 11.1 hr

INTERACTIONS

Increase: CYP3A inhibition: anastrozole (high doses), aprepitant, fosaprepitant, clarithromycin, conivaptan, delavirdine, efavirenz (induces or inhibits), erythromycin, fluconazole, FLUoxetine, fluvoxamine, imatinib, itraconazole, ketoconazole, mibefradil, nefazodone, voriconazole, and others

Increase: CYP3A induction: barbiturates, bosentan, carbamazepine,

nevirapine, phenytoin, fosphenytoin, rifabutin, rifampin, rifapentine, troglitazone

Increase: myelosuppression—other antineoplastics, radiation

Decrease: immune response—live virus vaccines

NURSING CONSIDERATIONS

Assess:

Black Box Warning:

CBC, differential, platelet count before treatment and weekly; withhold product if WBC is $<1500/\text{mm}^3$ or platelet count is $<100,000/\text{mm}^3$; notify prescriber

Black Box Warning:

DOCEtaxel, polysorbate 80 hypersensitivity: contraindicated

Black Box Warning:

Edema: oral corticosteroids should be given as premedication, assess for fluid retention

Black Box Warning:

Lung cancer: increased mortality in those with increased LFTs and a history of platinum-based products

- Monitor temp; fever may indicate beginning of infection

Black Box Warning:

Hepatic disease: hepatic studies before, during therapy (bilirubin, AST, ALT, LDH) prn or monthly; check for jaundiced skin and sclera, dark urine, clay-colored stools, itchy skin, abdominal pain, fever, diarrhea

- **CNS changes:** confusion, paresthesias, peripheral neuropathy, dysethenia, pain, weakness; if severe, product should be discontinued
- VS during 1st hr of inf, check IV site for signs of infiltration

Black Box Warning:

Hypersensitive reactions, anaphylaxis, including hypotension, dyspnea, angioedema, generalized urticaria; discontinue infusion immediately

- **Bone marrow depression/bleeding:** hematuria, guaiac, bruising or petechiae, mucosa or orifices q8hr; obtain prescription for viscous lidocaine (Xylocaine); avoid invasive procedures

- Effects of alopecia on body image; discuss feelings about body changes

Perform/provide:

- Confirmation that dexamethasone was given 12 hr and 6 hr before inf begins
- Storage of prepared sol up to 27 hr in refrigerator

Evaluate:

- Therapeutic response: decreased tumor size, spread of malignancy

Teach patient/family:

- To report signs of **infection**: fever, sore throat, flulike symptoms
 - To report signs of **anemia**: fatigue, headache, faintness, SOB, irritability
 - To report **bleeding**; to avoid use of razors, commercial mouthwash
 - To avoid use of aspirin, ibuprofen
 - That hair may be lost during treatment; that a wig or hairpiece may make patient feel better; that new hair may be different in color and texture
 - That pain in muscles and joints 2-5 days after inf is common
 - To use barrier contraception during and for several months after treatment, pregnancy (D); to avoid breastfeeding
 - To avoid receiving vaccinations while taking product
-

🍁 Canada only Side effects: *italics* = common; **bold** = life-threatening ⚠️
Nurse Alert

docosanol topical

See [Appendix B](#)

docusate calcium (OTC)

(dok'yoo-sate cal'see-um)

Kao-Tin, Stool Softener DC, Sur-Q-Lax, Walgreen's Stool Softener

docusate sodium (OTC)

Colace, Correctol, Diocto, Doc-Q-Lace, Docu DOK, Docolace, Enemeez, Equaline Stool Softener, Good Sense Stool Softener, Leader Stool Softener, Phillip's Stool Softener, Regulex , Select Brand Docusate Sodium, Selex , Silace, Soflax , Top Care Stool Softener, Walgreen's Stool Softener

Func. class.: Laxative, emollient; stool softener

Chem. class.: Anionic surfactant

ACTION:

Increases water, fat penetration in intestine; allows for easier passage of stool

USES:

Prevention of dry, hard stools

CONTRAINDICATIONS:

Hypersensitivity, obstruction, fecal impaction, nausea/vomiting

Precautions: Pregnancy (C), breastfeeding

DOSAGE AND ROUTES

Calculator

- **Adult:** PO 50-300 mg/day (sodium) or 240 mg (calcium) prn; **ENEMA** 4 ml
- **Child >12 yr:** **ENEMA** 2 ml
- **Child 6-12 yr:** PO 40-150 mg/day (sodium) in divided doses
- **Child 3-6 yr:** PO 20-60 mg/day (sodium) in divided doses
- **Child <3 yr:** PO 10-40 mg/day (sodium) in divided doses

Available forms: *Calcium:* 240 mg; *sodium:* caps 50, 100, 250 mg; tabs 100 mg; syr 20 mg/5 ml, 50 mg/15 ml, 100 mg/30 ml, 150 mg/15 ml; oral sol 10, 50 mg/ml; enema 283 mg/3.9 cap

Administer:

- Swallow tabs whole; do not break, crush, or chew

- Oral sol: diluted in milk, fruit juice to decrease bitter taste
- In morning or evening (oral dose)

SIDE EFFECTS

EENT: Bitter taste, throat irritation

GI: Nausea, anorexia, cramps, diarrhea

INTEG: Rash

PHARMACOKINETICS

Onset 12-72 hr

INTERACTIONS

- **Toxicity:** mineral oil

Drug/Herb

Increase: laxative action—flax, senna

NURSING CONSIDERATIONS

Assess:

- **Cause of constipation;** identify whether fluids, bulk, or exercise missing from lifestyle; constipating products
- Cramping, rectal bleeding, nausea, vomiting; if these occur, product should be discontinued

Perform/provide:

- Storage in cool environment; do not freeze

Evaluate:

- Therapeutic response: decrease in constipation

Teach patient/family:

- That normal bowel movements do not always occur daily
- Not to use in presence of abdominal pain, nausea, vomiting
- To notify prescriber if constipation unrelieved or if symptoms of electrolyte imbalance occur: muscle cramps, pain, weakness, dizziness, excessive thirst
- That product may take up to 3 days to soften stools
- To take oral preparations with a full glass of water (unless on fluid restrictions) and to increase fluid intake

☼ Canada only Side effects: *italics* = common; **bold** = life-threatening ⚠

Nurse Alert

dofetilide (Rx)

Tikosyn

Func. class.: Antidysrhythmic (Class III)

ACTION:

Blocks cardiac ion channel carrying the rapid component of delayed potassium current; no effect on sodium channels

USES:

Atrial fibrillation, flutter, maintenance of normal sinus rhythm

CONTRAINDICATIONS:

Children, hypersensitivity, digoxin toxicity, aortic stenosis, pulmonary hypertension, severe renal disease

Black Box Warning:

QT prolongation, torsades de pointes, renal failure

Precautions: Pregnancy (C), breastfeeding, AV block, bradycardia, electrolyte imbalance

Black Box Warning:

Renal disease, arrhythmias

DOSAGE AND ROUTES

Calculator

Conversion of atrial fibrillation/atrial flutter to normal sinus rhythm; maintenance therapy with highly symptomatic atrial fibrillation/atrial flutter of ≥ 1 week duration

- **Adult: PO** Individualize dosage based on renal function and QTc in a monitored facility. Refer to the step-by-step procedure for determining the initial dosage of dofetilide

Maintenance therapy of atrial fibrillation/atrial flutter after hospital discharge

- **Adult: PO** Continue dosage at discharge as from initial dosage titration. Individualize dosage based on renal function and QTc, which should be re-evaluated every 3 months or as medically warranted; if the QTc > 500 msec (550 msec in patients with ventricular conduction abnormalities) at any time,

discontinue; carefully monitor until QTc returns to baseline; if renal function deteriorates, adjust the dosage as described in the dosage guidelines for patients with renal impairment.

Discontinuation of dofetilide before use of interacting drugs

- **Adult: PO** Discontinue dofetilide for ≥ 2 days before starting a potentially interacting drug

Renal dose

- **Adult: PO** CCr >60 ml/min, 500 mcg bid; CCr 40-60 ml/min, 250 mcg bid; CCr 20-39 ml/min, 125 mcg bid; CCr <20 ml/min, do not use

Available forms: Caps 125, 250, 500 mcg

Administer:

Black Box Warning:

Step 1: Assess cardiac conduction: Before first dose, the QTc interval must be determined using an average of 5–10 beats; if the QTc interval is >440 msec (or >500 msec in ventricular conduction abnormalities), do not use. If baseline heart rate is <60 bpm, then the QT interval should be used

Black Box Warning:

Step 2: Assess renal function: Before first dose, determine renal function using the Cockcroft-Gault equation, use actual body weight to calculate creatinine clearance

Black Box Warning:

Step 3: Adjust starting dose according to renal function: Refer to the “Patients with renal impairment” section (below) to determine the appropriate initial dosage

Black Box Warning:

Step 4: ECG monitoring: Begin continuous ECG monitoring starting with the first dose

Black Box Warning:

Step 5: Dosage adjustments: Approximately 2–3 hr after the first dose, determine the QTc interval. If the QTc interval has increased by $>15\%$ (compared to baseline), or if the QTc interval is >500 msec (>550 msec in patients with ventricular conduction abnormalities), the initial dosage should be reduced by half as follows:

- Decrease an initial dose of 500 mcg bid to 250 mcg bid
- Decrease an initial dose of 250 mcg bid to 125 mcg bid
- Decrease an initial dose of 125 mcg bid to 125 mcg/day

Black Box Warning:

Step 6: Reassess QTc interval: Reassess the QTc interval 2–3 hr after each subsequent dose; if the QTc interval lengthens to >500 msec (or >550 msec in patients with ventricular conduction abnormalities), *discontinue*

Black Box Warning:

Step 7: ECG monitoring: Monitor continuous ECG for a minimum of 3 days or for 12 hr after conversion

to normal sinus rhythm, whichever is greater

SIDE EFFECTS

CNS: *Syncope, dizziness, headache, stroke*

CV: *Hypotension, postural hypotension, bradycardia, angina, PVCs, substernal pressure, transient hypertension, precipitation of angina, QT prolongation, torsades de pointes, ventricular dysrhythmias*

GI: *Nausea, vomiting, severe diarrhea, anorexia*

MISC: *Angioedema*

RESP: *Dyspnea, respiratory infections*

PHARMACOKINETICS

Well absorbed, max plasma conc 2-3 hr, steady state 2-3 days, half-life 10 hr, metabolized by liver, excreted by kidneys

INTERACTIONS

- Do not use with cimetidine, ketoconazole, verapamil, prochlorperazine, trimethoprim-sulfamethoxazole, megestrol, hydrochlorothiazide

Increase: QT prolongation, torsades de pointes—class IA/III antidysrhythmics, arsenic trioxide, chloroquine, clarithromycin, droperidol, erythromycin, halofantrine, haloperidol, levomethadyl, methadone, pentamidine, some phenothiazines, ziprasidone

Increase: hypokalemia—potassium-depleting diuretics

Increase: toxicity—amiloride metFORMIN, entecavir, lamivudine, memantine, triamterene, procainamide, trospium

Increase: dofetilide levels—antiretroviral protease inhibitors

Drug/Food

- Do not use with grapefruit juice

NURSING CONSIDERATIONS

Assess:

- AF patients should receive anticoagulation prior to cardioversion
- Cardiac status: rate, rhythm, character, continuously; B/P

Black Box Warning:

Severe renal impairment CCr <20 ml/min: do not use for mild to moderate renal disease; monitor BUN/creatinine; adjust dose based on creatinine clearance

Perform/provide:

- Place patient in supine position unless otherwise ordered; assist with ambulation

Evaluate:

- Therapeutic response: control of atrial fibrillation

Teach patient/family:

- To make position changes slowly; orthostatic hypotension may occur
- **To notify prescriber if fast heartbeats with fainting or dizziness occur**
- To notify all prescribers of all medications, supplements taken
- That if dose is missed, not to double; to take next dose at usual time
- To avoid breastfeeding

🌿 Canada only Side effects: *italics* = common; **bold** = life-threatening ⚠️
Nurse Alert

dolasetron (Rx)

(do-la'se-tron)

Anzemet

Func. class.: Antiemetic

Chem. class.: 5-HT₃ receptor antagonist

ACTION:

Prevents nausea, vomiting by blocking serotonin peripherally, centrally, and in the small intestine

USES:

Prevention of nausea, vomiting associated with cancer chemotherapy, radiotherapy; prevention of postoperative nausea, vomiting

Unlabeled uses: Radiotherapy-induced nausea/vomiting

CONTRAINDICATIONS:

Hypersensitivity

Precautions: Pregnancy (B), breastfeeding, children, geriatric patients, hypokalemia, electrolyte imbalances; granisetron/ondansetron/palonosetron hypersensitivity, QT prolongation

DOSAGE AND ROUTES

Calculator

Prevention of nausea and vomiting during cancer chemotherapy

- **Adult: PO** 100 mg 1 hr before chemotherapy
- **Child 2-16 yr: PO** 1.8 mg/kg before chemotherapy; max 100 mg

Prevention of postoperative nausea and vomiting

- **Adult: IV** 12.5 mg as single dose 15 min before cessation of anesthesia; **PO** 100 mg 2 hr before surgery (prevention only)
- **Child 2-16 yr: IV** 0.35 mg/kg as single dose 15 min before cessation of anesthesia; **PO** 1.2 mg/kg 2 hr before surgery (prevention only)

Available forms: Tabs 50, 100 mg; inj 20 mg/ml (12.5 mg/0.625 ml)

Administer:

PO route

- Do not mix product for oral administration in apple or apple-grape juice until

immediately before administration; diluted product can be kept for 2 hr at room temp

Intermittent IV INF route

- By inj 100 mg/30 sec or more or diluted in 50 ml compatible sol; give over 15 min
- Do not admix

SIDE EFFECTS

CNS: *Headache*, dizziness, fatigue, drowsiness

CV: *Dysrhythmias*, ECG changes, hypo/hypertension, tachycardia, bradycardia; *ventricular tachycardia/fibrillation, QT prolongation, torsades de pointes, cardiac arrest (IV)*

GI: *Diarrhea*, constipation, increased AST/ALT, abdominal pain, anorexia

GU: Urinary retention, oliguria

MISC: Rash, *bronchospasm*

PHARMACOKINETICS

Well absorbed, metabolized to active metabolite, half-life of active metabolite 8 hr, max concentrations after 1 hr

INTERACTIONS

• **QT Prolongation:** QRS, PR prolongation; do not use in those with congenital long QT syndrome, hypokalemia, hypomagnesemia, complete heart block (unless a pacemaker is in place), correct electrolytes before use, monitor ECG in elderly patients, renal cardiac disease

Increase: dysrhythmias—antidysrhythmics

Increase: dolasetron levels—cimetidine

Increase: QT prolongation—thiazide/loop diuretics, antidysrhythmics—class IA, III, arsenic trioxide, chloroquine, clarithromycin, droperidol, erythromycin, halofantrine, haloperidol, levomethadyl, methadone, pentamidine, some phenothiazines, ziprasidone; occurs at higher dose of dolasetron

Decrease: dolasetron levels—rifampin

NURSING CONSIDERATIONS

Assess:

- For absence of nausea, vomiting during chemotherapy

- **Hypersensitivity reaction:** rash, bronchospasm
- Cardiac conduction conditions, electrolyte imbalances, dysrhythmias, heart rate

Perform/provide:

- Storage at room temp 48 hr after dilution

Evaluate:

- Therapeutic response: absence of nausea, vomiting during cancer chemotherapy

Teach patient/family:

- To report diarrhea, constipation, nausea, vomiting, rash, or changes in respirations
- May cause headache; use analgesic

☼ Canada only Side effects: *italics* = common; **bold** = life-threatening ⚠
Nurse Alert

donepezil (Rx)

(don-ep-ee'zill)

Aricept, Aricept ODT

Func. class.: Anti-Alzheimer's agent

Chem. class.: Reversible cholinesterase inhibitor

ACTION:

Elevates acetylcholine concentrations (cerebral cortex) by slowing degradation of acetylcholine released in cholinergic neurons; does not alter underlying dementia

USES:

Mild to severe dementia with Alzheimer's disease

Unlabeled uses: Subcortical, vascular dementia; dementia with Lewy bodies

CONTRAINDICATIONS:

Hypersensitivity to this product or piperidine derivatives

Precautions: Pregnancy (C), breastfeeding, children, sick sinus syndrome, history of ulcers, GI bleeding, hepatic disease, bladder obstruction, asthma, seizures, COPD, abrupt discontinuation, AV block, GI obstruction, Parkinson's disease, surgery

DOSAGE AND ROUTES

Calculator

• **Adult: PO** 5 mg/day at bedtime; may increase to 10 mg/day after 4-6 wk, may increase to 23 mg/day after 3 mo of 10 mg/day

Available forms: Tabs 5, 10, 23 mg; orally disintegrating tabs (Aricept ODT) 5, 10 mg

Administer:

- Daily in the evening before bedtime; swallow whole; do not cut, break, chew, or crush tab
- Dosage adjusted to response no more than q4-6wk; oral dosage forms are interchangeable
- **Orally disintegrating tabs:** allow to dissolve on tongue before swallowing; may be given with/without water

SIDE EFFECTS

CNS: Dizziness, *insomnia*, somnolence, *headache*, fatigue, abnormal dreams, syncope, **seizures**, drowsiness, agitation, depression, confusion, fever, hallucinations

CV: **Atrial fibrillation**, hypo/hypertension, **sinus bradycardia**, **AV block**

GI: *Nausea*, *vomiting*, anorexia, *diarrhea*, abdominal pain, **GI bleeding**, weight loss

GU: Urinary frequency, UTI, incontinence

INTEG: Rash, flushing, diaphoresis, bruising

META: Hyperlipidemia

MS: Cramps, arthritis, arthralgia

RESP: Rhinitis, URI, cough, pharyngitis, dyspnea

PHARMACOKINETICS

Well absorbed PO; metabolized by CYP2D6, CYP3A4; elimination half-life 10 hr single dose, 70 hr multiple doses; protein binding 96%

INTERACTIONS

Increase: donepezil effects—CYP2D6, CYP3A4 inhibitors

Increase: synergistic effect—succinylcholine, cholinesterase inhibitors, cholinergic agonists

Increase: gastric acid secretions—NSAIDs

Decrease: donepezil effects—CYP2D6, CYP3A4 inducers

Decrease: action of anticholinergics

Decrease: donepezil effect—carbamazepine, dexamethasone, phenytoin, phenobarbital, rifampin

Drug/Herb

Decrease: donepezil—St. John's wort

NURSING CONSIDERATIONS

Assess:

- B/P: hypo/hypertension, heart rate
- Mental status: affect, mood, behavioral changes, depression, complete suicide assessment; neurologic status
- GI status: nausea, vomiting, anorexia, diarrhea; monitor weight
- GU status: urinary frequency, incontinence, I&O

Perform/provide:

- Assistance with ambulation during beginning therapy; dizziness, ataxia may occur

Evaluate:

- Therapeutic response: decrease in confusion, improved mood

Teach patient/family:

- To report side effects: twitching, nausea, vomiting, sweating, dizziness; indicates cholinergic crisis or overdose
 - To use product exactly as prescribed
 - To notify prescriber of nausea, vomiting, diarrhea (dose increase or beginning treatment), or rash
 - **Not to increase or abruptly decrease dose; serious consequences may result**
 - That product is not a cure, relieves symptoms
-

☼ Canada only Side effects: *italics* = common; **bold** = life-threatening ⚠
Nurse Alert

HIGH ALERT

DOPamine (Rx)

(doe'pa-meen)

Func. class.: Adrenergic

Chem. class.: Catecholamine

Do not confuse: **DOPamine**/DOBUtamine

ACTION:

Causes increased cardiac output; acts on β_1 - and α -receptors, causing vasoconstriction in blood vessels; low dose causes renal and mesenteric vasodilation; β_1 stimulation produces inotropic effects with increased cardiac output

USES:

Shock, increased perfusion, hypotension, cardiogenic/septic shock

Unlabeled uses: Bradycardia, cardiac arrest, CPR, acute renal failure, cirrhosis, barbiturate intoxication

CONTRAINDICATIONS:

Hypersensitivity, ventricular fibrillation, tachydysrhythmias, pheochromocytoma, hypovolemia

Precautions: Pregnancy (C), breastfeeding, geriatric patients, arterial embolism, peripheral vascular disease, sulfite hypersensitivity, acute MI

Black Box Warning:

Extravasation

DOSAGE AND ROUTES

Calculator

Shock

- **Adult:** IV INF 2-5 mcg/kg/min, titrate upward in 5-10 mcg/kg/min increments, max 50 mcg/kg/min; titrate to patient's response
- **Child:** IV 1-5 mcg/kg/min initially; usual dosage range, 2-20 mcg/kg/min

COPD

- **Adult:** IV 4 mcg/kg/min

CHF

- **Adult: IV** 3-10 mcg/kg/min

Bradycardia (unlabeled)

- **Adult: IV** 2-10 mcg/kg/min, titrate as needed

Available forms: Inj 40 mg, 80 mg, 160 mg/ml; conc for IV inf 0.8, 1.6, 3.2 mg/ml in 250, 500 ml D₅W

Administer:

IV route

- IV after diluting 200-400 mg/250-500 ml of D₅W, D₅ 0.45% NaCl, D₅ 0.9% NaCl, D₅LR, LR; use large vein
- After reconstituting, use inf pump; give at rate of 0.5-5 mcg/kg/min, increase by 1-4 mcg/kg/min at 10-30 min intervals until desired response

Black Box Warning:

Extravasation: if extravasation occurs, stop infusion, may inject area with phentolamine 10 mg/15 ml of NS

Y-site compatibilities: Alfentanil, alprostadil, amifostine, amikacin, aminocaproic acid, aminophylline, amiodarone, anidulafungin, argatroban, ascorbic acid injection, atenolol, atracurium, atropine, aztreonam, benztropine, bivalirudin, bleomycin, bumetanide, buprenorphine, butorphanol, calcium chloride/gluconate, CARBOplatin, caspofungin, cefamandole, cefmetazole, cefonicid, cefotaxime, cefoTetan, cefOXitin, cefpirome, ceftAZidime, ceftizoxime, cefTRIAxone, cefuroxime, chlorproMAZINE, cimetidine, ciprofloxacin, cisatracurium, CISplatin, cladribine, clarithromycin, clindamycin, cloNIDine, codeine, cyanocobalamin, cyclophosphamide, cycloSPORINE, cytarabine, DACTINomycin, DAPTOmycin, dexamethasone, dexmedetomidine, digoxin, diltiazem, diphenhydrAMINE, DOBUTamine, DOCEtaxel, doripenem, doxacurium, DOXOrubicin, DOXOrubicin liposomal, doxycycline, droperidol, enalaprilat, ePHEDrine, EPINEPHrine, epirubicin, epoetin alfa, eptifibatide, ertapenem, erythromycin, esmolol, etoposide, famotidine, fenoldopam, fentaNYL, fluconazole, fludarabine, fluorouracil, folic acid, foscarnet, gatifloxacin, gemcitabine, gemtuzumab, gentamicin, glycopyrrolate, granisetron, heparin, hydrocortisone, HYDROmorphine, hydrOXYzine, IDArubicin, ifosfamide, imipenem-cilastatin, irinotecan, isoproterenol, ketorolac, labetalol, levofloxacin, lidocaine, linezolid, LORazepam, LR, magnesium sulfate,

mannitol, mechlorethamine, meperidine, metaraminol, methicillin, methoxamine, methyl dopate, methyl PREDNISolone, metoclopramide, metoprolol, metroNIDAZOLE, mezlocillin, miconazole, midazolam, milrinone, minocycline, mitoXANtrone, morphine, moxalactam, multiple vitamins injection, mycophenolate, nafcillin, nalbuphine, naloxone, netilmicin, niCARdipine, nitroglycerin, nitroprusside, norepinephrine, octreotide, ondansetron, oxacillin, oxaliplatin, oxytocin, PACLitaxel, palonosetron, pamidronate, pancuronium, pantoprazole, papaverine, PEMEtrexed, penicillin G potassium/sodium, pentamidine, pentazocine, PENTobarbital, PHENobarbital, phenylephrine, phytonadione, piperacillin, piperacillin-tazobactam, polymyxin B, potassium chloride, procainamide, prochlorperazine, promethazine, propofol, propranolol, protamine, pyridoxine, quiNIDine, ranitidine, remifentanyl, Ringer's, ritodrine, riTUXimab, rocuronium, sargramostim, sodium acetate, succinylcholine, SUFentanyl, tacrolimus, temocillin, teniposide, theophylline, thiamine, thiotepa, ticarcillin, ticarcillin-clavulanate, tigecycline, tirofiban, TNA, tobramycin, tolazoline, TPN, trastuzumab, trimetaphan, urokinase, vancomycin, vasopressin, vecuronium, verapamil, vinCRISTine, vinorelbine, vitamin B complex/C, voriconazole, warfarin, zidovudine, zoledronic acid

SIDE EFFECTS

CNS: *Headache, anxiety*

CV: *Palpitations, tachycardia, hypertension, ectopic beats, angina, wide QRS complex, peripheral vasoconstriction, hypotension*

GI: *Nausea, vomiting, diarrhea*

INTEG: *Necrosis, tissue sloughing with extravasation, gangrene*

RESP: *Dyspnea*

PHARMACOKINETICS

IV: Onset 5 min; duration <10 min; metabolized in liver, kidney, plasma; excreted in urine (metabolites); half-life 2 min

INTERACTIONS

- *Do not use within 2 wk of MAOIs; hypertensive crisis may result*

Increase: bradycardia, hypotension—phenytoin

Increase: dysrhythmias—general anesthetics

Increase: severe hypertension—ergots

Increase: B/P—oxytocics

Increase: pressor effect—tricyclics, MAOIs

Decrease: DOPamine action— β -/ α -blockers

Drug/Lab Test

Increase: urinary catecholamine, serum glucose

NURSING CONSIDERATIONS

Assess:

- Hypovolemia; if present, correct first
- **Oxygenation/perfusion deficit:** check B/P, chest pain, dizziness, loss of consciousness
- **Heart failure:** S₃ gallop, dyspnea, neck venous distention, bibasilar crackles in patients with CHF, cardiomyopathy, palpate peripheral pulses
- I&O ratio: if urine output decreases without decrease in B/P, product may need to be reduced
- **ECG** during administration continuously; if B/P increases, product should be decreased; PCWP, CVP during inf
- B/P, pulse q5min
- Paresthesias and coldness of extremities; peripheral blood flow may decrease
- **Inj site:** tissue sloughing; if this occurs, administer phentolamine mixed with NS

Perform/provide:

- Storage of reconstituted sol for up to 24 hr if refrigerated
- Do not use discolored sol; protect from light

Evaluate:

- Therapeutic response: increased B/P with stabilization; increased urine output

Teach patient/family:

- About the reason for product administration

TREATMENT OF OVERDOSE:

Discontinue IV, may give a short-acting α -adrenergic blocker

☛ Canada only Side effects: *italics* = common; **bold** = life-threatening ⚠
Nurse Alert

doripenem (Rx)

(dore-i-pen'em)

Doribax

Func. class.: Antiinfective—miscellaneous

Chem. class.: Carbapenem

ACTION:

Bactericidal; interferes with cell-wall replication of susceptible organisms; osmotically unstable cell wall swells, bursts from osmotic pressure

USES:

Serious infections caused by *Acinetobacter baumannii*, *Bacteroides caccae*, *Bacteroides fragilis*, *Bacteroides thetaiotaomicron*, *Bacteroides uniformis*, *Bacteroides vulgatus*, *Escherichia coli*, *Klebsiella pneumoniae*, *Peptostreptococcus micros*, *Proteus mirabilis*, *Pseudomonas aeruginosa*, *Streptococcus constellatus*, *Streptococcus intermedius*; complicated urinary tract infections, pyelonephritis, complicated intraabdominal infections

CONTRAINDICATIONS:

Hypersensitivity to carbapenems (meropenem, doripenem, imipenem), penicillin, β -lactam; viral infection

Precautions: Pregnancy (B), breastfeeding, geriatric patients, renal disease, seizure disorder, pseudomembranous colitis, nebulizer or inhalation use

DOSAGE AND ROUTES

Calculator

• **Adult: IV** 500 mg q8hr $\times$ 5-14 days; if improvement occurs after 3 days, switch to appropriate oral product

Renal dose

• **Adult: IV** CCr 30-50 ml/min, 250 mg over 1 hr, q8hr; CCr >10 to <30 ml/min, 250 mg over 1 hr q12hr; CCr $\leq$ 10 ml/min, no data

Available forms: Powder for inj 250, 500 mg

Administer:

IV route

- Visually inspect parenteral products for particulate matter and discoloration

before use, diluted range in color from clear, colorless solutions to solutions that are clear and slightly yellow

- **Reconstitution:** No bacteriostatic preservative is present; observe aseptic technique while preparing the infusion

- **500-mg dose using the 500-mg vial:** Constitute the vial with 10 ml of sterile water for injection or sodium chloride 0.9% (normal saline). Gently shake (50 mg/ml); *the constituted suspension is not for direct injection; further dilution is required.* Using a syringe with a 21-G needle, withdraw the suspension and add it to an infusion bag containing 100 ml of NS or D₅W; gently shake until clear: final concentration: 4.5 mg/ml

- **250-mg dose using the 500 mg vial:** Constitute the vial with 10 ml of sterile water for injection or sodium chloride 0.9% (normal saline). Gently shake (50 mg/ml); *the constituted suspension is not for direct injection; further dilution is required.* Using a syringe with a 21-G needle, withdraw the suspension and add it to an infusion bag containing 100 ml of normal saline or D₅W; gently shake until clear; remove 55 ml of this solution and discard. The remaining inf sol contains 250 mg (4.5 mg/ml)

- **250-mg dose using the 250 mg vial:** Constitute the vial with 10 ml of sterile water for injection or sodium chloride 0.9% (normal saline). Gently shake (25 mg/ml); *the constituted suspension is not for direct injection; further dilution is required.* Using a syringe with a 21-G needle, withdraw the suspension and add it to an infusion bag containing 50 or 100 ml of normal saline or D₅W; gently shake until clear; final concentration 4.2 mg/ml (50 ml infusion bag) or 2.3 mg/ml (100 ml infusion bag)

- **Storage:** Constituted suspensions may be held in vial for up to 1 hr before transfer and dilution in the infusion bag. Including storage and infusion time, diluted infusion sols are stable for up to 12 hr (NS) or 4 hr (D₅W) at controlled room temperature; diluted infusion sols are stable for up to 72 hr (NS) or 24 hr (D₅W) refrigerated, do not freeze constituted solutions.

- If Baxter Minibag Plus inf bags are to be used, consult the instructions provided by the inf bag manufacturer

Intermittent IV INF route

- After C&S is taken

- Do not mix with or physically add to solutions containing other drugs,

infuse over 1 hr

Y-site compatibilities: Acyclovir, amikacin, aminophylline, amiodarone, anidulafungin, atropine, azithromycin, bumetanide, calcium gluconate, CARBOplatin, caspofungin, ceftobiprole, cimetidine, ciprofloxacin, CISplatin, cyclophosphamide, cycloSPORINE, DAPTOmycin, dexamethasone, digoxin, diltiazem, diphenhydrAMINE, DOBUTamine, DOCEtaxel, DOPamine, DOXOrubicin, enalaprilat, esmolol, esomeprazole, etoposide, famotidine, fentaNYL, fluconazole, fluorouracil, foscarnet, furosemide, gemcitabine, gentamicin, granisetron, heparin, hydrocortisone, HYDROmorphone, ifosfamide, insulin (regular), labetalol, levofloxacin, linezolid, LORazepam, magnesium sulfate, mannitol, meperidine, methotrexate, methylPREDNISolone, metoclopramide, metroNIDAZOLE, micafungin, midazolam, milrinone, morphine, moxifloxacin, norepinephrine, ondansetron, PACLitaxel, pantoprazole, PHENobarbital, phenylephrine, potassium chloride, ranitidine, sodium bicarbonate/phosphates, tacrolimus, tigecycline, tobramycin, vancomycin, voriconazole, zidovudine

Solution compatibilities: D₅W, 0.9% NaCl, sterile water for inj

SIDE EFFECTS

CNS: Seizures, headache

GI: Diarrhea, nausea, vomiting, pseudomembranous colitis, hepatitis

HEMA: Neutropenia, leukopenia, anemia

INTEG: Rash, urticaria, phlebitis, erythema at inj site, Stevens-Johnson syndrome, toxic epidermal necrolysis, pruritus

SYST: Anaphylaxis

PHARMACOKINETICS

IV: Distributed to most body fluids/tissue, excreted mainly unchanged in urine, 70% recovered in 48 hr, half-life 1 hr, half-life extended in renal disease

INTERACTIONS

Increase: doripenem plasma levels—probenecid

Decrease: effect of valproic acid, divalproex sodium

Drug/Lab Test

Increase: AST, ALT, LDH, BUN, alk phos, bilirubin, creatinine

False positive: direct Coombs' test

NURSING CONSIDERATIONS

Assess:

- Sensitivity to carbapenem antibiotics, penicillins
- Renal disease: lower dose may be required
- Bowel pattern daily; if severe diarrhea occurs, product should be discontinued; may indicate pseudomembranous colitis
- For infection: temp; sputum; characteristics of wound before, during, and after treatment

⚠ Allergic reactions, anaphylaxis: rash, urticaria, pruritus; may occur few days after therapy begins

• **Overgrowth of infection:** perineal itching, fever, malaise, redness, pain, swelling, drainage, rash, diarrhea, change in cough, sputum

Evaluate:

- Therapeutic response: negative C&S; absence of symptoms and signs of infection

Teach patient/family:

- To report severe diarrhea; may indicate pseudomembranous colitis
- To report sore throat, bruising, bleeding, joint pain; may indicate blood dyscrasias (rare)
- To report overgrowth of infection: black, furry tongue; vaginal itching; foul-smelling stools
- To avoid breastfeeding; product is excreted in breast milk

TREATMENT OF HYPERSENSITIVITY:

EPINEPHrine, antihistamines; resuscitate if needed (anaphylaxis)

☼ Canada only Side effects: *italics* = common; **bold** = life-threatening ⚠
Nurse Alert

dorzolamide (ophthalmic)

(dor-zole'ah-mide)

Trusopt

Func. class.: Antiglaucoma

Chem. class.: Carbonic anhydrase inhibitor

ACTION:

Decreases aqueous humor secretion by decreasing bicarbonate, thus decreasing IOP

USES:

For the treatment of elevated intraocular pressure in patients with ocular hypertension or open-angle glaucoma

CONTRAINDICATIONS:

Hypersensitivity

Precautions: Hypersensitivity to sulfonamides, hepatic/renal disease, angle-closure glaucoma, electrolyte disturbances

DOSAGE AND ROUTES

Calculator

Elevated intraocular pressure in patients with ocular hypertension or open-angle glaucoma

• **Adult/adolescent/child/infant/neonate ≥ 1 wk: Ophthalmic** Instill 1 drop of a 2% solution into the affected eye(s) tid

Available forms: Ophthalmic solution 2%

Administer:

- Wash hands before and after use, tilt the head back slightly and pull the lower eyelid down with the index finger to form a pouch, squeeze the prescribed number of drops into the pouch and gently close eyes for 1–2 min. Do not blink
- Care should be taken to avoid contamination, do not touch the tip of the dropper to the eye, fingertips, or other surface
- The sol may be used concomitantly with other topical ophthalmic drug products to lower IOP. If more than one topical ophthalmic drug is being used,

administer ≥ 10 min apart

SIDE EFFECTS

CNS: Headache

EENT: Blurred vision, tearing, allergy, burning/stinging, photophobia

GI: Bitter taste

PHARMACOKINETICS

Onset 1-2 hr, peak 3 hr, duration 8 hr, half-life 4 mo

INTERACTIONS

Increase: effects—carbonic anhydrase inhibitors (PO), salicylates

NURSING CONSIDERATIONS

Assess:

- Hypersensitivity
- Monitor IOP during treatment

Evaluate:

- Decreasing IOP

Teach patient/family:

- How to use product
- Not to share with others or use for other conditions
- **To notify prescriber immediately if vision changes or if condition worsens**
- To take as prescribed

☼ Canada only Side effects: *italics* = common; **bold** = life-threatening ⚠

Nurse Alert

doxapram (Rx)

(dox'a-pram)

Dopram

Func. class.: Analeptic

ACTION:

Respiratory stimulation through activation of peripheral carotid chemoreceptor; with higher doses, medullary respiratory centers are stimulated; with progressive CNS stimulation

USES:

Chronic obstructive pulmonary disease (COPD), postanesthesia respiratory depression, prevention of acute hypercapnia, product-induced CNS depression

Unlabeled uses: Neonatal apnea

CONTRAINDICATIONS:

Hypersensitivity, seizure disorders, severe hypertension, severe bronchial asthma, severe dyspnea, severe cardiac disorders, flail chest, pneumothorax, PE, severe respiratory disease

Precautions: Pregnancy (B), breastfeeding, children, bronchial asthma, pheochromocytoma, severe tachycardia, dysrhythmias, hypertension, hyperthyroidism

DOSAGE AND ROUTES

Calculator

Postanesthesia

• **Adult:** IV inj 0.5-1 mg/kg, not to exceed 1.5 mg/kg total as a single inj; IV INF 250 mg in 250 ml sol, not to exceed 4 mg/kg; run at 1-3 mg/min

Drug-induced CNS depression

• **Adult:** IV Priming dose of 2 mg/kg, repeated in 5 min; repeat q1-2hr until patient awakes; IV INF priming dose 2 mg/kg at 1-3 mg/min, not to exceed 3 g/day

COPD (hypercapnia)

• **Adult:** IV INF 1-2 mg/min, not to exceed 3 mg/min for no longer than 2 hr

Available forms: Inj 20 mg/ml

SIDE EFFECTS

CNS: Seizures (clonus/generalized), headache, restlessness, dizziness, confusion, paresthesias, flushing, sweating, bilateral Babinski's sign, rigidity, depression

CV: Chest pain, hypertension, change in heart rate, lowered T waves, tachycardia, dysrhythmias

EENT: Pupil dilation, sneezing

GI: Nausea, vomiting, diarrhea, desire to defecate

GU: Retention, incontinence, elevation of BUN, albuminuria

INTEG: Pruritus, irritation at inj site

RESP: Laryngospasm, bronchospasm, rebound hypoventilation, dyspnea, cough, tachypnea, hiccups

PHARMACOKINETICS

IV: Onset 20-40 sec, peak 1-2 min, duration 5-10 min, metabolized by liver, excreted by kidneys (metabolites), half-life 2.5-4 hr

INTERACTIONS

- Synergistic pressor effect: MAOIs, sympathomimetics
- Cardiac dysrhythmias: halothane, cyclopropane, enflurane; delay use of doxapram for at least 10 min after inhalation anesthetics

NURSING CONSIDERATIONS

Assess:

- BP, heart rate, deep tendon reflexes, ABGs, LOC before administration, q30min
- PO₂, PCO₂, O₂ saturation during treatment
- Hypertension, dysrhythmias, tachycardia, dyspnea, skeletal muscle hyperactivity; may indicate overdose; discontinue product
- Respiratory stimulation: increased rate, abnormal rhythm
- Extravasation; change IV site q48hr
- Patient closely for ½-1 hr

Administer:

IV route

- Undiluted or diluted with equal parts of sterile water for inj; may be diluted 250 mg/250 ml of D₅W, D₁₀W and run as inf; rapid inf may cause hemolysis

- IV undiluted over 5 min; IV inf at 1-3 mg/min; adjust for desired respiratory response, using inf pump IV; if an inf is used after initial dose, start at 1-3 mg/min depending on patient response; D/C after 2 hr; wait 1-2 hr and repeat
- Only after adequate airway is established
- After O₂, IV barbiturates, resuscitative equipment available

Syringe compatibilities: Amikacin, bumetadine, chlorproMAZINE, cimetidine, CISplatin, cyclophosphamide, DOPamine, doxycycline, EPINEPHrine, hydrOXYzine, imipramine, isoniazid, lincomycin, methotrexate, netilmicin, phytonadione, pyridoxine, terbutaline, thiamine, tobramycin, vinCRISTine

Perform/provide:

- Placing patient in Sims' position to prevent aspiration of vomitus
- Discontinue infusion if side effects occur; narrow margin of safety

Evaluate:

- Therapeutic response: increased breathing capacity

Teach patient/family:

- Purpose of medication

🍁 Canada only Side effects: *italics* = common; **bold** = life-threatening ⚠️
Nurse Alert

doxazosin (Rx)

(dox-ay'zoe-sin)

Cardura, Cardura XL

Func. class.: Peripheral α_1 -adrenergic receptor blocker

Chem. class.: Quinazoline

Do not confuse: Cardura/Coumadin/Cardene/Ridaura

ACTION:

Dilates peripheral blood vessels, lowers peripheral resistance; reduction in B/P results from peripheral α_1 -adrenergic receptors being blocked

USES:

Hypertension, urinary outflow obstruction, symptoms of benign prostatic hyperplasia

CONTRAINDICATIONS:

Hypersensitivity to quinazolines

Precautions: Pregnancy (C), breastfeeding, children, hepatic disease

DOSAGE AND ROUTES

Calculator

BPH

- **Adult: PO** 1 mg/day, increase in stepwise manner to 2, 4, 8 mg/day as needed at 1-2 wk intervals, max 8 mg

Hypertension

- **Adult: PO** 1 mg/day increasing up to 16 mg/day if required; usual range 4-16 mg/day

- **Geriatric: PO** 0.5 mg nightly, gradually increase

Available forms: Tabs 1, 2, 4, 8 mg; ext rel tabs 4, 8 mg

Administer:

- Store in tight container at room temperature
- **Tabs** broken, crushed, or chewed; if chewed, will be bitter; do not break, crush, chew XL tabs
- **Immediate release tab:** without regard to meals; **ext rel tabs:** give with breakfast; when switching from immediate release to ext rel, the final evening

dose of immediate release should not be taken

SIDE EFFECTS

CNS: *Dizziness*, headache, drowsiness, anxiety, depression, vertigo, weakness, fatigue, asthenia

CV: Palpitations, *orthostatic hypotension*, tachycardia, edema, **dysrhythmias**, chest pain

EENT: Epistaxis, tinnitus, dry mouth, red sclera, pharyngitis, rhinitis

GI: Nausea, vomiting, diarrhea, constipation, abdominal pain

GU: Incontinence, polyuria, priapism

PHARMACOKINETICS

PO: Onset 2 hr, peak 2-6 hr, duration 6-12 hr, half-life 22 hr, metabolized in liver, excreted via bile/feces (<63%) and in urine (9%), extensively protein bound (98%)

INTERACTIONS

Increase: hypotensive effects—alcohol, other antihypertensives, sildenafil, vardenafil, nitrates

Decrease: antihypertensive effects of clonidine

NURSING CONSIDERATIONS

Assess:

- **Hypertension:** B/P (lying, standing), pulse 2-6 hr after each dose, with each increase; postural effects may occur, crackles, dyspnea, orthopnea with B/P; pulse; jugular venous distention during beginning treatment
- **BPH:** urinary pattern changes (hesitancy, dribbling, incomplete bladder emptying, dysuria, urgency, nocturia, urgency incontinence, intermittency) before and during treatment
- I&O, weight daily; edema in feet, legs daily

Evaluate:

- Therapeutic response: decreased B/P; decreased symptoms of BPH

Teach patient/family:

- That fainting occasionally occurs after 1st dose; not to drive, operate machinery for 4 hr after 1st dose, after dosage increase; to take 1st dose at bedtime; may take 1-2 wk to respond with BPH

TREATMENT OF OVERDOSE:

Administer volume expanders or vasopressors; discontinue product; place patient in supine position

🍁 Canada only Side effects: *italics* = common; **bold** = life-threatening ⚠️

Nurse Alert

doxepin (Rx)

(dox'e-pin)

Prudoxin Cream, Silenor, Zonalon Topical Cream

Func. class.: Antidepressant, tricyclic, antihistamine (topical)

Chem. class.: Dibenzoxepin, tertiary amine

ACTION:

Blocks reuptake of norepinephrine, serotonin into nerve endings, increasing action of norepinephrine, serotonin in nerve cells

USES:

Major depression, anxiety; *topical*: lichen simplex, atopic dermatitis, eczema

Unlabeled uses: Topical pruritus, insomnia, migraine prophylaxis

CONTRAINDICATIONS:

Hypersensitivity to tricyclics, urinary retention, closed-angle glaucoma, prostatic hypertrophy, acute recovery from MI

Precautions: Pregnancy (C) (PO) (B) (topical), breastfeeding, geriatric patients, seizures

Black Box Warning:

Children, suicidal patients

DOSAGE AND ROUTES

Calculator

Depression/anxiety

- **Adult: PO** 50-75 mg/day, may increase to 300 mg/day for severely ill; give in divided doses if >150 mg/day
- **Geriatric: PO** 25-50 mg at bedtime, increase weekly by 25-50 mg to desired dose, max 150 mg/day

Pruritus

- **Adult: PO** 10 mg at bedtime, may increase to 25 mg at bedtime; **TOP** apply thin film qid at least 3 hr apart

Insomnia (Silenor)

- **Adult: PO** 6 mg 30 min before bedtime, 3 mg may be sufficient, max 6 mg/night

Available forms: Caps 10, 25, 50, 75, 100, 150 mg; oral conc 10 mg/ml; cream 5%; tabs (Silenor) 3, 6 mg

Administer:

- **Oral conc:** should be diluted with 120 ml water, milk or orange, grapefruit, tomato, prune, or pineapple juice; do not mix with grape juice
- Increased fluids, bulk in diet for constipation
- With food, milk for GI symptoms; do not give with carbonated beverages
- Dosage at bedtime to avoid oversedation during day; may take entire dose at bedtime; geriatric patients may not tolerate daily dosing
- Gum, hard candy, or frequent sips of water for dry mouth
- **Topical:** by applying to affected area, rub slightly; do not use occlusive dressings

SIDE EFFECTS

CNS: *Dizziness, drowsiness, confusion, headache, anxiety, tremors, stimulation, weakness, insomnia, nightmares, EPS (geriatric patients), increased psychiatric symptoms, paresthesia, suicidal ideation*

CV: *Orthostatic hypotension, ECG changes, tachycardia, hypertension, palpitations, dysrhythmias*

EENT: *Blurred vision, tinnitus, mydriasis, ophthalmoplegia, glossitis*

GI: *Diarrhea, dry mouth, nausea, vomiting, paralytic ileus, increased appetite, cramps, epigastric distress, jaundice, hepatitis, stomatitis, constipation*

GU: *Urinary retention, acute renal failure*

HEMA: *Agranulocytosis, thrombocytopenia, eosinophilia, leukopenia, pancytopenia, purpuric disorder*

INTEG: *Rash, urticaria, sweating, pruritus, photosensitivity*

PHARMACOKINETICS

PO: *Steady state 2-8 days, metabolized by liver, excreted by kidneys, crosses placenta, excreted in breast milk, half-life 8-24 hr*

INTERACTIONS

Increase: *hyperpyretic crisis, seizures, hypertensive episode—MAOIs*

Increase: *hypertensive action—EPINEPHrine, norepinephrine*

Increase: *hypertensive crisis—cloNIDine; do not use together*

Increase: *doxepin effect—cimetidine, FLUoxetine, fluvoxamine, PARoxetine,*

sertraline

Increase: CNS depression—barbiturates, benzodiazepines, sedative/hypnotics, alcohol, other CNS depressants

Increase: QT interval: class IC/III antiarrhythmics (propafenone, flecainide), quinolones

Serotonin syndrome

Increase: toxicity—SSRIs, SNRIs, serotonin-receptor agonists

Increase: anticholinergic effects—anticholinergics

Drug/Herb

- Serotonin syndrome: St. John's wort

Drug/Lab Test

Increase: serum bilirubin, blood glucose, alk phos, LFTs

NURSING CONSIDERATIONS

Assess:

- B/P (lying, standing), pulse q4hr; if systolic B/P drops 20 mm Hg, hold product, notify prescriber; VS q4hr in patients with CV disease
- Blood studies: CBC, leukocytes, differential, cardiac enzymes if patient is receiving long-term therapy
- Hepatic studies: AST, ALT, bilirubin
- Weight weekly; appetite may increase with product
- **ECG** for flattening of T wave, bundle branch block, AV block, dysrhythmias in cardiac patients; product should be discontinued gradually several days before surgery
- **EPS** primarily in geriatric patients: rigidity, dystonia, akathisia
- **Depression:** mood, sensorium, affect, suicidal tendencies, increase in psychiatric symptoms
- **Chronic pain:** location, severity, type before and during treatment, alleviating/aggravating factors
- Urinary retention, constipation; constipation most likely in children, geriatric patients
- **Withdrawal symptoms:** headache, nausea, vomiting, muscle pain, weakness; not usual unless product is discontinued abruptly
- Alcohol consumption; if alcohol is consumed, hold dose until morning

Perform/provide:

- Storage in tight container protected from direct sunlight
- Assistance with ambulation during beginning therapy because drowsiness/dizziness occurs; safety measures primarily for geriatric patients
- Check to confirm that PO medication is swallowed

Evaluate:

- Therapeutic response: decreased anxiety, depression

Teach patient/family:

- That therapeutic effect (depression) may take 2-3 wk, antianxiety effects sooner
- To use caution when driving, during other activities requiring alertness because of drowsiness, dizziness, blurred vision
- To avoid alcohol, other CNS depressants; may potentiate effects
- Not to discontinue medication abruptly after long-term use; may cause nausea, headache, malaise
- To wear sunscreen or large hat; photosensitivity occurs
- **That clinical worsening and suicide may occur**
- To immediately report urinary retention

TREATMENT OF OVERDOSE:

ECG monitoring; lavage, activated charcoal; administer anticonvulsant, sodium bicarbonate

☼ Canada only Side effects: *italics* = common; **bold** = life-threatening ⚠
Nurse Alert

DOXOrubicin

(dox-oh-roo'bi-sin)

Adriamycin

Func. class.: Antineoplastic, antibiotic

Chem. class.: Anthracycline glycoside

Do not confuse: DOXOrubicin /DOXOrubicin liposomal/DAUNOrubicin

ACTION:

Inhibits DNA synthesis primarily; replication is decreased by binding to DNA, which causes strand splitting; active throughout entire cell cycle; a vesicant

USES:

Wilms' tumor; bladder, breast, lung, ovarian, stomach, thyroid cancer; Hodgkin's/non-Hodgkin's disease; acute lymphoblastic leukemia; myeloblastic leukemia; neuroblastomas; lymphomas; soft tissue/bone sarcomas

CONTRAINDICATIONS:

Pregnancy (D) 1st trimester, breastfeeding, hypersensitivity, systemic infections, cardiac disorders, severe myelosuppression, lifetime dose of 550 mg/m²

Black Box Warning:

Hepatic disease

Precautions: Accidental exposure, cardiac disease, dental work, electrolyte imbalance, infection, hyperuricemia

Black Box Warning:

Bone marrow suppression, extravasation, heart failure, secondary malignancy; requires an experienced clinician

DOSAGE AND ROUTES

Calculator

• **Adult: IV** 60-75 mg/m² every 3 wk, or may be used in combination with other antineoplastics with 40-60 mg/m² every 21-28 days, max cumulative dose 550 mg/m² or 450 mg/m² if prior DAUNOrubicin, cyclophosphamide, mediastinal XRT

Hepatic dose

 **Adult: IV** Bilirubin 1.2-3 mg/dl, give 50% of dose; bilirubin 3.1-5 mg/dl,

give 25% of dose

Renal dose

 **Adult:** IV CCr < 10 ml/min give 75% of dose

Available forms: Powder for inj 10, 20, 50 mg; inj 2 mg/ml

Administer:

IV route

- Give antiemetic 30-60 min before product to prevent vomiting
- Give allopurinol or sodium bicarbonate to maintain uric acid levels, alkalization of urine
- Use cytotoxic handling procedures: Inspect for particulate and discoloration before use

Black Box Warning:

Do not give IM, subcut

Black Box Warning:

If extravasation occurs, stop infusion and complete via another vein, preferably in another limb

- Aluminum needles may be used during administration, avoid aluminum during storage
- Rapid injection can cause facial flushing or erythema along the vein

Reconstitution:

- To avoid risks with reconstitution, the commercially available injection may be used; there are still risks involved in handling the injection
- Do not use diluents containing preservatives to reconstitute powder for injection
- Reconstitute 10, 20, 50, 100 mg of DOXOrubicin with 5, 10, 25, 50 ml, respectively, of nonbacteriostatic NS injection (2 mg/ ml), shake until completely dissolved; use reconstituted solution within 24 hr. Do not expose to sunlight
- **IV injection** Inject reconstituted solution over >3–5 min via Y-site or 3-way stopcock into a free-flowing IV infusion of NS or D₅W. A butterfly needle inserted into a large vein is preferred.

Black Box Warning:

Care should be taken to avoid extravasation because the drug is extremely irritating to extravascular tissue

Y-site compatibilities: Alemtuzumab, alfentanil, amifostine, amikacin,

anidulafungin, argatroban, aztreonam, bivalirudin, bleomycin, bumetanide, buprenorphine, butorphanol, calcium chloride/gluconate, CARBOplatin, carmustine, caspofungin, ceftizoxime, chlorproMAZINE, cimetidine, ciprofloxacin, CISplatin, cladribine, clindamycin, cyclophosphamide, cycloSPORINE, cytarabine, DACTINomycin, DAPTOmycin, dexamethasone, diltiazem, diphenhydrAMINE, DOBUTamine, DOCEtaxel, dolasetron, DOPamine, doripenem, doxycycline, droperidol, enalaprilat, ePHEDrine, EPINEPHrine, erythromycin, esmolol, etoposide, etoposide phosphate, famotidine, fenoldopam, fentaNYL, filgrastim, fluconazole, fludarabine, gemcitabine, gentamicin, granisetron, haloperidol, hydrocortisone, HYDROmorphone, ifosfamide, imipenem cilastatin, inamrinone, isoproterenol, ketorolac, labetalol, leucovorin, levorphanol, lidocaine, linezolid, LORazepam, mannitol, mechlorethamine, melphalan, meperidine, mesna, methotrexate, metoclopramide, metoprolol, metroNIDAZOLE, midazolam, milrinone, mitoMYcin, morphine, nalbuphine, naloxone, nesiritide, niCARdipine, nitroglycerin, nitroprusside, octreotide, ofloxacin, ondansetron, oxaliplatin, PACLitaxel, palonosetron, pancuronium, phenylephrine, potassium chloride, procainamide, prochlorperazine, promethazine, propranolol, quinupristin-dalfopristin, ranitidine, sargramostim, sodium acetate, tacrolimus, teniposide, theophylline, thiotepa, ticarcillin/clavulanate, tigecycline, tirofiban, tobramycin, topotecan, trastuzumab, trimethobenzamide, vancomycin, vasopressin, vecuronium, verapamil, vinBLASTine, vinCRISTine, vinorelbine, zidovudine, zoledronic acid

SIDE EFFECTS

CV: Increased B/P, sinus tachycardia, PVCs, chest pain, bradycardia, extrasystoles, **irreversible cardiomyopathy, acute left ventricular failure**

GI: *Nausea, vomiting, anorexia, mucositis, **hepatotoxicity***

GU: Impotence, sterility, amenorrhea, gynecomastia, hyperuricemia, urine discoloration

HEMA: **Thrombocytopenia, leukopenia, anemia**

INTEG: *Rash, **necrosis at inj site**, dermatitis, reversible **alopecia**, cellulitis, thrombophlebitis at inj site*

SYST: **Anaphylaxis**

PHARMACOKINETICS

Half-life 30 min, terminal 16.5 hr; metabolized by liver; crosses placenta; excreted in urine, bile, breast milk

INTERACTIONS

Increase: life-threatening dysrhythmias—posaconazole, fluconazole, do not use together

Increase: QT prolongation—other drugs that increase QT prolongation

Increase: neutropenia, thrombocytopenia—progesterone

Increase: Cardiomyopathy—calcium-channel blockers

Increase: Toxicity—other antineoplastics, cycloSPORINE, radiation, mercaptopurine

Increase: Hemorrhagic cystitis risk, cardiac toxicity—cyclophosphamide

Increase: Effect of phenytoin, fosphenytoin

Increase: DOXOrubicin effect—streptozocin

Decrease: DOXOrubicin effect—PHENobarbital

Decrease: Antibody response—live virus vaccine

Decrease: Antineoplastic effect—hematopoietic progenitor cell; do not use 24 hr before or after treatment

Decrease: Clearance of DOXOrubicin—PACLitaxel

Drug/Lab Test

Increase: uric acid

NURSING CONSIDERATIONS

Assess:

Black Box Warning:

Bone marrow depression: CBC, differential, platelet count weekly; withhold or reduce dose of product if WBC is $<1500/\text{mm}^3$ or platelet count is $<50,000/\text{mm}^3$; notify prescriber of these results

Renal studies: BUN, serum uric acid, urine CCr, electrolytes before, during therapy

I&O ratio: Report fall in urine output to $<30 \text{ ml/hr}$

Monitor temp: Fever might indicate beginning infection

Black Box Warning:

Hepatotoxicity: hepatic studies before, during therapy: bilirubin, AST, ALT, alk phos as needed or monthly; check for jaundice of skin and sclera, dark urine, clay-colored stools, itchy skin, abdominal pain, fever, diarrhea

Black Box Warning:

Dysrhythmias: ECG; watch for ST-T wave changes, low QRS and T, possible dysrhythmias (sinus tachycardia, heart block, PVCs), ejection fraction before treatment, signs of irreversible cardiomyopathy, can occur up to 6 mo after treatment begins

- Bleeding: hematuria, guaiac, bruising, petechiae of mucosa or orifices every 8 hr
- Effects of alopecia on body image; discuss feelings about body changes; almost total alopecia is expected
- Buccal cavity every 8 hr for dryness, sores, ulceration, white patches, oral pain, bleeding, dysphagia
- Alkalosis if severe vomiting is present

Black Box Warning:

Extravasation: local irritation, pain, burning at inj site; a vesicant; if extravasation occurs, stop drug, restart at another site, apply ice, elevate extremity to reduce swelling; if resolution does not occur, surgical debridement may be required

- GI symptoms: frequency of stools, cramping

Perform/provide:

- Increased fluid intake to 2-3 L/day to prevent urate, calculi formation
- Rinsing of mouth tid-qid with water, club soda; brushing of teeth bid-tid with soft brush or cotton-tipped applicators for stomatitis; use unwaxed dental floss
- Storage at room temp for 24 hr after reconstituting

Evaluate:

- Therapeutic response: decreased tumor size, spread of malignancy

Teach patient/family:

- To add 2-3 L of fluids unless contraindicated before and for 24-48 hr after to decrease possible hemorrhagic cystitis
- To report any complaints, side effects to nurse or prescriber
- That hair may be lost during treatment; that wig or hairpiece might make patient feel better; that new hair might be different in color, texture
- To avoid foods with citric acid, hot or rough texture
- To report any bleeding, white spots, ulcerations in mouth to prescriber; to examine mouth daily
- That urine, other body fluids may be red-orange for 48 hr
- To avoid crowds and persons with infections when granulocyte count is low
- That barrier contraceptive measures are recommended during therapy and for 4

mo after (pregnancy [D]); to avoid breastfeeding

- To avoid vaccinations

🍁 Canada only Side effects: *italics* = common; **bold** = life-threatening ⚠️

Nurse Alert

DOXOrubicin liposomal

(dox-oh-roo'bi-sin)

Doxil, Lipodex

Func. class.: Antineoplastic, antibiotic

Chem. class.: Anthracycline glycoside

Do not confuse: **DOXOrubicin** *DOXOrubicin liposomal* DAUNOrubicin

ACTION:

Inhibits DNA synthesis primarily; replication is decreased by binding to DNA, which causes strand splitting; active throughout entire cell cycle; a vesicant

USES:

AIDS-related Kaposi's sarcoma, multiple myeloma, metastatic ovarian carcinoma

CONTRAINDICATIONS:

Pregnancy (D), breastfeeding, hypersensitivity, systemic infections, cardiac disorders

Black Box Warning:

Cardiotoxicity, infusion reactions, myelosuppression, hepatic disease

Precautions: Children, infection, leukopenia, stomatitis, thrombocytopenia

DOSAGE AND ROUTES

Calculator

Max lifetime cumulative dose 550 mg/m²; 400 mg/m² for those that have received other cardiotoxics or mediastinal radiation

Kaposi's sarcoma

- **Adult:** IV 20 mg/m² every 3 wk

Multiple myeloma

- **Adult:** IV 30 mg/m² IV infusion on day 4 every 3 wk plus bortezomib 1.3 mg/m²/dose IV bolus on days 1, 4, 8, 11 of each cycle; give DOXOrubicin liposomal after bortezomib receipt on day 4. Administer up to 8 treatment cycles or until disease progression or unacceptable toxicity occurs

Ovarian cancer that has progressed or recurred after platinum-based chemotherapy

- **Adult: IV** 50 mg/m² every 4 wk. Continue treatment for as long as the patient shows benefit and does not progress. A minimum of 4 courses is recommended

Available forms: Liposomal dispersion for inj: 2 mg/ml

Administer:

- Prepared liposomal DOXOrubicin is a translucent, red liposomal dispersion. Visually inspect for particulate matter and discoloration before use
- Pegylated liposomal DOXOrubicin (Doxil) is for IV INF use only and should not be given IM/subcut, give under the supervision of a physician who is experienced in cancer chemotherapy

Black Box Warning:

Care should be taken to avoid extravasation because the drug is irritating to extravascular tissue

- Premedication with antiemetics is recommended

IV route

- **Reconstitution (Doxil):** Dilute the appropriate dose, not to exceed 90 mg/250 ml D₅W. Do not mix with any other diluent, drugs, or bacteriostatic agent, use aseptic technique; product contains no preservative or bacteriostatic agent; diluted solution must be refrigerated and used within 24 hr
- **IV INF (Doxil):** Do not administer as a bolus injection or an undiluted solution. Rapid injection can increase the risk of an infusion-related reaction

Black Box Warning:

Care should be taken to avoid extravasation because the drug is irritating to extravascular tissue

- An acute infusion reaction can occur during the first infusion and is usually resolved by slowing the rate of infusion. Most patients can tolerate subsequent infusions
- **Rate:** Infuse at an initial rate of 1 mg/min. If no infusion-related action, the rate can be increased to complete the infusion over 1 hr; do not filter
- **For hematologic toxicity in patients with ovarian cancer or HIV-related Kaposi's sarcoma: Grade 1 (ANC of 1500-1900/mm³, platelets ≥75,000/mm³):** No dose reduction. **Grade 2 (ANC of 1000-1499/mm³, platelets ≥50,000/mm³ and < 75,000/mm³):** Wait until ANC ≥1500 cells/mm³ and platelets ≥75,000 cells/mm³; redose with no dose reduction. **Grade 3 (ANC of 500-999/mm³, platelets ≥25,000/mm³ and**

<50,000/mm³: Wait until ANC $\geq$ 1500 cells/mm³ and platelets $\geq$ 75,000 cells/mm³; redose with no dose reduction. **Grade 4 (ANC <500/mm³, platelets <25,000/mm³):** Wait until ANC $\geq$ 1500 cells/mm³ and platelets $\geq$ 75,000 cells/mm³; reduce dose by 25% or continue with full dose with colony-stimulating factor

- Give antiemetic 30-60 min before product to prevent vomiting
- Use allopurinol or sodium bicarbonate to maintain uric acid levels, alkalinization of urine
- Avoid mixing with other products

SIDE EFFECTS

CNS: Paresthesias, headache, depression, insomnia, fatigue, fever

CV: Chest pain, decreased B/P, **cardiomyopathy, heart failure, dysrhythmias, tachycardia**

EENT: Optic neuritis, rhinitis, pharyngitis, stomatitis

GI: Nausea, vomiting, anorexia, *mucositis*, **hepatotoxicity, constipation, oral candidiasis, abdominal pain**

HEMA: **Thrombocytopenia, leukopenia, anemia, neutropenia**

INTEG: *Rash*, **necrosis at inj site, dermatitis, reversible alopecia, exfoliative dermatitis, palmar-plantar erythrodysesthesia**, thrombophlebitis at inj site

RESP: Dyspnea, cough, respiratory infections

PHARMACOKINETICS

Half-life 55 hr; metabolized by liver; crosses placenta; excreted in urine, bile, breast milk

INTERACTIONS

Increase: life-threatening dysrhythmias—posaconazole, fluconazole, do not use together

Increase: QT prolongation—other drugs that increase QT prolongation

Increase: neutropenia, thrombocytopenia—progesterone

Increase: cardiomyopathy—calcium-channel blockers

Increase: toxicity—other antineoplastics, cycloSPORINE, radiation, mercaptopurine

Increase: hemorrhagic cystitis risk, cardiac toxicity—cyclophosphamide

Increase: effect of—phenytoin, fosphenytoin

Increase: DOXOrubicin effect—streptozocin

Decrease: DOXOrubicin effect—PHENobarbital

Decrease: antibody response—live virus vaccine

Decrease: antineoplastic effect—hematopoietic progenitor cell; do not use 24 hr before or after treatment

Decrease: clearance of DOXOrubicin—PACLitaxel

Drug/Lab Test

Increase: uric acid

NURSING CONSIDERATIONS

Assess:

Black Box Warning:

Bone marrow depression: CBC, differential, platelet count weekly; withhold product if WBC is $<4000/\text{mm}^3$ or platelet count is $<75,000/\text{mm}^3$; notify prescriber of these results

- Renal studies: BUN, serum uric acid, urine CCr, electrolytes before, during therapy
- I&O ratio: report fall in urine output to $<30 \text{ ml/hr}$
- Monitor temp; fever can indicate beginning infection

Black Box Warning:

Hepatotoxicity: Hepatic studies before, during therapy: bilirubin, AST, ALT, alk phos as needed or monthly; check for jaundice of skin and sclera, dark urine, clay-colored stools, itchy skin, abdominal pain, fever, diarrhea

Black Box Warning:

Dysrhythmias: ECG: watch for ST-T wave changes, low QRS and T, possible dysrhythmias (sinus tachycardia, heart block, PVCs), ejection fraction before treatment, signs of irreversible cardiomyopathy, can occur up to 6 mo after treatment begins

- Bleeding: hematuria, guaiac, bruising, petechiae of mucosa or orifices every 8 hr
- Effects of alopecia on body image; discuss feelings about body changes; almost total alopecia is expected
- Inflammation of mucosa, breaks in skin
- Buccal cavity every 8 hr for dryness, sores, ulceration, white patches, oral pain, bleeding, dysphagia
- Alkalosis if severe vomiting is present

Black Box Warning:

Extravasation: Local irritation, pain, burning at inj site; a vesicant; if extravasation occurs, stop drug, restart at another site, apply ice, elevate extremity to reduce swelling; if resolution does not occur, surgical debridement may be required

- GI symptoms: frequency of stools, cramping

Perform/provide:

- Liquid diet: carbonated beverages, gelatin may be added if patient is not nauseated or vomiting
- Increased fluid intake to 2-3 L/day to prevent urate, calculi formation
- Rinsing of mouth tid-qid with water, club soda; brushing of teeth bid-tid with soft brush or cotton-tipped applicators for stomatitis; use unwaxed dental floss
- Store refrigerated for 24 hr after reconstituting

Evaluate:

- Therapeutic response: decreased tumor size, spread of malignancy

Teach patient/family:

- To add 2-3 L of fluids unless contraindicated before and for 24-48 hr after to decrease possible **hemorrhagic cystitis**
- To report any complaints, side effects to nurse or prescriber
- That hair may be lost during treatment; that wig or hairpiece might make patient feel better; that new hair may be different in color, texture
- To avoid foods with citric acid, hot or rough texture
- To report any bleeding, white spots, ulcerations in mouth to prescriber; to examine mouth daily
- That urine, other body fluids may be red-orange for 48 hr
- To avoid crowds and persons with infections when granulocyte count is low
- That barrier contraceptive measures are recommended during therapy and for 4 mo after (pregnancy [D]); to avoid breastfeeding
- To avoid vaccinations because reactions can occur; to avoid alcohol

Nurse Alert

doxycycline (Rx)

(dox-i-sye'kleen)

Oracea

doxycycline calcium

Vibramycin

doxycycline hyclate

Adoxa, Apo-Doxy 🌿, Doryx, Doxy, Doxycaps, Doxycin 🌿, Periostat, Vibramycin, Vibra-Tabs

doxycycline monohydrate

Adoxa, Monodox, Vibramycin

Func. class.: Antiinfective

Chem. class.: Tetracycline

Do not confuse: **doxycycline**/doxepin/dicyclomine

ACTION:

Inhibits protein synthesis, phosphorylation in microorganisms by binding to 30S ribosomal subunits, reversibly binding to 50S ribosomal subunits; bacteriostatic

USES:

Syphilis, *Chlamydia trachomatis*, gonorrhea, *Rickettsia*, lymphogranuloma venereum, uncommon gram-negative/gram-positive organisms, malaria prophylaxis, chronic periodontitis, acne, anthrax, Lyme disease

Unlabeled uses: Traveler's diarrhea, prevention of chronic bronchitis, leptospirosis, pleural effusion, malaria (chloroquine-resistant *Plasmodium falciparum*)

CONTRAINDICATIONS:

Pregnancy (D), children <8 yr, hypersensitivity to tetracyclines, esophageal ulceration

Precautions: Breastfeeding, hepatic disease, pseudomembranous colitis, ulcerative colitis

DOSAGE AND ROUTES

Calculator

Most infections

- **Adult: PO/IV** 100 mg q12hr on day 1 then 100 mg/day; **IV** 200 mg in 1-2 inf on day 1 then 100-200 mg/day
- **Child >8 yr, ≥45 kg: PO** 100 mg q12hr on day 1 then 100 mg daily; severe infections 100 mg q12hr; **IV** 200 mg on day 1 then 100-200 mg daily, give 200 mg dose as 1 or 2 inf
- **Child ≥8 yr, <45 kg: PO** 2.2 mg/kg q12hr on day 1 then 2.2 mg/kg daily, severe infections 2.2 mg/kg q12hr; **IV** 4.4 mg/kg on day 1 then 2.2-4.4 mg/kg daily in 1 to 2 divided doses

Gonorrhea (uncomplicated) in patients allergic to penicillin

- **Adult: PO** 100 mg q12hr × 7 days or 300 mg followed 1 hr later by another 300 mg

Malaria prophylaxis

- **Adult: PO** 100 mg/day 1-2 days before travel, daily during travel, and for 4 wk after return
- **Adolescent/child ≥8 yr, <45 kg: PO** 2 mg/kg/day (up to 100 mg/day) begin 1-2 days before travel, continue for 4 wk after return

C. trachomatis

- **Adult: PO** 100 mg bid × 7 days

Syphilis

- **Adult: PO** 100 mg bid × 14 days

Anthrax

- **Adult and child >8 yr and ≥45 kg: IV** 100 mg q12hr; change to **PO** when able × 60 days
- **Adolescent/child ≥8 yr and <45 kg: PO** 2.2 mg/kg q12hr × 60 days; **IV** 100 mg q12hr, change to **PO** when able × 60 days

Lyme disease

- **Adult/adolescent/child ≥8 yr: PO** 100 mg bid × 10-21 days

Periodontitis

- **Adult:** 20 mg bid after scaling and root planing for ≤9 mo; give close to meal time AM OR PM

Pleural effusion (unlabeled)

- **Adult: INTRACAVITARY** 500 mg diluted with 250 ml 0.9% NaCl given by chest tube lavage and drainage

Available forms: Doxycycline: cap 40 mg; doxycycline calcium: syrup 50 mg/5

ml; doxycycline hyclate: cap 50, 100 mg; pellet caps 75, 100 mg; inj 42.5, 100, 200 mg; tabs 20, 100 mg; doxycycline monohydrate: caps 50, 100 mg; tabs 50, 75, 100 mg; oral susp 25 mg/5 ml

Administer:

PO route

- Do not break, crush, or chew caps; may crush tabs and mix with food
- On empty stomach or with full glass of water 2 hr before or after meals; avoid dairy products, antacids, laxatives, iron-containing products; if these must be taken, give 2 hr before or after product; avoid giving oral products within 1 hr of bedtime, esophageal ulceration may occur

Intermittent IV INF route

- After diluting 100 mg or less/10 ml of sterile water or NS for inj, further dilute with 100-1000 ml of NaCl, D₅, Ringer's, LR D₅LR, Normosol-M, Normosol-R in D₅W; run 100 mg or less over 1-4 hr; inf must be completed in 6 hr when diluted in LR sol or 12 hr with other sol; protect from light, heat

Y-site compatibilities: Acyclovir, alemtuzumab, alfentanil, amifostine, amikacin, aminophylline, amiodarone, anidulafungin, ascorbic acid, atracurium, atropine, aztreonam, bivalirudin, bumetanide, buprenorphine, butorphanol, calcium chloride/gluconate, CARBOplatin, caspofungin, cefonicid, cefotaxime, cefTRIAXone, chlorproMAZINE, cimetidine, cisatracurium, CISplatin, clindamycin, codeine, cyanocobalamin, cyclophosphamide, cycloSPORINE, cytarabine, DACTINomycin, DAPTOmycin, dexmedetomidine, digoxin, diltiazem, diphenhydrAMINE, DOBUTamine, DOCEtaxel, DOPamine, doxacurium, DOXOrubicin, enalaprilat, ePHEDrine, EPINEPHrine, epirubicin, epoetin alfa, eptifibatide, ertapenem, esmolol, etoposide, etoposide phosphate, famotidine, fenoldopam, fentaNYL, filgrastim, fluconazole, fludarabine, gemcitabine, gentuzumab, gentamicin, glycopyrrolate, granisetron, HYDROmorphine, IDArubicin, ifosfamide, imipenem/cilastatin, insulin, isoproterenol, labetalol, levofloxacin, lidocaine, linezolid, LORazepam, magnesium sulfate, mannitol, mechlorethamine, melphalan, meperidine, metaraminol, methoxamine, methyldopate, metoclopramide, metoprolol, metroNIDAZOLE, miconazole, midazolam, milrinone, mitoXANtrone, morphine, multivitamins, nalbuphine, naloxone, nesiritide, netilmicin, nitroglycerin, nitroprusside, norepinephrine, octreotide, ondansetron, oxaliplatin,

oxytocin, PACLitaxel, pancuronium, pantoprazole, papaverine, pentamidine, pentazocine, perphenazine, phentolamine, phenylephrine, phytonadione, potassium chloride, procainamide, prochlorperazine, promethazine, propofol, propranolol, protamine, pyridoxime, quinupristin/dalfopristin, ranitidine, remifentanyl, ritodrine, ritUXimab, rocuronium, sargramostim, sodium acetate, succinylcholine, SUFentanyl, tacrolimus, telavancin, teniposide, theophylline, thiamine, thiotepa, tirofiban, tobramycin, tolazoline, TPN (2 in 1), trastuzumab, trimetaphan, urokinase, vancomycin, vasopressin, vecuronium, verapamil, vinCRISTine, vinorelbine, voriconazole, zoledronic acid

SIDE EFFECTS

CNS: Fever

CV: Pericarditis

EENT: Dysphagia, glossitis, decreased calcification of deciduous teeth, oral candidiasis, tooth discoloration

GI: Nausea, abdominal pain, vomiting, diarrhea, anorexia, enterocolitis, hepatotoxicity, flatulence, abdominal cramps, gastric burning, stomatitis

GU: Increased BUN

HEMA: Eosinophilia, neutropenia, thrombocytopenia, hemolytic anemia

INTEG: Rash, urticaria, photosensitivity, increased pigmentation, exfoliative dermatitis, pruritus

MS: Bone growth retardation (<8 yr old)

SYST: Stevens-Johnson syndrome, angioedema, anaphylaxis

PHARMACOKINETICS

PO: Well absorbed; widely distributed; peak 1½-4 hr; half-life 14-17 hr; excreted in urine, feces, bile; 90% protein bound; crosses placenta; enters breast milk

INTERACTIONS

Increase: effect of—anticoagulants, digoxin

Decrease: doxycycline effect—antacids, NaHCO₃, dairy products, alkali products, iron, kaolin/pectin, barbiturates, carbamazepine, phenytoin, cimetidine, sucralfate, cholestyramine, colestipol, rifampin, bismuth; iron, magnesium, zinc, calcium, aluminum salts

Decrease: effects—penicillins, oral contraceptives, digoxin

Drug/Lab Test

Increase: BUN, alk phos, bilirubin, amylase, ALT, AST, eosinophils, WBC

Decrease: Hgb

False increase: urinary catecholamines

NURSING CONSIDERATIONS

Assess:

- I&O ratio
- Blood studies: PT, CBC, AST, ALT, BUN, creatinine
- Signs of infection
- **Allergic reactions:** rash, itching, pruritus, angioedema
- Nausea, vomiting, diarrhea; administer antiemetic, antacids as ordered
- **Overgrowth of infection:** fever, malaise, redness, pain, swelling, drainage, perineal itching, diarrhea, changes in cough or sputum
- IV site for phlebitis/thrombosis; product is highly irritating
- After C&S is obtained, do not wait for results

Perform/provide:

- Storage in tight, light-resistant container at room temp; IV stable for 12 hr at room temp, 72 hr refrigerated; discard if precipitate forms

Evaluate:

- Therapeutic response: decreased temp, absence of lesions, negative C&S

Teach patient/family:

- To avoid sun because burns may occur; that sunscreen does not seem to decrease photosensitivity
- **That all prescribed medication must be taken to prevent superinfection; not to use outdated products because Fanconi syndrome may occur (reversible nephrotoxicity)**
- **That if children ≤ 8 yr old are undergoing tooth development, teeth will be permanently discolored**

✳ Canada only Side effects: *italics* = common; **bold** = life-threatening ⚠
Nurse Alert

HIGH ALERT

dronedarone (Rx)

(drone'da'rone)

Multaq

Func. class.: Antidysrhythmic (class III)

Chem. class.: Iodinated benzofuran derivative

ACTION:

Prolongs duration of action potential and effective refractory period, noncompetitive α - and β -adrenergic inhibition; increases RR and QT intervals, decreases sinus rate, decreases peripheral vascular resistance

USES:

Atrial fibrillation, atrial flutter

CONTRAINDICATIONS:

Pregnancy (X), breastfeeding; 2nd-, 3rd-degree AV block; bradycardia, severe sinus node dysfunction, hypersensitivity, heart failure, hepatic disease, QT prolongation, aminodarone-induced lung toxicity

Black Box Warning:

NYHA Class IV heart failure or Class II-III with recent decompensation requiring hospitalization, permanent atrial fibrillation (cannot restore sinus rhythm)

Precautions: Children, geriatric patients, Asian patients, females, electrolyte imbalances, atrial fibrillation/flutter

DOSAGE AND ROUTES

Calculator

• **Adult:** PO 400 mg bid; **discontinue class I, III antidysrhythmics or strong CYP3A4 inhibitors before beginning treatment; max 800 mg/day**

Available forms: Tabs 400 mg

Administer:

PO route

- Give bid with morning, evening meals
- Give MedGuide; should be dispensed with each prescription, refill

SIDE EFFECTS

CV: *Bradycardia*, heart failure, QT prolongation, torsades de pointes

ENDO: Hypo/hyperthyroidism

GI: Nausea, vomiting, diarrhea, abdominal pain, severe hepatic injury, hepatic failure

INTEG: Rash, photosensitivity, anaphylaxis

PHARMACOKINETICS

Peak 3-6 hr, half-life 13-19 hr, metabolized by liver, excreted in feces (84%), via kidneys (6%), protein binding >98%

INTERACTIONS

Increase: dronedarone levels: CYP3A inhibitors/2D6 inhibitors

Decrease: dronedarone levels: 3A/2D6 inducers

Increase: 3A/2D6 substrate levels

Increase: bradycardia— β -blockers, calcium channel blockers

Increase: levels of cycloSPORINE, dextromethorphan, digoxin, disopyramide, flecainide, methotrexate, phenytoin, procainamide, quiniDine, theophylline

Increase: anticoagulant effects—dabigatran, warfarin

Drug/Herb

Increase: anticoagulant effect—yohimbine

Decrease: dronedarone effect—St. John's wort

Drug/Food:

Increase: dronedarone effect, grapefruit; avoid use

Drug/Lab Test

Increase: T₄, creatinine

NURSING CONSIDERATIONS

Assess:

Black Box Warning:

NYHA Class IV heart failure or symptomatic heart failure with recent decomposition requiring hospitalization doubles risk of death

- **ECG** to determine product effectiveness; measure PR, QRS, QT intervals; check for PVCs, other dysrhythmias, B/P continuously for hypo/hypertension; report dysrhythmias, slowing heart rate
- Serum creatinine, potassium, magnesium

- I&O ratio; electrolytes (potassium, creatinine, magnesium)
- Dehydration or hypovolemia
- Rebound hypertension after 1-2 hr
- **Hypothyroidism:** lethargy, dizziness, constipation, enlarged thyroid gland, edema of extremities; cool, pale skin
- **Hyperthyroidism:** restlessness, tachycardia, eyelid puffiness, weight loss, frequent urination, menstrual irregularities, dyspnea; warm, moist skin
- Cardiac rate, respiration: rate, rhythm, character, chest pain; start with patient hospitalized and monitored up to 1 wk

Evaluate:

- Therapeutic response: atrial fibrillation, flutter

Teach patient/family:

- To take this product as directed; to avoid missed doses; not to use with grapefruit juice, to avoid all other products without approval of provider
- To immediately report weight gain, edema, difficulty breathing
- To use effective contraception during treatment (pregnancy X) not to breastfeed

TREATMENT OF OVERDOSE:

O₂, artificial ventilation, ECG, administer DOPamine for circulatory depression; administer diazepam or thiopental for seizures, isoproterenol

☼ Canada only Side effects: *italics* = common; **bold** = life-threatening ⚠
Nurse Alert

HIGH ALERT

droperidol (Rx)

(droe-per'i-dole)

Func. class.: Sedative/hypnotic

Chem. class.: Butyrophenone

ACTION:

Acts on CNS at subcortical levels, produces tranquilization, sleep; antiemetic; mild α -blockade

USES:

Premedication for surgery; induction, maintenance in general anesthesia; postoperatively for nausea, vomiting

Unlabeled uses: Anxiety, general anesthesia induction/maintenance, preanesthesia, sedation induction

CONTRAINDICATIONS:

Breastfeeding, children <2 yr, hypersensitivity

Black Box Warning:

QT prolongation, torsades de pointes

Precautions: Pregnancy (C), geriatric patients, CV disease (hypotension, bradydysrhythmias), renal/hepatic disease, Parkinson's disease, pheochromocytoma, CHF, hypokalemia, hypomagnesemia, cardiac hypertrophy

DOSAGE AND ROUTES

Calculator

Induction, adjunct

- **Adult:** IV/IM 1.25-2.5 mg, may give additional 1.25 mg with caution
- **Child 2-12 yr:** IV 0.05-0.1 mg/kg, titrate to response

Premedication

- **Adult:** IM 2.5 mg 1/2-1 hr before surgery, may give 1.25-2.5 mg additionally
- **Child 2-12 yr:** IM 0.05-0.1 mg/kg

Available forms: Inj 2.5 mg/ml

Administer:

- Protect sol from light
- Anticholinergics (benztropine, diphenhydrAMINE) for EPS
- Only with crash cart, resuscitative equipment nearby
- IM deep in large muscle mass

Direct IV route

- Undiluted; give through **Y**-tube at 10 mg or less/min; titrate to patient response

Intermittent IV INF route

- May be given as inf by adding dose to 250 ml LR, D₅W, 0.9% NaCl; give slowly, titrate to patient response

Syringe compatibilities: Atropine, bleomycin, butorphanol, chlorproMAZINE, cimetidine, CISplatin, cyclophosphamide, dimenhyDRINATE, diphenhydrAMINE, DOXOrubicin, fentaNYL, glycopyrrolate, hydrOXYzine, meperidine, metoclopramide, midazolam, mitoMYcin, morphine, nalbuphine, pentazocine, perphenazine, prochlorperazine, promazine, promethazine, scopolamine, vinBLAS^tine, vinCRIS^tine

Y-site compatibilities: Amifostine, aztreonam, bleomycin, cisatracurium, CISplatin, cladribine, cyclophosphamide, cytarabine, DOXOrubicin, DOXOrubicin liposome, famotidine, filgrastim, fluconazole, fludarabine, granisetron, hydrocortisone, IDArubicin, melphalan, meperidine, metoclopramide, mitoMYcin, ondansetron, PACLitaxel, potassium chloride, propofol, remifentanyl, sargramostim, teniposide, thiotepa, vinBLAS^tine, vinCRIS^tine, vinorelbine, vit B/C

SIDE EFFECTS

CNS: EPS (dystonia, akathisia, flexion of arms, fine tremors); dizziness, anxiety, drowsiness, restlessness, hallucination, depression, **seizures, neuroleptic malignant syndrome**

CV: *Tachycardia, hypotension, prolonged QT, torsades de pointes*

EENT: Upward rotation of eyes, oculogyric crisis

INTEG: *Chills, facial sweating, shivering*

RESP: **Laryngospasm, bronchospasm**

PHARMACOKINETICS

IM/IV: Onset 3-10 min, peak 1/2 hr, duration 3-6 hr, metabolized in liver,

excreted in urine as metabolites, crosses placenta, half-life 2-3 hr

INTERACTIONS

Increase: CNS depression—alcohol, opiates, barbiturates, antihistamines, antipsychotics, or other CNS depressants

Increase: hypotension—nitrates, antihypertensives

Increase: side effects of lithium

Black Box Warning:

Increase: QT prolongation—class IA/III antiarrhythmics, some phenothiazines, tricyclics, some quinolones, others

Drug/Herb

Increase: action—kava, valerian, hops, chamomile

NURSING CONSIDERATIONS

Assess:

- VS q10min during IV administration, q30min after IM dose
- EPS: dystonia, akathisia

 For increasing heart rate or decreasing B/P, notify prescriber at once; do not place patient in Trendelenburg position because sympathetic blockade may occur, thereby causing respiratory arrest

Black Box Warning:

QT prolongation, torsades de pointes: ECG before and 2-3 hr after administration for serious arrhythmias

Evaluate:

- Therapeutic response: decreased anxiety, absence of vomiting during and after surgery

Teach patient/family:

- To rise slowly from sitting or standing to minimize orthostatic hypotension
- To avoid ambulation without assistance; drowsiness, dizziness may occur

☼ Canada only Side effects: *italics* = common; **bold** = life-threatening 
Nurse Alert

DULoxetine (Rx)

(du-lox'uh-teen)

Cymbalta

Func. class.: Antidepressant

Chem. class.: Serotonin-norepinephrine reuptake inhibitor (SNRI)

ACTION:

May potentiate serotonergic, noradrenergic activity in the CNS; in studies, DULoxetine is a potent inhibitor of neuronal serotonin and norepinephrine reuptake

USES:

Major depressive disorder (MDD), neuropathic pain associated with diabetic neuropathy, generalized anxiety disorder, fibromyalgia, chronic low back pain, osteoarthritis pain

Unlabeled uses: Stress, urinary incontinence

CONTRAINDICATIONS:

Alcohol intoxication, alcoholism, closed-angle glaucoma, hepatic disease, hepatitis, jaundice, hypersensitivity

Precautions: Pregnancy (C), breastfeeding, geriatric patients, mania, hypertension, renal/cardiac disease, seizures, increased intraocular pressure, anorexia nervosa, bleeding, dehydration, diabetes, hyponatremia, hypotension, hypovolemia, orthostatic hypotension, abrupt product withdrawal

Black Box Warning:

Children, suicidal ideation

DOSAGE AND ROUTES

Calculator

Depression

- **Adult: PO** 40-60 mg/day as single dose or 2 divided doses

Diabetic neuropathy

- **Adult: PO** 60 mg/day

Generalized anxiety disorder

- **Adult: PO** 60 mg/day, may start with 30 mg/day $\times$ 1 wk then increase to 60

mg/day; maintenance 60-120 mg/day

Fibromyalgia

- **Adult: PO** 30 mg/day × 1 wk then 60 mg/day

Musculoskeletal pain

- **Adult: PO** 60 mg/day or 30 mg/day × 1 wk then 60 mg/day

Renal dose

- **Adult: PO** Start with 20 mg, gradually increase; avoid use in severe renal disease

Available forms: Caps 20, 30, 60 mg

Administer:

- Swallow cap whole; do not break, crush, or chew; do not sprinkle on food or mix with liquid
- Without regard to food

SIDE EFFECTS

CNS: Insomnia, anxiety, dizziness, tremor, somnolence, fatigue, decreased appetite, decreased weight, agitation, diaphoresis, hallucinations, **neuroleptic malignant-like syndrome reaction**, aggression, **seizures**, **headache**

CV: **Thrombophlebitis**, peripheral edema, hypertension, palpitations, **supraventricular dysrhythmia**

EENT: *Abnormal vision*

ENDO: Hypo/hyperglycemia

GI: Constipation, diarrhea, dysphagia, *nausea*, vomiting, anorexia, dry mouth, colitis, gastritis, abdominal pain, **hepatic failure**

GU: Abnormal ejaculation, urinary hesitation/retention/frequency, ejaculation delayed, erectile dysfunction, gynecologic bleeding

INTEG: Photosensitivity, bruising, sweating, **Stevens-Johnson syndrome**

MS: Gait disturbance, muscle spasm, restless leg syndrome

SYST: **Anaphylaxis**, **angioedema**, **serotonin syndrome**, **Stevens-Johnson syndrome**

PHARMACOKINETICS

Well absorbed; extensively metabolized (CYP2D6, CYP1A2) in the liver to an active metabolite; 70% of product recovered in urine, 20% in feces; 90% protein binding; elimination half-life 9.2-19.1 hr

INTERACTIONS

- Do not use with linezolid or methylene blue IV
- Narrow therapeutic index: CYP2D6 extensively metabolized products (flecainide, phenothiazines, propafenone, tricyclics, thioridazine)
- ⚠️ Hyperthermia, rigidity, rapid fluctuations of vital signs, mental status changes, neuroleptic malignant syndrome—MAOIs, coadministration contraindicated within 14 days of MAOI use

Increase: CNS depression—opioids, antihistamines, sedative/hypnotics

Increase: serotonin syndrome, neuroleptic malignant syndrome—SSRIs, serotonin-receptor agonists

Increase: bleeding risk—anticoagulants, antiplatelets, salicylates, NSAIDs

Increase: action of DULoxetine—CYP1A2 inhibitors (fluvoxamine, quinolone anti-infectives); CYP2D6 inhibitors (FLUoxetine, quINIDine, PARoxetine)

Increase: ALT, bilirubin—alcohol

Drug/Herb

- Serotonin syndrome: St. John's wort

Increase: CNS depression—kava, valerian

Drug/Lab Test

Increase: blood glucose

NURSING CONSIDERATIONS

Assess:

Black Box Warning:

Depression: mood, sensorium, affect, **suicidal tendencies**, increase in psychiatric symptoms; depression, panic, monitor children q wk face to face during first 4 wk, or dosage change, then every other week for next 4 wk, then at 12 wk

- B/P lying, standing; pulse q4hr; if systolic B/P drops 20 mm Hg, hold product, notify prescriber; take VS q4hr in patients with CV disease
- Hepatic studies: AST, ALT, bilirubin
- Weight weekly; weight loss or gain; appetite may increase; peripheral edema may occur
- Sugarless gum, hard candy, frequent sips of water for dry mouth
- **Withdrawal symptoms:** headache, nausea, vomiting, muscle pain, weakness; not common unless product is discontinued abruptly

⚠️ **Malignant neuroleptic-like syndrome reaction**

 **Serotonin syndrome:** nausea/vomiting, dizziness, facial flush, shivering, sweating

- **Sexual dysfunction:** ejaculation dysfunction, erectile dysfunction, decreased libido, orgasm dysfunction

Perform/provide:

- Storage in tight container at room temp; do not freeze
- Assistance with ambulation during beginning therapy; drowsiness, dizziness occur
- Confirmation that PO medication swallowed

Evaluate:

- Therapeutic response: decreased depression

Teach patient/family:

- To report urinary retention; about signs and symptoms of bleeding (GI bleeding, nosebleed, ecchymoses, bruising)
- To use with caution when driving, performing other activities requiring alertness because of drowsiness, dizziness, blurred vision
- To avoid alcohol ingestion, MAOIs, other CNS depressants
- Not to discontinue medication quickly after long-term use; may cause nausea, headache, malaise; taper

Black Box Warning:

That clinical worsening and suicide risk may occur

- To wear sunscreen or large hat; photosensitivity may occur
- To notify prescriber if pregnancy planned or suspected, or if breastfeeding
- Improvement may occur in 4-8 wk or in up to 12 wk (geriatric patients)

🍁 Canada only Side effects: *italics* = common; **bold** = life-threatening 
Nurse Alert

dutasteride (Rx)

(doo-tass'ter-ide)

Avodart

Func. class.: Androgen inhibitor

Chem. class.: Synthetic 5 α -reductase inhibitor, 4-azasteroid compound

ACTION:

Inhibits both type 1 and type 2 forms of a steroid enzyme that converts testosterone to 5 α -dihydrotestosterone (DHT), which is responsible for the initial growth of prostatic tissue

USES:

Treatment of benign prostatic hyperplasia (BPH) in men with an enlarged prostate gland; may be used in combination with tamsulosin

Unlabeled uses: Alopecia

CONTRAINDICATIONS:

Pregnancy (X), breastfeeding, women, children, hypersensitivity

Precautions: Hepatic disease

DOSAGE AND ROUTES

Calculator

Benign prostatic hyperplasia (BPH)

- **Adult: PO** 0.5 mg/day

Alopecia (unlabeled)

- **Adult: PO** 0.5-2.5 mg/day

Available form: Caps 0.5 mg

Administer:

- Swallow caps whole; do not break, crush, chew
- Without regard to meals

SIDE EFFECTS

GU: Decreased libido, impotence, gynecomastia, ejaculation disorders (rare), mastalgia, **teratogenesis**

INTEG: **Serious skin infections**

PHARMACOKINETICS

Peak 2-3 hr, protein binding 99%, metabolized in liver by CYP3A4, excreted in feces, half-life 5 wk at steady state

INTERACTIONS

Increase: dutasteride concentrations—ritonavir, ketoconazole, verapamil, diltiazem, cimetidine, ciprofloxacin, antiretroviral protease inhibitors, or other products metabolized by CYP3A4

Drug/Lab Test

Decrease: PSA

NURSING CONSIDERATIONS

Assess:

- **For decreasing symptoms of BPH:** decreasing urinary retention, frequency, urgency, nocturia
- PSA levels; digital rectal, urinary obstruction; determine the absence of urinary cancer before starting treatment
- Blood studies: ALT, AST, bilirubin, CBC with differential, serum creatinine, serum electrolytes

Evaluate:

- Therapeutic response: decreasing symptoms of BPH; decreased urinary retention, frequency, urgency, nocturia

Teach patient/family:

- To read patient information leaflet before starting therapy; to reread it upon prescription renewal
- To notify prescriber if therapeutic response decreases, if edema occurs
- Not to discontinue product abruptly
- About changes in sex characteristics
- That men taking dutasteride should not donate blood for at least 6 mo after last dose to prevent blood administration to pregnant female
- That caps should not be handled by a woman who is pregnant or who may become pregnant because product can be absorbed through skin
- That ejaculate volume may decrease during treatment; that product rarely interferes with sexual function
- Should not be used or handled by breastfeeding women

- Swallow whole. Do not crush, chew or open
 - May increase risk for developing high-grade prostate cancer
-

🍁 Canada only Side effects: *italics* = common; **bold** = life-threatening ⚠️
Nurse Alert

ecallantide

(ee-kal'an-tide)

Kalbitor

Func. class.: Hematological agents

Chem. class.: Kallikrein inhibitor

ACTION:

Selectively, reversibly inhibits kallikrein within the inflammatory pathways, preventing excess production of bradykinin

USES:

Acute attacks of hereditary angioedema (≥ 16 yr)

CONTRAINDICATIONS:

Hypersensitivity to the drug or its components

Black Box Warning:

Anaphylaxis has occurred after administrations (usually within first hour after dosing). Drug should be administered only by health care provider with medical support available to treat anaphylaxis and hereditary angioedema. Monitor patient closely

Precautions: Pregnancy (C), breastfeeding, geriatric patients

DOSAGE AND ROUTES

Calculator

• **Adult/adolescent ≥ 16 yr:** SUBCUT 30 mg given as three 10-mg injections; give additional 30-mg dose within 24 hours if attack persists

Available forms: Solution 10 mg/ml

Administer:

- Using aseptic technique, withdraw 1 ml (10 mg) using a large bore needle; change the needle on the syringe to a needle suitable for subcut inj (27 gauge recommended)
- Inject into the skin of the abdomen, thigh, or upper arm
- Repeat the procedure for each of the three vials (30 mg total dose); the injection site for each of the three injections may be in the same or different anatomic location (abdomen, thigh, or upper arm); there is no need for site rotation; individual injections should be separated by at least 2 inches and away

from the anatomical site of attack

- The same directions for administration apply if an additional dose is required within 24 hr; different injection sites or the same anatomical location as used for the first dose may be used
- Visually inspect parenteral products for particulate matter and discoloration prior to administration

SIDE EFFECTS

CNS: Fatigue, fever, headache

EENT: Nasopharyngitis

GI: Abdominal pain, diarrhea, nausea, vomiting

INTEG: Injection-site reactions, pruritus, rash, urticaria

RESP: Upper respiratory tract infection

Black Box Warning:

Assess: anaphylaxis; usually within first hr after dosing

NURSING CONSIDERATIONS

Teach patient/family:

- To immediately report wheezing, cough, chest tightness, trouble breathing, dizziness, fainting, throat tightness, itchiness, hives, and swelling of tongue or throat.
- Inform patient that drug must be given by health care provider in a health care setting in case serious allergic reaction occurs

🍁 Canada only Side effects: *italics* = common; **bold** = life-threatening ⚠️
Nurse Alert

econazole

(ee-koe'na-zole)

Func. class.: Topical antifungal

Chem. class.: Imidazole derivative

ACTION:

Antifungal activity results from inhibiting cell wall permeability

USES:

Tinea corporis, cruris, pedis, versicolor; cutaneous candidiasis

CONTRAINDICATIONS:

Hypersensitivity

DOSAGE AND ROUTES

Calculator

Tinea corporis, cruris, pedis, versicolor

- **Adult/child:** TOP Rub into affected areas daily $\times$ 2 wk, or $\times$ 4 wk (pedis)

Cutaneous candidiasis

- **Adult/child:** Rub into affected areas bid

Available forms: Topical cream 1%

Administer:

Topical route

- Do not use products near the eyes, nose, or mouth
- Wash hands before and after use. Wash affected area and gently pat dry
- **Cream:** Apply to the cleansed affected area. Massage gently into affected areas

SIDE EFFECTS

INTEG: Burning, rash, pruritus

PHARMACOKINETICS

Unknown

NURSING CONSIDERATIONS

Assess:

- **Allergic reaction:** Assess for hypersensitivity, product might need to be discontinued

- **Infection:** Assess for itching, peeling

Evaluate:

- Decreased itching, peeling

Teach patient/family:

Topical route

- That product is for external use only; do not use skin products near the eyes, nose, or mouth

- To wash hands before and after use; to wash affected area and gently pat dry

- **Cream:** To apply a thin film to the cleansed affected area; massage gently into affected areas

🍁 Canada only Side effects: *italics* = common; **bold** = life-threatening ⚠️

Nurse Alert

econazole topical

See [Appendix B](#)

ecothiophate ophthalmic

See [Appendix B](#)

RARELY USED

edetate calcium disodium (Rx)

(ee'de-tate)

Calcium Disodium Versenate

Func. class.: Heavy metal antagonist (antidote)

Do not confuse: **edetate calcium disodium**/edetate disodium

USES:

Lead poisoning, acute lead encephalopathy

CONTRAINDICATIONS:

Hypersensitivity, anuria, poisoning of other metals, severe renal disease, hepatitis

Black Box Warning:

Child <3 yr

DOSAGE AND ROUTES

Calculator

Lead mobilization test (lead toxicity 25-45 mcg/dl)

- **Adult/adolescent:** IV INF 500 mg/m² over 1 hr or IM
- **Child:** IV INF 500 mg/m² over 1 hr or IM as single dose or 2 divided doses

Acute lead encephalopathy (blood levels >70 mcg/dl)

- **Adult/adolescent/child/infant:** IM/IV 1500 mg/m² as IV INF over 12-24 hr in combination with dimercaprol IM, give 1st dose ≥4 hr after initial

dimercaprol, when urine flow established

🍁 Canada only Side effects: *italics* = common; **bold** = life-threatening ⚠️
Nurse Alert

efavirenz (Rx)

(ef-ah-veer'enz)

Sustiva

Func. class.: Antiretroviral

Chem. class.: Nonnucleoside reverse transcriptase inhibitor (NNRTI)

ACTION:

Binds directly to reverse transcriptase and blocks RNA, DNA polymerase, thus causing a disruption of the enzyme's site

USES:

HIV-1 in combination with at least 2 other antivirals

Unlabeled uses: HIV prophylaxis

CONTRAINDICATIONS:

Pregnancy (D), hypersensitivity

Precautions: Breastfeeding, children <3 yr, renal/hepatic disease, myelosuppression, depression, seizures

DOSAGE AND ROUTES

Calculator

Given in combination with protease inhibitor or nucleoside analog reverse transcriptase inhibitors (NARTIs)

- **Adult and child >40 kg: PO 600 mg/day at bedtime**
- **Child ≥3 yr, 32.5-39.9 kg: PO 400 mg/day at bedtime**
- **Child ≥3 yr, 25-32.4 kg: PO 350 mg/day at bedtime**
- **Child ≥3 yr, 20-24.9 kg: PO 300 mg/day at bedtime**
- **Child ≥3 yr, 15-19.9 kg: PO 250 mg/day at bedtime**
- **Child ≥3 yr, 10-14.9 kg: PO 200 mg/day at bedtime**

Available forms: Caps 50, 100, 200 mg; 600-mg tabs

Administer:

- Give on empty stomach; give at bedtime to decrease CNS side effects
- Caps may be opened, added to grape jelly to disguise peppery taste

SIDE EFFECTS

CNS: Fatigue, impaired cognition, insomnia, abnormal dreams, depression, headache, dizziness, anxiety, drowsiness

GI: *Diarrhea*, abdominal pain, *nausea*, hyperlipidemia, constipation, increased LFTs

GU: Hematuria, kidney stones

INTEG: Rash, *erythema multiforme*, *Stevens-Johnson syndrome*, *toxic epidermal necrolysis*, *exfoliative dermatitis*

PHARMACOKINETICS

Peak 3-5 hr, well absorbed, metabolized by liver; terminal half-life 52-76 hr; >99% protein binding, excreted in urine, feces; concentrations higher in females and those of African, Asian, and Hispanic descent

INTERACTIONS

- Avoid use with boceprevir, delavirdine, rilpivirine; dosage change may be needed if given with telaprevir

- *Do not give together with benzodiazepines, ergots, midazolam, triazolam, CISapride*

Increase: CNS depression—alcohol, antidepressants, antihistamines, opioids

Increase: levels of both products—ritonavir, estrogens, anticonvulsants

Increase: levels of warfarin, statins (except pravastatin, fluvastatin)

Decrease: levels of indinavir, amprenavir, lopinavir, oral contraceptives, nonoral contraceptives, ketoconazole, itraconazole, posaconazole, voriconazole, saquinavir, clarithromycin, methadone

Decrease: efavirenz metabolism—CYP3A4 inhibitors (conivaptan, ambrisentan, sorafenib)

Decrease: efavirenz effect—CYP3A4 inducers (carbamazepine, rifamycins)

Drug/Herb

Decrease: efavirenz level—St. John's wort; do not use together

Drug/Food

Increase: absorption—high-fat foods

Drug/Lab Test

Increase: ALT

False positive: cannabinoids

NURSING CONSIDERATIONS

Assess:

- **Pregnancy:** Rule out pregnancy (D) before starting treatment; a type of contraception is needed, oral/nonoral contraceptives are decreased
- Bowel pattern before, during treatment; if severe abdominal pain with bleeding occurs, product should be discontinued; monitor hydration
- **Serious skin reactions:** Stevens-Johnson syndrome, toxic epidermal necrolysis
- **HIV:** Monitor CBC, blood chemistry, plasma HIV RNA, absolute CD4+/CD8+ cell counts/%, serum β_2 microglobulin, serum ICD+24 antigen levels, cholesterol, hepatic enzymes
- **Signs of toxicity:** severe nausea/vomiting, maculopapular rash

Evaluate:

- Therapeutic response: increased CD4 cell counts; decreased viral load; slowing progression of HIV

Teach patient/family:

- To take as prescribed; if dose is missed, to take as soon as remembered; not to double dose; to take with water, juice; to take on empty stomach at bedtime
- To make sure health care provider knows all medications, supplements, OTC products taken
- That, if severe rash occurs, to notify health care provider; that adverse reactions (rash, dizziness, abnormal dreams, insomnia) lessen after 1 mo
- Not to breastfeed or become pregnant if taking this product; to use nonhormonal contraception because serious birth defects have occurred (pregnancy D)
- To avoid hazardous activities if dizziness, drowsiness occur
- That product does not cure disease but controls symptoms; that HIV can be transmitted to others even while taking this product; to continue with safe-sex practices

☛ Canada only Side effects: *italics* = common; **bold** = life-threatening ⚠
Nurse Alert

eletriptan (Rx)

(el-ee-trip'tan)

Relpax

Func. class.: Antimigraine agent, abortive

Chem. class.: 5-HT₁-1B/1D receptor agonist, triptan

ACTION:

Binds selectively to the vascular 5-HT₁-receptor subtype; causes vasoconstriction in cranial arteries

USES:

Acute treatment of migraine with/without aura

CONTRAINDICATIONS:

Hypersensitivity, coronary artery vasospasm, peripheral vascular disease, hemiplegic/basilar migraine, uncontrolled hypertension; ischemic bowel, heart disease; severe renal/hepatic disease, acute MI, stroke, angina, CV disease

Precautions: Pregnancy (C), breastfeeding, children, geriatric patients, postmenopausal women, men >40 yr; risk factors of CAD, MI, or other cardiac disease; hypercholesterolemia, obesity, diabetes, impaired renal/hepatic function

DOSAGE AND ROUTES

Calculator

• **Adult: PO** 20 or 40 mg, may increase if needed, max 40 mg (single dose); may repeat in 2 hr if headache improves but returns, max 80 mg/24 hr

Available forms: Tabs 20, 40 mg

Administer:

- Swallow tabs whole; do not break, crush, or chew, use with 8 oz of water
- At beginning of headache; if headache returns, repeat dose after 2 hr of 1st dose if 1st dose is ineffective

SIDE EFFECTS

CNS: Dizziness, headache, anxiety, paresthesia, asthenia, somnolence, flushing, fatigue, hot/cold sensation, chills, vertigo, hypertonia, **seizures, serotonin**

syndrome

CV: Chest pain, palpitations, hypertension, **MI, sinus tachycardia, stroke, ventricular fibrillation/tachycardia, atrial fibrillation, AV block, bradycardia, chest pressure syndrome, coronary vasospasm**

GI: Nausea, dry mouth, vomiting

MS: *Weakness*, back pain

RESP: Chest tightness, pressure

PHARMACOKINETICS

Onset of pain relief 2 hr, metabolized in the liver, 70% excreted in urine and feces

INTERACTIONS

Increase: plasma concentration of eletriptan—CYP3A4 inhibitors (clarithromycin, erythromycin, itraconazole, ketoconazole, nelfinavir, ritonavir), propranolol, ergots

Increase: serotonin syndrome—SSRIs, SNRIs, serotonin-receptor agonists

NURSING CONSIDERATIONS

Assess:

- **Migraine:** pain location, character, intensity, nausea, vomiting, aura; quiet, calm environment with decreased stimulation from noise, bright light, excessive talking
- B/P; signs, symptoms of coronary vasospasms, geriatric patients may be at higher risk
- Tingling, hot sensation, burning, feeling of pressure, numbness, flushing
- Stress level, activity, recreation, coping mechanisms
- Neurologic status: LOC, blurring vision, nausea, vomiting, tingling in extremities preceding headache
- Ingestion of tyramine foods (pickled products, beer, wine, aged cheese), food additives, preservatives, colorings, artificial sweeteners, chocolate, caffeine, which may precipitate these types of headaches
- Patients with CAD risk factors; 1st dose should be administered in prescriber's office or medical facility

Evaluate:

- Therapeutic response: decrease in frequency, severity of migraine

Teach patient/family:

- To report any side effects to prescriber
 - To use contraception while taking product; to inform prescriber if pregnant or intending to become pregnant
 - To provide dark, quiet environment
 - That product does not prevent or reduce number of migraine attacks
-

emedastine ophthalmic

See [Appendix B](#)

emtricitabine (Rx)

(em-tri-sit'uh-bean)

[Emtriva](#)

Func. class.: Antiretroviral

Chem. class.: Nucleoside reverse transcriptase inhibitor (NRTI)

ACTION:

A synthetic nucleoside analog of cytosine; inhibits replication of HIV virus by competing with the natural substrate and then becoming incorporated into cellular DNA by viral reverse transcriptase, thereby terminating cellular DNA chain

USES:

HIV-1 infection with other antiretroviral

Unlabeled uses: HBV (hepatitis B virus) infection with HIV, HIV prophylaxis

CONTRAINDICATIONS:

Hypersensitivity

Black Box Warning:

Lactic acidosis

Precautions: Pregnancy (B), breastfeeding, children, geriatric patients, renal disease

Black Box Warning:

Hepatic insufficiency, chronic hepatitis B virus (HPV)

DOSAGE AND ROUTES

Calculator

Oral cap and solution are not interchangeable

- **Adult: PO** Caps 200 mg/day; oral sol 240 mg (24 ml)/day
- **Adolescent/child >33 kg: PO** Caps 200 mg/day; **child 3 mo-17 yr:** oral sol 6 mg/kg/day, max 240 mg (24 ml)

- **Infants <3 mo:** **PO oral sol** 3 mg/kg daily, do not use caps

Renal dose

- **Adult: PO Caps** CCr 30-49 ml/min, 200 mg q48hr; oral sol 120 mg q24hr; caps CCr 15-29 ml/min, 200 mg q72hr; oral sol 80 mg q24hr; caps CCr <15 ml/min, 200 mg q96hr; oral sol 60 mg q24hr

Available forms: Cap 200 mg; oral sol 10 mg/ml

Administer:

- Give without regard to meals
- **Oral cap and solution not interchangeable**
- Storage (caps) at 25° C (77° F); (oral sol) refrigerated, use within 3 mo

SIDE EFFECTS

CNS: *Headache*, abnormal dreams, *depression*, dizziness, *insomnia*, neuropathy, paresthesia, *asthenia*

GI: *Nausea*, *vomiting*, *diarrhea*, *anorexia*, *abdominal pain*, *dyspepsia*, **hepatomegaly with steatosis (may be fatal)**

INTEG: *Rash*, skin discolorization

MS: Arthralgia, myalgia

RESP: *Cough*

SYST: Change in body fat distribution, **lactic acidosis**

PHARMACOKINETICS

Rapidly, extensively absorbed; peak 1-2 hr; protein binding <4%; excreted unchanged in urine (86%), feces (14%); half-life 10 hr

INTERACTIONS

- **Do not use with efavirenz, tenofovir, lamivudine, treatment duplication**

Decrease: emtricitabine level—interferons

- Complex interactions—ribavirin, cautious use

NURSING CONSIDERATIONS

Assess:

- Renal/hepatic function tests: AST, ALT, bilirubin, amylase, lipase, triglycerides periodically during treatment

Black Box Warning:

Lactic acidosis, severe hepatomegaly with steatosis; if lab reports confirm these conditions, discontinue

treatment; may be fatal

Black Box Warning:

Hepatotoxicity: do not use in those with risk factors such as alcoholism, discontinue if hepatotoxicity occurs

Black Box Warning:

Hepatitis B and HIV coinfection (unlabeled); perform HBV screening in any patient who has HIV to ensure appropriate treatment; avoid single-drug treatments in HBV

Evaluate:

- Therapeutic response: decreased signs, symptoms of HIV; decreased viral load, increased CD4 counts

Teach patient/family:

- That GI complaints resolve after 3-4 wk of treatment
- **To report planned or suspected pregnancy; not to breastfeed while taking product**
- That product must be taken at same time of day to maintain blood level
- That product will control symptoms but is not a cure for HIV; patient still infectious, may pass HIV virus on to others; that other products may be necessary to prevent other infections
- That changes in body fat distribution may occur

Black Box Warning:

Lactic acidosis: to notify prescriber immediately if fatigue, muscle aches/pains, abdominal pain, difficulty breathing, nausea, vomiting, change in heart rhythm occur

Black Box Warning:

Hepatotoxicity: to notify prescriber of dark urine, yellowing of skin/eyes, clay-colored stools, anorexia, nausea, vomiting

☼ Canada only Side effects: *italics* = common; **bold** = life-threatening ⚠
Nurse Alert

enalapril/enalaprilat (Rx)

(e-nal'a-pril)/(e-nal'a-pril-at)

Vasotec

Func. class.: Antihypertensive

Chem. class.: Angiotensin-converting enzyme (ACE) inhibitor

Do not confuse: enalapril/ramipril/Anafranil/Eldepryl

ACTION:

Selectively suppresses renin-angiotensin-aldosterone system; inhibits ACE; prevents conversion of angiotensin I to angiotensin II, dilation of arterial, venous vessels

USES:

Hypertension, CHF, left ventricular dysfunction

Unlabeled uses: Diabetic nephropathy, hypertensive emergency/urgency, post-MI, proteinuria, renal crisis in scleroderma

CONTRAINDICATIONS:

Hypersensitivity, history of angioedema

Black Box Warning:

Pregnancy (D)

Precautions: Breastfeeding, renal disease, hyperkalemia, hepatic failure, dehydration, bilateral renal artery stenosis

DOSAGE AND ROUTES

Calculator

Hypertension

- **Adult: PO** 2.5-5 mg/day, may increase or decrease to desired response, range 10-40 mg/day; **IV** 0.625-1.25 mg q6hr over 5 min
- **Child: PO** 0.08 mg/kg/day in 1-2 divided doses, max 0.58 mg/kg/day
- **Child: IV** 5-10 mcg/kg/dose q8-24hr

CHF

- **Adult: PO** 2.5-20 mg/day in 2 divided doses, max 40 mg/day in divided doses

Renal disease

• **Adult: PO** 2.5 mg/day (CCr <30 ml/min), increase gradually; **IV** CCr >30 ml/min, 1.25 mg q6hr; CCr <30 ml/min, 0.625 mg as one-time dose, increase as per B/P

Hypertensive emergency/urgency (unlabeled)

• **Adult: IV** 1.25-5 mg q6hr

Available forms: *Enalapril*: tabs 2.5, 5, 10, 20 mg; *enalaprilat*: inj 1.25 mg/ml

Administer:

PO route

• Tab may be crushed, given without regard to meals

IV route

- Prepare in sterile environment using aseptic technique
- Dilute each dose with ≤50 ml compatible sol
- For 25 mcg/ml dilution often used for neonatal or pediatric patients, combine 1 ml enalaprilat 1.25 mg/ml and 49 ml compatible sol for IV

IV, Direct/Intermittent IV INF route

- Undiluted over ≥5 min, use diluent provided or 50 ml D₅W, 0.9% NaCl, 0.9% NaCl in D₅W or LR, Isolyte E; give through Y-tube of free-flowing inf of 0.9% NaCl, D₅W, LR, Isolyte E

Y-site compatibilities: Acyclovir, alemtuzumab, alfentanil, allopurinol, amifostine, amikacin, aminophylline, amphotericin B liposome, anidulafungin, ascorbic acid, atracurium, atropine, azaTHIOprine, aztreonam, benztropine, bivalirudin, bretylium, bumetanide, buprenorphine, butorphanol, calcium chloride/gluconate, CARBOplatin, ceFAZolin, cefonicid, cefoperazone, cefotaxime, cefoTEtan, cefOXitin, cefTAZidime, ceftizoxime, cefTRIAxone, cefuroxime, cephalothin, cephapirin, chloramphenicol, cimetidine, cisatracurium, cladribine, clindamycin, cyanocobalamin, cyclophosphamide, cycloSPORINE, cytarabine, DACTINomycin, DAPTOmycin, dexamethasone, dexmedetomidine, dextran 40, digoxin, diltiazem, diphenhydrAMINE, DOBUtamine, DOCEtaxel, DOPamine, doripenem, doxacurium, DOXOrubicin, DOXOrubicin liposome, doxycycline, ePHEDrine, EPINEPHrine, epirubicin, epoetin, ertapenem, erythromycin, esmolol, etoposide, etoposide phosphate, famotidine, fenoldopam, fentaNYL, filgrastim, fluconazole, fludarabine, fluorouracil, folic acid, furosemide, ganciclovir, gemcitabine, gentamicin, granisetron, heparin, hydrocortisone, HYDROmorphone, ifosfamide, imipenem-

cilastatin, indomethacin, insulin, isoproterenol, ketorolac, labetalol, levofloxacin, lidocaine, linezolid, LORazepam, magnesium sulfate, mannitol, mechlorethamine, melphalan, meperidine, meropenem, metaraminol, methicillin, methotrexate, methoxamine, methyl dopate, methylPREDNISolone, metoclopramide, metoprolol, metroNIDAZOLE, mezlocillin, miconazole, midazolam, milrinone, minocycline, mitoXANtrone, morphine, moxalactam, multiple vitamin injection, nafcillin, nalbuphine, naloxone, netilmicin, niCARdipine, nitroglycerin, nitroprusside, norepinephrine, octreotide, ondansetron, oxacillin, oxaliplatin, oxytocin, PACLitaxel, palonosetron, papaverine, PEMEtrexed, penicillin G potassium, pentamidine, pentazocine, PENTobarbital, PHENobarbital, phentolamine, phenylephrine, phytonadione, piperacillin-tazobactam, potassium chloride/phosphate, procainamide, prochlorperazine, promethazine, propofol, propranolol, protamine, pyridoxime, quinupristin-dalfopristin, ranitidine, remifentanyl, ritodrine, riTUXimab, rocuronium, sodium acetate, sodium bicarbonate, succinylcholine, SUFentanyl, tacrolimus, teniposide, tetracycline, theophylline, thiamine, thiotepa, ticarcillin/clavulanate, tigecycline, tirofiban, tobramycin, tolazoline, trastuzumab, trimetaphan, urokinase, vancomycin, vasopressin, vecuronium, verapamil, vinCRISTine, vinorelbine, voriconazole, zoledronic acid

Additive compatibilities: DOBUTamine, DOPamine, heparin, meropenem, nitroglycerin, nitroprusside, potassium chloride

SIDE EFFECTS

CNS: *Insomnia, dizziness, paresthesias, headache, fatigue, anxiety*

CV: *Hypotension, chest pain, tachycardia, dysrhythmias, syncope, angina, MI, orthostatic hypotension*

EENT: *Tinnitus; visual changes; sore throat; double vision; dry, burning eyes*

GI: *Nausea, vomiting, colitis, cramps, diarrhea, constipation, flatulence, dry mouth, loss of taste*

GU: *Proteinuria, renal failure, increased frequency of polyuria or oliguria*

HEMA: *Agranulocytosis, neutropenia*

INTEG: *Rash, purpura, alopecia, hyperhidrosis, photosensitivity*

META: *Hyperkalemia*

RESP: *Dyspnea, dry cough, crackles*

SYST: Toxic epidermal necrolysis, Stevens-Johnson syndrome, angioedema

PHARMACOKINETICS

Enalapril: PO: Onset 1 hr, peak 4-6 hr, duration ≥ 24 hr

Enalaprilat: IV: Onset 5-15 min, peak up to 4 hr, duration 4-6 hr, half-life 11 hr

Metabolized by liver to active metabolite, excreted in urine

INTERACTIONS

Increase: hypersensitivity—allopurinol

Increase: hypotension—diuretics, other antihypertensives, phenothiazines, nitrates, acute alcohol ingestion, general anesthesia

Increase: potassium levels—salt substitutes, potassium-sparing diuretics, potassium supplements, cycloSPORINE, indomethacin

Increase: levels of lithium, digoxin

Decrease: effects of enalapril—antacids, rifampin

Drug/Lab Test

Increase: ALT, AST, bilirubin, alk phos, glucose, uric acid

False positive: ANA titer

NURSING CONSIDERATIONS

Assess:

- **Bone marrow depression (rare):** neutrophils, decreased platelets; WBC with differential baseline, q3mo; if neutrophils $<1000/\text{mm}^3$, discontinue treatment (recommended with collagen-vascular disease)
- **Hypertension:** B/P, peak/trough level, orthostatic hypotension, syncope when used with diuretic, pulse q4hr; note rate, rhythm, quality
- Baselines of renal, hepatic studies before therapy begins and 1 wk into therapy; electrolytes: potassium, sodium, chloride during 1st 2 wk of therapy
- Skin turgor, dryness of mucous membranes for hydration status; edema in feet, legs daily
- **Symptoms of CHF:** edema, dyspnea, wet crackles, weight gain, jugular venous distension, difficulty breathing

Evaluate:

- Therapeutic response: decreased B/P

Teach patient/family:

- Not to use OTC (cough, cold, or allergy) products unless directed by prescriber; to avoid potassium, salt substitutes
- To avoid sunlight or wear sunscreen for photosensitivity
- To comply with dosage schedule even if feeling better
- To notify prescriber of mouth sores, sore throat, fever, swelling of hands or feet, irregular heartbeat, chest pain, signs of angioedema
- That excessive perspiration, dehydration, vomiting, diarrhea may lead to fall in blood pressure; to consult prescriber if these occur
- That product may cause dizziness, fainting; that lightheadedness may occur during 1st few days of therapy
- That product may cause skin rash, impaired perspiration or angioedema; to discontinue if angioedema occurs
- Not to discontinue product abruptly
- That CV adverse reactions may reoccur
- To rise slowly to sitting or standing position to minimize orthostatic hypotension

Black Box Warning:

To notify prescriber if pregnancy is planned or suspected; to use contraception during treatment; pregnancy (D)

TREATMENT OF OVERDOSE:

Lavage, IV atropine for bradycardia, IV theophylline for bronchospasm, digoxin, O₂, diuretic for cardiac failure

☼ Canada only Side effects: *italics* = common; **bold** = life-threatening ⚠
Nurse Alert

enfuvirtide (Rx)

(en-fyoo'virtide)

Fuzeon

Func. class.: Antiretroviral

Chem. class.: Fusion Inhibitor

ACTION:

Inhibitor of the fusion of HIV-1 with CD4+ cells

USES:

Treatment of HIV-1 infection in combination with other antiretrovirals

Unlabeled uses: HIV prophylaxis after occupational exposure

CONTRAINDICATIONS:

Breastfeeding, hypersensitivity

Precautions: Pregnancy (B), children <6 yr, liver disease, myelosuppression, infections

DOSAGE AND ROUTES

Calculator

- **Adult:** SUBCUT 90 mg (1 ml) bid
- **Child 6-16 yr and <42.6 kg:** SUBCUT 2 mg/kg bid, max 90 mg bid; 11-15.5 kg 27 mg/0.3 ml bid; 15.6-20 kg 36 mg/0.4 ml bid; 20.1-24.5 kg 45 mg/0.5 ml bid; 24.6-29 kg 54 mg/0.6 ml bid; 29.1-33.5 kg 63 mg/0.7 ml bid; 33.6-38 kg 72 mg/0.8 ml bid; 38.1-42.5 kg 81 mg/0.9 ml bid

HIV prophylaxis (unlabeled)

- **Adult:** SUBCUT 90 mg bid added to PEP regimen

Available forms: Powder for inj, lyophilized 108 mg (90 mg/ml when reconstituted)

Administer:

SUBCUT route

- **Reconstitute** vial with 1.1 ml sterile water for inj; tap and roll to mix; allow to stand until completely dissolved, may take up to 45 min; after dissolved, immediately **inject** or refrigerate up to 24 hr

- **Do not mix with other medications**

- SUBCUT: give bid, rotate sites; preferred sites: upper arm, anterior thigh, abdomen

SIDE EFFECTS

CNS: Anxiety, peripheral neuropathy, taste disturbance, **Guillain-Barré syndrome**, insomnia, depression

GI: Abdominal pain, anorexia, constipation, **pancreatitis**

GU: **Glomerulonephritis**, renal failure

HEMA: **Thrombocytopenia**, neutropenia

INTEG: *Inj site reactions*

MISC: Influenza, cough, conjunctivitis, lymphadenopathy, myalgia, hyperglycemia, **pneumonia**, rhinitis, fatigue, hypersensitivity

PHARMACOKINETICS

Peak 8 hr, terminal half-life 3.8 hr, well absorbed, undergoes catabolism, 92% protein binding

NURSING CONSIDERATIONS

Assess:

- **Signs of infection, inj site reactions**
- **Glomerulonephritis/renal failure:** BUN, creatinine, renal failure may occur
- Bowel pattern before, during treatment; if severe abdominal pain or constipation occurs, notify prescriber; monitor hydration
- Skin eruptions, rash, urticaria, itching
- Allergies before treatment, reaction to each medication
- **Immune reconstitution syndrome:** with combination therapy
- **HIV:** CBC, blood chemistry, plasma HIV RNA, absolute CD4+/CD8+ cell counts/%, serum β_2 microglobulin, serum ICD+24 antigen levels, cholesterol

Evaluate:

- Therapeutic response: increased CD4 cell counts; decreased viral load; slowing progression of HIV-1 infection

Teach patient/family:

- To notify prescriber if pregnancy is suspected or if breastfeeding
- That pneumonia may occur; to contact prescriber if cough, fever occur
- That hypersensitive reactions may occur; rash, pruritus; to stop product, contact prescriber

- That product is not a cure for HIV-1 infection but controls symptoms; HIV-1 can still be transmitted to others; that product is to be used in combination only with other antiretrovirals

🍁 Canada only Side effects: *italics* = common; **bold** = life-threatening ⚠️
Nurse Alert

HIGH ALERT

enoxaparin (Rx)

(ee-nox'a-par-in)

Lovenox

Func. class.: Anticoagulant, antithrombotic

Chem. class.: Low-molecular-weight heparin (LMWH)

Do not confuse: **enoxaparin**/enoxacin

Lovenox/Lotronex

ACTION:

Binds to antithrombin III inactivating factors Xa/IIa, thereby resulting in a higher ratio of anti-factor Xa to IIa

USES:

Prevention of DVT (inpatient or outpatient), PE (inpatient) in hip and knee replacement, abdominal surgery at risk for thrombosis; unstable angina/non-Q-wave MI

Unlabeled uses: Antiphospholipid antibody syndrome, arterial thromboembolism prophylaxis, cerebral thromboembolism, percutaneous coronary intervention

CONTRAINDICATIONS:

Hypersensitivity to this product, benzyl alcohol, heparin, pork; active major bleeding, hemophilia, leukemia with bleeding, peptic ulcer disease, thrombocytopenic purpura, heparin-induced thrombocytopenia

Precautions: Pregnancy (B), breastfeeding, children, geriatric patients, low weight men (<57 kg), women (<45 kg), severe renal/hepatic disease, blood dyscrasias, severe hypertension, subacute bacterial endocarditis, acute nephritis, recent burn, spinal surgery, indwelling catheters

Black Box Warning:

Lumbar puncture, epidural anesthesia, spinal anesthesia

DOSAGE AND ROUTES

Calculator

DVT prevention before hip or knee surgery

- **Adult: SUBCUT** 30 mg bid given 12-24 hr postop for 7-10 days until DVT risk is diminished

DVT prevention before hip replacement

- **Adult: SUBCUT** 40 mg/day started 9-15 hr preop or 30 mg q12hr started 12-24 hr postop, continued until DVT risk diminished or patient adequately on anticoagulant

DVT prophylaxis before abdominal surgery

- **Adult: SUBCUT** 40 mg/day starting 24 hr prior to surgery × 7-10 days to prevent thromboembolic complications

Treatment of DVT or PE

- **Adult: SUBCUT** 1 mg/kg q12hr (without PE, outpatient); 1 mg/kg q12hr or 1.5 mg/kg/day (with or without PE, inpatient); warfarin should be started within 72 hr, continued ≥5 days until INR is 2-3 (usually 7 days)

Prevention of ischemic complications in unstable angina or non-Q-wave MI

- **Adult: SUBCUT/IV** 1 mg/kg q12hr until stable with aspirin 100-325 mg/day × ≥2 days

Renal dose

- **Adult: SUBCUT** <30 ml/min 30 mg/day (thrombosis prophylaxis)

Available forms: Prefilled syringes/inj 30 mg/0.3 ml, 40 mg/0.4 ml, 60 mg/0.6 ml, 80 mg/0.8 ml, 100 mg/1 ml, 120 mg/0.8 ml, 150 mg/ml; multidose vials 100 mg/ml (3 ml)

Administer:

- Only after screening patient for bleeding disorders
- Do not mix with other products or inf fluids
- ⚠️ Only this product when ordered; not interchangeable with heparin or other LMWHs

- At same time each day to maintain steady blood levels
- Avoid all IM inj that may cause bleeding
- Prepare in a sterile environment using aseptic technique
- Dilution may be stored for up to 4 wk in glass vial at room temp, up to 2 wk in TB syringes with rubber stoppers at room temp or refrigerated

SUBCUT route

- Do not give IM; begin 1 hr prior to surgery; do not aspirate; rotate sites; do not expel bubble from syringe before administration

- To recumbent patient, give SUBCUT; rotate inj sites (left/right anterolateral, left/right posterolateral abdominal wall)
- Insert whole length of needle into skin fold held with thumb and forefinger
- If withdrawing from multidose vial, use TB syringe for proper measurement
- Prefilled syringes (30, 40 mg) not graduated; do not use for partial doses
- Do not administer if particulate is present

Direct IV route

- Use multidose vial for IV administration; use TB syringe, other graduated syringe to measure dose; give IV BOL through IV line, flush after

SIDE EFFECTS

CNS: Fever, confusion

GI: Nausea

HEMA: Hemorrhage, hypochromic anemia, thrombocytopenia, bleeding

INTEG: Ecchymosis, inj site hematoma

META: Hyperkalemia in renal failure

SYST: Edema, peripheral edema

PHARMACOKINETICS

SUBCUT: 90% absorbed, maximum antithrombin activity (3-5 hr), elimination half-life 4½ hr, excreted in urine

INTERACTIONS

Increase: enoxaparin action—anticoagulants, salicylates, NSAIDs, antiplatelets, thrombolytics

Drug/Lab Test

Increase: AST, ALT

Decrease: platelet count

NURSING CONSIDERATIONS

Assess:

- Blood studies (Hct/Hgb, CBC, coagulation studies, platelets, occult blood in stools), anti-factor Xa (should be checked 4 hr after inj); thrombocytopenia may occur
- Renal studies: BUN/creatinine baseline and periodically

- **Bleeding:** gums, petechiae, ecchymosis, black tarry stools, hematuria; notify prescriber

Black Box Warning:

Neurologic symptoms in patients who have received spinal anesthesia

Perform/provide:

- Storage at 77° F (25° C); do not freeze

Evaluate:

- Therapeutic response: prevention of DVT

Teach patient/family:

- To use soft-bristle toothbrush to avoid bleeding gums; to use electric razor
- To report any signs of bleeding: gums, under skin, urine, stools
- To avoid OTC products containing aspirin unless approved by prescriber

TREATMENT OF OVERDOSE:

Protamine SO₄ 1% sol; dose should equal dose of enoxaparin

☼ Canada only Side effects: *italics* = common; **bold** = life-threatening ⚠
Nurse Alert

entacapone (Rx)

(en'ta-kah-pone)

Comtan

Func. class.: Antiparkinson agent

Chem. class.: COMT inhibitor

ACTION:

Inhibits COMT (catechol O-methyltransferase) and alters the plasma pharmacokinetics of levodopa; given with levodopa/carbidopa

USES:

Parkinson's disease for those experiencing end of dose; decreased effect as adjunct to levodopa/carbidopa

CONTRAINDICATIONS:

Hypersensitivity

Precautions: Pregnancy (C), breastfeeding, children, renal/hepatic disease, affective disorders, psychosis

DOSAGE AND ROUTES

Calculator

• **Adult: PO** 200 mg given with carbidopa/levodopa, max 1600 mg/day; may allow for 25% dosage reduction in levodopa therapy

Available forms: Tabs, film coated 200 mg

Administer:

- Only after MAOIs have been discontinued for 2 wk
- Give with dose of levodopa/carbidopa; product has no effect on its own

SIDE EFFECTS

CNS: *Involuntary choreiform movements, hand tremors, fatigue, headache, anxiety, twitching, numbness, dyskinesia, hypokinesia, hyperkinesia, weakness, confusion, agitation, nightmares, psychosis, hallucination, hypomania, severe depression, dizziness, neuroleptic malignant syndrome*

CV: *Orthostatic hypotension*

GI: *Nausea, vomiting, anorexia, abdominal distress, dry mouth, flatulence, bitter*

taste, diarrhea, constipation, dyspepsia, gastritis, GI disorder

INTEG: Rash, sweating, alopecia

MISC: Dark urine and other body fluids, back pain, dyspnea, purpura, fatigue, asthenia, bacterial infection, **rhabdomyolysis**

PHARMACOKINETICS

Duration up to 8 hr; excreted in urine, feces; well absorbed; protein binding 98%; metabolized in liver extensively; enters breast milk; half-life of levodopa extended, half-life 0.5 hr initial, 2.5 hr second

INTERACTIONS

• **Prevents catecholamine metabolism—nonselective MAOIs; do not use together**

Increase: B/P, tachycardia, dysrhythmias, avoid use—bitolterol, DOPamine, DOBUTamine, EPINEPHrine, methyldopa, isoetharine, norepinephrine

Decrease: excretion of entacapone—ampicillin, chloramphenicol, probenecid, erythromycin, rifampin

Drug/Herb

Increase: B/P—ma huang

Decrease: effect—kava

NURSING CONSIDERATIONS

Assess:

⚠ **Neuroleptic malignant syndrome:** high temp, increased CPK, rigidity, change in LOC usually during rapid withdrawal

- **Involuntary movements of Parkinson's disease:** akinesia, tremors, staggering gait, muscle rigidity, drooling when given with levodopa/carbidopa
- B/P, respirations during initial treatment
- Mental status: affect, mood, behavioral changes, depression; complete suicide assessment

• **Rhabdomyolysis:** muscle pain, tenderness, weakness; swelling of affected muscles; may lead to decreased B/P, shock

Perform/provide:

- Assistance with ambulation during beginning therapy

Evaluate:

- Therapeutic response: decrease in akathisia, increased mood when given with levodopa/carbidopa

Teach patient/family:

- That hallucinations, mental changes, nausea, dyskinesia can occur; may mean patient is overmedicated
 - To change positions slowly to prevent orthostatic hypotension; not to drive, operate machinery until stabilized on medication and mental performance not affected
 - To use product exactly as prescribed; if dose is missed, to take as soon as remembered up to 2 hr before next dose; not to discontinue abruptly; to withdraw gradually
 - That urine, sweat may darken
 - To notify prescriber if pregnancy is suspected; if lactating, that product excreted in breast milk
-

🍁 Canada only Side effects: *italics* = common; **bold** = life-threatening ⚠️
Nurse Alert

entecavir (Rx)

(en-te'ka-veer)

Baraclude

Func. class.: Antiretroviral nucleoside reverse transcriptase inhibitor (NRTIs)

Chem. class.: Guanosine nucleoside analog

ACTION:

Inhibits hepatitis B virus DNA polymerase by competing with natural substrates and by causing DNA termination after its incorporation into viral DNA; causes viral DNA death

USES:

Chronic hepatitis B (HBV)

CONTRAINDICATIONS:

Hypersensitivity

Precautions: Pregnancy (C), breastfeeding, children, geriatric patients, severe renal disease

Black Box Warning:

Hepatic disease, hepatitis, HIV, lactic acidosis

DOSAGE AND ROUTES

Calculator

Chronic hepatitis B (nucleoside treatment naive)

- **Adult and adolescent ≥ 16 yr:** PO 0.5 mg/day

Chronic hepatitis B with compensated liver disease and history of hepatitis B viremia while receiving lamivudine or known lamivudine/telbivudine-resistant mutations

- **Adult and adolescent ≥ 16 yr:** PO 1 mg/day

Renal dose

- **Adult:** PO CCr ≥ 50 ml/min, 0.5 mg/day; CCr 30-49 ml/min, 0.25 mg/day, 0.5 mg/day or 1 mg q48hr for lamiVUDine-refractory patient; CCr 10-29 ml/min, 0.15/day, 0.3 mg or 1 mg q72hr for lamiVUDine-refractory patient; CCr < 10 ml/min, 0.05 mg/day, 0.1 mg/day or 1 mg q7days for lamiVUDine-refractory patient

Available forms: Tabs, film coated 0.5, 1 mg; oral sol 0.05 mg/ml

Administer:

- After hemodialysis
- By mouth on empty stomach 2 hr before or after food
- Store at room temperature
- **Oral liquid:** use calibrated oral dosing spoon provided; may be used interchangeably with tabs

SIDE EFFECTS

CNS: *Headache*, fatigue, dizziness, insomnia

ENDO: Hyperglycemia

GI: *Dyspepsia*, nausea, vomiting, diarrhea, elevated liver function enzymes

INTEG: Alopecia, rash

SYST: Lactic acidosis, severe hepatomegaly with steatosis

PHARMACOKINETICS

Peak 0.5-1.5 hr, steady state 6-10 days, 100% bioavailability, extensively distributed to tissues, protein binding 13%, terminal half-life 128-149 hr, excreted unchanged (62%-73%) via kidneys

INTERACTIONS

Drug/Food

Decrease: absorption—high-fat meal

Drug/Lab Test

Increase: ALT, AST, total bilirubin, amylase, lipase, creatinine, blood glucose, urine glucose

Decrease: platelets, albumin

NURSING CONSIDERATIONS

Assess:

- **For nephrotoxicity:** increasing CCr, BUN

Black Box Warning:

For HIV before beginning treatment because HIV resistance may occur in chronic hepatitis B patients; monitor HIV RNA

Black Box Warning:

For lactic acidosis, severe hepatomegaly with steatosis; increased serum lactate, increased hepatic

enzymes, palpate line; discontinue if present

- Geriatric patients more carefully; may develop renal, cardiac symptoms more rapidly

Black Box Warning:

For exacerbations of hepatitis (jaundice, pruritus, fatigue) after discontinuing treatment, monitor LFTs

Evaluate:

- Therapeutic response: decreased symptoms of chronic hepatitis B, improving LFTs

Teach patient/family:

- Not to take with food
- To take exactly as prescribed
- Not to stop medication without approval of prescriber
- That optimal duration of treatment is unknown
- To avoid use with other medications unless approved by prescriber
- To notify prescriber of decreased urinary output, blood in urine

Black Box Warning:

Symptoms of lactic acidosis: muscle pain, severe tiredness, weakness, trouble breathing, stomach pain with nausea/vomiting, coldness in arms/legs, fast/irregular heartbeat, dizziness

Black Box Warning:

Symptoms of hepatotoxicity: eyes/skin turning yellow, dark urine, light bowel movements, no appetite for days, nausea, stomach pain

- That product does not cure but lowers amount of HBV in body
- That product does not stop spread of HBV to others by sex, sharing needles, or being exposed to blood
- **Not to breastfeed**

🍁 Canada only Side effects: *italics* = common; **bold** = life-threatening ⚠️
Nurse Alert

ePHEDrine nasal agent

See [Appendix B](#)

epinastine (ophthalmic)

(ep-ih-nas'teen)

[Elestat](#)

Func. class.: Antihistamine (ophthalmic)

Chem. class.: Histamine 1 receptor antagonist/mast cell stabilizer

ACTION:

A topically active, direct H₁- receptor antagonist and mast cell stabilizer; by reducing these inflammatory mediators, it relieves the ocular pruritus associated with allergic conjunctivitis

USES:

Prevention of ocular pruritus associated with signs and symptoms of allergic conjunctivitis

CONTRAINDICATIONS:

Hypersensitivity

Precautions: Pregnancy (C), breastfeeding, children, contact lenses

DOSAGE AND ROUTES

Calculator

• **Adult/child ≥3 yr: OPHTH** Instill 1 drop in each eye bid

Available forms: Ophthalmic sol 0.5%

Ophthalmic route

- For topical ophthalmic use only
- Wash hands before and after use. Tilt the head back slightly and pull the lower eyelid down with the index finger. Squeeze the prescribed number of drops into the conjunctival sac and gently close eyes for 1–2 min; do not blink
- Do not touch the tip of the dropper to the eye, fingertips, or other surface
- The preservative benzalkonium chloride may be absorbed by soft contact lenses. Wait ≥10 min after instilling the ophthalmic solution before inserting

contact lenses; contact lenses should not be worn if eye is red

- Do not share ophthalmic drops with others
- Keep bottle tightly closed when not in use
- Treatment should be continued throughout the period of exposure (i.e., until the pollen season is over or until exposure to the offending allergen is terminated), even when symptoms are absent

SIDE EFFECTS

EENT: Ocular irritation, folliculosis, hyperemia, ocular pruritus

MISC: Infection (including cold symptoms and upper respiratory infections), headache, rhinitis, sinusitis, increased cough, pharyngitis

PHARMACOKINETICS

Onset 3-5 min, peak 2 hr, duration 8 hr

NURSING CONSIDERATIONS

Assess:

- Eyes: for itching, redness, use of soft or hard contact lenses

Evaluate:

- Therapeutic response: absence of redness, itching in the eyes

Teach patient/family:

Ophthalmic route

- Product is for topical ophthalmic use only
 - Wash hands before and after use. Tilt the head back slightly and pull the lower eyelid down with the index finger. Squeeze the prescribed number of drops into the conjunctival sac and gently close eyes for 1–2 min; do not blink
 - Do not touch the tip of the dropper to the eye, fingertips, or other surface
 - Wait ≥ 10 min after instilling the ophthalmic solution before inserting contact lenses; contact lenses should not be worn if eye is red
 - Keep bottle tightly closed when not in use
 - Do not share ophthalmic drops with others
 - Remove contact lenses before use because the preservative benzalkonium chloride may be absorbed by soft contact lenses; product should not be used to treat contact lens–related irritation
-

Nurse Alert

HIGH ALERT

EPINEPHrine (Rx)

(ep-i-nef'rin)

Adrenaclick, Primatene Mist, Twinject, Walgreens Bronchial Mist

EPINEPHrine HCL

Adrenalin, EpiPen, EpiPen Jr.

Func. class.: Bronchodilator nonselective adrenergic agonist, vasopressor

Chem. class.: Catecholamine

Do not confuse: **EPINEPHrine**/ePHEDrine

ACTION:

β_1 - and β_2 -agonist causing increased levels of cAMP, thereby producing bronchodilation, cardiac, and CNS stimulation; high doses cause vasoconstriction via α -receptors; low doses can cause vasodilation via β_2 -vascular receptors

USES:

Acute asthmatic attacks, hemostasis, bronchospasm, anaphylaxis, allergic reactions, cardiac arrest, adjunct in anesthesia, shock

Unlabeled uses: Bradycardia, chloroquine overdose

CONTRAINDICATIONS:

Hypersensitivity to sympathomimetics, sulfites, closed-angle glaucoma, nonanaphylactic shock during general anesthesia

Precautions: Pregnancy (C), breastfeeding, cardiac disorders, hyperthyroidism, diabetes mellitus, prostatic hypertrophy, hypertension, organic brain syndrome, local anesthesia of certain areas, labor, cardiac dilation, coronary insufficiency, cerebral arteriosclerosis, organic heart disease

DOSAGE AND ROUTES

Calculator

Anaphylaxis/severe asthma exacerbation

- **Adult:** IM/SUBCUT 0.3-0.5 mg, may repeat q10-15min (anaphylaxis) or

q20min-4 hr (asthma)

Severe allergic reactions type I

- **Adult/child ≥ 30 kg:** IM 0.3 mg (EpiPen/EpiPen 2-Pak, 1:1000)
- **Child < 30 kg:** IM 0.15 mg (EpiPen Jr/EpiPen Jr 2-Pak 1:2000)
- **Adult/child ≥ 66 lb:** IM/SUBCUT 0.3 mg (0.3 ml) initially (Twinject 1.1 ml 1:1000, 1 mg/ml, containing 2 doses of 0.3 mg)
- **Adult/child 33-66 lb:** IM/SUBCUT 0.15 mg (0.15 ml) initially, may give another 0.15 mg after 10 min (Twinject 1.1 ml 1:1000 [1 mg/ml] containing 2 doses of 0.15 mg)

Status asthmaticus

- **Adult/adolescent:** SUBCUT 0.3-0.5 mg (0.3-0.5 ml of the 1:1000 injection) q20min $\times$ 3 doses
- **Infant/child:** SUBCUT 0.01 mg/kg-0.5 mg q20min $\times$ 3 doses

Available forms: Nasal spray (sol) 1 mg/ml; sol for inj 1 mg/ml, 1:10,000, 1:1000; inh vapor (sol) 0.22 mg/actuation; pressurized inh (sol) 0.22 mg/actuation; sol for inj 0.15 mg/0.15 ml autoinjector, 0.3 mg/0.3 ml autoinjector, 0.15 mg/0.3 ml

Administer:

- Increased dose of insulin for diabetic patients if glucose is elevated
- Check for correct concentration, route, dosage before administering
- Give subcut, IM, intraosseously, IV; suspensions are for subcut use only; do not give IV
- Visually inspect parenteral products for particulate matter and discoloration before use; do not use sols that are pinkish to brownish or that contain a precipitate
- **Avoid extravasation during parenteral administration; if extravasation occurs, infiltrate the affected area with phentolamine diluted in NS**

Inhalation route

- Place in nebulizer (10 gtt of a 1% base sol)
- Dilute racepinephrine 2.25% sol

IM route

- EPINEPHrine injection should preferably be into the deltoid or anterior thigh (vastus lateralis). Do not administer into the gluteal muscle
- Twinject is light sensitive and should be stored in the carrying case provided. Do not refrigerate. Protect from freezing. Replace if solution is discolored or

contains a precipitate

SUBCUT route

- Inject, taking care not to inject intradermally. Massage injection site well after use to enhance absorption and to decrease local vasoconstriction. Injection can cause tissue irritation

Intraosseous INF route (unlabeled)

- During CPR, the same EPINEPHrine dosage may be given via the intraosseous route when IV access is not available

Intracardiac route

- Intracardiac route should be reserved for extreme emergencies. Intracardiac injection should only be performed by properly trained medical personnel

Endotracheal route

- Per the ACLS or PALS guidelines, the EPINEPHrine parenteral product is administered via endotracheal (ET) route. ET administration should only be used if access to IV or intraosseous routes is not possible
- **Adult:** Dilute dose in 5–10 ml of NS or sterile distilled water. Administer via ET tube. Endotracheal absorption of EPINEPHrine may be improved by diluting with water instead of NS
- **Child:** After dose administration, flush the ET tube with a minimum of 5 ml NS

Direct IV INJ route

- Inject EPINEPHrine directly into a vein over 5–10 min for adults or 1–3 min for children. May be given IV push in cardiac arrest
- In neonates, may administer via the umbilical vein
- **During adult cardiopulmonary resuscitation (CPR):** Resuscitation drugs may be given IV by bolus injection into a peripheral vein, followed by an injection of 20 ml IV fluid; elevate the extremity for 10–20 sec to facilitate drug delivery to the central circulation

Continuous IV INF route

- Dilute 1 mg EPINEPHrine in 250 or 500 ml of a compatible IV inf sol to provide a concentration of 4 or 2 mcg/ml, respectively; give into a large vein, if possible. More-concentrated sols (16–32 mcg/ml) may be used in fluid-restricted patients when administered through a central line

Y-site compatibilities: Alfentanil, amikacin, amiodarone, amphotericin B

liposome, anidulafungin, ascorbic acid, atracurium, atropine, aztreonam, benztropine, bivalirudin, bleomycin, bumetanide, buprenorphine, butorphanol, calcium chloride/gluconate, CARBOplatin, caspofungin, ceFAZolin, cefoperazone, cefotaxime, cefoTEtan, cefOXitin, cefTAZidime, ceftizoxime, cefTRIAxone, cefuroxime, chloramphenicol, chlorproMAZINE, cimetidine, cisatracurium, CISplatin, clindamycin, cyanocobalamin, cyclophosphamide, cycloSPORINE, cytarabine, DACTINomycin, DAPTOmycin, dexamethasone, dexmedetomidine, digoxin, diltiazem, diphenhydrAMINE, DOBUTamine, DOCEtaxel, DOPamine, DOXOrubicin, doxycycline, enalaprilat, epirubicin, epoetin alfa, ertapenem, erythromycin, esmolol, etoposide, etoposide phosphate, famotidine, fenoldopam, fentaNYL, fluconazole, fludarabine, folic acid, furosemide, gemcitabine, gentamicin, glycopyrrolate, granisetron, heparin, hydrocortisone, HYDROmorphone, ifosfamide, imipenem-cilastatin, isoproterenol, ketorolac, labetalol, levofloxacin, lidocaine, linezolid, LORazepam, magnesium sulfate, mannitol, mechlorethamine, meperidine, metaraminol, methicillin, methotrexate, methoxamine, methyl dopa, methylPREDNISolone, metoclopramide, metoprolol, metroNIDAZOLE, midazolam, milrinone, minocycline, mitoXANtrone, morphine, multiple vitamins, nafcillin, nalbuphine, naloxone, niCARdipine, nitroglycerin, nitroprusside, norepinephrine, octreotide, ondansetron, oxacillin, oxaliplatin, oxytocin, PACLitaxel, palonosetron, pancuronium, pantoprazole, PEMEtrexed, penicillin G potassium, pentamidine, pentazocine, phentolamine, phenylephrine, phytonadione, piperacillin/tazobactam, potassium chloride, procainamide, prochlorperazine, promethazine, propofol, propranolol, protamine, pyridoxime, quinupristin/dalfopristin, ranitidine, remifentanyl, ritodrine, rocuronium, sodium acetate, streptomycin, succinylcholine, SUFentanyl, tacrolimus, teniposide, theophylline, thiamine, thiotepa, ticarcillin/clavulanate, tigecycline, tirofiban, tobramycin, tolazoline, trimethaphan, urokinase, vancomycin, vasopressin, vecuronium, verapamil, vinCRISTine, vinorelbine, vitamin B complex with C, voriconazole, warfarin, zoledronic acid

SIDE EFFECTS

CNS: Tremors, anxiety, insomnia, headache, dizziness, confusion, hallucinations, cerebral hemorrhage, weakness, drowsiness

CV: *Palpitations, tachycardia, hypertension, dysrhythmias, increased T wave*

GI: *Anorexia, nausea, vomiting*

MISC: *Sweating, dry eyes*

RESP: *Dyspnea*

PHARMACOKINETICS

Crosses placenta, metabolized in liver

IM: Onset variable, duration 1-4 hr

SUBCUT: Onset 5-15 min, duration 20 min-4 hr

INH: Onset 1-5 min, duration 1-3 hr

INTERACTIONS

- Do not use with MAOIs or tricyclics; hypertensive crisis may occur

- Toxicity: other sympathomimetics

Decrease: hypertensive effects— β -adrenergic blockers

Drug/Herb

- Increased stimulation: coffee, tea, guarana, yerba maté

NURSING CONSIDERATIONS

Assess:

- **Asthma:** auscultate lungs, pulse, B/P, respirations, sputum (color, character); monitor pulmonary function studies before and during treatment

- **ECG** during administration continuously; if B/P increases, decrease dose; B/P, pulse q5min after parenteral route; CVP, ISVR, PCWP during inf if possible; inadvertent high arterial B/P can result in angina, aortic rupture, cerebral hemorrhage

- Inj site: tissue sloughing; administer phentolamine with NS

- **Sulfite sensitivity;** may be life-threatening

- Cardiac status, I&O; blood glucose in diabetes

- **Allergic reactions, bronchospasms:** withhold dose, notify prescriber

Perform/provide:

- Storage of reconstituted sol refrigerated ≤ 24 hr

- Do not use discolored sol

Evaluate:

- Therapeutic response: increased B/P with stabilization or ease of breathing

Teach patient/family:

- About the reason for product administration; how to administer
- To rinse mouth after use to prevent dryness after inhalation
- Not to take OTC preparations

TREATMENT OF OVERDOSE:

Administer α -blocker and β -blocker

🍁 Canada only Side effects: *italics* = common; **bold** = life-threatening ⚠️

EPINEPHrine nasal agent

See [Appendix B](#)

HIGH ALERT

epirubicin (Rx)

(ep-ih-roo'bi-sin)

Ellence, Pharmorubicin 

Func. class.: Antineoplastic, antibiotic

Chem. class.: Anthracycline

Do not confuse: **DOXOrubicin** DAUNOrubicin, eribulin, IDArubicin
epirubicin/eribulin

ACTION:

Inhibits DNA synthesis primarily; replication is decreased by binding to DNA, which causes strand splitting; maximum cytotoxic effects at S and for G₂ phases; a vesicant

USES:

Adjuvant therapy for breast cancer with axillary node involvement after resection

Unlabeled uses: Used in combination for treatment of advanced forms of cancer: bladder, gastric, head and neck, hepatocellular, lung, ovarian, multiple myeloma, soft-tissue sarcoma

CONTRAINDICATIONS:

Pregnancy (D), breastfeeding, hypersensitivity to product, anthracyclines,

anthracenediones, baseline neutrophil count $<1500 \text{ cell/mm}^3$, severe myocardial insufficiency, recent MI

Black Box Warning:

Severe hepatic disease, IM/SUBCUT use

Precautions: Children, geriatric patients, cardiac/renal/hepatic disease, accidental exposure, angina, dental disease, herpes, hyperkalemia, hyperphosphatemia, hypertension, hyperuricemia, hypocalcemia, infection, infertility, tumor lysis syndrome, ventricular dysfunction, previous anthracycline use

Black Box Warning:

Bone marrow depression (severe), heart failure, extravasation, secondary malignancy, requires an experienced clinician

DOSAGE AND ROUTES

Calculator

Breast cancer with axillary node involvement following resection of the primary tumor in combination with cyclophosphamide and fluorouracil

- **Adult:** IV 100 mg/m^2 on day 1 with fluorouracil and cyclophosphamide (FEC regimen) every 21 days $\times$ 6 cycles or 60 mg/m^2 on days 1 and 8 with oral cyclophosphamide and fluorouracil every 28 days $\times$ 6 cycles.

Breast cancer in combination with cyclophosphamide

- **Adult:** IV 60 mg/m^2 day 1 with cyclophosphamide (500 mg/m^2 IV day 1), repeated every 21 days $\times$ 8 cycles or a higher-dose regimen of epirubicin 100 mg/m^2 IV day 1 with cyclophosphamide (830 mg/m^2 IV day 1), every 21 days $\times$ 8 cycles

Dosage adjustments based upon hematologic and nonhematologic toxicities

- **Nadir platelet counts $<50,000/\text{mm}^3$, absolute neutrophil counts (ANC) $<250/\text{mm}^3$, neutropenic fever, or grades 3/4 nonhematologic toxicities:** Day 1 dose in subsequent cycles should be reduced by 25% of the previous dose
- **For patients receiving divided-dose epirubicin (i.e., day 1 and 8):** Day 8 dose should be reduced by 25% of the day 1 dose if the platelet counts are $75,000\text{--}100,000/\text{mm}^3$ and the ANC is $1000\text{--}1499/\text{mm}^3$; if day 8 platelet counts are $<75,000/\text{mm}^3$, ANC $<1000/\text{mm}^3$, or Grade 3/4 nonhematologic toxicity has occurred, omit the day 8 dose

Hepatic dose

- **Adult: IV** Bilirubin 1.2-3 mg/dl or AST 2-4× normal upper limit, 50% of starting dose; bilirubin >3-5 mg/dl or AST >4 × normal upper limit, 25% of starting dose

Available forms: Inj (2 mg/ml) 10 mg/5 ml, 50 mg/25 ml, 150 mg/75 ml, 200 mg/100 ml

Administer:

- Antiemetic 30-60 min before product to prevent vomiting
- Allopurinol or sodium bicarbonate to maintain uric acid levels, alkalinization of urine, monitor electrolytes

Black Box Warning:

To be used by a clinician experienced in giving cytotoxic products

Black Box Warning:

Do not use IM/SUBCUT because of severe tissue necrosis

- Give IV, do not give IM, subcut; a vesicant; if extravasation occurs stop and complete via another vein, preferably in another limb; avoid infusion into veins over joints or in extremities with compromised venous or lymphatic drainage
- Rapid injection can cause facial flushing or erythema along the vein; avoid administration time of <3 min
- Product should be given to those with neutrophils $\geq 1500/\text{mm}^3$, platelet count $\geq 100,000/\text{mm}^3$, and nonhematologic toxicities recovered to $\leq$ grade 1
- When refrigerated, the preservative-free, ready-to-use solution can form a gelled product and will return to solution after 2–4 hr at room temperature
- Visually inspect for particulate matter and discoloration before use

IV route

- Use cytotoxic handling procedures; pregnant women must not handle product
- Reconstitute 50 mg and 200 mg powder for injection vials with 25 ml and 100 ml, respectively, of Sterile Water for Injection (2 mg/ml), shake vigorously for up to 4 min; reconstituted sols are stable for 24 hr when stored refrigerated and protected from light or at room temperature in normal light
- Solution can be further diluted with Sterile Water for Injection

IV INJ route

- Give doses of 100–120 mg/m² into tubing of a freely flowing 0.9% sodium chloride (NS) or D₅W IV inf over 15–20 min; the infusion time may be

decreased, proportionally, in those who require lower doses; infusion times <3 min are not recommended

- Direct injection into the vein is not recommended because of the risk of extravasation; avoid use with any solution of alkaline pH because hydrolysis will occur

IV INF route

- Dilute dose in 0.9% sodium chloride (NS) or D₅W, infuse over 30–60 min, avoid use with any solution of alkaline pH because hydrolysis will occur

Y-site compatibilities: Alemtuzumab, alfentanil, amifostine, amikacin, aminocaproic acid, anidulafungin, atracurium, aztreonam, bivalirudin, bleomycin, bumetanide, buprenorphine, butorphanol, calcium chloride/gluconate, CARBOplatin, caspofungin, ceFAZolin, cefotaxime, ceftizoxime, chlorproMAZINE, cimetidine, ciprofloxacin, cisatracurium, CISplatin, clindamycin, cyclophosphamide, cycloSPORINE, DAPTOmycin, dexrazoxane, digoxin, diltiazem, diphenhydrAMINE, DOBUTamine, DOCEtaxel, dolasetron, DOPamine, doxacurium, doxycycline, droperidol, enalaprilat, ePHEDrine, EPINEPHrine, ertapenem, erythromycin, etoposide, famotidine, fenoldopam, fentaNYL, fluconazole, gatifloxacin, gemcitabine, gentamicin, granisetron, haloperidol, hydrocortisone, HYDROmorphone, hydrOXYzine, ifosfamide, imipenem-cilastatin, inamrinone, insulin (regular), isoproterenol, labetalol, levofloxacin, levorphanol, lidocaine, linezolid, LORazepam, mannitol, meperidine, mesna, methotrexate, metoclopramide, metoprolol, metroNIDAZOLE, midazolam, milrinone, minocycline, mitoMYcin, mivacurium, morphine, nalbuphine, naloxone, nesiritide, niCARdipine, nitroglycerin, nitroprusside, norepinephrine, octreotide, ofloxacin, ondansetron, oxaliplatin, PACLitaxel, palonosetron, pamidronate, pancuronium, pentamidine, pentazocine, phenylephrine, potassium chloride, procainamide, prochlorperazine, promethazine, propranolol, quinupristin-dalfopristin, ranitidine, remifentanil, rocuronium, sodium acetate, succinylcholine, SUFentanil, tacrolimus, teniposide, theophylline, thiotepa, tigecycline, tirofiban, tobramycin, trimethobenzamide, vancomycin, vasopressin, vecuronium, verapamil, vinBLASStine, vinCRISStine, vinorelbine, voriconazole, zidovudine, zoledronic acid

SIDE EFFECTS

CV: Increased B/P, sinus tachycardia, PVCs, chest pain, bradycardia, extrasystoles, cardiomyopathy

GI: Nausea, vomiting, anorexia, mucositis, diarrhea

GU: Amenorrhea, hot flashes, hyperuricemia

HEMA: Thrombocytopenia, leukopenia, anemia, neutropenia, secondary AML

INTEG: Rash, necrosis, pain at inj site, reversible alopecia

MISC: Infection, febrile neutropenia, lethargy, fever, conjunctivitis, tumor lysis syndrome

PHARMACOKINETICS

Triphasic pattern of elimination; half-life 3 min, 2.5 hr, 33 hr; metabolized by liver; crosses placenta; excreted in urine, bile, breast milk

INTERACTIONS

- Give epirubicin before PACLitaxel if both are given

Increase: toxicity—other antineoplastics or radiation, cimetidine

Increase: ventricular dysfunction, CHF—trastuzumab

Increased: heart failure—calcium channel blockers

Decrease: antibody response—live virus vaccine

NURSING CONSIDERATIONS

Assess:

Black Box Warning:

Bone marrow depression (severe): CBC, differential, platelet count weekly; withhold product if baseline neutrophil $\leq 1500/\text{mm}^3$; leukocyte nadir occurs 10-14 days after administration, recovery by day 21; notify prescriber of results

- **Infection:** treat before receiving this product if regimens $>120 \text{ mg/m}^2$, prophylactic antibiotics should be given (trimethoprim-sulfamethoxazole or a quinolone)
- Blood, urine uric acid levels; swelling, joint pain primarily in extremities; patient should be well hydrated to prevent urate deposits
- Renal disease: BUN, serum uric acid, urine CCr, electrolytes before, during therapy; I&O ratio; report fall in urine output to $<30 \text{ ml/hr}$; dosage adjustment needed if serum creatinine $>5 \text{ mg/dl}$
- Increased fluid intake to 2-3 L/day to prevent urate, calculi formation

Black Box Warning:

Hepatic studies before, during therapy: bilirubin, AST, ALT, alk phos as needed or monthly

Black Box Warning:

Heart failure: B/P, pulse, character, rhythm, rate, ABGs, ECG, LVEF, MUGA scan, or ECHO; watch for ST-T wave changes, low QRS and T, possible dysrhythmias (sinus tachycardia, heart block, PVCs); identify cumulative amount of anthracycline received (lifetime)

- Bleeding: hematuria, guaiac, bruising, or petechiae, mucosa or orifices q8hr
- Effects of alopecia on body image; discuss feelings about body changes

Black Box Warning:

Extravasation (vesicant): local irritation, pain, burning, necrosis at inj site, discontinue and start at another site

- GI symptoms: frequency of stools, cramping

Evaluate:

- Therapeutic response: decreased tumor size, spread of malignancy

Teach patient/family:

- That hair may be lost during treatment; that wig or hairpiece may make patient feel better; that new hair may be different in color, texture; new hair growth occurs in ≤ 3 mo after treatment
- To avoid crowds, persons with infections when granulocyte count is low
- **That contraceptive measures recommended during therapy and for 4 mo thereafter for men and women; pregnancy (D)**
- To avoid vaccinations because reactions may occur; to avoid cimetidine during therapy
- That urine may appear red for 2 days
- To avoid OTC medications, supplements unless approved by prescriber

Black Box Warning:

That irreversible myocardial damage, leukopenia, menopause may occur

- **To report rapid heart beat, trouble breathing, fever, nausea, vomiting, oral sores**

☼ Canada only Side effects: *italics* = common; **bold** = life-threatening ⚠
Nurse Alert

eplerenone (Rx)

(ep-ler-ee'known)

Inspira

Func. class.: Antihypertensive

Chem. class.: Selective aldosterone receptor antagonist

ACTION:

Binds to mineralocorticoid receptor and blocks the binding of aldosterone, a component of the renin-angiotensin-aldosterone system (RAAS)

USES:

Hypertension, alone or in combination with thiazide diuretics, CHF, post-MI

CONTRAINDICATIONS:

Hypersensitivity; increased serum creatinine >2 mg/dl (male), >1.8 mg/dl (female); potassium >5.5 mEq/L, type 2 diabetes with microalbuminuria, hepatic disease, CCr <30 ml/min; CCr <50 ml/min in hypertension

Precautions: Pregnancy (B), breastfeeding, child, geriatric patients, impaired renal/hepatic function, hyperkalemia

DOSAGE AND ROUTES

Calculator

• **Adult: PO** 50 mg/day initially, may increase to 50 mg bid after 4 wk; start dose at 25 mg/day if patient is taking CYP3A4 inhibitors

CHF or Post-MI

• **Adult: PO** 25 mg/day initially, may increase to 50 mg/day max after 4 wk

Available forms: Tabs 25, 50 mg

Administer:

- Without regard to food
- Do not use salt substitutes containing potassium

SIDE EFFECTS

CNS: Headache, dizziness, fatigue

CV: Angina, **MI**

GI: Increased GGT diarrhea, abdominal pain, increased ALT

GU: Gynecomastia, mastodynia (males), abnormal vaginal bleeding

META: Hyperkalemia, hyponatremia, hypercholesteremia, hypertriglyceridemia, increased uric acid

RESP: Cough

PHARMACOKINETICS

Peak 1½ hr; serum protein binding 50%; half-life 4-6 hr; metabolized in liver by CYP3A4 inhibitor; excreted in urine, feces

INTERACTIONS

Increase: hyperkalemia—ACE inhibitors, angiotensin II antagonists, NSAIDs, potassium supplements, potassium-sparing diuretics

Increase: serum levels of lithium

Increase: levels of eplerenone—CYP3A4 inhibitors (ketoconazole, itraconazole, saquinavir, erythromycin, verapamil, fluconazole); reduce dose of eplerenone

Decrease: antihypertensive effect—NSAIDs

Drug/Herb

Decrease: antihypertensive effect—ephedra

Drug/Food

- Grapefruit, grapefruit juice increase product level by 25%
- Do not use salt substitutes containing potassium

Drug/Lab Test

Increase: BUN, creatinine, potassium, cholesterol, lipids, uric acid

Decrease: sodium

NURSING CONSIDERATIONS

Assess:

- **Hypertension:** B/P at peak/trough level of product, orthostatic hypotension, syncope when used with diuretic; monitor lithium level in those also taking lithium
- Renal studies: protein, BUN, creatinine; increased LFTs, uric acid may be increased
- Potassium levels, hyperkalemia may occur

Perform/provide:

- Storage in tight container at ≤86° F (30° C)

Evaluate:

- Therapeutic response: decreased B/P

Teach patient/family:

- Not to discontinue product abruptly
 - Not to use OTC products (cough, cold, allergy) unless directed by prescriber; not to use salt substitutes containing potassium without consulting prescriber
 - To comply with dosage schedule, even if feeling better
 - That product may cause dizziness, fainting, lightheadedness; may occur during first few days of therapy
 - How to take B/P; and about normal readings for age group
-

🍁 Canada only Side effects: *italics* = common; **bold** = life-threatening ⚠️
Nurse Alert

epoetin alfa (Rx)

(ee-poe'e-tin)

Epogen, Eprex , Procrit

Func. class.: Antianemic, biologic modifier, hormone

Chem. class.: Amino acid polypeptide

ACTION:

Erythropoietin is 1 factor controlling the rate of red cell production; product is developed by recombinant DNA technology

USES:

Anemia caused by reduced endogenous erythropoietin production, primarily end-stage renal disease; to correct hemostatic defect in uremia; anemia due to AZT treatment in patients with HIV or those receiving chemotherapy; reduction of allogenic blood transfusion in surgery patients

Unlabeled uses: Anemia in premature preterm infants, anemia due to ribavirin and interferon-alfa therapy in hepatitic C

CONTRAINDICATIONS:

Hypersensitivity to mammalian-cell–derived products, human albumin; uncontrolled hypertension

Precautions: Pregnancy (C), breastfeeding, children <1 mo, seizure disorder; multidose preserved formulation contains benzyl alcohol and should not be used in premature infants; porphyria, CV disease, hemodialysis, latex allergy, hypertension, history of CABG

Black Box Warning:

Hgb >12 g/dl, surgery, neoplastic disease

DOSAGE AND ROUTES

Calculator

Anemia (chronic kidney disease including dialysis-dependent and dialysis-independent patients to decrease the need for red blood cell transfusion)

- **Adult/adolescent ≥17 yr:** SUBCUT/IV Initially, 50–100 units/kg 3×/wk; for patients on dialysis, administer IV. For patients on dialysis, initiate treatment when hemoglobin (Hgb) is <10 g/dl. If Hgb approaches or exceeds 11 g/dl,

reduce or interrupt the dose. For patients not on dialysis, consider initiating treatment only when Hgb is <10 g/dl and the rate of Hgb decline indicates the likelihood of requiring RBC transfusion and reducing the risk of alloimmunization and/or other RBC transfusion-related risks is a goal. If Hgb is >10 g/dl, reduce or interrupt the dose, and use the lowest dose sufficient to reduce the need for RBC transfusions. If the Hgb rises >1 g/dl in any 2-week period, reduce dose by 25% or more as needed to reduce rapid responses. In contrast, if Hgb has not increased >1 g/dl after 4 wk of therapy, increase the dose by 25%. For patients who do not respond adequately over a 12-wk escalation period, increasing the dose further is unlikely to improve response and can increase risks. Use the lowest dose that will maintain a Hgb concentration sufficient to reduce the need for RBC transfusions. Evaluate other causes of anemia, and discontinue if responsiveness does not improve

- **Infant/child/adolescent ≤16 yr:** SUBCUT/IV 50 units/kg 3×/wk initially. For dosage adjustments, see adult dosage.

Zidovudine-induced anemia in HIV-infected patients with circulating endogenous erythropoietin concentrations ≤500 munits/ml who are receiving a dose of zidovudine ≤4200 mg/week

- **Adult:** SUBCUT/IV Initially, 100 units/kg 3×/wk. If Hgb does not increase after 8 wk, increase by 50–100 units/kg at 4-8-wk intervals until Hgb is at a concentration to avoid RBC transfusions or a dose of 300 units/kg is reached. If the Hgb is >12 g/dl, withhold, once Hgb is <11 g/dl resume at a dose 25% below the previous dose

Anemia (non-myeloid malignancies where the anemia is due to the effect of concomitantly administered chemotherapy and at least 2 additional months of chemotherapy is planned)

- **Adult:** SUBCUT 150 units/kg 3×/wk or 40,000 units 1×/wk only when the hemoglobin is <10 g/dl and only until the chemotherapy course is completed. Adjust the dosage to maintain the lowest Hgb concentration sufficient to avoid RBC transfusions. If no rise in Hgb ≥1 g/dl after 4 wk of therapy and Hgb is <10 g/dl, the dosage may be increased to 300 units/kg subcut 3×/wk or 60,000 units 1×/wk. Discontinue if after 8 wk of therapy there is no response as measured by Hgb concentrations or if transfusions are still required. Reduce the dosage by approximately 25% if Hgb increases by >1 g/dl in any 2-wk period or if Hgb reaches a concentration needed to avoid RBC infusion. If Hgb is increasing and

exceeds a concentration necessary to avoid blood transfusions, hold therapy and reinstitute at a dose that is 25% lower when the Hgb reaches a concentration where transfusions may be needed

- **Adolescent/child ≥ 5 yr: IV** 600 units/kg/wk only when the hemoglobin is <10 g/dl and only until the chemotherapy course is completed. Adjust the dosage to maintain the lowest Hgb concentration sufficient to avoid RBC transfusions. If no rise in Hgb ≥ 1 g/dl after 4 wk of therapy and Hgb is <10 g/dl, the dosage may be increased to 900 units/kg (up to 60,000 units)/wk IV. Discontinue if after 8 wk there is no response as measured by Hgb concentrations or if transfusions are still required. Reduce the dosage by approximately 25% if Hgb increases by more than 1 g/dl in any 2-wk period or if Hgb reaches a concentration needed to avoid RBC infusion. If the Hgb is increasing and exceeds a concentration necessary to avoid blood transfusions, hold therapy and reinstitute at a dose that is 25% lower when the Hgb reaches a concentration where transfusions may be needed

To reduce the need for allogenic blood transfusions in anemic patients (hemoglobin >10 and ≤ 13 g/dl) scheduled to undergo elective, noncardiac, nonvascular surgery

- **Adult: SUBCUT** 300 units/kg/day $\times$ 10 days before surgery, on the day of surgery, and for 4 days after surgery (14 days total) or 600 units/kg 1 $\times$ /wk, 21, 14, and 7 days before surgery plus 1 dose on the day of surgery

Available forms: Inj 2000, 3000, 4000, 10,000, 20,000, 40,000 units/ml

Administer:

- Do not shake vial
- Use 1 single-use vial/dose, once syringe has entered single dose vial, sterility cannot be guaranteed, do not administer with other product, multidose vials can be stored in refrigerator up to 21 days once opened

SUBCUT route

- Before injecting preservative free-, single-dose formulation may be admixed using 0.9% NaCl with benzyl alcohol 0.9% at a 1:1 ratio to reduce inj site discomfort

Direct IV route

- Additional heparin to lower chance of clots
- By direct inj or bolus into IV tubing or venous line at end of dialysis

- Decrease dose by 25 units/kg if Hct increases by 4% in 2 wk; increase dose if Hct does not increase by 5-6 pts after 8 wk of therapy; suggested target Hct range 30%–36%

Solution compatibilities: Do not dilute or administer with other sol

SIDE EFFECTS

CNS: Seizures, coldness, sweating, headache

CV: Hypertension, hypertensive encephalopathy, CHF, edema, DVT

INTEG: Pruritus, rash, inj site reaction

MISC: Iron deficiency

MS: Bone pain

RESP: Cough

PHARMACOKINETICS

IV: Metabolized in body, extent of metabolism unknown, onset of increased reticulocyte count 2-6 wk, peak immediate

INTERACTIONS

- Need for increased heparin during hemodialysis

NURSING CONSIDERATIONS

Assess:

- Renal studies: urinalysis, protein, blood, BUN, creatinine; I&O, report drop in output <50 ml/hr

Black Box Warning:

Blood studies: ferritin, transferrin, serum iron monthly; transferrin sat $\geq 20\%$, ferritin ≥ 100 ng/ml; Hct 2 $\times$ /wk until stabilized in target range (30%-36%) then at regular intervals; those with endogenous erythropoietin levels of <500 units/L respond to product; monitor Hct 2 $\times$ /wk with chronic renal failure; patients treated with zidovudine or patients with cancer should be monitored weekly then periodically after stabilization; death may occur with Hgb >12 g/dl

- B/P; check for rising B/P as Hct rises, antihypertensives may be needed; hypertension may occur rapidly, leading to hypertensive encephalopathy
- CNS symptoms: coldness, sweating, pain in long bones; for seizures if Hct is increased within 2 wk by 4 pts
- Hypersensitivity reactions: skin rashes, urticaria (rare), antibody development does not occur

⚠️ **Pure cell aplasia (PRCA)** in absence of other causes; evaluate by testing sera for recombinant erythropoietin antibodies; any loss of response to epoetin should be evaluated

- Dialysis patients: thrill, bruit of shunts; monitor for circulation impairment
- **Seizures:** place patient on seizure precautions if increase of ≥ 4 points HCT in 2 wk, increased B/P; more common in chronic renal failure during the first 90 days of treatment

Evaluate:

- Therapeutic response: increase in reticulocyte count in 2-6 wk, Hgb/Hct; increased appetite, enhanced sense of well-being

Teach patient/family:

- To avoid driving or hazardous activities during beginning of treatment
- To monitor B/P
- To take iron supplements, vit B₁₂, folic acid as directed

🍁 Canada only Side effects: *italics* = common; **bold** = life-threatening ⚠️
Nurse Alert

eprosartan (Rx)

(ep-roh-sar'tan)

Teveten

Func. class.: Antihypertensive

Chem. class.: Angiotensin II–receptor antagonist (Subtype AT₁)

ACTION:

Blocks the vasoconstrictive and aldosterone-secreting effects of angiotensin II; selectively blocks the binding of angiotensin II to the AT₁ receptor found in tissues

USES:

Hypertension, alone or with other antihypertensives

CONTRAINDICATIONS:

Hypersensitivity

Black Box Warning:

Pregnancy (D) 2nd/3rd trimesters

Precautions: Pregnancy (C) 1st trimester, breastfeeding, children, geriatric patients, hypersensitivity to ACE inhibitors; renal/hepatic disease, angioedema

DOSAGE AND ROUTES

Calculator

• **Adult: PO** 600 mg/day; dose may be divided, given bid, with total daily doses from 400-800 mg, max 900 mg/day

Available forms: Tabs 400, 600 mg

Administer:

• Without regard to meals

SIDE EFFECTS

CNS: Dizziness, depression, fatigue, headache

CV: Chest pain, hypotension

EENT: Sinusitis

GI: Diarrhea, dyspepsia, abdominal pain

GU: UTI

INTEG: Pruritus, **angioedema**

META: Hypertriglyceridemia

MS: Myalgia, arthralgia, **rhabdomyolysis**

RESP: *Cough, upper respiratory infection*, rhinitis, pharyngitis, viral infection

SYST: **Anaphylaxis**

PHARMACOKINETICS

Peak 1-2 hr, food delays absorption; protein binding 98%; moderate renal impairment increases product levels by 30%, hepatic impairment increases levels by 40%; excreted in urine and feces; half-life 5-9 hr

INTERACTIONS

Decrease: antihypertensive effect—NSAIDs, salicylates

Drug/Lab Test

Increase: ALT, AST, alk phos

Decrease: Hgb

NURSING CONSIDERATIONS

Assess:

- B/P with position changes, pulse q4hr; note rate, rhythm, quality

- **Hypersensitivity reactions, including anaphylaxis**

- **Myalgia, arthralgia; may cause rhabdomyolysis**

- Baselines of renal, hepatic studies before therapy begins

- Edema in feet, legs daily

- Skin turgor, dryness of mucous membranes for hydration status

Evaluate:

- Therapeutic response: decreased B/P

Teach patient/family:

- To comply with dosage schedule, even if feeling better

- To notify prescriber of fever; chest pain; swelling of hands, feet, face, lip, or tongue

- That excessive perspiration, dehydration, diarrhea may lead to fall in B/P; consult prescriber if these occur

- That product may cause dizziness; to avoid hazardous activities until effect is

known

Black Box Warning:

Not to take this product if pregnant or breastfeeding, or if have had an allergic reaction to product

- To take missed dose as soon as possible unless within 1 hr before next dose
- That therapeutic effect may take 2-3 wk

☼ Canada only Side effects: *italics* = common; **bold** = life-threatening ⚠

Nurse Alert

HIGH ALERT

eptifibatide (Rx)

(ep-tih-fib'ah-tide)

Integrilin

Func. class.: Antiplatelet agent

Chem. class.: Glycoprotein IIb/IIIa inhibitor

ACTION:

Platelet glycoprotein antagonist; this agent reversibly prevents fibrinogen, von Willebrand's factor from binding to the glycoprotein IIb/IIIa receptor, thus inhibiting platelet aggregation

USES:

Acute coronary syndrome including those undergoing percutaneous coronary intervention (PCI)

CONTRAINDICATIONS:

Hypersensitivity, active internal bleeding; history of bleeding, stroke within 2 yr; major surgery with severe trauma, severe hypertension, history of intracranial bleeding, current or planned use of another parenteral GP IIb/IIIa inhibitor, dependence on renal dialysis, coagulopathy, AV malformation, aneurysm

Precautions: Pregnancy (B), breastfeeding, children, geriatric patients, bleeding, impaired renal function

DOSAGE AND ROUTES

Calculator

Acute coronary syndrome

• **Adult: IV BOL** 180 mcg/kg as soon as diagnosed, max 22.6 mg, then **IV CONT** 2 mcg/kg/min until discharge or CABG up to 72 hr, max 15 mg/hr

PCI in patients without acute coronary syndrome

• **Adult: IV BOL** 180 mcg/kg given immediately before PCI then 2 mcg/kg/min × 18 hr **CONT IV INF** and a second 180-mcg/kg bolus by 10 min after 1st bolus; continue inf for up to 18-24 hr at rate of 1 mcg/kg/min

Renal dose

- **Adult: IV** maintenance CCr <50 ml/min, 1 micro mcg/kg/min, max rate 7.5 mg/hr; CCr <10 ml/min, contraindicated

Available forms: Sol for inj 2 mg/ml (10 ml), 0.75 mg/ml (100 ml)

Administer:

- Aspirin and heparin may be given with this product; check for bleeding
- D/C heparin before removing femoral artery sheath, after PCI

Direct IV route

- After withdrawing bolus dose from 10-ml vial, give IV push over 1-2 min

Continuous IV INF route

- Follow bolus dose with continuous inf using pump; give product undiluted directly from 100-ml vial, spike 100-ml vial with vented inf set, use caution when centering spike on circle of stopper top

Y-site compatibilities: Alfentanil, alteplase, amikacin, aminophylline, amphotericin B lipid complex, amphotericin B liposome, ampicillin, ampicillin-sulbactam, anidulafungin, argatroban, atenolol, atracurium, atropine, azithromycin, aztreonam, bivalirudin, bumetanide, buprenorphine, butorphanol, calcium chloride/gluconate, ceFAZolin, cefepime, cefoperazone, cefotaxime, cefoTEtan, cefOXitin, cefTAZidime, ceftizoxime, cefTRIAxone, cefuroxime, cimetidine, ciprofloxacin, cisatracurium, clindamycin, cycloSPORINE, DAPTOmycin, dexamethasone, D₅/NaCl 0.9%, diazepam, diltiazem, diphenhydrAMINE, DOBUtamine, dolasetron, DOPamine, doxycycline, droperidol, enalaprilat, ePHEDrine, EPINEPHrine, ertapenem, erythromycin, esmolol, famotidine, fentaNYL, fluconazole, fosphenytoin, ganciclovir, gatifloxacin, gentamicin, granisetron, haloperidol, heparin, hydrocortisone, HYDROmorphone, hydrOXYzine, imipenem-cilastatin, inamrinone, isoproterenol, ketorolac, labetalol, leucovorin, levofloxacin, levorphanol, lidocaine, linezolid, LORazepam, magnesium sulfate, mannitol, meperidine, meropenem, methylPREDNISolone, metoclopramide, metoprolol, metroNIDAZOLE, micafungin, midazolam, milrinone, minocycline, mivacurium, morphine, nalbuphine, naloxone, niCARdipine, nitroglycerin, nitroprusside, NS, octreotide, ofloxacin, ondansetron, oxytocin, palonosetron, pancuronium, PEMEtrexed, PENTobarbital, PHENobarbital, phenylephrine, piperacillin, piperacillin-tazobactam, potassium chloride/phosphates, procainamide, prochlorperazine, promethazine, propranolol, ranitidine,

remifentanyl, rocuronium, sodium bicarbonate/phosphates, succinylcholine, SUFentanyl, sulfamethoxazole-trimethoprim, teniposide, theophylline, ticarcillin, ticarcillin-clavulanate, tigecycline, tirofiban, tobramycin, trimethobenzamide, vancomycin, vecuronium, verapamil, zidovudine, zoledronic acid

Solution compatibilities: 0.9% NaCl, D₅/0.9% NaCl

SIDE EFFECTS

CV: **Stroke**, hypotension

GU: Hematuria

HEMA: **Thrombocytopenia**

SYST: **Bleeding, anaphylaxis**

PHARMACOKINETICS

Onset within 1 hr, protein binding 25%, half-life 1.5-2 hr, steady state 4-6 hr, metabolism limited, excretion via kidneys

INTERACTIONS

• **Do not give with glycoprotein inhibitors IIb, IIIa**

Increase: bleeding—aspirin, heparin, NSAIDs, anticoagulants, ticlopidine, clopidogrel, dipyridamole, thrombolytics, valproate, abciximab

Drug/Herb

Increase: Bleeding risk—arnica, chamomile, clove, dong quai, feverfew, garlic, ginger, ginkgo, Panax ginseng

NURSING CONSIDERATIONS

Assess:

⚠ Thrombocytopenia: platelets, Hgb, Hct, creatinine, PT/APTT baseline INR within 6 hr of loading dose, daily thereafter, patients undergoing PCI should have ACT monitored; maintain APTT 50-70 sec unless PCI to be performed; during PCI, ACT should be 200-300 sec; if platelets drop $<100,000/\text{mm}^3$, obtain additional platelet counts; if thrombocytopenia is confirmed, discontinue product; draw Hct, Hgb, serum creatinine

⚠ Bleeding: gums, bruising, ecchymosis, petechiae; from GI, GU tract, cardiac cath sites, IM inj sites

Perform/provide:

• Do not give discolored solutions, those with particulates; discard unused

amount

- Discontinue product prior to CABG
- All medications PO if possible; avoid IM inj, all catheters

Teach patient/family:

- About reason for medication and expected results
 - To report bruising, bleeding, chest pain immediately
-

🍁 Canada only Side effects: *italics* = common; **bold** = life-threatening ⚠️

Nurse Alert

eribulin

(er'i-bu'lin)

Halaven

Func. class.: Antineoplastics—non-taxane

Do not confuse: eribulin/epirubicin/erlotinib

ACTION:

Potent antimitotic agent, different from taxanes, vinca alkaloids, epothilones; blocks cell progression during G2-M phase; inhibits the growth phase of microtubules and sequesters tubules, leading to the disruption of mitotic spindles and apoptotic cell death

USES:

Metastatic breast cancer in patients who have received at least 2 chemotherapy regimens

CONTRAINDICATIONS:

Hypersensitivity, pregnancy (D)

Precautions: Breastfeeding, neonates, infants, children, bradycardia, electrolyte imbalances, heart failure, hypokalemia, hypomagnesemia, infertility, neutropenia, peripheral neuropathy, QT prolongation, hepatic/renal disease

DOSAGE AND ROUTES

Calculator

- **Adult: IV** 1.4 mg/m² over 2-5 min on days 1 and 8, repeat q21days
- **Recommendations for dose delay:** for ANC <1000/mm³, platelets <75,000/mm³, or grade 3 or 4 nonhematologic toxicities: do not administer; the day 8 dose may be delayed a maximum of 1 wk; for the day 8 dose, if toxicities do not resolve to ≤ Grade 2 by day 15: omit the dose; for the day 8 dose, if toxicities resolve or improve to ≤ Grade 2 by day 15: administer eribulin at reduced dose (see below), initiate the next cycle no sooner than 2 wk later
- **Dose adjustments for hematologic toxicity:** ANC <500/mm³ for >7 days or ANC <1000/mm³ with fever or infection: permanently reduce dose to 1.1 mg/m²; platelets <25,000/mm³ or <50,000/mm³ requiring transfusion:

permanently reduce dose to 1.1 mg/m²; if day 8 of previous cycle omitted or delayed: permanently reduce dose to 1.1 mg/m²; while receiving 1.1 mg/m², if recurrence of hematologic event occurs, or if day 8 of previous cycle omitted or delayed: permanently reduce dose to 0.7 mg/m²; while receiving 0.7 mg/m², if recurrence of hematologic event occurs, or if day 8 of previous cycle omitted or delayed: discontinue

• **Dose adjustments of eribulin for nonhematologic toxicity during treatment:** any Grade 3 or 4 nonhematologic toxicity: permanently reduce dose to 1.1 mg/m²; if day 8 of previous cycle omitted or delayed: permanently reduce dose to 1.1 mg/m²; while receiving 1.1 mg/m², if recurrence of Grade 3 or 4 nonhematologic toxicity occurs, or if day 8 of previous cycle omitted or delayed: permanently reduce dose to 0.7 mg/m²; while receiving 0.7 mg/m², if recurrence of Grade 3 or 4 nonhematologic toxicity occurs, or if day 8 of previous cycle omitted or delayed: discontinue

Available forms: Sol for inj 1 mg/2 ml

Administer:

IV direct, intermittent route

- Visually inspect for particulate matter, discoloration as solution and container permit; withdraw required amount (0.5 mg/ml) from single-use vial, give undiluted over 2-5 min or diluted in 100 ml 0.9% NaCl and give as intermittent inf; do not give through line with dextrose or any other product

SIDE EFFECTS

CNS: Depression, dizziness, *fatigue*, fever, headache, insomnia, *peripheral neuropathy*

CV: **QT prolongation**, peripheral edema

GI: Abdominal pain, anorexia, constipation, diarrhea, dyspepsia, nausea, vomiting, weight loss

HEMA: **Anemia, neutropenia, thrombocytopenia**

INTEG: *Alopecia*, rash, stomatitis

META: Hypokalemia

MS: Arthralgia, myalgia, bone/back pain

RESP: Cough, dyspnea

SYST: Infection

PHARMACOKINETICS

Protein binding 49%-65%; inhibits CYP3A4; excreted in feces 82%; urine 9%; elimination half-life 40 hr; increased levels in hepatic/renal disease

INTERACTIONS

Increase: QT prolongation—arsenic trioxide, astemizole, bepridil, chloroquine, certain phenothiazines (chlorproMAZINE, mesoridazine, thioridazine), cisapride, clarithromycin, class IA antiarrhythmics (disopyramide, procainamide, quiNIDine), class III antiarrhythmics (amiodarone, bretylium, dofetilide, ibutilide, sotalol), dextromethorphan; quiNIDine, dronedarone, droperidol, erythromycin, halofantrine, haloperidol, levomethadyl, methadone, pentamidine, pimozone, posaconazole, probucol, propafenone, saquinavir, sparfloxacin, terfenadine, troleandomycin, and ziprasidone; also to a lesser degree abarelix, alfuzosin, amoxapine, apomorphine, artemether; lumefantrine, asenapine, β -agonists, ofloxacin, cloZAPine, cyclobenzaprine, dasatinib, dolasetron, flecainide, gatifloxacin, gemifloxacin, halogenated anesthetics, iloperidone, lapatinib, levofloxacin, local anesthetics, lopinavir; ritonavir, magnesium sulfate; potassium sulfate; sodium sulfate, maprotiline, mefloquine, moxifloxacin, nilotinib, norfloxacin, octreotide, ciprofloxacin, OLANZapine, ondansetron, paliperidone, palonosetron, some phenothiazines (fluPHENAZine, perphenazine, prochlorperazine, trifluoperazine), QUETiapine, ranolazine, risperiDONE, sertindole, SUNItinib, tacrolimus, telavancin, telithromycin, tetrabenazine, tricyclic antidepressants, venlafaxine, vardenafil, vorinostat

NURSING CONSIDERATIONS

Assess:

- Peripheral neuropathy: pain, numbness in extremities
- Infection: increased temperature, sore throat, flulike symptoms
- **QT prolongation:** assess for drug interactions that may occur; monitor ECG, heart rate
- **Bone marrow depression:** CBC, differential, serum creatinine, BUN, electrolytes, LFTs at baseline, periodically; increased AST/ALT $>3 \times$ ULN or total bilirubin $>1.5 \times$ ULN involve greater chance of Grade 4 or febrile neutropenia

Perform/provide:

- Storage at room temp for 4 hr or 24 hr refrigerated

Teach patient/family:

- **Infection:** to notify prescriber of increased temperature, sore throat, fatigue, flulike symptoms

- **QT prolongation:** to report extra heart beats
 - **Peripheral neuropathy:** to report tingling, pain in extremities
 - About reason for product and expected results
 - To avoid other medications, supplements unless approved by provider; serious drug interactions may occur
 - About hair loss, use of wig or hairpiece
 - To notify prescriber if pregnancy is planned or suspected (pregnancy [D]), to avoid breastfeeding
-

🍁 Canada only Side effects: *italics* = common; **bold** = life-threatening ⚠️
Nurse Alert

erlotinib (Rx)

(er-loe'tye-nib)

Tarceva

Func. class.: Antineoplastic—miscellaneous

Chem. class.: Epidermal growth factor receptor inhibitor

ACTION:

Not fully understood; inhibits intracellular phosphorylation of cell-surface receptors associated with epidermal growth factor receptors

USES:

Non–small-cell lung cancer (NSCLC), pancreatic cancer

Unlabeled uses: Squamous cell head and neck cancer

CONTRAINDICATIONS:

Pregnancy (D), breastfeeding

Precautions: Children, geriatric patients, ocular/pulmonary/renal/hepatic disorders, bradycardia, heart failure, hypokalemia, infertility, QT prolongation

DOSAGE AND ROUTES

Calculator

Non–small-cell lung cancer (NSCLC)

- **Adult: PO** 150 mg/day

Pancreatic cancer

- **Adult: PO** 100 mg/day in combination with gemcitabine 1000 mg/m² cycle 1, days 1, 8, 15, 22, 29, 36, 43 of 8-wk cycle; cycle 2 and subsequent cycle, days 1, 8, 15 of 4-wk cycle

CYP3A4 inducers concurrently (e.g., rifampin, phenytoin)

- Dosage increase is advised

CYP3A4 inhibitors (atazanavir, clarithromycin, indinavir, itraconazole, ketoconazole, telithromycin, ritonavir, saquinavir, troleandomycin, nelfinavir)

- Dosage reduction may be needed

Hepatic dose

- **Adult: PO** interrupt if total bilirubin >3 times ULN and/or transaminases >5

times ULN

Head or neck cancer (unlabeled)

- **Adult: PO** 150 mg daily

Available forms: Tabs 25, 100, 150 mg

Administer:

- 1 hr before or 2 hr after food; at same time of day

SIDE EFFECTS

CNS: CVA, anxiety, depression, headache, rigors

CV: MI/ischemia

EENT: Ocular changes, conjunctivitis, eye pain

GI: Nausea, diarrhea, vomiting, anorexia, mouth ulceration, hepatic failure, GI perforation

GU: Renal impairment/failure

HEMA: Deep vein thrombosis

INTEG: Rash, Stevens-Johnson–like skin reaction, toxic epidermal necrolysis

MISC: Fatigue, infection

RESP: Interstitial lung disease, cough, dyspnea, ARDS, pulmonary fibrosis

SYST: Hepatorenal syndrome

PHARMACOKINETICS

Slowly absorbed (60%); peak 3-7 hr; excreted in feces (86%), urine (<4%); metabolized by CYP3A4; terminal half-life 36 hr; protein binding 93%

INTERACTIONS

Increase: GI bleeding, may be fatal—warfarin

Increase: erlotinib concentrations—CYP3A4 inhibitors (ketoconazole, itraconazole, erythromycin, clarithromycin, telithromycin)

Increase: plasma concentration of warfarin, metoprolol

Increase: myopathy—HMG-CoA reductase inhibitors

Decrease: erlotinib levels—CYP3A4 inducers (phenytoin, rifampin, carbamazepine, phenobarbital), proton-pump inhibitors

Drug/Herb

Decrease: erlotinib levels—St. John's wort

Drug/Smoking

Decrease: erlotinib level; dose may need to be increased

Drug/Food

Increase: effect of erlotinib—grapefruit juice

NURSING CONSIDERATIONS

Assess:

- Serious skin toxicities: toxic epidermal necrolysis, Stevens-Johnson syndrome
- ⚠ **MI/ischemia, CVA** in patients with pancreatic cancer
- ⚠ **Pulmonary changes:** lung sounds, cough, dyspnea; interstitial lung disease may occur, may be fatal; discontinue therapy if confirmed
- **Ocular changes:** eye irritation, corneal erosion/ulcer, aberrant eyelash growth
- GI symptoms: frequency of stools; if diarrhea is poorly tolerated, therapy may be discontinued for ≤ 14 days, monitor for dehydration, fluid status during period of vomiting and diarrhea
- Blood studies: INR, LFTs, PT
- **Hepatic failure:** interrupt dosing if severe changes to liver function occur (total bilirubin $>3 \times$ ULN and/or transaminases $>5 \times$ ULN when normal pretreatment LFTs)
- **GI perforation/bleeding:** some cases have been fatal

Evaluate:

- Therapeutic response: decrease in NSCLC cells, pancreatic cancer cells

Teach patient/family:

- ⚠ To report adverse reactions immediately: SOB, severe abdominal pain, persistent diarrhea or vomiting, ocular changes, skin eruptions
- About reason for treatment, expected results
- To use reliable contraception during treatment (pregnancy D); to avoid breastfeeding
- To avoid use with other products, herbs, supplements unless approved by provider
- To avoid smoking, decreases effect of this product

✳ Canada only Side effects: *italics* = common; **bold** = life-threatening ⚠
Nurse Alert

ertapenem (Rx)

(er-tah-pen'em)

Invanz

Func. class.: Antiinfective—miscellaneous

Chem. class.: Carbapenem

Do not confuse: INVanz/AVINza

ACTION:

Interferes with cell wall replication of susceptible organisms; osmotically unstable cell wall swells, bursts from osmotic pressure; bactericidal

USES:

Adult patients with moderate to severe infections caused by the following organisms: intraabdominal infections—*Escherichia coli*, *Clostridium clostridioforme*, *Eubacterium lentum*, *Peptostreptococcus* sp., *Bacteroides fragilis*, *Bacteroides distasonis*, *Bacteroides ovatus*, *Bacteroides thetaiotaomicron*, *Bacteroides uniformis*; complicated skin/skin-structure infections—*Staphylococcus aureus* (methicillin-susceptible), *Streptococcus pyogenes*, *E. coli*, *Peptostreptococcus* sp.; community-acquired pneumonia—*Streptococcus pneumoniae* (penicillin-susceptible), *Haemophilus influenzae* (β -lactamase-negative), *Moraxella catarrhalis*; complicated UTI—*E. coli*, *Klebsiella pneumoniae*; acute pelvic infections—*Streptococcus agalactiae*, *E. coli*, *B. fragilis*, *Porphyromonas asaccharolytica*, *Peptostreptococcus* sp., *Prevotella bivia*, infection prophylaxis prior to elective colorectal surgery

CONTRAINDICATIONS:

Hypersensitivity to this product, its components, amide-type local anesthetics (IM only); anaphylactic reactions to β -lactams

Precautions: Pregnancy (B), breastfeeding, children, geriatric patients, GI/renal/hepatic disease

DOSAGE AND ROUTES

Calculator

Complicated intraabdominal infections

- **Adult/adolescent: IM/IV 1 g/day × 5-14 days**
- **Infant ≥3 mo/child: IM/IV 15 mg/kg bid (max 1 g/day) × 5-14 days**

Complicated skin/skin-structure infections

- **Adult: IM/IV 1 g/day × 7-14 days**
- **Child 3 mo-12 yr: IM/IV 15 mg/kg bid × 7-14 days**

Community-acquired pneumonia

- **Adult: IM/IV 1 g/day × 10-14 days**
- **Child 3 mo-12 yr: IM/IV 15 mg/kg bid × 10-14 days**

Complicated UTI

- **Adult: IM/IV 1 g/day × 10-14 days**
- **Child 3 mo-12 yr: IM/IV 15 mg/kg bid × 10-14 days**

Acute pelvic infections

- **Adult: IM/IV 1 g/day × 3-10 days**
- **Child 3 mo-12 yr: IM/IV 15 mg/kg bid 3-10 days**

Surgical infection prophylaxis (unlabeled)

- **Adult: IV 1 g as a single dose 1 hr prior to surgical incision**

Available form: Powder, lyophilized, 1 g

Administer:

IM route

- Reconstitute the 1 g vial of ertapenem with 3.2 ml of 1% lidocaine HCl injection (without EPINEPHrine) (280 mg/ml), agitate well to form a solution; the IM reconstituted formulation is not for IV use
- IM administration may be used as an alternative to IV administration in the treatment of infections where IM therapy is appropriate; only give via IM injection × 7 days
- **For a 1 g dose:** immediately withdraw the contents of the vial and inject deeply into a large muscle, aspirate before injection to avoid injection into a blood vessel
- **For a dose <1 g (i.e., for pediatric patients 3 mo–12 yr):** immediately withdraw a volume equal to 15 mg/kg (max 1 g/day) and inject deeply into a large muscle, aspirate before injection to avoid injecting into a blood vessel; use the reconstituted IM sol within 1 hr after preparation

IV route

- Visually inspect for particulate matter and discoloration before use, may be

colorless to pale yellow; do not mix with other products; dextrose sols are not compatible

- **1 g vial:** For each gram reconstitute with 10 ml of either NS injection, sterile water for injection, or bacteriostatic water for injection to 100 mg/ml, shake

- **1 g dose:** immediately transfer contents of the reconstituted vial to 50 ml of NS injection; for a dose <1 g (pediatric patients 3 mo–12 yr): from the reconstituted vial, immediately withdraw a volume equal to 15 mg/kg of body weight (max 1 g/day) and dilute in NS injection to a concentration of 20 mg/ml or less

IV INF route

- Complete the inf within 6 hr of reconstitution, infuse over 30 min; do not co-infuse with other medications
- The reconstituted IV sol may be stored at room temperature if used within 6 hr, or store under refrigeration for 24 hr and use within 4 hours after removal from refrigeration; do not freeze

Y-site compatibilities: Acyclovir, alfentanil, amifostine, amikacin, aminocaproic acid, aminophylline, amphotericin B lipid complex, amphotericin B liposome, argatroban, arsenic trioxide, atenolol, atracurium, azithromycin, aztreonam, bivalirudin, bleomycin, bumetanide, buprenorphine, busulfan, butorphanol, calcium chloride/gluconate, CARBOplatin, carmustine, chloramphenicol, cimetidine, ciprofloxacin, cisatracurium, CISplatin, cyclophosphamide, cycloSPORINE, cytarabine, dacarbazine, DACTINomycin, DAPTOmycin, dexamethasone, dexmedetomidine, dexrazoxane, digoxin, diltiazem, diphenhydrAMINE, DOCEtaxel, dolasetron, DOPamine, doxacurium, doxycycline, enalaprilat, ePHEDrine, EPINEPHrine, eptifibatide, erythromycin, esmolol, etoposide, famotidine, fenoldopam, fluconazole, fludarabine, fluorouracil, foscarnet, fosphenytoin, furosemide, ganciclovir, gatifloxacin, gemcitabine, gemtuzumab, gentamicin, glycopyrrolate, granisetron, haloperidol, heparin, hydrocortisone, HYDROmorphine, ifosfamide, inamrinone, insulin (regular), irinotecan, isoproterenol, ketorolac, labetalol, leucovorin, levofloxacin, lidocaine, linezolid, LORazepam, magnesium sulfate, mannitol, mechlorethamine, melphalan, meperidine, mesna, metaraminol, methotrexate, methyl dopate, methylPREDNISolone, metoclopramide, metroNIDAZOLE,

milrinone, mitoMYcin, mivacurium, morphine, moxifloxacin, nalbuphine, naloxone, nesiritide, nitroglycerin, nitroprusside, norepinephrine, octreotide, oxaliplatin, oxytocin, PACLitaxel, pamidronate, pancuronium, pantoprazole, PEMEtrexed, PENTobarbital, PHENobarbital, phentolamine, phenylephrine, polymyxin B, potassium acetate/chloride/phosphates, procainamide, propranolol, ranitidine, remifentanyl, rocuronium, sodium acetate/bicarbonate/phosphates, streptozocin, succinylcholine, SUFentanyl, sulfamethoxazole-trimethoprim, tacrolimus, teniposide, theophylline, thiotepa, tigecycline, tirofiban, tobramycin, trimethobenzamide, vancomycin, vasopressin, vecuronium, vinBLAStine, vinCRISStine, vinorelbine, voriconazole, zidovudine

SIDE EFFECTS

CNS: Insomnia, **seizures**, dizziness, *headache*

CV: **Tachycardia**

GI: *Diarrhea, nausea, vomiting*, **pseudomembranous colitis**

GU: *Vaginitis*

INTEG: *Rash, urticaria, pruritus, pain at inj site, infused vein complication, phlebitis/thrombophlebitis, erythema at inj site*

RESP: *Dyspnea, cough, pharyngitis, crackles, respiratory distress*

SYST: **Anaphylaxis**

PHARMACOKINETICS

IV: Onset immediate; peak dose dependent; half-life 4 hr; metabolized by liver; excreted in urine, feces, breast milk

INTERACTIONS

Increase: ertapenem levels—probenecid; do not coadminister

Decrease: effect of valproic acid

Drug/Lab Test

Increase: hepatic enzymes

NURSING CONSIDERATIONS

Assess:

- Renal disease: lower dose may be required
- **Pseudomembranous colitis:** bowel pattern daily: if severe diarrhea occurs, product should be discontinued

- For infection: temp, sputum, characteristics of wound before, during, after treatment

⚠ **Allergic reactions, anaphylaxis;** rash, urticaria, pruritus; may occur a few days after therapy begins; sensitivity to carbapenem antibiotics, other β -lactam antibiotics, penicillins

- **Overgrowth of infection:** perineal itching, fever, malaise, redness, pain, swelling, drainage, rash, diarrhea, change in cough or sputum

Evaluate:

- Therapeutic response: negative C&S; absence of signs, symptoms of infection

Teach patient/family:

- To report severe diarrhea (may indicate **pseudomembranous colitis**), CNS side effects
- To report overgrowth of infection: black, furry tongue; vaginal itching; foul-smelling stools
- To avoid breastfeeding; product is excreted in breast milk

TREATMENT OF OVERDOSE:

EPINEPHrine, antihistamines; resuscitate if needed (anaphylaxis)

☼ Canada only Side effects: *italics* = common; **bold** = life-threatening ⚠
Nurse Alert

erythromycin

(e-rith'roe-mye'sin)

Ilotycin, Romycin

Func. class.: Ophthalmic antiinfective

Chem. class.: Macrolide

ACTION:

Inhibits protein synthesis, thereby decreasing bacterial replication

USES:

Conjunctivitis, eye infections, prevention of ophthalmic neonatorum

CONTRAINDICATIONS:

Hypersensitivity to this product or macrolides

Precautions: Pregnancy (B), breastfeeding

DOSAGE AND ROUTES

Calculator

Bacterial conjunctivitis

- **Adult/adolescent/child:** Apply 1 cm of ointment directly to the eye up to 6 times a day $\times$ 7–10 days depending on severity of infection

Prevention of ophthalmic neonatorum

Neonate: Ointment Apply 1 cm ribbon to lower conjunctival sac of each eye once after birth

Administer:

Ophthalmic route

- Apply ribbon of ointment directly to the eye; for ophthalmic use only

SIDE EFFECTS

EENT: Hypersensitivity, irritation, redness

PHARMACOKINETICS

Unknown

NURSING CONSIDERATIONS

Assess:

- **Allergic reaction:** Assess for hypersensitivity, discontinue product

Evaluate:

- Decreased ophthalmic infection

Teach patient/family:

Ophthalmic route:

- Apply ribbon of ointment directly to the eye; for ophthalmic use only

🌿 Canada only Side effects: *italics* = common; **bold** = life-threatening ⚠️

Nurse Alert

erythromycin base (Rx)

(eh-rith-roh-my'sin)

Apo-Erythro , Ery-Tab, Novo-Rythro Encap , PCE

erythromycin ethylsuccinate (Rx)

Apo-Erythro-Es , E.E.S., Ery Ped, Novo-Rythro 

erythromycin lactobionate (Rx)

Erythrocin

erythromycin stearate (Rx)

Apo-Erythro-S , Erythrocin, My-E, Novo-Rythro 

Func. class.: Antiinfective

Chem. class.: Macrolide

Do not confuse: erythromycin/azithromycin

ACTION:

Binds to 50S ribosomal subunits of susceptible bacteria and suppresses protein synthesis

USES:

Infections caused by *Neisseria gonorrhoeae*; mild to moderate respiratory tract, skin, soft-tissue infections caused by *Bordetella pertussis*, *Borrelia burgdorferi*, *Chlamydia trachomatis*; *Corynebacterium diphtheriae*, *Haemophilus influenzae* (when used with sulfonamides); *Legionella pneumophila*, Legionnaire's disease, *Listeria monocytogenes*; *Mycoplasma pneumoniae*, *Streptococcus pneumoniae*, syphilis: *Treponema pallidum*; *Staphylococcus* sp.

Unlabeled uses: Bartonellosis, burn wound infection, chancroid, cholera, diabetic gastroparesis, endocarditis, prophylaxis, gastroenteritis, granuloma inguinale, Lyme disease, tetanus

CONTRAINDICATIONS:

Hypersensitivity, preexisting hepatic disease (estolate)

Precautions: Pregnancy (B), breastfeeding, geriatric patients, hepatic disease,

GI disease, QT prolongation, seizure disorder, myasthenia gravis

DOSAGE AND ROUTES

Calculator

Acne vulgaris

- **Adult: PO** 250 mg qid

Mild to moderately severe upper respiratory tract infections (otitis media, sinusitis) or lower respiratory tract infections (pneumonia, bronchitis) caused by susceptible organisms

- **Adult: PO** 250–500 mg (of base, estolate, or stearate) every 6 hr or 400–800 mg (ethylsuccinate) every 6 hr; **IV** 15–20 mg/kg/day in divided doses every 4–6 hr, max 4 g/day
- **Adolescent/child/infant: PO** 20–50 mg/kg/day divided every 6 hr, max adult doses; **IV** 15–20 mg/kg/day in divided doses every 4–6 hr, or as a continuous inf, max dose 4 g/day
- **Neonate >7 days, ≥1200 g: PO** 30 mg/kg/day in divided doses every 8 hr
- **Neonates >7 days, <1200 g: PO** 20 mg/kg/day in divided doses every 12 hr
- **Neonates ≤7 days: PO** 20 mg/kg/day in divided doses every 12 hr

Pneumonia caused by *Chlamydia trachomatis*

- **Infant/neonate: PO** CDC recommends 50 mg/kg/day in 4 divided doses × 14 days (erythromycin base or ethylsuccinate)

Mycoplasma infection such as *Mycoplasma pneumoniae* pneumonia

- **Adult: PO** 250–500 mg tid
- **Adult/adolescent/child/infant: IV** 15–20 mg/kg/day, given in divided doses every 4–6 hr, or as a continuous inf, max dose 4 g/day; replace by oral dosage as soon as possible

Legionnaire's disease (caused by *Legionella pneumophila*)

- **Adult: PO/IV** 0.5–1 g every 6 hr × 21 days

Treatment of group A β -hemolytic streptococcal (GAS) pharyngitis (primary rheumatic fever prophylaxis)

- **Adult: PO** 250–500 mg (base, estolate, or stearate) every 6 hr or 400–800 mg (ethylsuccinate) every 6 hr × 10 days
- **Adolescent/child/infant: PO** 20–50 mg/kg/day, divided every 6 hr × 10 days, max adult dose

Secondary prevention of rheumatic fever (prevention of recurrent attacks of rheumatic fever)

- **Adult/adolescent/child: PO** 250 mg bid in patients allergic to penicillin and sulfADIAZINE for 10 yr or age 40 whichever is longer, secondary prophylaxis (American Heart Association)

Listeriosis

- **Adult: PO** 250–500 mg (base, estolate or stearate) every 6 hr or 400–800 mg (ethylsuccinate) every 6 hr
- **Adolescent/child/infant: PO** 20–50 mg/kg/day, divided every 6 hr, max adult doses

Cervicitis caused by *Chlamydia trachomatis*

- **Adult/adolescent: PO** CDC recommends erythromycin base 500 mg qid or erythromycin ethylsuccinate 800 mg qid × 7 days as alternatives to first-line agents doxycycline or azithromycin
- **Pregnant females: PO** As alternatives to first-line agents azithromycin or amoxicillin, CDC recommends base 500 mg qid × 7 days, base 250 mg qid × 14 days, ethylsuccinate 800 mg qid × 7 days, ethylsuccinate 400 mg qid × 14 days
- **Child ≤45 kg: PO** CDC recommends base or ethylsuccinate 50 mg/kg/day in 4 doses × 14 days

Proctitis caused by *Chlamydia trachomatis*

- **Adult/adolescent: PO** (base) 500 mg qid

Chlamydial conjunctivitis caused by *Chlamydia trachomatis* including trachoma and inclusion conjunctivitis

- **Pregnant/lactating woman/child <8 yr: PO** 250–500 mg qid × 10–14 days

Infant pneumonia caused by *Chlamydia trachomatis*

- **Infant/neonate: PO** (base or ethylsuccinate) CDC recommends 50 mg/kg/day 4 divided doses × 14 days

Non-gonococcal urethritis (NGU) caused by *Chlamydia trachomatis* or *Ureaplasma urealyticum*

- **Adult/adolescent: PO** CDC recommends 500 mg (base) qid or 800 mg (ethylsuccinate) qid × 7 days as alternatives to first-line agents doxycycline or azithromycin
- **Pregnant female: PO** CDC recommends base 500 mg qid × 7 days
- **Child <45 kg: PO** CDC recommends base 50 mg/kg/day in 4 divided doses × 10–14 days, second course of therapy may be required

Ophthalmia neonatorum caused by *Chlamydia trachomatis*

- **Neonate: PO** (erythromycin base or ethylsuccinate) CDC recommends 50 mg/kg/day in qid $\times$ 14 days, may repeat if condition returns

Lymphogranuloma venereum caused by *Chlamydia trachomatis*

- **Adult: PO** (base) CDC recommends 500 mg qid $\times$ 21 days as an alternative to doxycycline

Adjunctive treatment of diphtheria to prevent establishment of carrier state and to eradicate *Corynebacterium diphtheriae* in carriers

- **Adult: PO** 500 mg every 6 hr $\times$ 10 days

Intestinal amebiasis (unable to take metronidazole)

- **Adult: PO** 250 mg every 6 hr $\times$ 10–14 days
- **Adolescent/child: PO** 30–50 mg/kg/day, divided every 6 hr $\times$ 10–14 days, max adult dose

Acute pelvic inflammatory disease (PID) caused by *Neisseria gonorrhoeae*

- **Adult: IV** 500 mg (lactobionate) every 6 hr $\times$ 3 days, then PO 250 mg (base, estolate, stearate) or **PO** 400 mg (ethylsuccinate) every 6 hr $\times$ 7 days

Pertussis (whooping cough) caused by *Bordetella pertussis* or for postexposure pertussis prophylaxis:

- **Adult: PO** 500 mg qid (2 g total) $\times$ 14 days
- **Adolescent/child/infant: PO** 40–50 mg/kg/day (max 2 g/day) in 4 divided doses $\times$ 14 days

Primary or secondary syphilis (caused by *Treponema pallidum*) in penicillin-allergic nonpregnant patients

- **Adult: PO** (CDC) 500 mg qid $\times$ 14 days as an alternative therapy

Surgical infection prophylaxis as a bowel preparation in combination with neomycin

- **Adult:** It is generally recommended that if surgery is scheduled for 8 am, 1 g of erythromycin PO with neomycin sulfate PO should be given at 1 pm, 2 pm, and 11 pm on the day before surgery

Available forms: *Base:* enteric-coated tabs 250, 333, 500 mg; film-coated tabs 250, 500 mg; enteric-coated caps 250, 333 mg; *stearate:* film-coated tabs 250 mg; *ethylsuccinate:* granules for oral susp 200, 400 mg/5 ml; powder for inj 500 mg, 1 g (lactobionate), 1 g (as gluceptate)

Administer:

- Do not break, crush, or chew time rel cap or tab; chew only chewable tabs;

enteric-coated tablets may be given with food • Do not give by IM or IV push

- Oral product with full glass of water; do not give with fruit juice
- Give 1 hr before or 2 hr after meals
- Chew tab: crush or chew

IV route

- After **reconstituting** 500 mg or less/10 ml sterile water without preservatives; dilute further in 100-250 ml of 0.9% NaCl, LR, Normosol-R; may be **further diluted** to 1 mg/ml and **given** as cont inf; run 1 g or less/100 ml over 1/2-1 hr; cont inf over 6 hr, may require buffers to neutralize pH if dilution is <250 ml, use inf pump

Lactobionate

Y-site compatibilities: Acyclovir, alfentanil, amikacin, aminocaproic acid, aminophylline, amiodarone, anidulafungin, atenolol, atosiban, atracurium, atropine, azaTHIOprine, benztropine, bivalirudin, bleomycin, bumetanide, buprenorphine, butorphanol, calcium chloride/gluconate, CARBOplatin, caspofungin, cefotaxime, cefTAZidime, cefTRIAxone, cefuroxime, chlorproMAZINE, cimetidine, CISplatin, cyanocobalamin, cyclophosphamide, cycloSPORINE, cytarabine, DACTINomycin, DAPTOmycin, dexmedetomidine, digoxin, diltiazem, diphenhydrAMINE, DOBUTamine, DOCEtaxel, DOPamine, doxacurium, doxapram, DOXOrubicin, enalaprilat, ePHEDrine, EPINEPHrine, epirubicin, epoetin alfa, eptifibatide, ertapenem, esmolol, etoposide, famotidine, fenoldopam, fentaNYL, fluconazole, fludarabine, fluorouracil, folic acid, foscarnet, gatifloxacin, gemcitabine, gentamicin, glycopyrrolate, granisetron, hydrocortisone, HYDROmorphone, hydrOXYzine, IDArubicin, ifosfamide, imipenem-cilastatin, insulin (regular), irinotecan, isoproterenol, labetalol, levofloxacin, lidocaine, LORazepam, LR, mannitol, mechlorethamine, meperidine, methicillin, methotrexate, methoxamine, methyl dopate, methylPREDNISolone, metoclopramide, metroNIDAZOLE, miconazole, midazolam, milrinone, mitoXANtrone, morphine, multiple vitamins injection, mycophenolate, nafcillin, nalbuphine, naloxone, nesiritide, netilmicin, niCARdipine, nitroglycerin, norepinephrine, octreotide, ondansetron, oxacillin, oxaliplatin, oxytocin, PACLitaxel, palonosetron, pamidronate, pancuronium, papaverine, pentamidine, pentazocine, perphenazine, phenylephrine, phytonadione, piperacillin, piperacillin-tazobactam, polymyxin B, procainamide,

prochlorperazine, promethazine, propranolol, protamine, pyridoxine, quiniDine, ranitidine, Ringer's, ritodrine, sodium acetate/bicarbonate, succinylcholine, SUFentanil, tacrolimus, temocillin, teniposide, theophylline, thiamine, thiotepa, tigecycline, tirofiban, TNA, tobramycin, tolazoline, TPN, trimetaphan, urokinase, vancomycin, vasopressin, vecuronium, verapamil, vinCRISTine, vinorelbine, vitamin B complex/C, voriconazole, zidovudine, zoledronic acid

SIDE EFFECTS

CNS: Seizures

CV: Dysrhythmias, QT prolongation

EENT: Hearing loss, tinnitus

GI: Nausea, vomiting, diarrhea, hepatotoxicity, abdominal pain, stomatitis, heartburn, anorexia, pseudomembranous colitis

GU: Vaginitis, moniliasis

INTEG: Rash, urticaria, pruritus, thrombophlebitis (IV site)

SYST: Anaphylaxis

PHARMACOKINETICS

Peak 4 hr (base); 1/2-2½ hr (ethylsuccinate); half-life 1-2 hr; metabolized in liver; excreted in bile, feces; protein binding 75%-90%; inhibitor of CYP3A4 and P-glycoprotein

INTERACTIONS

 Serious dysrhythmias—diltiazem, itraconazole, ketoconazole, nefazodone, pimozide, protease inhibitors, verapamil

Increase: action, toxicity of alfentanil, ALPRAZolam, bromocriptine, busPIRone, carBAMazepine, cilostazol, clindamycin, cloZAPine, cycloSPORINE, diazepam, digoxin, disopyramide, ergots, felodipine, HMG-CoA reductase inhibitors, methylPREDNISolone, midazolam, quiniDine, rifabutin, sildenafil, tacrolimus, tadalafil, theophylline, triazolam, vardenafil, vinBLASTine, warfarin

Drug/Lab Test

Increase: AST/ALT

Decrease: folate assay

False increase: 17-OHCS/17-KS

NURSING CONSIDERATIONS

Assess:

- **Infection:** temp, characteristics of wounds, urine, stools, sputum, WBCs at baseline and periodically • I&O ratio; report hematuria, oliguria in renal disease
- Hepatic studies: AST, ALT if patient is receiving long-term therapy
- Hearing at baseline and after treatment
- Renal studies: urinalysis, protein, blood
- C&S before product therapy; product may be given as soon as culture is taken; C&S may be repeated after treatment • **Pseudomembranous colitis:** diarrhea with blood, mucus; abdominal pain, fever; product should be discontinued immediately, notify prescriber • **Anaphylaxis:** generalized hives, itching, flushing, swelling of lips, tongue, throat, wheezing; have emergency equipment nearby • **QT prolongation:** may occur (IV >15 mg/min); those with electrolyte imbalances, congenital QT prolongation, elderly at greater risk; correct electrolyte imbalances before treatment, ECG

Perform/provide:

- Storage at room temp; store susp in refrigerator
- Adequate intake of fluids (2 L) during diarrhea episodes

Evaluate:

- Therapeutic response: decreased symptoms of infection

Teach patient/family:

- To report sore throat, fever, fatigue (could indicate superinfection), rhythm changes in the heart, hearing loss • To notify nurse of diarrhea stools, dark urine, pale stools, jaundice of eyes or skin, severe abdominal pain • To take at evenly spaced intervals; to complete dosage regimen; to take without food

TREATMENT OF HYPERSENSITIVITY:

Withdraw product; maintain airway; administer EPINEPHrine, aminophylline, O₂, IV corticosteroids

☛ Canada only Side effects: *italics* = common; **bold** = life-threatening ⚠
Nurse Alert

erythromycin (topical)

(e-rith-roe-mye'sin)

Akne-mycin, Ery-sol 

Func. class.: Topical antiinfective, anti-acne

Chem. class.: Macrolide

ACTION:

Antibacterial activity results from inhibition of protein synthesis; bacteriostatic

USES:

Treatment of acne vulgaris

CONTRAINDICATIONS:

Hypersensitivity, children

DOSAGE AND ROUTES

Calculator

Acne vulgaris

• **Adult/adolescent: TOP** Apply to affected areas bid, AM, PM

Available forms: Topical gel, ointment, pledget, solution 2%

Administer:

Topical route

- For external use only; do not use skin products near the eyes, nose, or mouth
- Wash hands before and after use. Wash affected area and gently pat dry before using
- **Gel/ointment/pledget/solution:** Apply to the cleansed affected area. Massage gently into affected areas • Each pledget should be used once and discarded

SIDE EFFECTS

INTEG: Burning, rash, pruritus, peeling, irritation

NURSING CONSIDERATIONS

Assess:

- **Allergic reaction:** Assess for hypersensitivity, product might need to be discontinued
- **Infection:** Assess for number of lesions, severity in acne

Evaluate:

- Decreased lesions in acne

Teach patient/family:**Topical route:**

- That product is for external use only; do not use skin products near the eyes, nose, or mouth • To wash hands before and after use, wash affected area and gently pat dry before using
 - **Gel/pledget/solution/ointment/lotion:** To apply to the cleansed affected area; massage gently into affected areas • That each pledget should be used once and discarded
-

🌿 Canada only Side effects: *italics* = common; **bold** = life-threatening ⚠️

Nurse Alert

escitalopram (Rx)

(es-sit-tal'oh-pram)

Lexapro

Func. class.: Antidepressant, SSRI (selective serotonin reuptake inhibitor)

ACTION:

Inhibits CNS neuron uptake of serotonin but not of norepinephrine

USES:

General anxiety disorder; major depressive disorder in adults/adolescents

Unlabeled uses: Panic disorder, social phobia

CONTRAINDICATIONS:

Hypersensitivity to this product, citalopram

Precautions: Pregnancy (C), breastfeeding, geriatric patients, renal/hepatic disease, history of seizures

Black Box Warning:

Children/adolescents ≤ 12 yr, suicidal ideation

DOSAGE AND ROUTES

Calculator

- **Adult: PO** 10 mg/day in AM or PM; after 1 wk, if no clinical improvement is noted, dose may be increased to 20 mg/day PM; maintenance 10-20 mg/day; reassess to determine need for treatment

Hepatic dose/geriatric

- **Adult: PO** 10 mg/day

Available forms: Tabs 5, 10, 20 mg; oral sol 5 mg (as base)/5 ml (contains sorbitol)

Administer:

- With food or milk for GI symptoms, give with full glass of water
- Crushed if patient is unable to swallow medication whole
- Dosage at bedtime if oversedation occurs during the day
- Gum, hard candy, frequent sips of water for dry mouth
- **Oral sol:** measure with calibrated device
- Storage at room temp; do not freeze

SIDE EFFECTS

CNS: Headache, nervousness, insomnia, suicidal ideation, drowsiness, anxiety, tremor, dizziness, fatigue, sedation, poor concentration, abnormal dreams, agitation, seizures, apathy, euphoria, hallucinations, delusions, psychosis, neuroleptic malignant-like syndrome

CV: Hot flashes, palpitations, angina pectoris, hemorrhage, hypertension, tachycardia, 1st-degree AV block, bradycardia, MI, thrombophlebitis, postural hypotension

EENT: Visual changes, ear/eye pain, photophobia, tinnitus

GI: Nausea, diarrhea, dry mouth, anorexia, dyspepsia, constipation, cramps, vomiting, taste changes, flatulence, decreased appetite

GU: Dysmenorrhea, decreased libido, urinary frequency, UTI, amenorrhea, cystitis, impotence, urine retention, ejaculation disorder

INTEG: Sweating, rash, pruritus, acne, alopecia, urticaria, photosensitivity

MS: Pain, arthritis, twitching

RESP: Infection, pharyngitis, nasal congestion, sinus headache, sinusitis, cough, dyspnea, bronchitis, asthma, hyperventilation, pneumonia

SYST: Asthenia, viral infection, fever, allergy, chills, serotonin syndrome

PHARMACOKINETICS

PO: Metabolized in liver; excreted in urine; 56% protein binding; metabolized by CYP2C19, 3A4, half-life 27-32 hr; half-life increased by 50% in geriatric patients

INTERACTIONS

- Paradoxical worsening of OCD: busPIRone

Increase: serotonin syndrome—tryptophan, amphetamines, busPIRone, lithium, amantadine, bromocriptine, SSRI, SNRIs, serotonin-receptor agonists, tramadol
⚠ Do not use pimozide, MAOIs, with or 14 days before escitalopram

Increase: CNS depression—alcohol, antidepressants, opioids, sedatives

Increase: side effects of escitalopram—highly protein-bound products

Increase: levels or toxicity of carBAMazepine, lithium, warfarin, phenytoin, antipsychotics, antidysrhythmics

Increase: levels of tricyclics, phenothiazines, haloperidol, diazepam

Increase: bleeding risk—NSAIDs, salicylates, anticoagulants, SSRIs, platelet

inhibitors

Decrease: escitalopram effect—cyproheptadine

Drug/Herb

- St. John's wort: do not use together, serotonin syndrome may occur

Increase: CNS effect—kava, valerian

Drug/Food

- Grapefruit juice—increased escitalopram effect

Drug/Lab Test

Increase: serum bilirubin, blood glucose, alk phos

Decrease: VMA, 5-HIAA

False increase: urinary catecholamines

NURSING CONSIDERATIONS

Assess:

Black Box Warning:

Mental status: mood, sensorium, affect, **suicidal tendencies**, increase in psychiatric symptoms, depression, panic, not approved for use in children

- Appetite with bulimia nervosa, weight daily; increase nutritious foods in diet, watch for bingeing and vomiting
- **Allergic reactions:** itching, rash, urticaria; product should be discontinued, may need to give antihistamine
- B/P (lying/standing), pulse q4hr; if systolic B/P drops 20 mm Hg, hold product, notify prescriber
- Blood studies: CBC, leukocytes, differential, cardiac enzymes if patient receiving long-term therapy; check platelets; bleeding can occur
- **Serotonin syndrome:** nausea, vomiting, sedation, dizziness, sweating, facial flushing, mental changes, shivering, increased B/P; discontinue product, notify prescriber
- Hepatic studies: AST, ALT, bilirubin, creatinine; thyroid function studies
- Weight weekly; appetite may decrease with product
- **ECG** for flattening of T wave, bundle branch, AV block, dysrhythmias in cardiac patients
- **Alcohol consumption;** if alcohol is consumed, hold dose until AM
- **Sexual dysfunction:** ejaculation dysfunction, erectile dysfunction, decreased libido, orgasm dysfunction, priapism
- Assistance with ambulation during therapy, since drowsiness, dizziness occur; safety measures primarily for geriatric patients

Evaluate:

- Therapeutic response: decreased depression

Teach patient/family:

- That therapeutic effect may take 1-4 wk, may have increased anxiety for first 5-7 days
- To use caution when driving, performing other activities requiring alertness because drowsiness, dizziness, blurred vision may occur
- To avoid alcohol, other CNS depressants; to avoid all OTC products unless approved by prescriber
- To notify prescriber if pregnant or planning to become pregnant or breastfeeding
- To change positions slowly, orthostatic hypotension may occur
- To report signs of urinary retention immediately

Black Box Warning:

That clinical worsening and suicide risk may occur

- To use MedGuide provided

TREATMENT OF OVERDOSE:

Activated charcoal, supportive care, serotonin antagonist

🍁 Canada only Side effects: *italics* = common; **bold** = life-threatening ⚠️
Nurse Alert

esmolol (Rx)

(ez'moe-lole)

Brevibloc

Func. class.: β -Adrenergic blocker (antidysrhythmic II)

Do not confuse: esmolol/Osmitrol

Brevibloc/Brevital

ACTION:

Competitively blocks stimulation of β_1 -adrenergic receptors in the myocardium; produces negative chronotropic, inotropic activity (decreases rate of SA node discharge, increases recovery time), slows conduction of AV node, decreases heart rate, decreases O_2 consumption in myocardium; also decreases renin-aldosterone-angiotensin system at high doses; inhibits β_2 -receptors in bronchial system at higher doses

USES:

Supraventricular tachycardia, noncompensatory sinus tachycardia, hypertensive crisis, intraoperative and postoperative tachycardia and hypertension

Unlabeled uses: Acute MI, ECT, thyroid storm, pheochromocytoma

CONTRAINDICATIONS:

2nd-or 3rd-degree heart block; cardiogenic shock, CHF, cardiac failure, hypersensitivity, severe bradycardia

Precautions: Pregnancy (C), breastfeeding, geriatric patients, hypotension, peripheral vascular disease, diabetes, hypoglycemia, thyrotoxicosis, renal disease, atrial fibrillation, bronchospasms, hyperthyroidism, myasthenia gravis

Black Box Warning:

Abrupt discontinuation

DOSAGE AND ROUTES

Calculator

- **Adult:** IV loading dose 500 mcg/kg/min over 1 min; maintenance 50 mcg/kg/min for 4 min; if no response after 5 min, give 2nd loading dose then increase inf to 100 mcg/kg/min for 4 min; if no response, repeat loading dose then increase maintenance inf by 50 mcg/kg/min (max of 200 mcg/kg/min);

titrate to patient response

- **Child: IV** total loading dose of 600 mcg/kg over 2 min, maintenance **IV INF** 200 mcg/kg/min, titrate upward by 50-100 mcg/kg/min q5-10min until B/P, heart rate reduced by >10%

Available forms: Inj 10 mg, 20 mg/ml

Administer:

- Do not discontinue product suddenly
- Store protected from light, moisture; in cool environment

IV route

- Check that correct concentration being given

- 10 mg/ml inj sol needs no dilution, may be used as an IV loading dose using a handheld syringe

Continuous IV INF route

- Ready-to-use bags of premixed isotonic sol of 10 mg/ml and 20 mg/ml available in 100-, 250-ml bags; use controlled inf device, central line preferred; rate is based on patient's weight

Additive compatibilities: Aminophylline, atracurium, heparin, potassium chloride, sodium bicarbonate

Y-site compatibilities: Amikacin, aminophylline, amiodarone, atracurium, butorphanol, calcium chloride, ceFAZolin, cefTAZidime, ceftizoxime, chloramphenicol, cimetidine, cisatracurium, clindamycin, diltiazem, DOPamine, enalaprilat, erythromycin, famotidine, fentaNYL, gentamicin, insulin (regular), labetalol, magnesium sulfate, methyldopate, metroNIDAZOLE, midazolam, morphine, nitroglycerin, nitroprusside, norepinephrine, pancuronium, penicillin G potassium, piperacillin, polymyxin B, potassium chloride, potassium phosphate, propofol, ranitidine, remifentanyl, streptomycin, tacrolimus, tobramycin, trimethoprim-sulfamethoxazole, vancomycin, vecuronium, voriconazole, zoledronic acid

SIDE EFFECTS

CNS: Confusion, lightheadedness, paresthesia, somnolence, fever, dizziness, fatigue, headache, depression, anxiety, **seizures**

CV: Hypotension, bradycardia, chest pain, peripheral ischemia, SOB, **CHF**, conduction disturbances; 1st-, 2nd-, 3rd-degree heart block

GI: Nausea, vomiting, anorexia, gastric pain, flatulence, constipation, heartburn, bloating

GU: Urinary retention, impotence, dysuria

INTEG: Induration, inflammation at site, discoloration, edema, erythema, burning pallor, flushing, rash, pruritus, dry skin, alopecia

RESP: Bronchospasm, dyspnea, cough, wheeziness, nasal stuffiness, pulmonary edema

PHARMACOKINETICS

Onset very rapid, duration short, half-life 9 min, metabolized by hydrolysis of ester linkage, excreted via kidneys

INTERACTIONS

- Avoid use with MAOIs

Increase: antihypertensive effect—general anesthetics

Increase: digoxin levels—digoxin

Increase: α -adrenergic stimulation—ePHEDrine, EPINEPHrine, amphetamine, norepinephrine, phenylephrine, pseudoephEDrine

Decrease: action of thyroid hormones

Decrease: action of esmolol—thyroid hormone

Drug/Herb

Increase: β -blocking effect—hawthorn

Decrease: antihypertensive effect—ephedra

Drug/Lab Test

Interference: glucose/insulin tolerance test

NURSING CONSIDERATIONS

Assess:

- **CHF:** I&O ratio, weight daily, jugular venous distention, weight gain, crackles, edema
- **Dysrhythmias:** B/P, pulse q4hr; note rate, rhythm, quality; rapid changes can cause shock; if systolic <100 or diastolic <60, notify prescriber before giving product; ECG continuously during inf, hypotension common, if severe, slow or stop infusion
- Baselines in renal/hepatic studies, blood glucose before therapy begins

- **Bronchospasm:** breath sounds, respiratory pattern

Evaluate:

- Therapeutic response: lower B/P immediately, lower heart rate

Teach patient/family:

- About reason for use, expected results
- To notify prescriber if chest pain, SOB, wheezing, hypotension, bradycardia, pain, swelling at IV site occurs

TREATMENT OF OVERDOSE:

Discontinue product

☼ Canada only Side effects: *italics* = common; **bold** = life-threatening ⚠
Nurse Alert

esomeprazole (Rx)

(es'oh-mep'rah-zohl)

NexIUM

Func. class.: Antiulcer

Chem. class.: Proton pump inhibitor, benzimidazole

Do not confuse: NexIUM/NexAVAR

ACTION:

Suppresses gastric secretions by inhibiting hydrogen/potassium ATPase enzyme system in gastric parietal cell; characterized as gastric acid pump inhibitor because it blocks the final step of acid production

USES:

Gastroesophageal reflux disease (GERD), adult/child/infant; severe erosive esophagitis, adult/child; treatment of active duodenal ulcers in combination with antiinfectives for *Helicobacter pylori* infection; long-term use for hypersecretory conditions

CONTRAINDICATIONS:

Hypersensitivity to proton pump inhibitors (PPIs)

Precautions: Pregnancy (B), breastfeeding, children, geriatric patients

DOSAGE AND ROUTES

Calculator

Active duodenal ulcers associated with *H. pylori*

- **Adult: PO** 40 mg/day × 10 days in combination with clarithromycin 500 mg bid × 10 days and amoxicillin 1000 mg bid × 10 days

Hepatic dose

- **Adult: PO/IV** max 20 mg/day (severe hepatic disease)

GERD/erosive esophagitis

- **Adult: PO** 20 or 40 mg/day × 4-8 wk; no adjustment needed in renal/liver failure, geriatric patients; **IV** 20 or 40 mg/day up to 10 days

- **Adolescent and child 12-17 yr: PO** 20 or 40 mg/day 1 hr before meals for ≤8 wk

- **Child 1-11 yr and ≥ 20 kg:** PO 10 mg/day 1 hr before meals for ≤ 8 wk
- **Infant ≥ 1 mo:** IV 0.5 mg/day over 10-30 min
- **Infant 1-11 mo (>7.5 -12 kg):** PO 10 mg daily $\times$ up to 6 wk
- **Infant 1-11 mo (>5 -7.5 kg):** PO 5 mg daily $\times$ up to 6 wk
- **Infant 1-11 mo (3-5 kg):** PO 2.5 mg daily $\times$ up to 6 wk

Available forms: Del rel caps 20, 40 mg; powder for IV inj 20, 40 mg/vial; del rel powder for oral susp 10, 20, 40 mg

Administer:

PO route

- Swallow caps whole; do not crush or chew; cap may be opened and sprinkled over Tbsp of applesauce • Same time daily, 1 hr before meal
- **Oral susp (del rel):** empty contents of packet into container with 1 Tbsp of water, let stand 2-3 min to thicken, stir, give within 30 min of mixing; any residual product should be flushed with more water, taken immediately • **NG tube (del rel oral susp):** add 15 ml water to contents of packet in syringe, shake, leave 2-3 min to thicken, shake, inject through NG tube within 30 min

IV, direct route

- Reconstitute each vial with 5 ml 0.9% NaCl, D₅W, LR; give over 3 min

Intermittent IV INF route

- Dilute reconstituted sol to 50 ml, give over 30 min, do not admix, flush line with D₅W, 0.9% NaCl, LR after inf

Solution compatibilities: D₅W, LR, 0.9% NaCl

SIDE EFFECTS

CNS: Headache, dizziness

GI: Diarrhea, flatulence, abdominal pain, constipation, dry mouth, hepatic failure, hepatitis, microscopic colitis

INTEG: Rash, dry skin

MISC: Heart failure

RESP: Cough, pneumonia

SYST: Stevens-Johnson syndrome, toxic epidermal necrolysis, exfoliative dermatitis

PHARMACOKINETICS

Well absorbed 90%; protein binding 97%; extensively metabolized in liver (CYP2C19); terminal half-life 1-1.5 hr; eliminated in urine as metabolites and in feces; in geriatric patients, elimination rate decreased, bioavailability increased

INTERACTIONS

Increase: effect, toxicity of diazepam, digoxin, penicillins, saquinavir

Decrease: effect—atazanavir, nelfinavir, dapsone, iron, itraconazole, ketoconazole, indinavir, calcium carbonate, vit B₁₂, clopidogrel

Drug/Lab Test

Interference: sodium, Hgb, WBC, platelets, magnesium

NURSING CONSIDERATIONS

Assess:

- GI system: bowel sounds q8hr, abdomen for pain, swelling, anorexia
- **Hepatic failure, hepatitis:** AST, ALT, alk phos at baseline and periodically during treatment
- **Serious skin disorders:** Stevens-Johnson syndrome, toxic epidermal necrolysis, exfoliative dermatitis

Evaluate:

- Therapeutic response: absence of epigastric pain, swelling, fullness

Teach patient/family:

- To report severe diarrhea; abdominal pain; black, tarry stools, rash; product may have to be discontinued
- That hypoglycemia may occur if diabetic
- To avoid hazardous activities; dizziness may occur
- To avoid alcohol, salicylates, NSAIDs; may cause GI irritation
- To take ≥1 hr before meal; not to crush, chew del rel product
- If cap is unable to be swallowed, whole contents may be mixed with a Tbsp of applesauce

☼ Canada only Side effects: *italics* = common; **bold** = life-threatening ⚠

Divigel, Elestrin, Estrogel

estradiol spray (Rx)

Evamist

estradiol topical emulsion (Rx)

Estrasorb

estradiol valerate (Rx)

Delestrogen

estradiol transdermal system (Rx)

Alora, Climara, Menostar, Vivelle-Dot

estradiol vaginal tablet (Rx)

Vagifem

estradiol vaginal ring (Rx)

Estring, Femring

Func. class.: Estrogen, progestins

ACTION:

Needed for adequate functioning of female reproductive system; affects release of pituitary gonadotropins; inhibits ovulation, adequate calcium use in bone

USES:

Vasomotor symptoms (menopause), inoperable breast cancer (selected cases), prostatic cancer, atrophic vaginitis, kraurosis vulvae, hypogonadism, primary ovarian failure, prevention of osteoporosis, castration

CONTRAINDICATIONS:

Pregnancy (X), breastfeeding, reproductive cancer, genital bleeding (abnormal, undiagnosed), protein C, protein S, antithrombin deficiency

Black Box Warning:

Breast/endometrial cancer, thromboembolic disorders, MI, stroke

Precautions: Hypertension, asthma, blood dyscrasias, gallbladder/bone/renal/hepatic disease, CHF, diabetes mellitus, depression, migraine headache, seizure disorders, family history of cancer of breast or reproductive tract, smoking, uterine fibroids, vaginal irritation/infection, accidental exposure of children, pets to topical product, history of angioedema

Black Box Warning:

Cardiac disease, dementia

DOSAGE AND ROUTES

Calculator

Hormone replacement/menopause symptoms

- **Adult: TRANSDERMAL** 1 patch delivering 0.025, 0.0375, 0.05, 0.075, or 0.1 mg/day 2×/wk (Alora, Estraderm, Vivelle-Dot); 1 patch delivering 0.025, 0.0375, 0.05, 0.06, 0.075, or 0.1 mg/day replace q7days (Climara); 1 patch delivering 0.025 mg/day, replace q7days, may increase to 2 patches after 4-6 wk; **GEL** apply entire unit-dose packet to 5 × 7-inch area of upper thigh/day, alternate thighs; **SPRAY** (Evamist) 1 spray to inner surface of forearm/day in AM

Menopause/hypogonadism/castration/ovarian failure

- **Adult: PO** 1-2 mg/day, 3 wk on, 1 wk off or 5 days on, 2 days off; **IM** (cypionate) 1-5 mg q3-4wk; (valerate) 10-20 mg q4wk
- **Adult: TOP** (Estraderm) 0.05 mg/24 hr applied 2×/wk; (Climara) 0.05 mg/hr applied 1×/wk in cyclic regimen; women with hysterectomy may use continuously

Prostatic cancer (inoperable)

- **Adult: IM** (valerate) 30 mg q1-2wk; **PO** (oral estradiol) 1-2 mg bid-tid

Breast cancer (palliative treatment)

- **Adult: PO** 10 mg tid × 3 mo or longer

Atrophic vaginitis/kraurosis vulvae

- **Adult: VAG CREAM** 2-4 g/day × 1-2 wk, then 1 g 1-3×/wk cycled; vag tab 1/day × 2 wk, maintenance 1 tab 2×/wk; **VAG RING** inserted, left in place

continuously for 3 mo

Vasomotor symptoms

- **Adult: TOP** after cleaning and drying skin on left thigh, calf, rub in contents of pouch using both hands until completely absorbed; wash hands

Available forms: **Estradiol:** tabs 0.5, 1, 2 mg; **valerate:** inj 10, 20, 40 mg/ml; **transdermal:** 0.025, 0.0375, 0.05, 0.06, 0.075, 0.1 mg/24 hr release rate; **vag cream:** 100 mcg/g; **vag tab:** 10 mcg; **vag ring:** 2 mg/90 days; **topical emulsion:** 2.5 mg; **gel** (Divigel) 0.1%; **spray** (Evamist) 1.53 mg/acuation

Administer:

- Titrated dose; use lowest effective dose
- IM inj deeply in large muscle mass

PO route

- With food or milk to decrease GI symptoms

Transdermal route

- May contain aluminum or other metals in backing of patch, can overheat in MRI scan and burn patients • Apply to trunk of body 2×/wk; press firmly, hold in place for 10 sec to ensure good contact; do not apply to breasts • On intermittent cycle schedule: 3 wk on then 1 wk off; if patch falls off, reapply

Topical route

- Use Evamist daily; spray to inner upper arm; may increase to 2-3×/day based on response; allow to dry for 2 min, **avoid secondary exposure to children, pets, caregivers**

Vaginal route

- Use a new applicator daily, provided

SIDE EFFECTS

CNS: Dizziness, headache, migraines, depression, **seizures**

CV: Hypertension, thrombophlebitis, edema, **thromboembolism, stroke, pulmonary embolism, MI**, chest pain

EENT: Contact lens intolerance, increased myopia, astigmatism, throat swelling, eyelid edema

GI: Nausea, vomiting, diarrhea, anorexia, pancreatitis, cramps, constipation, increased appetite, increased weight, **cholestatic jaundice, hepatic adenoma**

GU: Amenorrhea, cervical erosion, breakthrough bleeding, dysmenorrhea, vaginal candidiasis, breast changes, *gynecomastia, testicular atrophy, impotence*,

increased risk of breast cancer, endometrial cancer, changes in libido; toxic shock, vaginal wall ulceration/erosion (vag ring)

INTEG: Rash, urticaria, acne, hirsutism, alopecia, oily skin, seborrhea, purpura, erythema, pruritus, melasma; site irritation (transdermal)

META: Folic acid deficiency, hypercalcemia, hyperglycemia

PHARMACOKINETICS

PO/INJ/TRANSDERMAL: Degraded in liver, excreted in urine, crosses placenta, excreted in breast milk

INTERACTIONS

Increase: action of corticosteroids

Increase: toxicity—cycloSPORINE, dantrolene

Decrease: action of anticoagulants, oral hypoglycemics, tamoxifen

Decrease: estradiol action—anticonvulsants, barbiturates, phenylbutazone, rifampin, calcium

Drug/Herb

- Altered estrogen effect: black cohosh, DHEA

Decrease: estrogen effect—saw palmetto, St. John's wort

Drug/Food

Increase: estrogen level—grapefruit juice

Drug/Lab Test

Increase: BSP retention test, PBI, T₄, serum sodium, platelet aggregation, thyroxine-binding globulin (TBG), prothrombin; factors VII, VIII, IX, X; triglycerides

Decrease: serum folate, serum triglyceride, T₃ resin uptake test, glucose tolerance test, antithrombin III, pregnanediol, metyrapone test

False positive: LE prep, ANA

NURSING CONSIDERATIONS

Assess:

Black Box Warning:

For previous breast/endometrial cancer, thromboembolic disorders, MI, stroke, dementia

- Blood glucose of diabetic patient; hyperglycemia may occur
- Weight daily; notify prescriber of weekly weight gain >5 lb; if increase,

diuretic may be ordered • B/P q4hr; watch for increase caused by water and sodium retention

- I&O ratio; decreasing urinary output, increasing edema, report changes
- Hepatic studies, including AST, ALT, bilirubin, alk phos at baseline, periodically; periodic folic acid level • Hypertension, cardiac symptoms, jaundice, hypercalcemia
- Mental status: affect, mood, behavioral changes, aggression
- Female patient for intact uterus; if so, progesterone should be added to estrogen therapy to decrease risk of endometrial cancer

Evaluate:

- Therapeutic response: reversal of menopause symptoms; decrease in tumor size in prostatic, breast cancer

Teach patient/family:

- To weigh weekly; to report gain >5 lb

⚠ To report breast lumps, vaginal bleeding, edema, jaundice, dark urine, clay-colored stools, dyspnea, headache, blurred vision, abdominal pain, numbness or stiffness in legs, chest pain; tenderness, redness, and swelling in extremities; males to report impotence, gynecomastia; to report dermal rash with transdermal patch • To avoid grapefruit or grapefruit juice (PO)

🍁 Canada only Side effects: *italics* = common; **bold** = life-threatening ⚠
Nurse Alert

RARELY USED

estramustine (Rx)

(ess-tra-muss'teen)

Emcyt

Func. class.: Antineoplastic alkylating agent

USES:

Metastatic prostate cancer

CONTRAINDICATIONS:

Pregnancy (D), hypersensitivity to estradiol, thromboembolic disorders, stroke, thrombophlebitis

DOSAGE AND ROUTES

Calculator

• **Adult: PO** 14-16 mg/kg/day or 600 mg/m²/day in 3-4 divided doses; treatment may continue for ≥3 mo

☼ Canada only Side effects: *italics* = common; **bold** = life-threatening ⚠
Nurse Alert

estrogens, conjugated (Rx)

Cenestin, Premarin

estrogens, conjugated synthetic B (Rx)

Enjuvia

Func. class.: Estrogen, hormone

Do not confuse: **Premarin**/Provera

ACTION:

Needed for adequate functioning of female reproductive system; affects release of pituitary gonadotropins, inhibits ovulation, adequate calcium use in bone

USES:

Vasomotor symptoms (menopause), inoperable breast cancer, prostatic cancer, abnormal uterine bleeding, hypogonadism, primary ovarian failure, prevention of osteoporosis, castration, atrophic vaginitis

Unlabeled uses: hyperparathyroidism, infertility

CONTRAINDICATIONS:

Pregnancy (X), breastfeeding, thromboembolic disorders, reproductive cancer, genital bleeding (abnormal, undiagnosed), hypersensitivity, MI, stroke, thrombophlebitis

Black Box Warning:

Endometrial, breast cancer, thromboembolic diseases

Precautions: Hypertension, asthma, blood dyscrasias, CHF, diabetes mellitus, depression, migraine headache, seizure disorders, gallbladder/bone/hepatic/renal disease, family history of cancer of breast or reproductive tract, smoking, dementia, hypothyroidism, obesity, SLE

DOSAGE AND ROUTES

Calculator

Estrogens conjugated

Vasomotor symptoms (menopause)

- **Adult: PO** 0.3-1.25 mg/day 3 wk on, 1 wk off

Prevention of osteoporosis

- **Adult: PO** 0.3 mg/day or in cycle

Atrophic vaginitis

- **Adult: VAG CREAM** 0.5 g/day × 21 days, off 7 days, repeat

Prostatic cancer

- **Adult: PO** 1.25-2.5 mg tid

Advanced inoperable breast cancer

- **Adult: PO** 10 mg tid × ≥3 mo

Abnormal uterine bleeding

- **Adult: IV/IM** 25 mg q6-12hr

Castration/primary ovarian failure

- **Adult: PO** 1.25 mg/day 3 wk on, 1 wk off

Hypogonadism

- **Adult: PO** 2.5-7.5 mg/day × 20 days/mo

Estrogens conjugated synthetic B**Vasomotor symptoms (menopause)**

- **Adult: PO** 0.625 mg/day initially; may increase based on response

Available forms: Tabs 0.3, 0.45, 0.625, 0.9, 1.25, 2.5 mg; inj 25 mg/vial; vag cream 0.625 mg/g; *synthetic B*: tabs 0.625, 1.25 mg

Administer:

- Titrated dose; use lowest effective dose

PO route

- Give with or immediately after food to reduce nausea

IM route

- IM reconstitute after withdrawing 5 ml of air from container, inject sterile diluent on vial side, rotate to dissolve; give inj deep in large muscle mass, aspirate before inj

Vaginal route

- Use applicator provided, wash after use

Direct IV route

- IV, after reconstituting as for IM, inject into distal port of running IV line of D₅W, 0.9% NaCl at ≤5 mg/min

Y-site compatibilities: Heparin, hydrocortisone, potassium chloride, vit B/C

SIDE EFFECTS

CNS: Dizziness, headache, migraine, depression, **seizures**, mood disturbances

CV: Hypertension, thrombophlebitis, edema, **thromboembolism, stroke, pulmonary embolism, MI**, chest pain

EENT: Contact lens intolerance, increased myopia, astigmatism

GI: *Nausea*, vomiting, diarrhea, anorexia, pancreatitis, cramps, constipation, increased appetite, **cholestatic jaundice, hepatic adenoma**, weight gain/loss

GU: Amenorrhea, cervical erosion, breakthrough bleeding, dysmenorrhea, vaginal candidiasis, breast changes, *gynecomastia, testicular atrophy, impotence*, **increased risk of breast cancer, endometrial cancer**, libido changes

INTEG: Rash, urticaria, acne, hirsutism, alopecia, oily skin, seborrhea, purpura, melasma

META: Folic acid deficiency, hypercalcemia, hyperglycemia

PHARMACOKINETICS

PO/IM/IV: Degraded in liver, excreted in urine, crosses placenta, excreted in breast milk

INTERACTIONS

Increase: toxicity—**cycloSPORINE, dantrolene**

Increase: action of corticosteroids

Decrease: action of estrogens—anticonvulsants, barbiturates, phenylbutazone, rifampin

Decrease: action of anticoagulants, oral hypoglycemics, tamoxifen, thyroid

Drug/Food

Increase: estrogen level—grapefruit juice

Drug/Lab Test

Increase: BSP retention test, PBI, T_4 , serum sodium, platelet aggregation, thyroxine-binding globulin (TBG), prothrombin; factors VII, VIII, IX, X; triglycerides

Decrease: serum folate, serum triglyceride, T_3 resin uptake test, glucose tolerance test, antithrombin III, pregnanediol, metyrapone test

False positive: LE prep, antinuclear antibodies

NURSING CONSIDERATIONS

Assess:

Black Box Warning:

Breast, endometrial cancer: estrogens should not be used in known, suspected, or history of these disorders

Black Box Warning:

Stroke, thromboembolic disease of MI: Should not be used in these conditions or known protein C deficiency, protein S deficiency, or antithrombin deficiency

- Blood glucose if diabetic patient; hyperglycemia may occur
- Weight daily; notify prescriber of weekly weight gain >5 lb; if increase, diuretic may be ordered; check for edema; B/P baseline and periodically
- Hepatic studies: AST, ALT, bilirubin, alk phos
- Hypertension, cardiac symptoms, jaundice, hypercalcemia
- Mental status: affect, mood, behavioral changes, aggression
- Female patient for intact uterus; if so, progesterone should be added to estrogen therapy to decrease risk of endometrial cancer; abnormal uterine bleeding, breast exam; Pap smear

Evaluate:

- Therapeutic response: absence of breast engorgement, reversal of menopause symptoms, decrease in tumor size with prostatic cancer

Teach patient/family:

- To avoid breastfeeding, since product excreted in breast milk
- To weigh weekly; to report gain >5 lb

Black Box Warning:

To report breast lumps, vaginal bleeding, edema, jaundice, dark urine, clay-colored stools, dyspnea, headache, blurred vision, abdominal pain; leg pain and redness, numbness or stiffness; chest pain; males to report impotence or gynecomastia

- To avoid sunlight or wear sunscreen; burns may occur
- To notify prescriber if pregnancy is suspected
- That vasomotor symptoms improve in 2 wk, max relief in 8 wk

☛ Canada only Side effects: *italics* = common; **bold** = life-threatening ⚠
Nurse Alert

RARELY USED

estropipate

(ess-troe-pip'ate)

Func. class.: Estrogen

USES:

Primary ovarian failure, menopausal symptoms, prevention of osteoporosis, vaginal atrophy

CONTRAINDICATIONS:

Hypersensitivity, coagulation disorders, breast and reproductive cancers, undiagnosed genital bleeding

Black Box Warning:

Pregnancy (X)

DOSAGE AND ROUTES

Calculator

Vaginal atrophy/vulval atrophy/menopausal symptoms

- **Adult (women): PO** 0.75-6 mg/day × 3 wk on 1 wk off, may be used continuously in menopausal symptoms

Primary ovarian failure

- **Adult (women): PO** 1.5-9 mg/day × 3 wk, then off for 8-10 days; if bleeding does not occur, repeat cycle

Osteoporosis prevention

- **Adult (women): PO** 0.75 mg/day × 25 days, 6 days off, repeat as needed

☼ Canada only Side effects: *italics* = common; **bold** = life-threatening ⚠
Nurse Alert

eszopiclone (Rx)

(es-zop'i-klone)

Lunesta

Func. class.: Sedative/hypnotic, nonbenzodiazepine

Chem. class.: Cyclopyrrolone

Controlled Substance Schedule IV

ACTION:

Interacts with GABA receptors

USES:

Insomnia

CONTRAINDICATIONS:

Hypersensitivity, ethanol intoxication

Precautions: Pregnancy (C), breastfeeding, children, geriatric patients, severe hepatic disease, abrupt discontinuation, COPD, depression, labor, sleep apnea, substance abuse, suicidal ideation

DOSAGE AND ROUTES

Calculator

- **Adult: PO** 2 mg immediately before bed, may increase to 3 mg if needed

Hepatic dose/CYP3A4 inhibitors

- **Adult: PO** 1 mg immediately before bed with severe hepatic disease

Available forms: Tabs 1, 2, 3 mg

Administer:

- Do not break, crush, or chew tab
- Immediately before bedtime; avoid use with food; for short-term use only

SIDE EFFECTS

CNS: Worsening depression, hallucinations, headache, daytime drowsiness, suicidal thoughts/actions, migraine, restlessness, anxiety, sleep driving, sleepwalking

CV: Peripheral edema, chest pain

GI: Dry mouth, bitter taste (dysgeusia)

GU: Gynecomastia, dysmenorrhea

INTEG: Rash, **angioedema**

PHARMACOKINETICS

Onset rapid; peak 1 hr; duration 6 hr; extensively metabolized in the liver by CYP3A4, CYP2E1; excreted via kidneys; half-life 6 hr, geriatric patients 9 hr, protein binding 52%-59%

INTERACTIONS

Increase: CNS depression—CNS depressants

Increase: toxicity due to decreased eszopiclone elimination—CYP3A4 inhibitors (clarithromycin, itraconazole, ketoconazole, nefazodone, nelfinavir, ritonavir, troleandomycin, SSRIs)

Drug/Food

Decrease: product action—food

NURSING CONSIDERATIONS

Assess:

- **Sleep pattern:** ability to go to sleep, stay asleep, early morning awakenings, conservative methods used • For abuse of this product, other products
- **Anaphylaxis, angioedema:** monitor during first dose

Perform/provide:

- Alternative methods to improve sleep: reading, quiet environment, warm bath, milk
- Assistance with ambulation, night light, call bell within reach
- Check to see that product swallowed

Evaluate:

- Therapeutic response: ability to fall asleep and stay asleep throughout the night

Teach patient/family:

- That daytime drowsiness may occur; not to engage in hazardous activities until effect is known; that memory problems may occur • That all other medications and supplements should be avoided unless approved by prescriber; to avoid alcohol • To notify prescriber if pregnancy is suspected or planned
- To avoid use after a high fat meal

- To swallow tab whole
- Not to stop drug abruptly, tolerance may occur

🍁 Canada only Side effects: *italics* = common; **bold** = life-threatening ⚠️
Nurse Alert

etanercept (Rx)

(eh-tan'er-sept)

Enbrel

Func. class.: Antirheumatic agent (disease modifying)(DMARDs) *Chem. class.:* Anti-TNF agent

ACTION:

Binds tumor necrosis factor (TNF), which is involved in immune and inflammatory reactions

USES:

Acute, chronic rheumatoid arthritis that has not responded to other disease-modifying agents, polyarticular course of juvenile rheumatoid arthritis (JRA), ankylosing spondylitis, plaque psoriasis, psoriatic arthritis

Unlabeled uses: Crohn's disease; plaque psoriasis (child ≥ 4 yr)

CONTRAINDICATIONS:

Sepsis, active infections

Black Box Warning:

Hypersensitivity to product, latex needle cap, benzyl alcohol

Precautions: Pregnancy (B), breastfeeding, children < 4 yr, geriatric patients, malignancies, CHF, seizures, multiple sclerosis

Black Box Warning:

Infection, lymphoma, neoplastic disease

DOSAGE AND ROUTES

Calculator

Rheumatoid/psoriatic arthritis, ankylosing spondylitis

- **Adult:** SUBCUT 50 mg/wk or 25 mg 2 $\times$ /wk, 3-4 days apart
- **Child 2-17 yr:** SUBCUT 0.8 mg/kg/wk, max 50 mg/wk

Plaque psoriasis

- **Adult:** SUBCUT 50 mg 2 $\times$ /wk $\times$ 3 mo
- **Adolescent/child 4-17 yr (unlabeled):** SUBCUT 0.8 mg/kg/wk, max 50 mg/wk

Juvenile rheumatoid arthritis (JRA)

- **Adolescent/child 2-17 yr:** SUBCUT 0.8 mg/kg/wk, max 50 mg/wk

Available forms: Powder for inj 25 mg; inj 50 mg/ml; autoinjector, single use

Administer:

- After reconstituting 1 ml of supplied diluent, slowly inject diluent into vial, swirl contents; do not shake, sol should be clear/colorless, do not use if cloudy, discolored
- Do not admix with other sol or medications, do not use filter
- May be injected SUBCUT into upper arm, abdomen, thigh; rotate inj sites

SIDE EFFECTS

CNS: *Headache*, asthenia, dizziness

GI: Abdominal pain, dyspepsia, vomiting

HEMA: Pancytopenia, anemia, thrombocytopenia, leukopenia, neutropenia

INTEG: Rash, *inj site reaction*, keratoderma blenorrhagicum

RESP: Pharyngitis, cough, URI, non-URI, sinusitis, rhinitis

SYST: Serious infections, sepsis, death, malignancies

PHARMACOKINETICS

Elimination half-life 102 hr, 60% absorbed (SUBCUT)

INTERACTIONS

- **Increase:** neutropenia—sulfaSALazine
- Do not give concurrently with vaccines; immunizations should be brought up to date before treatment
- Avoid use with anakinra, cyclophosphamide, rilonacept

NURSING CONSIDERATIONS

Assess:

- **RA:** pain, stiffness, ROM, swelling of joints before, during, after treatment
- For inj site pain, swelling; usually occurs after 2 inj (4-5 days)

Black Box Warning:

Infection: patients using immunosuppressives, corticosteroids, methotrexate at greater risk; assess for fever

- **Hypersensitivity:** to this product, latex needle cap, benzyl alcohol; usual reactions to product last 3-5 days

Evaluate:

- Therapeutic response: decreased inflammation, pain in joints

Teach patient/family:

- That product must be continued for prescribed time to be effective
 - To use caution when driving; dizziness may occur
 - Not to receive live vaccinations during treatment
 - About self-administration if appropriate: inj should be made in thigh, abdomen, upper arm; rotate sites at least 1 in from previous site
 - To notify prescriber of possible infection (upper respiratory, other)
-

🍁 Canada only Side effects: *italics* = common; **bold** = life-threatening ⚠️
Nurse Alert

ethambutol (Rx)

(e-tham'byoo-tole)

Etibi , Myambutol

Func. class.: Antitubercular

Chem. class.: Diisopropylethylene diamide derivative

Do not confuse: **ethambutol**/Ethmazine

ACTION:

Inhibits RNA synthesis, decreases tubercle bacilli replication

USES:

Pulmonary TB as an adjunct, other mycobacterial infections

CONTRAINDICATIONS:

Children <13 yr, hypersensitivity, optic neuritis

Precautions: Pregnancy (B), breastfeeding, renal disease, diabetic retinopathy, cataracts, ocular defects, hepatic and hematopoietic disorders

DOSAGE AND ROUTES

Calculator

- **Adult/child >13 yr: PO** 15-25 mg/kg/day as single dose, 50 mg/kg 2×/wk, or 25-30 mg/kg 3×/wk

Renal disease

- CCr 10-50 ml/min, dose q24-36hr; CCr <10 ml/min, dose q48hr

Retreatment

- **Adult: PO** 25 mg/kg/day as single dose × 2 mo with at least 1 other product then decrease to 15 mg/kg/day as single dose, max 2.5 g/day
- **Child: PO** 15 mg/kg/day

Available forms: Tabs 100, 400 mg

Administer:

- With meals to decrease GI symptoms
- Antiemetic if vomiting occurs
- After C&S completed; monthly to detect resistance
- 2 hr before antacids

SIDE EFFECTS

CNS: *Headache, confusion, fever, malaise, dizziness, disorientation, hallucinations, peripheral neuropathy*

EENT: Blurred vision, optic neuritis, photophobia, decreased visual acuity

GI: *Abdominal distress, anorexia, nausea, vomiting*

INTEG: Dermatitis, pruritus, **toxic epidermal necrolysis**, erythema multiforme

META: *Elevated uric acid, acute gout*, impaired hepatic function

MISC: **Thrombocytopenia**, joint pain, **anaphylaxis**

PHARMACOKINETICS

Peak 2-4 hr, half-life 3 hr, metabolized in liver, excreted in urine (unchanged product/inactive metabolites, unchanged product in feces)

INTERACTIONS

- Delayed absorption of ethambutol: aluminum salts, separate by 4 hr
- **Neurotoxicity: other neurotoxics**

NURSING CONSIDERATIONS

Assess:

- Hepatic studies weekly $\times$ 2 wk then q2mo: ALT, AST, bilirubin; decreased appetite, jaundice, dark urine, fatigue
- Signs of anemia: Hct, Hgb, fatigue
- Mental status often: affect, mood, behavioral changes; psychosis may occur
- C&S, including sputum, before treatment
- Visual status: decreased activity, altered color perception
- **Serious skin reactions:** toxic epidermal necrolysis

Evaluate:

- Therapeutic response: decreased symptoms of TB, decrease in acid-fast bacteria

Teach patient/family:

- To avoid alcohol products
 - That compliance with dosage schedule, duration is necessary
 - That scheduled appointments must be kept or relapse may occur
 - **To report to prescriber any visual changes; rash; hot, swollen, painful joints; numbness, tingling of extremities**
-

🍁 Canada only Side effects: *italics* = common; **bold** = life-threatening ⚠️

etodolac

(ee-toe'doe-lak)

Lodine, Lodine XL

Func. class.: Nonsteroidal antiinflammatory/nonopioid analgesic

Do not confuse: **Lodine**/codeine/iodine

ACTION:

Inhibits prostaglandin synthesis by decreasing an enzyme needed for biosynthesis; analgesic, antiinflammatory

USES:

Mild to moderate pain, osteoarthritis

CONTRAINDICATIONS:

Hypersensitivity; patients in whom aspirin, iodides, or NSAIDs have produced asthma; rhinitis, urticaria, nasal polyps, angioedema, bronchospasm

Black Box Warning:

Coronary artery bypass graft surgery (CABG)

Precautions: Edema, renal/hepatic disease, children, GI ulcers, geriatric patients

DOSAGE AND ROUTES

Calculator

Osteoarthritis

- **Adult: PO** 800-1200 mg/day in divided doses every 6-8 hr initially, then adjust dosage to 600-1200 mg/day in divided doses; do not exceed 1200 mg/day; patients <60 kg not to exceed 20 mg/kg; ext rel 400-1200 mg q day

Analgesia

- **Adult: PO** 200-400 mg every 6-8 hr prn for acute pain; do not exceed 1200 mg/day; patients <60 kg, not to exceed 20 mg/kg

Available forms: Caps 200, 300 mg; tabs 400, 500 mg; ext rel 400, 500, 600 mg

Administer:

- Without regard to food
- Store at room temperature

SIDE EFFECTS

CNS: Dizziness, headache, drowsiness, fatigue, tremors, confusion, insomnia, anxiety, depression, lightheadedness, vertigo

CV: Tachycardia, peripheral edema, fluid retention, palpitations, **dysrhythmias, CHF**

EENT: Tinnitus, hearing loss, blurred vision, photophobia

GI: Nausea, anorexia, vomiting, diarrhea, jaundice, **cholestatic hepatitis**, constipation, flatulence, cramps, dry mouth, peptic ulcer, dyspepsia, GI bleeding

GU: **Nephrotoxicity: dysuria, hematuria, oliguria, azotemia, cystitis, urinary tract infection**

HEMA: **Blood dyscrasias**

INTEG: Erythema, urticaria, purpura, rash, pruritus, sweating, **Stevens–Johnson syndrome**

SYST: **Angioedema, anaphylaxis**

PHARMACOKINETICS

Peak 1½-2 hr, serum protein binding >99%, half-life 7 hr; metabolized by liver (metabolites excreted in urine)

INTERACTIONS

Increase: toxicity—cycloSPORINE, digoxin, lithium, methotrexate, phenytoin

Increase: GI toxicity—aspirin

Decrease: effect of—etodolac: antacids

Decrease: effect of—beta blockers, diuretics

NURSING CONSIDERATIONS

Assess:

- **Pain:** location, frequency, characteristics; relief after medication
- Blood, renal, liver tests: BUN, creatinine, AST, ALT, Hgb, before treatment, periodically thereafter
- For GI bleeding: black stools, hematemesis
- Audiometric, ophthalmic examination before, during, after treatment
- For eye, ear problems: blurred vision, tinnitus; can indicate toxicity
- **For asthma, aspirin hypersensitivity, nasal polyps that may be hypersensitive to etodolac**

Evaluate:

- Therapeutic response: decreased pain, stiffness, swelling in joints, ability to

move more easily

Teach patient/family:

- To report blurred vision or ringing, roaring in the ears; might indicate toxicity
- Not to break, crush, or chew ext rel tabs
- To report change in urine pattern, weight increase, edema, pain increase in joints, fever, blood in urine; indicates nephrotoxicity • That therapeutic effects can take up to 1 mo
- To avoid aspirin, NSAIDs, acetaminophen, alcoholic beverages while taking this medication

🍁 Canada only Side effects: *italics* = common; **bold** = life-threatening ⚠️
Nurse Alert

RARELY USED

etomidate (Rx)

(e-tom'i-date)

Amide

Func. class.: General anesthetic

USES:

Induction of general anesthesia

CONTRAINDICATIONS:

Hypersensitivity, labor/delivery

DOSAGE AND ROUTES

Calculator

- **Adult/child >10 yr: IV** 0.2-0.6 mg/kg over 1/2-1 min

HIGH ALERT

etoposide (Rx)

(e-toe-poe'side)

Toposar

etoposide phosphate (Rx)

Etopophos

Func. class.: Antineoplastic—miscellaneous

Chem. class.: Semisynthetic podophyllotoxin

ACTION:

Inhibits cells from entering mitosis, depresses DNA/RNA synthesis, cell-cycle-specific S and G₂; binds to a complex of DNA and topoisomerase II leading to DNA strand breaks

USES:

Testicular cancer

Unlabeled uses: Leukemias (ALL, AML), desmoid tumor, gastric/ovarian cancer, bone marrow ablation, Hodgkin's/non-Hodgkin's lymphoma, malignant glioma, neuroblastoma, stem cell transplant preparation, trophoblastic disease

CONTRAINDICATIONS:

Pregnancy (D), breastfeeding, hypersensitivity

Precautions: Children, renal/hepatic disease, gout

Black Box Warning:

Bone marrow depression, infection, bleeding, requires an experienced clinician

DOSAGE AND ROUTES

Calculator

Testicular cancer

- **Adult:** IV 100 mg/m²/day on days 1, 2 in combination with methotrexate, leucovorin, actinomycin D, cyclophosphamide and vinCRistine (EMA-CO regimen) q2-3wk or 1-5 with bleomycin, CISplatin (BEP regimen) or 100 mg/m²/day on days 1, 3, 5, repeat q3-4wk

Renal dose

- **Adult: IV** CCr 45-60 ml/min, reduce dose by 15%; CCr 30-44 ml/min, reduce dose by 20%; CCr <30 ml/min, reduce dose by 25%

Hepatic dose

- **Adult: IV/PO** total bilirubin 1.5-3 mg/dl reduce dose by 50% total bilirubin 3-5 mg/dl: reduce dose by 75%; total bilirubin >5 mg/dl: hold

Available forms: Inj 20 mg/ml; caps 50 mg

Administer:

- Antiemetic 30-60 min before product and prn to prevent vomiting
- **Urate nephropathy:** Allopurinol, aggressive alkalinization to maintain uric acid levels
- Antispasmodic, EPINEPHrine, corticosteroids, antihistamines for reactions

PO route

- Give without regard to food

IV route

- **Do not use acrylic or ABS plastic devices; may crack, leak**

Intermittent IV INF route (etoposide)

- Use cytotoxic handling procedures, use Luer-Lok fittings to prevent leakage
- After **diluting** 5-ml vial with 100 mg/250 ml or more D₅W or NaCl to 0.2-0.4 mg/ml, **infuse** over 30-60 min

Additive compatibilities: CARBOplatin, cytarabine, floxuridine, fluorouracil, hydrOXYzine, ifosfamide, ondansetron

Y-site compatibilities: Acyclovir, alfentanil, allopurinol, amifostine, amikacin, aminocaproic acid, aminophylline, amiodarone, amphotericin B colloidal, amphotericin B lipid complex, amphotericin B liposome, ampicillin, ampicillin-sulbactam, anidulafungin, atenolol, atracurium, aztreonam, bivalirudin, bleomycin, bumetanide, buprenorphine, butorphanol, calcium chloride/gluconate, CARBOplatin, caspofungin, ceFAZolin, cefoperazone, cefotaxime, cefoTetan, cefOXitin, cefTAZidime, ceftizoxime, cefTRIAXone, cefuroxime, chloramphenicol, chlorproMAZINE, cimetidine, ciprofloxacin, cisatracurium, CISplatin, cladribine, clindamycin, codeine, cyclophosphamide, cycloSPORINE, cytarabine, DACTINomycin, DAPTOmycin, DAUNOrubicin, dexamethasone, dexmedetomidine, dexrazoxane, digoxin, diltiazem, diphenhydrAMINE, DOBUTamine, DOCEtaxel, DOPamine, doxacurium, DOXOrubicin, DOXOrubicin liposomal, doxycycline, droperidol, enalaprilat,

ePHEDrine, EPINEPHrine, epirubicin, ertapenem, erythromycin, esmolol, famotidine, fenoldopam, fentaNYL, floxuridine, fluconazole, fludarabine, fluorouracil, foscarnet, fosphenytoin, furosemide, ganciclovir, gatifloxacin, gemcitabine, gentamicin, glycopyrrolate, granisetron, haloperidol, heparin, hydrALAZINE, hydrocortisone, HYDROmorphone, hydrOXYzine, ifosfamide, imipenem-cilastatin, inamrinone, insulin (regular), irinotecan, isoproterenol, ketorolac, labetalol, lansoprazole, leucovorin, levofloxacin, levorphanol, lidocaine, linezolid, LORazepam, magnesium sulfate, mannitol, mechlorethamine, melphalan, meperidine, meropenem, mesna, methohexital, methotrexate, methyl dopate, methylPREDNISolone, metoclopramide, metoprolol, metroNIDAZOLE, micafungin, midazolam, milrinone, minocycline, mitoXANtrone, mivacurium, morphine, nafcillin, nalbuphine, naloxone, nesiritide, nitroglycerin, nitroprusside, norepinephrine, NS, octreotide, ofloxacin, ondansetron, oxaliplatin, PACLitaxel, palonosetron, pamidronate, pancuronium, PEMEtrexed, pentamidine, pentazocine, PENTobarbital, PHENobarbital, phenylephrine, piperacillin, piperacillin-tazobactam, polymyxin B, potassium chloride/phosphates, procainamide, prochlorperazine, promethazine, propranolol, quinupristin-dalfopristin, ranitidine, remifentanyl, rocuronium, sargramostim, sodium acetate/bicarbonate/phosphates, succinylcholine, SUFentanyl, sulfamethoxazole-trimethoprim, tacrolimus, teniposide, theophylline, thiotepa, ticarcillin, ticarcillin-clavulanate, tigecycline, tirofiban, tobramycin, topotecan, trimethobenzamide, vancomycin, vasopressin, vecuronium, verapamil, vinBLASTine, vinCRISTine, vinorelbine, voriconazole, zidovudine, zoledronic acid

Intermittent IV INF route (etoposide phosphate)

- **Reconstitute** each vial with 5 or 10 ml of D₅W, 0.9% NaCl for a concentration of 20 mg/ml or 10 mg/ml, respectively; may give diluted or undiluted to concentration of as little as 0.1 mg/ml, **give** over 5-210 min

Y-site compatibilities: Acyclovir, alfentanil, amifostine, amikacin, aminocaproic acid, aminophylline, amiodarone, ampicillin, ampicillin-sulbactam, anidulafungin, atenolol, atracurium, aztreonam, bivalirudin, bleomycin, bumetanide, buprenorphine, butorphanol, calcium acetate/chloride/gluconate, CARBOplatin, carmustine, caspofungin, ceFAZolin, cefonicid, cefoperazone, cefotaxime, cefoTEtan, cefOXitin, cefTAZidime,

ceftizoxime, cefTRIAxone, cefuroxime, chloramphenicol, cimetidine, ciprofloxacin, cisatracurium, CISplatin, clindamycin, codeine, cyclophosphamide, cycloSPORINE, cytarabine, dacarbazine, DACTINomycin, DAPTOMycin, DAUNOrubicin, dexamethasone, digoxin, diltiazem, diphenhydrAMINE, DOBUTamine, DOCEtaxel, DOPamine, doripenem, doxacurium, DOXOrubicin, HCL/liposome, doxycycline, enalaprilat, ePHEDrine, EPINEPHrine, epirubicin, ertapenem, erythromycin, esmolol, famotidine, fenoldopam, fentaNYL, floxuridine, fluconazole, fludarabine, fluorouracil, foscarnet, fosphenytoin, furosemide, ganciclovir, gatifloxacin, gemcitabine, gentamicin, glycopyrrolate, granisetron, haloperidol, heparin, hydrALAZINE, hydrocortisone, HYDROmorphone, hydrOXYzine, IDArubicin, ifosfamide, inamrinone, insulin (regular), irinotecan, isoproterenol, ketorolac, labetalol, leucovorin, levofloxacin, levorphanol, lidocaine, linezolid, LORazepam, magnesium sulfate, mannitol, mechlorethamine, meperidine, meropenem, mesna, metaraminol, methotrexate, methyl dopate, metoclopramide, metoprolol, metroNIDAZOLE, midazolam, milrinone, minocycline, mitoXANtrone, mivacurium, morphine, nafcillin, nalbuphine, naloxone, nesiritide, netilmicin, nitroglycerin, nitroprusside, norepinephrine, octreotide, ofloxacin, ondansetron, oxaliplatin, PACLitaxel, palonosetron, pamidronate, pancuronium, PEMEtrexed, pentamidine, pentazocine, PENTobarbital, PHENobarbital, phenylephrine, piperacillin, piperacillin-tazobactam, plicamycin, polymyxin B, potassium chloride/phosphates, procainamide, promethazine, propranolol, quiNIDine, quinupristin-dalfopristin, ranitidine, remifentanyl, riTUXimab, rocuronium, sodium acetate/bicarbonate/phosphates, streptozocin, succinylcholine, SUFentanyl, sulfamethoxazole-trimethoprim, tacrolimus, teniposide, theophylline, thiopental, thiotepa, ticarcillin, ticarcillin-clavulanate, tigecycline, tirofiban, tobramycin, tolazoline, trastuzumab, trimethobenzamide, vancomycin, vasopressin, vecuronium, verapamil, vinBLASline, vinCRISline, vinorelbine, voriconazole, zidovudine, zoledronic acid

SIDE EFFECTS

CNS: Headache, *fever*, peripheral neuropathy, paresthesias, confusion, chills, fever

CV: Hypotension, MI, dysrhythmias

GI: Nausea, vomiting, anorexia, hepatotoxicity, dyspepsia, diarrhea, constipation

GU: Nephrotoxicity

HEMA: Thrombocytopenia, leukopenia, myelosuppression, anemia

INTEG: Rash, alopecia, phlebitis at IV site, Stevens-Johnson syndrome

RESP: Bronchospasm

SYST: Anaphylaxis, secondary malignancy

PHARMACOKINETICS

Half-life 7 hr, metabolized in liver, excreted in urine, feces, crosses placental barrier, protein binding 95%

INTERACTIONS

Increase: bone marrow depression—other antineoplastics, radiation, immunosuppressives

Increase: adverse reactions—live virus vaccines, toxoids

Increase: effect of etoposide, toxicity—voriconazole, conivaptan, cycloSPORINE, imatinib, nilotinib, etravirine, telithromycin

Increase: risk of bleeding—anticoagulants, NSAIDs, platelet inhibitors, thrombolytics, salicylate

Decrease: etoposide effect—sargramostim, filgrastim, separate by ≥ 24 hr

Drug/Food

- Decreased oral etoposide—grapefruit juice

Drug/Lab Test

Decrease: platelets, RBC, WBC, neutrophils, Hgb, calcium, phosphate

Increase: uric acid, potassium

NURSING CONSIDERATIONS

Assess:

Black Box Warning:

Bone marrow depression: CBC, differential, platelet count weekly; withhold product if WBC is <500 or platelet count is $<50,000$; notify prescriber, treatment should be delayed

- **Nephrotoxicity:** BUN; serum uric acid; urine CCr; electrolytes before, during therapy; I&O ratio; report fall in urine output to <30 ml/hr; check B/P bid, report any significant decrease

Black Box Warning:

Infection: Monitor temp; fever may indicate beginning infection, treat active infection before treatment

Black Box Warning:

Infection: Hepatic studies before, during therapy (bilirubin, AST, ALT, LDH) as needed or monthly

Black Box Warning:

Bleeding: hematuria, guaiac stools, bruising or petechiae, mucosa or orifices q8hr

- Effects of alopecia on body image; discuss feelings about body changes
- **Hepatotoxicity:** Jaundice of skin and sclera, dark urine, clay-colored stools, itchy skin, abdominal pain, fever, diarrhea • B/P q15min during inf; if systolic reading <90 mm Hg, discontinue inf, notify prescriber • Buccal cavity q8hr for dryness, sores or ulceration, white patches, oral pain, bleeding, dysphagia
- **Injection site reaction:** monitor site closely for infiltration
- Local irritation, pain, burning, discoloration at inj site
- **Symptoms indicating severe allergic reaction:** rash, pruritus, urticaria, purpuric skin lesions, itching, flushing, restlessness, coughing, difficulty breathing • **Frequency of stools, characteristics:** cramping, acidosis; **signs of dehydration:** rapid respirations, poor skin turgor, decreased urine output, dry skin, restlessness, weakness • **Geriatric patients:** increased alopecia, GI effects, infection, nephrotoxicity, myelosuppression

Perform/provide:

Black Box Warning:

An experienced clinician knowledgeable in the use of cytotoxic products

- Increased fluid intake to 2-3 L/day to prevent urate deposits, calculi formation
- Refrigerate oral product, do not freeze

Evaluate:

- Therapeutic response: decreased tumor size, spread of malignancy

Teach patient/family:

- To report any changes in breathing or coughing
- That hair may be lost during treatment; that a wig or hairpiece may make patient feel better; that new hair may be different in color, texture • That metallic taste may occur

Black Box Warning:

Infection: To report symptoms of infection (fever, sore throat); to avoid crowds, persons with known infections

- To avoid immunizations

- **Pregnancy:** To notify prescriber if pregnancy is planned or suspected pregnancy (D); to use reliable contraception during and for several months after therapy; to avoid breastfeeding • To take as prescribed (PO), not to double dose
 - To report signs of infection (flu-like symptoms, fever, fatigue, sore throat)
 - To take B/P often, hypotension occurs
-

🌿 Canada only Side effects: *italics* = common; **bold** = life-threatening ⚠️
Nurse Alert

etravirine (Rx)

(e-tra'veer-een)

INTELENCE

Func. class.: Antiretroviral

Chem. class.: Nonnucleoside reverse transcriptase inhibitor (NNRTI)

ACTION:

Binds directly to reverse transcriptase, thus blocking the RNA-and DNA-dependent DNA polymerase action and causing a disruption of the enzyme's catalytic site

USES:

In combination with other antiretroviral agents for HIV infection in treatment-experienced patients with evidence of HIV replication despite ongoing antiretroviral therapy

CONTRAINDICATIONS:

Breastfeeding, hypersensitivity

Precautions: Pregnancy (B), children, geriatric patients, impaired hepatic function, antimicrobial resistance, hepatitis, hypercholesterolemia, hypertriglycerides, immune reconstitution syndrome

DOSAGE AND ROUTES

Calculator

• **Adult: PO** 200 mg bid after a meal, max 400 mg/day; not established for treatment-naïve patients

Available forms: Tabs 100, 200 mg

Administer:

- In combination with other antiretrovirals with food or after a meal
- Tabs may be dispersed in water; once dispersed, stir well, give immediately, rinse glass, have patient drink to ensure all medication taken

SIDE EFFECTS

CNS: Headache, insomnia, amnesia, anxiety, confusion, fatigue, nightmares, peripheral neuropathy, seizures, stroke, tremor

CV: Atrial fibrillation, hypertension, MI

EENT: Blurred vision

GI: Nausea, vomiting, diarrhea, anorexia, abdominal pain, increased AST/ALT, constipation, flatulence, gastritis, GERD, hematemesis, hepatitis, hepatomegaly, pancreatitis

GU: Renal failure

HEMA: Hemolytic anemia, neutropenia, thrombocytopenia, anemia

INTEG: Rash, erythema multiforme, angioedema, Stevens-Johnson syndrome

MS: Rhabdomyolysis

OTHER: Diabetes mellitus, gynecomastia, hyperamylasemia, hypercholesterolemia, hyperglycemia, hyperlipidemia

RESP: Dyspnea, bronchospasm

PHARMACOKINETICS

99.9% plasma protein binding; metabolized by CYP3A4, 2C9, 2C19; half-life 21-61 hr; excreted in feces

INTERACTIONS

• Do not use concurrently with atazanavir, carbamazepine, delavirdine, fosamprenavir, fosphenytoin, phenytoin, phenobarbital, rifapentine, rifampin, tipranavir, rilpivirine • Altered effect of cyclosporine, tacrolimus, sirolimus

Increase: myopathy, rhabdomyolysis—HMG-CoA reductase inhibitors

Increase: etravirine levels—CYP3A4 inhibitors (fluconazole, itraconazole, ketoconazole, lopinavir, posaconazole, ritonavir, voriconazole)

Increase: withdrawal symptoms—methadone

Increase: levels of diazepam, rifampin, voriconazole, warfarin

Decrease: levels of CYP3A4 inducers (amiodarone, atazanavir, clarithromycin, flecainide, fosamprenavir, lidocaine, mexiletine, propafenone, quinidine, sildenafil, tadalafil, vardenafil)

Decrease: etravirine levels—darunavir, dexamethasone, disopyramide, efavirenz, nevirapine, ritonavir, saquinavir, tipranavir

Drug/Herb

Decrease: etravirine—St. John's wort

NURSING CONSIDERATIONS

Assess:

- **Symptoms of HIV**, possible infections; increased temp

⚠ Fatal hypersensitivity reactions: fever, rash, nausea, vomiting, fatigue, cough, dyspnea, diarrhea, abdominal discomfort; treatment should be discontinued and not restarted • **Blood dyscrasias** (anemia, granulocytopenia): bruising, fatigue, bleeding, poor healing • **Renal failure:** BUN, serum uric acid, CCr before, during therapy; may be elevated throughout treatment

- **Hepatitis/pancreatitis:** hepatic studies before and during therapy: bilirubin, AST, ALT, amylase, alk phos, creatine phosphokinase, creatinine, monthly

- **HIV:** monitor viral load, CD4 counts, plasma HIV RNA during treatment; watch for decreasing granulocytes, Hgb; if low, therapy may have to be discontinued and restarted after hematologic recovery; blood transfusions may be required; cholesterol/lipid profile

Perform/provide:

- Storage in cool environment; protect from light

Evaluate:

- Therapeutic response: increased CD4 count, decreased viral load

Teach patient/family:

- That product is not a cure but will control symptoms; that patient is still infective, may pass AIDS virus to others • To notify prescriber of sore throat, swollen lymph nodes, malaise, fever; other infections may occur; to stop product and notify prescriber immediately if skin rash, fever, cough, SOB, GI symptoms occur; to advise all health care providers that allergic reaction has occurred with etravirine • That follow-up visits must be continued, since serious toxicity may occur; blood counts must be performed • To use contraception during treatment; that patient still able to transmit disease

- About information on medication guide and warning card; discuss points on guide

- That other products may be necessary to prevent other infections

- To take medication after a meal

✳ Canada only Side effects: *italics* = common; **bold** = life-threatening ⚠

Nurse Alert

everolimus (Rx)

(e-ve-ro'li-mus)

Afinitor, Afinitor Disperz, Zortress

Func. class.: Antineoplastic—miscellaneous

Chem. class.: Immunosuppressant, macrolide

Do not confuse: everolimus/sirolimus/tacrolimus/temsirolimus

ACTION:

Proliferation signal inhibitor that inhibits mammalian target of rapamycin (mTOR); this pathway is dysregulated in cancer

USES:

Renal cell cancer in those with failed treatment with sorafenib or SUNItinib
kidney transplant rejection prophylaxis with cycloSPORINE, subependymal giant cell astrocytoma, progressive pancreatic neuroendocrine tumor (PNET) with unresectable locally advanced/metastatic disease, breast cancer hormone receptor positive/HER-2 negative, renal angiomyolipoma, tuberous sclerosis complex

CONTRAINDICATIONS:

Breastfeeding; hypersensitivity to this product, Rapamune, torisel, pregnancy (D)

Precautions: Children, renal/hepatic disease; diabetes mellitus, hyperlipidemia, plural effusion

Black Box Warning:

Immunosuppression, infection, renal artery thrombosis, renal impairment, renal vein thrombosis

DOSAGE AND ROUTES

Calculator

Kidney transplant rejection prophylaxis (Zortress)

- **Adult: PO** 0.75 mg q12hr with cycloSPORINE in combination with basiliximab, corticosteroids, reduced doses of cycloSPORINE

Advanced renal cancer (Afinitor)

- **Adult: PO** 10 mg daily as long as clinically beneficial; with strong 3A4 inducers 10 mg daily then may increase by 5 mg increments to 20 mg daily

Progressive neuroendocrine tumor (PNET) (Afinitor only)

- **Adult: PO** 10 mg daily, reduce dose to 5 mg daily if intolerable adverse reactions occur

Subependymal giant-cell astrocytoma (SEGA) (Afinitor only)

- **Adult/adolescent/Child:** 4.5 mg/m² q day, then titrate to a target trough of 5-15 ng/ml

Hepatic dose

- **Adult: PO** (Child-Pugh A): Afinitor 7.5 mg/day; (Child-Pugh B) Afinitor: 5 mg/day; Zortress: 0.75 mg/day divided q12hr; (Child-Pugh C) Afinitor 2.5 mg/day

Available forms: Tabs 0.25, 0.5, 0.75 (Zortress); 2.5, 5, 7.5, 10 mg (Afinitor)

Administer:

- Follow procedure for proper handling of antineoplastics
- Swallow tabs whole with a full glass of water; do not chew, crush, or break
- **Afinitor:** take at same time of day; if unable to swallow, consistently with or without food, disperse in 30 ml of water • **Zortress:** must take consistently with/without food, give at same time of day q12hr with cycloSPORINE
- Store protected from light at room temp

Afinitor adjustments for toxicity**Noninfectious pneumonitis**

- Grade 1, asymptomatic with radiographic findings only: No dosage change
- Grade 2, symptomatic but no interference with activities of daily living (ADL): Consider withholding therapy, resume Afinitor at a lower dosage when symptoms improve to ≤ grade 1; discontinue Afinitor if symptoms do not improve within 4 wk • Grade 3, symptomatic and interfering with ADL and oxygen therapy indicated: hold therapy. Consider resuming Afinitor at a lower dosage when symptoms improve to ≤ grade 1. Consider discontinuing Afinitor if grade 3 toxicity recurs • Grade 4, life-threatening and ventilator support indicated: discontinue therapy

Stomatitis

- Grade 1, minimum symptoms and normal diet: No dosage adjustment required
- Grade 2, symptomatic but can eat and swallow modified diet: Hold therapy until symptoms improve to ≤ grade 1 and resume Afinitor at the same dosage. If grade 2 toxicity recurs, hold therapy and resume Afinitor at a lower dosage when symptoms improve to ≤ grade 1
- Grade 3, symptomatic and unable to adequately eat or hydrate orally: Hold therapy. Resume Afinitor at a lower dosage when symptoms improve to ≤

grade 1

- Grade 4, symptomatic and life-threatening: discontinue therapy

Other nonhematologic toxicity (excluding metabolic events)

- **Grade 1:** No dosage adjustment required if toxicity is tolerable
- **Grade 2:** No dosage adjustment required if toxicity is tolerable. If toxicity is intolerable, hold therapy until symptoms improve to $\leq$ grade 1 and resume Afinitor at the same dosage. If grade 2 toxicity recurs, hold therapy and resume Afinitor at a lower dosage when symptoms improve to $\leq$ grade 1
- **Grade 3:** Hold therapy. Consider resuming Afinitor at a lower dosage when symptoms improve to $\leq$ grade 1. If grade 3 toxicity recurs, consider discontinuing therapy
- **Grade 4:** Discontinue Afinitor therapy

Metabolic events (hyperglycemia, dyslipidemia)

- **Grade 1 or 2:** No dose adjustment required
- **Grade 3:** Temporarily withhold therapy. Resume Afinitor at a lower dosage
- **Grade 4:** Discontinue Afinitor therapy

SIDE EFFECTS

CNS: Headache, insomnia, paresthesia, chills, fever, seizure/personality changes/dizziness

CV: Hypertension, CHF, peripheral edema

EENT: Blurred vision, photophobia

GI: Nausea, vomiting, diarrhea, constipation, stomatitis

GU: Renal failure

HEMA: Anemia, leukopenia, thrombocytopenia

INTEG: Rash, acne

META: Hyperglycemia, increased creatinine, hyperlipemia, hypophosphatemia, weight loss

RESP: Pleural effusion, dyspnea, noninfectious pneumonitis, pulmonary embolism

PHARMACOKINETICS

Rapidly absorbed; peak 1-2 hr; protein binding 74%; extensively metabolized by CYP3A4 enzyme system; half-life 30 hr; reduced by high-fat meal; excreted in feces (80%), urine (5%)

INTERACTIONS

Increase: Everolimus effect—CYP3A4 inhibitors (strong, moderate),

antifungals, calcium channel blockers, cimetidine, danazol, erythromycin, cycloSPORINE, HIV-protease inhibitors

Decrease: blood levels of everolimus—carbamazepine, phenobarbital, phenytoin, rifamycin, rifapentine

Increase: nephrotoxicity—immunosuppressants

Decrease: effect of live vaccines

Drug/Herb

- St. John's wort: may decrease effect of everolimus

Drug/Food

- Alters bioavailability; use consistently with/without food; do not use with grapefruit juice

Drug/Lab Test

Increase: bilirubin, calcium, cholesterol, glucose, potassium, lipids, phosphate, triglycerides, uric acid

Decrease: calcium, glucose, potassium, magnesium, phosphate

NURSING CONSIDERATIONS

Assess:

- Lipid profile: cholesterol, triglycerides, lipid-lowering agent may be needed; blood glucose

Black Box Warning:

Immunosuppression: CBC with differential during treatment monthly; if leukocytes $<3000/\text{mm}^3$ or platelets $<100,000/\text{mm}^3$, product should be discontinued or reduced; decreased hemoglobin level may indicate bone marrow suppression

- Hepatic/renal studies: AST, ALT, amylase, bilirubin, creatinine, phosphate, and for hepatotoxicity: dark urine, jaundice, itching, light-colored stools; product should be discontinued

Black Box Warning:

Infection: bacterial fungal infections can occur and are more common with combination immunosuppression therapy

- **Renal artery/vein thrombosis (Zortress):** May result in graft loss within 30 days after transplantation • Obtain everolimus blood levels in kidney transplant, hepatic disease, CYP3A4 inducers, inhibitors

Evaluate:

- Therapeutic response

Teach patient/family:

Black Box Warning:

To report fever, rash, severe diarrhea, chills, sore throat, fatigue; serious infections may occur; to report clay-colored stools, cramping (hepatotoxicity)

Black Box Warning:

To avoid crowds, persons with known infections to reduce risk for infection

- **Pregnancy:** to notify prescriber if pregnancy is planned or suspected, pregnancy (D) • To use contraception before, during, and 12 wk after product discontinued; to avoid breastfeeding • Not to use with grapefruit juice
- To avoid live vaccines
- That product may decrease male, female fertility
- That drinking alcohol is not recommended
- To take consistently with or without food
- To report vision changes, weight gain, edema, shortness of breath

☼ Canada only Side effects: *italics* = common; **bold** = life-threatening ⚠
Nurse Alert

exemestane (Rx)

(ex-em'eh-stane)

Aromasin

Func. class.: Antineoplastic

Chem. class.: Aromatase inhibitor

Do not confuse: exemestane/ezetimibe/estramustine

ACTION:

Lowers serum estradiol concentrations; many breast cancers have strong estrogen receptors

USES:

Advanced breast carcinoma not responsive to other therapy (postmenopausal)

CONTRAINDICATIONS:

Pregnancy (X), breastfeeding, premenopausal women, hypersensitivity

Precautions: Children, geriatric patients, renal/hepatic disease

DOSAGE AND ROUTES

Calculator

- **Adult: PO** 25 mg/day after meals; may need 50 mg/day if taken with a potent CYP3A4 inducer

Available forms: Tabs 25 mg

Administer:

- After meals at same time of day

SIDE EFFECTS

CNS: Headache, depression, insomnia, anxiety, fatigue, hot flashes, diaphoresis, dizziness

CV: Hypertension, edema

GI: Nausea, vomiting, diarrhea, constipation, abdominal pain, increased appetite

HEMA: Lymphopenia

MS: Fracture, bone loss

RESP: Cough, dyspnea

PHARMACOKINETICS

Half-life 24 hr; excreted in feces, urine

INTERACTIONS

Decrease: exemestane action—CYP3A4 inducers, estrogens

NURSING CONSIDERATIONS

Assess:

- B/P; hypertension may occur
- Bone mineral density, x-ray of thoracic or lumbar spine if bone changes suspected

Perform/provide:

- At room temp

Evaluate:

- Therapeutic response: decreased tumor size, spread of malignancy

Teach patient/family:

- To report any complaints, side effects to prescriber
- That hot flashes are reversible after discontinuing treatment
- **To use reliable contraception (pregnancy X); not to breastfeed**
- That vit D, calcium may be used for bone loss

☼ Canada only Side effects: *italics* = common; **bold** = life-threatening ⚠
Nurse Alert

exenatide (Rx)

(ex-en'a-tide)

Bydureon, Byetta

Func. class.: Antidiabetic

Chem. class.: Incretin mimetic

ACTION:

Binds and activates known human GLP-1 receptor, mimics natural physiology for self-regulating glycemic control

USES:

Type 2 diabetes mellitus given in combination with metFORMIN, a sulfonylurea, or a thiazolidinedione

Unlabeled uses: Once-weekly dosing

CONTRAINDICATIONS:

Hypersensitivity

Precautions: Pregnancy (C), geriatric patients, severe renal/hepatic/GI disease, pancreatitis

DOSAGE AND ROUTES

Calculator

• **Adult: SUBCUT** 5 mcg bid 1 hr before morning and evening meal; may increase to 10 mcg bid after 1 mo of therapy; ext rel SUBCUT (Bydureon) 2 mg q7days; ext rel inj 2 mg q7days

Available forms: Inj 5, 10 mcg pen; ext rel powder for susp for inj 2 mg

Administer:

SUBCUT route (regular release—Byetta)

- May be used as monotherapy or combined with other products
- SUBCUT only, do not give IV/IM
- Pen needles must be purchased separately, compatible; prime before use; inject into thigh, abdomen, upper arm; rotate sites
- Product 1 hr before meals, approximately 6 hr apart; if patient is NPO, may need to hold dose to prevent hypoglycemia
- If added to insulin glargine, insulin, or detemir, a dosage

reduction in these products may be required

SUBCUT route (ext rel—Bydureon)

- Use at same time of day q7days without regard to meals
- Give every 7 days (weekly); the dose can be given at any time of day without regard to meals
- Available as a single-dose tray containing a vial of 2 mg, a pre-filled syringe delivering 0.65 ml diluent, a vial connector, and two custom needles (23GX 5/16') specific to this delivery system (one is a spare needle); do not substitute needles or any other components
- Inject immediately after the white to off-white powder is suspended in the diluent and transferred to the syringe
- Inject subcut into the thigh, abdomen, or upper arm, rotate sites to prevent lipodystrophy

SIDE EFFECTS

CNS: *Headache, dizziness, feeling jittery, restlessness, weakness*

ENDO: **Hypoglycemia**

GI: Nausea, vomiting, diarrhea, dyspepsia, anorexia, gastroesophageal reflux, weight loss, **pancreatitis**

SYST: Angioedema, anaphylaxis, inj site reactions

PHARMACOKINETICS

Peak 2.1 hr, elimination by glomerular filtration

INTERACTIONS

- May decrease effect of acetaminophen
- **Do not use with erythromycin, metoclopramide**

Increase: hypoglycemia—ACE inhibitors, disopyramide, sulfonylureas, androgens, fibric acid derivatives, alcohol

Increase: hyperglycemia—phenothiazines, corticosteroids, anabolic steroids

Decrease: action of digoxin, lovastatin, acetaminophen (elixir)

Decrease: hypoglycemia—niacin, dextrothyroxine, thiazide diuretics, triamterene, estrogens, progestins, oral contraceptives, MAOIs

NURSING CONSIDERATIONS

Assess:

- Fasting blood, glucose, A1c levels, postprandial glucose during treatment to

determine diabetes control • **Pancreatitis:** severe abdominal pain, with or without vomiting, product should be discontinued • Renal studies: urinalysis, creatinine

- Hypo/hyperglycemic reaction that can occur soon after meals; for severe hypoglycemia, give IV D₅₀W then IV dextrose solution • Nausea, vomiting, diarrhea, ability to tolerate product, may cause dehydration

Perform/provide:

- Storage in refrigerator for unopened pen; may store at room temp after opening for up to 30 days

Evaluate:

- Therapeutic response: decrease in polyuria, polydipsia, polyphagia, clear sensorium, improving A1c, weight; absence of dizziness, stable gait

Teach patient/family:

- About the symptoms of hypo/hyperglycemia, what to do about each; to have glucagon emergency kit available; to carry a glucose source (candy, sugar cube) to treat hypoglycemia • That product must be continued on a daily basis; about consequences of discontinuing product abruptly • That diabetes is a lifelong illness; product will not cure disease; to carry emergency ID with prescriber and medication information • To continue weight control, dietary restrictions, exercise, hygiene

- That regular blood glucose monitoring and A1c testing is needed

- **To notify prescriber if pregnant or intending to become pregnant (X)**

- About the importance of reading “Information for the Patient” and “Pen User Manual;” about self-injection • **Pancreatitis:** If severe abdominal pain with or without vomiting occurs seek medical attention immediately • Review injection procedure, to store product in refrigerator, room temperature after first use, discard 30 days after first use, do not freeze, protect from light (Byetta)

✳ Canada only Side effects: *italics* = common; **bold** = life-threatening ⚠
Nurse Alert

ezetimibe (Rx)

(ehz-eh-tim'bee)

Ezetrol , Zetia

Func. class.: Antilipemic; cholesterol absorption inhibitor

ACTION:

Inhibits absorption of cholesterol by the small intestine, causes reduced hepatic cholesterol stores

USES:

Hypercholesterolemia, homozygous familial hypercholesterolemia (HoFH), homozygous sitosterolemia

CONTRAINDICATIONS:

Hypersensitivity, severe hepatic disease

Precautions: Pregnancy (C), breastfeeding, children, hepatic disease

DOSAGE AND ROUTES

Calculator

- **Adult/adolescent/child >10 yr:** PO 10 mg/day; may be given with HMG-CoA reductase inhibitor at same time; may be given with bile acid sequestrant; give ezetimibe 2 hr before or 4 hr after bile acid sequestrant

Available forms: Tabs 10 mg

Administer:

- Without regard to meals

SIDE EFFECTS

CNS: Fatigue, dizziness, headache

GI: Diarrhea, abdominal pain

MISC: Chest pain

MS: Myalgias, arthralgias, back pain, myopathy, rhabdomyolysis

RESP: Pharyngitis, sinusitis, cough, URI

SYST: Angioedema

PHARMACOKINETICS

Metabolized in small intestine, liver; excreted in feces 78%, urine 11%; peak 4-12 hr; half-life 22 hr

INTERACTIONS

Increase: action of ezetimibe—fibric acid derivatives, cycloSPORINE

Decrease: action of ezetimibe—antacids, cholestyramine

Drug/Lab Test

Increase: LFTs

NURSING CONSIDERATIONS

Assess:

- **Hypercholesterolemia:** diet history: fat content, lipid levels (triglycerides, LDL, HDL, cholesterol); LFTs at baseline, periodically during treatment
- **Myopathy/rhabdomyolysis:** increased CPK, myalgia, muscle cramps, musculoskeletal pain, lethargy, fatigue, fever; more common when combined with statins

Evaluate:

- Therapeutic response: decreased cholesterol, LDL; increased HDL

Teach patient/family:

- That compliance is needed
- That risk factors should be decreased: high-fat diet, smoking, alcohol consumption, absence of exercise
- To notify prescriber if pregnancy suspected, planned or if breastfeeding
- **To notify prescriber if unexplained weakness, muscle pain present**
- To notify prescriber of dietary/herbal supplements

☼ Canada only Side effects: *italics* = common; **bold** = life-threatening ⚠
Nurse Alert

ezogabine

(e-zog'a-been)

Potiga

Func. class.: Anticonvulsant

ACTION:

The exact mechanism of anticonvulsant effects is not fully known. However, studies indicate that the drug enhances transmembrane potassium currents, which may stabilize the resting membrane potential and reduce brain excitability. May also augment GABA-mediated currents.

USES:

Partial seizures, migraines

CONTRAINDICATIONS:

Hypersensitivity

Precautions: Suicidal ideation/behavior, prostatic hypertrophy, dementia, psychotic disorders, QT prolongation, congestive heart failure, ventricular hypertrophy, hypokalemia, hypomagnesemia, abrupt discontinuation, renal impairment, hepatic disease, geriatrics pregnancy category C, breastfeeding, neonates, infants, children, adolescents

DOSAGE AND ROUTES

Calculator

- **Adult/geriatric patient ≤65 years of age: PO** Initially, 100 mg tid, increase by ≤50 mg tid per day at weekly intervals depending on response, up to a maintenance dose of 200-400 mg tid depending on response; max is 400 mg tid (1200 mg/day).
- **Geriatric patient > 65 years of age: PO** initially, 50 mg tid, increase by ≤ 50 mg tid per day at weekly intervals depending on response; max 250 mg tid (750 mg/day).

Available forms: Film-coated tabs 50, 200, 300, 400 mg

Administer:

- Tab should be swallowed whole without regard to meals

- Give in 3 equally divided doses

SIDE EFFECTS

CNS: Dizziness, drowsiness, memory impairment, tremor, vertigo, abnormal coordination, disturbance in attention, gait disturbance, aphasia, dysarthria, balance disorder, paresthesias, amnesia, dysphagia, myoclonia, hypokinesia, confusion, anxiety, hallucinations, **suicidal thoughts/behaviors**, fatigue, asthenia, malaise

EENT: Diplopia, blurred vision

GU: Urinary retention, hydronephrosis, dysuria, urinary hesitation, hematuria, chromaturia

GI: Nausea, constipation, dyspepsia, xerostomia, constipation, weight gain, appetite stimulation

MISC: Influenza, dyspnea, **QT prolongation**

MS: Muscle spasms, weakness

PHARMACOKINETICS

80% protein bound; extensively distributed in the body; extensively metabolized by glucuronidation and acetylation; inactive N-glucuronides are the primary metabolites; elimination half-lives of ezogabine and its N-acetyl metabolite are 7 hr and 11 hr, respectively; 36% excreted renally as exogabine, 18% as NAMR, 24% as the N-glucuronides of ezogabine and NAMR, 14% fecal excretion; rapidly absorbed, peak 0.5-2 hr, bioavailability 60%; high-fat food increases peak concentration; increased in hepatic/renal disease, geriatric patients, young adult females

INTERACTIONS:

Increase: QT prolongation—arsenic trioxide, chloroquine, chlorproMAZINE, mesoridazine thioridazine, clarithromycin, Class IA antiarrhythmics (disopyramide, procainamide, quinidine), Class III antiarrhythmics (amiodarone, dofetilide, ibutilide, sotalol), dextromethorphan, dronedarone, droperidol, erythromycin, grepafloxacin, halofantrine, levomethadyl, methadone, pentamidine, pimozide, posaconazole, probucol, propafenone, quinidine, saquinavir, sparfloxacin, terfenadine, troleandomycin, ziprasidone

Decrease: effect of phenytoin

Decrease: effect of ezogabine—carbamazepine

Increase: effect of digoxin

Increase: urinary retention—antimuscarinics, amantadine, H1-blockers

Increase: CNS depression—anxiolytics, sedatives, hypnotics, buprenorphine, butorphanol, dronabinol, mirtazapine, nabilone, nalbuphine, opiate agonists, pentazocine, pregabalin, skeletal muscle relaxants, traMADol, traZODone, ethanol

NURSING CONSIDERATIONS

Assess:

⚠ **Seizures:** Assess for type, duration, location, activity, presence of aura ⚠ **QT prolongation:** Monitor in those with known QT prolongation, congestive heart failure, ventricular hypertrophy, hypokalemia, hypomagnesemia, and in patients receiving medications known to cause QT prolongation. QT prolongation can occur within 3 hr of dose ⚠ **Abrupt withdrawal:** Withdraw gradually to minimize increased seizure frequency ⚠ **Suicidal thoughts/behaviors:** Assess for any unusual changes in moods or behaviors, including emotional lability or emerging or worsening depression and suicidal ideation

Teach patient/family:

- To avoid driving or operating machinery or performing other tasks that require mental alertness until reaction is known
- To avoid concurrent use of alcohol
- To avoid abruptly discontinuing this product

⚠ **Suicidal thought/behaviors:** Advise patient to notify prescriber immediately of suicidal thought/behaviors

🌿 Canada only Side effects: *italics* = common; **bold** = life-threatening ⚠
Nurse Alert

HIGH ALERT

factor IX complex (human) (Rx)

AlphaNine SD, Bebulin, BeneFIX, Mononine, Profilnine SD

Func. class.: Hemostatic

Chem. class.: Factors II, VII, IX, X

ACTION:

Causes an increase in blood levels of clotting factors II, VII, IX, X; factor IX (human) has IX activity

USES:

Hemophilia B (Christmas disease), factor IX deficiency, anticoagulant reversal, control of bleeding in patients with factor VIII inhibitors, reversal of overdose of anticoagulants in emergencies

CONTRAINDICATIONS:

Hypersensitivity to mouse or hamster protein, DIC, mild factor IX deficiency

Precautions: Pregnancy (C), neonates/infants, hepatic disease, elective surgery

DOSAGE AND ROUTES

Calculator

Factor IX complex (human) bleeding in hemophilia B

- **Adult and child: IV** establish 25% of normal factor IX or 60-75 units/kg then 10-20 units/kg/day 1-2×/wk

Prophylaxis for bleeding in hemophilia B (long term)

- **Adult and child: IV** 25-40 units/kg 2×/wk

Bleeding in hemophilia A/inhibitors of factor VIII (Proplex T, Konyne 80)

- **Adult and child: IV** 75 units/kg, repeat after 12 hr

Oral anticoagulant reversal (Factor IX complexer only) (unlabeled)

- **Adult and child: IV** 20-50 units/kg

Factor VII deficiency (use Proplex T only)

- **Adult and child: IV** $0.5 \text{ units/kg} \times \text{weight (kg)} \times \text{desired factor IX increase (\% of normal)}$; repeat q4-6hr if needed

Factor IX (human) minor to moderate hemorrhage

Use only AlphaNine, AlphaNine SD

- **Adult and child: IV** dose to increase factor IX level to 20%-30% in one dose

Serious hemorrhage

- **Adult and child: IV** dose to increase factor IX to 30%-50% as daily inf

Minor hemorrhage (mononine only)

- **Adult and child: IV** dose to increase factor IX to 15%-25% (20-30 units/kg), repeat after 24 hr if needed

Major hemorrhage

- **Adult and child: IV** dose to increase factor IX to 25%-50% (75 units/kg) q18-30hr × ≤10 days

Available forms: Inj (number of units noted on label)

Administer:

- Hepatitis B vaccine before administration
- IV after warming to room temp ≤3 ml/min, with plastic syringe only; do not admix
- After dilution with provided diluent, 50 units/ml or 25 units/ml; do not exceed 10 ml/min; decrease rate if fever, headache, flushing, tingling occur
- After cross-matching if patient has blood type A, B, AB to determine incompatibility with factor

BeneFIX

- Allow vials of concentrate/diluent to warm to room temp
- After removing flip-top cap from vial, wipe top of vial with alcohol swab; allow to dry
- Peel back cover from vial adapter package; do not remove
- Place vial adapter over vial; press firmly until it snaps; attach plunger rod to diluent syringe and break plastic tip cap from diluent syringe
- Lift package away from adapter and connect diluent syringe; depress plunger; swirl contents

SIDE EFFECTS

CNS: Headache, dizziness, malaise, paresthesia, *lethargy, chills, fever, flushing*

CV: *Hypotension*, tachycardia, *MI*, **venous thrombosis, pulmonary embolism**

GI: Nausea, vomiting, abdominal cramps, jaundice, **viral hepatitis**

HEMA: **Thrombosis, hemolysis, AIDS, DIC**

INTEG: Rash, flushing, *urticaria*, inj site reactions

RESP: Bronchospasm

PHARMACOKINETICS

IV: Half-life factor IX: 22 hr; rapidly cleared from plasma

INTERACTIONS

- Incompatible with protein products

⚠ Increase: thrombosis risk—aminocaproic acid; do not administer

Decrease: effect of warfarin

NURSING CONSIDERATIONS

Assess:

- Blood studies: coagulation factor assays by % normal: 5% prevents spontaneous hemorrhage, 30%-50% for surgery, 80%-100% for severe hemorrhage; APTT, clotting inhibitor titers, D-dimer, factor IX, VII concentration, fibrin degradation products, fibrinogen, platelets, PT, thrombin time
- Increased B/P, pulse
- For bleeding q15-30min; immobilize and apply ice to affected joints
- I&O; if urine becomes orange or red, notify prescriber
- **Allergic or pyrogenic reaction:** fever, chills, rash, itching, slow inf rate if not severe
- **⚠ DIC:** bleeding, ecchymosis, hypersensitivity, changes in coagulation tests
- For tingling sensation; if present, reduce rate

Perform/provide:

- Storage of reconstituted sol for 3 hr at room temp or for ≤ 2 yr with refrigeration (powder); check expiration date

Evaluate:

- Therapeutic response: prevention of hemorrhage

Teach patient/family:

- To report any signs of bleeding: gums, under skin, urine, stools, emesis; calf pain, joint pain, yellowing of eyes/skin
 - About the risk for viral hepatitis, AIDS; to be tested q2-3mo for HIV, although low risk
 - That immunization for hepatitis B may be given first
 - To carry emergency ID identifying disease; to avoid salicylates, NSAIDs; to inform other health professionals of condition
-

🍁 Canada only Side effects: *italics* = common; **bold** = life-threatening ⚠️
Nurse Alert

famciclovir (Rx)

(fam-cy'clo-veer)

Famvir

Func. class.: Antiviral

Chem. class.: Guanosine nucleoside

ACTION:

Inhibits DNA polymerase and viral DNA synthesis by conversion of this guanosine nucleoside to penciclovir

USES:

Treatment of acute herpes zoster (shingles), genital herpes; recurrent mucocutaneous herpes simplex virus (HSV) in patients with HIV; initial episodes of herpes genitalis; herpes labialis in the immunocompromised

Unlabeled uses: Bell's palsy, herpes labialis prophylaxis, postherpetic neuralgia prophylaxis

CONTRAINDICATIONS:

Hypersensitivity to this product, penciclovir, acyclovir, ganciclovir, valacyclovir, valganciclovir

Precautions: Pregnancy (B), breastfeeding, renal disease

DOSAGE AND ROUTES

Calculator

Herpes zoster

- **Adult: PO** 500 mg q8hr for 7 days

Renal dose

- **Adult: PO** CCr ≥ 60 ml/min, 500 mg q8hr; CCr 40-59 ml/min, 500 mg q12hr; CCr 20-39 ml/min, 500 mg q24hr; CCr < 20 ml/min, 250 mg q24hr

Recurrent herpes simplex virus

- **Adult: PO** 125 mg q12hr $\times$ 5 days

Renal dose

- **Adult: PO** 40-59 ml/min 500 mg bid; CCr 20-39 ml/min 500 q day; CCr < 20 ml/min 250 mg q day

Suppression of recurrent herpes simplex virus

- **Adult: PO** 250 mg q12hr up to 1 yr

Renal dose

- **Adult: PO** CCr 20-39 ml/min, 125 mg q12hr × 5 days; CCr <20 ml/min, 125 mg q24hr × 5 days

Genital herpes/herpes labialis (recurrent)

- **Adult: PO** 125 mg bid × 5 days or 1000 mg bid for 1 day; begin treatment at 1st sign of recurrence; immunocompetent herpes labialis 1500 mg as a single dose

Suppression of recurrent genital herpes

- **Adult: PO** 250 mg bid for up to 1 yr

Herpes genitalis initial episodes

- **Adult: PO** 250 mg tid × 7-10 days

Bell's palsy (unlabeled)

- **Adult: PO** 750 mg tid × 7 days with predniSONE

Varicella-zoster virus (shingles); chickenpox (unlabeled)

- **Adult: PO** 500 mg q8hr × 7 days, preferably within 48 hr of onset

Herpes zoster in HIV (unlabeled)

- **Adult/adolescent: PO** 500 mg tid × 7-10 days

Available forms: Tabs 125, 250, 500 mg

Administer:

- Without regard to meals
- As soon as diagnosed; for herpes zoster within 72 hr

SIDE EFFECTS

CNS: Headache, fatigue, dizziness, paresthesia, somnolence, fever

GI: Nausea, vomiting, diarrhea, constipation, abdominal pain, anorexia

GU: Decreased sperm count

INTEG: Pruritus

MS: Back pain, arthralgia

RESP: Pharyngitis, sinusitis

PHARMACOKINETICS

Bioavailability 77%, 20% protein binding, 73% excreted via kidneys, terminal plasma half-life 2-3 hr

INTERACTIONS

Decrease: renal excretion—theophylline, probenecid, digoxin

Decrease: metabolism—cimetidine

NURSING CONSIDERATIONS

Assess:

- **Herpes zoster:** number, distribution of lesions; burning, itching, pain, which are early symptoms of herpes infection; assess daily during therapy
- Renal studies: urine CCr; BUN before and during treatment if decreased renal function; dose may have to be lowered
- Bowel pattern before, during treatment; diarrhea may occur
- Posttherapeutic neuralgia during and after treatment

Evaluate:

- Therapeutic response: decreased size, spread of lesions

Teach patient/family:

- How to recognize beginning infection
- How to prevent spread of infection; that this medication does not prevent spread to others; that condoms should be used
- About the reason for medication, expected results
- That women with genital herpes should have yearly Pap smears; that cervical cancer is more likely

☼ Canada only Side effects: *italics* = common; **bold** = life-threatening ⚠
Nurse Alert

famotidine (OTC, Rx)

(fa-moe'ti-deen)

Pepcid, Pepcid AC

Func. class.: H₂-histamine receptor antagonist

ACTION:

Competitively inhibits histamine at histamine H₂-receptor site, thus decreasing gastric secretion while pepsin remains at a stable level

USES:

Short-term treatment of active duodenal ulcer, maintenance therapy for duodenal ulcer, Zollinger-Ellison syndrome, multiple endocrine adenomas, gastric ulcers; gastroesophageal reflux disease, heartburn

Unlabeled uses: GI disorders in those taking NSAIDs; urticaria; prevention of stress ulcers, aspiration pneumonitis, inactivation of oral pancreatic enzymes in pancreatic disorders

CONTRAINDICATIONS:

Hypersensitivity

Precautions: Pregnancy (B), breastfeeding, children <12 yr, geriatric patients, severe renal/hepatic disease

DOSAGE AND ROUTES

Calculator

Active ulcer

- **Adult: PO** 40 mg/day at bedtime × 4-8 wk then 20 mg/day at bedtime if needed (maintenance); **IV** 20 mg q12hr if unable to take **PO**
- **Child 1-16 yr: PO** 0.5 mg/kg/day at bedtime or divided bid, max 40 mg/day

Hypersecretory conditions

- **Adult: PO** 20 mg q6hr; may give 160 mg q6hr if needed; **IV** 20 mg q6hr if unable to take **PO**

Heartburn relief/prevention

- **Adult: PO** 10 mg with water or 15 min-1 hr before eating

Renal disease

- **Adult: PO** CCr <50 ml/min, decrease dose by 50% or extend interval to 36-48 hr

Available forms: Tabs 10, 20, 40 mg; gel cap 10 mg; powder for oral susp 40 mg/5 ml; inj 10 mg/ml, 20 mg/50 ml; chew tabs 10 mg

Administer:

PO route

- Antacids 1 hr before or 2 hr after famotidine; may be given with foods or liquids
- After shaking oral suspension

Direct IV route

- After diluting 2 ml of product (10 mg/ml) in 0.9% NaCl to total volume of 5-10 ml; inject over 2 min to prevent hypotension

Intermittent IV INF route

- After diluting 20 mg (2 ml) of product in 100 ml of LR, 0.9% NaCl, D₅W, D₁₀W; run over 15-30 min

Continuous IV INF route

- *Adults:* Dilute 40 mg of product in 250 ml D₅W, NS; infuse over 24 hr, run at 11 ml/hr, use inf device

Y-site compatibilities: Acyclovir, alfentanil, allopurinol, amifostine, amikacin, aminocaproic acid, aminophylline, amiodarone, amphotericin B lipid complex, amphotericin B liposome, amsacrine, anakinra, anidulafungin, ascorbic acid injection, atenolol, atracurium, atropine, aztreonam, benztropine, bivalirudin, bleomycin, bumetanide, buprenorphine, butorphanol, calcium chloride/gluconate, CARBOplatin, caspofungin, cefonicid, cefotaxime, cefTAZidime, cefuroxime, chlorproMAZINE, cimetidine, cisatracurium, CISplatin, cladribine, clindamycin, codeine, cyanocobalamin, cyclophosphamide, cycloSPORINE, cytarabine, DACTINomycin, DAPTOmycin, dexamethasone, dexmedetomidine, digoxin, diltiazem, diphenhydrAMINE, DOBUTamine, DOCEtaxel, DOPamine, doripenem, doxacurium, DOXOrubicin, DOXOrubicin liposomal, doxycycline, droperidol, enalaprilat, ePHEDrine, EPINEPHrine, epirubicin, epoetin alfa, eptifibatide, ertapenem, erythromycin, esmolol, etoposide, fenoldopam, fentaNYL, filgrastim, fluconazole, fludarabine, fluorouracil, folic acid, gatifloxacin, gemcitabine, gentamicin, glycopyrrolate, granisetron, heparin, hydrocortisone,

HYDROmorphone, hydrOXYzine, IDArubicin, ifosfamide, imipenem-cilastatin, irinotecan, isoproterenol, ketorolac, labetalol, levofloxacin, lidocaine, linezolid, LORazepam, LR, magnesium sulfate, mannitol, mechlorethamine, melphalan, meperidine, metaraminol, methicillin, methotrexate, methoxamine, methyl dopate, methylPREDNISolone, metoclopramide, metoprolol, metroNIDAZOLE, miconazole, midazolam, milrinone, mitoXANtrone, morphine, moxalactam, multiple vitamins injection, mycophenolate, nafcillin, nalbuphine, naloxone, nesiritide, netilmicin, niCARdipine, nitroglycerin, nitroprusside, norepinephrine, 0.9% NaCl, octreotide, ondansetron, oxacillin, oxaliplatin, oxytocin, PACLitaxel, palonosetron, pamidronate, pancuronium, papaverine, PEMEtrexed, penicillin G potassium/sodium, pentamidine, pentazocine, PENTobarbital, perphenazine, PHENobarbital, phenylephrine, phytonadione, polymyxin B, potassium chloride/phosphates, procainamide, prochlorperazine, promethazine, propofol, propranolol, protamine, pyridoxine, quiNIDine, ranitidine, remifentanyl, Ringer's, ritodrine, riTUXimab, sargramostim, sodium acetate/bicarbonate, succinylcholine, SUFentanyl, tacrolimus, teniposide, theophylline, thiamine, thiotepa, ticarcillin, ticarcillin-clavulanate, tigecycline, tirofiban, TNA, tobramycin, tolazoline, TPN, trastuzumab, trimetaphan, urokinase, vancomycin, vasopressin, vecuronium, verapamil, vinCRISTine, vinorelbine, voriconazole, zoledronic acid

SIDE EFFECTS

CNS: *Headache, dizziness, paresthesia, depression, anxiety, somnolence, insomnia, fever, seizures in renal disease*

CV: *Dysrhythmias, QT prolongation (impaired renal functioning)*

EENT: *Taste change, tinnitus, orbital edema*

GI: *Constipation, nausea, vomiting, anorexia, cramps, abnormal hepatic enzymes, diarrhea*

INTEG: *Rash, toxic epidermal necrolysis, Stevens-Johnson syndrome*

MS: *Myalgia, arthralgia*

RESP: *Pneumonia*

PHARMACOKINETICS

Plasma protein binding 15%-20%, metabolized in liver 30% (active metabolites), 70% excreted by kidneys, half-life 2½-3½ hr

PO: Onset 30-60 min, duration 6-12 hr, peak 1-3 hr, absorption 50%

IV: Onset immediate, peak 30-60 min, duration 8-15 hr

INTERACTIONS

Decrease: absorption—ketoconazole, itraconazole, cefpodoxime, cefditoren

Decrease: famotidine absorption—antacids

Decrease: effect of—atazanavir, delavirdine

NURSING CONSIDERATIONS

Assess:

- **Ulcers:** epigastric pain, abdominal pain, frank or occult blood in emesis, stools
- Intragastric pH, serum creatinine/BUN baseline and periodically
- **For bleeding, hematuria, hematuria, occult blood in stools; abdominal pain**

Perform/provide:

- Storage in cool environment (oral); IV sol stable for 48 hr at room temp; do not use discolored sol; discard unused oral sol after 1 mo
- Increase in bulk and fluids in diet to prevent constipation

Evaluate:

- Therapeutic response: decreased abdominal pain

Teach patient/family:

- That product must be continued for prescribed time in prescribed method to be effective; not to double dose
- About possibility of decreased libido; that this is reversible after discontinuing therapy
- To avoid irritating foods, alcohol, aspirin, extreme-temp foods that may irritate GI system
- That smoking should be avoided because it diminishes effectiveness of product
- To avoid tasks requiring alertness because dizziness, drowsiness may occur

☼ Canada only Side effects: *italics* = common; **bold** = life-threatening ⚠

Nurse Alert

fat emulsions (Rx)

Intralipid 10%, Intralipid 20%, Liposyn II 10%, Liposyn II 20%, Liposyn III 10%, Liposyn III 20%

Func. class.: Caloric

Chem. class.: Fatty acid, long chain; nutritional supplement

ACTION:

Needed for energy, heat production; consist of neutral triglycerides, primarily unsaturated fatty acids

USES:

Increase calorie intake, fatty acid deficiency, prevention

CONTRAINDICATIONS:

Hypersensitivity to this product or eggs, soybeans, legumes; hyperlipemia, lipid necrosis, acute pancreatitis accompanied by hyperlipemia, hyperbilirubinemia of the newborn; renal insufficiency, hepatic damage

Precautions: Pregnancy (C), premature/term newborns, severe hepatic disease, diabetes mellitus, thrombocytopenia, gastric ulcers, sepsis

Black Box Warning:

Preterm infants

DOSAGE AND ROUTES

Calculator

Deficiency

- **Adult and child: IV** 8%-10% of required calorie intake (intralipid)

Adjunct to TPN

- **Adult: IV** 1 ml/min over 15-30 min (10%) or 0.5 ml/min over 15-30 min (20%); may increase to 500 ml over 4-8 hr if no adverse reactions occur; max 2.5 g/kg
- **Child: IV** 0.1 ml/min over 10-15 min (10%) or 0.05 ml/min over 10-15 min (20%); may increase to 1 g/kg over 4 hr if no adverse reactions occur; max 4 g/kg

Prevention of deficiency

- **Adult: IV** 500 ml 2×/wk (10%), given 1 ml/min for 30 min, max 500 ml over 6 hr

• **Child: IV** 5-10 ml/kg/day (10%), given 0.1 ml/min for 30 min, max 100 ml/hr
Available forms: Inj 10% (50, 100, 200, 250, 500 ml), 20% (50, 100, 200, 250, 500 ml)

Administer:

Intermittent IV INF route

- At 10% (1 ml/min) or 20% (0.5 ml/min) initially × 15-30 min, may increase 10% (120 ml/hr) or 20% (62.5 ml/hr) if no adverse reaction; do not give more than 500 ml on 1st day • After changing IV tubing at each inf; infection may occur with old tubing
- With inf pump at prescribed rate; do not use in-line filter sized for lipid emulsion; clogging will occur

SIDE EFFECTS

CNS: Dizziness, headache, drowsiness, focal seizures

CV: Shock

GI: Nausea, vomiting, hepatomegaly

HEMA: Hyperlipemia, hypercoagulation, thrombocytopenia, leukopenia, leukocytosis

RESP: Dyspnea, fat in lung tissue

PHARMACOKINETICS

Completely absorbed, distributed to intravascular space, converted to triglycerides then to free fatty acids

NURSING CONSIDERATIONS

Assess:

- Triglycerides, free fatty acid levels, platelet counts daily to prevent fat overload, thrombocytopenia • Hepatic studies: AST, ALT, Hct, Hgb; notify prescriber if abnormal
- Nutritional status: calorie count by dietitian; monitor weight daily

Perform/provide:

- Do not use mixed sol if separated or oily looking

Evaluate:

- Therapeutic response: increased weight

Teach patient/family:

- About the reason for use of lipids

🍁 Canada only Side effects: *italics* = common; **bold** = life-threatening ⚠️
Nurse Alert

febuxostat (Rx)

(feb-ux'oh-stat)

Uloric

Func. class.: Antigout drug, antihyperuricemic

Chem. class.: Xanthine oxidase inhibitor

ACTION:

Inhibits the enzyme xanthine oxidase, thereby reducing uric acid synthesis; more selective for xanthine oxidase than allopurinol

USES:

Chronic gout, hyperuricemia

CONTRAINDICATIONS:

Hypersensitivity

Precautions: Pregnancy (C), breastfeeding, children, renal/hepatic/cardiac/neoplastic disease, stroke, MI, organ transplant, Lesch-Nyhan syndrome

DOSAGE AND ROUTES

Calculator

• **Adult: PO** 40 mg daily, may increase to 80 mg daily if uric acid levels are >6 mg/dl after 2 wk of therapy

Available forms: Tabs 40, 80 mg

Administer:

PO route

- Without regard to meals or antacids; may crush and add to foods or fluids
- A few days before antineoplastic therapy

SIDE EFFECTS

CNS: Weakness, flushing

CV: MI, atrial fibrillation, atrial flutter, AV block, bradycardia, hypo/hypertension, palpitations, sinus tachycardia, stroke, angina

EENT: Retinopathy, cataracts, epistaxis

GI: Nausea, vomiting, anorexia, constipation, diarrhea, dyspepsia, hematemesis,

hepatitis, hepatomegaly, weight gain/loss, cholecystitis, cholelithiasis, melena
GU: Renal failure, urinary urgency/frequency/incontinence, nephrolithiasis, hematuria

HEMA: Thrombocytopenia, anemia, pancytopenia, leukopenia, bone marrow suppression

INTEG: Rash

MISC: Arthralgia, gout flare

PHARMACOKINETICS

Peak 1-1.5 hr; excreted in feces, urine; half-life 5-8 hr; protein binding 99.2%

INTERACTIONS

Increase: toxicity—azathioprine

Increase: xanthine nephropathy, calculi—rasburicase, antineoplastics

Increase: myelosuppression—mercaptopurine, theophylline

NURSING CONSIDERATIONS

Assess:

- **Hyperuricemia:** uric acid levels q2wk; uric acid levels should be ≤ 6 mg/dl, flares may occur during first 6 wk of treatment
- **CBC, AST, BUN, creatinine** before starting treatment, periodically
- **Renal disease:** I&O ratio; increase fluids to 2 L/day to prevent stone formation and toxicity
- For rash, hypersensitivity reactions; discontinue
- **Gout:** joint pain, swelling; may use with NSAIDs for acute gouty attacks and gout flare (first 6 wk)

Evaluate:

- Therapeutic response: decreased pain in joints, decreased stone formation in kidneys, decreased uric acid levels

Teach patient/family:

- That tabs may be crushed
 - To take as prescribed; if dose is missed, to take as soon as remembered; not to double dose
 - To increase fluid intake to 2 L/day unless contraindicated
 - To avoid alcohol, caffeine because they will increase uric acid levels
 - To report cardiovascular events to prescriber immediately
 - **Gout:** That flares may occur during first 6 wk of treatment
-

🍁 Canada only Side effects: *italics* = common; **bold** = life-threatening ⚠️
Nurse Alert

felodipine (Rx)

(fe-loe'-di-peen)

Plendil , Renedil 

Func. class.: Antihypertensive, calcium channel blocker, antianginal *Chem. class.:* Dihydropyridine

Do not confuse: Plendil/pindolol/Pletal/PriLOSEC/Prinivil

ACTION:

Inhibits calcium ion influx across cell membrane, resulting in the inhibition of the excitation and contraction of vascular smooth muscle

USES:

Essential hypertension alone or with other antihypertensives

Unlabeled uses: Hypertension in adolescents and children, angina pectoris; Prinzmetal's angina (vasospastic)

CONTRAINDICATIONS:

Hypersensitivity to this product or dihydropyridines, sick sinus syndrome, 2nd- or 3rd-degree heart block, hypotension <90 mm Hg systolic

Precautions: Pregnancy (C), breastfeeding, children, geriatric patients, CHF, hepatic injury, renal disease

DOSAGE AND ROUTES

Calculator

- **Adult: PO** 5 mg/day initially; usual range 2.5-10 mg/day; max 10 mg/day; do not adjust dosage at intervals of <2 wk

- **Geriatric: PO** 2.5 mg/day

Hepatic disease

- **Adult: PO** 2.5-5 mg, max 10 mg/day

Hypertension in adolescent/child (unlabeled)

- **Adolescent and child: PO** 2.5 mg initially, titrate upward, max 10 mg/day

Available forms: Ext rel tabs 2.5, 5, 10 mg

Administer:

PO route

- Swallow whole; do not break, crush, or chew ext rel products

- Once daily with light meal; avoid grapefruit juice

SIDE EFFECTS

CNS: *Headache*, fatigue, drowsiness, dizziness, anxiety, depression, nervousness, insomnia, light-headedness, paresthesia, tinnitus, psychosis, somnolence, flushing

CV: *Dysrhythmia*, *edema*, *CHF*, hypotension, palpitations, *MI*, *pulmonary edema*, tachycardia, syncope, AV block, angina

GI: Nausea, vomiting, diarrhea, gastric upset, constipation, increased LFTs, dry mouth

GU: Nocturia, polyuria

HEMA: Anemia

INTEG: Rash, pruritus

MISC: Flushing, sexual difficulties, cough, nasal congestion, SOB, wheezing, epistaxis, respiratory infection, chest pain, *angioedema*, gingival hyperplasia

PHARMACOKINETICS

Peak plasma levels 2.5-5 hr, highly protein bound >99%, metabolized in liver, 0.5% excreted unchanged in urine, elimination half-life 11-16 hr

INTERACTIONS

Increase: bradycardia, CHF— β -blockers, digoxin, phenytoin, disopyramide

Increase: toxicity, hypotension—nitrates, alcohol, quinidine, zileuton, miconazole, diltiazem, delavirdine, quinupristin, dalfopristin, conivaptan, cycloSPORINE, cimetidine, clarithromycin, antiretroviral protease inhibitors, other antihypertensives, MAOIs, ketoconazole, erythromycin, itraconazole, propranolol

Decrease: antihypertensive effects—NSAIDs, carbamazepine, barbiturates, phenytoin

Drug/Herb

Increase: antihypertensive effect—ginseng, ginkgo, hawthorn

Decrease: antihypertensive effect—ephedra, St. John's wort

Drug/Food

Increase: felodipine level—grapefruit juice

NURSING CONSIDERATIONS

Assess:

- **CHF:** I&O, weight daily; weight gain, crackles, dyspnea, edema, jugular venous distention • Cardiac status: B/P, pulse, respiration; ECG periodically
- **Angina pain:** location, duration, intensity; ameliorating, aggravating factors

Evaluate:

- Therapeutic response: decreased B/P, decreased anginal attacks, increased activity tolerance

Teach patient/family:

- To avoid hazardous activities until stabilized on product, dizziness no longer a problem • To avoid OTC products, alcohol unless directed by prescriber; to limit caffeine consumption • About the importance of complying with all areas of medical regimen: diet, exercise, stress reduction, product therapy • That tablets may appear in stools but are insignificant
- To report dyspnea, palpitations, irregular heart beat, swelling of extremities, nausea, vomiting, severe dizziness, severe headache • To change positions slowly to prevent orthostatic hypotension
- To obtain correct pulse; to contact prescriber if pulse <50 bpm

TREATMENT OF OVERDOSE:

Atropine for AV block, vasopressor for hypotension

☼ Canada only Side effects: *italics* = common; **bold** = life-threatening ⚠
Nurse Alert

fenofibrate (Rx)

(fen-oh-fee'brate)

Antara, Apo-Feno-Micro , Fenoglide, Lipidil Micro , Lipidil Supra Cap, Lipofen, Lofibra, Tricor, Triglide *Func. class.: Antilipemic*

Chem. class.: Fibric acid derivative

ACTION:

Increases lipolysis and elimination of triglyceride-rich particles from plasma by activating lipoprotein lipase, thereby resulting in changes in triglyceride size and composition of LDL, leading to rapid breakdown of LDL; mobilizes triglycerides from tissue; increases excretion of neutral sterols

USES:

Hypercholesterolemia; types IV, V hyperlipidemia that do not respond to other treatment and that increase risk for pancreatitis; Fredrickson type IV, V hypertriglyceridemia

CONTRAINDICATIONS:

Hypertensivity, severe renal/hepatic disease, primary biliary cirrhosis, preexisting gallbladder disease

Precautions: Pregnancy (C), breastfeeding, geriatric patients, peptic ulcer, pancreatitis, renal/hepatic disease

DOSAGE AND ROUTES

Calculator

Hypertriglyceridemia

- **Adult: PO** (Antara) 43-130 mg/day; (Lofibra) 67-200 mg/day; (Tricor) 48-145 mg/day; (Triglide) 50-160 mg/day

Primary hypercholesterolemia/mixed hyperlipidemia

- **Adult: PO** (Antara) 130 mg/day; (Lofibra) 200 mg/day; (Tricor) 145 mg/day; (Triglide) 160 mg/day

Renal dose (geriatric)

- **Adult: PO** (Tricor) CCr 30-80 ml/min, 48 mg/day; CCr <30 ml/min, contraindicated

- **Adult: PO** CCr 30-48 ml/min, 50 mg/day (Triglide, Lipofen), 43 mg/day

(Antara), 67 mg/day (Lofibra caps), 54 mg/day (Lofibra tabs); CCr <10 ml/min, contraindicated (Antara, Lipofen, Lofibra, Triglide); 40 mg/day (Fenoglide)

Available forms: Tabs (Triglide) 50, 160 mg; (Tricor) 48, 145 mg; micronized cap (Antara) 43, 130 mg; (Lofibra) 67, 134, 200 mg; cap (Lipofen) 50, 100, 150 mg; tabs (Fenoglide) 40, 120 mg

Administer:

- Product with meals (Lipofen, Lofibra); Triglide without regard to food; may increase q4-8wk; brands are not interchangeable; therapy should be discontinued if there is not adequate response after 2 mo

SIDE EFFECTS

CNS: *Fatigue, weakness, drowsiness, dizziness, insomnia, depression, vertigo*

CV: Angina, hypertension

GI: *Nausea, vomiting, dyspepsia, increased liver enzymes, flatulence, hepatomegaly, gastritis, pancreatitis, cholelithiasis*

GU: Dysuria, urinary frequency

HEMA: Anemia, leukopenia, thrombosis/pulmonary embolism

INTEG: *Rash, urticaria, pruritus, photosensitivity*

MISC: Polyphagia, weight gain, infection, flulike syndrome

MS: *Myalgias, arthralgias, myopathy, rhabdomyolysis*

RESP: Pharyngitis, bronchitis, cough

PHARMACOKINETICS

Peak 6-8 hr, protein binding 99%, converted to fenofibric acid, metabolized in liver, excreted in urine (60%), feces (25%), half-life 20 hr

INTERACTIONS

Increase: myopathy—colchicine

Increase: nephrotoxicity—cycloSPORINE

- **Avoid use with HMG-CoA reductase inhibitors; rhabdomyolysis may occur**

Increase: anticoagulant effects—oral anticoagulants

Increase: effects of—antidiabetics

Decrease: absorption of fenofibrate—bile acid sequestrants

Drug/Herb

Increase: effect—red yeast rice

Drug/Food

Increase: absorption

Drug/Lab Test

Increase: ALT, AST, BUN, CK, creatinine

Decrease: WBC, uric acid, Hgb, paradoxical effect in HDL

NURSING CONSIDERATIONS

Assess:

• **Diet history:** fat content; lipid levels (triglycerides, LDL, HDL, cholesterol), may cause a paradoxical decrease in HDL, LFTs at baseline, periodically during treatment, CPK if muscle pain occurs, CBC, Hct, Hgb; PT with anticoagulant therapy • **Pancreatitis, cholelithiasis renal failure, rhabdomyolysis** (when combined with HMG Co-A reductase inhibitors), myositis; product should be discontinued

Evaluate:

• Therapeutic response: decreased triglycerides, cholesterol levels

Teach patient/family:

- That compliance is needed
- That risk factors should be decreased: high-fat diet, smoking, alcohol consumption, absence of exercise • To notify prescriber if pregnancy is suspected or planned
- To report GU symptoms: decreased libido, impotence, dysuria, proteinuria, oliguria, hematuria • To notify prescriber of muscle pain, weakness, fever, fatigue, epigastric pain

☼ Canada only Side effects: *italics* = common; **bold** = life-threatening ⚠
Nurse Alert

HIGH ALERT

fentaNYL (Rx)

(fen'ta-nill)

ABSTRAL, Actiq, Fentora, Onsolis, RAN-Fentanyl 

fentaNYL transdermal (Rx)

Duragesic

fentaNYL nasal spray (Rx)

Lazanda

fentaNYL SL spray

Subsys

Func. class.: Opioid analgesic

Chem. class.: Synthetic phenylpiperidine

Controlled Substance Schedule II

Do not confuse: fentaNYL/Sufenta

ACTION:

Inhibits ascending pain pathways in CNS, increases pain threshold, alters pain perception by binding to opiate receptors

USES:

Controls moderate to severe pain; preoperatively, postoperatively; adjunct to general anesthetic, adjunct to regional anesthesia; **FentaNYL:** anesthesia as premedication, conscious sedation; **Actiq:** breakthrough cancer pain

CONTRAINDICATIONS:

Hypersensitivity to opiates, myasthenia gravis

Black Box Warning:

Headache, migraine (Actiq, ABSTRAL, Fentora, Lazanda, Onsolis); emergency room use (ABSTRAL, Lazanda); outpatient surgeries (Duragesic TD); opioid-naïve patients, respiratory depression

Precautions: Pregnancy (C), breastfeeding, geriatric patients, increased intracranial pressure, seizure disorders, severe respiratory disorders, cardiac dysrhythmias

Black Box Warning:

Accidental exposure, ambient temperature increase, fever, skin abrasion (TD patch), substance abuse, surgery, requires an experienced clinician

DOSAGE AND ROUTES

Calculator

Fentanyl

Anesthetic

- **Adult: IV** 50-100 mcg/kg over 1-2 min

Anesthesia supplement

- **Adult and child >12 yr: IM/IV** 2-20 mcg/kg **IV INF** 0.025-0.25 mcg/kg/min

Induction and maintenance

- **Child 2-12 yr: IV** 2-3 mcg/kg

Preoperatively

- **Adult and child >12 yr: IM/IV** 50-100 mcg q30-60min before surgery

Postoperatively

- **Adult and child >12 yr: IM/IV** 0.05-0.1 mg q1-2hr prn

Moderate/severe pain

- **Adult: IV/IM** 50-100 mcg q1-2hr

Actiq

- **Adult: TRANSMUCOSAL** 200 mcg; redose if needed 15 min after completion of 1st dose; do not give more than 2 doses during titration period, max 4 doses/day

Fentora

- **Adult: BUCCAL** 100 mcg placed above rear molar between upper cheek and gum, a second 100 mcg dose, if needed, may be started 30 min after 1st dose

Onsolis

- **Adult: TRANSMUCOSAL** 200 mcg, titrate, max 1200 mcg/dose or 4 doses/day

ABSTRAL

- **Adult: SL** 100 mcg; another dose may be taken 30 min after 1st, max 2 doses per episode of breakthrough pain; ≥2 hr must elapse before treating again; titrate stepwise over consecutive episodes

FentaNYL transdermal

- **Adult:** 25 mcg/hr; may increase until pain relief occurs; apply patch to flat surface on upper torso and wear for 72 hr; apply new patch on different site for

continued relief

FentaNYL nasal spray

- **Adult:** 100 mcg (1 spray in 1 nostril), may retreat after ≥ 2 hr, titrate upward until adequate analgesia; treat a max of 4 episodes daily

FentaNYL SL spray

- **Adult:** 100 mcg sprayed under tongue, titrate stepwise carefully

Available forms: Inj 0.05 mg/ml; lozenges 100, 200, 300, 400, 600, 800, 1200, 1600 mcg; lozenges on a stick 200, 400, 600, 800, 1200, 1600 mcg; buccal tab 100, 200, 400, 600, 800 mcg; oral dissolving film (Onsolis) 200, 400, 600, 800, 1200 mcg; SL tab (ABSTRAL) 100, 200, 300, 400, 600, 800 mcg; *transdermal*: patch 12, 25, 50, 75, 100 mcg/hr; *SL spray*: 100, 200, 400, 600, 800, 1200, 1600 mcg/spray

Administer:

- By inj (IM, IV); give slowly to prevent rigidity
- **Must have emergency equipment available, opioid antagonists, O₂; to be used only by those appropriately trained; IV products to be used in OR, ER, ICU**

Transmucosal route

- Remove foil just before administration; instruct patient to place product between cheek and lower gum, moving it back and forth and sucking, not chewing (Actiq); place above rear molar (Fentora); place film on the inside of the cheek (Onsolis); all products not used or only partially used should be flushed down the toilet

Transdermal route

- q72hr for continuous pain relief; dosage adjusted after at least 2 applications; apply to clean, dry skin and press firmly • Give short-acting analgesics until patch takes effect (8-24 hr); when reducing dosage or switching to alternative IV treatment, withdraw gradually; serum levels drop gradually, give 1/2 the equianalgesic dose of new analgesic 12-18 hr after removal as ordered

SL spray

- Open blister package with scissors immediately before use; spray contents of unit under tongue; dispose of each used unit after use by placing it into one of the disposable bags provided; seal bag, discard into a trash container out of reach of children

IV route

- IV undiluted by anesthesiologist or diluted with 5 ml or more sterile water or 0.9% NaCl given through Y-tube or 3-way stopcock at 0.1 mg or less/1-2 min. Muscular rigidity may occur with rapid IV administration

Additive compatibilities: Bupivacaine, caffeine citrate, cloNIDine, droperidol, EPINEPHrine, ketamine, lidocaine, ziconotide

Solution compatibilities: D₅W, 0.9% NaCl

Syringe compatibilities: Alprostadil, atracurium, atropine, bupivacaine/ketamine, butorphanol, chlorproMAZINE, cimetidine, cloNIDine/lidocaine, diphenhyDRINATE, diphenhydrAMINE, droperidol, heparin, HYDROmorphone, hydrOXYzine, lidocaine, meperidine, metoclopramide, midazolam, morphine, pentazocine, perphenazine, prochlorperazine, promazine, promethazine, ranitidine, scopolamine

Y-site compatibilities: Abciximab, acyclovir, alfentanil, alprostadil, amikacin, aminocaproic acid, aminophylline, amiodarone, amphotericin B cholesteryl, amphotericin B lipid complex, amphotericin B liposome, anidulafungin, argatroban, ascorbic acid injection, atenolol, atracurium, atropine, azathioprine, aztreonam, benztropine, bivalirudin, bleomycin, bumetanide, buprenorphine, butorphanol, calcium chloride/gluconate, CARBOplatin, caspofungin, cefamandole, ceFAZolin, cefmetazole, cefonicid, cefoperazone, cefotaxime, cefoTEtan, cefOXitin, cefTAZidime, ceftizoxime, ceftobiprole, cefTRIAxone, cefuroxime, cephalothin, chloramphenicol, chlorproMAZINE, cimetidine, cisatracurium, CISplatin, clindamycin, cloNIDine, cyanocobalamin, cyclophosphamide, cycloSPORINE, cytarabine, DACTINomycin, DAPTOmycin, dexamethasone, dexmedetomidine, digoxin, diltiazem, diphenhydrAMINE, DOBUTamine, DOCEtaxel, DOPamine, doripenem, doxacurium, doxapram, DOXOrubicin, doxycycline, enalaprilat, ePHEDrine, EPINEPHrine, epirubicin, epoetin alfa, eptifibatide, erythromycin, esmolol, etomidate, etoposide, famotidine, fenoldopam, fluconazole, fludarabine, fluorouracil, folic acid, furosemide, ganciclovir, gatifloxacin, gemcitabine, gentamicin, glycopyrrolate, granisetron, heparin, hydrocortisone, HYDROmorphone, hydrOXYzine, IDArubicin, ifosfamide, imipenem-cilastatin, inamrinone, insulin (regular), irinotecan, isoproterenol, ketorolac, labetalol, lansoprazole, levofloxacin, lidocaine, linezolid, LORazepam, LR, magnesium sulfate, mannitol, mechlorethamine, meperidine, metaraminol, methicillin,

methotrexate, methotrimeprazine, methoxamine, methyldopate, methylPREDNISolone, metoclopramide, metoprolol, metroNIDAZOLE, mezlocillin, miconazole, midazolam, milrinone, minocycline, mitoXANtrone, mivacurium, morphine, moxalactam, multiple vitamins injection, mycophenolate, nafcillin, nalbuphine, naloxone, nesiritide, netilmicin, niCARdipine, nitroglycerin, nitroprusside, norepinephrine, octreotide, ondansetron, oxacillin, oxaliplatin, oxytocin, PACLitaxel, palonosetron, pamidronate, pancuronium, papaverine, PEMEtrexed, penicillin G potassium/sodium, pentamidine, pentazocine, PENTobarbital, PHENobarbital, phenylephrine, phytonadione, piperacillin, piperacillin-tazobactam, polymyxin B, potassium chloride, procainamide, prochlorperazine, promethazine, propofol, propranolol, protamine, pyridoxine, quinIDine, quinupristin-dalfopristin, ranitidine, remifentanyl, Ringer's, ritodrine, riTUXimab, rocuronium, sargramostim, scopolamine, sodium acetate/bicarbonate, succinylcholine, SUFentanyl, tacrolimus, teniposide, theophylline, thiamine, thiopental, thiotepa, ticarcillin, ticarcillin-clavulanate, tigecycline, tirofiban, TNA, tobramycin, tolazoline, TPN, trastuzumab, trimetaphan, urokinase, vancomycin, vasopressin, vecuronium, verapamil, vinCRISTine, vinorelbine, vitamin B complex/C, voriconazole, zoledronic acid

SIDE EFFECTS

CNS: Dizziness, delirium, euphoria, sedation

CV: Bradycardia, arrest, hypo/hypertension

EENT: Blurred vision, miosis

GI: Nausea, vomiting, constipation

GU: Urinary retention

INTEG: Rash, diaphoresis

MS: Muscle rigidity

RESP: Respiratory depression, arrest, laryngospasm

PHARMACOKINETICS

Metabolized by liver, excreted by kidneys, crosses placenta, excreted in breast milk, Half-life: IV: 2-4 hr, Transdermal: 13-22 hr, Transmucosal: 7 hr, Buccal: 4-12 hr, 80% bound to plasma proteins

IM: Onset 7-8 min, peak 30 min, duration 1-2 hr

IV: Onset 1 min, peak 3-5 min, duration 1/2-1 hr

INTERACTIONS

Black Box Warning:

Increase: fentaNYL effect, fetal respiratory depression: (cycloSPORINE, ketoconazole, itraconazole, cimetidine, conivaptan, fluconazole, nefazodine, ranolazine, zafirlukast, zileuton)

Increase: hypotension—droperidol

Increase: CV depression—diazepam

Increase: fentaNYL effect with other CNS depressants—alcohol, opioids, sedative/hypnotics, antipsychotics, skeletal muscle relaxants, protease inhibitors

Decrease: fentaNYL effect—CYP3A4 inducers (carBAMazepine, phenytoin, PHENobarbital, rifampin)

Drug/Herb

Increase: action of fentaNYL—St. John's wort

Decrease: effect of fentaNYL—echinacea

Drug/Lab Test

Increase: amylase, lipase

NURSING CONSIDERATIONS

Assess:

- VS after parenteral route; note muscle rigidity, drug history, hepatic/renal function tests • CNS changes: dizziness, drowsiness, hallucinations, euphoria, LOC, pupil reaction
- Allergic reactions: rash, urticaria

Black Box Warning:

Respiratory dysfunction: respiratory depression, character, rate, rhythm; notify prescriber if respirations are <10/min

Black Box Warning:

Headache/migraine: ABSTRAL, Actiq, Fentora, Lazanda, Onsolis not to be used for this condition; ABSTRAL, Lazanda not to be used in ER; Duragesic TD not to be used for outpatient surgery patients

Black Box Warning:

Apnea, respiratory arrest in opioid-naïve patients: do not use ABSTRAL, Actiq, Duragesic, Fentora, Lazanda, Onsolis; opioid-tolerant patients are those using ≥60 mg/day oral morphine, ≥30 mg/day oxyCODONE PO, 8 mg/day HYDROMorphone, 25 mcg TD fentaNYL/hr

Evaluate:

- Therapeutic response: induction of anesthesia, relief of breakthrough cancer

pain, general pain relief • Cancer pain, general pain relief

Teach patient/family:

- About CNS changes: physical dependence; not to use with alcohol, other CNS depressants

Black Box Warning:

Accidental exposure: Discuss the dangers of children or pets ingesting or coming in contact with product

Transdermal route

Black Box Warning:

Ambient temperature: that excessive heat may increase absorption; do not use with heating pads, electric blankets, heat/tanning lamps, saunas, hot tubs, heated waterbeds, when sunbathing

- That excessive perspiration may alter adhesiveness
- To dispose of patch by placing sticky sides together and flushing down toilet
- That patient may need to clip hair before applying to ensure adhesion
- May add first aid tape around the edges if there is a problem with adhesion

Available forms: **Fumarate:** tabs 63, 195, 200, 324, 325 mg; chewable tabs 100 mg; cont rel tabs 300 mg; oral susp 100 mg/5 ml, 45 mg/0.6 ml; **gluconate:** tabs 300, 320, 325 mg; caps 86, 325, 435 mg; film-coated tabs 300 mg; elix 300 mg/5 ml; **sulfate:** tabs 195, 300, 325 mg; enteric-coated tabs 325 mg; ext rel tabs, time-rel caps, 525 mg; **dried:** tabs 200 mg; ext rel tabs 160 mg; ext rel caps 160 mg; **iron polysaccharide:** tabs 50 mg; caps 150 mg; sol 100 mg/5 ml

Administer:

PO route

- Swallow tabs whole; do not break, crush, or chew unless labeled as chewable
- Between meals for best absorption; may give with juice; do not give with antacids or milk, delay at least 1 hr; if GI symptoms occur, give after meals even if absorption is decreased; eggs, milk products, chocolate, caffeine interfere with absorption • **Liquid** through plastic straw to avoid discoloration of tooth enamel; dilute thoroughly • At least 1 hr before bedtime; corrosion may occur in stomach; ferrous gluconate is less irritating of GI tract than ferrous sulfate • For

<6 mo for anemia

SIDE EFFECTS

GI: *Nausea, constipation, epigastric pain, black and red tarry stools, vomiting, diarrhea*

INTEG: Temporarily discolored tooth enamel and eyes

SYST: Hypersensitivity reactions (Ferrlecit)

PHARMACOKINETICS

PO: Excreted in feces, urine, skin, breast milk; enters bloodstream; bound to transferrin; crosses placenta

INTERACTIONS

Increase: action of iron preparation—ascorbic acid, chloramphenicol

Decrease: absorption of penicillamine, levodopa, methyldopa, fluoroquinolones, L-thyroxine, tetracycline

Decrease: absorption of iron preparations—antacids, H₂-antagonists, proton pump inhibitors, cholestyramine, vit E

Drug/Food

Decrease: absorption—dairy products, caffeine, eggs

Drug/Lab Test

False positive: occult blood

NURSING CONSIDERATIONS

Assess:

- Blood studies: Hct, Hgb, reticulocytes, bilirubin before treatment, at least monthly; iron studies (Iron, TIBC, ferritin) ⚠️ **Toxicity:** nausea, vomiting, diarrhea (green then tarry stools), hematemesis, pallor, cyanosis, shock, coma
- Elimination; if constipation occurs, increase water, bulk, activity
- **Nutrition:** amount of iron in diet (meat, dark green leafy vegetables, dried beans, dried fruits, eggs) • Cause of iron loss or anemia, including salicylates, sulfonamides, antimalarials, quinine

Perform/provide:

- Storage in tight, light-resistant container

Evaluate:

- Therapeutic response: improvement in Hct, Hgb, reticulocytes; decreased fatigue, weakness

Teach patient/family:

- That iron will turn stools black or dark green
- **Accidental exposure:** to keep out of reach of children, pets; iron poisoning may occur if increased beyond recommended level • Not to substitute 1 iron salt for another; that elemental iron content differs (e.g., 300 mg ferrous fumarate contains about 100 mg elemental iron; 300 mg ferrous gluconate contains only about 30 mg elemental iron) • To avoid reclining position for 15-30 min after taking product to avoid esophageal corrosion • To follow a diet high in iron; to avoid taking iron, dairy products, calcium supplements, and vit C together because they compete for absorption

TREATMENT OF OVERDOSE:

Induce vomiting; give eggs, milk until lavage can be done

☛ Canada only Side effects: *italics* = common; **bold** = life-threatening ⚠
Nurse Alert

fesoterodine (Rx)

(fess'oh-ter-oh-deen)

Toviaz

Func. class.: Overactive bladder product

Chem. class.: Muscarinic receptor antagonist

ACTION:

Relaxes smooth muscles in urinary tract by inhibiting acetylcholine at postganglionic sites

USES:

Overactive bladder (urinary frequency, urgency), urinary incontinence

CONTRAINDICATIONS:

GI obstruction, ileus, pyloric stenosis, urinary retention, gastric retention, hypersensitivity, closed-angle glaucoma

Precautions: Pregnancy (C), breastfeeding, children, renal/hepatic disease, urinary tract obstruction, ambient temperature increase, autonomic neuropathy, constipation, contact lenses, hazardous activity, GERD, gastroparesis, myasthenia gravis, prostatic hypertrophy, toxic megacolon, ulcerative colitis, possible cross-sensitivity with tolterodine

DOSAGE AND ROUTES

Calculator

• **Adult and geriatric:** PO EXT REL 4 mg/day, may increase to 8 mg/day based on response, max 4 mg/day in those taking potent CYP3A4 inhibitors

Renal dose

• **Adult:** PO EXT REL CCr <30 ml/min, max 4 mg/day in severe renal impairment

Available forms: EXT REL TABS 4, 8 mg

Administer:

- Do not break, crush, or chew ext rel product
- Give without regard to meals

SIDE EFFECTS

CV: Chest pain, angina, **QT prolongation**

EENT: Xerophthalmia

GI: *Nausea, vomiting*, abdominal pain, constipation, dry mouth

GU: Dysuria, urinary retention

INTEG: Rash, **angioedema**

MISC: Peripheral edema, insomnia

MS: Back pain

RESP: Cough

SYST: Infection

PHARMACOKINETICS

Peak 5 hr, rapidly absorbed, protein binding 50%, excreted in urine/feces, half-life 7 hr

INTERACTIONS

Increase: action of fesoterodine—CYP3A4 inhibitors (antiretroviral protease inhibitors, macrolide antiinfectives, azole antifungals)

Increase: anticholinergic effect—antimuscarinics, anticholinergics

Increase: urinary frequency—diuretics

Drug/Herb

Decrease: fesoterodine—caffeine, green tea, guarana

Drug/Food

Increase: fesoterodine level—grapefruit juice

Decrease: fesoterodine level—cola, coffee, tea

NURSING CONSIDERATIONS

Assess:

- **Urinary patterns:** distention, nocturia, frequency, urgency, incontinence
- **Allergic reactions:** rash; if this occurs, product should be discontinued

Perform/provide:

- Storage at room temp; protect from moisture

Evaluate:

- Therapeutic response: absence of urinary frequency, urgency, incontinence

Teach patient/family:

- Not to drink liquids before bedtime

- About the importance of bladder maintenance

🍁 Canada only Side effects: *italics* = common; **bold** = life-threatening ⚠️
Nurse Alert

fexofenadine (Rx, OTC)

(fex-oh-fi'na-deen)

Allegra, Allegra ODT, GNP Allergy Relief, Premier Value Allergy Relief

Func. class.: Antihistamine—2nd generation

Chem. class.: Piperidine, peripherally selective

Do not confuse: Allegra/Viagra

ACTION:

Acts on blood vessels, GI, respiratory system by competing with histamine for H₁-receptor site; decreases allergic response by blocking pharmacologic effects of histamine, less sedating

USES:

Rhinitis, allergy symptoms, chronic idiopathic urticaria

CONTRAINDICATIONS:

Breastfeeding, newborn or premature infants, hypersensitivity, severe hepatic disease

Precautions: Pregnancy (C), children, geriatric patients, respiratory disease, closed-angle glaucoma, prostatic hypertrophy, bladder neck obstruction, asthma

DOSAGE AND ROUTES

Calculator

- **Adult and child >12 yr: PO** Rx only, 60 mg bid or 180 mg/day; PO OTC only, 60 mg bid or 180 mg/day (self-treatment of allergic rhinitis)
- **Child 2-11 yr: PO** 30 mg bid; **ORALLY DISINTEGRATING TAB Child 6-11 yr:** 30 mg bid dissolved on tongue

Renal dose

- **Adult and child ≥12 yr: PO** CCr <80 ml/min, 60 mg/day
- **Child 2-11 yr: PO** CCr <80 ml/min, 30 mg q day
- **Child <2 yr: PO** CCr <80 ml/min, 15 mg q day

Available forms: Tabs 30, 60, 180 mg; oral susp 6 mg/ml, orally disintegrating tab 30 mg

Administer:

- Without regard to meals; caps/tabs should not be given with or right before

grapefruit, orange, or apple juice • **Orally disintegrating tab:** allow to dissolve, swallow; do not remove from blister pack until time of administration • **Oral susp:** shake well, use calibrated measuring device

SIDE EFFECTS

CNS: Headache, stimulation, drowsiness, sedation, fatigue, confusion, blurred vision, tinnitus, restlessness, tremors, paradoxical excitation in children or geriatric patients

CV: Hypotension, palpitations, bradycardia, tachycardia, **dysrhythmias** (rare)

GI: Nausea, diarrhea, abdominal pain, vomiting, constipation

GU: Frequency, dysuria, urinary retention, impotence

HEMA: **Hemolytic anemia, thrombocytopenia, leukopenia, agranulocytosis, pancytopenia**

INTEG: Rash, eczema, photosensitivity, urticaria

RESP: Thickening of bronchial secretions, dry nose, throat

PHARMACOKINETICS

Well absorbed; onset 1 hr; peak 2-3 hr; duration 12-24 hr; 80% excreted in urine; half-life 14.5 hr, increased in renal disease

INTERACTIONS

Decrease: effect—magnesium-aluminum-containing antacids

Drug/Food

Decrease: absorption of product—apple, orange, grapefruit juice

Drug/Lab Test

False negative: skin allergy tests

NURSING CONSIDERATIONS

Assess:

- **Allergy:** itchy, runny, watery eyes; congested nose; before and during treatment
- **I&O ratio:** be alert for urinary retention, frequency, dysuria, especially among geriatric patients; product should be discontinued if these occur; serum creatinine/BUN at baseline and periodically during treatment
- **Respiratory status:** rate, rhythm, increase in bronchial secretions, wheezing, chest tightness

Perform/provide:

- Storage in tight, light-resistant container

Evaluate:

- Therapeutic response: absence of running or congested nose or rashes

Teach patient/family:

- About all aspects of product use; to notify prescriber if confusion, sedation, hypotension occur
- To avoid driving, other hazardous activity if drowsiness occurs
- To avoid alcohol, other CNS depressants
- **Not to exceed recommended dose; that dysrhythmias may occur**

TREATMENT OF OVERDOSE:

Lavage, diazepam, vasopressors, IV phenytoin

☼ Canada only Side effects: *italics* = common; **bold** = life-threatening ⚠
Nurse Alert

fidaxomicin

(fye-dax'oh-mye'sin)

Dificid

Func. class.: Antiinfective-macrolide

ACTION:

Bactericidal against *Clostridium difficile*; is a fermentation product obtained from *Dactylosporangium aurantiacum*; inhibits RNA synthesis by inhibiting transcription of bacterial RNA polymerases; may act at the early stages of transcription

USES:

Pseudomembranous colitis

Clostridium difficile-associated diarrhea

CONTRAINDICATIONS:

Hypersensitivity

Precautions: Pregnancy (B), breastfeeding, children

DOSAGE AND ROUTES

Calculator

• **Adult: PO** 200 mg bid × 10 days

Available forms: Tab 200 mg

Administer:

- Without regard to food
- Store at room temperature

SIDE EFFECTS

GI: Nausea, vomiting, abdominal pain, **GI bleeding**

HEMA: Anemia, neutropenia

META: **Metabolic acidosis**, hyperglycemia

PHARMACOKINETICS

Half-life 12 hr, onset 1 hr, peak 1-5 hr, excreted in feces 92%

INTERACTIONS

Increase: fidaxomicin action—cycloSPORINE

Drug/Lab Test

Increase: Glucose, LFTs, alk phos

Decrease: sodium bicarbonate

NURSING CONSIDERATIONS

Assess:

• **Pseudomembraneous colitis:** for diarrhea, abdominal pain, fever, fatigue, anorexia, anemia, elevated WBC and low serum albumin; product may be used in place of vancomycin; monitor CBC with differential and stool culture (*Clostridium difficile*), not to be used for systemic infection, obtain C&S before use, monitor glucose (diabetic patients)

Evaluate:

• Positive therapeutic response: resolution of *Clostridium difficile*

Teach patient/family:

- To report GI bleeding, or severe abdominal pain
- To report if pregnancy is planned or suspected or if breastfeeding
- May take without regard to food

☼ Canada only Side effects: *italics* = common; **bold** = life-threatening ⚠

Nurse Alert

filgrastim (Rx)

(fill-grass'stim)

G-CSF, granulocyte colony stimulator, Neupogen

Func. class.: Biologic modifier

Chem. class.: Granulocyte colony-stimulating factor

ACTION:

Stimulates proliferation and differentiation of neutrophils

USES:

To decrease infection in patients receiving antineoplastics that are myelosuppressive; to increase WBC in patients with product-induced neutropenia; bone marrow transplantation

Unlabeled uses: Neutropenia with HIV infection, aplastic anemia, ganciclovir-induced neutropenia, zidovudine-induced neutropenia

CONTRAINDICATIONS:

Hypersensitivity to proteins of *Escherichia coli*

Precautions: Pregnancy (C), breastfeeding, cardiac conditions, children, myeloid malignancies, radiation therapy, sepsis, sickle cell disease, chemotherapy, respiratory disease

DOSAGE AND ROUTES

Calculator

After myelosuppressive chemotherapy

- **Adult and child:** IV/SUBCUT 5 mcg/kg/day in a single dose $\times$ 14 days; may increase by 5 mcg/kg with each cycle

After bone marrow transplantation

- **Adult:** IV/SUBCUT 10 mcg/kg/day as **INF (IV)** over 4 hr or 24 hr, begin 24 hr after chemotherapy and 24 hr after bone marrow transplantation

Peripheral blood progenitor cell collection/therapy

- **Adult:** 10 mcg/kg/day as bolus or **CONT INF** $\times$ $\geq$ 4 days before leukapheresis, continue to last leukapheresis; may alter dose if WBC $>100,000$ cells/mm³

Severe neutropenia (chronic), idiopathic/cyclical

- **Adult: SUBCUT** 5 mcg/kg daily

Available forms: Inj 300 mcg/ml, 480 mcg/1.6 ml, 480 mcg/0.8 ml, 3000 mcg/0.5 ml

Administer:

- Given by subcut inj, short IV inf, or continuous SC or IV inf
- Avoid use within 24 hr before or after chemotherapy
- Do not shake commercial single-dose vials before withdrawing the dose. If the vial is shaken and froth or bubbles form, allow the vial to stand undisturbed for a few minutes until the froth or bubbles dissipate • Before injection, filgrastim may be allowed to reach room temperature for a maximum of 24 hr. Any vial or syringe exposed to room temperature for more than 24 hr should be discarded
- Visually inspect for particulate matter and discoloration before use

SUBCUT route

- **Subcut inj:** No dilution is necessary; inject by rapid subcut inj, taking care not to inject intradermally • **Subcut continuous inf:** Infuse subcut at a rate not to exceed 2 ml/hr

IV route

- May be diluted with 5% dextrose. Do not dilute with NS; product can precipitate
- May be diluted to concentrations 5–15 mcg/ml; should be protected from adsorption to plastic by the addition of albumin to a final albumin concentration of 2 mg/ml. Do not dilute filgrastim to a concentration <5 mcg/ml • **IV inf:** Infuse IV over 15–30 min or as a continuous infusion over 24 hr

Y-site compatibilities: Acyclovir, allopurinol, amikacin, aminophylline, ampicillin, ampicillin/sulbactam, aztreonam, bleomycin, bumetanide, buprenorphine, butorphanol, calcium gluconate, CARBOplatin, carmustine, ceFAZolin, cefoTEtan, cefTAZidime, chlorproMAZINE, cimetidine, CISplatin, cyclophosphamide, cytarabine, dacarbazine, DAUNOrubicin, dexamethasone, diphenhydrAMINE, DOXOrubicin, doxycycline, droperidol, enalaprilat, famotidine, floxuridine, fluconazole, fludarabine, gallium, ganciclovir, granisetron, haloperidol, hydrocortisone, HYDROmorphone, hydrOXYzine, IDArubicin, ifosfamide, leucovorin, LORazepam, mechlorethamine, melphalan, meperidine, mesna, methotrexate, metoclopramide, miconazole, minocycline,

mitoXANtrone, morphine, nalbuphine, netilmicin, ondansetron, plicamycin, potassium chloride, promethazine, ranitidine, sodium bicarbonate, streptozocin, ticarcillin, ticarcillin/clavulanate, tobramycin, trimethoprim-sulfamethoxazole, vancomycin, vinBLAStine, vinCRISStine, vinorelbine, zidovudine

SIDE EFFECTS

CNS: Fever, headache

GI: *Nausea*, vomiting, diarrhea, mucositis, anorexia

HEMA: **Thrombocytopenia**, excessive leukocytosis

INTEG: Alopecia, exacerbation of skin conditions, urticaria, cutaneous vasculitis

MS: Osteoporosis, skeletal pain

OTHER: Chest pain, hypotension

RESP: **Acute respiratory distress syndrome**, wheezing, **alveolar hemorrhage**

PHARMACOKINETICS

SUBCUT: Onset 5-60 min, peak 2-8 hr, duration up to 1 wk

IV: Onset 5-60 min, peak 24 hr, duration up to 1 wk

INTERACTIONS

Increase: adverse reactions—do not use this product concomitantly with antineoplastics, lithium

Drug/Lab Test

Increase: uric acid, LDH, alk phos, WBC

NURSING CONSIDERATIONS

Assess:

- Blood studies: CBC, platelet count before treatment and twice weekly; neutrophil counts may be increased for 2 days after therapy
- B/P, respirations, pulse before and during therapy
- Bone pain; give mild analgesics
- CBC with differential, platelets

Perform/provide:

- Storage in refrigerator; do not freeze; may store at room temp up to 24 hr

Evaluate:

- Therapeutic response: absence of infection

Teach patient/family:

- About the technique for self-administration: dose, side effects, disposal of containers and needles; provide instruction sheet
-

🍁 Canada only Side effects: *italics* = common; **bold** = life-threatening ⚠️
Nurse Alert

finasteride (Rx)

(fin-ass'te-ride)

Propecia, Proscar

Func. class.: Hormone, androgen inhibitor, hair stimulant *Chem. class.:* 5- α -Reductase inhibitor

Do not confuse: finasteride/furosemide

Proscar/ProSom/PROzac

ACTION:

Inhibits 5- α -reductase and reduction in DHT; DHT induces androgenic effects by binding to androgen receptors in the cell nuclei of the prostate gland, liver, skin; prevents development of BHP

USES:

Symptomatic benign prostatic hyperplasia (Proscar); male-pattern baldness (Propecia)

Unlabeled uses: Hirsutism, prostate cancer prophylaxis

CONTRAINDICATIONS:

Pregnancy (X), breastfeeding, children, women who are pregnant or who may become pregnant should not handle tabs, hypersensitivity

Precautions: Large residual urinary volume, severely diminished urinary flow, hepatic function abnormalities

DOSAGE AND ROUTES

Calculator

BPH

- **Adult: PO** 5 mg/day $\times$ 6-12 mo (Proscar)

Male-pattern baldness

- **Adult: PO** 1 mg/day for 3 mo or more for results (Propecia)

Hirsutism (unlabeled)

- **Adult (nonpregnant): PO** 5 mg/day alone or in combination with oral contraceptives

Prostate cancer prophylaxis (unlabeled)

- **Adult (male): PO** 5 mg/day

Available forms: Tabs (Propecia) 1 mg, (Proscar) 5 mg

Administer:

- Without regard to meals
- For a minimum of 6 mo; not all patients will respond

SIDE EFFECTS

GU: Impotence, decreased libido, decreased volume of ejaculate, sexual dysfunction

INTEG: Rash

MISC: Breast tenderness, secondary malignancy

PHARMACOKINETICS

Bioavailability 63%; readily absorbed from GI tract; plasma protein binding 90%; metabolized in the liver; excreted in urine (metabolites) 39%, feces (57%); crosses blood-brain barrier; peak 1-2 hr; duration 24 hr

INTERACTIONS

Decrease: finasteride effect—theophylline, adrenergic bronchodilators, anticholinergics

Drug/Lab Test

Decrease: PSA levels

NURSING CONSIDERATIONS

Assess:

- **BPH:** urinary patterns, residual urinary volume, severely diminished urinary flow
- PSA levels and digital rectal exam prior to initiating therapy and periodically thereafter
- Hepatic studies before treatment; extensively metabolized in liver

Perform/provide:

- Storage <86° F (30° C); protect from light; keep container tightly closed

Evaluate:

- Therapeutic response: increased urinary flow; decreased postvoiding dribbling, frequency, nocturia or hair growth within 3-6 mo; regression of prostate size

Teach patient/family:

 That pregnant women or women who may become pregnant should not touch crushed tabs or come into contact with the semen of a patient taking this product;

that product may adversely affect developing male fetus • That volume of ejaculate may be decreased during treatment; that impotence and decreased libido may also occur and may continue after discontinuing treatment • That Propecia results may not occur for 3 mo

- That Proscar results may not occur for 6-12 mo

✳ Canada only Side effects: *italics* = common; **bold** = life-threatening ⚠

Nurse Alert

fingolimod (Rx)

(fin-gol'i-mod)

Gilenya

Func. class.: Biologic response modifier

Chem. class.: Sphingosine 1-phosphate receptor modulator

ACTION:

Binds with high affinity to sphingosine 1-phosphate receptors; blocks lymphocyte egress to lymph nodes, thereby reducing the number of peripheral blood lymphocytes; may reduce lymphocyte migration into the CNS

USES:

To reduce frequency of exacerbation, to delay physical disability of relapsing forms of MS

CONTRAINDICATIONS:

Hypersensitivity

Precautions: Pregnancy (C), breastfeeding, neonates/infants/children, AIDS, asthma, AV block, bradycardia, cardiac disease, COPD, diabetes mellitus, dysrhythmias, heart failure, hepatic disease, HIV, hypertension, immunosuppression, leukemia, lymphoma, QT prolongation, respiratory insufficiency, sick sinus syndrome, syncope, uveitis

DOSAGE AND ROUTES

Calculator

• **Adult: PO** 0.5 mg/day

Hepatic dose

• **Adult: PO** Child-Pugh C, total score >10: closely monitor, fingolimod exposure is doubled

Available forms: Caps 0.5 mg

Administer:

PO route

• Watch patient for 6 hr after initial dose or if product not given for >2 wk for development of bradycardia • Give without regard to food

SIDE EFFECTS

CNS: Asthenia, depression, fatigue, headache, dizziness, encephalopathy, migraine, paresthesias, **stroke**

CV: AV block, bradycardia, chest pain, hypertension, palpitations

EENT: Blurred vision, vision impairment, ocular pain, macular edema

GI: Abdominal pain, anorexia, diarrhea, jaundice, vomiting, weight loss

HEMA: **Leukopenia, lymphopenia, neutropenia**

INTEG: Alopecia, pruritus

MS: Back pain

RESP: Dyspnea, cough

SYST: Infection, influenza, **secondary malignancy**

PHARMACOKINETICS

Protein binding (99.7%), distributed to RBCs (86%), steady state 1-2 months, metabolized by CYP4F2 and CYP2D6 to a lesser extent, terminal half-life 6-9 days, excreted in urine (81% inactive metabolites), peak 12-16 hr

INTERACTIONS

Increase: immunosuppression—antineoplastics, immunosuppressants, immune modulating therapies

Increase: fingolimod effect—ketoconazole

Increase: infection risk—live vaccines

Decrease: effect of—inactive vaccines, toxoids

Increase: **risk of torsades de pointes—Class Ia/III antidysrhythmics**

NURSING CONSIDERATIONS

Assess:

- **Multiple sclerosis:** improving paresthesia, muscle weakness, clonus, muscle spasms, difficulty with moving, difficulty with coordination of balance, speech, swallowing, vision problems, fatigue; prevention of increasing disability
- **Laboratory monitoring:** obtain before initial dose; CBC, LFTs, serum bilirubin, ophthalmologic exam, antibodies to VZV; if there is no history of chickenpox or no vaccination, may give VZV vaccination to antibody-negative patient before giving product, postpone for 1 mo after vaccination; obtain ECG for evidence of bradycardia, AV block

Perform/provide:

- Storage at room temp, protect from moisture

Evaluate:

- Therapeutic response: improved symptoms of multiple sclerosis and prevention of increasing disability

Teach patient/family:

- About use of product and expected results; provide med guide to patient
 - That continuing follow-up exams and laboratory tests will be required on a regular basis
 - To report any side effects of therapy
 - To protect product from moisture
 - To report chest pain, palpitations, jaundice
-

☼ Canada only Side effects: *italics* = common; **bold** = life-threatening ⚠

Nurse Alert

flecainide (Rx)

(flek-ay'nide)

Tambocor

Func. class.: Antidysrhythmic (Class IC)

ACTION:

Decreases conduction in all parts of the heart, with greatest effect on the His-Purkinje system, which stabilizes cardiac membrane

USES:

Life-threatening ventricular dysrhythmias, sustained ventricular tachycardia, supraventricular tachydysrhythmias, paroxysmal atrial fibrillation/flutter associated with disabling symptoms

Unlabeled uses: Atrial fibrillation, single dose

CONTRAINDICATIONS:

Hypersensitivity, AV bundle branch block, cardiogenic shock

Precautions: Pregnancy (C), breastfeeding, children, geriatric patients, renal/hepatic disease, CHF, respiratory depression, myasthenia gravis, electrolyte abnormalities, atrial fibrillation, sick sinus syndrome, torsades de pointes

Black Box Warning:

MI, cardiac arrhythmias, atrial fibrillation

DOSAGE AND ROUTES

Calculator

PSVT/PAT

- **Adult: PO** 50 mg q12hr; may increase q4days by 50 mg q12hr to desired response, max 300 mg/day

Life-threatening ventricular dysrhythmias

- **Adult: PO** 100 mg q12hr; may increase by 50 mg q12hr q4days, max 400 mg/day

Renal dose

- **Adult: PO** CCr <35 ml/min, 100 mg daily or 50 mg bid initially

Available forms: Tabs 50, 100, 150 mg

Administer:

PO route

- Reduced dosage as soon as dysrhythmia is controlled
- May give with meals for GI upset
- May adjust dose q4days
- Therapeutic trough serum concentrations for adults range from 200 to 1000 ng/ml (average, 500 ng/ml); toxicity is more common with trough serum concentrations >1000 ng/mL; usual therapeutic range in children is 200–500 ng/mL; in some cases, up to 800 ng/mL is required • Adjust dosage at intervals of ≥4 days (approximate plateau effects) following dosage adjustments; however, longer intervals are needed in patients with renal or hepatic impairment
- Frequent serum drug concentration monitoring is required for patients with severe renal (CrCl <35 ml/min) or hepatic disease and may also be helpful in patients with CHF or in patients with moderate renal disease • Monitoring of flecainide serum concentrations is strongly recommended in patients receiving amiodarone therapy

SIDE EFFECTS

CNS: *Headache, dizziness*, involuntary movement, confusion, psychosis, restlessness, irritability, paresthesias, ataxia, flushing, somnolence, depression, anxiety, malaise, fatigue, asthenia, tremors

CV: *Hypotension, bradycardia*, angina, PVCs, **heart block, cardiovascular collapse, arrest**, dysrhythmias, **CHF, fatal ventricular tachycardia**, palpitations, **QT prolongation, torsades de pointes**

EENT: Tinnitus, *blurred vision*, hearing loss, corneal deposits, dry eyes

GI: Nausea, vomiting, anorexia, constipation, abdominal pain, flatulence, change in taste, diarrhea

GU: Impotence, decreased libido, polyuria, urinary retention

HEMA: **Leukopenia, thrombocytopenia**

INTEG: Rash, urticaria, edema, swelling

RESP: Dyspnea, **respiratory depression**

PHARMACOKINETICS

Peak 3 hr, half-life 12-27 hr, metabolized by liver, excreted unchanged by kidneys (10%), excreted in breast milk

INTERACTIONS

Increase: of both products—propranolol

Increase: CV depressant action— β -blockers, disopyramide, verapamil

Increase: flecainide level—amiodarone, cimetidine, ritonavir

Increase: digoxin level—digoxin

Increase or decrease: effect—urinary, alkalinizing agents, acidifying agents

Drug/Lab Test

Increase: CPK

NURSING CONSIDERATIONS

Black Box Warning:

MI, CHF, cardiogenic shock: should not be used in these conditions

Black Box Warning:

Atrial fibrillation: avoid use, risk of ventricular dysrhythmias

Black Box Warning:

Cardiac dysrhythmias: discontinue in those with prolonged QRS >180 ms or prolonged PR >300 ms

Assess:

• **Electrolyte imbalances:** hypo/hyperkalemia before administration; correct electrolytes before use • **CNS effects:** dizziness, confusion, psychosis, paresthesias, seizures; product should be discontinued • **Flecainide level:** Monitor level in those with CHF or renal failure; peak, trough

Evaluate:

• Therapeutic response: decreased dysrhythmias

Teach patient/family:

- To change position slowly from lying or sitting to standing to minimize orthostatic hypotension
- To take as prescribed; not to skip or double dose
- To avoid hazardous activities that require alertness until response is known
- To carry emergency ID with disorder, medications taken
- To notify all health care providers of treatment
- To report new or worsening cardiac symptoms

TREATMENT OF OVERDOSE:

O₂, artificial ventilation, ECG, DOPamine for circulatory depression, diazepam or thiopental for seizures, treat ventricular dysrhythmias

🍁 Canada only Side effects: *italics* = common; **bold** = life-threatening ⚠️
Nurse Alert

fluconazole (Rx)

(floo-kon'a-zole)

Diflucan

Func. class.: Antifungal, systemic; azole

Chem class: Triazole

Do not confuse: Diflucan/Diprivan

ACTION:

Inhibits ergosterol biosynthesis, causes direct damage to fungal membrane phospholipids

USES:

Oropharyngeal candidiasis, chronic mucocutaneous candidiasis; systemic, vaginal, urinary candidiasis; cryptococcal meningitis; prevention of candidiasis in bone marrow transplant in those who receive chemotherapy and/or radiation therapy; cystitis, fungal prophylaxis, peritonitis, pneumonia, pyelonephritis

Unlabeled uses: Prophylaxis, systemic candidiasis in very-low-birthweight premature infants, blastomycosis, chemotherapy-induced neutropenia, coccidioidomycosis cryptococcosis prophylaxis, endocarditis, endophthalmitis, histoplasmosis infectious arthritis, myocarditis, osteomyelitis, pericarditis

CONTRAINDICATIONS:

Hypersensitivity to this product or azoles, pregnancy (D)

Precautions: Breastfeeding, renal/hepatic disease, torsades de pointes

DOSAGE AND ROUTES

Calculator

Vulvovaginal candidiasis

- **Adult:** PO 150 mg as a single dose

Serious fungal infections

- **Adult:** PO/IV 50-400 mg initially then 200 mg/day for 4 wk
- **Child:** 6-12 mg/kg/day

Oropharyngeal candidiasis

- **Adult:** PO/IV 200 mg initially then 100 mg/day for ≥ 2 wk

- **Child: PO/IV** 6 mg/kg initially then 3 mg/kg/day for ≥ 2 wk

Esophageal candidiasis

- **Adult: PO/IV** 200 mg on 1st day, then 100 mg daily $\times \geq 3$ wk and for ≥ 2 wk after resolution of symptoms
- **Child: PO/IV** 6 mg/kg on 1st day, then 3 mg/kg $\times \geq 3$ wk and for ≥ 2 wk after resolution of symptoms

Cryptococcal meningitis

- **Adult: PO/IV** 400 mg on 1st day, then 200 mg daily $\times 10$ -12 wk after CSF culture negative
- **Child/infants/neonates ≥ 14 days: PO/IV** 12 mg/kg on 1st day, then 6-12 mg/kg daily $\times 10$ -12 wk after CSF culture negative, max 600 mg/day
- **Neonates 0-14 days: PO/IV** 12 mg/kg on 1st day, then 6-12 mg/kg q72hr $\times 10$ -12 wk after CSF culture negative

Prevention of candidiasis in bone marrow transplant

- **Adult: PO/IV** 400 mg/day

Renal disease

- **Adult: PO/IV** CCr ≤ 50 ml/min, after loading dose, give 50% of usual dose

Available forms: Tabs 50, 100, 150, 200 mg; inj 2 mg/ml; powder for oral susp 50, 200 mg/ml

Administer:

PO route

- Tap bottle to loosen powder, add 24 ml distilled or purified water to bottles with 0.35 or 1.4 g drug, shake well, conc 50 or 200 mg/5 ml, respectively
- Shake oral susp before each use

Intermittent IV INF route

- After diluting according to package directions; run at ≤ 200 mg/hr; do not use plastic containers in connections; check for bag leaks • Use inf pump; check for extravasation and necrosis q2hr
- Do not use if cloudy or precipitated
- Do not admix; do not refrigerate

Y-site compatibilities: Acyclovir, aldesleukin, alfentanil, allopurinol, amifostine, amikacin, aminocaproic acid, aminophylline, amiodarone, anidulafungin, ascorbic acid injection, atenolol, atracurium, atropine, azaTHIOprine, aztreonam, benztropine, bivalirudin, bleomycin, bumetanide,

buprenorphine, butorphanol, calcium chloride, CARBOplatin, caspofungin, cefamandole, ceFAZolin, cefepime, cefmetazole, cefonicid, cefoperazone, cefoTEtan, cefOXitin, cefpirome, cefTAZidime, ceftizoxime, ceftobiprole, cephalothin, cephapirin, chlorproMAZINE, cimetidine, cisatracurium, CISplatin, codeine, cyanocobalamin, cyclophosphamide, cycloSPORINE, cytarabine, DACTINomycin, DAPTOmycin, dexamethasone, diltiazem, dimenhyDRINATE, diphenhydrAMINE, DOBUTamine, DOCEtaxel, DOPamine, doripenem, doxacurium, DOXOrubicin, DOXOrubicin liposomal, doxycycline, droperidol, drotrecogin alfa, enalaprilat, ePHEDrine, EPINEPHrine, epirubicin, epoetin alfa, eptifibatide, ertapenem, erythromycin, esmolol, etoposide, famotidine, fenoldopam, fentaNYL, filgrastim, fludarabine, fluorouracil, folic acid, foscarnet, gallium, ganciclovir, gatifloxacin, gemcitabine, gentamicin, glycopyrrolate, granisetron, heparin, hydrocortisone, HYDROmorphone, IDArubicin, ifosfamide, IV immune globulin, inamrinone, indomethacin, insulin (regular), irinotecan, isoproterenol, ketorolac, labetalol, lansoprazole, leucovorin, levofloxacin, lidocaine, linezolid, LORazepam, LR, magnesium sulfate, mannitol, mechlorethamine, melphalan, meperidine, meropenem, metaraminol, methicillin, methotrexate, methoxamine, methyl dopate, methylPREDNISolone, metoclopramide, metoprolol, metroNIDAZOLE, mezlocillin, miconazole, midazolam, milrinone, minocycline, mitoXANtrone, morphine, moxalactam, multiple vitamins injection, mycophenolate, nafcillin, nalbuphine, naloxone, nesiritide, nitroglycerin, nitroprusside, norepinephrine, octreotide, ondansetron, oxacillin, oxaliplatin, oxytocin, PACLitaxel, palonosetron, pamidronate, pancuronium, papaverine, PEMEtrexed, penicillin G potassium/sodium, pentazocine, PENTobarbital, PHENobarbital, phenylephrine, phenytoin, phytonadione, piperacillin-tazobactam, polymyxin B, potassium chloride, procainamide, prochlorperazine, promethazine, propofol, propranolol, protamine, pyridoxine, quiNIDine, quinupristin-dalfopristin, ranitidine, remifentanyl, Ringer's, ritodrine, riTUXimab, rocuronium, sargramostim, sodium acetate/bicarbonate, succinylcholine, SUFentanyl, tacrolimus, temocillin, teniposide, theophylline, thiotepa, ticarcillin-clavulanate, tigecycline, tirofiban, TNA, tobramycin, tolazoline, TPN, trastuzumab, trimetaphan, urokinase, vancomycin, vasopressin, vecuronium, verapamil, vinCRISTine, vinorelbine, voriconazole, zidovudine, zoledronic acid

SIDE EFFECTS

CNS: Headache, seizures

CV: QT prolongation, torsades de pointes

GI: Nausea, vomiting, diarrhea, cramping, flatus, increased AST, ALT, hepatotoxicity

HEMA: Agranulocytosis, eosinophilia, leukopenia, neutropenia, thrombocytopenia

INTEG: Stevens-Johnson syndrome, angioedema, anaphylaxis, exfoliative dermatitis, toxic epidermal necrolysis

PHARMACOKINETICS

Peak 2-4 hr, bioavailability (PO) >90%, excreted unchanged in urine 80%, metabolized by CYP3A enzyme system at dose >200 mg/day, elimination half-life 30 hr

INTERACTIONS

Increase: hypoglycemia—oral antidiabetics

Increase: anticoagulation—warfarin

Increase: plasma concentrations—cycloSPORINE, phenytoin, theophylline, rifabutin, tacrolimus, sirolimus

Increase: myopathy, rhabdomyolysis risk—lovastatin, simvastatin

Increase: effect of zidovudine, methadone, SUFentanil, alfentanil, buprenorphine, saquinavir, fentaNYL, ergots

Decrease: effect of oral contraceptives, calcium channel blockers

NURSING CONSIDERATIONS

Assess:

- **Infection:** clearing of CSF and other culture during treatment, obtain C&S baseline and throughout treatment, product may be started as soon as culture is taken
- **Hepatotoxicity:** increasing AST, ALT, periodically alk phos, bilirubin;
- for renal status: BUN, creatinine

Perform/provide:

- Storage protected from moisture and light; diluted sol stable 24 hr; do not freeze

Evaluate:

- Therapeutic response: decreasing oral candidiasis, fever, malaise, rash; negative C&S for infection organism

Teach patient/family:

- That long-term therapy may be needed to clear infection
 - That medication may be taken with food to reduce GI effects
 - To notify prescriber of nausea, vomiting, diarrhea, jaundice, anorexia, clay-colored stools, dark urine • To use alternative method of contraception while taking this product, pregnancy (D)
-

☼ Canada only Side effects: *italics* = common; **bold** = life-threatening ⚠
Nurse Alert

RARELY USED

fludarabine (Rx)

(floo-dar'a-been)

Fludara, Oforta

Func. class.: Antineoplastic, antimetabolite

USES:

Chronic lymphocytic leukemia, non-Hodgkin's lymphoma

CONTRAINDICATIONS:

Pregnancy (D), breastfeeding, hypersensitivity

Black Box Warning:

Hemolytic anemia, bone marrow suppression, coma, seizures, visual disturbances

DOSAGE AND ROUTES

Calculator

• **Adult:** **IV** 25 mg/m² over 30 min × 5 days, may repeat q28days; reconstitute with 2 ml of sterile water for inj; dissolution should occur in <15 sec, adjust dose based on toxicity; **PO** 40 mg/m² × 5 days q28days

☼ Canada only Side effects: *italics* = common; **bold** = life-threatening ⚠
Nurse Alert

fludrocortisone (Rx)

(floo-droe-kor'ti-sone)

Func. class.: Corticosteroid, synthetic

Chem. class.: Mineralocorticoid

ACTION:

Promotes increased reabsorption of sodium and loss of potassium, water, hydrogen from distal renal tubules

USES:

Adrenal insufficiency, salt-losing adrenogenital syndrome, Addison's disease

Unlabeled uses: Renal tubular acidosis (type IV), idiopathic orthostatic hypotension

CONTRAINDICATIONS:

Children <2 yr, hypersensitivity, acute glomerulonephritis, amebiasis, psychoses, Cushing's syndrome, fungal infections

Precautions: Pregnancy (C), breastfeeding, children >2 yr, osteoporosis, CHF, hypertension, diabetes

DOSAGE AND ROUTES

Calculator

• **Adult: PO** 100-200 mcg/day

• **Child: PO** 50-100 mcg/day

Idiopathic hypotension (unlabeled)

• **Adult: PO** 50-200 mcg/day

Available forms: Tabs 100 mcg (0.1 mg)

SIDE EFFECTS

CNS: *Flushing, sweating, headache, paralysis, dizziness, seizures*

CV: *Hypertension, circulatory collapse, thrombophlebitis, embolism, tachycardia, CHF, edema*

ENDO: Weight gain, adrenal suppression, hyperglycemia

META: *Hypokalemia*

MISC: Hypersensitivity, cataracts, GI ulcers, anaphylaxis

MS: Fractures, osteoporosis, weakness

PHARMACOKINETICS

Peak 1.5 hr, half-life 18-36 hr, metabolized by liver, excreted in urine

INTERACTIONS

Increase: B/P—sodium-containing food or medication

Decrease: fludrocortisone action—barbiturates, rifampin, phenytoin

Decrease: potassium levels—thiazides, potassium-wasting products, loop diuretics, amphotericin B, piperacillin, mezlocillin

Drug/Herb

Increase: hypokalemia—aloe, buckthorn, cascara sagrada, Chinese rhubarb, senna

Increase: corticosteroid effect—aloe, licorice, perilla

Drug/Lab Test

Increase: potassium, sodium

Decrease: Hct

NURSING CONSIDERATIONS

Assess:

- Weight daily; notify prescriber of weekly gain >5 lb
- I&O ratio; be alert for decreasing urinary output, increasing edema
- B/P q4hr, pulse; notify prescriber if chest pain occurs
- Potassium depletion: paresthesias, fatigue, nausea, vomiting, depression, polyuria, dysrhythmias, weakness
- Electrolytes: sodium, potassium, chloride, hypokalemia is common

Administer:

- Titrated dose; use lowest effective dose
- With food or milk to decrease GI symptoms

Perform/provide:

- Assistance with ambulation in patient with bone tissue disease to prevent fractures

Evaluate:

- Therapeutic response: correction of adrenal insufficiency

Teach patient/family:

- That emergency ID as steroid user should be carried
 - Not to discontinue this medication abruptly
 - To notify health care provider of muscle cramps, weight gain, edema, nausea, infection, trauma, stress • Not to breastfeed while taking this medication
 - Avoid exposure to disease, trauma
-

🍁 Canada only Side effects: *italics* = common; **bold** = life-threatening ⚠️
Nurse Alert

flumazenil (Rx)

(flu-maz'e-nill)

Anexate , Romazicon

Func. class.: Antidote: benzodiazepine receptor antagonist *Chem. class.:* Imidazobenzodiazepine derivative

ACTION:

Antagonizes actions of benzodiazepines on CNS, competitively inhibits activity at benzodiazepine recognition site on GABA/benzodiazepine receptor complex

USES:

Reversal of sedative effects of benzodiazepines

CONTRAINDICATIONS:

Hypersensitivity to this product or benzodiazepines, serious cyclic antidepressant overdose, patients given benzodiazepine for control of life-threatening conditions

Precautions: Pregnancy (C), breastfeeding, children, geriatric patients, status epilepticus, head injury, labor/delivery, renal/hepatic disease, hypoventilation, panic disorder, drug and alcohol dependency, ambulatory patients

Black Box Warning:

Benzodiazepine dependence, seizures

DOSAGE AND ROUTES

Calculator

Reversal of conscious sedation or general anesthesia

- **Adult:** IV 0.2 mg given over 15 sec; wait 45 sec then give 0.2 mg if consciousness does not occur; may be repeated at 60-sec intervals prn (max 3 mg/hr) or 1 mg/5 min
- **Child:** IV 10 mcg (0.01 mg)/kg; cumulative dose of 1 mg or less

Management of suspected benzodiazepine overdose

- **Adult:** IV 0.2 mg given over 30 sec; wait 30 sec then give 0.3 mg over 30 sec if consciousness does not occur; further doses of 0.5 mg can be given over 30 sec at intervals of 1 min up to cumulative dose of 3 mg
- **Child:** IV 10 mcg (0.01 mg/kg), cumulative dose of <1 mg

Available forms: Inj 0.1 mg/ml

Administer:

- Check airway and IV access before administration
- Use large vein

Direct IV route

- Give undiluted or diluted with 0.9% NaCl, D₅W, LR; give over 15-30 sec into running IV
- Stable for 24 hr if drawn into a syringe or mixed with other solutions

SIDE EFFECTS

CNS: Dizziness, agitation, emotional lability, confusion, **seizures**, somnolence, panic attacks

CV: Hypertension, palpitations, cutaneous vasodilation, **dysrhythmias**, bradycardia, tachycardia, chest pain

EENT: Abnormal vision, blurred vision, tinnitus

GI: Nausea, vomiting, hiccups

SYST: Headache, inj site pain, increased sweating, fatigue, rigors

PHARMACOKINETICS

Terminal half-life 41-79 min, metabolized in liver, onset 1-2 min

INTERACTIONS

- Toxicity: mixed product overdose
- Antagonize action of benzodiazepines, zaleplon, zolpidem

NURSING CONSIDERATIONS

Assess:

- Cardiac status using continuous monitoring

Black Box Warning:

For seizures; protect patient from injury; most likely among those who are withdrawing from benzodiazepines; flumazenil can precipitate benzodiazepine withdrawal and onset of seizures, seizures are increased in head trauma

- GI symptoms: nausea, vomiting; place patient in side-lying position to prevent aspiration
- **Allergic reactions:** flushing, rash, urticaria, pruritus

Black Box Warning:

Seizures/benzodiazepine dependence: do not use in those who have used these products for IIP or status

epilepticus; use in intensive care setting cautiously, there may be unrecognized benzodiazepine dependence

Evaluate:

- Therapeutic response: decreased sedation, respiratory depression, toxicity

Teach patient/family:

- That amnesia may continue
- Not to engage in hazardous activities for 18-24 hr after discharge
- Not to take any alcohol or nonprescription products for 18-24 hr

🍁 Canada only Side effects: *italics* = common; **bold** = life-threatening ⚠️

HIGH ALERT

fluorouracil (Rx)

(flure-oh-yoor'a-sil)

Adrucil, Carac, Efudex, 5-FU

Func. class.: Antineoplastic, antimetabolite

Chem. class.: Pyrimidine analog

Do not confuse: **fluorouracil**/flucytosine

ACTION:

Inhibits DNA, RNA synthesis; interferes with cell replication by competitively inhibiting thymidylate production, specific for S phase of cell cycle

USES:

Systemic: cancer of breast, colon, rectum, stomach, pancreas; **topical:** multiple actinic keratoses, superficial basal cell carcinomas

Unlabeled uses: Anal, biliary tract, cervical, head and neck, hepatocellular, ovarian cancer

CONTRAINDICATIONS:

Pregnancy (X), breastfeeding, hypersensitivity, poor nutritional status, serious infections

Black Box Warning:

Bone marrow suppression

Precautions: Children, renal/hepatic disease, angina

Black Box Warning:

GI bleeding

DOSAGE AND ROUTES

Calculator

Doses vary widely, based on actual body weight unless obese, then based on lean body weight

Advanced colorectal cancer

- **Adult: IV bolus** 300-500 mg/m²/day × 4-5 days q28days or 600-1500 mg/m² weekly or every other wk; continuous IV infusion: 300-1000 mg/m²/day × 4-5

days q4wk or 300 mg/m²/day indefinitely, high dose 3000-3400 mg/m² over 24-72 hr

Breast cancer

- **Adult: IV bolus** 400-600 mg/m² on days 1 and 8 of every cycle with cyclophosphamide and methotrexate or 600 mg/m² day 1 with cyclophosphamide and methotrexate q21-28days

Pancreatic cancer

- **Adult: IV bolus** 600 mg/m² on days 1, 8, 29, 36 with DOXOrubicin and mitoMYcin q8wk

Actinic/solar keratoses

- **Adult: TOP** 1% cream/sol 1-2×/day or 2-5% sol for hands

Superficial basal cell carcinoma

- **Adult: TOP** 5% sol or cream 2×/day × 3-12 wk

Available forms: Inj 50 mg/ml; cream 0.5%, 1%, 5%; sol 1%, 2%, 5%

Administer:

- Antiemetic 30-60 min before product to prevent vomiting, for several days thereafter

Topical route

- The 1% strength is used on face; higher strengths are used on other parts of the body
- Wear gloves when applying; may use with a loose dressing; use plastic or wooden applicator

IV route

- Prepared in biologic cabinet using gloves, gown, mask; use cytotoxic handling procedures
- Undiluted; may inject through Y-tube or 3-way stopcock; give over 1-3 min; may be diluted in NS, D₅W; given as a continuous infusion in plastic containers, do not refrigerate/freeze, protect from light, discard unused portion

Y-site compatibilities: Acyclovir, alatrofloxacin, alfentanil, allopurinol, amifostine, amikacin, amphotericin B lipid complex, amphotericin B liposome, ampicillin, ampicillin-sulbactam, anidulafungin, argatroban, atenolol, atracurium, azithromycin, aztreonam, bivalirudin, bleomycin, bumetanide, butorphanol, calcium gluconate, CARBOplatin, ceFAZolin, cefepime, cefoperazone, cefotaxime, cefoTEtan, cefOXitin, cefTAZidime, ceftizoxime,

cefTRIAxone, cefuroxime, cimetidine, cisatracurium, CISplatin, clindamycin, codeine, cyclophosphamide, cycloSPORINE, DAPTOmycin, dexamethasone, digoxin, DOCEtaxel, DOPamine, doripenem, DOXOrubicin liposomal, enalaprilat, ePHEDrine, ertapenem, erythromycin, esmolol, etoposide phosphate, famotidine, fenoldopam, fentaNYL, fluconazole, fludarabine, foscarnet, fosphenytoin, furosemide, ganciclovir, gatifloxacin, gemcitabine, gentamicin, granisetron, heparin, hydrocortisone, HYDROmorphone, ifosfamide, imipenem-cilastatin, inamrinone, isoproterenol, ketorolac, labetalol, leucovorin, levorphanol, lidocaine, linezolid, magnesium sulfate, mannitol, melphalan, meperidine, meropenem, mesna, methohexital, methotrexate, methylPREDNISolone, metoprolol, metroNIDAZOLE, milrinone, mitoMYcin, mitoXANtrone, morphine sulfate, nalbuphine, naloxone, nesiritide, nitroglycerin, nitroprusside, octreotide, ofloxacin, PACLitaxel, palonosetron, pamidronate, pancuronium, pantoprazole, PEMEtrexed, PENTobarbital, PHENobarbital, phenylephrine, piperacillin, piperacillin-tazobactam, potassium chloride/phosphates, procainamide, propofol, propranolol, ranitidine, remifentanyl, riTUXimab, sargramostim, sodium acetate/bicarbonate/phosphates, succinylcholine, SUFentanyl, sulfamethoxazole-trimethoprim, teniposide, theophylline, thiopental, thiotepa, ticarcillin, ticarcillin-clavulanate, tigecycline, tirofiban, tobramycin, trastuzumab, vasopressin, vecuronium, vinBLASTine, vinCRISTine, vitamin B complex/C, voriconazole, zidovudine, zoledronic acid

SIDE EFFECTS

Systemic use

CNS: Lethargy, malaise, weakness, acute cerebellar dysfunction

CV: Myocardial ischemia, angina

EENT: Light intolerance, lacrimation

GI: Anorexia, stomatitis, diarrhea, nausea, vomiting, hemorrhage, enteritis, glossitis

HEMA: Thrombocytopenia, leukopenia, myelosuppression, anemia, agranulocytosis

INTEG: Rash, fever, photosensitivity, anaphylaxis

PHARMACOKINETICS

Half-life 20 hr terminal; metabolized in liver; excreted in urine; crosses blood-

brain barrier

INTERACTIONS

Increase: bleeding—anticoagulants, NSAIDs, platelet inhibitors, thrombolytics

Increase: toxicity—metroNIDAZOLE

Increase: toxicity, bone marrow depression—radiation or other antineoplastics, leucovorin

Decrease: antibody response—live virus vaccines

Decrease: effect of phenytoin

Drug/Lab Test

Increase: AST, ALT, LDH, serum bilirubin, Hct, Hgb, WBC, platelets, 5-HIAA

Decrease: albumin

NURSING CONSIDERATIONS

Assess:

Black Box Warning:

Bone marrow suppression: CBC, differential, platelet count daily (IV); withhold product if WBC is $<3500/\text{mm}^3$ or platelet count is $<100,000/\text{mm}^3$; notify prescriber of results; product should be discontinued; nadir of leukopenia within 2 wk, recovery 1 mo, if pretreatment of WBC $<2,000/\text{mm}^3$ or platelets $<100,000/\text{mm}^3$, delay until recovery of counts above this level

- Renal studies: BUN, serum uric acid, urine CCr, electrolytes before, during therapy
- Hepatic studies before, during therapy: bilirubin, alk phos, AST, ALT, LDH before, during therapy
- **Bleeding:** hematuria, guaiac, bruising, petechiae, mucosa or orifices q8hr
- Inflammation of mucosa, breaks in skin; buccal cavity q8hr for dryness, sores or ulceration, white patches, oral pain, bleeding, dysphagia
- GI symptoms: frequency of stools, cramping, intractable vomiting, stomatitis
- **Infection:** those with current infections should be treated before receiving 5-FU, the dose reduced or discontinued if infection occurs

Evaluate:

- Therapeutic response: decreased tumor size, spread of malignancy

Teach patient/family:

- To avoid crowds, persons with known infection
- To avoid foods with citric acid, hot or rough texture if stomatitis is present; to

drink adequate fluids • To report stomatitis: any bleeding, white spots, ulcerations in mouth; that patient should examine mouth daily, report symptoms; viscous lidocaine may be used; rinsing of mouth tid-qid with water, club soda; brushing of teeth bid-tid with soft brush or cotton-tipped applicator for stomatitis; use unwaxed dental floss, give ice chips for mucositis • To report signs of **infection**: fever, sore throat, flulike symptoms

- To report signs of **anemia**: fatigue, headache, faintness, shortness of breath, irritability • To report **bleeding**: to avoid razors, commercial mouthwash, IM inj if counts are low • Not to use aspirin products or NSAIDs
- To use contraception during therapy (men and women), pregnancy (X); to avoid breastfeeding (topical use) • Not to receive vaccinations during therapy
- To use sunscreen or stay out of the sun to prevent photosensitivity
- About hair loss; to explore use of wigs or other products until hair regrowth occurs
- To apply topically only to affected areas, being careful around mouth, nose, eyes

🍁 Canada only Side effects: *italics* = common; **bold** = life-threatening ⚠️
Nurse Alert

FLUoxetine (Rx)

(floo-ox'eh-teen)

PROzac, PROzac Weekly, Sarafem

Func. class.: Antidepressant, SSRI (selective serotonin reuptake inhibitor)

Do not confuse: PROzac/Proscar/ProSom/PriLOSEC

Sarafem/Serophene

ACTION:

Inhibits CNS neuron uptake of serotonin but not of norepinephrine

USES:

Major depressive disorder, obsessive-compulsive disorder (OCD), bulimia nervosa; Sarafem: premenstrual dysphoric disorder (PMDD), panic disorder

Unlabeled uses: Alcoholism, anorexia nervosa, borderline personality disorder, obesity, posttraumatic stress disorder, autism, fibromyalgia, orthostatic hypotension, premature ejaculation

CONTRAINDICATIONS:

Hypersensitivity

Precautions: Pregnancy (C), breastfeeding, geriatric patients, diabetes mellitus, narrow-angle glaucoma, cardiac malformations in infants (exposed to

FLUoxetine in utero)

Black Box Warning:

Children, suicidal ideation

DOSAGE AND ROUTES

Calculator

Depression/obsessive-compulsive disorder

- **Adult:** PO 20 mg/day in AM; after 4 wk, if no clinical improvement is noted, dose may be increased to 20 mg bid in AM, PM, max 80 mg/day; PO 90 mg/wk
- **Geriatric:** PO 5-10 mg/day, increase as needed
- **Child 8-18 yr:** PO 10-20 mg/day, max 20 mg/day

Premenstrual dysphoric disorder (Sarafem)

- **Adult:** PO 20 mg/day, may be taken daily 14 days before menses

Alcoholism (unlabeled)

- **Adult: PO** 20-80 mg/day

Anorexia nervosa (unlabeled)

- **Adult: PO** 10 mg q day, max 60 mg/day

Borderline personality disorder/fibromyalgia/autism/orthostatic hypotension/premature ejaculation/hot flashes (unlabeled)

- **Adult: PO** 20 mg/day, max 80 mg/day

Obesity (unlabeled)

- **Adult: PO** 60 mg/day after titration

Posttraumatic stress disorder (unlabeled)

- **Adult: PO** 10-80 mg/day

Available forms: Caps 10, 20, 40 mg; tabs 10, 20 mg; oral sol 20 mg/5 ml; del rel caps (PROzac Weekly) 90 mg; tab 10, 15, 20 mg (Sarafem)

Administer:

- Without regard to meals
- Crushed if patient is unable to swallow medication whole (tab only)
- Gum, hard candy, frequent sips of water for dry mouth
- **PROzac Weekly** on the same day each week, swallow whole; do not crush, cut, chew • **Oral sol:** use oral syringe or calibrated measuring device

SIDE EFFECTS

CNS: Headache, nervousness, insomnia, drowsiness, anxiety, tremor, dizziness, fatigue, sedation, poor concentration, abnormal dreams, agitation, seizures, apathy, euphoria, hallucinations, delusions, psychosis, suicidal ideation, neuroleptic malignant syndrome–like reactions, serotonin syndrome

CV: Hot flashes, palpitations, angina pectoris, hypertension, tachycardia, 1st-degree AV block, bradycardia, MI, thrombophlebitis

EENT: Visual changes, ear/eye pain, photophobia, tinnitus

GI: Nausea, diarrhea, dry mouth, anorexia, dyspepsia, constipation, cramps, vomiting, taste changes, flatulence, decreased appetite

GU: Dysmenorrhea, decreased libido, urinary frequency, UTI, amenorrhea, cystitis, impotence, urine retention

HEMA: Hemorrhage

INTEG: Sweating, rash, pruritus, acne, alopecia, urticaria, angioedema, exfoliative dermatitis, Stevens-Johnson syndrome, toxic epidermal necrolysis

META: Hyponatremia

MS: Pain, arthritis, twitching

RESP: Infection, pharyngitis, nasal congestion, sinus headache, sinusitis, cough, dyspnea, bronchitis, asthma, hyperventilation, pneumonia

SYST: Asthenia, viral infection, fever, allergy, chills

PHARMACOKINETICS

PO: Peak 6-8 hr, metabolized in liver, excreted in urine, terminal half-life 2-3 days, norfluoxetine active metabolite half-life 4-16 days, steady state 28-35 days, protein binding 94%

INTERACTIONS

Increase: serotonin syndrome—SSRIs, SNRIs, serotonin-receptor agonists, selegiline, busPIRone, tryptophan, phenothiazines, haloperidol, loxapine, thiothixene, tricyclics; do not use concurrently

Increase: bleeding risk—platelet inhibitors, thrombolytics, NSAIDs, salicylates, anticoagulants

 **Do not use MAOIs with or 14 days prior to FLUoxetine**

Increase: levels or toxicity of carBAMazepine, lithium, digoxin, warfarin, phenytoin, diazepam, vinBLASStine, donepezil, antidiabetics, dorifenacin, paricalcitol, budesonide, bosentan, thioridazine

Increase: CNS depression—alcohol, antidepressants, opioids, sedatives

Decrease: FLUoxetine effect—cyproheptadine

Drug/Herb

 **Do not use together; increased risk of serotonin syndrome: St. John's wort, SAM-e**

Increase: CNS effect—hops, kava, lavender, valerian

Drug/Lab Test

Increase: serum bilirubin, blood glucose, alk phos, BUN, CK

NURSING CONSIDERATIONS

Assess:

Black Box Warning:

Mental status: mood, sensorium, affect, suicidal tendencies (child/young adult), increase in psychiatric symptoms, depression, panic; monitor for seizures, seizure potential increased, sarafem is not approved for children

- **Bulimia nervosa:** appetite, weight daily, increase nutritious foods in diet,

watch for bingeing and vomiting  **Allergic reactions/serious skin reactions:** angioedema, exfoliative dermatitis, Stevens-Johnson syndrome, toxic epidermal necrolysis, itching, rash, urticaria; product should be discontinued, may need to give antihistamine • B/P (lying/standing), pulse q4hr; if systolic B/P drops 20 mm Hg, hold product, notify prescriber; ECG for flattening of T wave, bundle branch, AV block, dysrhythmias in cardiac patients • Blood studies: CBC, leukocytes, differential, cardiac enzymes if patient is receiving long-term therapy; check platelets; bleeding can occur, thyroid function, growth rate, weight • Hepatic studies: AST, ALT, bilirubin, creatinine, weight weekly; appetite may decrease with product • Alcohol consumption; if alcohol is consumed, hold dose until AM

Perform/provide:

- Storage at room temp; do not freeze
- Safety measures, primarily for geriatric patients

Evaluate:

- Therapeutic response: decreased depression, symptoms of OCD

Teach patient/family:

- That therapeutic effect may take 1-4 wk
- To use caution when driving, performing other activities requiring alertness because of drowsiness, dizziness, blurred vision • To avoid alcohol, other CNS depressants
- To notify prescriber if pregnant, planning to become pregnant, or breastfeeding
- To change positions slowly because orthostatic hypotension may occur
- To avoid all OTC products unless approved by prescriber

Black Box Warning:

That suicidal thoughts/behaviors may occur in young adults, children

☼ Canada only Side effects: *italics* = common; **bold** = life-threatening 
Nurse Alert

fluPHENAZine decanoate (Rx)

(floo-fen'a-zeen)

Moderate 

fluPHENAZine hydrochloride (Rx)

Func. class.: Antipsychotic

Chem. class.: Phenothiazine, piperazine

Do not confuse: **Prolixin**/Proloid

ACTION:

Depresses cerebral cortex, hypothalamus, limbic system, which control activity and aggression; blocks neurotransmission produced by DOPamine at synapse; exhibits strong α -adrenergic and anticholinergic blocking action; mechanism for antipsychotic effects is unclear

USES:

Psychotic disorders, schizophrenia

CONTRAINDICATIONS:

Hypersensitivity, circulatory collapse, hepatic damage, cerebral arteriosclerosis, coronary disease, severe hypo/hypertension, blood dyscrasias, coma, brain damage, closed-angle glaucoma, bone marrow depression, alcohol and barbiturate withdrawal

Precautions: Pregnancy (C), breastfeeding, children <12 yr, geriatric patients, seizure disorders, hypertension, cardiac/hepatic disease

Black Box Warning:

Increased mortality in elderly patients with dementia-related psychosis

DOSAGE AND ROUTES

Calculator

Decanoate

- **Adult and child >16 yr:** IM/SUBCUT 12.5-25 mg q1-3wk, may increase slowly

- **Child 12-16 yr: IM/SUBCUT** 6.25-18.75 mg, then repeat q1-3wk, then increase slowly; max 25 mg
- **Child 5-12 yr: IM/SUBCUT** 3.125-12.5 mg, then repeat q1-3wk, increase slowly

HCl

- **Adult: PO** 2.5-10 mg in divided doses q6-8hr, max 40 mg/day; **IM** initially 1.25 mg then 2.5-10 mg in divided doses q6-8hr
- **Child: PO** 0.25-3.5 mg/day in divided doses q4-6hr, max 10 mg/day

Available forms: *Decanoate*: inj 25 mg/ml; *HCl*: tabs 1, 2.5, 5, 10 mg; inj 2.5 mg/ml; elixir 2.5 mg/5 ml; oral solution 5 mg/ml

Administer:

PO route

- Give with food, milk, or a full glass of water to minimize gastric irritation
- **Oral concentrate:** Give using a calibrated measuring device. Dilute just before use with 120–240 ml of water, saline, milk, 7-Up, carbonated orange beverage, or apricot, orange, pineapple, prune, tomato, or V-8 juice. Do not mix with beverages containing caffeine (coffee, cola), tannics (tea), or pectinates (apple juice) or with other liquid medications. Avoid spilling the solution on the skin and clothing
- **Oral elixir:** Give using a calibrated measuring device. Avoid spilling the solution on the skin and clothing

Injectable routes

- Visually inspect for particulate matter and discoloration before use, slight yellow to amber color does not alter potency, markedly discolored solutions should be discarded

IM route (fluPHENAZine HCl only)

- No dilution necessary; if irritation occurs, subsequent IM doses may be diluted with NS for injection or 2% procaine
- Inject slowly and deeply into the upper outer quadrant of the gluteal muscle using a dry syringe and needle, aspirate before injection
- Keep patient in a recumbent position for at least 30 min following injection to minimize hypotensive effects
- Rotate the site of injection to avoid irritation or sterile abscess formation with repeat use

IM depot injection (fluPHENAZine decanoate or fluPHENAZine enanthate)

- FluPHENAZine decanoate or enanthate injections are administered IM or subcut, do not give IV

- FluPHENAZine depot injections must be drawn up using a dry syringe and needle of at least 21-G, do not dilute
- Inject slowly and deeply into the upper outer quadrant of the gluteal muscle, aspirate before injection
- Keep patient in a recumbent position for at least 30 min following the initial injection to minimize hypotensive effects. Once patient is dose-stabilized on depot formulation, this precaution may be modified. Rotate the site of injection to avoid irritation or sterile abscess formation with repeat administration

Subcut injection route (fluPHENAZine decanoate or fluPHENAZine enanthate)

- FluPHENAZine decanoate or enanthate injections are administered via IM or SC injection only, do not administer IV
- FluPHENAZine depot injection solutions must be drawn up using a dry syringe and a needle of at least 21-G, do not dilute
- Inject subcut, taking care not to inject intradermally
- Keep patient in a recumbent position for at least 30 min following the initial injection to minimize hypotensive effects. Once patient is dose-stabilized on depot formulation, this precaution may be modified for ambulatory patients; rotate the injection sites

SIDE EFFECTS

CNS: *EPS: pseudoparkinsonism, akathisia, dystonia, tardive dyskinesia, drowsiness, headache, seizures, neuroleptic malignant syndrome*

CV: *Orthostatic hypotension, hypertension, cardiac arrest, ECG changes, tachycardia*

EENT: Blurred vision, glaucoma, dry eyes

GI: *Dry mouth, nausea, vomiting, anorexia, constipation, diarrhea, jaundice, weight gain, paralytic ileus, hepatitis, cholecystic jaundice*

GU: Urinary retention, urinary frequency, enuresis, impotence, amenorrhea, gynecomastia

HEMA: Anemia, leukopenia, leukocytosis, agranulocytosis, aplastic anemia, thrombocytopenia

INTEG: *Rash, photosensitivity, dermatitis*

RESP: *Laryngospasm, dyspnea, respiratory depression*

PHARMACOKINETICS

Metabolized by liver, excreted in urine (metabolites), crosses placenta, enters breast milk, protein binding >90%, not dialyzable

PO/IM (HCl): Onset 1 hr, peak 2-4 hr, duration 6-8 hr, half-life 3.5-4 days

IM/SUBCUT (decanoate): Onset 1-3 days; peak 1-2 days, duration over 4 wk, single-dose half-life 6.8-9.6 days, multiple dose 14.3 days

INTERACTIONS

Increase: serotonin syndrome, neuroleptic malignant syndrome—SSRIs, SNRIs, serotonin-receptor agonists

Increase: QT prolongation, torsades de pointes (at higher doses)—amiodarone, arsenic trioxide, astemizole, dasatinib, disopyramide, dofetilide, droperidol, erythromycin, flecainide, gatifloxacin, ibutilide, levomethadyl, ondansetron, paliperidone, palonosetron, some antidepressants, vorinostat, ziprasidone, haloperidol

Increase: sedation—other CNS depressants, alcohol, barbiturate anesthetics, haloperidol, metyrosine, risperidone

Increase: toxicity—EPINEPHrine

Increase: anticholinergic effects—anticholinergics

Decrease: effects of levodopa, lithium

Decrease: fluPHENAZine effects—smoking, barbiturates

Drug/Lab Test

Increase: LFTs, cardiac enzymes, cholesterol, blood glucose, prolactin, bilirubin, cholinesterase

Decrease: hormones (blood and urine)

False positive: pregnancy tests, PKU urinary steroids, 17-OHCS

NURSING CONSIDERATIONS

Assess:

Black Box Warning:

Increased mortality in elderly patients with dementia-related psychosis

- **Serotonin syndrome, neuroleptic malignant syndrome:** severe EPS, increased CPK, altered mental state, sinus tachycardia, change in B/P, sweating, often occurs in young men, heat stress, physical exhaustion, dehydration, organic brain disease ⚠️ **QT prolongation, torsades de pointes:** ECG for changes
- Bilirubin, CBC, LFTs monthly

- Urinalysis recommended before and during prolonged therapy
- Affect, orientation, LOC, reflexes, gait, coordination, sleep pattern disturbances
- B/P standing and lying; pulse and respirations q4hr during initial treatment; establish baseline before starting treatment; report drops of 30 mm Hg
- Dizziness, faintness, palpitations, tachycardia on rising
- **EPS** including akathisia (inability to sit still, no pattern to movements), tardive dyskinesia (bizarre movements of jaw, mouth, tongue, extremities), pseudoparkinsonism (rigidity, tremors, pill rolling, shuffling gait) • Constipation, urinary retention daily; if these occur, increase bulk, water in diet

Perform/provide:

- Supervised ambulation until stabilized on medication; do not involve patient in strenuous exercise; fainting possible; patient should not stand still for long periods

Evaluate:

- Therapeutic response: decrease in emotional excitement, hallucinations, delusions, paranoia, reorganization of patterns of thought, speech

Teach patient/family:

- That orthostatic hypotension occurs often; to rise from sitting or lying position gradually; to avoid hazardous activities until stabilized on medication • To avoid hot tubs, hot showers, tub baths because hypotension may occur; that in hot weather, heat stroke may occur; to take extra precautions to stay cool ⚠️ To avoid abrupt withdrawal of this product or EPS may result; that product should be withdrawn slowly • To avoid OTC preparations (cough, hay fever, cold) unless approved by prescriber; that serious product interactions may occur; to avoid use with alcohol, CNS depressants; that increased drowsiness may occur • To use a sunscreen to prevent burns
- About the importance of compliance with product regimen
- About EPS and the need for meticulous oral hygiene because oral candidiasis may occur
- To report sore throat, malaise, fever, bleeding, mouth sores; if these occur, CBC should be drawn, product discontinued • That urine may turn pink to reddish brown

TREATMENT OF OVERDOSE:

Lavage; if orally ingested, provide an airway; *do not induce vomiting*

🍁 Canada only Side effects: *italics* = common; **bold** = life-threatening ⚠️
Nurse Alert

flurandrenolide topical

See Appendix B

flurbiprofen ophthalmic

See Appendix B

flutamide (Rx)

(floo'ta-mide)

Euflex 

Func. class.: Antineoplastic, hormone

Chem. class.: Antiandrogen

ACTION:

Interferes with androgen uptake in the nucleus or androgen activity in target tissues; arrests tumor growth in androgen-sensitive tissue (i.e., prostate gland)

USES:

Metastatic prostatic carcinoma, stage D₂ in combination with LHRH agonistic analogs (leuprolide), B₂-C in combination with goserelin and radiation

CONTRAINDICATIONS:

Pregnancy (D), hypersensitivity

Black Box Warning:

Severe hepatic disease

Precautions: G6PD deficiency, hemoglobinopathy, lactase deficiency, polycystic ovary syndrome, tobacco smoking

DOSAGE AND ROUTES

Calculator

• **Adult: PO** 250 mg q8hr for a daily dosage of 750 mg

Available forms: Caps 125, 250  mg

Administer:

• Do not break, crush, chew caps

- Give without regard to food with a full glass of water
- Use cytotoxic handling procedures

SIDE EFFECTS

CNS: *Hot flashes*, drowsiness, confusion, depression, anxiety, paresthesia

GI: *Diarrhea, nausea, vomiting*, increased levels in hepatic studies, **hepatitis**, anorexia, **hepatotoxicity, abdominal pain, cholestasis, hepatic necrosis/failure**

GU: *Decreased libido, impotence, gynecomastia*

HEMA: **Hemolytic anemia, leukopenia, thrombocytopenia**

INTEG: Irritation at site, rash, photosensitivity

MISC: Edema, neuromuscular and pulmonary symptoms, hypertension, secondary malignancy

PHARMACOKINETICS

Rapidly and completely absorbed; excreted in urine and feces as metabolites; half-life 6 hr, geriatric half-life 8 hr; 94% protein binding, peak 2 hr

INTERACTIONS

Increase: PT—warfarin

Decrease: flutamide action—LHRH analog (leuprolide)

Drug/Lab Test

Increase: LFTs, BUN, creatinine

Decrease: WBC, platelets

NURSING CONSIDERATIONS

Assess:

Black Box Warning:

Severe hepatic disease: AST, ALT, alk phos, which may be elevated; if LFTs elevated, product may need to be discontinued; monitor CBC, bilirubin, creatinine

- CNS symptoms, including drowsiness, confusion, depression, anxiety

Evaluate:

- Therapeutic response: decrease in prostatic tumor size, decrease in spread of cancer

Teach patient/family:

- To report side effects: decreased libido, impotence, breast enlargement, hot flashes, diarrhea

Black Box Warning:

Hepatotoxicity: to report nausea, vomiting, yellow eyes or skin, dark urine, clay-colored stools; hepatotoxicity may be the cause

- Notify of yellow, green urine discoloration
- Avoid sun exposure, tanning beds
- To use contraception during treatment; pregnancy category (D)

🍁 Canada only Side effects: *italics* = common; **bold** = life-threatening ⚠️
Nurse Alert

fluticasone (Rx)

(floo-tic'a-sone)

Flonase, Flovent HFA, Flovent Diskus, Veramyst (nasal spray)

Func. class: Corticosteroids, inhalation; antiasthmatic

ACTION:

Decreases inflammation by inhibiting mast cells, macrophages, and leukotrienes; antiinflammatory and vasoconstrictor properties

USES:

Prevention of chronic asthma during maintenance treatment in those requiring oral corticosteroids; nasal symptoms of seasonal/perennial, allergic/nonallergic rhinitis

Unlabeled uses: COPD

CONTRAINDICATIONS:

Hypersensitivity to this product or milk protein, primary treatment in status asthmaticus

Precautions: Pregnancy (C), breastfeeding, active infections, glaucoma, diabetes, immunocompromised patients

DOSAGE AND ROUTES

Calculator

Prevention of chronic asthma during maintenance treatment in those requiring oral corticosteroids

Flovent HFA

- **Adult and child ≥ 12 yr:** INH 88-660 mcg bid (in those previously taking bronchodilators alone); INH 88-220 mcg bid, max 440 mcg bid (in those previously taking inhaled corticosteroids); INH 440 mcg bid, max 880 mcg bid (in those previously taking oral corticosteroids)
- **Child 4-11 yr:** INH 88 mcg bid

Flovent Diskus

- **Adult and child ≥ 12 yr:** INH 100 mcg bid, max 500 mcg (in those previously taking bronchodilators alone); INH 100-250 mcg bid, max 500 mcg bid (in those

previously taking inhaled corticosteroids); **INH** 500-1000 mcg bid, max 1000 mcg bid (in those previously taking oral corticosteroids)

- **Child 4-11 yr: INH** Initially 50 mcg bid, max 100 mcg bid (in those previously taking bronchodilators alone or inhaled corticosteroids)

Nasal symptoms of seasonal, perennial allergic, nonallergic rhinitis

Flonase

- **Adult:** nasal 2 sprays initially, in each nostril daily or 1 spray bid, when controlled, lower to 1 spray in each nostril daily
- **Adolescent/child >4 yr:** nasal 1 spray in each nostril daily, may increase to 2 sprays in each nostril daily, when controlled lower to 1 spray in each nostril daily

Veramyst

- **Adult/child ≥12 yr:** nasal 2 sprays in each nostril daily
- **Child 2-11 yr:** nasal 1 spray in each nostril daily

Available forms: Oral inhalation aerosol 44, 110, 220 mcg; oral inhalation powder 50, 100, 250 mcg; nasal spray (Veramyst) 27.5 mcg/actuation, (Flonase) 50 mcg/actuation

Administer:

- Give at 1-min intervals; if a bronchodilator aerosol spray is used, use bronchodilator first, wait 5-15 min, then use fluticasone • Decrease dose to lowest effective dose after desired effect; decrease dose at 2-4 wk intervals

Inhalation route (aerosol)

- Shake well, prime before 1st use, release 4 sprays into air away from face, prime using 1 spray if not used for ≥7 days; when the counter reads 000, discard; clean inhaler daily in warm water, dry; do not share inhaler with others • In general, child <4 yr requires a face mask with spacer/VHC device for delivery; allow 3-5 INH per actuation; do not use spacer with Flovent Diskus

Inhalation route: Powder for oral inhalation (Flovent Diskus)

- Before initial use, remove the diskus foil pouch and throw away the foil pouch; the diskus will be in the closed position. Fill in the “Pouch opened” and “Use by” dates in the blank lines on the label; the “Use by” date for Flovent Diskus 50 mcg is 6 wk from the date the pouch is opened; the “Use by” date for Diskus 100 mcg and 250 mcg is 2 months from the date the pouch is opened • Open the diskus by holding in one hand and using the thumb of the other to push the thumb grip away as far as it will go until the mouthpiece shows and snaps into

place • Hold the diskus in a level, flat position with the mouthpiece toward the patient and slide the lever away from the patient as far as it will go until it clicks. The number on the dose counter will count down by 1; the diskus is now ready to use • Before inhaling the dose, have patient breathe out as much as possible while holding the diskus level and away from the mouth. The patient should never breathe out into the mouthpiece • Instruct the patient to put the mouthpiece to the lips and breathe in through the mouth quickly and deeply through the diskus. Remove the diskus from the mouth, hold breath for about 10 sec, and breathe out slowly • After taking a dose, close the diskus by sliding the thumb grip back as far as it will go. The diskus will click shut. The lever automatically returns to its original position • The counter displays how many doses are left. The counter number counts down each time the patient uses the diskus After 55 doses (23 doses from the sample pack), numbers 5 to 0 are red to warn that there are only a few doses left • After use, patient should rinse mouth with water and spit out the water, not swallow it

- To avoid the spread of infection, do not use the inhaler for more than one person

Intranasal

- Prime before first use
- Shake well before each use
- Rinse tip after use, dry with tissue

SIDE EFFECTS

CNS: Fever, headache, nervousness, dizziness, migraines, numbness in fingers

EENT: *Pharyngitis*, sinusitis, rhinitis, laryngitis, hoarseness, dry eyes, cataracts, nasal discharge, epistaxis

GI: Diarrhea, abdominal pain, nausea, vomiting, *oral candidiasis*, gastroenteritis

GU: UTI

INTEG: Urticaria, dermatitis

META: Hyperglycemia, growth retardation in children, cushingoid features

MISC: Influenza, **eosinophilic conditions, angioedema, Churg-Strauss syndrome, anaphylaxis, adrenal insufficiency (high doses)**, bone mineral density reduction

MS: Osteoporosis, muscle soreness, joint pain

RESP: *Upper respiratory infection*, dyspnea, cough, bronchitis, **bronchospasm**

PHARMACOKINETICS

Absorption 30% aerosol, 13.5% powder; protein binding 91%; metabolized in liver after absorption in lung; half-life 7.8 hr; <5% excreted in urine and feces

Oral INH: Onset 24 hr, peak several days, duration 1-2 wk

INTERACTIONS

Increase: fluticasone levels—CYP3A4 inhibitors (ketoconazole, itraconazole), darunavir, nelfinavir, ritonavir, amprenavir, fosamprenavir, atazanavir, delavirdine, saquinavir

Increase: tendonitis, tendon rupture—quinolones

Decrease: effects of growth hormones—mecasermin

Drug/Lab Test

Increase: urine/serum glucose

NURSING CONSIDERATIONS

Assess:

- **Respiratory status:** lung sounds, pulmonary function tests during, for several months after change from systemic to inhalation corticosteroids
- Withdrawal symptoms from oral corticosteroids: depression, pain in joints, fatigue

⚠ Adrenal insufficiency: nausea, weakness, fatigue, hypotension, hypoglycemia, anorexia; may occur when changing from systemic to inhalation corticosteroids; may be life-threatening; adrenal function tests periodically: hypothalamic–pituitary–adrenal axis suppression in long-term treatment

- Growth rate in children; blood glucose, serum potassium for all patients

Evaluate:

- Therapeutic response: decreased severity of asthma

Teach patient/family:

- To use bronchodilator 1st, before using inhalation, if taking both
 - Not to use for acute asthmatic attack; acute asthma may require oral corticosteroids
 - To avoid smoking, smoke-filled rooms, those with URIs, those not immunized against chickenpox or measles
 - To rinse mouth after inhaled product to decrease risk of oral candidiasis
-

🍁 Canada only Side effects: *italics* = common; **bold** = life-threatening ⚠️
Nurse Alert

fluticasone (topical)

(floo-tic'a-sone)

Cutivate

Func. class.: Corticosteroid, topical

Do not confuse: fluticasone/mometasone/fludrocortisone

ACTION:

Crosses cell membrane to attach to receptors to decrease inflammation, itching; inhibits multiple inflammatory cytokines

USES:

Inflammation/itching of corticosteroid-responsive dermatoses on the skin

CONTRAINDICATIONS:

Hypersensitivity, monotherapy in primary infections

Precautions: Pregnancy (C), children, breastfeeding, skin infections, skin atrophy

DOSAGE AND ROUTES

Calculator

- **Adult:** Apply to affected areas bid (cream/ointment) or daily (lotion)

Available forms: Lotion, cream 0.05%, ointment 0.005%

Administer:

Topical route

 **Do not use with occlusive dressings**

- **Cream/Ointment/Lotion:** Apply sparingly in a thin film and rub gently into the cleansed, affected area • Reassess treatment after 2 weeks

SIDE EFFECTS

INTEG: Burning, pruritus, dermatitis, hypertrichosis, hives

META: Hyperglycemia, glycosuria

MISC: HPA axis suppression, Cushing syndrome

PHARMACOKINETICS

Duration 10 hr, half life 7 hr

INTERACTIONS

Increase: Blood glucose

NURSING CONSIDERATIONS

Assess:

- Skin reactions: burning, pruritus, dermatitis

Evaluate:

- Decreasing itching, inflammation on the skin

Teach patient/family:

Topical route:

 **Not to use with occlusive dressings**

- **Cream/Ointment/Lotion:** To apply sparingly in a thin film and rub gently into the cleansed, affected area • To reassess treatment after 2 weeks

☼ Canada only Side effects: *italics* = common; **bold** = life-threatening 

Nurse Alert

fluticasone/salmeterol

(floo-tic'a-son) (sal-mee'ter-ol)

Advair Diskus, Advair HFA

Func. class.: Corticosteroid, long-acting/ β_2 -adrenergic agonist

ACTION:

Decreased inflammation in inhibiting mast cells, macrophages and leukotrienes; antiinflammatory and vasoconstrictor properties relaxes bronchial smooth muscles

USES:

Maintenance of asthma (long term), COPD

CONTRAINDICATIONS:

Hypersensitivity, acute asthma/COPD episodes, severe hypersensitivity to milk proteins

Black Box Warning:

Asthma-related deaths

Precautions: Pregnancy (C), breastfeeding, active infections, diabetes mellitus, glaucoma, immunosuppression

DOSAGE AND ROUTES

Calculator

Asthma maintenance

- **Adult/adolescent ≥ 12 yr: INH** 1 inhalation of Advair diskus q12hr, or 2 inhalations of Advair HFA q12hr
- **Child 4-11 yr: INH** 1 inhalation of fluticasone 100 mcg/salmeterol 50 mcg (Advair Diskus) q12hr

COPD

- **Adult: INH** 1 inhalation of Advair diskus q12hr

Available forms: Inhalation 100/50, 250/50, 500/50 mcg fluticasone/salmeterol; aerosol spray 45/21, 115/21, 230/21 mcg fluticasone/salmeterol

Administer:

Oral inhalation route

powder for oral inhalation (Diskus):

- Most children <4 years of age do not generate sufficient inspiratory flow to activate dry powder inhalers
- Give with the Diskus device: Have the patient to open and prepare mouthpiece, slide device lever to activate the first dose, do not advance the lever >1 time; holding the Diskus mouthpiece level to, but away from the mouth, exhale; then put the mouthpiece to the lips and breathe in the dose deeply and slowly; remove the Diskus from the mouth, hold breath for at least 10 sec, and then exhale slowly; close the Diskus, which also resets the dose lever for the next scheduled dose
- Mouth should be rinsed
- Discard device after 1 month or when counter reads 0 (whichever comes first)

HFA aerosol:

- Shake canister; prime the inhaler before first use with 4 test sprays away from face or with 2 test sprays (away from the face) if it has not been used for more than 4 wk, or after dropping
- Rinse mouth with water after use; clean inhaler mouthpiece at least every day; discard inhaler after 120 sprays or when the counter reads 000

SIDE EFFECTS

CNS: Fever, headache, nervousness, dizziness, migraines, numbness to fingers

EENT: Pharyngitis, sinusitis, rhinitis, laryngitis, hoarseness, dry eyes, cataracts, nasal discharge, epistaxis

GI: Diarrhea, abdominal pain, nausea, vomiting, oral candidiasis, gastroenteritis

GU: UTI

INTEG: Urticaria, dermatitis

META: Hyperglycemia, growth retardation in children, cushingoid features

MISC: Influenza, eosinophilic conditions, **angioedema, Churg–Strauss syndrome, anaphylaxis, adrenal insufficiency (high doses)**, reduced bone mineral density

MS: Osteoporosis, muscle soreness, joint pain

RESP: Upper respiratory infection, dyspnea, cough, bronchitis, **bronchospasm**

PHARMACOKINETICS

Fluticasone: half-life 8 hr, peak 2 hr; Salmeterol: half-life 5.5 hr, peak 5 min

INTERACTIONS

Increase: Fluticasone levels—CYP3A4 inhibitors (ketoconazole, itraconazole), darunavir, nelfinavir, ritonavir, amprenavir, fosamprenavir, atazanavir, delavirdine, saquinavir

Increase: Tendinitis, tendon rupture—quinolones

Increase: Hypokalemia—loop diuretics, thiazides

Drug/Lab Test

Increase: LFTs

NURSING CONSIDERATIONS

Assess:

Respiratory status: Lung status, pulmonary function tests during, for several months after change from systemic to inhalation corticosteroid

- Withdrawal symptoms from oral corticosteroids: depression, pain in joints, fatigue

Black Box Warning:

Adrenal Insufficiency: nausea, weakness, fatigue, hypotension, hypoglycemia, anorexia; can occur when changing from systemic to inhalation corticosteroids; may be life threatening; adrenal function tests periodically: hypothalamic-pituitary-adrenal axis suppression in long-term treatment

- Growth rate in children; blood glucose, serum potassium for all patients

Evaluate:

- Therapeutic response: decreased severity of asthma

Teach patient/family:

- To use bronchodilator first, before using inhalation, if taking both
- **Not to use for acute asthmatic attack; acute asthma might require oral corticosteroids**
- To avoid smoking, smoke-filled rooms, those with URIs, those not immunized against chickenpox or measles • To rinse mouth after inhaled product to reduce the risk of oral candidiasis

☼ Canada only Side effects: *italics* = common; **bold** = life-threatening ⚠

Nurse Alert

fluvastatin (Rx)

(flu'vah-stay-tin)

Lescol, Lescol XL

Func. class.: Antilipemic

Chem. class.: HMG-CoA reductase inhibitor

Do not confuse: fluvastatin/FLUoxetine

ACTION:

Inhibits HMG-CoA reductase enzyme, which reduces cholesterol synthesis

USES:

As an adjunct for primary hypercholesterolemia (types Ia, Ib), coronary atherosclerosis in CAD; to reduce the risk for secondary prevention of coronary events in patients with CAD; as an adjunct to diet to reduce LDL, total cholesterol, apo B levels in heterozygous familial hypercholesterolemia (LDL-C ≥ 190 mg/dl) or LDL-C ≥ 160 mg/dl with history of premature CV disease

CONTRAINDICATIONS:

Pregnancy (X), breastfeeding, hypersensitivity, active hepatic disease

Precautions: Previous hepatic disease, alcoholism, severe acute infections, trauma, hypotension, uncontrolled seizure disorders, severe metabolic disorders, electrolyte imbalance, myopathy, rhabdomyolysis

DOSAGE AND ROUTES

Calculator

- **Adult: PO** 20-40 mg/day in PM initially, usual range 20-80 mg, max 80 mg; may be given in 2 doses (40 mg AM, 40 mg PM); dosage adjustments may be made at ≥ 4 -wk intervals

Heterozygous familial hypercholesterolemia

- **Adolescent ≥ 1 yr postmenarche (10-16 yr): PO** 20 mg daily at bedtime, may increase q6wk, max 40 mg bid (cap) or 80 mg (ext rel)

Available forms: Caps 20, 40 mg; ext rel tab 80 mg

Administer:

- Do not break, crush, or chew ext rel tabs, use at any time of day (tab), in the evening (cap) • Bile acid sequestrant should be given at least 4 hr before fluvastatin
- Give without regard to food
- Store at room temperature, protected from light

SIDE EFFECTS

CNS: Headache, dizziness, insomnia

EENT: Lens opacities

GI: *Abdominal pain, cramps, nausea, constipation, diarrhea, dyspepsia, flatus, hepatic dysfunction, pancreatitis*

HEMA: *Thrombocytopenia, hemolytic anemia, leukopenia*

INTEG: Rash, pruritus

MISC: Fatigue, influenza, photosensitivity

MS: Myalgia, *myositis, rhabdomyolysis, arthritis, arthralgia*

RESP: *Upper respiratory infection, rhinitis, cough, pharyngitis, sinusitis, bronchitis*

PHARMACOKINETICS

Peak response 3-4 wk, metabolized in liver, >98% protein bound, excreted primarily in feces, enters breast milk, half-life 1.2 hr, steady state 4-5 wk

INTERACTIONS

Increase: effects of warfarin, digoxin, phenytoin

Increase: *myopathy—cycloSPORINE, niacin, colchicine, protease inhibitors, fibric acid derivatives*

Increase: effects of fluvastatin—alcohol, cimetidine, ranitidine, omeprazole, phenytoin

Decrease: fluvastatin effect—cholestyramine, colestipol, separate by ≥ 4 hr

Drug/Herb

Increase: adverse reactions—red yeast rice

Drug/Food

- Grapefruit juice: possible increased toxicity

Drug/Lab Test

Increase: LFTs, CK

Decrease: platelets, WBC

NURSING CONSIDERATIONS

Assess:

- **Hypercholesterolemia:** diet history: fats, fasting lipid profile (cholesterol, LDL, HDL, TG) before and q4-6wk, then q3-6mo when stable
- **Hepatotoxicity/pancreatitis:** monitor hepatic studies before, q12wk after dosage change, then q6mo; AST, ALT, LFTs may be increased • Renal studies in patients with compromised renal system: BUN, I&O ratio, creatinine

⚠ Myopathy, rhabdomyolysis: muscle pain, tenderness; obtain baseline CPK if elevated; if these occur, product should be discontinued

Evaluate:

- Therapeutic response: decrease in sLDL, VLDL, total cholesterol; increased HDL, decreased triglycerides, slowing of CAD

Teach patient/family:

- That blood work will be necessary during treatment; to take product as prescribed, that effect may take ≥ 4 wk • To report severe GI symptoms, headache, muscle pain, weakness, tenderness
- That previously prescribed regimen will continue: low-cholesterol diet, exercise program, smoking cessation • To report suspected pregnancy; not to use during pregnancy (X), breastfeeding
- To take without regard to meals; take immediate release product in the evening, separate by ≥ 4 hr from bile-acid product

☼ Canada only Side effects: *italics* = common; **bold** = life-threatening ⚠
Nurse Alert

fluvoxamine (Rx)

(flu-vox'a-meen)

Luvox CR

Func. class.: Antidepressant SSRI (selective serotonin reuptake inhibitor)

Do not confuse: Luvox/Levoxyl/Lasix/Lovenox

Fluvoxamine/FLUoxetine/FluPHENAZine

ACTION:

Inhibits CNS neuron uptake of serotonin but not of norepinephrine

USES:

Obsessive-compulsive disorder, social phobia

Unlabeled uses: Depression, bulimia nervosa, panic disorder, autism, anxiety, posttraumatic stress disorder (PTSD), premenstrual dysphoric disorder (PMDD)

CONTRAINDICATIONS:

Hypersensitivity

Precautions: Pregnancy (C), breastfeeding, geriatric patients, hepatic/cardiac disease, abrupt discontinuation, dehydration, ECT, hyponatremia, hypovolemia, bipolar disorder, seizure disorder

Black Box Warning:

Children <8 yr, suicidal ideation

DOSAGE AND ROUTES

Calculator

Obsessive-compulsive disorder (OCD)

- **Adult: PO** 50 mg at bedtime, increase by 50 mg at 4-7 day intervals, max 300 mg; doses over 100 mg should be divided; **EXT REL** 100 mg at bedtime, may titrate upward by 50 mg/wk, max 300 mg/day
- **Child 12-17 yr: PO** 25 mg at bedtime, increase by 25 mg/day q4-7days, max 300 mg/day; doses over 50 mg should be divided
- **Child 8-11 yr: PO** 25 mg/day at bedtime, may increase q4-7days, max 200 mg/day

Social anxiety disorder

- **Adult: PO EXT REL CAP** (Luvox CR) 100 mg at bedtime initially, titrate as

needed by 50 mg/wk to 100-300 mg/day; **PO** 50 mg at bedtime, titrate as needed by 50 mg q4-7days to 50-300 mg/day

- **Child/adolescent 12-17 yr:** **PO** 25 mg at bedtime, titrate by 25-50 mg q4-7days, max 300 mg/day; if total daily dose >50 mg, divide equally

Hepatic dose/geriatric

- **Adult:** **PO** 25 mg at bedtime, may titrate upward slowly

Autism (unlabeled)

- **Adult:** **PO** up to 150 mg/day

Bulimia nervosa, depression (unlabeled)

- **Adult:** **PO** 50 mg at bedtime × 4-7 days, titrate by 25-50 mg/dose q4-7days as needed

Premenstrual dysphoric disorder (unlabeled)

- **Adult:** **PO** 50 mg/day, may titrate to 100 mg/day

Schizophrenia (unlabeled)

- **Adult:** **PO** 100 mg daily in combination with other agents

Posttraumatic stress disorder (PTSD) (unlabeled)

- **Adult:** **PO** 25-50 mg at bedtime × 4-7 days then titrate by 25-50 mg/dose q4-7days, range 25-300 mg/day single or divided dose × 3-12 wk

Available forms: Tabs 25, 50, 100 mg; ext rel cap 100, 150 mg

Administer:

- With food, milk for GI symptoms
- **Immediate release:** give at bedtime; doses >100 mg/day (or >50 mg/day in those aged 8-17 yr) in 2 divided doses; if doses are not equal, give larger dose at bedtime
- **Ext rel:** give at bedtime; do not break, crush, chew ext rel product

SIDE EFFECTS

CNS: Headache, drowsiness, dizziness, seizures, sleep disorders, insomnia, suicidal ideation (children/adolescents), neuroleptic malignant syndrome–like reactions, weakness

GI: Nausea, anorexia, constipation, hepatotoxicity, vomiting, diarrhea, dry mouth

GU: Decreased libido, anorgasmia

INTEG: Rash, sweating

PHARMACOKINETICS

Crosses blood-brain barrier, 77% protein binding, metabolism by the liver, terminal half-life 15.6 hr, peak 2-8 hr

INTERACTIONS

 **Fatal reaction—MAOIs**

Increase: CNS depression—alcohol, barbiturates, benzodiazepines

Increase: effect of—ramelteon, thioridazine; do not use together

 **Increase:** QT prolongation, death—pimozide, do not use together

Increase: fluvoxamine, toxicity levels—tricyclics, clozapine, alosetron, tiZANidine; do not use together

Increase: metabolism, decrease effects—smoking

Increase: serotonin syndrome, neuroleptic malignant syndrome: SSRIs, SNRIs, serotonin-receptor agonists, atypical antipsychotics

Increase: bleeding risk—anticoagulants, NSAIDs, salicylates, thrombolytics

- Avoid use with clopidogrel

Decrease: metabolism, increase action of propranolol, diazepam, lithium, theophylline, carbamazepine, warfarin

Drug/Herb

Increase: CNS effect—kava, valerian

Increase: serotonin syndrome—tryptophan, St. John's wort; do not use together

NURSING CONSIDERATIONS

Assess:

- Hepatic studies: AST, ALT, bilirubin
- Mental status: mood, sensorium, affect, **suicidal tendencies**; increase in psychiatric symptoms: depression, panic, obsessive-compulsive symptoms
- Constipation; most likely in geriatric patients

 **For toxicity:** nausea, vomiting, diarrhea, syncope, increased pulse, seizures

Perform/provide:

- Storage at room temp; do not freeze

Evaluate:

- Therapeutic response: decrease in depression

Teach patient/family:

- That therapeutic effects may take 2-3 wk
- To use caution when driving, performing other activities requiring alertness because drowsiness, dizziness may occur
- Not to use other CNS depressants,

alcohol, barbiturates, benzodiazepines, St. John's wort, kava • To notify prescriber if pregnancy is suspected, planned

- To notify prescriber of allergic reaction
- To increase bulk in diet if constipation occurs, especially in geriatric patients

Black Box Warning:

That suicidal thoughts/behaviors may occur

- To stop taking MAOIs at least 14 days before starting product

TREATMENT OF OVERDOSE:

Activated charcoal, gastric lavage

☼ Canada only Side effects: *italics* = common; **bold** = life-threatening ⚠
Nurse Alert

folic acid (vit B₉) (OTC)

(foe'lik a'sid)

Equaline Folic Acid, Folacin, Vitamin B₉, Walgreens Gold Seal Folic Acid

Func. class.: Vit B complex group, water-soluble vitamin

ACTION:

Needed for erythropoiesis; increases RBC, WBC, platelet formation with megaloblastic anemias

USES:

Megaloblastic or macrocytic anemia caused by folic acid deficiency; hepatic disease, alcoholism, hemolysis, intestinal obstruction, pregnancy to reduce risk for neural tube defects

Unlabeled uses: Reduce risk for heart disease, stroke, methotrexate toxicity prophylaxis

CONTRAINDICATIONS:

Hypersensitivity

Precautions: Pregnancy (A), anemias other than megaloblastic/macrocytic anemia, vit B₁₂ deficiency anemia, uncorrected pernicious anemia

DOSAGE AND ROUTES

Calculator

RDA

- **Adult and child ≥14 yr: PO 400 mcg**
- **Adult (pregnant/lactating): PO 600 mcg/day**
- **Child 9-13 yr: PO 300 mcg**
- **Child 4-8 yr: PO 200 mcg**
- **Child 1-3 yr: PO 150 mcg**
- **Infant 6 mo-1 yr: PO 80 mcg**
- **Neonate/infant <6 mo: PO 65 mcg**

Megaloblastic/macrocytic anemia due to folic acid or nutritional deficiency

- **Pregnant/lactating: PO 800-1000 mcg**

Therapeutic dose

- **Adult and child: PO/IM/SUBCUT/IV** up to 1 mg/day

Maintenance dose

- **Adult and child >4 yr: PO/IM/SUBCUT/IV** 0.4 mg/day
- **Pregnant and lactating: PO/IM/SUBCUT/IV** 0.8-1 mg/day
- **Child <4 yr: PO/IM/SUBCUT/IV** up to 0.3 mg/day
- **Infant: PO/IM/SUBCUT/IV** up to 0.1 mg/day

Prevention of neural tube defects during pregnancy

- **Adult: PO** 0.6 mg/day

Prevention of megaloblastic anemia during pregnancy

- **Adult: PO/IM/SUBCUT** up to 1 mg/day during pregnancy

Tropical sprue

- **Adult: PO** 3-15 mg/day

Available forms: Tabs 0.1, 0.4, 0.8, 1, 5 mg; inj 5, 10 mg/ml

Administer:

SUBCUT route

- Do not inject intradermally

IM route

- Inject deeply in large muscle mass, aspirate

Direct IV route

- Direct undiluted ≤ 5 mg/1 min or more

Continuous IV INF route

- May be added to most IV sol or TPN

Y-site compatibilities: Alfentanil, aminophylline, ascorbic acid injection, atracurium, atropine, azaTHIOprine, aztreonam, benztropine, bumetanide, calcium gluconate, cefamandole, ceFAZolin, cefmetazole, cefonicid, cefoperazone, cefotaxime, cefoTEtan, cefOXitin, cefTAZidime, ceftizoxime, cefTRIAxone, cefuroxime, cephalothin, cephapirin, chloramphenicol, cimetidine, clindamycin, cyanocobalamin, cycloSPORINE, dexamethasone, digoxin, diphenhydrAMINE, DOPamine, enalaprilat, ePHEDrine, EPINEPHrine, epoetin alfa, erythromycin, esmolol, famotidine, fentaNYL, fluconazole, furosemide, ganciclovir, glycopyrrolate, heparin, hydrocortisone, hydrOXYzine, imipenem-cilastatin, indomethacin, insulin (regular), ketorolac, labetalol, lidocaine, LR, magnesium sulfate, mannitol, meperidine, methicillin, methylPREDNISolone, metoclopramide, metoprolol, mezlocillin, midazolam,

moxalactam, multiple vitamins injection, naloxone, nitroglycerin, nitroprusside, ondansetron, oxacillin, oxytocin, penicillin G potassium/sodium, PENTobarbital, PHENobarbital, phenylephrine, phytonadione, piperacillin, potassium chloride, procainamide, propranolol, ranitidine, Ringer's, ritodrine, sodium bicarbonate, succinylcholine, SUFentanil, theophylline, ticarcillin, ticarcillin-clavulanate, TPN, trimetaphan, urokinase, vancomycin, vasopressin

SIDE EFFECTS

CNS: Confusion, depression, excitability, irritability

GI: Anorexia, nausea

INTEG: Pruritus, rash, erythema

RESP: Bronchospasm

SYST: Anaphylaxis (rare)

PHARMACOKINETICS

PO: Peak 1/2-1 hr, bound to plasma proteins, excreted in breast milk, metabolized by liver, excreted in urine (small amounts)

INTERACTIONS

Increase: need for folic acid—estrogen, hydantoins, carbamazepine, glucocorticoids

Decrease: folate levels—methotrexate, sulfonamides, sulfasalazine, trimethoprim

Decrease: phenytoin levels, fosphenytoin, may increase seizures

NURSING CONSIDERATIONS

Assess:

- Megaloblastic anemia: fatigue, dyspnea, weakness
- Hgb, Hct, reticulocyte count
- Nutritional status: bran, yeast, dried beans, nuts, fruits, fresh vegetables, asparagus
- Products currently taken: estrogen, carbamazepine, glucocorticoids, hydantoins; these products may cause increased folic acid use by body and contribute to a deficiency if taking other neurotoxic products

Perform/provide:

- Storage in light-resistant container

Evaluate:

- Therapeutic response: increased weight, oriented, well-being; absence of fatigue; increase in reticulocyte count within 5 days of beginning treatment, absence of neural tube defect

Teach patient/family:

- To take product exactly as prescribed; that periodic lab work is required
- To alter nutrition to include high-folic-acid foods: organ meats, vegetables, fruit
- That urine will turn bright yellow
- To notify prescriber of allergic reaction
- To avoid breastfeeding

🍁 Canada only Side effects: *italics* = common; **bold** = life-threatening ⚠️
Nurse Alert

HIGH ALERT

fondaparinux (Rx)

(fon-dah-pair'ih-nux)

Arixtra

Func. class.: Anticoagulant, antithrombotic

Chem. class.: Synthetic, selective factor Xa inhibitor

Do not confuse: *Arixtra*/Anti-Xa

ACTION:

Acts by antithrombin III (ATIII)-mediated selective inhibition of factor Xa; neutralization of factor Xa interrupts blood coagulation and inhibits thrombin formation; does not inactivate thrombin (activated factor II) or affect platelets

USES:

Prevention/treatment of deep venous thrombosis, PE in hip and knee replacement, hip fracture or abdominal surgery

Unlabeled uses: Acute coronary syndrome

CONTRAINDICATIONS:

Hypersensitivity to this product; hemophilia, leukemia with bleeding, peptic ulcer disease, hemorrhagic stroke, surgery, thrombocytopenic purpura, weight <50 kg, severe renal disease (CCr <30 ml/min), active major bleeding, bacterial endocarditis

Precautions: Pregnancy (B), breastfeeding, children, geriatric patients, alcoholism, hepatic disease (severe), blood dyscrasias, heparin-induced thrombocytopenia, uncontrolled severe hypertension, subacute bacterial endocarditis, acute nephritis, mild to moderate renal disease

Black Box Warning:

Spinal/epidural anesthesia, lumbar puncture

DOSAGE AND ROUTES

Calculator

Deep venous thrombosis/PE

• **Adult <50 kg: SUBCUT** 5 mg/day × ≥5 days until INR 2-3; may give warfarin within 72 hr of fondaparinux

- **Adult 50-100 kg: SUBCUT** 7.5 mg/day $\times \geq 5$ days until INR 2-3; may give warfarin within 72 hr of fondaparinux
- **Adult >100 kg: SUBCUT** 10 mg/day $\times \geq 5$ days until INR 2-3; may give warfarin within 72 hr of fondaparinux

Prevention of deep venous thrombosis

- **Adult: SUBCUT** 2.5 mg/day given 6 hr after surgery; continue for 5-9 days; for hip surgery, up to 32 days; for abdominal surgery, up to 24 days

Coronary artery thrombosis prophylaxis/acute coronary syndrome (unlabeled)

- **Adult: SUBCUT** 2.5 mg until hospital discharge or ≤ 8 days with standard treatment

Renal disease

- **Adult: SUBCUT** $CCr < 30$ ml/min, do not use

Available forms: Inj 2.5 mg/0.5 ml, 5 mg/0.4 ml, 7.5 mg/0.6 ml, 10 mg/0.8 ml prefilled syringes

Administer:

- Alone; do not mix with other products or solutions; cannot be used interchangeably (unit to unit) with other anticoagulants
- For 5-9 days
- Only after screening patient for bleeding disorders

SUBCUT route

- SUBCUT only; do not give IM; do not give < 6 hr after surgery
- Check for discolored sol or sol with particulate; if present, do not give
- Administer 6-8 hr after surgery; administer to recumbent patient, rotate inj sites (left/right anterolateral, left/right posterolateral abdominal wall)
- Wipe surface of inj site with alcohol swab, twist plunger cap and remove, remove rigid needle guard by pulling straight off needle; do not aspirate, do not expel air bubble from surface
- Insert whole length of needle into skinfold held with thumb and forefinger
- When product is injected, a soft click may be felt or heard
- Give at same time each day to maintain steady blood levels; observe inj site
- Avoid all IM inj that may cause bleeding

 **Administer only this product when ordered; not interchangeable with heparin**

SIDE EFFECTS

CNS: *Fever, confusion, headache, dizziness, insomnia*

GI: Nausea, vomiting, diarrhea, dyspepsia, constipation, increased AST, ALT

GU: UTI, urinary retention

HEMA: Anemia, minor bleeding, purpura, hematoma, thrombocytopenia, major bleeding (intracranial, cerebral, retroperitoneal hemorrhage), postoperative hemorrhage, heparin-induced thrombocytopenia

INTEG: Increased wound drainage, bullous eruption, local reaction—rash, pruritus, inj site bleeding

META: Hypokalemia

OTHER: Hypotension, pain, edema

PHARMACOKINETICS

Rapidly, completely absorbed; peak steady state 3 hr; distributed primarily in blood; does not bind to plasma proteins except 94% to ATIII; metabolism unknown; eliminated unchanged in urine within 72 hr with normal renal function; terminal half-life 17-21 hr

INTERACTIONS

Increase: bleeding risk—salicylates, NSAIDs, abciximab, eptifibatide, tirofiban, clopidogrel, dipyridamole, quINIDine, valproic acid

Drug/Herb

Increase: bleeding risk—feverfew, garlic, ginger, ginkgo, ginseng, green tea, horse chestnut, kava

NURSING CONSIDERATIONS

Assess:

Black Box Warning:

Monitor patients who have received epidural/spinal anesthesia or lumbar puncture for neurological impairment

- Blood studies (CBC, anti-Xa, Hgb/Hct, prothrombin time, platelets, occult blood in stools), thrombocytopenia may occur; if platelets $<100,000/\text{mm}^3$, treatment should be discontinued; renal studies: BUN, creatinine
- For bleeding: gums, petechiae, ecchymosis, black tarry stools, hematuria; decreased Hct, notify prescriber
- For risk of hemorrhage if coadministering with other products that may cause bleeding
- For hypersensitivity: rash, fever, chills; notify prescriber

Perform/provide:

- Storage at 77° F (25° C); do not freeze

Evaluate:

- Therapeutic response: prevention of DVT

Teach patient/family:

- To use soft-bristle toothbrush to avoid bleeding gums; to use electric razor
 - To report any signs of bleeding: gums, under skin, urine, stools
 - To avoid OTC products containing aspirin, NSAIDs
-

🍁 Canada only Side effects: *italics* = common; **bold** = life-threatening ⚠️

Nurse Alert

formoterol (Rx)

(for-moh'ter-ahl)

Foradil Aerolizer, Oxeze , Perforomist

Func. class.: Bronchodilator

Chem. class.: β -Adrenergic agonist

Do not confuse: Foradil/Toradol

ACTION:

Has β_1 and β_2 action; relaxes bronchial smooth muscle and dilates the trachea and main bronchi by increasing levels of cAMP, which relaxes smooth muscles; causes increased contractility and heart rate by acting on β -receptors in heart

USES:

Maintenance, treatment of asthma, COPD; prevention of exercise-induced bronchospasm

CONTRAINDICATIONS:

Hypersensitivity to sympathomimetics, monotherapy for asthma, COPD, status asthmaticus

Precautions: Pregnancy (C), geriatric patients, cardiac disorders, hyperthyroidism, diabetes mellitus, prostatic hypertrophy, hypertension, African descendants, aneurysm

Black Box Warning:

Asthma-related death

DOSAGE AND ROUTES

Calculator

Maintenance, treatment of asthma

- **Adult and child ≥ 5 yr:** INH AM and PM long-term 1 cap (12 mcg) q12hr using aerolizer inhaler

Maintenance of COPD

- **Adult:** INH 12 mcg q12hr

Prevention of exercise-induced bronchospasm

- **Adult and child ≥ 12 yr:** INH prn occasionally 1 cap (12 mcg) ≥ 15 min before exercise, do not use additional doses for ≥ 12 hr

Available form: INH powder in cap 12 mcg; nebulizer sol for INH 20 mcg/2 ml

Administer:

Inhalation route

- Place cap in aerolizer inhaler; cap is punctured; do not wash aerolizer inhaler
- Pull off cover, twist mouthpiece to open, push buttons in; make sure the 4 pins are visible; remove cap from blister pack, place cap in chamber; twist to close, press (a click will be heard), release; patient should exhale, place inhaler in mouth, inhale rapidly

SIDE EFFECTS

CNS: Tremors, anxiety, insomnia, headache, dizziness, stimulation

CV: Palpitations, tachycardia, hypertension, chest pain

GI: Nausea, vomiting, xerostomia

RESP: Bronchial irritation, dryness of oropharynx, bronchospasms (overuse), infection, inflammatory reaction (child)

PHARMACOKINETICS

Onset 15 min; peak 1-3 hr; duration 12 hr; metabolized in liver, lungs, GI tract; half-life 10 hr

INTERACTIONS

 **Increase:** serious dysrhythmias—MAOIs, tricyclics

Increase: hypokalemia—loop/thiazide diuretics

Increase: effects of both products—other sympathomimetics, thyroid hormones

Increase: QT prolongation—class IA/III antiarrhythmics, phenothiazines, pimozide, haloperidol, risperiDONE, sertindole, ziprasidone, amoxapine, arsenic trioxide, chloroquine, clarithromycin, dasatinib, dolasetron, droperidol, erythromycin, halofantrine, halogenated anesthetics, levomethadyl, maprotiline, methadone, some quinolones, ondansetron, paliperidone, palonosetron, pentamidine, probucol, ranolazine, SUNItinib, tricyclics, vorinostat

Decrease: action when used with β -blockers

NURSING CONSIDERATIONS

Assess:

- Respiratory function: B/P, pulse, lung sounds; note sputum color, character; respiratory function tests before, during treatment
- Cardiac status: hypertension,

palpitations, tachycardia

- For paresthesias, coldness of extremities; peripheral blood flow may decrease

Perform/provide:

- Storage at room temp; protection from heat, moisture

Evaluate:

- Therapeutic response: ease of breathing

Teach patient/family:

Black Box Warning:

Asthma-related death, severe asthma exacerbations; if wheezing worsens and cannot be relieved during an acute asthma attack, immediate medical attention should be sought

- To rinse mouth after use
- About correct use of inhaler/nebulizer (review package insert with patient); to avoid getting aerosol in eyes
- About all aspects of product; to avoid smoking, smoke-filled rooms, persons with respiratory infections; not to swallow caps

TREATMENT OF OVERDOSE:

Administration of β -blocker

☼ Canada only Side effects: *italics* = common; **bold** = life-threatening ⚠
Nurse Alert

fosamprenavir (Rx)

(fos-am-pren'a-veer)

Lexiva, Telzir 

Func. class.: Antiretroviral

Chem. class.: Protease inhibitor

ACTION:

A prodrug of amprenavir; inhibits human immunodeficiency virus (HIV) protease, which prevents maturation of the infectious virus

USES:

HIV-1 infection in combination with antiretrovirals

CONTRAINDICATIONS:

Hypersensitivity to protease inhibitors

Precautions: Pregnancy (C), breastfeeding, geriatric patients, hepatic disease, hemolytic anemia, diabetes, sulfa sensitivity, autoimmune disease with immune reconstitution

DOSAGE AND ROUTES

Calculator

Therapy-naïve patients

- **Adult: PO** 1400 mg bid without ritonavir or fosamprenavir 1400 mg/day and with ritonavir 200 mg/day or fosamprenavir 700 mg bid and ritonavir 100 mg bid
- **Infant/child ≥ 4 wk, adolescents: PO** 30 mg/kg bid max 1400 mg/dose, without ritonavir

Protease-experienced patients (PI)

- **Adult: PO** 700 mg bid and ritonavir 100 mg bid
- **Child/adolescent ≥ 20 kg: PO** 18 mg/kg bid with ritonavir 3 mg/kg bid
- **Child/adolescent 15 kg to <20 kg: PO** 23 mg/kg bid with ritonavir 3 mg/kg bid
- **Child/adolescent 11 kg to <15 kg: PO** 30 mg/kg bid with ritonavir 3 mg/kg bid

- **Child/adolescent <11 kg: PO** 45 mg bid with ritonavir 7 mg bid
- **Infant ≥6 mo: 15 kg to <20 kg: PO** susp 23 mg/kg bid with ritonavir 3 mg/kg bid
- **Infant ≥6 mo: 11 kg to <15 kg: PO** susp 30 mg/kg bid with ritonavir 3 mg/kg bid
- **Infant ≥6 mo: <11 kg: PO** susp 45 mg/kg bid with ritonavir 7 mg/kg bid

Combination with efavirenz

- **Adult: PO** add another 100 mg/day of ritonavir for a total of 300 mg/day when all 3 products given

Hepatic dose

- **Adult: PO** (Child-Pugh 5-6) 700 mg bid without ritonavir (treatment-naïve patients) or 700 mg bid with ritonavir 100 mg daily (treatment-naïve or experienced patients); (Child-Pugh 7-9) 700 mg bid without ritonavir (treatment-naïve patients) or 450 mg bid with ritonavir 100 mg daily (treatment-naïve or experienced patients); (Child-Pugh 10-15) 350 mg bid without ritonavir (treatment-naïve patients) or 300 mg bid with ritonavir 100 mg daily (treatment-naïve or experienced patients)

Available forms: Tabs 700 mg (equivalent to 600 mg amprenavir); oral susp 50 mg/ml

Administer:

- **Tab:** without regard to food
- **Oral susp:** give without food (adult), with food (pediatric); if vomiting occurs within 30 min of dose, readminister; shake vigorously before dose, use calibrated device

SIDE EFFECTS

CNS: Headache, fatigue, depression, oral paresthesia

GI: *Nausea, diarrhea, vomiting, abdominal pain*

INTEG: Rash, pruritus

MISC: Redistribution or accumulation of body fat, hyperglycemia, **Stevens-Johnson syndrome**

PHARMACOKINETICS

Prodrug of amprenavir, peak 1½-4 hr; 90% protein binding; metabolized in liver by cytochrome P4503A4 (CYP3A4); excretion of unchanged product minimal; half-life 7.7 hr

INTERACTIONS

Increase: effect of—warfarin

 **Serious life-threatening reactions:** amiodarone, calcium channel blockers, lidocaine, pimozide, ergots, midazolam, triazolam, flecainide, lovastatin, simvastatin, propafenone

Increase: effect of—ARIPiprazole, rifbutin, ketoconazole, itraconazole, sildenafil, vardenafil

Increase: toxicity—HMG-CoA reductase inhibitors

Decrease: effect of oral contraceptives, methadone

Decrease: fosamprenavir levels—nevirapine, antacids, efavirenz, saquinavir, ranitidine, carbamazepine, phenytoin, lopinavir/ritonavir, barbiturates, proton-pump inhibitors, H₂-receptor antagonists, dexamethasone; avoid concurrent use

Drug/Herb

- Avoid use with St. John's wort

Drug/Lab Test

Increase: serum glucose, AST, ALT, triglycerides

NURSING CONSIDERATIONS

Assess:

- **HIV:** monitor CD4 + T cell count, plasma HIV RNA, serum cholesterol, serum lipid profile
- Bowel pattern before, during treatment; monitor hydration
- Skin eruptions, rash, urticaria, itching; allergy to sulfonamides; cross-sensitivity may occur  Stevens-Johnson syndrome; skin reactions, report immediately
- **Immune reconstitution syndrome:** may occur with combination antiretroviral therapy, autoimmune disease may also develop, up to months after treatment starts

Teach patient/family:

- To avoid taking with other medications unless directed by provider
- That product does not cure but does manage symptoms; that product does not prevent transmission of HIV to others
- To use a nonhormonal form of birth control while taking this product
- That if dose is missed, to take as soon as remembered up to 1 hr before next dose; not to double dose
- Not to alter dose or stop therapy without talking to physician
- To advise physician if patient has sulfa allergy

- To report all medications, including herbal supplements, to physician
 - That patients receiving phosphodiesterase type 5 inhibitors may be at increased risk for PDE5 inhibitor adverse effects
-

🍁 Canada only Side effects: *italics* = common; **bold** = life-threatening ⚠️
Nurse Alert

foscarnet (Rx)

(foss-kar'net)

Foscavir

Func. class.: Antiviral

Chem. class.: Inorganic pyrophosphate organic analog

ACTION:

Antiviral activity is produced by selective inhibition at the pyrophosphate binding site on virus-specific DNA polymerases and reverse transcriptases at concentrations that do not affect cellular DNA polymerases

USES:

Treatment of CMV retinitis, HSV infections; used with ganciclovir for relapsing patients

CONTRAINDICATIONS:

Hypersensitivity, CCr <0.4 ml/min/kg

Precautions: Pregnancy (C), breastfeeding, children, geriatric patients, seizure disorders, severe anemia

Black Box Warning:

Renal disease, electrolyte/mineral imbalances

DOSAGE AND ROUTES

Calculator

Acyclovir-resistant mucocutaneous herpes simplex virus infection (herpes labialis, herpes febrilis, herpes genitalis) in HIV-infected patients

- **Adult/adolescent (unlabeled):** IV 40 mg/kg every 8–12 hr × 2–3 wk or until lesions are healed

Cytomegalovirus (CMV) encephalitis (unlabeled); CMV neurological disease (unlabeled) (including encephalitis) in HIV-infected patients

- **Adult/adolescent:** IV 90 mg/kg every 12 hr or 60 mg/kg every 8 hr × 3 wk (or until symptomatic improvement) with ganciclovir 5 mg/kg IV every 12 hr × 2–3 wk

Encephalitis (unlabeled) caused by human herpesvirus 6 (HHV-6) in immunocompromised patients

- **Adult:** IV 60 mg/kg every 8 hr or 90 mg/kg every 12 hr alone or in

combination with ganciclovir 5 mg/kg IV every 12 hr

CMV retinitis or disseminated disease (unlabeled) in HIV-infected patients, recurrent or relapsed CMV retinitis in HIV-infected patients

- **Adult: IV** Induction with 90 mg/kg every 12 hr or 60 mg/kg IV every 8 hr × 14–21 days, depending upon the clinical response

Renal dose

- HSV induction dosage equivalent to 80 mg/kg/day (40 mg/kg IV every 12 hr)
- **Adult: IV** CCr >1.4 ml/min/kg: No change; CCr > 1–1.4 ml/min/kg: Decrease to 30 mg/kg every 12 hr; CCr >0.8–1 ml/min/kg: Decrease to 20 mg/kg every 12 hr; CCr >0.6–0.8 ml/min/kg: Decrease to 35 mg/kg every 24 hr; CCr >0.5–0.6 ml/min/kg: Decrease to 25 mg/kg every 24 hr; CCr ≥0.4–0.5 ml/min/kg: Decrease to 20 mg/kg every 24 hr; CCr <0.4 ml/min/kg: Not recommended

HSV induction dosage equivalent to 120 mg/kg/day (40 mg/kg IV every 8 hr)

- **Adult: IV** CCr >1.4 ml/min/kg: No change; CCr >1–1.4 ml/min/kg: Decrease to 30 mg/kg every 8 hr; CCr >0.8–1 ml/min/kg: Decrease to 35 mg/kg every 12 hr; CCr >0.6–0.8 ml/min/kg: Decrease to 25 mg/kg every 12 hr; CCr 0.5–0.6 ml/min/kg: Decrease to 40 mg/kg every 24 hr; CCr ≥0.4–0.5 ml/min/kg: Decrease to 35 mg/kg every 24 hr; CCr <0.4 ml/min/kg: Not recommended

CMV induction dosage equivalent to 180 mg/kg/day (60 mg/kg every 8 hr)

- **Adult: IV** CCr >1.4 ml/min/kg: No change; CCr >1–1.4 ml/min/kg: Decrease to 45 mg/kg every 8 hr; CCr >0.8–1 ml/min/kg: Decrease to 50 mg/kg every 12 hr; CCr >0.6–0.8 ml/min/kg: Decrease to 40 mg/kg every 12 hr; CCr >0.5–0.6 ml/min/kg: Decrease to 60 mg/kg every 24 hr; CCr ≥0.4–0.5 ml/min/kg: Decrease to 50 mg/kg every 24 hr; CCr <0.4 ml/min/kg: Not recommended

CMV induction dosage equivalent to 180 mg/kg/day (90 mg/kg IV every 12 hr)

- **Adult: IV** CCr >1.4 ml/min/kg: No change; CCr >1–1.4 ml/min/kg: Decrease to 70 mg/kg every 12 hr; CCr >0.8–1 ml/min/kg: Decrease to 50 mg/kg every 12 hr; CCr >0.6–0.8 ml/min/kg: Decrease to 80 mg/kg every 24 hr; CCr >0.5–0.6 ml/min/kg: Decrease to 60 mg/kg every 24 hr; CCr ≥0.4–0.5 ml/min/kg: Decrease to 50 mg/kg every 24 hr; CCr <0.4 ml/min/kg: Not recommended

Available forms: Inj 6000 mg/250 ml, 12,000 mg/500 ml (24 mg/ml)

Administer:

- Increased fluids before and during product administration to induce diuresis,

minimize renal toxicity

Intermittent IV INF route

- Using inf device at no more than 1 mg/kg/min; do not give by rapid or bolus IV; give by CVP or peripheral vein; standard 24 mg/ml sol may be used without dilution if using by CVP; dilute the 24 mg/ml sol to 12 mg/ml with D₅W or NS if using peripheral vein • Manufacturer recommends product not be given with other medications in syringe or admixed

SIDE EFFECTS

CNS: *Fever, dizziness, headache, seizures, fatigue, neuropathy, asthenia, encephalopathy, malaise, meningitis, paresthesia, depression, confusion, anxiety*

CV: ECG abnormalities, 1st-degree AV block, nonspecific ST-T segment changes, cerebrovascular disorder, *cardiomyopathy, cardiac arrest, atrial fibrillation, CHF, sinus tachycardia*

GI: *Nausea, vomiting, diarrhea, anorexia, abdominal pain, pancreatitis*

GU: *Acute renal failure, decreased CCr, increased serum creatinine, azotemia, diabetes insipidus, renal tubular disorders*

HEMA: *Anemia, granulocytopenia, leukopenia, thrombocytopenia, thrombosis, neutropenia, lymphadenopathy*

INTEG: *Rash, sweating, pruritus, skin discoloration*

RESP: *Coughing, dyspnea, pneumonia, pulmonary infiltration, pneumothorax, hemoptysis*

SYST: *Hypokalemia, hypocalcemia, hypomagnesemia; hypophosphatemia*

PHARMACOKINETICS

14%-17% protein bound, half-life 18-88 hr in normal renal function, 79%-92% excreted via kidneys

INTERACTIONS

Black Box Warning:

Increase: nephrotoxicity—acyclovir, cidofovir, CISplatin, gold compounds, penicillamine, tacrolimus, tenofovir, vancomycin, aminoglycosides, amphotericin B, NSAIDs, lithium, cycloSPORINE

Increase: hypocalcemia—pentamidine

NURSING CONSIDERATIONS

Assess:

Black Box Warning:

Renal tubular disorders: I&O ratio, urine pH, serum creatinine at baseline, 3×/wk during initial therapy then 2×/wk thereafter; CCr at baseline, throughout treatment; if CCr <0.4 ml/min/kg, discontinue

- Blood counts q2wk; watch for decreasing granulocytes, Hgb; if low, therapy may have to be discontinued and restarted after hematologic recovery; blood transfusions may be required
- Lesions in HSV
- Electrolytes and minerals (calcium, phosphate, magnesium, potassium); watch closely for tetany during 1st administration
- GI symptoms: nausea, vomiting, diarrhea; severe symptoms may necessitate discontinuing product
- ⚠ **Blood dyscrasias** (anemia, granulocytopenia): bruising, fatigue, bleeding, poor healing
- **Allergic reactions:** flushing, rash, urticaria, pruritus

CMV retinitis

- Culture should be performed prior to treatment (blood, urine, throat); a negative culture does not rule out CMV
- Ophthalmic exam should confirm diagnosis

Perform/provide:

- Close monitoring during therapy for tingling, numbness, paresthesias; if these occur, stop inf, obtain lab sample for electrolytes

Evaluate:

- Therapeutic response: improvement in CMV retinitis

Teach patient/family:

- To call prescriber if sore throat, swollen lymph nodes, malaise, fever occur, since other infections may occur
- To report perioral tingling, numbness in extremities, and paresthesias
- That serious product interactions may occur if OTC products are ingested; check first with prescriber
- That product is not a cure but will control symptoms

☼ Canada only Side effects: *italics* = common; **bold** = life-threatening ⚠
Nurse Alert

fosinopril (Rx)

(foss'in-oh-pril)

Monopril

Func. class.: Antihypertensive

Chem. class.: Angiotensin-converting enzyme (ACE) inhibitor

Do not confuse: **Monopril**/minoxidil/Accupril/Monoket

ACTION:

Selectively suppresses renin-angiotensin-aldosterone system; inhibits ACE; prevents conversion of angiotensin I to angiotensin II; results in dilation of arterial, venous vessels

USES:

Hypertension, alone or in combination with thiazide diuretics, systolic CHF

Unlabeled uses: Proteinuria in nondiabetic nephropathy

CONTRAINDICATIONS:

Breastfeeding, children, hypersensitivity to ACE inhibitors, history of ACE-inhibitor-induced angioedema

Black Box Warning:

Pregnancy (D)

Precautions: Geriatric patients, impaired hepatic function, hypovolemia, blood dyscrasias, CHF, COPD, asthma, angioedema, hyperkalemia, renal artery stenosis, renal disease

DOSAGE AND ROUTES

Calculator

CHF

- **Adult: PO** 10 mg/day then up to 40 mg/day increased over several weeks; use lower dose for those diuresed before fosinopril

Hypertension

- **Adult: PO** 10 mg/day initially then 20-40 mg/day divided bid or daily, max 80 mg/day

Available forms: Tabs 10, 20, 40 mg

Administer:

- May be taken without regard to meals

SIDE EFFECTS

CNS: *Headache, dizziness, fatigue*

CV: *Hypotension, orthostatic hypotension, tachycardia*

GI: *Nausea, constipation, vomiting, diarrhea, hepatotoxicity, cholestatic jaundice, fulminant hepatic necrosis, hepatic failure, death*

GU: Increased BUN, creatinine, azotemia, renal artery stenosis

HEMA: Decreased Hct, Hgb; eosinophilia, leukopenia, neutropenia

META: Hyperkalemia

RESP: Cough

SYST: Anaphylaxis, angioedema

PHARMACOKINETICS

Peak 3 hr, serum protein binding 97%, half-life 11.5-14 hr, metabolized by liver (metabolites excreted in urine, feces)

INTERACTIONS

Increase: hypotension—diuretics, other antihypertensives, ganglionic blockers, adrenergic blockers, nitrates, acute alcohol ingestion

Increase: toxicity—vasodilators, hydralazine, prazosin, potassium-sparing diuretics, sympathomimetics, digoxin, lithium, NSAIDs

Decrease: absorption—antacids

Decrease: antihypertensive effect—salicylates

Drug/Herb

Increase: antihypertensive effect—hawthorn

Decrease: antihypertensive effect—ephedra

Drug/Lab Test

Increase: AST, ALT, alk phos, glucose, bilirubin, uric acid

False positive: urine acetone

Positive: ANA titer

NURSING CONSIDERATIONS

Assess:

- **Hypertension:** B/P, orthostatic hypotension, syncope
- Blood studies: neutrophils, decreased platelets; obtain WBC with differential baseline and monthly $\times 6$ mo then q2-3mo $\times 1$ yr; if neutrophils $<1000/\text{mm}^3$, discontinue (recommended with collagen–vascular disease)
- Renal studies: protein, BUN, creatinine; increased levels may indicate nephrotic syndrome
- Baselines of renal, hepatic studies before therapy begins
- Potassium levels, although hyperkalemia rarely occurs
- **CHF:** edema in feet, legs daily; weigh daily
- **Allergic reactions:** rash, fever, pruritus, urticaria; product should be discontinued if antihistamines fail to help

Perform/provide:

- Storage in tight container at $\leq 86^\circ \text{ F}$ (30° C)
- Supine position for severe hypotension

Evaluate:

- Therapeutic response: decrease in B/P

Teach patient/family:

- Not to discontinue product abruptly; to take at same time of day
- Not to use OTC products (cough, cold, allergy) unless directed by prescriber; not to use salt substitutes containing potassium without consulting prescriber
- About the importance of complying with dosage schedule, even if feeling better
- To rise slowly to sitting or standing position to minimize orthostatic hypotension
- To notify prescriber of mouth sores, sore throat, fever, swelling of hands or feet, irregular heartbeat, chest pain, nonproductive cough
- To report excessive perspiration, dehydration, vomiting, diarrhea; may lead to fall in B/P
- That product may cause dizziness, fainting, lightheadedness during first few days of therapy
- That product may cause skin rash or impaired perspiration
- How to take B/P; normal readings for age group

Black Box Warning:

To notify prescriber if pregnancy is planned or suspected, pregnancy (D)

TREATMENT OF OVERDOSE:

0.9% NaCl IV inf, hemodialysis

🍁 Canada only Side effects: *italics* = common; **bold** = life-threatening ⚠️
Nurse Alert

fosphenytoin (Rx)

(foss-fen'i-toy-in)

Func. class.: Anticonvulsant

Chem. class.: Hydantoin, phosphate phenytoin ester

ACTION:

Inhibits spread of seizure activity in motor cortex by altering ion transport; increases AV conduction, prodrug of phenytoin

USES:

Generalized tonic-clonic seizures, status epilepticus, partial seizures

CONTRAINDICATIONS:

Pregnancy (D), hypersensitivity, psychiatric conditions, bradycardia, SA and AV block, Stokes-Adams syndrome, absence seizures

Precautions: Breastfeeding, allergies, renal/hepatic disease, myocardial insufficiency, hypoalbuminemia, hypothyroidism, Asian patients positive for HLA-B 1502

Black Box Warning:

Rapid IV inf

DOSAGE AND ROUTES

Calculator

All doses in PE (phenytoin sodium equivalent)

Status epilepticus

- **Adult and adolescent:** IV 15-20 mg PE/kg
- **Child <12 yr (unlabeled):** IV 15-20 mg PE/kg

Nonemergency/maintenance dosing

- **Adult and adolescent >16 yr:** IM/IV 10-20 mg PE/kg; 4-6 mg PE/kg/day (maintenance); start maintenance 12 hr after loading dose; give in 2-3 divided doses

Available forms: Inj 150 mg (100 mg phenytoin equiv), 750 mg (500 mg phenytoin equiv), 50-mg/ml vials

Administer:

Injectable routes

- Give IM/IV; the dosage, concentration, and infusion rate of fosphenytoin should always be expressed, prescribed, and dispensed in phenytoin sodium equivalents (PE); exercise extreme caution when preparing and administering fosphenytoin; the concentration and dosage should be carefully confirmed; fatal overdoses have occurred in children when the per ml concentration of the product (50 mg PE/mL) was misinterpreted as the total amount of drug in the vial
- Visually inspect for particulate matter and discoloration before use

IV INF route

- Before infusion, dilute in 5% dextrose or 0.9% saline solution to a concentration ranging from 1.5 to 25 mg PE/ml
- Because of the risk of hypotension, do not exceed recommended infusion rates. Continuous monitoring of ECG, B/P, and respiratory function is recommended, especially throughout the period where phenytoin concentrations peak (about 10–20 min after the end of the infusion)
- Loading doses should always be followed by maintenance doses of oral or parenteral phenytoin or parenteral fosphenytoin
- **Adult: IV** Infuse at a max rate of 150 mg PE/min
- **Elderly or debilitated adults: IV** Infuse at a max 3 mg PE/kg/min or 150 mg PE/min, whichever is less
- **Child: IV** Infuse at a rate of 0.5–3 mg PE/kg/min or max 150 mg PE/min, whichever is less
- **Infant/neonate: IV** Infuse at a rate max 0.5–3 mg PE/kg/min

Y-site compatibilities: Aminocaproic acid, amphotericin B lipid complex, amphotericin B liposome, anidulafungin, atenolol, bivalirudin, bleomycin, CARBOplatin, CISplatin, cyclophosphamide, cytarabine, DACTINomycin, DAPTOmycin, dexmedetomidine, diltiazem, DOCEtaxel, doxacurium, eptifibatide, ertapenem, etoposide, fludarabine, fluorouracil, gatifloxacin, gemcitabine, gemtuzumab, granisetron, ifosfamide, levofloxacin, linezolid, LORazepam, mechlorethamine, meperidine, methotrexate, metroNIDAZOLE, nesiritide, octreotide, oxaliplatin, oxytocin, PACLitaxel, palonosetron, pamidronate, pantoprazole, PEMEtrexed, PHENobarbital, piperacillin-tazobactam, rocuronium, sodium acetate, tacrolimus, teniposide, thiotepa, tigecycline, tirofiban, vinCRISTine, vinorelbine, voriconazole, zoledronic acid

SIDE EFFECTS

CNS: *Drowsiness*, dizziness, insomnia, paresthesias, depression, **suicidal tendencies**, aggression, headache, confusion, paresthesia

CV: Hypo/hypertension, **ventricular fibrillation, CHF, shock**

EENT: Nystagmus, diplopia, blurred vision

GI: Nausea, vomiting, diarrhea, constipation, anorexia, weight loss, hepatitis, jaundice, gingival hyperplasia

HEMA: **Agranulocytosis, leukopenia, aplastic anemia, thrombocytopenia, megaloblastic anemia**

INTEG: Rash, lupus erythematosus, **Stevens-Johnson syndrome**, hirsutism, hypersensitivity, pruritus

SYST: Hyperglycemia, hypokalemia, SJS/TEN Asian patients positive for HLA-B 1502; **drug reaction with eosinophilia and systemic symptoms (DRESS), purple glove syndrome, anaphylaxis**

PHARMACOKINETICS

Metabolized by liver, excreted by kidneys, protein binding 95%-99%, rapidly converted to phenytoin

INTERACTIONS

Increase: fosphenytoin level—cimetidine, amiodarone, chloramphenicol, estrogens, H₂ antagonists, phenothiazines, salicylates, sulfonamides, tricyclics, CYP1A2 inhibitors

Decrease: fosphenytoin effects—alcohol (chronic use), antihistamines, antacids, tramadol, antineoplastics, rifampin, folic acid, carbamazepine, theophylline, CYP1A2 inducers

Decrease: virologic response, resistance—delavirdine, do not use concurrently
Drug/Herb

Increase: anticonvulsant effect—ginkgo

Decrease: anticonvulsant effect—ginseng, valerian

Drug/Lab Test

Increase: glucose, alk phos

Decrease: dexamethasone, metyrapone test serum, PBI, urinary steroids

NURSING CONSIDERATIONS

Assess:

- Drug level: target level 10-20 mcg/ml, toxic level 30-50 mcg/ml, wait >2 hr after dose before testing, 4 hr after IM dose
- Blood studies: CBC, platelets q2wk until stabilized, then monthly $\times$ 12 mo, then q3mo; discontinue product if neutrophils $<1600/\text{mm}^3$; serum calcium, albumin, phosphorus ⚠ Mental status: mood, sensorium, affect, memory (long, short), **suicidal thoughts/behaviors**
- **Serious skin reactions:** usually occurring within 28 days of treatment; if a rash develops, patient should be evaluated for DRESS
- Seizure activity including type, location, duration, character; provide seizure precaution
- Renal studies: urinalysis, BUN, urine creatinine
- Hepatic studies: ALT, AST, bilirubin, creatinine
- Allergic reaction: red, raised rash; product should be discontinued
- **Toxicity/bone marrow depression:** nausea, vomiting, ataxia, diplopia, cardiovascular collapse, slurred speech, confusion
- Respiratory depression: rate, depth, character of respirations
- ⚠ **Blood dyscrasias:** fever, sore throat, bruising, rash, jaundice
- Continuous monitoring of ECG, B/P, respiratory function
- Rash; discontinue as soon as rash develops, serious adverse reactions such as **Stevens-Johnson syndrome** can occur

Evaluate:

- Therapeutic response: decrease in severity of seizures

Teach patient/family:

- About the reason for, expected outcomes of treatment
- Not to use machinery or engage in hazardous activity, since drowsiness, dizziness may occur
- To carry emergency ID denoting product use, name of prescriber
- To notify prescriber of rash, bleeding, bruising, slurred speech, jaundice of skin or eyes, joint pain, nausea, vomiting, severe headaches
- To keep all medical appointments, including those for lab work, physical assessment
- To notify prescriber if pregnancy is planned, suspected
- To use contraception while using this product

✳ Canada only Side effects: *italics* = common; **bold** = life-threatening ⚠
Nurse Alert

HIGH ALERT

fospropofol (Rx)

(fos-proe'poe-fol)

Lusedra

Func. class.: General anesthetic

ACTION:

Produces dose-dependent CNS depression by activation of GABA receptor

USES:

Induction or maintenance of anesthesia as part of balanced anesthetic technique; sedation in mechanically ventilated patients

CONTRAINDICATIONS:

Hypersensitivity to product

Precautions: Pregnancy (B), breastfeeding, children, geriatric patients, respiratory depression, severe respiratory disorders, cardiac dysrhythmias, labor/delivery, renal disease, hyperlipidemia

DOSAGE AND ROUTES

Calculator

Induction/Maintenance

- **Adult <65 (healthy), >90 kg:** 577.5 **IV BOL**, may give supplemental doses up to max of 140 mg, give no more frequently than q4min; 61-89 kg 6.5 mg/kg (max 577.5 mg) **IV BOL** may give supplemental doses up to 1.6 mg/kg/dose (max 140 mg/dose; give no more frequently than q4min); <60 kg 385 mg **IV BOL**, may give supplemental doses up to max 105 mg/dose, give no more frequently than q4min
- **Adult: <65 yr (severe systemic disease), ≥90 kg** 437.5 mg **IV BOL**, give supplemental doses up to max 105 mg/dose, give no more frequently than q4min; 61-89 kg 4.875 mg/kg (max 437.5 mg) give supplemental doses of 75% of standard dose/up to 1.2 mg/kg/dose (max 105 mg/dose) give no more frequently than q4min; <60 kg 297.5 **IV BOL**, give supplemental doses up to

max 70 mg/dose, give no more frequently than q4min

• **Geriatric ≥90 kg: IV BOL** 437.5 then supplemental doses up to max 105 mg; give no more frequently than q4min; 61-89 kg, **IV BOL** give 75% standard dosing regimen (4.875 mg/kg), give no more frequently than q4min (max 105 mg/dose)

Available forms: Inj 1050 mg/30 ml

Administer:

IV Bolus route

- Visually inspect for particulate matter and discoloration
- Each vial is single patient/single use
- Draw from vial, discard unused portion
- Do not mix with other drugs prior to use
- Give by IV BOL in free-flowing peripheral IV line of D₅W, 5% dextrose/0.2% NaCl, 5% dextrose/0.45% NaCl D₅LR, LR, 0.45% NaCl, NS, 5% dextrose/0.45% NaCl/20 mEq KCl; do not mix with other fluids, flush line with NS before and after administration • No filtration needed
- Give only with resuscitative equipment available
- Only qualified persons trained in anesthesia should administer

SIDE EFFECTS

CNS: Involuntary movement, headache, jerking, fever, dizziness, shivering, tremor, confusion, somnolence, paresthesia, agitation, abnormal dreams, euphoria, fatigue, **increased intracranial pressure, impaired cerebral flow, seizures**

CV: *Bradycardia, hypotension*, hypertension, PVC, PAC, tachycardia, abnormal ECG, ST segment depression, **asystole, bradydysrhythmias**

EENT: Blurred vision, tinnitus, eye pain, strange taste, diplopia

GI: *Nausea, vomiting, abdominal cramping*, dry mouth, swallowing, hypersalivation, **pancreatitis**

GU: Urine retention, green urine, cloudy urine, oliguria

INTEG: *Flushing, phlebitis, hives, burning/stinging at inj site*, rash, pain of extremities

MS: Myalgia

RESP: **Apnea**, *cough, hiccups*, dyspnea, hypoventilation, sneezing, wheezing,

tachypnea, hypoxia, respiratory acidosis

PHARMACOKINETICS

Onset 15-30 sec, rapid distribution, half-life 1-8 min, terminal half-life .81-.88 hr; 70% excreted in urine; metabolized in liver by conjugation to inactive metabolites, 95%-99% protein binding

INTERACTIONS

 **Do not use within 10 days of MAOIs**

Increase: CNS depression—alcohol, opioids, sedative/hypnotics, antipsychotics, skeletal muscle relaxants, inhalational anesthetics

Drug/Herb

Increase: fospropofol effect—St. John's wort

Drug/Lab Test

Increase: LFTs, bilirubin

NURSING CONSIDERATIONS

Assess:

- Inj site: phlebitis, burning, stinging
- **ECG** for changes: PVC, PAC, ST segment changes; monitor VS
- CNS changes: movement, jerking, tremors, dizziness, LOC, pupil reaction
- Allergic reactions: hives
- **Respiratory depression**, character, rate, rhythm; notify prescriber if respirations are <10/min; hypoxemia detectable by pulse oximetry

Perform/provide:

- Storage of unopened vials at room temp

Evaluate:

- Therapeutic response: induction of anesthesia

Teach patient/family:

- That this medication will cause dizziness, drowsiness, sedation

TREATMENT OF OVERDOSE:

Discontinue product; administer vasopressor agents or anticholinergics, artificial ventilation

Nurse Alert

frovatriptan (Rx)

(froh-vah-trip'tan)

Frova

Func. class.: Antimigraine agent

Chem. class.: 5-HT₁-Receptor agonist

ACTION:

Binds selectively to the vascular 5-HT_{1B}, 5-HT_{1D} receptor subtypes; exerts antimigraine effect; binds to benzodiazepine receptor sites, causes vasoconstriction in cranium

USES:

Acute treatment of migraine with/without aura

CONTRAINDICATIONS:

Hypersensitivity, angina pectoris, history of MI, documented silent ischemia, Prinzmetal's angina, ischemic heart disease; concurrent ergotamine-containing preparations; uncontrolled hypertension; basilar or hemiplegic migraine; ischemic bowel disease; peripheral vascular disease, severe hepatic disease, prophylactic migraine treatment

Precautions: Pregnancy (C), breastfeeding, children, geriatric patients, postmenopausal women, men >40 yr, risk factors for CAD, hypercholesterolemia, obesity, diabetes, impaired hepatic function, seizure disorder

DOSAGE AND ROUTES

Calculator

• **Adult: PO** 2.5 mg; a 2nd dose may be taken after ≥2 hr; max 3 tabs (7.5 mg/day)

Available form: Tabs 2.5 mg

Administer:

- Swallow tabs whole; do not break, crush, or chew
- With fluids
- 2 days/wk or less; rebound headache may occur

SIDE EFFECTS

CNS: *Hot/cold sensation*, paresthesia, *dizziness*, headache, fatigue, insomnia, anxiety, somnolence, **seizures**

CV: *Flushing*, chest pain, palpitation

GI: Dry mouth, dyspepsia, abdominal pain, diarrhea, vomiting, nausea

MS: Skeletal pain

PHARMACOKINETICS

Onset of pain relief 2-3 hr, terminal half-life 25-29 hr, protein binding 15%, metabolized liver by CYP1A2

INTERACTIONS

Increase: frovatriptan levels—CYP1A2 inhibitors (cimetidine, ciprofloxacin, erythromycin), estrogen, propranolol, oral contraceptives

Increase: toxicity—SSRIs, other serotonin agonists (dextromethorphan, tramadol, antidepressants)

NURSING CONSIDERATIONS

Assess:

- **Migraine symptoms:** aura, unable to view light; ingestion of tyramine-containing foods (pickled products, beer, wine, aged cheese), food additives, preservatives, colorings, artificial sweeteners, chocolate, caffeine, which may precipitate these types of headaches • B/P; signs, symptoms of coronary vasospasms
- For stress level, activity, recreation, coping mechanisms

Perform/provide:

- Quiet, calm environment with decreased stimulation from noise, bright light, excessive talking

Evaluate:

- Therapeutic response: decrease in frequency, severity of migraine

Teach patient/family:

- To report any side effects to prescriber
 - To use contraception while taking product; to inform prescriber if pregnant or planning to become pregnant • To consult prescriber if breastfeeding
-

🍁 Canada only Side effects: *italics* = common; **bold** = life-threatening ⚠️
Nurse Alert

fulvestrant (Rx)

(full-vess'trant)

Faslodex

Func. class.: Antineoplastic

Chem. class.: Estrogen-receptor antagonist

ACTION:

Inhibits cell division by competitive binding to cytoplasmic estrogen receptors, downregulates estrogen receptors

USES:

Advanced breast carcinoma in estrogen-receptor–positive patients (usually postmenopausal)

Unlabeled uses: Loading dose for metastatic breast cancer

CONTRAINDICATIONS:

Pregnancy (D), breastfeeding, children, hypersensitivity

Precautions: Hepatic disease, jaundice, thrombocytopenia, biliary tract disease, coagulopathy

DOSAGE AND ROUTES

Calculator

• **Adult:** IM 500 mg as 2, 5-ml injections on days 1, 15, 29 and monthly thereafter

Available forms: Inj 50 mg/ml

Administer:

IM route

- IM 5 ml give one inj in each buttock slowly
- Antiemetic 30-60 min before product to prevent vomiting prn

SIDE EFFECTS

CNS: Headache, depression, dizziness, insomnia, paresthesia, anxiety

GI: Nausea, vomiting, anorexia, constipation, diarrhea, abdominal pain, hepatitis, hepatic failure, hyperbilirubinemia

HEMA: Anemia

INTEG: *Rash*, sweating, *hot flashes*, inj site pain

MS: Bone pain, arthritis, back pain

RESP: Pharyngitis, dyspnea, cough

SYST: **Angioedema**

PHARMACOKINETICS

Half-life 40 days, metabolized by CYP3A4, excretion in feces 90%

INTERACTIONS

Increase: Bleeding—anticoagulants, do not use concurrently

Drug/Lab Test

Increase: LFTs

NURSING CONSIDERATIONS

Assess:

- For anticoagulant use
- For side effects; report to prescriber

Perform/provide:

- Liquid diet, if needed, including cola, gelatin; dry toast or crackers may be added if patient is not nauseated or vomiting
- Store in refrigerator, protect from light

Evaluate:

- Therapeutic response: decreased tumor size, spread of malignancy

Teach patient/family:

- To report any complaints, side effects to prescriber
- To report vaginal bleeding immediately
- That tumor flare (increase in size of tumor, increased bone pain) may occur, will subside rapidly; that analgesics may be taken for pain
- That premenopausal women must use mechanical birth control because ovulation may be induced; not to breastfeed
- To use contraception to prevent pregnancy; pregnancy category (D)

☛ Canada only Side effects: *italics* = common; **bold** = life-threatening ⚠

Nurse Alert

furosemide (Rx)

(fur-oh'se-mide)

Lasix

Func. class.: Loop diuretic

Chem. class.: Sulfonamide derivative

Do not confuse: furosemide/torsemide

Lasix/Luvox/Lomotil/Lanoxin

ACTION:

Inhibits reabsorption of sodium and chloride at proximal and distal tubule and in the loop of Henle

USES:

Pulmonary edema; edema with CHF, hepatic disease, nephrotic syndrome, ascites, hypertension

Unlabeled uses: Hypercalcemia with malignancy, hypertensive emergency/urgency, pulmonary edema or prevention of hemodynamic effects associated with blood product transfusion, ascites

CONTRAINDICATIONS:

Breastfeeding, infants, anuria, hypovolemia, electrolyte depletion

Precautions: Pregnancy (C), diabetes mellitus, dehydration, severe renal disease, cirrhosis, ascites, hypersensitivity to sulfonamides/thiazides

DOSAGE AND ROUTES

Calculator

Edema

- **Adult:** PO 20-80 mg/day in AM; may give another dose after 6 hr up to 600 mg/day; IM/IV 20-40 mg; increase by 20 mg q2hr until desired response
- **Child:** PO/IM/IV 2 mg/kg; may increase by 1-2 mg/kg q6-8hr up to 6 mg/kg

Acute pulmonary edema

- **Adult:** IV 40 mg given over several min, repeated after 1 hr; increase to 80 mg if needed
- **Child:** IV/IM 1-2 mg/kg q6-12hr, max 6 mg/kg/dose

- **Premature neonate >32 wk postconceptional age: IV/IM 1-2 mg/kg q12-24hr**

- **Premature neonate ≤32 wk postconceptional age: IV/IM max 1 mg/kg initially**

Antihypercalcemia

- **Adult: IM/IV 80-100 mg q1-4hr or PO 120 mg/day or divided bid**

- **Child: IM/IV 25-50 mg, repeat q4hr if needed**

Acute/chronic renal failure

- **Adult: PO 80 mg/day, increase by 80-120 mg/day to desired response; IV 100-200 mg, max 600-800 mg**

Hypertensive emergency/urgency (unlabeled)

- **Adult: IV 40-80 mg**

Pulmonary edema/prevention of adverse hemodynamic effects associated with blood product transfusion (unlabeled)

- **Adult: IV 40 mg injected slowly then 80 mg injected slowly after 2 hr if needed**

- **Child: IM/IV 1-2 mg/kg q6-12hr**

- **Premature neonate >32 wk postconceptional age: IM/IV 1-2 mg/kg q12-24hr**

- **Premature neonate ≤32 wk postconceptional age: IM/IV Max 1 mg/kg, give no more frequently than q24hr**

Available forms: Tabs 20, 40, 80 mg; oral sol 8 mg/ml, 10 mg/ml; inj 10 mg/ml

Administer:

- In AM to avoid interference with sleep if using product as diuretic • Potassium replacement if potassium <3 mg/dl

PO route

- PO with food if nausea occurs; absorption may be decreased slightly; tabs may be crushed

IV route

- Undiluted; may be given through Y-tube or 3-way stopcock; give ≤20 mg/min

Intermittent IV Infusion route

- May be added to NS or D₅W; if large doses required and given as IV inf, max 4 mg/min; use inf pump

Y-site compatibilities: Acyclovir, alfentanil, allopurinol, alprostadil, amifostine, amikacin, aminocaproic acid, aminophylline, amphotericin B cholesteryl/lipid complex/liposome, anidulafungin, argatroban, ascorbic acid, atenolol, atropine, azaTHIOprine, aztreonam, bivalirudin, bleomycin, bumetanide, calcium chloride/gluconate, CARBOplatin, cefamandole, ceFAZolin, cefepime, cefmetazole, cefonicid, cefoperazone, cefotaxime, cefoTEtan, cefOXitin, cefTAZidime, ceftizoxime, ceftobiprole, cefTRIAxone, cefuroxime, cephalothin, cephapirin, chloramphenicol, CISplatin, cladribine, clindamycin, cyanocobalamin, cyclophosphamide, cycloSPORINE, cytarabine, DACTINomycin, DAPTOmycin, dexamethasone, dexmedetomidine, digoxin, DOCEtaxel, doripenem, doxacurium, DOXOrubicin liposome, enalaprilat, ePHEDrine, EPINEPHrine, etoposide, fentaNYL, fludarabine, fluorouracil, folic acid, foscarnet, gallium nitrate, ganciclovir, granisetron, heparin, hydrocortisone, HYDROmorphone, ifosfamide, imipenem-cilastatin, indomethacin, insulin (regular), isosorbide, kanamycin, leucovorin, lidocaine, linezolid, LORazepam, LR, mannitol, mechlorethamine, melphalan, meropenem, methicillin, methotrexate, methylPREDNISolone, metoprolol, metroNIDAZOLE, mezlocillin, micafungin, miconazole, mitoMYcin, moxalactam, multiple vitamin injection, nafcillin, naloxone, nitroprusside, octreotide, oxacillin, oxaliplatin, oxytocin, PACLitaxel, palonosetron, pamidronate, pantoprazole, PEMEtrexed, penicillin G, PENTobarbital, PHENobarbital, phytonadione, piperacillin, piperacillin-tazobactam, potassium chloride, procainamide, propofol, propranolol, ranitidine, remifentanil, Ringer's, ritodrine, sargramostim, sodium acetate/bicarbonate, succinylcholine, SUFentanil, temocillin, teniposide, theophylline, thiopental, thiotepa, ticarcillin, ticarcillin-clavulanate, tigecycline, tirofiban, TNA, tobramycin, urokinase, vit B/C, voriconazole, zoledronic acid

SIDE EFFECTS

CNS: Headache, fatigue, weakness, vertigo, paresthesias

CV: Orthostatic hypotension, chest pain, ECG changes, **circulatory collapse**

EENT: Loss of hearing, ear pain, tinnitus, blurred vision

ELECT: *Hypokalemia, hypochloremic alkalosis, hypomagnesemia, hyperuricemia, hypocalcemia, hyponatremia, metabolic alkalosis*

ENDO: *Hyperglycemia*

GI: Nausea, diarrhea, dry mouth, vomiting, anorexia, cramps, oral, gastric irritations, pancreatitis

GU: Polyuria, renal failure, glycosuria

HEMA: Thrombocytopenia, agranulocytosis, leukopenia, neutropenia, anemia

INTEG: Rash, pruritus, purpura, Stevens-Johnson syndrome, sweating, photosensitivity, urticaria

MS: Cramps, stiffness

PHARMACOKINETICS

PO: Onset 1 hr, peak 1-2 hr, duration 6-8 hr, absorbed 70%

IV: Onset 5 min; peak 1/2 hr; duration 2 hr (metabolized by the liver 30%); excreted in urine, some as unchanged product, and feces; crosses placenta; excreted in breast milk; half-life 1/2-1 hr

INTERACTIONS

Increase: toxicity—lithium, nondepolarizing skeletal muscle relaxants, digoxin

Increase: hypotensive action of antihypertensives, nitrates

Increase: ototoxicity—aminoglycosides, CISplatin, vancomycin

Increase: effects of anticoagulants, salicylates

Decrease: furosemide effect—probenecid

Drug/Lab Test

Interference: GTT

Increase: LDL

NURSING CONSIDERATIONS

Assess:

- **CHF:** weight, I&O daily to determine fluid loss; effect of product may be decreased if used daily
- **Hypertension:** B/P lying, standing; postural hypotension may occur
- Metabolic alkalosis: drowsiness, restlessness
- **Hypokalemia:** postural hypotension, malaise, fatigue, tachycardia, leg cramps, weakness
- Rashes, temp elevation daily
- Confusion, especially in geriatric patients; take safety precautions if needed
- **Hearing,** including tinnitus and hearing loss, when giving high doses for extended periods
- Rate, depth, rhythm of respiration, effect of exertion, lung

sounds

- Electrolytes (potassium, sodium, chloride); include BUN, blood glucose, CBC, serum creatinine, blood pH, ABGs, uric acid • Glucose in urine if patient diabetic

- Allergies to sulfonamides, thiazides

Perform/provide:

- Increased fluid intake 2-3 L/day unless contraindicated

Evaluate:

- Therapeutic response: improvement in edema of feet, legs, sacral area (CHF); increase urine output, decreased B/P; decreased calcium levels (hypercalcemia)

Teach patient/family:

- To discuss the need for a high-potassium diet or potassium replacement with prescriber

- To rise slowly from lying or sitting position because orthostatic hypotension may occur

- To recognize adverse reactions that may occur: muscle cramps, weakness, nausea, dizziness

- About the entire treatment regimen, including exercise, diet, stress relief for hypertension • To take with food or milk for GI symptoms

- To use sunscreen or protective clothing to prevent photosensitivity

- To take early in the day to prevent sleeplessness

- To avoid OTC medications unless directed by prescriber

TREATMENT OF OVERDOSE:

Lavage if taken orally; monitor electrolytes; administer dextrose in saline; monitor hydration, CV, renal status

☼ Canada only Side effects: *italics* = common; **bold** = life-threatening ⚠

Nurse Alert

gabapentin (Rx)

(gab'a-pen-tin)

Gralise, Horizant, Neurontin

Func. class.: Anticonvulsant

Do not confuse: **Neurontin**/Noroxin/Neoral

ACTION:

Mechanism unknown; may increase seizure threshold; structurally similar to GABA; gabapentin binding sites in neocortex, hippocampus

USES:

Adjunct treatment of partial seizures, with/without generalization in patients >12 yr; adjunct for partial seizures in children 3-12 yr, postherpetic neuralgia, primary restless leg syndrome in adults

Unlabeled uses: Tremors with multiple sclerosis (MS), neuropathic pain, bipolar disorder, migraine prophylaxis, diabetic neuropathy, nystagmus, pruritus, spasticity, menopause, hot flashes, ALS, MS

CONTRAINDICATIONS:

Hypersensitivity to this product

Precautions: Pregnancy (C), breastfeeding, children <3 yr, geriatric patients, renal disease, hemodialysis, suicidal thoughts, depression

DOSAGE AND ROUTES

Calculator

- **Adult and child >12 yr: PO** 900-1800 mg/day in 3 divided doses; may titrate by giving 300 mg on 1st day, 300 mg bid on 2nd day, 300 mg tid on 3rd day; may increase to 1800-2400 mg/day by adding 300 mg on subsequent days
- **Child 3-12 yr: PO** 10-15 mg/kg/day in 3 divided doses, initially titrate dose upward over approximately 3 days; 25-35 mg/kg/day; all given in 3 divided doses

Postherpetic neuralgia

- **Adult: PO** 300 mg on day 1, 600 mg/day divided bid on day 2, 900 mg/day divided tid, may titrate to 1800-3600 mg divided tid if needed; **EXT REL**

(Gralise only) 300 mg on day 1, 600 mg on day 2, 900 mg on days 3-6, 1200 mg on days 7-10, 1500 mg on days 11-14, 1800 mg on day 15 and thereafter

Moderate to severe restless leg syndrome (RLS) (Horizant only)

- **Adult: PO EXT REL** 600 mg daily with food at about 5 PM; if dose missed, take next day at 5 PM

Renal dose

- **Adult and child >12 yr:** CCr 30-59 ml/min, 200-700 mg bid, CCr 15-29 ml/min, 200-700 mg/day, CCr <15 ml/min, 100-300 mg/day

Uremic pruritus in hemodialysis (unlabeled)

- **Adult: PO** 300 mg 3×/wk

Brachioradial pruritus (unlabeled)

- **Adult: PO** 300-1800 mg/day

ALS (unlabeled)

- **Adult: PO** 1000 mg/day in divided doses × 6 mo

Pendular/congenital nystagmus (unlabeled)

- **Adult: PO** 900 mg/day in divided doses initially, up to 2400 mg/day in divided doses

Spasticity in MS (unlabeled)

- **Adult: PO** 600-1200 mg/day in divided doses

Available forms: Caps 100, 300, 400 mg; tabs 600, 800 mg; Horizant: ext rel tab 600 mg; oral sol 250 mg/5 ml; ext rel tab (Gralise): 300, 600 mg

Administer:

- Do not crush or chew caps, ext rel tabs; caps may be opened and contents put in applesauce or dissolved in juice; scored tabs may be cut in half • 2 hr apart when giving antacids
- Give without regard to meals
- **Gradually withdraw over 7 days; abrupt withdrawal may precipitate seizures**
- Beginning dose at bedtime to minimize daytime drowsiness
- **Oral sol:** Measure with calibrated device
- **Ext rel:** Give with food at about 5 PM, bioavailability increased with food; swallow whole; do not interchange Gralise with Horizant

SIDE EFFECTS

CNS: *Drowsiness, confusion, dizziness, fatigue, anxiety, somnolence, ataxia, amnesia, abnormal thinking, unsteady gait, depression;* children 3-12 yr old,

emotional lability, aggression, thought disorder, hyperkinesia, hostility, **seizures**, **suicidal ideation**

CV: Vasodilation, peripheral edema, hypotension

EENT: Dry mouth, blurred vision, *diplopia*, nystagmus

GI: Constipation, increased appetite, dental abnormalities, nausea, vomiting

GU: Impotence, bleeding, *UTI*

HEMA: **Leukopenia**, decreased WBC

INTEG: Pruritus, abrasion, **Stevens-Johnson syndrome**

MS: Myalgia

RESP: *Rhinitis*, pharyngitis, cough

SYST: **Drug reaction with eosinophilia and systemic symptoms (DRESS)**

PHARMACOKINETICS

Protein binding <3% not metabolized; excreted in urine (unchanged);
elimination half-life 5-7 hr, prolonged to 130 hr in ESRD

INTERACTIONS

Increase: CNS depression—alcohol, sedatives, antihistamines, all other CNS depressants

Increase: gabapentin levels—morphine

Decrease: gabapentin levels—antacids, sevelamar, cimetidine

Decrease: effect of—HYDROcodone

Drug/Lab Test

False positive: urinary protein using Ames N-multistix SG

NURSING CONSIDERATIONS

Assess:

- **Seizures:** aura, location, duration, activity at onset
- **Pain:** location, duration, characteristics if using for chronic pain, migraine ⚠️

Mental status: mood, sensorium, affect, behavioral changes, **suicidal**

thoughts/behaviors; if mental status changes, notify prescriber • Eye problems, need for ophthalmic exam before, during, after treatment (slit lamp, funduscopy, tonometry) • WBC, gabapentin level (therapeutic 5.9-21 mcg/ml, toxic >85 mcg/ml)

- Drug reaction with eosinophilia and systemic symptoms

Perform/provide:

- Storage at room temp away from heat and light
- **Seizure precautions:** padded side rails; move objects that may harm patient
- Increased fluids, bulk in diet for constipation

Evaluate:

- Therapeutic response: decreased seizure activity; decrease in chronic pain

Teach patient/family:

- To carry emergency ID stating patient's name, products taken, condition, prescriber's name and phone number
- To avoid driving, other activities that require alertness because dizziness, drowsiness may occur
- **Not to discontinue medication quickly after long-term use; to taper over ≥ 1 wk because withdrawal-precipitated seizures may occur; not to double doses if dose is missed; to take if 2 hr or more before next dose**
- **To notify prescriber if pregnancy planned or suspected; to avoid breastfeeding**
- Not to use within 2 hr of antacid, may take regular release without regard to meals; ext rel should be taken with food; to take as directed, doses interval should not be ≥ 12 hr

☼ Canada only Side effects: *italics* = common; **bold** = life-threatening ⚠
Nurse Alert

galantamine (Rx)

(gah-lan'tah-meen)

Razadyne, Razadyne ER, Reminyl 

Func. class.: Anti-Alzheimer agent

Chem. class.: Centrally acting cholinesterase inhibitor

ACTION:

Enhances cholinergic functioning by increasing acetylcholine in cerebral cortex

USES:

Mild to moderate dementia of Alzheimer's disease

Unlabeled uses: Vascular dementia, dementia with Lewy bodies, Pick's disease

CONTRAINDICATIONS:

Hypersensitivity to this product, GI bleeding, jaundice, renal failure, breastfeeding, children

Precautions: Pregnancy (B), geriatric patients, respiratory/renal/hepatic/cardiac disease, seizure disorder, peptic ulcer, asthma, bradycardia, heart block, surgery, urinary tract obstruction

DOSAGE AND ROUTES

Calculator

• **Adult: PO** 4 mg bid with morning and evening meals; after 4 wk or more, may increase to 8 mg bid; may increase to 12 mg bid after another 4 wk, usual dose 16-24 mg/day in 2 divided doses; **EXT REL** 8 mg/day in AM; may increase to 16 mg/day after 4 wk and 24 mg/day after another 4 wk

Hepatic dose

• **Adult: PO** Child-Pugh 7-9, max 16 mg/day; Child-Pugh 10-15, avoid use

Renal dose

• **Adult: PO** CCr 10-70 ml/min, max 16 mg/day; CCr <9 ml/min, avoid use

Available forms: Tabs 4, 8, 12 mg; ext rel tabs 8, 16, 24 mg; oral sol 4 mg/ml

Administer:

PO route

• With meals; take with morning and evening meal (immediate rel); morning (ext

rel)

- Dose increase after minimum of 4 wk at prior dose; if dose is interrupted for ≥ 3 days, restart at lower dose, titrate to current dose • Ext rel in AM with food; do not crush, open, or chew
- **Oral sol:** use pipette provided, put in liquid and have patient consume

SIDE EFFECTS

CNS: Tremors, insomnia, depression, dizziness, headache, somnolence, fatigue

CV: Bradycardia, chest pain, AV block

GI: Nausea, vomiting, anorexia, abdominal distress, flatulence, diarrhea

GU: Urinary incontinence, bladder outflow obstruction, hematuria

HEMA: Anemia

META: Weight decrease

MS: Asthenia

RESP: Upper respiratory tract infection, rhinitis

PHARMACOKINETICS

Rapidly and completely absorbed; metabolized by CYP2D6, 3A4; excreted via kidneys; clearance is lower in geriatric patients, hepatic disease; clearance is 20% lower in females; elimination half-life 7 hr; 18% protein binding

INTERACTIONS

Increase: Synergistic effect: cholinomimetics, other cholinesterase inhibitors

Increase: galantamine effect—CYP3A4, CYP2D6 inhibitors (antiretroviral protease inhibitors, ketoconazole, erythromycin, conivaptan, delaviridine, diltiazem, efavirenz, fluconazole, fluvoxamine, imatinib, itraconazole, clarithromycin, troleandomycin, nefazodone, nicardipine, verapamil, voriconazole, zafirlukast)

Increase: GI effects—NSAIDs

Decrease: galantamine effect—CYP3A4, CYP2D6 inducers (bosentan, carbamazepine, nevirapine, oxcarbazepine, phenytoin, fosphenytoin/rifabutin, rifampin, rifapentine, troglitazone)

Drug/Herb

Decrease: galantamine effect—St. John's wort

NURSING CONSIDERATIONS

Assess:

Alzheimer's disease: mental status: affect, mood, behavioral changes, depression, attention, confusion; neurologic status: long-and short-term memory, cognitive functioning

- Hepatic/renal studies: AST, ALT, alk phos, LDH, bilirubin, CBC; BUN, creatinine
- For severe GI effects: nausea, vomiting, anorexia, weight loss
- B/P, heart rate, respiration during initial treatment: bradycardia/AV block may occur
- Fluid status: ensure adequate hydration

Perform/provide:

- Assistance with ambulation during beginning therapy

Evaluate:

- Therapeutic response: decreased confusion

Teach patient/family:

- To notify all prescribers of use
- About correct procedure for giving oral sol using instruction sheet provided
- To notify prescriber of severe GI effects; hypo/hypertension, slow heart rate
- That product is not a cure but relieves symptoms
- That results may take several weeks or months to occur

☼ Canada only Side effects: *italics* = common; **bold** = life-threatening ⚠
Nurse Alert

ganciclovir (Rx)

(gan-sye'kloe-vir)

Cytovene, Vitrasert, Zirgan

Func. class.: Antiviral

Chem. class.: Synthetic nucleoside analog

Do not confuse: Cytovene/Cytosar

ACTION:

Inhibits replication of herpesviruses; competitively inhibits human CMV DNA polymerase and is incorporated, resulting in termination of DNA elongation

USES:

Cytomegalovirus (CMV) retinitis in immunocompromised persons, including those with AIDS, after indirect ophthalmoscopy confirms diagnosis; prophylaxis for CMV in transplantation; ophthalmic: acute herpes keratitis

Unlabeled uses: CMV pneumonia in organ transplant patients; CMV gastroenteritis, esophagitis, colitis; CMV pneumonitis, congenital CMV disease; Epstein-Barr virus; herpes simplex types 1, 2; varicella-zoster, hepatitis B

CONTRAINDICATIONS:

Hypersensitivity to acyclovir, ganciclovir

Black Box Warning:

Absolute neutrophil count <500, platelet count <25,000 (intravitreal)

Precautions: Pregnancy (C), breastfeeding, children <6 mo, geriatric patients, preexisting cytopenias, renal function impairment, radiation therapy, hypersensitivity to famciclovir, penciclovir, valacyclovir, valganciclovir

Black Box Warning:

Secondary malignancy, bone marrow suppression, anemia, infertility, neutropenia

DOSAGE AND ROUTES

Calculator

Prevention of CMV

• **Adult/adolescent (unlabeled):** IV 5 mg/kg/dose over 1 hr q12hr × 1-2 wk, then 5 mg/kg/day 7 day/wk, then 6 mg/kg/day × 5 days/wk; **PO** 1000 mg tid starting 10 days posttransplant × 14 wk

Induction treatment

- **Adult: IV** 5 mg/kg/dose given over 1 hr, q12hr × 2-3 wk

Maintenance treatment

- **Adult: IV INF** 5 mg/kg given over 1 hr, daily × 7 days/wk or 6 mg/kg/day × 5 days/wk; **PO** 1000 mg tid with food or 500 mg q3hr while awake for 6 doses; **INTRAVITREAL** 4.5 mg implant

Acute herpes keratitis

- **Adult/adolescent/child ≥2 yr: OPHTH** 1 drop in affected eye 5 times daily

Renal dose

- **Adult: IV** CCr 50-69 ml/min, reduce to 2.5 mg/kg q12hr (induction), 2.5 mg/kg q24hr (maintenance); **PO** 1500 mg/day or 500 mg tid; **IV** CCr 25-49 ml/min, reduce to 2.5 mg q24hr (induction); 1.25 mg/kg q24hr (maintenance); **PO** 1000 mg/day or 500 mg bid; **IV** CCr 10-24 ml/min, reduce to 1.25 mg/kg q24hr (induction); 0.625 mg/kg q24hr (maintenance); **PO** 500 mg/day; **IV** CCr <10 ml/min, reduce to 1.25 mg/kg 3×/wk after hemodialysis (induction); 0.625 mg/kg 3×/wk after hemodialysis (maintenance); **PO** 500 mg 3×/wk after hemodialysis

Available forms: Powder for inj 500 mg/vial; caps 250, 500 mg; implant, intravitreal 4.5 mg; ophth gel 0.15% (Zirgan)

Administer:**PO route**

- With food and a full glass of water
- Do not open, crush capsules

Intravitreal implant route

- Implanted by surgeon only
- Handle carefully to prevent damage to coating

Intravitreal inj route (unlabeled)

- Reconstitute and dilute IV powder to 2 mg/0.1 ml or 5 mg/0.1 ml, depending on dose; injected using TB syringe

IV route

- Mixed in biologic cabinet using gown, gloves, mask; use cytotoxic handling procedures

Intermittent IV INF route

- IV after reconstituting 500 mg/10 ml sterile water for inj (50 mg/ml); shake;

further dilute in 50-250 ml D₅W, 0.9% NaCl, LR, Ringer's and run over 1 hr;
use inf pump, in-line filter • Do not give by bolus IV, IM, SUBCUT inj
• Use reconstituted sol within 24 hr; do not refrigerate or freeze

Y-site compatibilities: Allopurinol, amphotericin B cholesteryl, CISplatin, cyclophosphamide, DOXOrubicin liposome, enalaprilat, etoposide, filgrastim, fluconazole, gatifloxacin, granisetron, linezolid, melphalan, methotrexate, PACLitaxel, propofol, remifentanyl, tacrolimus, teniposide, thiotepa

SIDE EFFECTS

CNS: *Fever, chills, coma, confusion, abnormal thoughts, dizziness, bizarre dreams, headache, psychosis, tremors, somnolence, paresthesia, weakness, seizures, peripheral neuropathy*

CV: Dysrhythmia, hypo/hypertension

EENT: Retinal detachment in CMV retinitis, ocular hypertension, ocular pain, conjunctival scarring, cataracts

GI: *Abnormal LFTs, nausea, vomiting, anorexia, diarrhea, abdominal pain, hemorrhage, perforation, pancreatitis*

GU: *Hematuria, increased creatinine, BUN, infertility, decreased sperm count*

HEMA: *Granulocytopenia, thrombocytopenia, irreversible neutropenia, anemia, eosinophilia, pancytopenia*

INTEG: *Rash, alopecia, pruritus, urticaria, pain at site, phlebitis*

RESP: Dyspnea

PHARMACOKINETICS

Half-life 3-4½ hr; excreted by kidneys (unchanged); crosses blood-brain barrier, CSF, increased bioavailability with fatty foods

INTERACTIONS

Increase: *severe granulocytopenia—zidovudine, antineoplastics, radiation; do not give together*

Increase: ganciclovir toxicity—adriamycin, amphotericin B, cycloSPORINE, dapsone, DOXOrubicin, flucytosine, pentamidine, probenecid, trimethoprim-sulfamethoxazole combinations, vinBLASTine, vinCRISTine, other nucleoside analogs, mycophenolate, tenofovir, tacrolimus, aminoglycosides, NSAIDs

Increase: seizures—imipenem/cilastatin

Increase: didanosine effect—didanosine

Drug/Lab Test

Increase: LFTs, creatinine

Decrease: Hgb, WBC, platelets, neutrophils, granulocytes

NURSING CONSIDERATIONS

Assess:

- **CMV retinitis:** culture should be completed before starting treatment (urine, blood, throat), ophthalmic exam
- **Infection:** increased temp, sore throat, chills, fever; report to prescriber

Black Box Warning:

Leukopenia/neutropenia/thrombocytopenia: CBC, WBCs, platelets q2days during 2×/day dosing and then q1wk for leukopenia with daily WBC count in patients with prior leukopenia with other nucleoside analogs or for whom leukopenia counts are <1000 cells/mm³ at start of treatment

- Serum creatinine or CCr $\geq$ q2wk, BUN; LFTs; ophthalmic exam
- For seizures, dysrhythmias

Evaluate:

Black Box Warning:

Secondary malignancy: avoid direct contact with powder in caps/solution, if skin contact occurs, wash thoroughly with soap and water; do not get in the eyes

- Therapeutic response: decreased symptoms or prevention of CMV

Teach patient/family:

- Do not wear contact lenses while using gel
- That product does not cure condition; that regular blood tests, ophthalmologic exams are necessary
- That major toxicities may necessitate discontinuing product

Black Box Warning:

To use contraception during treatment and that infertility may occur; to use barrier contraception for 90 days after treatment; may cause reversible infertility at lower doses, irreversible infertility at higher doses

- To take PO with food

 **To report infection:** fever, chills, sore throat; blood dyscrasias: bruising, bleeding, petechiae; to avoid crowds, persons with respiratory infections

✳ Canada only Side effects: *italics* = common; **bold** = life-threatening 
Nurse Alert

ganciclovir ophthalmic

See Appendix B

gatifloxacin

(ga-ti-floks'a-sin)

Zymar, Zymaxid

Func. class.: Ophthalmic anti-infective

Chem. class.: Fluoroquinolone

Do not confuse: gatifloxacin/levofloxacin/moxifloxacin

ACTION:

Inhibits DNA gyrase, thereby decreasing bacterial replication

USES:

Bacterial conjunctivitis

CONTRAINDICATIONS:

Hypersensitivity to this product or fluoroquinolones, infants <1 yr

Precautions: Pregnancy (C), breastfeeding

DOSAGE AND ROUTES

Calculator

Bacterial conjunctivitis

• **Adult/adolescent/child ≥1 yr:** **OPHTH SOL** Instill 1 drop in affected eye(s) every 2 hr while awake × 2 days, then 1 drop up to qid × 5 more days or Zymaxid 1 drop every 2 hr while awake first day, then bid to qid while awake days 2 to 7

Available forms: Ophthalmic solution 0.3%, 0.5%

Administer:

Ophthalmic route

- Commercially available ophthalmic solutions are not for injection subconjunctivally or into the anterior chamber of the eye • Apply topically to the eye, taking care to avoid contamination
- Do not touch the tip of the dropper to the eye, fingertips, or other surface

- Apply pressure to lacrimal sac for 1 min after instillation
- Avoid wearing contact lenses during treatment

SIDE EFFECTS

EENT: Hypersensitivity, irritation, redness, tearing, keratitis, blepharitis, taste changes

PHARMACOKINETICS

Unknown

NURSING CONSIDERATIONS

Assess:

- **Allergic reaction:** hypersensitivity, discontinue product

Evaluate:

- Decreased ophthalmic infection

Teach patient/family:

Ophthalmic route

- To apply topically to the eye, taking care to avoid contamination; for ophthalmic use only
- Not to touch the tip of the dropper to the eye, fingertips, or other surface
- To apply pressure to lacrimal sac for 1 min after instillation
- To avoid wearing contact lenses during treatment

☼ Canada only Side effects: *italics* = common; **bold** = life-threatening ⚠
Nurse Alert

gefitinib (Rx)

(ge-fi'tye-nib)

Iressa

Func. class.: Antineoplastic—miscellaneous

Chem. class.: Epidermal growth factor receptor inhibitor

ACTION:

Not fully understood; inhibits intracellular phosphorylation of cell surface receptors associated with epidermal growth factor receptors

USES:

Advanced/metastatic non–small cell lung cancer (NSCLC) in those who have not responded to platinum or DOCEtaxel products

CONTRAINDICATIONS:

Pregnancy (D), breastfeeding, children, hypersensitivity

Precautions: Geriatric patients, ocular/pulmonary/renal/hepatic disorders

DOSAGE AND ROUTES

Calculator

• **Adult:** PO 250 mg/day

Available forms: Tabs 250 mg

SIDE EFFECTS

EENT: Amblyopia, conjunctivitis, eye pain, corneal erosion/ulcer

GI: Nausea, diarrhea, vomiting, anorexia, pancreatitis, mouth ulceration, hepatotoxicity

INTEG: Rash, pruritus, acne, dry skin, toxic epidermal necrolysis, angioedema

MISC: Peripheral edema, hemorrhage

RESP: Interstitial lung disease, cough, dyspnea, pneumonia

PHARMACOKINETICS

Slowly absorbed; excreted in feces (86%), urine (<4%); elimination half-life 48 hr; metabolism by CYP3A4

INTERACTIONS

Increase: gefitinib concentrations—ketoconazole, itraconazole, erythromycin, clarithromycin

Increase: bone marrow suppression—clozapine

Increase: plasma concentration of warfarin, metoprolol

Decrease: gefitinib levels—phenytoin, rifampin, cimetidine, ranitidine, sodium bicarbonate

Drug/Herb

Decrease: gefitinib levels—St. John's wort

NURSING CONSIDERATIONS

Assess:

⚠️ **Pulmonary changes:** lung sounds, cough, dyspnea; interstitial lung disease may occur, may be fatal; discontinue therapy if confirmed • **Ocular changes:** eye irritation, corneal erosion/ulcer, aberrant eyelash growth

⚠️ **Pancreatitis:** abdominal pain, levels of amylase, lipase ⚠️ **Toxic epidermal necrolysis, angioedema** • **GI symptoms:** frequency of stools, if diarrhea is poorly tolerated, therapy may be discontinued for up to 14 days; LFTs baseline and periodically

Administer:

- Without regard to food; avoid grapefruit juice
- May be dispersed in half-glass of water (noncarbonated), rinse glass and drink liquid, may be given through NG tube

Evaluate:

- Therapeutic response: decreased NSCLC

Teach patient/family:

⚠️ **To report adverse reactions immediately:** shortness of breath, severe abdominal pain, ocular changes, skin eruptions • **Reason for treatment, expected results**

- Use contraception during treatment; avoid breastfeeding
- Avoid persons with infections

✳️ Canada only Side effects: *italics* = common; **bold** = life-threatening ⚠️
Nurse Alert

gemcitabine (Rx)

(jem-sit'a-been)

Gemzar

Func. class.: Antineoplastic—miscellaneous

Chem. class.: Nucleoside analog

Do not confuse: **Gemzar**/Zinecard

ACTION:

Exhibits antitumor activity by killing cells undergoing DNA synthesis (S phase) and blocking G1/S-phase boundary

USES:

Adenocarcinoma of the pancreas (nonresectable stage II, III, or metastatic stage IV); in combination with CISplatin for inoperable, advanced, or metastatic non-small-cell lung cancer; advanced breast cancer in combination with PACLitaxel; with CARBOplatin for ovarian cancer

Unlabeled uses: Bladder cancer, mesothelioma, adjuvant treatment of pancreatic cancer, ovarian cancer single agent, biliary tract cancer, advanced T-cell lymphoma

CONTRAINDICATIONS:

Pregnancy (D), breastfeeding, hypersensitivity

Precautions: Children, geriatric patients, myelosuppression, radiation therapy, renal/hepatic disease, accidental exposure, alcoholism, dental disease, infection

DOSAGE AND ROUTES

Calculator

Pancreatic carcinoma (nonresectable stage II, III, IV)

- **Adult: IV** 1000 mg/m² given over 30 min/wk up to 7 wk then 1 wk rest period; subsequent cycles should be infused 1×/wk × 3 wk out of every 4 wk depending on hematologic toxicity

Non-small-cell lung cancer

- **Adult: IV** (4-wk schedule) 1000 mg/m² given over 30 min on days 1, 8, 15, of each 28-day cycle; give CISplatin **IV** 100 mg/m² on day 1 after gemcitabine; 3-

wk schedule: 1250 mg/m² given over 30 min on days 1, 8 of each 21-day cycle; give CISplatin **IV** 100 mg/m² after the inf of gemcitabine on day 1

Advanced breast cancer

• **Adult: IV** 1250 mg/m² over 30 min on days 1 and 8 of 21-day cycle; give with PACLitaxel 175 mg/m² over 3 hr before gemcitabine on day 1

Recurrent ovarian cancer (single agent) (unlabeled)

• **Adult: IV** 1 g/m², days 1, 8, 15 of 28-day cycle

Available forms: Lyophilized powder for inj 20 mg/ml (10-, 50-ml vials)

Administer:

IV route

- Prepare in biologic cabinet using gown, mask, gloves; use cytotoxic handling procedures • After reconstituting with 0.9% NaCl 5 ml/200-mg vial of product or 25 ml/1-g vial of product (38 mg/ml) shake; may be further diluted with 0.9% NaCl to conc as low as 0.1 mg/ml; discard unused portions, give over 30 min, do not admix • Diluted solution stable at room temp for 24 hr, do not refrigerate
- Infusions longer than 60 min increase toxicity
- **Bone marrow depression:** CBC, differential, platelet count before each dose; single agent: absolute granulocyte count >1000 and platelets >100,000, give complete dose; absolute granulocyte count 500-999, platelets 50,000-99,999, give 75%; absolute granulocyte count <500 or platelets <50,000, do not give; combination with PACLitaxel for breast cancer: absolute granulocyte count >1200 and platelets >75,000, give complete dose; absolute granulocyte count 1000-1199 or platelets 50,000-75,000, give 75%; absolute granulocyte 700-999 or platelets ≥50,000, give 50%; granulocyte count <700 or platelet <50,000, do not give; combination with CARBOplatin for ovarian cancer: absolute granulocyte count >1500 and platelet count >100,000, give complete dose; absolute granulocyte count 1000-1499 or platelets 75,000-99,000, give 75%; absolute granulocyte count <1000 or platelets <75,000, do not give

Y-site compatibilities: Amifostine, amikacin, aminophylline, ampicillin, aztreonam, bleomycin, bumetanide, butorphanol, calcium gluconate, cefOXitin, cefTAZidime, ceftizoxime, cefTRIAxone, chlorproMAZINE, cimetidine, ciprofloxacin, CISplatin, clindamycin, cyclophosphamide, cytarabine,

DACTINomycin, DAUNOrubicin, diphenhydrAMINE, DOBUTamine, DOCEtaxel, DOPamine, DOXOrubicin, droperidol, enalaprilat, etoposide, famotidine, floxuridine, fluconazole, fludarabine, fluorouracil, gentamicin, granisetron, haloperidol, heparin, hydrocortisone, HYDROmorphone, IDArubicin, ifosfamide, leucovorin, linezolid, LORazepam, mannitol, meperidine, mesna, metoclopramide, metroNIDAZOLE, minocycline, mitoXANtrone, morphine, nalbuphine, ondansetron, PACLitaxel, promethazine, ranitidine, streptozocin, teniposide, thiotepa, ticarcillin, tobramycin, topotecan, trimethoprim/sulfamethoxazole, vancomycin, vinBLASine, vinCRISine, vinorelbine, zidovudine, zoledronic acid

SIDE EFFECTS

ENDO: Hyperglycemia

GI: Diarrhea, *nausea, vomiting*, anorexia, constipation, stomatitis

GU: *Proteinuria*, hematuria

HEMA: *Leukopenia, anemia, neutropenia, thrombocytopenia*

INTEG: Irritation at site, *rash, alopecia*

META: Hypocalcemia, hypokalemia, hypomagnesemia

OTHER: Dyspnea, *fever, hemorrhage*, infection, flulike symptoms, paresthesia, *peripheral edema*, myalgia

PHARMACOKINETICS

Half-life 42-379 min, crosses placenta, excretion: renal, 92%-98%

INTERACTIONS

Increase: bleeding—NSAIDs, alcohol, salicylates, anticoagulants

Increase: myelosuppression, diarrhea—other antineoplastics, radiation

Decrease: antibody response—live virus vaccines

Drug/Lab Test

Increase: BUN, AST, ALT, alk phos, bilirubin, creatinine

Decrease: Hgb, WBC, neutrophils, platelets

NURSING CONSIDERATIONS

Assess:

- **Blood dyscrasias:** bruising, bleeding, petechiae

- I&O, nutritional intake; food preferences: list likes, dislikes
- Renal, hepatic studies before and during treatment; may increase AST, ALT, alk phos, bilirubin, BUN, creatinine, calcium, potassium, glucose, magnesium, urine protein • Buccal cavity for dryness, sores, ulceration, white patches, oral pain, bleeding, dysphagia • GI symptoms: frequency of stools, cramping
- Signs of dehydration: rapid respirations, poor skin turgor, decreased urine output, dry skin, restlessness, weakness

Perform/provide:

- Increased fluid intake to 2-3 L/day to prevent dehydration unless contraindicated
- Rinsing of mouth tid-qid with water, club soda; brushing of teeth bid-tid with soft brush or cotton-tipped applicator for stomatitis; use unwaxed dental floss
- Antiemetic agents

Evaluate:

- Therapeutic response: decrease in tumor size; decrease in spread of cancer; symptom relief

Teach patient/family:

- To avoid foods with citric acid or hot or rough texture if stomatitis is present; to drink adequate fluids; to avoid use with NSAIDs, alcohol, salicylates • To report stomatitis and any bleeding, white spots, ulcerations in mouth; to examine mouth daily, report symptoms • To report signs of anemia: fatigue, headache, faintness, SOB, irritability; hematuria, dysuria • To use contraception during therapy and for 4 mo after; pregnancy (D), do not breastfeed • Not to receive vaccinations during treatment
- About possible hair loss and what can be done
- To report flulike symptoms, swelling of feet/legs
- To report bruising, bleeding: gums, blood in urine, stool, emesis
- To avoid crowds, persons with known upper-respiratory infections
- To avoid use of hard-bristle toothbrush, electric razor
- **Infection: to report sore throat, fever, flulike symptoms immediately**

☛ Canada only Side effects: *italics* = common; **bold** = life-threatening ⚠
Nurse Alert

gemfibrozil (Rx)

(jem-fi'broe-zil)

Lopid

Func. class.: Antilipemic

Chem. class.: Fibric acid derivative

Do not confuse: **Lopid**/Levbid/Slo-bid

ACTION:

Inhibits biosynthesis of VLDL, decreases triglycerides, increases HDL

USES:

Type IIb, IV, V hyperlipidemia as adjunct with diet therapy, hypertriglyceridemia

CONTRAINDICATIONS:

Severe renal/hepatic disease, preexisting gallbladder disease, primary biliary cirrhosis, hypersensitivity

Precautions: Pregnancy (C), breastfeeding; monitor hematologic and hepatic function

DOSAGE AND ROUTES

Calculator

- **Adult: PO** 600 mg bid 30 min before AM, PM meal

Hepatic/renal dose

- Avoid use

Available forms: Tabs 600 mg; caps 300 mg 🍁

Administer:

PO route

- Should not be used with repaglinide or itraconazole
- 30 min before AM, PM meals • Discontinue product if response does not occur within 3 mo

SIDE EFFECTS

CNS: Fatigue, vertigo, headache, paresthesia, dizziness, somnolence

GI: *Dyspepsia, diarrhea, abdominal pain*, nausea, vomiting

HEMA: Leukopenia, anemia, eosinophilia, thrombocytopenia

INTEG: Rash, urticaria, pruritus

MISC: Taste perversion

MS: Myopathy, rhabdomyolysis

SYST: Angioedema, exfoliative dermatitis

PHARMACOKINETICS

Peak 1-2 hr; plasma protein binding >90%; half-life 1½ hr; 70% excreted in urine mostly unchanged; metabolized in liver (minimal)

INTERACTIONS

Increase: hypoglycemic effect—sulfonylureas, repaglinide

Increase: anticoagulant properties—warfarin

Increase: risk of myositis, myalgia—HMG-CoA reductase inhibitors

Decrease: effect of cycloSPORINE

Decrease: effect of gemfibrozil—bile acid sequestrants, separate by >2 hr

Drug/Lab Test

Increase: LFTs, CK

Decrease: Hgb, Hct, WBC, potassium, eosinophils, platelets

NURSING CONSIDERATIONS

Assess:

- Hyperlipidemia: diet history: fats, triglycerides, cholesterol; if lipids increase, product should be discontinued; LDL, VLDL baseline and periodically
- **Myopathy, rhabdomyolysis:** For muscle pain, tenderness; obtain baseline CPK; if elevated or if these occur, product should be discontinued; at greater risk if combined with HMG-Co-A reductase inhibitors
- Renal, hepatic studies, CBC, blood glucose if patient is receiving long-term therapy; if LFTs increase, therapy should be discontinued
- Bowel pattern daily; watch for increasing diarrhea (common)

Evaluate:

- Therapeutic response: decreased cholesterol, triglyceride levels; HDL, cholesterol ratios improved

Teach patient/family:

- That compliance is needed for positive results; not to double or skip dose

- That risk factors should be decreased: high-fat diet, smoking, alcohol consumption, absence of exercise
- To notify prescriber of diarrhea, nausea, vomiting, chills, fever, sore throat, muscle cramps, abdominal cramps, severe flatulence, tendon pain
- To avoid driving, hazardous activities if dizziness, blurred vision occur

🍁 Canada only Side effects: *italics* = common; **bold** = life-threatening ⚠️
Nurse Alert

gemifloxacin (Rx)

(gem-ah-flox'a-sin)

Factive

Func. class.: Antiinfective

Chem. class.: Fluoroquinolone

ACTION:

Inhibits DNA gyrase, which is an enzyme involved in replication, transcription, and repair of bacterial DNA

USES:

Acute bacterial exacerbation of chronic bronchitis caused by *Streptococcus pneumoniae*, *Haemophilus influenzae*, *Haemophilus parainfluenzae*, *Moraxella catarrhalis*; community-acquired pneumonia caused by *Streptococcus pneumoniae* including multiproduct-resistant strains, *H. influenzae*, *M. catarrhalis*, *Mycoplasma pneumoniae*, *Chlamydia pneumoniae*, *Klebsiella pneumoniae*

Unlabeled uses: *Actinobacter iwoffii*, cystitis, *Klebsiella oxytoca*, *Legionella pneumophila*, *Proteus vulgaris*, pyelonephritis, sinusitis, *Streptococcus pyogenes* (group A β -hemolytic streptococci), urinary tract infection

CONTRAINDICATIONS:

Hypersensitivity to quinolones

Precautions: Pregnancy (C), breastfeeding, children, geriatric patients, hypokalemia, hypomagnesium, renal disease, seizure disorders, excessive exposure to sunlight, psychosis, increased intracranial pressure, history of QT interval prolongation, dysrhythmias, myasthenia gravis, torsades de pointes

Black Box Warning:

Tendon pain/rupture, tendinitis, myasthenia gravis

DOSAGE AND ROUTES

Calculator

- **Adult: PO** 320 mg/day $\times$ 5-10 days depending on type of infection

Renal dose

- **Adult: PO** CCr $\leq$ 40 ml/min, 160 mg q24hr

Available forms: Tabs 320 mg

Administer:

- 2 hr before or 3 hr after aluminum/magnesium antacids, iron, zinc products, multivitamins, buffered products 2 hr before sucralfate

SIDE EFFECTS

CNS: *Dizziness, headache*, somnolence, depression, insomnia, nervousness, confusion, agitation, **seizures, pseudotumor cerebri**

CV: QT prolongation, vasodilation

EENT: Visual disturbances

GI: Diarrhea, *nausea*, vomiting, anorexia, flatulence, heartburn, dry mouth; increased AST, ALT; constipation, abdominal pain, oral thrush, glossitis, stomatitis, **pseudomembranous colitis**

GU: Crystalluria (rare)

HEMA: **Thrombocytopenia, neutropenia**

INTEG: Rash, pruritus, urticaria, *photosensitivity*

MS: Tendinitis, **tendon rupture**

SYST: **Anaphylaxis, Stevens-Johnson syndrome**

PHARMACOKINETICS

Rapidly absorbed; bioavailability 71%; peak 1-2 hr; halflife 4-12 hr; excreted in urine as active product, metabolites

INTERACTIONS

Increase: CNS stimulation—NSAIDs

Increase: toxicity of gemifloxacin—probenecid

⚠ Increase: QT prolongation—class IA, III antidysrhythmics, tricyclics, amoxapine, maprotiline, phenothiazines, haloperidol, pimozide, risperiDONE, sertindole, ziprasidone, β -blockers, chloroquine, cloZAPine, dasatinib, dolasetron, droperidol, dronedarone, flecainide, halogenated/local anesthetics, local anesthetics, lapatinib, methadone, erythromycin, telithromycin, troleandomycin, octreotide, ondansetron, palonosetron, pentamidine, propafenone, ranolazine, SUNItinib, tacrolimus, vardenafil, vorinostat

Decrease: absorption antacids containing aluminum, magnesium, sucralfate, zinc, iron, give 2 hr before or 3 hr after meals

NURSING CONSIDERATIONS

Assess:

- Renal, hepatic studies: BUN, creatinine, AST, ALT; I&O ratio
- CNS symptoms: insomnia, vertigo, headache, agitation, confusion

 **Allergic reactions and anaphylaxis:** rash, flushing, urticaria, pruritus, chills, fever, joint pain; may occur a few days after therapy begins; EPINEPHrine and resuscitation equipment should be available for anaphylactic reaction

• **Pseudomembranous colitis:** bowel pattern daily; if severe diarrhea, fever, abdominal pain occur, product should be discontinued • **QT prolongation:** avoid use of quinolones in patients with known QT prolongation, females and those with ongoing proarrhythmic conditions (TdP) are at a greater risk; monitor ECG and/or holter monitoring if product is used • **Overgrowth of infection:** perineal itching, fever, malaise, redness, pain, swelling, drainage, rash, diarrhea, change in cough, sputum

Black Box Warning:

Tendon rupture: tendon pain, inflammation; if present, discontinue use, more common when used with corticosteroids, discontinue immediately if tendon pain, inflammation occurs

• **Toxic psychosis/pseudotumor cerebri:** headache, blurred vision, neck/shoulder pain, nausea, vomiting, dizziness, tinnitus; discontinue immediately

Evaluate

- Therapeutic response: negative C&S, absence of signs, symptoms of infection

Teach patient/family:

- To take with/without food
- That fluids must be increased to 2 L/day to avoid crystallization in kidneys
- That if dizziness or lightheadedness occurs, to perform activities with assistance
- To complete full course of product therapy
- To contact prescriber if adverse reactions occur
- To avoid iron-or mineral-containing supplements or aluminum/magnesium antacids, buffered products within 2 hr before and 3 hr after dosing, 2 hr before sucralfate • That photosensitivity may occur and sunscreen should be used
- To use frequent rinsing of mouth, sugarless candy or gum for dry mouth
- To avoid other medication unless approved by prescriber

Nurse Alert

gentamicin (Rx)

(jen-ta-mye'sin)

Func. class.: Antiinfective

Chem. class.: Aminoglycoside

Do not confuse: gentamicin/kanamycin

ACTION:

Interferes with protein synthesis in bacterial cell by binding to ribosomal subunit, thus causing misreading of genetic code; inaccurate peptide sequence forms in protein chain, thereby causing bacterial death

USES:

Severe systemic infections of CNS, respiratory, GI, urinary tract, bone, skin, soft tissues caused by susceptible strains of *Pseudomonas aeruginosa*, *Proteus*, *Klebsiella*, *Serratia*, *Escherichia coli*, *Enterobacter*, *Citrobacter*, *Staphylococcus*, *Shigella*, *Salmonella*, *Acinetobacter*, *Bacillus anthracis*, acute PID

CONTRAINDICATIONS:

Hypersensitivity to this product, other aminoglycosides; fungal/viral/mycobacterial infection

Black Box Warning:

Pregnancy (D), severe renal disease

Precautions: Breastfeeding, neonates, geriatric patients

Black Box Warning:

Mild renal disease, hearing deficits, myasthenia gravis, Parkinson's disease, infant botulism

DOSAGE AND ROUTES

Calculator

Severe systemic infections

- **Adult:** **IV INF** 3-5 mg/kg/day in divided doses q8hr; dilute in 50-200 ml 0.9% NaCl or D₅W given over 30 min-1 hr; **IV** (pulse dosing, once-daily dosing) (unlabeled) 5-7 mg/kg; **IM** 3 mg/kg/day in divided doses q8hr
- **Child:** **IM/IV** 2-2.5 mg/kg q8hr; **IV** (pulse dosing, once daily dosing) (unlabeled) 5 mg/kg

- **Neonate and infant: IM/IV** 2.5 mg/kg q8-12hr
- **Neonate <1 wk: IV** 2.5 mg/kg q12-24hr

Renal dose

- **Adult: IM/IV** CCr 70-100 ml/min, reduce dose by multiplying maintenance dose by 0.85, give q8-12hr; CCr 50-69 ml/min, reduce as above, give q12hr; CCr 25-49 ml/min, reduce as above, give q24hr; CCr <25 ml/min, reduce as above, give based on serum concentrations, give doses after dialysis

Available forms: Inj 10, 40 mg/ml; premixed inj 60, 80, 100 mg/50 ml, 120 mg/100 ml

Administer:

IM route

- IM inj in large muscle mass; rotate inj sites
- Product in evenly spaced doses to maintain blood level

Intermittent IV INF route

- After diluting in 50-200 ml NS, D₅W; decrease vol of diluent in child; maintain 0.1% sol run over 1/2-1 hr (adults) or up to 2 hr (children); flush IV line with NS, D₅W after administration

Syringe compatibilities: Clindamycin

Y-site compatibilities: Amifostine, amiodarone, amsacrine, atracurium, aztreonam, cefpirome, ciprofloxacin, cyclophosphamide, cytarabine, diltiazem, enalaprilat, esmolol, famotidine, filgrastim, fluconazole, fludarabine, foscarnet, granisetron, HYDROmorphine, IL-2, insulin, labetalol, LORazepam, magnesium sulfate, melphalan, meperidine, meropenem, midazolam, morphine, multivitamins, ondansetron, PACLitaxel, pancuronium, perphenazine, sargramostim, tacrolimus, teniposide, theophylline, thiotepa, tolazine, vecuronium, vinorelbine, vit B/C, zidovudine

SIDE EFFECTS

CNS: Confusion, depression, numbness, tremors, **seizures**, muscle twitching, **neurotoxicity**, dizziness, vertigo

CV: Hypo/hypertension, palpitations, edema

EENT: **Ototoxicity**, **deafness**, visual disturbances, tinnitus

GI: *Nausea, vomiting, anorexia*; increased ALT, AST, bilirubin; hepatomegaly, **hepatic necrosis**, splenomegaly

GU: Oliguria, hematuria, renal damage, azotemia, renal failure, nephrotoxicity, proteinuria

HEMA: Agranulocytosis, thrombocytopenia, leukopenia, eosinophilia, anemia

INTEG: Rash, burning, urticaria, dermatitis, alopecia, photosensitivity

PHARMACOKINETICS

Not metabolized, excreted unchanged in urine, crosses placental barrier

IM: Onset rapid, peak 1-2 hr

IV: Onset immediate; peak 1-2 hr; plasma half-life 1-2 hr, infants 6-7 hr; duration 6-8 hr

INTERACTIONS

- Do not use at the same time or physically mix with penicillins

Black Box Warning:

Increase: ototoxicity, neurotoxicity, nephrotoxicity—other aminoglycosides, amphotericin B, polymyxin, vancomycin, ethacrynic acid, furosemide, mannitol, methoxyflurane, CISplatin, cephalosporins, penicillins, cidofovir, acyclovir

Increase: effects—nondepolarizing neuromuscular blockers

Drug/Lab Test

Increase: LDH, AST, ALT, bilirubin, BUN, creatinine, eosinophils

Decrease: Hgb, WBC, platelet, granulocytes

NURSING CONSIDERATIONS

Assess:

Black Box Warning:

Neuromuscular disease (myasthenia gravis, Parkinson's disease, infant botulism): paresthesias, tetany, positive Chvostek's/Trousseau's signs, confusion (adults), tetany, muscle weakness (infants); correct electrolyte imbalance

- Weight before treatment; calculation of dosage is usually based on ideal body weight but may be calculated on actual body weight

Black Box Warning:

Renal disease: I&O ratio, urinalysis daily for proteinuria, cells, casts; report sudden change in urine output; urine pH if product is used for UTI; urine should be kept alkaline; urine for CCr testing, BUN, serum creatinine; lower dosage should be given with renal impairment (CCr <80 ml/min); toxicity is increased in patients with decreased renal function if high doses are given

- VS during inf; watch for hypotension, change in pulse
- IV site for thrombophlebitis, including pain, redness, swelling q30min, change

site if needed; discontinue, apply warm compresses to site • Serum peak drawn at 30-60 min after IV inf or 60 min after IM inj and trough level drawn just before next dose; blood level should be 2-4 times bacteriostatic level; peak (5-10 mcg/ml), trough (0.5-2 mcg/ml), depending on type of infection

Black Box Warning:

Hearing deficits: eighth cranial nerve dysfunction by audiometric testing; also ringing, roaring in ears, vertigo; assess hearing before, during, after treatment

- Dehydration: high specific gravity, decrease in skin turgor, dry mucous membranes, dark urine • **Overgrowth of infection:** fever, malaise, redness, pain, swelling, perineal itching, diarrhea, stomatitis, change in cough or sputum • C&S before starting treatment to identify infecting organism
- **Vestibular dysfunction:** nausea, vomiting, dizziness, headache; product should be discontinued if severe • Inj sites for redness, swelling, abscesses; use warm compresses at site

Perform/provide:

- Adequate fluids of 2-3 L/day unless contraindicated to prevent irritation of tubules
- Supervised ambulation, other safety measures with vestibular dysfunction

Evaluate:

- Therapeutic response: absence of fever, draining wounds, negative C&S after treatment

Teach patient/family:

- To report headache, dizziness, symptoms of overgrowth of infection, renal impairment

Black Box Warning:

To report loss of hearing; ringing, roaring in ears; feeling of fullness in head

☼ Canada only Side effects: *italics* = common; **bold** = life-threatening ⚠
Nurse Alert

gentamicin (ophthalmic)

(jen-ta-mye'sin)

Gentak, Garamycin

Func. class.: Ophthalmic anti-infective

Chem. class.: Aminoglycoside

Do not confuse: clindamycin/tobramycin/erythromycin/vancomycin/GenTeal

ACTION:

Inhibits protein synthesis, thereby decreasing bacterial replication

USES:

External ocular infections

CONTRAINDICATIONS:

Hypersensitivity to this product or aminoglycosides

Precautions: Pregnancy (C), breastfeeding

DOSAGE AND ROUTES

Calculator

Ophthalmic (solution)

• **Adult/adolescent/child ≥ 1 mo:** SOL 1–2 drops in affected eye(s) every 4 hr while awake $\times$ 2 days, then every 4 hr; severe infections ≤ 2 drops every 1 hr

• **Ointment:** apply a small amount (1/2") to lower conjunctival sac bid or tid

Available forms: Ophthalmic ointment, ophthalmic solution 0.3%

Administer:

Ophthalmic route

- Commercially available ophthalmic solutions are not for injection subconjunctivally or into the anterior chamber of the eye • Apply topically to the eye, taking care to avoid contamination
- Do not touch the tip of the dropper to the eye, fingertips, or other surface
- Apply pressure to lacrimal sac for 1 min after instillation
- To apply the ointment: pull down gently on lower eyelid, and apply a thin film of the ointment

SIDE EFFECTS

EENT: Burning, hypersensitivity, stinging, blurred vision, hyperemia, corneal ulcers

PHARMACOKINETICS

Unknown

NURSING CONSIDERATIONS

Assess:

- **Allergic reaction:** hypersensitivity, discontinue product

Evaluate:

- Decreased ophthalmic infection

Teach patient/family:

Ophthalmic route

- To apply topically to the eye, taking care to avoid contamination; for ophthalmic use only
- Not to touch the tip of the dropper to the eye, fingertips, or other surface
- To apply pressure to lacrimal sac for 1 min after instillation
- To apply the ointment by pulling down gently on lower eyelid, and applying a thin film of the ointment

🍁 Canada only Side effects: *italics* = common; **bold** = life-threatening ⚠️

Nurse Alert

gentamicin (topical)

(jen-ta-mye'sin)

Func. class.: Topical anti-infective

Chem. class.: Aminoglycoside

Do not confuse: gentamicin/clindamycin

ACTION:

Antibacterial activity results from inhibition of protein synthesis; bactericidal

USES:

Superficial infections

CONTRAINDICATIONS:

Hypersensitivity to this product or other aminoglycosides

Precautions: Infections

DOSAGE AND ROUTES

Calculator

- **Adult/child >1 yr:** Apply to affected areas tid-qid

Available forms: Topical cream, ointment 0.1%

Administer:

- For external use only; do not use skin products near the eyes, nose, or mouth
- Wash hands before and after use; wash affected area and gently pat dry
- **Cream/Ointment:** Apply to the cleansed affected area, massage gently into affected areas

SIDE EFFECTS

INTEG: Rash, irritation

PHARMACOKINETICS

Unknown

NURSING CONSIDERATIONS

Assess:

- **Allergic reaction:** hypersensitivity, product may need to be discontinued

- **Infection:** skin infection

Evaluate:

- Decreased skin infection

Teach patient/family:

- To use for external use only; do not use skin products near the eyes, nose, or mouth
- To wash hands before and after use, wash affected area and gently pat dry
- **Cream/Ointment:** To apply to the cleansed affected area and massage gently into affected areas

☼ Canada only Side effects: *italics* = common; **bold** = life-threatening ⚠
Nurse Alert

glatiramer (Rx)

(glah-tear'a-meer)

Copaxone

Func. class.: Multiple sclerosis agent

Chem. class.: Biological response modifier

ACTION:

Unknown; may modify the immune responses responsible for multiple sclerosis (MS)

USES:

Reduction of the frequency of relapses in patients with relapsing or remitting MS after first clinical episode with MRI results consistent with MS

CONTRAINDICATIONS:

Hypersensitivity to this product or mannitol, IV use

Precautions: Pregnancy (B), breastfeeding, children <18 yr, immune disorders, renal disease, infection, vaccinations, geriatric patients

DOSAGE AND ROUTES

Calculator

• **Adult: SUBCUT** 20 mg/day

Available forms: Inj, premixed 20 mg/ml and 40 mg mannitol in single use syringe

Administer:

SUBCUT route

• If refrigerated, allow to warm for 20 min; visually inspect for particulate or cloudiness, if present discard; prefilled syringe contents is for single use; administer SUBCUT into hip, thigh, arm; discard unused portion • Use SUBCUT route only; do not give IM or IV

SIDE EFFECTS

CNS: Anxiety, hypertonia, tremor, vertigo, speech disorder, agitation, confusion, flushing

CV: Migraine, palpitations, syncope, tachycardia, vasodilation, chest pain,

hypertension

EENT: *Ear pain, blurred vision*

GI: *Nausea, vomiting, diarrhea, anorexia, gastroenteritis*

GU: *Urinary urgency, dysmenorrhea, vaginal moniliasis*

HEMA: *Ecchymosis, lymphadenopathy*

INTEG: *Pruritus, rash, sweating, urticaria, erythema, inj site reaction*

META: *Edema, weight gain*

MS: *Arthralgia, back pain, neck pain, increased muscle tone*

RESP: *Bronchitis, dyspnea, laryngismus, rhinitis*

PHARMACOKINETICS

May be hydrolyzed locally, may reach regional lymph nodes

NURSING CONSIDERATIONS

Assess:

- CNS symptoms: anxiety, confusion, vertigo
- GI status: diarrhea, vomiting, abdominal pain, gastroenteritis
- Cardiac status: tachycardia, palpitations, vasodilation, chest pain

Evaluate:

- Therapeutic response: decreased symptoms of MS

Teach patient/family:

- With written, detailed instructions about product; provide initial and return demonstrations on inj procedure; give information about use and disposal of product, inj site reaction (hives, rash, irritation, severe pain, flushing, chest pain)
- To notify prescribers of allergic reactions including itching, trouble breathing; chest pain, dizziness, sweating • That irregular menses, dysmenorrhea, metrorrhagia, breast pain may occur; to use contraception during treatment
- That if pregnancy is suspected or if nursing to notify prescriber
- Not to change dosing or stop taking product without advice of prescriber
- About **immediate postinjection reaction**: flushing, chest pain, palpitations, anxiety, dyspnea, laryngeal constriction, urticaria; does not usually require treatment, may occur months after beginning treatment • To take as directed, not to stop product or change schedule; teach on self-injection technique

Nurse Alert

glimepiride (Rx)

(glye-me'pi-ride)

Amaryl

glipiZIDE (Rx)

(glip-i'zide)

Glucotrol, Glucotrol XL

Func. class.: Antidiabetic

Chem. class.: Sulfonylurea (2nd generation)

Do not confuse: glipiZIDE/Glucotrol/glyBURIDE

ACTION:

Causes functioning β cells in pancreas to release insulin, leading to drop in blood glucose levels; may improve insulin binding to insulin receptors or increase the number of insulin receptors with prolonged administration; may also reduce basal hepatic glucose secretion; not effective if patient lacks functioning β cells

USES:

Type 2 diabetes mellitus

CONTRAINDICATIONS:

Hypersensitivity to sulfonylureas, type 1 diabetes, diabetic ketoacidosis

Precautions: Pregnancy (C), geriatric patients, cardiac disease, severe renal/hepatic disease, G6PD deficiency

DOSAGE AND ROUTES

Calculator

Glimepiride

- **Adult: PO** 1-2 mg/day with breakfast, then increase by ≤ 2 mg/day q1-2wk, max 8 mg/day
- **Geriatric: PO** 1 mg/day; may increase if needed

Renal dose

- **Adult: PO** 1 mg/day with breakfast; may titrate upward as needed

GlipiZIDE

- **Adult: PO** 5 mg initially before breakfast then increase by 2.5-5 mg after

several days to desired response; max 40 mg/day in divided doses or 15 mg/dose; **PO** (XL) 5 mg/day with breakfast, may increase to 10 mg/day, max 20 mg/day

- **Geriatric:** **PO** 2.5 mg/day; may increase if needed

Hepatic disease

- **Adult:** **PO** 2.5 mg initially then increase to desired response; max 40 mg/day in divided doses or 15 mg/dose

Available forms: *Glimepiride*: tabs 1, 2, 4 mg; *glipiZIDE*: tabs, scored 5, 10 mg; ext rel tab (XL) 2.5, 5, 10 mg

Administer:

- Do not break, crush, or chew ext rel tabs; may crush tabs and mix with fluids if unable to swallow whole • **GlipiZIDE:** product 30 min before meals (regular release); with breakfast (ext rel); **Glimepiride:** with breakfast; if patient is NPO, may need to hold dose to prevent hypoglycemia • Gradual conversion from other oral hypoglycemics to these products is not needed; insulin ≥ 20 units/day, convert using 25% reduction in insulin dose every day or every other day

SIDE EFFECTS

CNS: Headache, weakness, dizziness, drowsiness, tinnitus, fatigue, vertigo

ENDO: Hypoglycemia

GI: Hepatotoxicity, cholestatic jaundice, nausea, vomiting, diarrhea, heartburn

HEMA: Leukopenia, thrombocytopenia, agranulocytosis, aplastic anemia; increased AST, ALT, alk phos; pancytopenia, hemolytic anemia

INTEG: Rash, allergic reactions, pruritus, urticaria, eczema, photosensitivity, erythema, allergic vasculitis

PHARMACOKINETICS

PO: Completely absorbed by GI route; **glipiZIDE:** onset 1-1½ hr, peak 1-3 hr, duration 10-24 hr, halflife 2-4 hr; **glimepiride:** peak 2-3 hr, halflife 5 hr; metabolized in liver, excreted in urine, 90%-95% plasma-protein bound

INTERACTIONS

- May mask symptoms of hypoglycemia: β -blockers

Increase: action of digoxin, glycosides

Increase: hypoglycemic effects—insulin, MAOIs, cimetidine, chloramphenicol,

guanethidine, methyl dopa, NSAIDs, salicylates, probenecid, androgens, anticoagulants, clofibrate, fenfluramine, fluconazole, gemfibrozil, histamine H₂ antagonists, magnesium salts, phenylbutazone, sulfinpyrazone, sulfonamides, tricyclics, urinary acidifiers, clarithromycin, fibric acid derivatives, voriconazole
Decrease: hypoglycemic effect—thiazide diuretics, rifampin, isoniazid, cholestyramine, diazoxide, hydantoin, urinary alkalinizers, charcoal, corticosteroids

Drug/Herb

Increase: antidiabetic effect—garlic, horse chestnut

Decrease: hypoglycemic effect—green tea

Drug/Lab Test

Increase: AST, ALT, LDH, BUN, creatinine

NURSING CONSIDERATIONS

Assess:

- **Hypo/hyperglycemic reaction** that can occur soon after meals; for severe hypoglycemia give IV D₅₀W, then IV dextrose solution
- Blood glucose, A1c levels during treatment to determine diabetes control

 **Blood dyscrasias:** CBC at baseline and throughout treatment; report decreased blood count

Perform/provide:

- Storage in tight, light-resistant container at room temp

Evaluate:

- Therapeutic response: decrease in polyuria, polydipsia, polyphagia; clear sensorium; absence of dizziness; stable gait; improved serum glucose, A1c

Teach patient/family:

- Not to drink alcohol; about disulfiram reaction (nausea, headache, cramps, flushing, hypoglycemia)
- To report bleeding, bruising, weight gain, edema, SOB, weakness, sore throat
- To check for symptoms of cholestatic jaundice: dark urine, pruritus, yellow sclera; prescriber should be notified
- About symptoms of hypo/hyperglycemia, what to do about each; to have glucagon emergency kit available; to carry sugar packets
- That product must be continued on daily basis; about consequences of discontinuing product abruptly; to take product in morning to prevent hypoglycemic reactions at night
- To use sunscreen or stay out of the sun, wear

protective clothing (photosensitivity)

- To avoid OTC medications unless ordered by prescriber
- That diabetes is a lifelong illness; product will not cure disease
- That all food in diet plan must be eaten to prevent hypoglycemia; to continue weight control, dietary restrictions, exercise, hygiene
- To carry emergency ID with prescriber and medication information
- To test using blood glucose meter while taking this product
- That ext rel tab may appear in stool

TREATMENT OF OVERDOSE:

Glucose 25 g IV via dextrose 50% sol, 50 ml, 1 mg glucagon, or carbohydrate depending on severity

🍁 Canada only Side effects: *italics* = common; **bold** = life-threatening ⚠️
Nurse Alert

glucagon

(gloo'ka-gon)

GlucaGen

Func. class.: Antihypoglycemic

ACTION:

Increases in blood glucose, relaxation of smooth muscle of the GI tract, and a positive inotropic and chronotropic effect on the heart; increases in blood glucose are secondary to stimulation of glycogenolysis

USES:

Hypoglycemia, used to temporarily inhibit movement of GI tract as a diagnostic test

CONTRAINDICATIONS:

Hypersensitivity, pheochromocytoma, insulinoma

Precautions: Pregnancy (B), breastfeeding, cardiac disease, adrenal insufficiency

DOSAGE AND ROUTES

Calculator

Hypoglycemia in those with diabetes mellitus

- **Adult/adolescent/child ≥ 55 lb (25 kg): IM/IV/SUBCUT (GlucaGen) 1 mg (1 IU)**
- **Child < 55 lb (25 kg) or < 6 -8 yr: IM/IV/SUBCUT 0.5 mg (0.5 IU)(Glucagon)**
- **Adult/adolescent/child ≥ 44 lb (20 kg): IM/IV/SUBCUT (Glucagon) 1 mg (1IU)**
- **Child < 44 lb (20 kg): (Glucagon) 0.5 mg (0.5 IU) or 0.02–0.03 mg/kg (IU/kg) max/mg**

Available forms: Powder for injection 1-mg vial

Administer:

- Visually inspect for particulate matter and discoloration before use

Reconstitution: Reconstitute with 1 ml of sterile water for injection or with diluent supplied by the manufacturer; the reconstituted injection should be clear

and of water-like consistency (1 mg/ml); discard any unused portion

IM route

- Inject into a large muscle mass; aspirate before injection to avoid injection into a blood vessel

SUBCUT route

- Inject, taking care not to inject intradermally

IV route

- Inject directly into a vein at a rate ≤ 1 IU/min (mg/min); may be given through line running D₅W or given at the same time as a bolus of dextrose

SIDE EFFECTS

CNS: Dizziness, headache

CV: Hypotension

GI: Nausea, vomiting

SYST: Hypersensitivity

PHARMACOKINETICS

IV: Onset immediate, peak 30 min, duration 1-1½ hr

IM/subcut: Onset 5-10 min, peak 13-20 min, duration 12-30 min

INTERACTIONS

Increase: Increased bleeding risk—anticoagulants

NURSING CONSIDERATIONS

Assess:

- **Hypoglycemia:** Monitor glucose levels before and after product use; use other products to control hypoglycemia if patient is conscious

Evaluate:

- Decreased hypoglycemia

Teach patient/family:

- How to use this product, symptoms of hypoglycemia

☛ Canada only Side effects: *italics* = common; **bold** = life-threatening ⚠

Nurse Alert

glucarpidase

(glu-car-pie'dase)

Voraxaze

Func. class.: Recombinant bacterial enzyme

ACTION:

A recombinant bacterial enzyme that hydrolyzes glutamate residue from methotrexate and provides an alternate nonrenal pathway for methotrexate elimination in patients with renal dysfunction during high-dose methotrexate treatment. As a result of its enzymatic action, converts methotrexate to its inactive metabolites

USES:

The treatment of methotrexate toxicity (methotrexate plasma concentration >1 micromole/liter) in those with delayed methotrexate clearance due to impaired renal function

Precautions: Pregnancy (C), breastfeeding

DOSAGE AND ROUTES

Calculator

• **Adult/adolescent/child:** IV 50 units/kg over 5min; continue to give leucovorin, IV hydration, urinary alkalinization as needed

Available forms: Sol for IV

Administer:

IV direct route

- Visually inspect parenteral products for particulate matter and discoloration prior to administration
- Reconstitution: add 1 ml of sterile saline for injection to vial, roll and tilt the vial gently to mix; do not shake; flush the IV line then inject as a bolus inj over 5 min; flush the IV line again
- Do not administer to patients who exhibit the expected clearance of methotrexate (plasma methotrexate concentrations within 2 standard deviations of the mean methotrexate excretion curve specific for the dose of methotrexate administered)
- Do not administer to patients with normal or mildly impaired renal function because of the potential risk of subtherapeutic exposure to

methotrexate • Continue to administer leucovorin after glucarpidase, but do not administer leucovorin within 2 hr before or after a glucarpidase. For the first 48 hr after glucarpidase administration, administer the same leucovorin dose as given before glucarpidase. After 48 hr after glucarpidase, administer leucovorin based on the measured methotrexate concentration. Do not discontinue therapy with leucovorin based on the determination of a single methotrexate concentration below the leucovorin treatment threshold. Continue leucovorin until the methotrexate concentration has been maintained below the leucovorin treatment threshold for a minimum of 3 days; use of a chromatographic method to determine methotrexate concentrations is needed for the first 48 hr after glucarpidase receipt

- Continue hydration and alkalinization of the urine as needed

SIDE EFFECTS

CNS: Paresthesias, headache

CV: Hypo/hypertension

EENT: Throat irritation or tightness

GI: Nausea, vomiting

INTEG: Flushing, hot, burning sensation; rash, hypersensitivity, serious allergic reactions

SYST: Antibody formation

PHARMACOKINETICS

Elimination half-life of 5.6 hr, methotrexate concentration reduced 97% within 15 min

INTERACTIONS

Decrease: glucarpidase level—PEMEtrexed, PRALAtrexate; avoid concurrent use

NURSING CONSIDERATIONS

Assess:

- Continue monitoring of methotrexate blood levels, renal status (creatinine/BUN) after glucarpidase is given. Methotrexate concentrations within 48 hr of glucarpidase are only reliable measure by a chromatographic method.

Leucovorin receipt is needed until methotrexate level has been maintained below leucovorin treatment threshold for a minimum of 3 days

Perform/provide:

- Storage of reconstituted solution refrigerated ≤ 4 hr; discard any unused product, no preservative is present

Evaluate:

- For resolution of methotrexate toxicity

Teach patient/family:

- To immediately report any infusion-related reactions: fever, chills, flushing, feeling hot, rash, hives, itching, throat tightness or breathing problems, tingling, numbness, or headache

🍁 Canada only Side effects: *italics* = common; **bold** = life-threatening ⚠️
Nurse Alert

glyBURIDE (Rx)

(glye'byoor-ide)

DiaBeta, Glynase PresTab

Func. class.: Antidiabetic

Chem. class.: Sulfonylurea (2nd generation)

Do not confuse: glyBURIDE/Glucotrol/glipiZIDE

DiaBeta/Zebeta

ACTION:

Causes functioning β cells in pancreas to release insulin, thereby leading to a drop in blood glucose levels; may improve insulin binding to insulin receptors and increase number of insulin receptors with prolonged administration; may also reduce basal hepatic glucose secretion; not effective if patient lacks functioning β cells

USES:

Type 2 diabetes mellitus

Unlabeled use: Gestational diabetes not controlled by diet

CONTRAINDICATIONS:

Hypersensitivity to sulfonylureas, type 1 diabetes, diabetic ketoacidosis, renal failure

Precautions: Pregnancy (B) Glynase; (C) Diabeta, geriatric patients, cardiac/thyroid disease, severe renal/hepatic disease, severe hypoglycemic reactions, sulfonamide/sulfonylurea hypersensitivity, G6PD deficiency

DOSAGE AND ROUTES

Calculator

DiaBeta (nonmicronized)

- **Adult: PO** 1.25-5 mg initially then increase to desired response at weekly intervals up to 20 mg/day; may be given as a single or divided dose
- **Geriatric: PO** 1.25 mg initially then increase to desired response; max 20 mg/day, maintenance 1.25-20 mg/day

Glynase PresTab (micronized)

- **Adult: PO** 1.5-3 mg/day initially, may increase by 1.5 mg/wk, max 12 mg/day
- **Geriatric: PO** 0.75-3 mg/day, may increase by 1.5 mg/wk

Gestational diabetes (unlabeled)

- **Adult (pregnant female): PO** 2.5 mg/day titrated up to 20 mg/day (conventional glyBURIDE)

Available forms: Tabs (DiaBeta) 1.25, 2.5, 5 mg (nonmicronized); (Glynase PresTab) 1.5, 3, 6 mg (micronized)

Administer:

- With breakfast as single or divided dose, hold dose if patient NPO to avoid hypoglycemia, take at same time each day
- Gradual conversion from other oral hypoglycemics to product is not needed; insulin ≥ 20 units/day; convert using 25% reduction in insulin dose every day
- Micronized glyBURIDE/nonmicronized glyBURIDE are not equivalent

SIDE EFFECTS

CNS: *Headache, weakness, paresthesia, tinnitus, fatigue, vertigo*

EENT: Blurred vision

ENDO: **Hypoglycemia**

GI: Nausea, fullness, heartburn, **hepatotoxicity, cholestatic jaundice**, vomiting, diarrhea, **hepatic failure**

HEMA: **Leukopenia, thrombocytopenia, agranulocytosis, aplastic anemia (rare)**, increased AST, ALT, alk phos

INTEG: Rash, allergic reactions, pruritus, urticaria, eczema, photosensitivity, erythema

MISC: **Angioedema**

MS: Joint pain

PHARMACOKINETICS

PO: Completely absorbed by GI route; onset 2 hr; peak 2-4 hr; duration 24 hr; halflife 10 hr; metabolized in liver; excreted in urine, feces (metabolites); crosses placenta; 99% plasma-protein bound

INTERACTIONS

Increase: masking symptoms of hypoglycemia— β -blockers

Increase: level—digoxin

Increase: hypoglycemic effects—insulin, MAOIs, oral anticoagulants, chloramphenicol, guanethidine, methyldopa, NSAIDs, salicylates, probenecid, androgens, fenfluramine, fluconazole, gemfibrozil, histamine H₂ antagonists, magnesium salts, phenylbutazone, sulfinpyrazone, sulfonamides, tricyclics, urinary acidifiers, β -blockers, clarithromycin

Increase: LFTs—bosentan; avoid concurrent use

Increase: triglyceride levels—colesevelam

Increase: action of—cycloSPORINE

Decrease: both products' effects—diazoxide

Decrease: glyBURIDE action—thiazide diuretics, rifampin, isoniazid, cholestyramine, hydantoin, urinary alkalinizers, charcoal, corticosteroids, phenothiazines; oral contraceptives, estrogens, thyroid, voriconazole

Drug/Herb

Increase: antidiabetic effect—garlic, horse chestnut

Decrease: hypoglycemic effect—green tea

Drug/Lab Test

Increase: AST, ALT, LDH, BUN, creatinine

Decrease: Hgb, sodium, glucose

NURSING CONSIDERATIONS

Assess:

- Hypo/hyperglycemic reaction that can occur soon after meals; for severe hypoglycemia, give IV D₅₀W then IV dextrose sol
- Blood glucose; A1c levels during treatment

 **Blood dyscrasias:** CBC at baseline, throughout treatment; report decreased blood counts

Perform/provide:

- Storage in tight container in cool environment

Evaluate:

- Therapeutic response: decrease in polyuria, polydipsia, polyphagia; clear sensorium; absence of dizziness; stable gait; improved serum glucose, A1c

Teach patient/family:

- To check for symptoms of cholestatic jaundice: dark urine, pruritus, jaundiced sclera; if these occur, notify prescriber
- To use a blood glucose meter for testing while taking this product

- About the symptoms of hypo/hyperglycemia, what to do about each
- That product must be continued on a daily basis; about consequences of discontinuing product abruptly; that in times of stress, infection, surgery, trauma, a higher dose may be needed • To take product in morning to prevent hypoglycemic reactions at night if taking once a day • To avoid OTC medications unless ordered by prescriber
- To report bleeding, bruising, weight gain, edema, shortness of breath, weakness, sore throat • That diabetes is a lifelong illness; that product will not cure disease
- That all food included in diet plan must be eaten to prevent hypoglycemia; to have glucagon emergency kit, sugar packets always available • To use sunscreen or stay out of the sun, wear protective clothing (photosensitivity)
- To carry an emergency ID with prescriber and medication information

TREATMENT OF OVERDOSE:

Glucose 25 g IV via dextrose 50% sol, 50 ml, 1 mg glucagon, or carbohydrate depending on severity

☼ Canada only Side effects: *italics* = common; **bold** = life-threatening ⚠
Nurse Alert

RARELY USED

glycerin (OTC)

(gli'ser-in)

Sani-Supp

Func. class.: Laxative, hyperosmotic

USES:

Constipation

CONTRAINDICATIONS:

Hypersensitivity

DOSAGE AND ROUTES

Calculator

Laxative

- **Adult and child >6 yr: RECT SUPP 3 g; ENEMA 5-15 ml**
- **Child <6 yr: RECT SUPP 1-1.8 g; ENEMA 2-5 ml**

Nurse Alert

golimumab (Rx)

(goal-lim'yu-mab)

Simponi

Func. class.: Antirheumatic agent (disease modifying), immunomodulator *Chem. class.:* Monoclonal antibody, DMARD, tumor necrosis factor (TNF- α) modifier

ACTION:

Monoclonal antibody specific for human tumor necrosis factor (TNF); elevated levels of TNF are found in patients with rheumatoid arthritis

USES:

Rheumatoid arthritis (RA), ankylosing spondylitis, psoriatic arthritis

CONTRAINDICATIONS:

Hypersensitivity, active infections

Precautions: Pregnancy (B), breastfeeding, children, geriatric patients, CNS demyelinating disease, Guillain-Barré syndrome, CHF, hepatitis B carriers, blood dyscrasias, surgery, MS, neurologic disease, diabetes, immunosuppression

Black Box Warning:

Neoplastic disease, TB; fungal, bacterial, viral infections

DOSAGE AND ROUTES

Calculator

• **Adult: SUBCUT** 50 mg q month; for RA, give with methotrexate

Available form: Inj 50 mg/0.5 ml prefilled syringe, SmartJect Auto Injector

Administer:

SUBCUT route

• Visually inspect sol for particulate or discoloration, sol should be clear to slightly opalescent and colorless to slightly yellow, there may be tiny white particles; do not shake; rotate injection sites • **SmartJect autoinjector:** Allow to reach room temp for 30 min before use; remove cap, and inject within 5 min of removing cap, do not put cap back on, place open end against the inj site at a 90-degree angle without pushing button, push the injector firmly against the skin, press the button once and release, listen for the first click, wait for the second click or 15 sec, then remove injector; do not rub site • **Prefilled syringe:** Allow

to warm to room temp for 30 min, remove needle cover by pulling straight off, do not twist or recap, inject within 5 min of needle cover removal, hold syringe in one hand like a pencil and use other hand to pinch the skin, inject needle at a 45-degree angle, push plunger down as far as it will go, keep pressure on plunger head and remove needle from skin, remove pressure from plunger head, needle guard will cover needle; do not rub site

SIDE EFFECTS

CNS: Dizziness, paresthesia, **CNS demyelinating disorder**, weakness

CV: Hypertension, **CHF**

GI: **Hepatitis**

HEMA: **Agranulocytosis, aplastic anemia, leukopenia, polycythemia, thrombocytopenia, pancytopenia**

INTEG: Psoriasis

MISC: **Increased cancer risk**, antibody development to this drug; **risk for infection (TB, invasive fungal infections, other opportunistic infections)**, may be **fatal**, inj site reactions

PHARMACOKINETICS

Terminal half-life 2 wk, lower

INTERACTIONS

- Do not give concurrently with vaccines; immunizations should be brought up to date before treatment
- Dosage change may be needed: warfarin, cycloSPORINE, theophylline

Increase: infection—abatacept, etanercept, rilonacept, ritUXimab, adalimumab, anakinra, immunosuppressants, inFLIXimab

NURSING CONSIDERATIONS

Assess:

- **Pain**, stiffness, ROM, swelling of joints during treatment
- Inj site pain, swelling; usually occur after 2 inj (4-5 days)

Black Box Warning:

TB: obtain TB skin test before starting treatment, treat latent TB before starting therapy

⚠ Blood dyscrasias: CBC, differential prior to and periodically during

treatment

Black Box Warning:

Infection: fever, flulike symptoms, dyspnea, change in urination, redness/swelling around any wounds; stop treatment if present; some serious infections including sepsis may occur, may be fatal; patients with active infections should not be started on this product; obtain a chest x-ray, fungal serology, TB testing before starting treatment

- LFTs; hepatitis B serology, may reactivate HBV
- **CHF:** B/P, pulse, edema, SOB
- **Psoriasis:** may occur or worsen

Black Box Warning:

Neoplastic disease: may occur in those <18 yr, avoid use in those with known malignancies

Perform/provide:

- Refrigerate, do not freeze; allow to warm to room temp before using

Evaluate:

- Therapeutic response: decreased inflammation, pain in joints, decreased joint destruction

Teach patient/family:

- About self-administration if appropriate: inj should be made in thigh, abdomen, upper arm; rotate sites at least 1 inch from old site, do not inject in areas that are bruised, red, hard
- That, if medication not taken when due, to inject next dose as soon as remembered and then the following dose as scheduled
- Not to receive any live virus vaccines during treatment

Black Box Warning:

To report signs, symptoms of infection, allergic reaction, or lupuslike syndrome

- To notify prescriber if pregnancy is planned or suspected, not to breastfeed

☼ Canada only Side effects: *italics* = common; **bold** = life-threatening ⚠
Nurse Alert

goserelin (Rx)

(goe'se-rel-lin)

Zoladex

Func. class.: Gonadotropin-releasing hormone, antineoplastic (hormone) *Chem. class.:* Synthetic decapeptide analog of LHRH

ACTION:

Inhibitor of pituitary gonadotropin secretion; initially increases LH and FSH, with increases in testosterone, reduction in sex steroid levels (substitute serum testosterone levels)

USES:

Advanced and locally confined prostate cancer stage B2-C (10.8 mg), endometriosis, advanced breast cancer, endometrial thinning (3.6 mg)

CONTRAINDICATIONS:

Hypersensitivity; pregnancy D (breast cancer), X (endometriosis); breastfeeding, children, nondiagnosed vaginal bleeding; hypersensitivity to LHRH, LHRH-agonist analogs; 10.8 mg dose contraindicated in women

Precautions: Spinal cord decompression, renal disease, bone mineral density loss, hyperglycemia, diabetes mellitus, CV disease

DOSAGE AND ROUTES

Calculator

Breast cancer

- **Adult: SUBCUT** 3.6 mg q28days or 10.8 mg q12wk

Endometrial thinning

- **Adult: SUBCUT** 3.6 mg 1-2 depot inj, usually 1 depot, surgery performed at 4 wk; if 2 depots, surgery performed 2-4 wk after 2nd depot

Available forms: Depot inj 3.6, 10.8 mg

Administer:

Depot

- SUBCUT using implant, inserted by qualified person into upper subcutaneous tissue in abdominal wall q28days or q12wk (10.8 mg); do not attempt to remove air bubbles from syringe

SIDE EFFECTS

CNS: Headaches, **spinal cord compression**, anxiety, depression, dizziness, insomnia, lethargy, hot flashes, emotional lability

CV: **Dysrhythmia**, **cerebrovascular accident**, hypertension, chest pain, **CHF**; MI, sudden cardiac death, stroke (men), *peripheral edema*

ENDO: Gynecomastia, breast tenderness, breast enlargement, *hot flashes*; hyperglycemia, diabetes (men)

GI: Nausea, vomiting, constipation, diarrhea, ulcer

GU: *Spotting*, *breakthrough bleeding*, *decreased libido*, renal insufficiency, urinary obstruction, urinary tract infection, *impotence*

INTEG: Rash, pain on inj, diaphoresis

MS: Osteoneuralgia

RESP: COPD, URI

PHARMACOKINETICS

Peak 12-15 days, half-life 4½ hr, 30% protein bound

INTERACTIONS

Drug/Lab Test

Increase: alk phos, estradiol, FSH, LH, testosterone levels, triglycerides

Decrease: testosterone levels, progesterone

NURSING CONSIDERATIONS

Assess:

- **Reproductive studies:** pelvic ultrasound, pelvic exam, PSA, serum estradiol/testosterone, pregnancy test prior to therapy • I&O ratios; palpate bladder for distention in urinary obstruction
- **Cancer metastases:** for relief of bone pain (back pain), change in motor function • Blood studies: lipid profile, acid phosphatase; calcium; hypercalcemia may occur

Evaluate:

- Therapeutic response: more normal levels of PSA, acid phosphatase, alk phos; testosterone level of <25 ng/dl; thinning of endometrial lining

Teach patient/family:

- To continue with appointments monthly

- That hyperglycemia may occur in diabetic patients
 - That gynecomastia and postmenopausal symptoms may occur but will decrease when treatment is discontinued
 - That bone pain may increase then decrease
 - To notify prescriber of difficulty urinating, hot flashes
 - Not to breastfeed; to use effective nonhormonal contraception; to notify prescriber if menstrual period continues
-

🌿 Canada only Side effects: *italics* = common; **bold** = life-threatening ⚠️
Nurse Alert

granisetron (Rx)

(grane-iss'e-tron)

Granisol, Kytril, Sancuso

Func. class.: Antiemetic

Chem. class.: 5-HT₃ receptor antagonist

ACTION:

Prevents nausea, vomiting by blocking serotonin peripherally, centrally, and in the small intestine

USES:

Prevention of nausea, vomiting associated with cancer chemotherapy, including high-dose CISplatin, radiation

Unlabeled uses: Acute nausea, vomiting after surgery

CONTRAINDICATIONS:

Hypersensitivity to this product, benzyl alcohol

Precautions: Pregnancy (B), breastfeeding, children, geriatric patients, ondansetron/palonosetron/dolasetron hypersensitivity, cardiac dysrhythmias, cardiac/hepatic disease, electrolyte imbalances

DOSAGE AND ROUTES

Calculator

Nausea, vomiting in chemotherapy

- **Adult and child ≥2 yr:** **IV** 10 mcg/kg over 5 min, 30 min before the start of cancer chemotherapy; **TD** apply 1 patch (3.1 mg/24 hr) to upper outer arm 24-48 hr before chemotherapy, patch may be worn up to 7 days
- **Adult:** **PO** 1 mg bid, give 1st dose 1 hr before chemotherapy and next dose 12 hr after 1st or 2 mg as a single dose anytime within 1 hr prior to chemotherapy

Nausea, vomiting in radiation therapy

- **Adult:** **PO** 2 mg/day 1 hr before radiation

Available forms: Inj 1 mg/ml; tab 1 mg; oral sol 2 mg/10 ml; patch TD 3.1 mg/24 hr

Administer:

- Chemotherapy/radiation: given on day of chemotherapy or radiation

PO route

- Give dose 1 hr before chemotherapy/radiation and another 12 hr after 1st dose

Direct IV route

- May give undiluted over 30 sec via **Y-site**

Intermittent IV INF route

- Dilute in 0.9% NaCl for inj or D₅W (20-50 ml); give over 5-15 min 30 min before chemotherapy

Additive compatibilities: Dexamethasone, methylPREDNISolone

Solution compatibilities: D₅W, 0.9% NaCl

Y-site compatibilities: Acyclovir, allopurinol, amifostine, amikacin, aminophylline, amphotericin B cholesteryl, ampicillin, ampicillin/sulbactam, amsacrine, aztreonam, bleomycin, bumetanide, buprenorphine, butorphanol, calcium gluconate, CARBOplatin, carmustine, ceFAZolin, cefepime, cefonicid, cefoperazone, cefotaxime, cefoTETan, cefOXitin, cefTAZidime, ceftizoxime, cefTRIAxone, cefuroxime, chlorproMAZINE, cimetidine, ciprofloxacin, CISplatin, cladribine, clindamycin, cyclophosphamide, cytarabine, dacarbazine, DACTINomycin, DAUNOrubicin, dexamethasone, diphenhydrAMINE, DOBUTamine, DOPamine, DOXOrubicin, DOXOrubicin liposome, doxycycline, droperidol, enalaprilat, etoposide, famotidine, filgrastim, fluconazole, fluorouracil, floxuridine, fludarabine, furosemide, gallium, ganciclovir, gentamicin, haloperidol, heparin hydrocortisone, HYDROmorphone, hydrOXYzine, IDArubicin, ifosfamide, imipenem-cilastatin, leucovorin, LORazepam, magnesium sulfate, melphalan, meperidine, mesna, methotrexate, methylPREDNISolone, metoclopramide, metroNIDAZOLE, mezlocillin, miconazole, minocycline, mitoMYcin, mitoXANtrone, morphine, nalbuphine, netilmicin, ofloxacin, PACLitaxel, piperacillin, piperacillin/tazobactam, plicamycin, potassium chloride, prochlorperazine, promethazine, propofol, ranitidine, sargramostim, sodium bicarbonate, streptozocin, teniposide, thiotepa, ticarcillin, ticarcillin/clavulanate, tobramycin, trimethoprim-sulfamethoxazole, vancomycin, vinBLASline, vinCRISline, vinorelbine, zidovudine

Transdermal route

- Apply to dry, clean, intact skin of upper outer arm 24-48 hr before

chemotherapy, firmly press on skin, keep on during chemotherapy; can bathe, avoid swimming, whirlpool; remove ≥ 24 hr after chemotherapy completion, do not cut patch

SIDE EFFECTS

CNS: *Headache, asthenia, anxiety, dizziness*

CV: Hypertension, **QT prolongation**

GI: Diarrhea, *constipation*, increased AST, ALT, *nausea*

HEMA: **Leukopenia**, anemia, **thrombocytopenia**

MISC: Rash, **bronchospasm**

PHARMACOKINETICS

Metabolized in liver to an active metabolite, half-life 10-12 hr, protein binding 65%

INTERACTIONS

Increase: EPS—antipsychotics

Increase: QT prolongation—amoxapine, β -blockers, chloroquine, class IA, III antidysrhythmics, clozapine, dasatinib, dolasetron, dronedarone, droperidol, erythromycin, flecainide, halogenated/local anesthetics, haloperidol, lapatinib, maprotiline, methadone, octreotide, ondansetron, palonosetron, pentamidine, phenothiazines, pimozide, propafenone, ranolazine, risperidone, sertindole, sunitinib, tacrolimus, telithromycin, tricyclics, troleandomycin, vardenafil, vorinostat, ziprasidone

NURSING CONSIDERATIONS

Assess:

- For absence of nausea, vomiting during chemotherapy
- **Hypersensitivity reaction:** rash, bronchospasm

Perform/provide:

- Storage at room temp for 24 hr after dilution

Evaluate:

- Therapeutic response: absence of nausea, vomiting during cancer chemotherapy

Teach patient/family:

- To report diarrhea, constipation, rash, changes in respirations

- That headache requiring an analgesic is common

🍁 Canada only Side effects: *italics* = common; **bold** = life-threatening ⚠️
Nurse Alert

guaiFENesin (OTC, Rx)

(gwy'e-fen'e-sin)

Alfen, Altarussin, Balminil , Bidex, Diabetic Tussin, Elix Sure EX, Equaline Non-Drowsy Tussin, Equate Tussin Cough, Good Sense Mucus Relief, Good Sense Tussin Chest Congestion, Guaifenesin NR, Guiatuss, Humibid, Iophen NR, Liquibid, Miltuss EX, Mucinex, Mucinex Children's Mucus Relief, Mucinex Junior Strength, Naldecon Senior EX, Organ-1NR, Organidin NR, Q-Tussin, Robafen, Scot-Tussin Expectorant, Siltussin DAS, Siltussin SA, Top Care Children's Mucus Relief, Top Care Tussin Chest Congestion Solution, Wal-Tussin Expectorant, Xpect *Func. class.:* Expectorant

ACTION:

Increases the volume and reduces the viscosity of secretions in the trachea and bronchi to facilitate secretion removal

USES:

Productive and nonproductive cough

CONTRAINDICATIONS:

Hypersensitivity; chronic, persistent cough

Precautions: Pregnancy (C), breastfeeding, CHF, asthma, emphysema, fever

DOSAGE AND ROUTES

Calculator

- **Adult and adolescent:** PO 200-400 mg q4hr; **EXT REL** 600-1200 mg q12hr, max 2.4 g/day
- **Child 6-11 yr:** PO 100-200 mg q4hr; **EXT REL** 600 mg q12hr, max 1.2 g/day
- **Child 2-5 yr:** PO 50-100 mg q4hr; max 600 mg/day; ext rel 300 mg q12hr, max 600 mg/day

Available forms: Tabs 200, 400 mg; oral sol 100 mg/5 ml; ext rel tabs 600, 1200 mg; syrup 100 mg/5 ml; oral granules 50, 100 mg/packet

Administer:

- Do not break, crush, chew ext rel tabs

SIDE EFFECTS

CNS: Drowsiness, headache, dizziness

GI: Nausea, anorexia, vomiting, diarrhea

PHARMACOKINETICS

Half-life 1 hr, excreted in urine (metabolites)

NURSING CONSIDERATIONS

Assess:

- **Cough:** type, frequency, character, including sputum; fluids should be increased to 2 L/day

Perform/provide:

- Storage at room temp
- Increased fluids, room humidification to liquefy secretions

Evaluate:

- Therapeutic response: productive cough, thinner secretions

Teach patient/family:

- To avoid driving, other hazardous activities if drowsiness occurs (rare)
- To avoid smoking, smoke-filled room, perfumes, dust, environmental pollutants, cleansers
- To consult health provider if cough lasts >7 days

🍁 Canada only Side effects: *italics* = common; **bold** = life-threatening ⚠️

halcinonide topical

See [Appendix B](#)

haloperidol (Rx)

(hal-oh-pehr'ih-dol)

haloperidol decanoate (Rx)

Haldol Decanoate

haloperidol lactate (Rx)

Haldol

Func. class.: Antipsychotic, neuroleptic

Chem. class.: Butyrophenone

Do not confuse: [haloperidol](#)/Halotestin

ACTION:

Depresses cerebral cortex, hypothalamus, limbic system, which control activity and aggression; blocks neurotransmission produced by DOPamine at synapse; exhibits strong α -adrenergic, anticholinergic blocking action; mechanism for antipsychotic effects unclear

USES:

Psychotic disorders, control of tics, vocal utterances in Gilles de la Tourette's syndrome, short-term treatment of hyperactive children showing excessive motor activity, prolonged parenteral therapy in chronic schizophrenia, organic mental syndrome with psychotic features, hiccups (short-term), emergency sedation of severely agitated or delirious patients, ADHD

Unlabeled uses: Nausea, vomiting during surgery; autism; migraine

CONTRAINDICATIONS:

Children <3 yr, hypersensitivity, blood dyscrasias, coma, brain damage, bone marrow depression, alcohol and barbiturate withdrawal states, Parkinson's disease, angina, epilepsy, urinary retention, closed-angle glaucoma

Precautions: Pregnancy (C), breastfeeding, geriatric patients, seizure disorders, hypertension, pulmonary/cardiac/hepatic disease, QT prolongation, torsade de pointes

Black Box Warning:

Increased mortality in elderly patients with dementia-related psychosis

DOSAGE AND ROUTES

Calculator

Acute psychosis

- **Adult: IM/IV** (lactate) 2-10 mg, may repeat q1hr, convert to **PO** as soon as possible, **PO** should be 150% of total parenteral dose required
- **Child 6-12 yr: IM/IV** (lactate) (unlabeled) 1-3 mg q4-8hr, max 0.15 mg/kg/day, switch to **PO** as soon as possible

Chronic schizophrenia

- **Adult: IM** (decanoate) 50-100 mg q4wk, max 100 mg for 1st inj
- **Child 3-12 yr: PO/IM** 0.05-0.15 mg/kg/day

Tourette's syndrome

- **Adult and adolescent: PO** 0.5-2 mg bid-tid, increase until desired response occurs
- **Child 3-12 yr or weighing 15-40 kg: PO** 0.25-0.5 mg/day in 2-3 divided doses, increase by 0.25-0.5 mg q5-7days, max 0.15 mg/kg/day

ADHD

- **Child 3-12 yr: PO** 0.25-0.5 mg/day in 2-3 divided doses, may increase by 0.025-0.5 mg q5-7days; maintenance 0.01-0.03 mg/kg/day as a single dose

Autism (unlabeled)

- **Child: PO** 0.04 mg/kg/day or 1-3 mg/day, max 4 mg/day

Migraine (unlabeled)

- **Adult: PO/IM** (lactate) 5 mg at onset, may repeat once

Available forms: Tabs 0.5, 1, 2, 5, 10, 20 mg; *lactate*: oral sol 2 mg/ml; inj 5 mg/ml, *decanoate*: 50 mg/ml, 100 mg/ml

Administer:

- Reduced dose to geriatric patients
- Antiparkinsonian agent if EPS occurs
- Avoid use with CNS depressants

PO route

- **Oral liquid:** use calibrated device; do not mix in coffee or tea
- PO with food or milk

- Avoid skin contact with oral suspension or solution—may cause contact dermatitis

IM route

- IM inj into large muscle mass, use 21G, 2-in needle; give no more than 3 ml/inj site; patient should remain recumbent for 30 min

IV route (lactate)

- Give undiluted for psychotic episode at 5 mg/min
- Only use lactate for IV

Intermittent IV INF route

- Dilute in 30-50 ml of D₅W, give over 30 min

Y-site compatibilities: Amifostine, amsacrine, cisatracurium, cladribine, DOXOrubicin liposome, filgrastim, fludarabine, granisetron, LORazepam, melphalan, milrinone, PACLitaxel, palonosetron, pamidronate, pancuronium, propofol, remifentanyl, riTUXimab, rocuronium, tacrolimus, teniposide, thiotepa, tigecycline, tirofiban, TPN, trastuzumab, vecuronium, vinCRISTine, vinorelbine, voriconazole, zoledronic acid

SIDE EFFECTS

CNS: *EPS: pseudoparkinsonism, akathisia, dystonia, tardive dyskinesia, drowsiness, headache, seizures, neuroleptic malignant syndrome*, confusion

CV: *Orthostatic hypotension, hypertension, cardiac arrest*, ECG changes, *tachycardia, QT prolongation, sudden death, torsades de pointes*

EENT: Blurred vision, glaucoma, dry eyes

GI: *Dry mouth, nausea, vomiting, anorexia, constipation*, diarrhea, jaundice, weight gain, *ileus, hepatitis*

GU: Urinary retention, dysuria, urinary frequency, enuresis, impotence, amenorrhea, gynecomastia

INTEG: *Rash*, photosensitivity, dermatitis

RESP: *Laryngospasm*, dyspnea, *respiratory depression*

SYST: *Risk for death (dementia)*

PHARMACOKINETICS

Metabolized by liver; excreted in urine, bile; crosses placenta; enters breast milk; protein binding 92%; terminal half-life 12-36 hr (metabolites)

PO: Onset erratic, peak 2-6 hr, half-life 24 hr

IM: Onset 15-30 min, peak 15-20 min, half-life 21 hr

IM (Decanoate): Peak 4-11 days, half-life 3 wk

INTERACTIONS

Increase: serotonin syndrome, neuroleptic malignant syndrome—SSRIs, SNRIs

Increase: QT prolongation—class IA, III antidysrhythmics, tricyclics, amoxapine, maprotiline, phenothiazines, pimozide, risperidone, sertindole, ziprasidone, β -blockers, chloroquine, clozapine, dasatinib, dolasetron, droperidol, dronedarone, flecainide, halogenated/local anesthetics, lapatinib, methadone, erythromycin, telithromycin, troleandomycin, octreotide, ondansetron, palonosetron, pentamidine, propafenone, ranolazine, sunitinib, tacrolimus, vardenafil, vorinostat, usually with IV use

Increase: oversedation—other CNS depressants, alcohol, barbiturate anesthetics

Increase: toxicity—epinephrine, lithium

Increase: both drugs effects— β -adrenergic blockers, alcohol

Increase: anticholinergic effects—anticholinergics

Decrease: effects—lithium, levodopa

Decrease: haloperidol effects—phenobarbital, carbamazepine

Drug/Lab Test

Increase: LFTs

NURSING CONSIDERATIONS

Assess:

- Prolactin, CBC, urinalysis, ophthalmic exam before and during prolonged therapy

Black Box Warning:

Dementia, affect, orientation, LOC, reflexes, gait, coordination, sleep pattern disturbances, risk for death in dementia-related psychosis

- B/P standing, lying; take pulse, respirations q4hr during initial treatment; establish baseline before starting treatment; report drops of 30 mm Hg
- Dizziness, faintness, palpitations, tachycardia on rising
- **EPS** including akathisia (inability to sit still, no pattern to movements), tardive dyskinesia (bizarre movements of jaw, mouth, tongue, extremities), pseudoparkinsonism (rigidity, tremors, pill rolling, shuffling gait)  **Neuroleptic malignant syndrome/serotonin syndrome:** hyperthermia, muscle rigidity, altered mental status, increased CPK, seizures, hypo/hypertension, tachycardia;

notify prescriber immediately • Constipation, urinary retention daily; if these occur, increase bulk, water in diet

- **Abrupt discontinuation:** do not withdraw abruptly, taper

- **QT prolongation:** more common with IV use at high doses; monitor ECG in those with CV disease

Perform/provide:

- Supervised ambulation until patient stabilized on medication; do not involve patient in strenuous exercise program, fainting is possible; patient should not stand still for long periods • Sips of water, sugarless candy, gum for dry mouth
- Storage in tight, light-resistant container

Evaluate:

- Therapeutic response: decrease in emotional excitement, hallucinations, delusions, paranoia, reorganization of patterns of thought, speech; improvement in specific behaviors

Teach patient/family:

- That orthostatic hypotension occurs often; to rise from sitting or lying position gradually; to remain lying down after IM inj for at least 30 min • To avoid hazardous activities until stabilized on medication and effects are known
- To avoid abrupt withdrawal of this product because EPS may result; to withdraw slowly
- To avoid OTC preparations (cough, hay fever, cold) unless approved by prescriber, serious product interactions may occur; to avoid use with alcohol, increased drowsiness may occur • About EPS and necessity of meticulous oral hygiene because oral candidiasis may occur
- To report impaired vision, jaundice, tremors, muscle twitching

TREATMENT OF OVERDOSE:

Activated charcoal, lavage if orally ingested; provide an airway; do not induce vomiting

☼ Canada only Side effects: *italics* = common; **bold** = life-threatening ⚠
Nurse Alert

HIGH ALERT

heparin (Rx)

(hep'a-rin)

Hepalean , Heparin Leo , Hep-Lock, Hep-Lock U/P, Monoject Prefill *Func. class.:* Anticoagulant, antithrombotic

Do not confuse: **heparin**/Hespan

ACTION:

Prevents conversion of fibrinogen to fibrin and prothrombin to thrombin by enhancing inhibitory effects of antithrombin III

USES:

Prevention of deep venous thrombosis, PE, MI, open heart surgery, disseminated intravascular clotting syndrome, atrial fibrillation with embolization, as an anticoagulant in transfusion and dialysis procedures, prevention of DVT/PE, to maintain patency of indwelling venipuncture devices; diagnosis, treatment of DIC

CONTRAINDICATIONS:

Hypersensitivity, hemophilia, leukemia with bleeding, peptic ulcer disease, severe thrombocytopenic purpura, severe renal/hepatic disease, blood dyscrasias, severe hypertension, subacute bacterial endocarditis, acute nephritis; benzyl alcohol products in neonates/infants/pregnancy/lactation

Precautions: Pregnancy (C), children, geriatric patients, alcoholism, hyperlipidemia, diabetes, renal disease

DOSAGE AND ROUTES

Calculator

Deep venous thrombosis/pulmonary embolism

- **Adult: IV BOL** 80 international units/kg then maintenance **IV INF** 18 international units/kg/hr; if aPTT <35 (1.2× normal), increase **IV INF** rate by 4 international units/kg/hr and rebolus with 80 international units/kg; if aPTT 35-45 (1.2-1.5× normal), increase **IV INF** by 2 international units/kg/hr and rebolus

with 40 international units/kg; if aPTT 46-70 (1.5-2.3× normal), maintain **IV INF**; if aPTT 71-90 (2.3-3× normal), decrease **IV INF** by 2 international units/kg/hr; if aPTT >90 (>3× normal), hold **IV INF** for 1 hr then decrease rate 3 international units/kg/hr

- **Child/infant/neonate: IV** loading dose 75 international units/kg
- **Child >1 yr:** 20 international units/kg/hr
- **Infant/neonate <1 yr:** 28 international units/kg/hr as initial maintenance dose

Thrombosis prophylaxis (open heart/CV surgery)

- **Adult: IV** ≥150 international units/kg; procedures <60 min, up to 300 international units/kg; procedures >60 min, up to 400 international units/kg based on ACT

Thrombosis prophylaxis (PCI, not receiving abciximab)

- **Adult: IV BOL** weight adjusted with 60-100 international units/kg, maintain ACT within 250-300 sec (HemoTec) or 300-350 sec (Hemochron)
- **Child/infant/neonate: IV BOL** 100-150 international units/kg

Prophylaxis for DVT/PE

- **Adult: SUBCUT** 5000 units q8-12hr

IV catheter occlusion prophylaxis

- **Adult/child: IV** 10-100 units/ml
- **Infant <10 kg: IV** 10 units/ml

Available forms: Sol for inj 10, 100, 1000, 5000, 7500, 10,000, 20,000, 40,000 units/ml; premixed 1000 units/500 ml, 2000 units/1000 ml, 12,500 units/250 ml, 25,000 units/250 ml, 25,000 units/500 ml; lock flush preparations 10 units/ml

Administer:

- Cannot be used interchangeably (unit for unit) with LMWHs or heparinoids
- At same time each day to maintain steady blood levels

Heparin lock route

 **Do not mistake heparin sodium inj 10,000 units/ml and Hep-Lock U/P 10 units/ml; they have similar blue labeling; deaths in pediatric patients have occurred when heparin sodium inj vials were confused with heparin flush vials**

SUBCUT route

- **Give** deeply with 25G 3/8-1/2-in needle; do not massage area or aspirate when giving SUBCUT inj; give in abdomen between pelvic bones, rotate sites; do not pull back on plunger; leave in for 10 sec; apply gentle pressure for 1 min
- Changing needles is not recommended

- Avoid all IM inj that may cause bleeding, hematoma

Direct IV route

- Give loading dose undiluted, over ≥ 1 min, use before continuous inf

Continuous IV INF route

- Dilute 25,000 units/250-500 ml 0.9 NaCl or D₅W, (50-100 units) solutions are premixed and ready for use
- When product is added to inf sol for cont IV, invert container at least 6 times to ensure adequate mixing

Additive compatibilities: Avoid adding to sol, even if compatible; rate of heparin inf times may need to be changed

Y-site compatibilities: Acyclovir, allopurinol, amifostine, aminophylline, atropine, aztreonam, betamethasone, bleomycin, calcium gluconate, ceFAZolin, cefoTEtan, cefTAZidime, cefTRIAxone, chlordiazepoxide, cimetidine, CISplatin, cladribine, clindamycin, conjugated estrogens, cyanocobalamin, cyclophosphamide, cytarabine, dexamethasone, digoxin, DOPamine, DOXOrubicin liposome, edrophonium, enalaprilat, EPINEPHrine, esmolol, ethacrynate, etoposide, famotidine, fentaNYL, fluconazole, fludarabine, fluorouracil, foscarnet, furosemide, gallium, gemcitabine, granisetron, hydrocortisone, HYDROmorphone, insulin (regular), isoproterenol, kanamycin, leucovorin, linezolid, lidocaine, LORazepam, magnesium sulfate, melphalan, menadiol, meropenem, methotrexate, methoxamine, methyldopate, methylergonovine, metoclopramide, metroNIDAZOLE, midazolam, milrinone, minocycline, mitoMYcin, morphine, nafcillin, neostigmine, nitroglycerin, nitroprusside, norepinephrine, ondansetron, oxacillin, oxytocin, PACLitaxel, pancuronium, penicillin G potassium, phytonadione, piperacillin, piperacillin/tazobactam, potassium chloride, prednisoLONE, procainamide, propofol, propranolol, pyridostigmine, ranitidine, remifentanyl, sargramostim, scopolamine, sodium bicarbonate, succinylcholine, tacrolimus, theophylline, thiopental, thiotepa, ticarcillin, ticarcillin/clavulanate, tirofiban, trimethobenzamide, trimethaphan, vecuronium, vinBLAStine, warfarin, zidovudine, zoledronic acid

SIDE EFFECTS

CNS: *Fever*, chills, headache

GU: Hematuria

HEMA: Hemorrhage, thrombocytopenia, anemia

INTEG: Rash, dermatitis, urticaria, pruritus, delayed transient alopecia, hematoma, cutaneous necrosis (SUBCUT), inj site reactions

META: Hyperkalemia, hypoaldosteronism

SYST: Anaphylaxis

PHARMACOKINETICS

Half-life 1½ hr; excreted in urine; 95% bound to plasma proteins; does not cross placenta or alter breast milk; removed from the system via the lymph and spleen; partially metabolized in kidney, liver; excreted in urine (<50% unchanged)

SUBCUT: Onset 20-60 min, duration 8-12 hr, well absorbed >35,000 international units/24 hr

IV: Peak 5 min, duration 2-6 hr

INTERACTIONS

Increase: heparin action—oral anticoagulants, salicylates, dextran, NSAIDs, platelet inhibitors, cephalosporins, penicillins, ticlopidine, dipyridamole, antineoplastics, clopidogrel, prasugrel, SSRIs, SNRIs

Decrease: heparin action—digoxin, tetracyclines, antihistamines, cardiac glycosides, nicotine, nitroglycerin

Drug/Herb

Increase: bleeding risk—garlic, ginger, ginkgo, feverfew, green tea, horse chestnut

Drug/Lab Test

Increase: ALT, AST, INR, PT, PTT, potassium

Decrease: platelets

NURSING CONSIDERATIONS

Assess:

⚠ Bleeding, hemorrhage: gums, petechiae, ecchymosis, black tarry stools, hematuria, epistaxis, decrease in Hct, B/P; HIT may occur after product discontinuation • Blood studies (Hct, occult blood in stools) q3mo

• Partial prothrombin time, which should be 1.5-2.5× control; for continuous IV inf, check aPTT baseline 6 hr after initiation and 6 hr after any dose change; use aPTT for dosing adjustments; after therapeutic aPTT has been measured 2×,

check aPTT daily • Platelet count q2-3days; thrombocytopenia may occur on 4th day of treatment

- **Hypersensitivity:** rash, chills, fever, itching; report to prescriber

Perform/provide:

- Storage at room temp

Evaluate:

- Therapeutic response: decrease of DVT, adequate anticoagulation based on aPTT

Teach patient/family:

- To avoid OTC preparations that may cause serious product interactions unless directed by prescriber
- That product may be held during active bleeding (menstruation), depending on condition
- To use soft-bristle toothbrush to avoid bleeding gums; to avoid contact sports; to use an electric razor, to avoid IM inj
- To carry emergency ID identifying product taken
- To report to prescriber any signs of bleeding: gums, under skin, urine, stools
- To report to prescriber any signs of hypersensitivity: rash, chills, fever, itching

TREATMENT OF OVERDOSE:

Withdraw product, protamine 1 mg protamine/100 units heparin

☼ Canada only Side effects: *italics* = common; **bold** = life-threatening ⚠

Nurse Alert

hepatitis B immune globulin (HBIG) (Rx)

HepaGam B, Hyper HEP B S/D, Nabi-HB

Func. class.: Immune globulin

ACTION:

Provides passive immunity to hepatitis B

USES:

Prevention of hepatitis B virus in exposed patients, including passive immunity in neonates born to HBsAg-positive mother, prevention of hepatitis B recurrence after liver transplant in HBsAg-positive patients

CONTRAINDICATIONS:

Hypersensitivity to immune globulins, coagulation disorders

Precautions: Pregnancy (C), breastfeeding, children, geriatric patients, hemophilia, active infection, IgA deficiency

DOSAGE AND ROUTES

Calculator

Hepatitis B exposure in those at high risk

- **Adult and child:** IM 0.06 ml/kg (usual 3-5 ml) within 7 days of exposure; repeat 28 days after exposure if patient wishes to not receive hepatitis B vaccine

Neonates born to hepatitis B surface-antigen–positive persons

- **Neonate:** IM 0.5 ml within 12 hr of birth

Prevention of hepatitis B infection recurrence after liver transplant

- **Adult:** IV (HepaGam B only) 20,000 international units concurrent with grafting transplanted liver, then 20,000 international units/day on days 1-7, then 20,000 international units q2wk starting on day 14, then 20,000 international units/mo starting with mo 4

Available forms: Inj 1-, 4-, 5-ml vials; neonatal syringe 0.5 ml; HepaGam B sol for inj 312 units/ml; Hyper HEP B S/D 217 units/ml

Administer:

IM route

- After rotating vial; do not shake
- Only with EPINEPHrine 1:1000 on unit to treat laryngospasm
- In deltoid for better absorption (adult)

IV route (HepaGam B only)

- Calculate volume needed for each 20,000 international-unit dose using measured potency of each lot; HBIG potency stamped on label • Promptly use after vial entered; discard unused product
- Give at 2 ml/min through separate IV line, use inf pump, decrease to 1 ml/min if inf-related event occurs, patient becomes uncomfortable
- **Do not use HyperHEP B BS/D or Nabi-HB IV**

SIDE EFFECTS

CNS: Headache, dizziness, fever

GI: Nausea, vomiting

INTEG: Soreness at inj site, urticaria, erythema, swelling

SYST: Induration, **anaphylaxis, angioedema**

INTERACTIONS

- Do not use within 3 mo of hepatitis B immune globulin, MMR, varicella, or rotavirus vaccines even after discontinuing product

NURSING CONSIDERATIONS

Assess:

- History of allergies, skin conditions (eczema, psoriasis, dermatitis), reactions to vaccinations • Skin reactions: rash, induration, urticaria

⚠ Anaphylaxis: inability to breathe, bronchospasm, hypotension, wheezing, diaphoresis, fever, flushing • Can be used with hepatitis B vaccine in cases of direct contact

Perform/provide:

- Written record of immunization

Evaluate:

- Prevention of hepatitis B

Teach patient/family:

- That discomfort may occur at site
 - To report any rash, wheezing, inability to breathe immediately
-

🍁 Canada only Side effects: *italics* = common; **bold** = life-threatening ⚠️
Nurse Alert

homatropine ophthalmic

See [Appendix B](#)

hydrALAZINE (Rx)

(hye-dral'a-zeen)

Apresoline 

Func. class.: Antihypertensive, direct-acting peripheral vasodilator *Chem. class.:* Phthalazine

Do not confuse: **hydrALAZINE**/hydrOXYzine

Apresoline/allopurinol

ACTION:

Vasodilates arteriolar smooth muscle by direct relaxation; reduction in blood pressure with reflex increases in heart rate, stroke volume, cardiac output

USES:

Essential hypertension; severe essential hypertension

Unlabeled uses: CHF

CONTRAINDICATIONS:

Hypersensitivity to hydrALAZINES, mitral valvular rheumatic heart disease, CAD

Precautions: Pregnancy (C), breastfeeding, geriatric patients, CVA, advanced renal disease, hepatic disease, SLE, dissecting aortic aneurysm

DOSAGE AND ROUTES

Calculator

Hypertension

- **Adult: PO** 10 mg qid 2-4 days, then 25 mg for rest of 1st wk, then 50 mg qid individualized to desired response, max 300 mg/day
- **Child: PO** 0.75-1 mg/kg/day in 2-4 divided doses, max 25 mg/dose, increase over 3-4 wk to max 7.5 mg/kg/day or 200 mg, whichever is less

Hypertensive crisis

- **Adult: IV BOL** 10-20 mg q4-6hr, administer **PO** as soon as possible; **IM** 10-50 mg q4-6hr

- **Child: IV BOL** 0.1-0.6 mg/kg q4hr; **IM** 0.1-0.6 mg/kg q4-6hr, max 1.7-3.5 mg/kg/day

CHF

- **Adult: PO** 10-25 mg tid, max 75 mg tid

Available forms: Inj 20 mg/ml; tabs 10, 25, 50, 100 mg

Administer:

PO route

- Give with meals (PO) to enhance absorption

IM route

- Do not admix, switch to PO as soon as possible
- No dilution needed, inject deeply in large muscle, aspirate

Direct IV route

- IV undiluted; give through Y-tube or 3-way stopcock, give each 10 mg over ≥1 min
- To recumbent patient, keep recumbent for 1 hr after administration

Y-site compatibilities: Alemtuzumab, anidulafungin, argatroban, atenolol, bivalirudin, bleomycin, DACTINomycin, DAPTOmycin, dexrazoxone, diltiazem, DOCEtaxel, etoposide, fludarabine, gatifloxacin, gemcitabine, granisetron, HYDROmorphine, IDArubicin, irinotecan, leucovorin, linezolid, mechlorethamine, metroNIDAZOLE, milrinone, mitoXANtrone, octreotide, oxaliplatin, PACLitaxel, palonosetron, pancuronium, potassium chloride, tacrolimus, teniposide, thiotepa, tirofiban, vecuronium, vinorelbine, vitamin B/C, voriconazole

Solution compatibilities: D₅LR, D₅W, D₁₀W, D₁₀LR, 0.45% NaCl, 0.9% NaCl, Ringer's, LR

SIDE EFFECTS

CNS: *Headache, tremors, dizziness, anxiety*, peripheral neuritis, depression, fever, chills

CV: *Palpitations, reflex tachycardia, angina, shock*, rebound hypertension, orthostatic hypotension

GI: *Nausea, vomiting, anorexia, diarrhea*, constipation, paralytic ileus

GU: Urinary retention, glomerulonephritis, hematuria

HEMA: Leukopenia, agranulocytosis, anemia, thrombocytopenia

INTEG: Rash, pruritus, urticaria

MISC: Nasal congestion, muscle cramps, *lupuslike symptoms*, flushing, edema, dyspnea

PHARMACOKINETICS

Half-life 3-7 hr, metabolized by liver, 12%-14% excreted in urine, protein binding 89%

PO: Onset 20-30 min, peak 1-2 hr, duration 2-4 hr

IM: Onset 10-30 min, peak 1 hr, duration 2-6 hr

IV: Onset 5-30 min, peak 10-80 min, duration 2-6 hr

INTERACTIONS

Increase: severe hypotension—MAOIs

Increase: tachycardia, angina—sympathomimetics (EPINEPHrine, norepinephrine)

Increase: hypotension—other antihypertensives, alcohol, levodopa, thiazide diuretics

Increase: effects of β -blockers

Decrease: hydrALAZINE effects—NSAIDs, estrogens

Drug/Lab Test

Decrease: Hgb, WBC, RBC, platelets, neutrophils

Positive: ANA titer

NURSING CONSIDERATIONS

Assess:

- Cardiac status: B/P q5min $\times$ 2 hr, then q1hr $\times$ 2 hr, then q4hr; pulse, jugular venous distention q4hr
- Electrolytes, blood studies: potassium, sodium, chloride, carbon dioxide, CBC, serum glucose, LE prep, ANA titer before, during treatment; assess for fever, joint pain, rash, sore throat (*lupuslike symptoms*); notify prescriber
- Weight daily, I&O
- Edema in feet, legs daily, skin turgor, dryness of mucous membranes for hydration status
- Crackles, dyspnea, orthopnea
- IV site for extravasation, rate
- Mental status: affect, mood, behavior, anxiety; check for personality changes

Evaluate:

- Therapeutic response: decreased B/P

Teach patient/family:

- To take with food to increase bioavailability (PO)
- To avoid OTC preparations unless directed by prescriber
- To notify prescriber if chest pain, severe fatigue, fever, muscle or joint pain occurs
- To rise slowly to prevent orthostatic hypotension
- To notify prescriber if pregnancy is suspected

TREATMENT OF OVERDOSE:

Administer vasopressors, volume expanders for shock; if PO, lavage or give activated charcoal, digitalization

🍁 Canada only Side effects: *italics* = common; **bold** = life-threatening ⚠️
Nurse Alert

hydrochlorothiazide (Rx)

(hye-droe-klor-oh-thye'a-zide)

Apo-Hydro , Ezide, Neo-Codema 

Func. class.: Thiazide diuretic, antihypertensive

Chem. class.: Sulfonamide derivative

ACTION:

Acts on distal tubule and ascending limb of loop of Henle by increasing excretion of water, sodium, chloride, potassium

USES:

Edema, hypertension, diuresis, CHF; edema in corticosteroid, estrogen, NSAIDs; idiopathic lower extremity edema therapy

Unlabeled uses: Diabetes insipidus, hypercalciuria, nephrolithiasis, premenstrual syndrome, renal calculus

CONTRAINDICATIONS:

Hypersensitivity to thiazides or sulfonamides, anuria, renal decompensation, hypomagnesemia

Precautions: Pregnancy (B), breastfeeding, hypokalemia, renal/hepatic disease, gout, COPD, LE, diabetes mellitus, hyperlipidemia, CCr <30 ml/min

DOSAGE AND ROUTES

Calculator

- **Adult/adolescent: PO** 12.5-25 mg/day, may increase to 50 mg/day in 1-2 divided doses
- **Child >6 mo: PO** 1-2 mg/kg/day in divided doses, max 37.5 mg for 6 mo-2 yr; max 100 mg/day for 2-12 yr
- **Child <6 mo: PO** up to 2-3.3 mg/kg/day in divided doses

Available forms: Tabs 12.5, 25, 50 mg; caps 12.5 mg

Administer:

PO route

- In AM to avoid interference with sleep if using product as a diuretic; tab may be crushed, mixed with food
- Potassium replacement if potassium <3 mg/dl

- With food; if nausea occurs, absorption may be decreased slightly

SIDE EFFECTS

CNS: Drowsiness, paresthesia, depression, headache, *dizziness, fatigue, weakness, fever*

CV: Irregular pulse, orthostatic hypotension, palpitations, volume depletion, allergic myocarditis

EENT: Blurred vision

ELECT: *Hypokalemia*, hypercalcemia, hyponatremia, hypochloremia, hypomagnesemia

GI: *Nausea, vomiting, anorexia*, constipation, diarrhea, cramps, pancreatitis, GI irritation, *hepatitis*

GU: *Urinary frequency*, polyuria, *uremia, glucosuria*, hyperuricemia

HEMA: *Aplastic anemia, hemolytic anemia, leukopenia, agranulocytosis, thrombocytopenia, neutropenia*

INTEG: *Rash*, urticaria, purpura, photosensitivity, alopecia, erythema multiforme

META: *Hyperglycemia, hyperuricemia*, increased creatinine, BUN

PHARMACOKINETICS

PO: Onset 2 hr, peak 4 hr, duration 6-12 hr, half-life 6-15 hr, excreted unchanged by kidneys, crosses placenta, enters breast milk

INTERACTIONS

Increase: hyperglycemia, hyperuricemia, hypotension—diazoxide

Increase: hypokalemia—glucocorticoids, amphotericin B

Increase: toxicity—lithium, non-depolarizing skeletal muscle relaxants, cardiac glycosides

Increase: renal failure risk—NSAIDs

Increase: effects—loop diuretics

Decrease: antidiabetics effects

Decrease: thiazides absorption—cholestyramine, colestipol

Drug/Lab Test

Increase: parathyroid test, uric acid, calcium, glucose, cholesterol, triglycerides

Decrease: potassium, sodium, Hgb, WBC, platelets

NURSING CONSIDERATIONS

Assess:

- Weight, I&O daily to determine fluid loss; effect of product may be decreased if used daily
- Rate, depth, rhythm of respiration, effect of exertion
- B/P lying, standing; postural hypotension may occur
- Blood studies: BUN, blood glucose, CBC, serum creatinine, blood pH, ABGs, uric acid, electrolytes
- **Signs of metabolic alkalosis:** drowsiness, restlessness
- **Signs of hypokalemia:** postural hypotension, malaise, fatigue, tachycardia, leg cramps, weakness, dehydration
- Confusion, especially in geriatric patients; take safety precautions if needed

Evaluate:

- Therapeutic response: improvement in edema of feet, legs, sacral area daily, decreased B/P

Teach patient/family:

- To increase fluid intake to 2-3 L/day unless contraindicated; to rise slowly from lying or sitting position
- To notify prescriber of muscle weakness, cramps, nausea, dizziness; hypokalemia is common
- That product may be taken with food or milk
- To use sunscreen for photosensitivity
- That blood glucose may be increased in diabetics
- To take early in day to avoid nocturia
- To avoid alcohol, OTC meds unless approved by prescriber
- To rise slowly to prevent dizziness

TREATMENT OF OVERDOSE:

Lavage if taken orally; monitor electrolytes; administer dextrose in saline; monitor hydration, CV, renal status

☼ Canada only Side effects: *italics* = common; **bold** = life-threatening ⚠
Nurse Alert

HYDROcodone (Rx)

(hye-droe-koe'done)

Hycodan , Tussigon

HYDROcodone/ acetaminophen (Rx)

Co-Gesic, Dolorex Forte, Duocet, Hycet, Lorcet, Lortab, Margesic H, Liquicet, Maxidone, Norco, Polygesic, Stagesic, Vanacet, Vicodin, Vicodin ES, Vicodin HP, Xodol, Zamicet, Zydone

HYDROcodone/ ibuprofen (Rx)

Ibudone, Reprexain, Vicoprofen

Func. class.: Antitussive opioid analgesic/nonopioid analgesic

Controlled Substance Schedule III

Do not confuse: **HYDROcodone**/hydrocortisone
Hycodan/Vicodin

ACTION:

Acts directly on cough center in medulla to suppress cough; binds to opiate receptors in CNS to reduce pain

USES:

Hyperactive and nonproductive cough, mild to moderate pain

CONTRAINDICATIONS:

Acne rosacea/vulgaris, Cushing's syndrome, measles, perioral dermatitis, varicella, abrupt discontinuation; hypersensitivity to this product, benzyl

Precautions: Pregnancy (C), breastfeeding, neonates, addictive personality, increased intracranial pressure, MI (acute), severe heart disease, respiratory depression, renal/hepatic disease, bowel impaction, urinary retention, viral infection, ulcerative colitis, seizures, sulfite hypersensitivity, psychosis, hypertension, hyperthyroidism

DOSAGE AND ROUTES

Calculator

Analgesic

- **Adult: PO** 2.5-10 mg q3-6hr prn, max 60 mg/day

Antitussive

- **Adult: PO** 5 mg q4-6hr prn, max 30 mg/24 hr

Available forms: HYDROcodone: bulk powder;

HYDROcodone/acetaminophen: 5 mg HYDROcodone/500 mg acetaminophen (Co-Gesic, Lorcet, Lortab 5/500, Stagesic, Vicodin); 7.5 mg

HYDROcodone/400 mg acetaminophen (Zydane), 7.5 mg HYDROcodone/500 mg acetaminophen (Lortab 7.5/500), 7.5 mg HYDROcodone/750 mg acetaminophen (Vicodin ES), 5 mg HYDROcodone/325 acetaminophen, 10 mg HYDROcodone/325 acetaminophen (Norco), 10 mg HYDROcodone/500 mg acetaminophen (Lortab 10/500), 10 mg HYDROcodone/650 mg acetaminophen (Lorcet 10/650, Vicodin HP), 10 mg HYDROcodone/660 acetaminophen (Vicodin HP); caps 5 mg HYDROcodone/500 mg acetaminophen (Stagesic, Zydane); **HYDROcodone/ibuprofen:** tabs 7.5 mg HYDROcodone/200 mg ibuprofen (Vicoprofen)

Administer:

- Do not break, crush, or chew tabs; only scored tabs can be broken
- With antiemetic after meals if nausea or vomiting occurs
- Do not exceed 4 g acetaminophen with combination product
- Give with food or milk to prevent gastric upset

SIDE EFFECTS

CNS: *Drowsiness*, dizziness, light-headedness, confusion, headache, sedation, euphoria, dysphoria, weakness, hallucinations, disorientation, mood changes, dependence, **seizures**

CV: Palpitations, tachycardia, bradycardia, change in B/P, **circulatory depression**, syncope; **cardiac arrest (children)**

EENT: Tinnitus, blurred vision, miosis, diplopia

GI: *Nausea, vomiting, anorexia, constipation*, cramps, dry mouth, ulcers

GU: Increased urinary output, dysuria, urinary retention

INTEG: Rash, urticaria, flushing, pruritus

RESP: **Respiratory depression; pulmonary edema, bronchopneumonia,**

respiratory arrest (children)

PHARMACOKINETICS

Onset 10-20 min, duration 4-6 hr, half-life 3½-4½ hr, metabolized in liver, excreted in urine, crosses placenta

INTERACTIONS

Increase: CNS depression—alcohol, opioids, sedative/hypnotics, phenothiazines, skeletal muscle relaxants, general anesthetics, tricyclics

Increase: severe reactions—MAOIs

Drug/Herb

Increase: CNS depression—lavender, valerian

Drug/Lab Test

Increase: amylase, lipase

NURSING CONSIDERATIONS

Assess:

- **Pain:** intensity, type, location, other characteristics before, 1 hr after giving product; titrate upward by 25% until pain reduced by half; need for pain medication, physical dependence, opioid is more effective before pain is severe
- **CNS changes:** dizziness, drowsiness, hallucinations, euphoria, LOC, pupil reaction
- B/P, pulse, respirations before, periodically; if respirations <10/min, dose may need to be reduced, oversedation may occur
- Bowel status: constipation; provide fluids, fiber in diet, may need stimulate laxatives
- **Allergic reactions:** rash, urticaria
- Cough and respiratory dysfunction: respiratory depression, character, rate, rhythm
- History of ulcers if using ibuprofen combination product

Perform/provide:

- Storage in light-resistant area at room temp
- Safety measures: nightlight, call bell within easy reach; assistance with ambulation

Evaluate:

- Therapeutic response: decrease in pain or cough

Teach patient/family:

- To report any symptoms of CNS changes, allergic reactions
- That physical dependency may result when used for extended periods
- That withdrawal symptoms may occur: nausea, vomiting, cramps, fever, faintness, anorexia
- To avoid driving, other hazardous activities because drowsiness occurs
- To avoid other CNS depressants; they will enhance sedating properties of this product
- To change positions slowly to reduce orthostatic hypotension

TREATMENT OF OVERDOSE:

Naloxone HCl (Narcan) 0.2-0.8 mg IV, O₂, IV fluids, vasopressors

☼ Canada only Side effects: *italics* = common; **bold** = life-threatening ⚠
Nurse Alert

hydrocortisone (Rx)

(hy-dro-kor'tih-sone)

Cortef, Colocort, Cortenema

hydrocortisone acetate (Rx)

Anucort, Anusol, Cortifoam, Hemril, Proctocort, Rectasol

hydrocortisone sodium succinate (Rx)

A-hydroCort, Solu-Cortef

Func. class.: Corticosteroid

Chem. class.: Short-acting glucocorticoid

Do not confuse: **hydrocortisone**/HYDROcodone

ACTION:

Decreases inflammation by suppression of migration of polymorphonuclear leukocytes, fibroblasts, reversal of increased capillary permeability, and lysosomal stabilization

USES:

Severe inflammation, adrenal insufficiency, ulcerative colitis, collagen disorders

Unlabeled uses: Carpal tunnel syndrome, Churg-Strauss syndrome, endophthalmitis, mixed connective-tissue disease, multiple myeloma, polyarteritis nodosa, polychondritis, pulmonary edema, temporal arteritis, Wegener's granulomatosis

CONTRAINDICATIONS:

Fungal infection, hypersensitivity

Precautions: Pregnancy (C), breastfeeding, children <2 yr, diabetes mellitus, glaucoma, osteoporosis, seizure disorders, ulcerative colitis, CHF, myasthenia gravis, renal disease, esophagitis, peptic ulcer, metastatic carcinoma, psychosis, idiopathic thrombocytopenia (IM), acute glomerulonephritis, amebiasis, nonasthmatic bronchial disease, AIDS, TB, recent MI (associated with left ventricular rupture)

DOSAGE AND ROUTES

Calculator

Adrenal insufficiency/inflammation

- **Adult: PO** 20-240 mg daily; **IM/IV** 100-500 mg (succinate)

Shock prevention

- **Adult: IM/IV** (succinate) 50 mg/kg repeated after 4 hr, repeat q24hr as needed

Colitis

- **Adult: PO** 20-240 mg (base)/day in 2-4 divided doses; **ENEMA** 100 mg nightly for 21 days
- **Child: PO** 2-8 mg (base)/kg/day or 60-240 mg (base)/m²/day in 3-4 divided doses

Available forms: Tabs 5, 10, 20 mg; inj 25, 50 mg/ml; enema 100 mg/60 ml;

acetate: inj 25 , 50 mg/ml , rectal 10% aerosol foam; supp 25, 30 mg;

succinate: inj 100 mg, 250 mg, 500 mg, 1000 mg/vial

Administer:

- Daily dose in AM for better results
- In one dose in AM to prevent adrenal suppression; avoid SUBCUT administration, may damage tissue
- Do not use acetate or susp for IV

PO route

- With food or milk for GI symptoms

Rectal route

- Tell patient to retain for 1 hr if possible

IM route

- IM inj deep in large muscle mass; rotate sites; avoid deltoid; use 21G needle

IV route

- **Succinate:** IV in mix-o-vial or reconstitute ≤ 250 mg/2 ml bacteriostatic water for inj; mix gently; give direct IV over ≥ 1 min; may be further diluted in 100, 250, 500, or 1000 ml of D₅W, D₅ 0.9%, NaCl 0.9% given over ordered rate

Sodium succinate preparations

Y-site compatibilities: Acyclovir, allopurinol, amifostine, aminophylline, amphotericin B cholesteryl, ampicillin, amrinone, amsacrine, atracurium, atropine, aztreonam, betamethasone, calcium gluconate, cefepime, cefmetazole, cephalothin, cephapirin, chlordiazepoxide, chlorproMAZINE, cisatracurium, cladribine, cyanocobalamin, cytarabine, dexamethasone, digoxin,

diphenhydrAMINE, DOPamine, DOXOrubicin liposome, droperidol, edrophonium, enalaprilat, EPINEPHeine, esmolol, estrogens conjugated, ethacrynate, famotidine, fentaNYL, fentaNYL/droperidol, filgrastim, fludarabine, fluorouracil, foscarnet, furosemide, gallium, granisetron, heparin, hydrALAZINE, insulin (regular), isoproterenol, kanamycin, lidocaine, LORazepam, magnesium sulfate, melphalan, menadiol, meperidine, methicillin, methoxamine, methylergonovine, minocycline, morphine, neostigmine, norepinephrine, ondansetron, oxacillin, oxytocin, PACLitaxel, pancuronium, penicillin G potassium, pentazocine, phytonadione, piperacillin/tazobactam, prednisolONE, procainamide, prochlorperazine, propofol, propranolol, pyridostigmine, remifentanyl, scopolamine, sodium bicarbonate, succinylcholine, tacrolimus, teniposide, theophylline, thiotepa, trimethaphan, trimethobenzamide, vecuronium, vinorelbine

SIDE EFFECTS

CNS: *Depression, flushing, sweating, headache, mood changes, pseudotumor cerebri*

CV: *Hypertension, circulatory collapse, thrombophlebitis, embolism, tachycardia, edema*

EENT: *Fungal infections, increased intraocular pressure, blurred vision*

GI: *Diarrhea, nausea, abdominal distention, GI hemorrhage, increased appetite, pancreatitis*

HEMA: *Thrombocytopenia*

INTEG: *Acne, poor wound healing, ecchymosis, petechiae*

MS: *Fractures, osteoporosis, weakness*

PHARMACOKINETICS

Metabolized by liver, excreted in urine (17-OHCS, 17-KS), crosses placenta

PO: Peak 1-2 hr, duration 1-1½ days

IM/IV: Onset 20 min, peak 4-8 hr, duration 1-1½ days

RECT: Onset 3-5 days

INTERACTIONS

Increase: GI bleeding risk—salicylates, NSAIDs

Increase: side effects—alcohol, amphotericin B, digoxin, cycloSPORINE,

diuretics

Decrease: hydrocortisone action—bosentan, cholestyramine, colestipol, barbiturates, rifampin, ePHEDrine, phenytoin, theophylline

Decrease: anticoagulant effects, anticonvulsants, antidiabetics, calcium supplements, toxoids, vaccines

Drug/Lab Test

Increase: cholesterol, sodium, blood glucose, uric acid, calcium, glucose

Decrease: calcium, potassium, T₄, T₃, thyroid ¹³¹I uptake test, urine 17-OHCS, 17-KS

False negative: skin allergy tests

NURSING CONSIDERATIONS

Assess:

- Potassium, blood glucose, urine glucose while patient receiving long-term therapy; hypokalemia and hyperglycemia; potassium depletion: paresthesias, fatigue, nausea, vomiting, depression, polyuria, dysrhythmias, weakness • B/P, pulse; notify prescriber of chest pain
- I&O ratio; be alert for decreasing urinary output, increasing edema; weight daily, notify prescriber of weekly gain >5 lb • **Adrenal insufficiency (cushingoid symptoms):** nausea, anorexia, SOB, moon face, fatigue, dizziness, weakness, joint pain before and during treatment; plasma cortisol levels during long-term therapy (normal level: 138-635 nmol/L SI units when drawn at 8 AM)
- **Infection:** increased temp, WBC even after withdrawal of medication; product masks infection • Mental status: affect, mood, behavioral changes, aggression
- **GI effects:** nausea, vomiting, anorexia or appetite stimulation, diarrhea, constipation, abdominal pain, hiccups, gastritis, pancreatitis, GI bleeding/perforation with long-term treatment

Perform/provide:

- Assistance with ambulation for patient with bone-tissue disease to prevent fractures

Evaluate:

- Therapeutic response: decreased inflammation, GI symptoms

Teach patient/family:

- That emergency ID as corticosteroid user should be carried

- To immediately report abdominal pain, black tarry stools because GI bleeding/perforation can occur
 - To notify prescriber if therapeutic response decreases; that dosage adjustment may be needed; about signs of infection
 - Not to discontinue abruptly because adrenal crisis can result; that product should be tapered
 - That supplemental calcium/vit D may be needed if patient receiving long-term therapy
 - That product can mask infection and cause hypoglycemia (diabetic)
 - To avoid OTC products: salicylates, alcohol in cough products, cold preparations unless directed by prescriber
 - About cushingoid symptoms of adrenal insufficiency: nausea, anorexia, fatigue, dizziness, dyspnea, weakness, joint pain, moon face
 - To avoid live-virus vaccines if using steroids long term
-

hydrocortisone nasal

See [Appendix B](#)

hydrocortisone (topical)

(hye-droe-kor'ti-sone)

Ala-Cort, Ala-Scalp, Anusol HC, Cetacort, Cortizone-5, Cortizone-10, Cortizone-10 Quickshot, Dermolate, Hi-Cor 2.5, HydroSKIN, Hytone, LactiCare-HC, Maximum Strength Cortaid Faststick, Procort, Texacort

hydrocortisone acetate

Anusol HC, Cortaid, Cortef, Corticaine, ProctoCream-HC, ProctoFoam-HC, Tucks, U-cort

hydrocortisone butyrate

Locoid, Locoid Lipocream

hydrocortisone probutate

Pandel

hydrocortisone valerate

Func. class.: Corticosteroid, topical

ACTION:

Crosses cell membrane to attach to receptors to decrease inflammation, itching, inhibits multiple inflammatory cytokines

USES:

Inflammation/itching in corticosteroid-responsive dermatoses on the skin, rectal area

CONTRAINDICATIONS:

Hypersensitivity

Precautions: Pregnancy (C), breastfeeding, children

DOSAGE AND ROUTES

Calculator

Corticosteroid-responsive dermatoses, inflammation, pruritus

- **Adult/child: TOP** apply to affected area 1 to 4 times per day

Inflammation from proctitis

- **Adult: Rectal** 1 applicator full of foam once or twice a day × 2-3 wk, then every other day as needed; enema every night × 21 days or until improvement; may use every other night × 2-3 mo; suppository bid × 2 wk

Available forms: Hydrocortisone: cream 0.5%, 1%, 2.5%; gel 1%, 2%; lotion 0.25%, 0.5%, 1%, 2%, 2.5%; ointment 0.5%, 1%, 2.5%; rectal cream 1%; rectal ointment 1%; spray 1%; roll-on stick 1%; solution 1%, 2.5%; **Hydrocortisone acetate:** cream 0.5%, 1%, 2%, 2.5%; lotion 0.5%; ointment 0.5%, 1%; rectal foam 90 mg/application; suppositories 25 mg, 30 mg; **Hydrocortisone butyrate:** cream 0.1%; ointment 0.1%; solution 0.1%; **Hydrocortisone probutate:** cream 0.1%; **Hydrocortisone valerate:** cream 0.2%, ointment 0.2%

Administer:

Topical route

- May be used with dressings

Cream/Ointment/Lotion

- Apply sparingly in a thin film and rub gently

Rectal

- Remove wrapper and insert suppository

SIDE EFFECTS

INTEG: Burning, folliculitis, pruritus, dermatitis, maceration

MISC: Hyperglycemia; glycosuria

PHARMACOKINETICS

Unknown

NURSING CONSIDERATIONS

Assess:

- Skin reactions: burning, pruritus, folliculitis, dermatitis

Evaluate:

- Decreasing itching, inflammation on the skin, rectal area

Teach patient/family:

Topical route

- That product may be used with dressings

Cream/Ointment/Lotion

- To apply sparingly in a thin film and rub gently into the affected area

Gel

- To apply sparingly in a thin film and rub gently

Rectal

- To remove wrapper and insert suppository

Nurse Alert

HIGH ALERT

HYDROmorphine (Rx)

(hye-droe-mor'fone)

Dilaudid, Dilaudid HP, Exalgo, Hydromorph Contin 

Func. class.: Opiate analgesic

Chem. class.: Semisynthetic phenanthrene

Controlled Substance Schedule II

Do not confuse: **HYDROmorphine**/meperidine/morphine

Dilaudid/Demerol

ACTION:

Inhibits ascending pain pathways in CNS, increases pain threshold, alters pain perception

USES:

Moderate to severe pain, nonproductive cough

CONTRAINDICATIONS:

Hypersensitivity

Black Box Warning:

Respiratory depression, opioid-naïve patients

Precautions: Pregnancy (C), breastfeeding, children <18 yr, addictive personality, increased intracranial pressure, MI (acute), severe heart disease, renal/hepatic disease, bowel impaction, abrupt discontinuation, COPD

Black Box Warning:

Substance abuse, accidental exposure, potential for overdose/poisoning

DOSAGE AND ROUTES

Calculator

Analgesic

• **Adult: PO** (oral solution) 2.5-10 mg q3-6hr or (tabs) 2-4 mg q4-6hr; **EXT REL** (Exalgo): convert to **EXT REL** by giving total daily dose of immediate release/day, in 1 daily dose, if needed titrate **EXT REL** q3-4days until adequate

pain relief; use 25-50% increase for each titration step, if more than 2 doses of rescue medication needed in 24 hr consider titration; **IM/SUBCUT/IV** 1-2 mg q4-6hr prn, may be increased (opioid-naive patients may require lower dose); **RECT** 3 mg q6-8hr prn

- **Geriatric: PO** 1-2 mg q4-6hr
- **Child >50 kg (unlabeled): PO** 2-4 mg q3-4hr in opioid-naive patients, titrate
- **Infant >6 mo/child <50 kg (unlabeled): PO** 0.04-0.08 mg/kg q3-4hr in opioid-naive patients, titrate

Hepatic disease

- **Adult: Child-Pugh B, or C** (oral liquid, immediate rel tab, supp) give reduced dose based on response, impairment (parental) give 25% to 50% of dose (moderate impairment)

Available forms: Inj 1, 2, 4, 10 mg/ml; tabs 2, 4, 8 mg; supp 3 mg; oral sol 5 mg/5 ml; ext rel tab 8, 12, 16 mg

Administer:

PO route

- Give with food or milk for GI irritation
- **Ext rel (Exalgo):** discontinue all other ext rel opioids, give q24hr; do not crush, break, chew • When pain is beginning to return; determine interval by response

Black Box Warning:

Do not use ext rel products in opioid-naive patients

Extended release

- **Converting from oral opioids:** conversion ratios are approximate; initiate ext rel tabs at 50% of calculated total daily equivalent dose of ext rel, give q24hr; max increase q3-4days, consider titration increases of 25-50% with each step
- **Converting from transdermal patch (fentanyl):** initiate ext rel tabs 18 hr after removal of patch; for each 25 mcg/hr dose of transdermal fentaNYL dose is 12 mg q24hr, start dose at 50% of calculated HYDROmorphine ext rel dose q24hr; titrate no more often than q3-4days, consider dose increases of 25-50% with each step; if more than 2 rescue doses are required in 24 hr, consider titration

SUBCUT route

- Use short 30G needle, make sure not to inject ID
- Rotate inj sites

IV route

• **Direct**, diluted with 5 ml sterile water or NS; give through **Y**-connector or 3-way stopcock; give ≤ 2 mg over 3-5 min • **IV INF**: Dilute each 0.1-1 mg/ml NS (0.1-1 mg/ml), deliver by opioid syringe infusor; may be diluted in D₅W, D₅/NaCl, 0.45% NaCl, NS for larger amounts, delivery through inf pump

Additive compatibilities: Bupivacaine, cloNIDine, fluorouracil, heparin, midazolam, ondansetron, potassium chloride, promethazine, verapamil, ziconotide

Solution compatibilities: D₅W, D₅/0.45% NaCl, D₅/0.9% NaCl, D₅/LR, D₅/Ringer's sol, 0.45% NaCl, 0.9% NaCl, Ringer's and lactated Ringer's sol

Syringe compatibilities: Atropine, bupivacaine, ceftAZidime, chlorproMAZINE, cimetidine, dimenhyDRINATE, diphenhydrAMINE, fentaNYL, glycopyrrolate, hydrOXYzine, LORazepam, midazolam, pentazocine, promethazine, ranitidine, scopolamine, tetracaine, thiethylperazine, trimethobenzamide

Y-site compatibilities: Acyclovir, allopurinol, amifostine, amikacin, amsacrine, aztreonam, cefamandole, ceFAZolin, cefepime, cefmetazole, cefoperazone, cefotaxime, cefOXitin, ceftAZidime, ceftizoxime, cefuroxime, cephalothin, cephapirin, chloramphenicol, cisatracurium, CISplatin, cladribine, clindamycin, cyclophosphamide, cytarabine, diltiazem, DOBUTamine, DOPamine, DOXOrubicin, DOXOrubicin liposome, doxycycline, EPINEPHrine, erythromycin lactobionate, famotidine, fentaNYL, filgrastim, fludarabine, foscarnet, furosemide, gentamicin, granisetron, heparin, kanamycin, labetalol, LORazepam, magnesium sulfate, melphalan, methotrexate, metroNIDAZOLE, mezlocillin, midazolam, milrinone, morphine, moxalactam, nafcillin, niCARDipine, nitroglycerin, norepinephrine, ondansetron, oxacillin, PACLitaxel, penicillin G potassium, piperacillin, piperacillin/tazobactam, propofol, ranitidine, remifentanyl, teniposide, thiotepa, ticarcillin, tobramycin, trimethoprim-sulfamethoxazole, vancomycin, vecuronium, vinorelbine

SIDE EFFECTS

CNS: *Drowsiness, dizziness, confusion, headache, sedation, euphoria, mood changes, seizures*

CV: Palpitations, bradycardia, change in B/P, hypotension, tachycardia,

peripheral vasodilation

EENT: Tinnitus, blurred vision, miosis, diplopia

GI: *Nausea, vomiting, anorexia, constipation, cramps*, dry mouth, paralytic ileus

GU: Increased urinary output, dysuria, urinary retention

INTEG: *Rash*, urticaria, bruising, flushing, diaphoresis, pruritus

RESP: *Respiratory depression*, dyspnea

PHARMACOKINETICS

IM: Onset 15-30 min, peak 1/2-1 hr, duration 4-5 hr, metabolized by liver, excreted by kidneys, crosses placenta, excreted in breast milk, half-life 2-3 hr

INTERACTIONS

Increase: effects—other CNS depressants (alcohol, opiates, sedative/hypnotics, antipsychotics, skeletal muscle relaxants)

 **Increase:** *severe CNS, respiratory depression—MAOIs*

Decrease: HYDROmorphine effects—opiate antagonists

Drug/Herb

Increase: action—chamomile, hops, kava, lavender, St. John's wort, valerian

Drug/Lab Test

Increase: amylase

NURSING CONSIDERATIONS

Assess:

Black Box Warning:

Respiratory dysfunction: respiratory depression, character, rate, rhythm; notify prescriber if respirations <10/min

- I&O ratio; check for decreasing output; may indicate urinary retention
- CNS changes: dizziness, drowsiness, hallucinations, euphoria, LOC, pupil reaction
- Bowel function, constipation
- Allergic reactions: rash, urticaria
- Need for pain medication, physical dependence
- **Pain:** control, sedation by scoring on 0-10 scale, ATC dosing is best for pain control

Perform/provide:

- Storage in light-resistant area at room temp
- Assistance with ambulation
- Safety measures: side rails, nightlight, call bell within easy reach

Evaluate:

- Therapeutic response: decrease in pain

Teach patient/family:

- To report any symptoms of CNS changes, allergic reactions
- That physical dependency may result when used for extended periods; that withdrawal symptoms may occur: nausea, vomiting, cramps, fever, faintness, anorexia
- To avoid driving, other hazardous activities because drowsiness occurs

TREATMENT OF OVERDOSE:

Naloxone (Narcan) 0.2-0.8 mg IV (nontolerant patients), O₂, IV fluids, vasopressors

☼ Canada only Side effects: *italics* = common; **bold** = life-threatening ⚠
Nurse Alert

hydroxychloroquine (Rx)

(hye-drox-ee-klor'oh-kwin)

Apo-Hydroxyquine , Plaquenil

Func. class.: Antimalarial, antirheumatic (DMARDs)

Chem. class.: 4-Aminoquinoline derivative

ACTION:

Impairs complement-dependent antigen–antibody reactions

USES:

Malaria caused by susceptible strains of *Plasmodium vivax*, *P. malariae*, *P. ovale*, *P. falciparum* (some strains); SLE, rheumatoid arthritis

Unlabeled uses: SLE in children

CONTRAINDICATIONS:

Hypersensitivity to this product or chloroquine; retinal field changes

Black Box Warning:

Children (long term), ocular disease

Precautions: Pregnancy (C), breastfeeding, blood dyscrasias, severe GI disease, neurologic disease, alcoholism, hepatic disease, G6PD deficiency, psoriasis, eczema

DOSAGE AND ROUTES

Calculator

Malaria

- **Adult: PO Suppression or prevention:** 400 mg/wk, begin 1-2 wk before travel, continue 4 wk after returning; **treatment:** 800 mg, then 400 mg after 6-8 hr, then 400 mg/day on 2nd and 3rd day, total dose 2 g
- **Child: PO Suppression or prevention:** 6.4 mg/kg (5 mg/kg base) weekly, begin 1-2 wk before travel, continue 4 wk after returning; **treatment:** 10 mg/kg, 6.4 mg/kg (5 mg/kg base) at 6, 18, 24 hr after 1st dose

Lupus erythematosus

- **Adult: PO** 400 mg (310 mg base) daily-bid; length depends on patient response; **maintenance** 200-400 mg/day

- **Child (unlabeled): PO** 5 mg/kg/day, max 400 mg/day; long-term therapy is contraindicated

Rheumatoid arthritis

- **Adult: PO** 400-600 mg/day for 4-12 wk then 200-300 mg/day after good response

Available forms: Tabs 200 mg

Administer:

PO route

- Tabs may be crushed and mixed with food, fluids
- With food or milk; at same time each day to maintain product level
- For malaria, prophylaxis should be started 2 wk before exposure, continued for 4-6 wk after leaving exposure area

SIDE EFFECTS

CNS: Headache, stimulation, fatigue, irritability, **seizures**, bad dreams, dizziness, confusion, psychosis, decreased reflexes

CV: Hypotension, heart block, **asystole with syncope**

EENT: *Blurred vision, corneal changes, retinal changes, difficulty focusing, tinnitus, vertigo, deafness, photophobia, corneal edema*

GI: *Nausea, vomiting, anorexia, diarrhea, cramps*

HEMA: **Thrombocytopenia, agranulocytosis, leukopenia, aplastic anemia**

INTEG: Pruritus, pigmentation changes, skin eruptions, lichen-planus–like eruptions, eczema, **exfoliative dermatitis**, alopecia, **Stevens-Johnson syndrome**, photosensitivity

PHARMACOKINETICS

Peak 3 hr; terminal half-life 32-50 days; metabolized in liver; excreted in urine, feces, breast milk; crosses placenta, protein binding 45%

INTERACTIONS

Increase: digoxin, methotrexate levels

Increase: antibody titer—rabies vaccine

Decrease: hydroxychloroquine action—magnesium or aluminum compounds

Decrease: effect of—live virus vaccines, botulinum toxoids

NURSING CONSIDERATIONS

Assess:

- **SLE, malaria symptoms:** before treatment and daily
- **Rheumatoid arthritis:** pain, swelling, ROM, temp of joints
- Ophthalmic exam at baseline and q6mo if long-term treatment or product dosage >150 mg/day • Hepatic studies q wk: AST, ALT, bilirubin if patient receiving long-term treatment
- **Blood dyscrasias:** blood studies: CBC, platelets; WBC, RBC, platelets may be decreased; if severe, product should be discontinued; assess for malaise, fever, bruising, bleeding (rare) • For decreased reflexes: knee, ankle
- **ECG** during therapy: watch for depression of T waves, widening of QRS complex • **Allergic reactions:** pruritus, rash, urticaria
- **For ototoxicity** (tinnitus, vertigo, change in hearing); audiometric testing should be done before, after treatment  **For toxicity:** blurring vision, difficulty focusing, headache, dizziness, knee, ankle reflexes; product should be discontinued immediately

Perform/provide:

- Storage in tight, light-resistant container at room temp; keep inj in cool environment

Evaluate:

- Therapeutic response: decreased symptoms of malaria, SLE, rheumatoid arthritis

Teach patient/family:

- To use sunglasses in bright sunlight to decrease photophobia; to wear protective clothing (photosensitivity) • That urine may turn rust or brown; that skin may become blue-black
- To report hearing, visual problems, fever, fatigue, bruising, bleeding, which may indicate blood dyscrasias

TREATMENT OF OVERDOSE:

Induce vomiting; gastric lavage; administer barbiturate (ultrashort acting), vasopressor, ammonium chloride; tracheostomy may be necessary

☛ Canada only Side effects: *italics* = common; **bold** = life-threatening 
Nurse Alert

hydroxyurea (Rx)

(hye-drox'ee-yoo-ree-ah)

Droxia, Hydrea

Func. class.: Antineoplastic, antimetabolite

Chem. class.: Synthetic urea analog

Do not confuse: **hydroxyurea**/hydrOXYzine

ACTION:

Acts by inhibiting DNA synthesis without interfering with RNA or protein synthesis; incorporates thymidine into DNA, thereby causing direct damage to DNA strands; specific for S phase of cell cycle

USES:

Melanoma, chronic myelogenous leukemia, recurrent or metastatic ovarian cancer, squamous cell carcinoma of the head and neck, sickle cell anemia

Unlabeled uses: Psoriasis, acute myelogenous leukemia (AML), astrocytoma, HIV, lung cancer, malignant glioma, polycythemia vera, thrombocytosis

CONTRAINDICATIONS:

Pregnancy (D), breastfeeding, hypersensitivity, leukopenia ($<2500/\text{mm}^3$), thrombocytopenia ($<100,000/\text{mm}^3$), anemia (severe)

Precautions: Renal disease (severe), anemia, bone marrow suppression, dental disease, geriatric patients, HIV, hyperkalemia, hyperphosphatemia, hyperuricemia, hypocalcemia, infection, infertility, IM injection, tumor lysis syndrome, vaccinations

Black Box Warning:

Requires an experienced clinician, secondary malignancy

DOSAGE AND ROUTES

Calculator

Ovarian cancer, malignant melanoma

- **Adult: PO** 80 mg/kg as a single dose q3days or 20-30 mg/kg as a single dose daily

Ovarian cancer in combination with radiation

- **Adult: PO** 80 mg/kg as a single dose q3days

Chronic myelogenous leukemia (CML)/acute myelogenous leukemia (unlabeled)

- **Adult: PO** WBC >100,000/mm³, 50-75 mg/kg/day; WBC <100,000/mm³, 10-30 mg/kg/day; adjust for WBCs
- **Child: PO** 10-20 mg/kg/day, adjust to hematologic response

Sickle cell anemia

- **Adult: PO** 15 mg/kg/day, may increase by 5 mg/kg/day q12wk, max 35 mg/kg/day

Renal disease

- **Adult:** CCr <59 ml/min use 50% of dose

Available forms: Caps 200, 300, 400, 500 mg

Administer:

- Gloves should be worn when handling bottles or caps, including by caregivers, wash hands immediately and thoroughly • Do not crush or chew caps; caps can be opened and contents mixed with water
- Antiemetic 30-60 min before product and prn

SIDE EFFECTS

CNS: Headache, confusion, hallucinations, dizziness, **seizures**

CV: Angina, ischemia

GI: Nausea, vomiting, anorexia, diarrhea, stomatitis, constipation, **hepatotoxicity**, pancreatitis

GU: Increased BUN, uric acid, creatinine, temporary renal function impairment

HEMA: **Leukopenia, anemia, thrombocytopenia, megaloblastic erythropoiesis**

INTEG: *Rash*, urticaria, pruritus, dry skin, facial erythema

META: Hyperphosphatemia, hyperuricemia, hypocalcemia

MISC: Fever, chills, malaise, **secondary cancers, tumor lysis syndrome**

RESP: **Pulmonary fibrosis, diffuse pulmonary infiltrates**

PHARMACOKINETICS

Readily absorbed when taken orally; peak level in 1-4 hr; degraded in liver; excreted in urine, almost totally eliminated within 24 hr; readily crosses blood-brain barrier; eliminated as CO₂; terminal half-life 3.5-4.5 hr

INTERACTIONS

Increase: pancreatitis/hepatotoxicity—didanosine, stavudine

Increase: toxicity—radiation or other antineoplastics

Increase: bleeding risk—NSAIDs, anticoagulants, thrombolytics, salicylates, platelet inhibitors

Increase: uric acid levels—probenecid, sulfinpyrazone

- Do not use with live virus vaccines
- Do not use hematopoietic progenitor cells (sargramostim, filgrastim) 24 hr before or after antineoplastic

Drug/Lab Test

Increase: BUN, creatinine, LFTs, uric acid

False increase: urea, uric acid, lactic acid

Decrease: Hgb, WBC, platelets

NURSING CONSIDERATIONS

Assess:

- **Bone marrow suppression:** determine the hemoglobin concentration, total leukocyte count, and platelet count at least once a week during entire course; if the WBC is $\leq 2500/\text{mm}^3$ or platelets are $\leq 100,000/\text{mm}^3$, interrupt Hydrea until the values rise significantly toward normal concentrations; if severe anemia occurs, manage it without interrupting Hydrea receipt; for Droxia, monitor blood counts q2wk and interrupt drug receipt if neutrophils are $< 2000/\text{mm}^3$, platelets are $< 80,000/\text{mm}^3$, hemoglobin is $< 4.5 \text{ g/dl}$, or reticulocytes are $< 80,000/\text{mm}^3$ when the hemoglobin concentration is $< 9 \text{ g/dl}$; after recovery, Droxia may be resumed at lower dosage; Droxia therapy requires an experienced clinician knowledgeable in the use of this medication for the treatment of sickle cell anemia
- **Renal studies:** BUN, serum uric acid, urine CCr, electrolytes before, during therapy
- **Tumor lysis syndrome;** hyperkalemia, hyperphosphatemia, hyperuricemia, hypocalcemia; uric acid nephropathy, acute renal failure, metabolic acidosis can also occur; aggressive alkalinization of urine, allopurinol can prevent this
- **I&O ratio;** report fall in urine output to $< 30 \text{ ml/hr}$
- Monitor temp; fever may indicate beginning infection
- Hepatic studies before, during therapy: bilirubin, alk phos, AST, ALT, LDH;

prn or q mo • **Cutaneous vasculitic toxicity and gangrene:** more common in those who are receiving interferon • **Bleeding:** hematuria, guaiac, bruising or petechiae, mucosa or orifices q8hr • Buccal cavity for dryness, sores or ulceration, white patches, oral pain, bleeding, dysphagia • **Pulmonary reactions:** assess for pulmonary fibrosis, fever, dyspnea, diffuse pulmonary infiltrates • **Symptoms indicating severe allergic reaction:** rash, urticaria, itching, flushing • **Neurotoxicity:** headaches, hallucinations, seizures, dizziness

Perform/provide:

- Rinsing of mouth tid-qid with water, club soda; brushing of teeth bid-tid with soft brush or cotton-tipped applicators for stomatitis; use unwaxed dental floss

Evaluate:

- Therapeutic response: decreased tumor size, spread of malignancy

Teach patient/family:

- To report signs of infection: elevated temp, sore throat, flulike symptoms
- To report signs of anemia: fatigue, headache, faintness, SOB, irritability
- To report bleeding: to avoid use of razors, commercial mouthwash
- To avoid use of aspirin products, ibuprofen (thrombocytopenia)
- To avoid foods with citric acid, hot or rough texture if stomatitis is present
- To report stomatitis: any bleeding, white spots, ulcerations in the mouth; to examine mouth daily, report symptoms
- To notify prescriber if pregnancy is planned or suspected, pregnancy (D)
- To notify prescriber of fever, chills, sore throat, nausea, vomiting, anorexia, diarrhea, bleeding, bruising; may indicate blood dyscrasias; mental status changes

☼ Canada only Side effects: *italics* = common; **bold** = life-threatening ⚠
Nurse Alert

hydrOXYzine (Rx)

(hye-drox'i-zeen)

Vistaril

Func. class.: Antianxiety/antihistamine/sedative/hypnotic, antiemetic *Chem. class.:* Piperazine derivative

Do not confuse: hydrOXYzine/hydrALAZINE

Vistaril/Versed

ACTION:

Depresses subcortical levels of CNS, including limbic system, reticular formation; competes with H₁-receptor sites

USES:

Anxiety preoperatively, postoperatively to prevent nausea, vomiting; to potentiate opioid analgesics; sedation; pruritus, ethanol withdrawal

Unlabeled uses: Insomnia, allergic rhinitis, generalized anxiety disorder

CONTRAINDICATIONS:

Pregnancy 1st trimester, breastfeeding; hypersensitivity to this product or cetirizine; acute asthma

Precautions: Pregnancy (C) (2nd/3rd trimester), geriatric patients, debilitated, renal/hepatic disease, closed-angle glaucoma, COPD, prostatic hypertrophy, asthma

DOSAGE AND ROUTES

Calculator

Anxiety

- **Adult:** PO 50-100 mg qid, max 600 mg/day; IM 50-100 mg q4-6hr
- **Geriatric:** PO max 50 mg/day
- **Child >6 yr:** PO 50-100 mg/day in divided doses
- **Child <6 yr:** PO 50 mg/day in divided doses

Alcohol withdrawal

- **Adult:** IM 50-100 mg q4-6hr

Preoperatively/postoperatively (nausea/vomiting)

- **Adult:** IM 25-100 mg q4-6hr

- **Child: IM** 1.1 mg/kg as a single dose

Pruritus

- **Adult: PO** 25 mg tid-qid; **IM** 50-100 mg then q4-6hr prn, switch to **PO** as soon as feasible
- **Child ≥6 yr: PO** 50-100 mg/day in divided doses; **IM** 0.5-1 mg/kg/dose q4-6hr prn, use **PO** when possible
- **Child <6 yr: PO** 50 mg/day in divided doses

Insomnia (unlabeled)

- **Adult: PO** 50-100 mg 30-60 min before bedtime; **IM** 50 mg 30-60 min before bedtime

Renal dose

- **Adult: PO** CCr <50 ml/min, give 50% of dose

Available forms: Tabs 10, 25, 50 mg; caps 25, 50, 100 mg; oral sol 10 mg/ 5 ml; inj 25, 50 mg/ml; oral susp 25 mg/ 5 ml

Administer:

PO route

- Without regard to meals
- Crushed if patient is unable to swallow medication whole
- Shake oral susp before giving

IM route

- Does not need to be diluted; give by **Z**-track inj in large muscle to decrease pain, chance of necrosis, never give IV/SUBCUT (HCl)

Additive compatibilities: CISplatin, cyclophosphamide, cytarabine, dimenhyDRINATE, etoposide, lidocaine, mesna, methotrexate, nafcillin

Syringe compatibilities: Atropine, butorphanol, chlorproMAZINE, cimetidine, codeine, diphenhydrAMINE, doxapram, droperidol, fentaNYL, fluPHENAZine, glycopyrrolate, HYDROmorphine, lidocaine, meperidine, metoclopramide, midazolam, morphine, nalbuphine, oxymorphone, pentazocine, perphenazine, procaine, prochlorperazine, scopolamine, SUFentanil

SIDE EFFECTS

CNS: *Dizziness, drowsiness, confusion, headache, tremors, fatigue, depression, seizures*

CV: Hypotension

GI: Dry mouth, increased appetite, nausea, diarrhea, weight gain

PHARMACOKINETICS

PO: Onset 15-60 min, duration 4-6 hr, half-life 3 hr, metabolized by liver, excreted by kidneys

INTERACTIONS

Increase: CNS depressant effect—barbiturates, opioids, analgesics, alcohol, sedative/hypnotics, other CNS depressants

Increase: anticholinergic effects—phenothiazines, quinine, disopyramide, antihistamines, antidepressants, atropine, haloperidol, MAOIs

Drug/Lab Test

False negative: skin allergy testing

False increase: 17-hydroxycorticosteroids

NURSING CONSIDERATIONS

Assess:

- Anticholinergic effects: dry mouth, dizziness, confusion, hypotension, increased sedation; monitor B/P

Perform/provide:

- Assistance with ambulation during beginning therapy, since drowsiness, dizziness occurs

Evaluate:

- Therapeutic response: decreased anxiety

Teach patient/family:

- To avoid OTC preparations (cold, cough, hay fever) unless approved by prescriber
- To avoid driving, activities that require alertness
- To avoid alcohol, psychotropic medications
- Not to discontinue medication quickly after long-term use
- To rise slowly because fainting may occur

TREATMENT OF OVERDOSE:

Lavage if orally ingested; VS, supportive care; IV norepinephrine for hypotension

Nurse Alert

hyoscyamine (Rx)

(hye-oh-sye'a-meen)

Anaspaz, Colidrops, Colytrol Pediatric, Cystospaz-M, ED-SPAZ, HyoMax, HyoMax SL, Hyosyne, Levisin SL, NuLev, Oscimin, Spasdel, Symax *Func. class.:* Anticholinergic/antispasmodics

Chem. class.: Belladonna alkaloid

ACTION:

Inhibits muscarinic actions of acetylcholine at postganglionic parasympathetic neuroeffector sites; reduces rigidity, tremors, hyperhidrosis of parkinsonism

USES:

Treatment of peptic ulcer disease in combination with other products; other GI disorders, other spastic disorders, IBS, urinary incontinence

CONTRAINDICATIONS:

Hypersensitivity to anticholinergics, closed-angle glaucoma, GI obstruction, myasthenia gravis, paralytic ileus, GI atony, toxic megacolon, prostatic hypertrophy, urinary tract obstruction

Precautions: Pregnancy (C), geriatric patients, hyperthyroidism, dysrhythmias, CHF, ulcerative colitis, hypertension, hiatal hernia, renal/hepatic disease, urinary retention, CAD

DOSAGE AND ROUTES

Calculator

- **Adult/adolescent/child ≥ 12 yr:** PO/SL 0.125-0.25 mg q4hr; **EXT REL** 0.375-0.75 mg q12hr
- **Adult:** IM/SUBCUT/IV 0.25-0.5 mg in a single dose or 2-4 $\times$ /day q6hr
- **Geriatric:** Max 1.5 mg/day in divided doses or max 4 biphasic tabs
- **Child 2-12 yr:** PO SL 0.0625-0.125 q4hr

Available forms: Tabs 0.125, 0.15 mg; ext rel caps 0.375 mg; sol 0.125 mg/ml; elix 0.125 mg/5 ml; sol for inj 0.5 mg/ml; SL tab 0.125 mg; tab, biphasic 0.125, 0.375 mg; orally disintegrating tab 0.125 mg

Administer:

PO route

- Do not break, crush, or chew ext rel caps
- 1/2 hr before meals for better absorption
- Decreased dose to geriatric patients; metabolism may be slowed

IV route

- Use undiluted, inject slowly

SIDE EFFECTS

CNS: *Confusion, stimulation in geriatric patients, headache, insomnia, dizziness, drowsiness, anxiety, weakness, hallucination*

CV: *Palpitations, tachycardia*

EENT: *Blurred vision, photophobia, mydriasis, cycloplegia, increased ocular tension*

GI: *Dry mouth, constipation, paralytic ileus, heartburn, nausea, vomiting, dysphagia, absence of taste*

GU: *Urinary hesitancy, retention, impotence*

INTEG: *Urticaria, rash, pruritus, anhidrosis, fever, allergic reactions*

PHARMACOKINETICS

PO: Duration 4-6 hr, metabolized by liver, excreted in urine, half-life 3.5 hr

INTERACTIONS

Increase: anticholinergic effect—amantadine, tricyclics, MAOIs, H₁-antihistamines

Decrease: hyoscyamine effect—antacids

Decrease: effect of phenothiazines, levodopa, ketoconazole

NURSING CONSIDERATIONS

Assess:

- VS, cardiac status: checking for dysrhythmias, increased rate, palpitations
- I&O ratio; check for urinary retention or hesitancy
- GI complaints: pain, nausea, vomiting, anorexia

Perform/provide:

- Storage in tight container protected from light
- Increased fluids, bulk, exercise to decrease constipation

Evaluate:

- Therapeutic response: absence of epigastric pain, bleeding, nausea, vomiting

Teach patient/family:

- To avoid driving, other hazardous activities until stabilized on medication
- To avoid alcohol or other CNS depressants; they will enhance sedating properties of this product
- To avoid hot environments because heat stroke may occur; that product suppresses perspiration
- To use sunglasses when outside to prevent photophobia; that product may cause blurred vision
- To notify prescriber if pregnancy is planned or suspected, pregnancy (C)

☼ Canada only Side effects: *italics* = common; **bold** = life-threatening ⚠
Nurse Alert

ibandronate (Rx)

(eye-ban'dronate)

Boniva

Func. class.: Bone-resorption inhibitor, electrolyte modifier

Chem. class.: Bisphosphonate

ACTION:

Inhibits bone resorption, apparently without inhibiting bone formation and mineralization; absorbs calcium phosphate crystals in bone and may directly block dissolution of hydroxyapatite crystals of bone; more potent than other products

USES:

Osteoporosis and prophylaxis

Unlabeled uses: Hypercalcemia of malignancy, osteolytic metastases, Paget's disease, osteoporosis (treatment/prevention) in those taking anastrozole

CONTRAINDICATIONS:

Achalasia, esophageal stricture, hypocalcemia, intraarterial administration, renal failure, hypersensitivity to bisphosphonates

Precautions: Pregnancy (C), breastfeeding, children, geriatric patients, anemia, chemotherapy, coagulopathy, dental disease, diabetes mellitus, dysphagia, GI/renal disease, GERD, hypertension, infection, multiple myeloma, phosphate hypersensitivity, vit D deficiency

DOSAGE AND ROUTES

Calculator

Postmenopausal osteoporosis

- **Adult: PO** 2.5 mg/day or 150 mg/mo; **IV BOL** 3 mg q3mo

Prophylaxis

- **Adult: PO** 2.5 mg/day or 150 mg/mo

Paget's disease (unlabeled)

- **Adult: IV** 2 mg as a single dose

Osteoporosis in those taking anastrozole (unlabeled)

- **Postmenopausal women: PO** 150 mg/mo

Osteolytic metastases (unlabeled)

- **Adult:** IV 6 mg over 1 hr × 3 days, repeat q4wk

Hypercalcemia (unlabeled)

- **Adult:** IV INF 2-4 mg over 2 hr

Renal dose

- **Adult:** PO CCr <30 ml/min, avoid use

Available forms: Tabs 2.5, 150 mg; sol for inj 1 mg/ml

Administer:**PO route**

- Give early AM with a glass of water; if monthly, give on same day of each month

Direct IV route

- Use single-dose prefilled syringe; discard unused portion; give over 15-30 sec; give q3mo, do not use if discolored or contains particulates

SIDE EFFECTS

CNS: Fever, insomnia, dizziness, headache

CV: Hypertension, atrial fibrillation

EENT: Ocular pain/inflammation, uveitis

GI: Constipation, nausea, vomiting, diarrhea, dyspepsia

INTEG: Rash, inj site reaction

META: Hypomagnesemia, hypophosphatemia, hypocalcemia, hypercholesterolemia

MS: Bone pain, myalgia, osteonecrosis of the jaw

PHARMACOKINETICS

Half-life 5-60 hr, 86%-99% protein binding; taken up mainly by bones, primarily in areas of high bone turnover; eliminated primarily by kidneys

INTERACTIONS

Increase: neurotoxicity—aminoglycosides, cycloSPORINE, tacrolimus, NSAIDs, radiopaque contrast agents, vancomycin

Increase: hypocalcemia—loop diuretics

Decrease: ibandronate effect—calcium/vit D/iron/aluminum/magnesium salts; separate by 1 hr

Drug/Food

- Do not take with food, calcium

Increase: cholesterol

Drug/Lab Test

Decrease: Alk phos, magnesium, calcium, phosphate

NURSING CONSIDERATIONS

Assess:

- **Osteoporosis:** before and during treatment; DEXA scan for bone mineral density, correct electrolyte imbalances (calcium, magnesium, phosphate) before starting therapy
- Atrial fibrillation
- **Dental health:** before dental extraction, give antiinfectives, osteonecrosis of the jaw may occur
- Blood studies: electrolytes, creatinine/BUN, vit D: correct deficiencies prior to treatment
- For bone pain; use analgesics; may begin within 24 hr or even years after treatment; pain usually subsides after treatment is discontinued

Perform/provide:

- Storage at room temp

Evaluate:

- Therapeutic response: increased bone mineral density

Teach patient/family:

- **To report hypercalcemic relapse:** nausea, vomiting, bone pain, thirst, unusual muscle twitching, muscle spasms, severe diarrhea, constipation
 - To continue with dietary recommendations, including calcium, vit D
 - To obtain an analgesic from provider for bone pain
 - That, if nausea, vomiting occur, small, frequent meals may help
 - To report vision symptoms: blurred vision, edema, inflammation
 - To report if pregnancy is planned or suspected or if planning to breastfeed, pregnancy (C)
 - To exercise regularly, stop smoking, decrease alcohol intake
 - To take PO first thing in AM at least 60 min before other medications, food, beverages, to take monthly dose on same day
 - **To sit upright for ≥ 60 min after PO**
-

🍁 Canada only Side effects: *italics* = common; **bold** = life-threatening ⚠️
Nurse Alert

ibritumomab (Rx)

(ee-brit-u-moe'mab)

[Zevalin](#)

Func. class.: Radiopharmaceutical

Chem. class.: Monoclonal antibody

ACTION:

High affinity for indium-111, yttrium-90; induces CD20+ B-cell lines

USES:

Non-Hodgkin's lymphoma, B-cell NHL

CONTRAINDICATIONS:

Pregnancy (D), hypersensitivity to murine proteins, prior murine antibody exposure

Black Box Warning:

Hypersensitivity to this product, neutropenia, thrombocytopenia

Precautions: Breastfeeding, children, geriatric patients, cardiac conditions, immunizations after therapy

Black Box Warning:

Altered biodistribution, infusion-related reaction

DOSAGE AND ROUTES

Calculator

Step 1

• **Adult:** IV riTUXimab 250 mg/m² given first; premedicate with acetaminophen 650 mg and diphenhydrAMINE 50 mg

Step 2

• **Adult (baseline platelets $\geq 150,000/\text{mm}^3$):** 7-9 days after step 1, give a second dose of riTUXimab 250 mg/m²; within 4 hr of completing riTUXimab inf, give Y-90 ibritumomab tiuxetan 0.4 mCi/kg (14.8 MBq/kg) IV over 10 min, the dose given should be within 10% of actual prescribed dose of Y-90 ibritumomab tiuxetan, total dose given max 32 mCi (1184 MBq) regardless of patient's weight

• **Adult (baseline platelets 100,000-149,000/mm³):** 7-9 days after step 1, give a second dose of riTUXimab 250 mg/m² IV; within 4 hr of completing riTUXimab

inf, give Y-90 ibritumomab tiuxetan 0.3 mCi/kg (11.1 MBq/kg) IV over 10 min; the dose given should be within 10% of actual prescribed dose of Y-90 ibritumomab tiuxetan, total dose given max 32 mCi (1184 MBq) regardless of patient's weight

- **Adult (baseline platelets $<100,000/\text{mm}^3$):** do not use

Available forms: Inj 3.2 mg/2 ml

Administer:

- Do not use as bolus or direct IV
- See manufacturer's product labeling for preparation

SIDE EFFECTS

CV: Cardiac dysrhythmias

GI: Nausea, vomiting, anorexia, abdominal pain, diarrhea

GU: Renal failure

HEMA: Leukopenia, neutropenia, thrombocytopenia, anemia

INTEG: Irritation at site, rash, fatal mucocutaneous infections (rare)

OTHER: Fever, chills, asthenia, headache, angioedema, hypotension, myalgia, bronchospasm, hemorrhage, infections, cough, dyspnea, dizziness, anxiety

SYST: Stevens-Johnson syndrome, secondary malignancies (AML, MDS), fatal infections

PHARMACOKINETICS

Half-life 30 hr

NURSING CONSIDERATIONS

Assess:

Black Box Warning:

Fatal inf reaction: hypoxia, pulmonary infiltrates, ARDS, MI, ventricular fibrillation, cardiogenic shock; most fatal inf reactions occur with 1st inf; potentially fatal

- Biodistribution: 1st image 2-24 hr, 2nd image 48-72 hr, 3rd image 90-120 hr (optimal)
- For infection; murine antibody titers

Black Box Warning:

Severe mucocutaneous reactions: Stevens-Johnson syndrome, lichenoid dermatitis, toxic epidermal lysis; occur 1-13 wk after product given

Black Box Warning:

Tumor lysis syndrome: acute renal failure requiring hemodialysis, hyperkalemia, hypocalcemia, hyperuricemia, hyperphosphatemia

Black Box Warning:

Bone marrow depression: CBC, differential, platelet count weekly; withhold product if WBC $<3500/\text{mm}^3$, or platelet count $<150,000/\text{mm}^3$; notify prescriber

- GI symptoms: frequency of stools
- Signs of dehydration: rapid respirations, poor skin turgor, decreased urine output, dry skin, restlessness, weakness

Perform/provide:

- Increased fluid intake to 2-3 L/day to prevent dehydration unless contraindicated
- Emergency equipment nearby with EPINEPHrine, antihistamines, corticosteroids

Evaluate:

- Therapeutic response: improvement in blood counts, decreased evidence of disease

Teach patient/family:

- To report adverse reactions
- **To use contraception during and for 12 months after therapy; pregnancy (D)**
- About radiation safety precautions, disposal of bodily fluids
- About symptoms of infection
- About neutropenia and bleeding precautions

☼ Canada only Side effects: *italics* = common; **bold** = life-threatening ⚠

ibuprofen (OTC, Rx)

(eye-byoo-proe'fen)

Advil, Advil Children's, Advil Infants' Concentrated, Advil Junior Strength, Caldolor, ElixSure IB, Genpril, Ibren, IBU, Infants Leader Ibu-drops, Midol Cramps and Body Aches Formula, Motrin , Motrin IB, Motrin Infant's, Motrin Junior Strength, Pamprin IB , Samson-8 Select Brand, Top Care Infant, Wal-Profen

ibuprofen lysine (Rx)

NeoProfen

Func.class.: Nonsteroidal antiinflammatory, antipyretic, nonopioid analgesics

Chem. class.: Propionic acid derivative

Do not confuse: [Nuprin](#)/Lupron

ACTION:

Inhibits COX-1, COX-2 by blocking arachidonate; analgesic, antiinflammatory, antipyretic

USES:

Rheumatoid arthritis, osteoarthritis, primary dysmenorrhea, gout, dental pain, musculoskeletal disorders, fever, migraine

Unlabeled uses: Ankylosing spondylitis, bone pain, cystic fibrosis, gouty arthritis, psoriatic arthritis

CONTRAINDICATIONS:

Pregnancy (D) IV after 30 wks; hypersensitivity to this product, NSAIDs, salicylates; asthma; severe renal/hepatic disease

Black Box Warning:

Perioperative pain in CABG

Precautions: Pregnancy (C) 1st and 2nd trimesters, breastfeeding, children, geriatric patients, bleeding disorders, GI disorders, cardiac disorders, hypersensitivity to other antiinflammatory agents, CHF, CCr <25 ml/min

Black Box Warning:

GI bleeding, MI, stroke

DOSAGE AND ROUTES

Calculator

Self-treatment of minor aches/pains

- **Adult/adolescent: PO** (OTC product) 200 mg q4-6hr, may increase to 400 mg q4-6hr if needed, max 1200 mg/day

Analgesic

- **Adult: PO** 200-400 mg q4-6hr, max 3.2 g/day; OTC use max 1200 mg/day
- **Child: PO** 4-10 mg/kg/dose q6-8hr

Moderate to severe pain (hospitalized patients) (Caldolor)

- **Adult: IV** 400-800 mg q6hr as an adjunct to opiate-agonist therapy

Dysmenorrhea

- **Adult: PO** 400 mg q4hr, max 1200 mg/day

Antipyretic

- **Child 6 mo-12 yr: PO** 5 mg/kg (temp <102.5° F or 39.2° C), 10 mg/kg (temp >102.5° F), may repeat q6-8hr, max 40 mg/kg/day

Antiinflammatory

- **Adult: PO** 400-800 mg tid-qid, max 3.2 g/day
- **Child: PO** 30-40 mg/kg/day in 3-4 divided doses, max 50 mg/kg/day

Patent ductus arteriosus (PDA) (NeoProfen)

- **Premature neonate ≤32 wk gestation who weighs 500-1500 g: IV** 10 mg/kg initially, then, if needed, 2 doses of 5 mg/kg at 24-hr intervals; if oliguria occurs, hold dose

Available forms: Tabs 100, 200, 400, 600, 800 mg; cap, liq gels 200 mg; oral susp 100 mg/5 ml; liq 100 mg/5 ml; chew tabs 50, 100 mg; drops 50 mg/1.25 ml; inj 10 mg/ml (NeoProfen); inj (Caldolor) 100 mg/ml

Administer:

PO route

- With food, milk, or antacid to decrease GI symptoms; if nausea and vomiting occur or persist, notify prescriber
- Shake susp well before use
- **Do not use in pregnancy after 30 wks gestation**

IV route

- Patient must be well hydrated prior to administration
- Dilute to ≤4 mg/ml with 0.9% NaCl, LR, D₅; infuse over ≥30 min; do not give IM
- Discard unused portion
- Visually inspect for particulate

- **Ibuprofen lysine:** dilute with dextrose or saline to appropriate volume (10 mg/kg of ibuprofen is recommended); give within 30 min of preparation; give via IV port nearest insertion site; give over 15 min
- Check for extravasation; do not give in same line with TPN; interrupt TPN for 15 min before and after product administration

SIDE EFFECTS

CNS: *Headache*, dizziness, drowsiness, fatigue, tremors, confusion, insomnia, anxiety, depression

CV: Tachycardia, peripheral edema, palpitations, dysrhythmias, **CV thrombotic events, MI, stroke**

EENT: Tinnitus, hearing loss, blurred vision

GI: Nausea, *anorexia*, vomiting, diarrhea, jaundice, **hepatitis**, constipation, flatulence, cramps, dry mouth, peptic ulcer, **GI bleeding, ulceration, necrotizing enterocolitis, GI perforation**

GU: **Nephrotoxicity:** dysuria, hematuria, oliguria, azotemia

HEMA: **Blood dyscrasias**, increased bleeding time

INTEG: Purpura, rash, pruritus, sweating, urticaria, **necrotizing fasciitis**, photosensitivity, photophobia

META: Hyperkalemia, hyperuricemia, hypoglycemia, hyponatremia

SYST: **Anaphylaxis, Stevens-Johnson syndrome**

PHARMACOKINETICS

PO: Onset 1/2 hr, peak 1-2 hr, half-life 1.8-2 hr, metabolized in liver (inactive metabolites), excreted in urine (inactive metabolites), 90%-99% plasma protein binding, does not enter breast milk, well absorbed

INTERACTIONS

Increase: bleeding risk—valproic acid, thrombolytics, antiplatelets, anticoagulants, salicylates

Increase: blood dyscrasia risk—antineoplastics, radiation

Increase: toxicity—**lithium, oral anticoagulants, cycloSPORINE, methotrexate**

Increase: GI reactions—**aspirin, corticosteroids, NSAIDs, alcohol, tobacco**

Increase: hypoglycemia—oral antidiabetics

Decrease: effect of antihypertensives, thiazides, furosemide

Decrease: ibuprofen action—**aspirin**

Drug/Herb

Increase: bleeding risk—feverfew, garlic, ginger, ginkgo, ginseng (*Panax*)

Drug/Lab Test

Increase: BUN, creatinine, LFTs

Decrease: Hgb/Hct, blood glucose, WBC, platelets

NURSING CONSIDERATIONS**Assess:**

- Renal, hepatic, blood studies: BUN, creatinine, AST, ALT, Hgb, stool guaiac, before treatment, periodically thereafter, monitor electrolytes as needed

Black Box Warning:

Perioperative pain in CABG: MI, and stroke can result for 10-14 days, can be fatal

- **Pain:** note type, duration, location, intensity with ROM 1 hr after administration
- Audiometric, ophthalmic exam before, during, after long-term treatment; for eye, ear problems: blurred vision, tinnitus; may indicate toxicity
- **Infection,** may mask symptoms; fever: temp before and 1 hr after administration
- Cardiac status: edema (peripheral), tachycardia, palpitations; monitor B/P, pulse for character, quality, rhythm, especially in patients with cardiac disease, geriatric patients
- For history of peptic ulcer disorder; asthma, aspirin, hypersensitivity; check closely for hypersensitivity reactions

Black Box Warning:

GI bleeding/perforation: chronic use can cause gastritis with or without bleeding, those with a prior history of peptic ulcer disease or GI bleeding, initiate treatment at lower dose; geriatric patients are at greater risk and those who consume >3 alcohol drinks/day

Perform/provide:

- Storage at room temp

Evaluate:

- Therapeutic response: decreased pain, stiffness in joints; decreased swelling in joints; ability to move more easily; reduction in fever or menstrual cramping

Teach patient/family:

- To use sunscreen, sunglasses, and protective clothing to prevent photosensitivity, photophobia

- To report blurred vision, ringing, roaring in ears (may indicate toxicity); that eye and hearing tests should be done during long-term therapy
- To avoid driving, other hazardous activities if dizziness or drowsiness occurs
- ⚠ **Nephrotoxicity:** to report change in urinary pattern, increased weight, edema, increased pain in joints, fever, blood in urine; monitor fluid status, BUN, creatinine
- That therapeutic antiinflammatory effects may take up to 1 mo
- ⚠ To avoid alcohol, NSAIDs, salicylates; bleeding may occur
- To report use of this product to all health care providers
- **Pregnancy:** notify prescriber if pregnancy (C) is planned or suspected, avoid during 3rd trimester pregnancy (D) IV after 30 wk

TREATMENT OF OVERDOSE:

Lavage, activated charcoal, induce diuresis

☼ Canada only Side effects: *italics* = common; **bold** = life-threatening ⚠
Nurse Alert

HIGH ALERT

ibutilide (Rx)

(eye-byoo'tih-lide)

Corvert

Func. class.: Antidysrhythmic (class III)

Chem. class.: Methane sulfonamide

ACTION:

Prolongs duration of action potential and effective refractory period

USES:

For rapid conversion of atrial fibrillation/flutter, including within 1 wk of coronary artery bypass or valve surgery

CONTRAINDICATIONS:

Hypersensitivity

Precautions: Pregnancy (C), breastfeeding, children <18 yr, geriatric patients, sinus node dysfunction, 2nd-or 3rd-degree AV block, electrolyte imbalances, bradycardia, renal/hepatic disease, CHF

Black Box Warning:

QT prolongation, torsades de pointes, ventricular arrhythmias, ventricular tachycardia, cardiac dysrhythmias

DOSAGE AND ROUTES

Calculator

Atrial fibrillation/flutter

- **Adult ≥60 kg:** IV INF 1 vial (1 mg) given over 10 min, may repeat same dose after 10 min
- **Adult <60 kg:** IV INF 0.01 mg/kg given over 10 min, may repeat same dose after 10 min

Available forms: Inj 0.1 mg/ml

Administer:

- Ice compress after stopping inf for extravasation, tubing should be removed and attempt to aspirate product, elevate affected areas

IV route

- Undiluted or diluted in 50 ml 0.9% NaCl, or D₅W (0.017 mg/ml); give over 10 min
- Solution is stable for 48 hr refrigerated or 24 hr at room temp
- Do not admix with other sol, products
- Reduce dosage slowly with ECG monitoring
- Stop infusion as soon as arrhythmia is controlled
- Do not use if discolored or particulate is present

SIDE EFFECTS

CNS: Headache

CV: Hypotension, bradycardia, sinus arrest, CHF, dysrhythmias, torsades de pointes, hypertension, extrasystoles, ventricular tachycardia, bundle branch block, AV block, palpitations, supraventricular extrasystoles, syncope, prolonged QT interval

GI: Nausea

PHARMACOKINETICS

Elimination half-life 6 hr, metabolized by liver, excreted by kidneys

INTERACTIONS

Increase: prodysrhythmia—phenothiazines, tricyclics, tetracyclics, antidepressants, H₁-receptor antagonists, antihistamines

Increase: masking of cardiotoxicity—digoxin

- Do not use within 5 hr of ibutilide: class Ia antidysrhythmics (disopyramide, quinidine, procainamide), class III agents (amiodarone, sotalol)

NURSING CONSIDERATIONS

Assess:

Black Box Warning:

ECG continuously for ≥4 hr to determine product effectiveness; measure PR, QRS, QT intervals, check for PVCs, other dysrhythmias; discontinue if atrial fibrillation/flutter ceases; continue until QT interval corrected for heart rate (QTc) returned to baseline; if used ≥2 days, anticoagulation must be adequate

- I&O ratio; electrolytes: K, Na, Cl
- Hepatic studies: AST, ALT, bilirubin, alk phos
- Dehydration or hypovolemia
- Rebound hypertension after 1-2 hr

- Cardiac rate, respiration: rate, rhythm, character, chest pain

Evaluate:

- Therapeutic response: decrease in atrial fibrillation/flutter

Teach patient/family:

- To report side effects immediately
- About reason for medication

🍁 Canada only Side effects: *italics* = common; **bold** = life-threatening ⚠️

Nurse Alert

HIGH ALERT

IDArubicin (Rx)

(eye-dah-roob'ih-sin)

Idamycin PFS

Func. class.: Antineoplastic, antibiotic

Chem. class.: Anthracycline glycoside

Do not confuse: **IDArubicin**/DOXOrubicin/DAUNOrubicin/epirubicin

Idamycin/Adriamycin

ACTION:

Non-cell-cycle specific; topoisomerase II inhibitor; vesicant; intercalating between DNA base pairs, causing shape change, low free radicals

USES:

Used in combination with other antineoplastics for acute myelocytic leukemia in adults

Unlabeled uses: Breast cancer, liquid tumors, non-Hodgkin's lymphoma, ALL, CLL, AML

CONTRAINDICATIONS:

Pregnancy (D), breastfeeding, hypersensitivity

Black Box Warning:

Myelosuppression, bilirubin >5 mg/dl

Precautions: Children, gout, bone marrow depression, preexisting CV disease

Black Box Warning:

Renal/hepatic disease, heart failure

DOSAGE AND ROUTES

Calculator

- **Adult:** IV 8-12 mg/m²/day × 3 days in combination with cytarabine (induction)

- **Adolescent/child (unlabeled):** IV 10-12 mg/m²/day × 3 days

Renal/hepatic dose

- **Adult:** IV CCr >2.5 mg/dl, reduce dose; bilirubin 2.5-5 mg/dl, reduce dose by

50%; bilirubin >5 mg/dl, do not use

Available forms: Inj 1 mg/ml

Administer:

- Ice compress after stopping inf for extravasation

Intermittent IV INF route

- Do not give IM/SUBCUT
- Use cytotoxic handling procedures after preparing in biologic cabinet wearing gown, gloves, mask
- Antiemetic 30-60 min before product and 6-10 hr after treatment to prevent vomiting
- After reconstituting 5-mg vial with 5 ml 0.9% NaCl (1 mg/1 ml); give over 10-15 min through Y-tube or 3-way stopcock of inf of D₅ or NS; discard unused portion; use caution when needle inserted into vial (negative pressure)

Y-site compatibilities: Amifostine, amikacin, aztreonam, cimetidine, cladribine, cyclophosphamide, cytarabine, diphenhydrAMINE, droperidol, erythromycin, filgrastim, granisetron, imipenem/CISplatin, magnesium sulfate, mannitol, melphalan, metoclopramide, potassium chloride, ranitidine, sargramostim, thiotepe, vinorelbine

SIDE EFFECTS

CNS: Fever, chills, *headache*, *seizures*

CV: *Dysrhythmias*, *CHF*, *pericarditis*, *myocarditis*, peripheral edema, angina, *MI*, *myocardial toxicity*

GI: *Nausea*, *vomiting*, *abdominal pain*, *mucositis*, *diarrhea*, *hepatotoxicity*

GU: *Nephrotoxicity*, red urine

HEMA: *Thrombocytopenia*, *leukopenia*, *anemia*

INTEG: Rash, *extravasation*, dermatitis, *reversible alopecia*, urticaria; thrombophlebitis and tissue necrosis at inj site; radiation recall

SYST: *Infection*, tumor lysis syndrome

PHARMACOKINETICS

Half-life 22 hr; metabolized by liver; crosses placenta; excreted in bile, urine (primarily as metabolites); 97% protein binding

INTERACTIONS

Increase: bleeding risk—anticoagulants, salicylates, NSAIDs, thrombolytics;

avoid concurrent use

Decrease: IDArubicin effect—corticosteroids

Increase: CHF, ventricular dysfunction—trastuzumab

Increase: ECG changes (QT prolongation, changes in QRS voltage)—class IA/III antidysrhythmias, some phenothiazines, and other products that increase QT prolongation

Increase: cardiotoxicity—cyclophosphamide

Increase: toxicity—other antineoplastics or radiation

Decrease: antibody response—live virus vaccines

Drug/Lab Test

Decrease: calcium, platelets, neutrophils

Increase: uric acid, phosphate, potassium

NURSING CONSIDERATIONS

Assess:

Black Box Warning:

CBC, differential, platelet count weekly; notify prescriber of results, severe myelosuppression can occur

- Renal studies: BUN, serum uric acid, urine CCr, electrolytes before, during therapy

 **Tumor lysis syndrome: hyperkalemia, hyperphosphatemia, hyperuricemia, hypocalcemia**

- I&O ratio; report fall in urine output to <30 ml/hr
- Monitor temp; fever may indicate beginning infection

Black Box Warning:

Hepatic studies before, during therapy: bilirubin, AST, ALT, alk phos prn or monthly; check for jaundice of skin and sclera, dark urine, clay-colored stools, itchy skin, abdominal pain, fever, diarrhea

Black Box Warning:

Cardiac toxicity: CHF, dysrhythmias, cardiomyopathy; cardiac studies before and periodically during treatment: ECG, chest x-ray, MUGA; ECG: watch for ST-T wave changes, low QRS and T, possible dysrhythmias (sinus tachycardia, heart block, PVCs)

- **Bleeding:** hematuria, guaiac stools, bruising or petechiae, mucosa or orifices
- Effects of alopecia on body image; discuss feelings about body changes
- Inflammation of mucosa, breaks in skin
- Buccal cavity for dryness, sores, ulceration, white patches, oral pain, bleeding, dysphagia

Black Box Warning:

Local irritation, pain, burning at inj site; extravasation (vesicant)

- GI symptoms: frequency of stools, cramping

Perform/provide:

- Strict handwashing technique, gloves, protective clothing
- Increase fluid intake to 2-3 L/day to prevent urate and calculi formation
- Rinsing of mouth tid-qid with water, club soda; brushing of teeth tid-qid with soft brush or cotton-tipped applicators for stomatitis; use unwaxed dental floss
- Storage at room temp for 3 days after reconstituting or 7 days refrigerated

Evaluate:

- Therapeutic response: decreased liquid tumor, spread of malignancy

Teach patient/family:

- **To report signs of CHF, cardiac toxicity, beginning infection**
- That hair may be lost during treatment; that wig or hairpiece may make patient feel better; that new hair may be different in color, texture
- To avoid foods with citric acid, hot or rough texture
- To avoid crowds, persons with upper respiratory illness
- To report any bleeding, white spots, ulcerations in mouth; to examine mouth daily
- That urine may be red-orange for 48 hr
- **To report if pregnancy is planned or suspected, pregnancy (D)**
- **To use contraception during treatment, for ≥ 4 mo after treatment**
- That all body fluids will change color

☼ Canada only Side effects: *italics* = common; **bold** = life-threatening ⚠
Nurse Alert

HIGH ALERT

ifosfamide (Rx)

(i-foss'fa-mide)

Ifex

Func. class.: Antineoplastic alkylating agent

Chem. class.: Nitrogen mustard

Do not confuse: ifosfamide/cyclophosphamide

ACTION:

Alkylates DNA, RNA, inhibits enzymes that allow synthesis of amino acids in proteins; also responsible for cross-linking DNA strands; activity is not cell-cycle–stage specific

USES:

Testicular cancer

Unlabeled uses: Soft-tissue sarcoma, Ewing's sarcoma, non-Hodgkin's lymphoma, lung/pancreatic sarcoma, bladder, breast, cervical, thymic cancer, desmoid tumor, Ewing's sarcoma, rhabdomyosarcoma

CONTRAINDICATIONS:

Pregnancy (D), hypersensitivity

Black Box Warning:

Bone marrow suppression

Precautions: Breastfeeding, children, renal/hepatic disease, accidental exposure, dehydration, dental disease, infection, IM injection, ocular exposure varicella

Black Box Warning:

Coma, hemorrhagic cystitis

DOSAGE AND ROUTES

Calculator

• **Adult: IV** 1.2-2 g/m²/day × 5 days, repeat course q3wk, given with mesna, epirubicin, ondansetron alpha

Renal dose

• **Adult: IV** CCr 31-60 ml/min, give 75% of dose; CCr 10-30 ml/min, give 50%

of dose; CCr <10 ml/min, do not give

Available forms: Inj 1-, 3-g vials

Administer:

- Antiemetic 30-60 min before product to prevent vomiting
- Visually inspect parenteral products for particulate matter and discoloration before use

IV route

- Give as an intermittent infusion or continuous infusion
- Well hydrate with ≥ 2 L/day of oral or IV fluids to prevent bladder toxicity
- Must be given in combination with mesna to prevent hemorrhagic cystitis
- Close hematologic monitoring is recommended; WBC count, platelet count, and hemoglobin should be obtained before each use and periodically thereafter
- A urinalysis should be performed before each dose to monitor for hematuria

Reconstitution and further dilution:

- Reconstitute 1 or 3 grams with 20 or 60 ml, respectively, of sterile water for injection or bacteriostatic water for injection containing parabens or benzyl alcohol to give IV solutions containing 50 mg/ml
- Solutions may be diluted further to achieve concentrations of 0.6–20 mg/ml in the following solutions: 5% dextrose for injection, 0.9% sodium chloride for injection, lactated Ringer's for injection, or sterile water for injection
- Infuse slowly over at least 30 min
- Diluted and reconstituted solutions must be refrigerated and used within 24 hr

Additive compatibilities: CARBOplatin, CISplatin, etoposide, fluorouracil, mesna

Y-site compatibilities: Allopurinol, amifostine, amphotericin B cholesteryl, aztreonam, DOXOrubicin liposome, filgrastim, fludarabine, gallium, granisetron, melphalan, ondansetron, PACLitaxel, piperacillin/tazobactam, propofol, sargramostim, sodium bicarbonate, teniposide, thiotepa, vinorelbine

SIDE EFFECTS

CNS: Facial paresthesia, fever, malaise, somnolence, confusion, depression, hallucinations, dizziness, disorientation, **seizures, coma**, cranial nerve dysfunction, **encephalopathy**

GI: Nausea, vomiting, anorexia, **hepatotoxicity**, stomatitis, dyslipidemia, hyperglycemia, constipation, diarrhea

GU: **Hematuria**, **nephrotoxicity**, **hemorrhagic cystitis**, dysuria, urinary frequency

HEMA: **Thrombocytopenia**, **leukopenia**, **anemia**, retrograde ejaculation

INTEG: Dermatitis, alopecia, pain at inj site, hyperpigmentation

META: Metabolic acidosis

PHARMACOKINETICS

Metabolized by liver, saturation occurs at high doses, excreted in urine, half-life 7-15 hr, depends on dose

INTERACTIONS

Increase: myelosuppression—other antineoplastics, radiation

Increase: toxicity—CYP3A4, a weak P-gp inhibitor, inducers, barbiturates, allopurinol

Increase: bleeding risk—NSAIDs, anticoagulants, salicylates, thrombolytics

Decrease: antibody response—live virus vaccines

Decrease: effect of ifosfamide—CYP3A4 inhibitors

- Do not use within 24 hr of hematopoietic progenitor cells

NURSING CONSIDERATIONS

Assess:

- Hepatic studies before, during therapy (bilirubin, AST, ALT, LDH) monthly or as needed; jaundice of skin and sclera, dark urine, clay-colored stools, itchy skin, abdominal pain, fever, diarrhea

Black Box Warning:

CBC, differential, platelet count weekly; withhold product if WBC <2000 or platelet count <50,000; notify prescriber; severe myelosuppression may occur

- Monitor temp (may indicate beginning infection)
- Blood dyscrasias (anemia, granulocytopenia); bruising, fatigue, bleeding, poor healing
- Allergic reactions: dermatitis, exfoliative dermatitis, pruritus, urticaria

Black Box Warning:

I&O ratio; monitor for hematuria; hemorrhagic cystitis can occur; increase fluids to 3 L/day; urinalysis before each dose, not to give at night

Black Box Warning:

Neurologic symptoms: hallucinations, confusion, disorientation, coma; product should be discontinued

- Bleeding: hematuria, guaiac, bruising or petechiae, mucosa or orifices

Perform/provide:

- Storage of powder at room temp

Evaluate:

- Therapeutic response: decrease in size and spread of tumor

Teach patient/family:

- To notify prescriber of sore throat, swollen lymph nodes, malaise, fever; other infections may occur
- Not to have vaccinations during or after treatment
- That hair may be lost during treatment; that wig or hairpiece may make the patient feel better; that new hair may be different in color, texture
- To report signs of anemia: fatigue, headache, faintness, SOB, irritability
- To report bleeding; to avoid use of razors, commercial mouthwash
- To avoid use of aspirin products, NSAIDs, ibuprofen because hemorrhage can occur
- To notify prescriber if pregnancy is planned or suspected, pregnancy (D)
- To use contraceptive measures during therapy; not to breastfeed
- To avoid crowds, persons with infections
- To report confusion, hallucinations, extreme drowsiness, numbness, tingling; to avoid alcohol use for ≥ 4 mo after treatment
- To avoid driving, hazardous activities until reaction is known
- To use excessive fluids and urinate often to prevent hemorrhagic cystitis

🍁 Canada only Side effects: *italics* = common; **bold** = life-threatening ⚠️
Nurse Alert

iloperidone (Rx)

(ill-o-pehr'ih-dohn)

Fanapt

Func. class.: Antipsychotic

Chem. class.: Benzisoxazole derivative

ACTION:

Unknown; may be mediated through both dopamine type 2 (D2) and serotonin type 2 (5-HT2) antagonism

USES:

Schizophrenia

CONTRAINDICATIONS:

Breastfeeding, hypersensitivity

Precautions: Pregnancy (C), children, geriatric patients, renal/hepatic disease, breast cancer, Parkinson's disease, dementia with Lewy bodies, seizure disorder, QT prolongation, bundle branch block, acute MI, ambient temperature increase, AV block, stroke, substance abuse, suicidal ideation, tardive dyskinesia, torsade de pointes, blood dyscrasias

Black Box Warning:

Increased mortality in elderly patients with dementia-related psychosis

DOSAGE AND ROUTES

Calculator

• **Adult: PO** 1 mg bid day 1, 2 mg bid day 2, 4 mg bid day 3, 6 mg bid day 4, 8 mg bid day 5, 10 mg bid day 6, 12 mg bid day 7; max 24 mg/day in 2 divided doses; reduce dose by 50% in patient who is a poor metabolizer of CYP2D6 or when used with strong CYP2D6/CYP3A4 inhibitors

Available forms: Tabs 1, 2, 4, 6, 8, 10, 12 mg; titration pack

Administer:

- Use without regard to meals
- Reduced dose in geriatric patients
- Anticholinergic agent for EPS
- Avoid use with CNS depressants

SIDE EFFECTS

CNS: *EPS, pseudoparkinsonism, akathisia, dystonia, tardive dyskinesia; drowsiness, seizures, neuroleptic malignant syndrome*, dizziness, delirium, depression, paranoia, fatigue, hostility, lethargy, restlessness, vertigo, tremor

CV: Orthostatic hypotension, *heart failure, AV block, QT prolongation*, tachycardia

EENT: Blurred vision, cataracts, nystagmus, tinnitus

GI: *Nausea*, vomiting, *anorexia, constipation*, jaundice, weight gain/loss, abdominal pain, stomatitis

GU: Hyperprolactinemia, urinary retention/incontinence, testicular pain, *renal failure*

HEMA: *Agranulocytosis, leukopenia, neutropenia*

MISC: *Renal artery occlusion, hyperglycemia, dyslipidemia*

PHARMACOKINETICS

PO: Extensively metabolized by liver to major active metabolite by CYP2D6, CYP3A4; protein binding 95%; peak 2-4 hr; excreted in urine and feces; terminal half-life 18 hr in extensive metabolizers; 33 hr in poor metabolizers

INTERACTIONS

Increase: *serotonin syndrome, neuroleptic malignant syndrome—SSRIs, SNRI*

Increase: sedation—other CNS depressants, alcohol

Increase: iloperidone effect, decreased clearance—CYP2D6, CYP3A4 inhibitors (delavirdine, indinavir, isoniazid, itraconazole, dalfopristin, ritonavir, tipranavir), reduce dose

Increase: *QT prolongation—class IA/ III antidysrhythmics, some phenothiazines, β -agonists, local anesthetics, tricyclics, haloperidol, methadone, chloroquine, clarithromycin, droperidol, erythromycin, pentamidine*

Decrease: iloperidone action—CYP2D6, CYP3A4 inducers (carbamazepine, barbiturates, phenytoins, rifampin)

Drug/Lab Test

Increase: prolactin levels, cholesterol, glucose, lipids, triglycerides

Decrease: potassium

NURSING CONSIDERATIONS

Assess:

- Mental status before initial administration
- I&O ratio; palpate bladder if urinary output is low
- Bilirubin, CBC, hepatic studies monthly, monitor glucose, hyperglycemia may occur
- Urinalysis before, during prolonged therapy, monitor potassium, magnesium and lipid panel
- Affect, orientation, LOC, reflexes, gait, coordination, sleep-pattern disturbances
- B/P standing and lying; pulse, respirations; q4hr during initial treatment; establish baseline before starting treatment; report drops of 30 mm Hg; watch for ECG changes; QT prolongation may occur; dizziness, faintness, palpitations, tachycardia on rising
- EPS, including akathisia, tardive dyskinesia (bizarre movements of the jaw, mouth, tongue, extremities), pseudoparkinsonism (rigidity, tremors, pill rolling, shuffling gait)

Black Box Warning:

Serious reactions in the geriatric patient: fatal pneumonia, heart failure, sudden death, not to be used in the elderly with dementia

Black Box Warning:

Neuroleptic malignant syndrome: hyperthermia, increased CPK, altered mental status, muscle rigidity

- Constipation, urinary retention daily; if these occur, increase bulk and water in diet
- Weight gain, hyperglycemia, metabolic changes in diabetes

Perform/provide:

- Supervised ambulation until patient is stabilized on medication; do not involve patient in strenuous exercise program because fainting is possible; patient should not stand still for long periods
- Sips of water, candy, gum for dry mouth
- Storage in tight, light-resistant container (PO)

Evaluate:

- Therapeutic response: decrease in emotional excitement, hallucinations, delusions, paranoia; reorganization of patterns of thought, speech

Teach patient/family:

- That orthostatic hypotension may occur; to rise from sitting or lying position

gradually

- To avoid hot tubs, hot showers, tub baths because hypotension may occur; that heat stroke may occur in hot weather; to take extra precautions to stay cool
- To avoid abrupt withdrawal of product because EPS may result; that product should be withdrawn slowly, to review symptoms of neuroleptic malignant syndrome
- To avoid OTC preparations (cough, hay fever, cold) unless approved by prescriber because serious product interactions may occur; to avoid use of alcohol because increased drowsiness may occur
- To avoid hazardous activities if drowsy or dizzy
- To comply with product regimen
- To report impaired vision, tremors, muscle twitching
- To use contraception; to inform prescriber if pregnancy is planned or suspected

TREATMENT OF OVERDOSE:

Lavage if orally ingested; provide airway; *do not induce vomiting*

🍁 Canada only Side effects: *italics* = common; **bold** = life-threatening ⚠️
Nurse Alert

imatinib (Rx)

(im-ah-tin'ib)

Gleevec

Func. class.: Antineoplastic—miscellaneous

Chem. class.: Protein-tyrosine kinase inhibitor

ACTION:

Inhibits Bcr-Abl tyrosine kinase created in patients with chronic myeloid leukemia (CML), also inhibits tyrosine kinases including EGF, FGF, PDGF, SCF, VEGF, NFG

USES:

Treatment of chronic myeloid leukemia (CML); Philadelphia-chromosome–positive patients in blast-cell crisis or patients in chronic failure after treatment failure with interferon alfa; gastrointestinal stromal tumors (GIST) positive for c-Kit; chronic eosinophilic leukemia, acute lymphocytic leukemia, dermatofibrosarcoma protuberans, myelodysplastic syndrome, systemic mastocytosis

Unlabeled uses: Desmoid tumor

CONTRAINDICATIONS:

Pregnancy (D), hypersensitivity

Precautions: Breastfeeding, children, geriatric patients, cardiac/renal/hepatic/dental disease, GI bleeding, bone marrow suppression, infection, thrombocytopenia, neutropenia, immunosuppression

DOSAGE AND ROUTES

Calculator

For the treatment of Philadelphia chromosome positive (Ph+) chronic myelogenous leukemia (CML) chronic phase as initial therapy

- **Adult: PO** 400 mg/day, continue as long as beneficial; may increase to 600 mg/day in the absence of severe adverse reactions and severe non–leukemia-related neutropenia or thrombocytopenia
- **Adolescent/child >2 yr: PO** 340 mg/m²/day, max 600 mg/day; the daily dose may be given as a single dose or split into 2 doses given once in the morning and

once in the evening

Adult with Ph+ CML in chronic phase after the failure of interferon-alfa therapy

- **Adult: PO** 400 mg every day; continue as long as beneficial, may increase to 600 mg/day

Pediatric patients with Ph+ chronic phase CML whose disease has recurred after hematopoietic stem cell transplant or who are resistant to interferon-alfa therapy

- **Adolescent/child >3 yr: PO** 260 mg/m²/day as a single daily dose, or the dose may be divided given once in the morning and once in the evening; may increase to 340 mg/m²/day

Patients with Ph+ CML in accelerated phase or blast crisis

- **Adult: PO** 600 mg every day, continue as long as beneficial, may increase to 800 mg/day (400 mg bid)

Resistant or relapsed PH+ acute lymphocytic leukemia (ALL)

- **Adult: PO** 600 mg every day, continue as long as beneficial

Kit (CD117)-positive unresectable and/or metastatic GIST

- **Adult: PO** 400–600 mg every day, may increase to 400 mg bid

Adjuvant treatment of kit (CD117)-positive GIST after complete gross resection

- **Adult: PO** 400 mg/day

Patients with hypereosinophilic syndrome (HES) and/or chronic eosinophilic leukemia (CEL) who have the FIPL1L1-PDGFR α -fusion kinase (mutational analysis or FISH demonstration of CHIC2 allele deletion) and for patients with HES and/or CEL who are FIPL1L-PDGFR α -fusion kinase negative or unknown

- **Adult: PO** 400 mg/day in those who are FIPL1L-PDGFR α -fusion kinase negative or unknown; for HES/CEL patients with demonstrated FIP1L1-PDGFR α -fusion kinase, 100 mg/day, may increase to 400 mg

Myelodysplastic syndrome (MDS)/myeloproliferative disease (MPD) associated with the PDGFR (platelet-derived growth factor receptor) gene rearrangements

- **Adult: PO** 400 mg/day

Aggressive systemic mastocytosis (ASM) without D816V c-Kit mutation or with c-Kit mutation status unknown

- **Adult: PO** 400 mg/day in those without the FIP1L1-PDGFR- α c-Kit mutation;

if c-Kit status is unknown or not available, give 400 mg/day

Unresectable, recurrent, and/or metastatic dermatofibrosarcoma protuberans (DFSP)

- **Adult: PO** 400 mg bid (800 mg/day)

Renal dose

- **Adult: PO** CCr 40-59 ml/min, max 600 mg/day; CCr 20-39 ml/min, decrease initial dose by 50%, max 400 mg/day; CCr <20 ml/min, use with caution, 100 mg/day

Hepatic dose

- **Adult: PO** Total bilirubin 1.5-3 × ULN and any AST, decrease initial dose to 400 mg/day; total bilirubin >3 × ULN and any AST, decrease initial dose to 300 mg/day

Available forms: Tabs 100, 400 mg

Administer:

- With meal and large glass of water to decrease GI symptoms; doses of 800 mg should be given as 400 mg bid
- Tab may be dispersed in a glass of water or apple juice, use 50 ml of liquid for 100-mg tab, 200 ml liquid for 400-mg tab
- Continue as long as beneficial

SIDE EFFECTS

CNS: CNS hemorrhage, headache, dizziness, insomnia

CV: Hemorrhage, heart failure, cardiac tamponade, hypereosinophilia, cardiac toxicity

EENT: Blurred vision, conjunctivitis

GI: Nausea, hepatotoxicity, vomiting, dyspepsia, GI hemorrhage, anorexia, abdominal pain, GI perforation, diarrhea

HEMA: Neutropenia, thrombocytopenia, bleeding

INTEG: Rash, pruritus, alopecia, photosensitivity

META: Fluid retention, hypokalemia, edema

MISC: Fatigue, epistaxis, pyrexia, night sweats, increased weight, flulike symptoms, hypothyroidism

MS: Cramps, pain, arthralgia, myalgia

RESP: Cough, dyspnea, nasopharyngitis, pneumonia, upper respiratory tract infection, pleural effusion, edema

PHARMACOKINETICS

Well absorbed (98%); protein binding 95%; metabolized by CYP3A4; excreted in feces, small amount in urine; peak 2-4 hr; duration 24 hr (imatinib), 40 hr (metabolite); half-life 18-40 hr

INTERACTIONS

Increase: hepatotoxicity—acetaminophen

Increase: imatinib concentrations—CYP3A4 inhibitors (ketoconazole, itraconazole, erythromycin, clarithromycin)

Increase: plasma concentrations of simvastatin, calcium channel blockers, ergots

Increase: plasma concentration of warfarin; avoid use with warfarin; use low-molecular-weight anticoagulants instead

Decrease: imatinib concentrations—CYP3A4 inducers (dexamethasone, phenytoin, carbamazepine, rifampin, phenobarbital)

Drug/Herb

Decrease: imatinib concentration—St. John's wort

Drug/Lab Test

Increase: bilirubin, amylase, LFTs

Decrease: albumin, calcium, potassium, sodium, phosphate, platelets, neutrophils, leukocytes, lymphocytes

NURSING CONSIDERATIONS

Assess:

- **Bone marrow suppression:** ANC, platelets; during chronic phase, if $ANC < 1 \times 10^9/L$ and/or platelets $< 50 \times 10^9/L$, stop until $ANC > 1.5 \times 10^9/L$ and platelets $> 75 \times 10^9/L$; during accelerated phase/blast crisis, if $ANC < 0.5 \times 10^9/L$ and/or platelets $< 10 \times 10^9/L$, determine whether cytopenia related to biopsy/aspirate; if not, reduce dose by 200 mg; if cytopenia continues, reduce dose by another 100 mg; if cytopenia continues for 4 wk, stop product until $ANC \geq 1 \times 10^9/L$
- **Renal toxicity:** if bilirubin $> 3 \times IULN$, withhold imatinib until bilirubin levels return to $< 1.5 \times IULN$
- **Hepatotoxicity:** monitor LFTs, before treatment monthly; if liver transaminases $> 5 \times IULN$, withhold imatinib until transaminase levels return to $< 2.5 \times IULN$

- Monitor CBC for first month, biweekly next month and periodically thereafter; neutropenia (2-3 wk) and thrombocytopenia (3-4 wk) and anemia may occur; may need dosage decrease or discontinuation

- Signs of fluid retention, edema: weigh, monitor lung sounds, assess for edema; some fluid retention is dose dependent

Perform/provide:

- Nutritious diet with iron, vit supplement, low fiber, few dairy products
- Storage at 77° F (25° C)

Evaluate:

- Therapeutic response: decrease in leukemic cells or size of tumor

Teach patient/family:

- To report adverse reactions immediately: shortness of breath, swelling of extremities, bleeding
- About reason for treatment, expected results
- That effect on male infertility is unknown
- Not to stop or change dose—to avoid hazardous activities until response is known, dizziness may occur
- To take with food and water; for those unable to swallow tabs, to mix in liquid (30 m for 100 mg) or 200 ml for 400 mg) after dissolved, stir and consume
- To avoid OTC products unless approved by prescriber
- To notify prescriber if pregnancy is planned or suspected, pregnancy (D), do not breastfeed

☼ Canada only Side effects: *italics* = common; **bold** = life-threatening ⚠
Nurse Alert

imipenem/cilastatin (Rx)

(i-me-pen'em sye-la-stat'in)

Primaxin IM, Primaxin IV

Func. class.: Antiinfective—miscellaneous

Chem. class.: Carbapenem

Do not confuse: imipenem/Omnipen

Primaxin/Premarin

ACTION:

Interferes with cell-wall replication of susceptible organisms; osmotically unstable cell wall swells, bursts from osmotic pressure; addition of cilastatin prevents renal inactivation that occurs with high urinary concentrations of imipenem

USES:

Serious infections caused by gram-positive *Streptococcus pneumoniae*, group A β -hemolytic streptococci, *Staphylococcus aureus*, enterococcus; gram-negative *Klebsiella*, *Proteus*, *Escherichia coli*, *Acinetobacter*, *Serratia*, *Pseudomonas aeruginosa*, *Salmonella*, *Shigella*, *Haemophilus influenzae*, *Listeria* sp.

CONTRAINDICATIONS:

Hypersensitivity to this product or amide local anesthetics, or carbapenems; AV block, shock (IM)

Precautions: Pregnancy (C), breastfeeding, children, geriatric patients, seizure disorders, renal disease, head trauma; hypersensitivity to cephalosporins, penicillins; pseudomembranous colitis, ulcerative colitis

DOSAGE AND ROUTES

Calculator

Intraabdominal, gynecologic, lower respiratory tract, skin and skin structure, bone and joint infections; septicemia, endocarditis, febrile neutropenia (unlabeled), and polymicrobial infections for fully susceptible organisms including gram-positive or gram-negative aerobes and anaerobes

- **Adult ≥ 70 kg:** IV 250 mg every 6 hr (mild infections); 500 mg every 6–8 hr (moderate infections); 500 mg every 6 hr (severe life-threatening infections)

- **Adult 60 kg: IV** 250 mg IV every 8 hr (mild infections); 250 mg every 6 hr (moderate or severe life-threatening infections)
- **Adult 50 kg: IV** 125 mg every 6 hr (mild infections) 250 mg every 6 hr (moderate or severe life-threatening infections)
- **Adult 40 kg: IV** 125 mg every 6 hr (mild infections); 250 mg every 6–8 hr (moderate infections); 250 mg every 6 hr (severe life-threatening infections)
- **Adult 30 kg: IV** 125 mg every 8 hr (mild infections); 125 mg every 6 hr or 250 mg every 8 hr (moderate infections); 250 mg every 8 hr (severe life-threatening infections)
- **Adolescent/child/infant ≥3 mo: IV** 15–25 mg/kg every 6 hr
- **Infant 1–3 mo and ≥1500 g: IV** 25 mg/kg every 6 hr
- **Neonate 1–4 wk and ≥1500 g: IV** 25 mg/kg every 8 hr
- **Neonate <7 days and ≥1500 g: IV** 25 mg/kg every 12 hr

Moderately susceptible organisms, primarily some strains of *P. aeruginosa*

- **Adult ≥70 kg: IV** 500 mg every 6 hr (mild infections); 500 mg every 6 hr or 1 g every 8 hr (moderate infections); 1 g every 6–8 hr (life-threatening infections)
- **Adult 60 kg: IV** 500 mg every 8 hr (mild infections); 500 mg every 8 hr or 750 mg every 8 hr (moderate infections); 0.75–1 g every 8 hr (life-threatening infections)
- **Adult 50 kg: IV** 250 mg every 6 hr (mild infections); 250–500 mg every 6 hr (moderate infections); 500 mg every 6 hr or 750 mg every 8 hr (life-threatening infections)
- **Adult 40 kg: IV** 250 mg every 6 hr (mild infections); 250 mg every 6 hr or 500 mg every 8 hr (moderate infections); 500 mg every 6–8 hr (life-threatening infections)
- **Adult 30 kg: IV** 250 mg every 8 hr (mild infections); 250 mg every 6–8 hr; 250 mg every 6 hr or 500 mg every 8 hr (life-threatening infections)
- **Adolescent/child/infant ≥3 mo: IV** 15–25 mg/kg every 6 hr
- **Infant 1–3 mo weighing ≥1500 g: IV** 25 mg/kg every 6 hr
- **Neonate 1–4 wk weighing ≥1500 g: IV** 25 mg/kg every 8 hr
- **Neonate <7 days weighing ≥1500 g: IV** 25 mg/kg every 12 hr

Mild to moderate lower respiratory tract, skin and skin structure, or gynecologic infections

- **Adult/adolescent/child ≥12 yr: IM** 500 or 750 mg every 12 hr, max 1.5 g/day

Mild to moderate intraabdominal infections, including acute gangrenous or perforated appendicitis and appendicitis with peritonitis

- **Adult/adolescent/child ≥ 12 yr:** IM 750 mg every 12 hr, max 1.5 g/day

Community-acquired pneumonia (CAP) in ICU patients with risk factors for *Pseudomonas* infection

- Imipenem; cilastatin in combination with ciprofloxacin or an aminoglycoside plus a respiratory fluoroquinolone or an advanced macrolide

- **Adult ≥ 70 kg:** IV 500 mg every 6–8 hr
- **Adult 60 kg:** IV 250 mg every 6 hr
- **Adult 50 kg:** IV 250 mg every 6 hr
- **Adult 40 kg:** IV 250 mg every 6–8 hr
- **Adult 30 kg:** IV 125 mg every 6 hr or 250 mg every 8 hr

Empiric treatment of aspiration pneumonia

- **Adult:** IV 500–1000 mg every 6 hr $\times$ 10 days

Renal dose

- **Adult ≥ 70 kg (reduce normal dose of 1 g/day to):** IV CCr 41–70 ml/min, 250 mg q8hr; CCr 6–40 ml/min, 250 mg q12hr; *(reduce normal dose of 1.5 g/day to):* CCr 41–70 ml/min, 250 mg q6hr; CCr 21–40 ml/min, q8hr; CCr 6–20 ml/min, 250 mg q12hr; *(reduce normal dose of 2 g/day to):* CCr 41–70 ml/min, 500 mg q8hr; CCr 21–40 ml/min, 250 mg q6hr; CCr 6–20 ml/min, 250 mg q12hr

Available forms: Powder for sol inj 250, 500 mg; powder for susp 500 mg

Administer:

- After C&S is taken

IM route

- Reconstitute 500 mg/2 ml lidocaine without EPINEPHrine; shake
- Inject deeply in large muscle, aspirate, product for IM is not for IV use

IV route

- After reconstitution of 250 or 500 mg with 10 ml of diluent and shake; add to ≥ 100 ml of same inf sol
- 250–500 mg over 20–30 min; ≥ 750 mg over 40–60 min; give through Y-tube or 3-way stopcock; do not give by IV bolus or if cloudy

Y-site compatibilities: Acyclovir, amifostine, aztreonam, cefepime, cisatracurium, diltiazem, famotidine, fludarabine, foscarnet, granisetron, IDArubicin, insulin (regular), melphalan, methotrexate, ondansetron, propofol,

remifentanyl, tacrolimus, teniposide, thiotepe, vinorelbine, zidovudine

SIDE EFFECTS

CNS: Fever, somnolence, **seizures**, confusion, dizziness, weakness, myoclonus

CV: Hypotension, palpitations, tachycardia

GI: *Diarrhea, nausea, vomiting*, **pseudomembranous colitis, hepatitis**, glossitis

GU: **Renal toxicity/failure**

HEMA: **Eosinophilia, neutropenia**, decreased Hgb, Hct

INTEG: Rash, urticaria, pruritus, pain at inj site, phlebitis, erythema at inj site

RESP: Chest discomfort, dyspnea, hyperventilation

SYST: **Anaphylaxis, Stevens-Johnson syndrome**

PHARMACOKINETICS

IV: Onset immediate, peak 1/2-1 hr, half-life 1 hr, 70%-80% excreted unchanged in urine

INTERACTIONS

Increase: imipenem plasma levels—probenecid

Increase: antagonistic effect— β -lactam antibiotics

Increase: seizure risk—ganciclovir, theophylline, aminophylline, cycloSPORINE

Decrease: effect of valproic acid

Drug/Lab Test

Increase: AST, ALT, LDH, BUN, alk phos, bilirubin, creatinine

False positive: direct Coombs' test

NURSING CONSIDERATIONS

Assess:

- Renal studies: creatinine/BUN
- **Infection:** increased temp, WBC, characteristics of wounds, sputum, urine or stool culture
- Sensitivity to penicillin—may have sensitivity to this product
- Renal disease: lower dose may be required
- Bowel pattern daily; if severe diarrhea occurs, product should be discontinued; may indicate pseudomembranous colitis

⚠ Allergic reactions, anaphylaxis: rash, urticaria, pruritus, wheezing, laryngeal

edema; may occur a few days after therapy begins; have epinephrine, antihistamine, emergency equipment available

- **Overgrowth of infection:** perineal itching, fever, malaise, redness, pain, swelling, drainage, rash, diarrhea, change in cough, sputum

Evaluate:

- Therapeutic response: negative C&S; absence of signs and symptoms of infection

Teach patient/family:

⚠ To report severe diarrhea; may indicate pseudomembranous colitis

⚠ To report sore throat, bruising, bleeding, joint pain; may indicate blood dyscrasias (rare)

TREATMENT OF ANAPHYLAXIS:

EPINEPHrine, antihistamines; resuscitate if needed

🇨🇦 Canada only Side effects: *italics* = common; **bold** = life-threatening ⚠
Nurse Alert

imipramine (Rx)

(im-ip'ra-meen)

Tofranil, Tofranil PM

Func. class.: Antidepressant, tricyclic

Chem. class.: Dibenzazepine, tertiary amine

Do not confuse: **imipramine**/desipramine

ACTION:

Blocks reuptake of norepinephrine, serotonin into nerve endings, thereby increasing action of norepinephrine, serotonin in nerve cells

USES:

Depression, enuresis in children

Unlabeled uses: Chronic pain, migraine headaches, cluster headaches as adjunct, incontinence, ADHD, neuralgia, bulimia, neuropathic pain, social phobia

CONTRAINDICATIONS:

Pregnancy (D), hypersensitivity to tricyclics, AV block, bundle branch block, ileus, QT prolongation, acute MI

Precautions: Breastfeeding, geriatric patients, suicidal patients, severe depression, increased intraocular pressure, closed-angle glaucoma, urinary retention, cardiac/hepatic disease, hyperthyroidism, electroshock therapy, elective surgery, seizure disorders, prostatic hypertrophy, MI

Black Box Warning:

Children other than for enuresis; suicidal ideation

DOSAGE AND ROUTES

Calculator

Depression

- **Adult: PO** 75-100 mg/day in divided doses, may increase by 25-50 mg to 200 mg/day (outpatients), 300 mg/day (inpatients); may give daily dose at bedtime
- **Geriatric: PO** 25-50 mg at bedtime, may increase to 100 mg/day in divided doses
- **Child ≥6 yr (unlabeled): PO** 1.5 mg/kg/day in divided doses, max 2.5

mg/kg/day

Enuresis

- **Child 6-12 yr: PO** 10-25 mg at bedtime, max 50 mg

Neuropathic pain (unlabeled)

- **Adult: PO** 10-150 mg/day

Social phobia/panic disorder (unlabeled)

- **Adult: PO** 10 mg at bedtime, titrate q2-4days to 100-200 mg/day

Overactive bladder (OAB) (unlabeled)

- **Adult: PO** 10-50 mg daily, may titrate to 150 mg/day

Available forms: Tabs 10, 25, 50 mg; caps 75, 100, 125, 150 mg

Administer:

PO route

- Not to break, crush, or chew caps
- With food or milk for GI symptoms
- Dosage at bedtime if oversedation occurs during day; may take entire dose at bedtime; geriatric patients may not tolerate once daily dosing
- Sugarless gum, hard candy, or frequent sips of water for dry mouth

SIDE EFFECTS

CNS: *Dizziness, drowsiness, confusion, seizures, headache, anxiety, tremors, stimulation, weakness, insomnia, nightmares, EPS (geriatric patients), increased psychiatric symptoms, paresthesia*

CV: *Orthostatic hypotension, ECG changes, tachycardia, hypertension, palpitations, dysrhythmias*

EENT: *Blurred vision, tinnitus, mydriasis*

GI: *Diarrhea, dry mouth, nausea, vomiting, paralytic ileus; increased appetite; cramps, epigastric distress, jaundice, hepatitis, stomatitis, constipation, taste change*

GU: *Retention, acute renal failure*

HEMA: *Agranulocytosis, thrombocytopenia, eosinophilia, leukopenia*

INTEG: *Rash, urticaria, sweating, pruritus, photosensitivity; hyperpigmentation (rare)*

PHARMACOKINETICS

Steady state 2-5 days; metabolized to desipramine by liver; excreted in urine,

breast milk, feces; crosses placenta; half-life 6-20 hr

INTERACTIONS

⚠️ **Hyperpyretic crisis, seizures, hypertensive episode:** MAOIs, cloNIDine

⚠️ **Increase:** serotonin syndrome, neuroleptic malignant syndrome—SSRIs, SNRIs, serotonin-receptor agonists; avoid concurrent use, linezolid, methylene blue IV

Increase: QT interval—class IA/III antidysrhythmics, tricyclics, gatifloxacin, levofloxacin, moxifloxacin, ziprasidone

Increase: effects of direct-acting sympathomimetics (EPINEPHrine), alcohol, barbiturates, benzodiazepines, CNS depressants

Decrease: effects of guanethidine, cloNIDine, indirect-acting sympathomimetics (ePHEDrine)

Drug/Herb

Increase: serotonin syndrome—SAM-e, St. John's wort

Drug/Lab Test

Increase: serum bilirubin, alk phos, blood glucose

Decrease: 5-HIAA, VMA, urinary catecholamines

NURSING CONSIDERATIONS

Assess:

- B/P (lying, standing), pulse q4hr; if systolic B/P drops 20 mm Hg, hold product, notify prescriber; take vital signs q4hr in patients with CV disease
- Blood studies: CBC, leukocytes, differential, cardiac enzymes, serum imipramine levels (125-250 ng/ml) if patient is receiving long-term therapy
- Hepatic studies: AST, ALT, bilirubin
- Weight weekly; appetite may increase with product

⚠️ **QT prolongation:** ECG for flattening of T wave, bundle branch block, AV block, dysrhythmias in cardiac patients

- EPS primarily in geriatric patients: rigidity, dystonia, akathisia
- Mental status: mood, sensorium, affect, **suicidal tendencies**; increase in psychiatric symptoms: depression, panic
- Urinary retention, constipation; constipation is more likely to occur in children, geriatric patients; increase fluids, bulk in diet

⚠️ **Withdrawal symptoms:** headache, nausea, vomiting, muscle pain, weakness,

diarrhea, insomnia, restlessness; not usual unless product is discontinued abruptly

- Serotonin syndrome, hypertensive episodes, identify drug interactions before use of product

- Alcohol consumption; if alcohol is consumed, hold dose until morning

Perform/provide:

- Storage in tight container at room temp; do not freeze
- Assistance with ambulation during beginning therapy because drowsiness, dizziness, orthostatic hypotension occurs
- Safety measures, primarily for geriatric patients

Evaluate:

- Therapeutic response: decreased depression, enuresis, pain

Teach patient/family:

- That therapeutic effects may take 2-3 wk
- That product is dispensed in small amounts because of suicide potential, especially at beginning of therapy
- To use caution when driving, performing other activities requiring alertness because of drowsiness, dizziness, blurred vision
- To report urinary retention immediately
- To avoid alcohol, other CNS depressants during treatment
- Not to discontinue medication abruptly after long-term use; may cause nausea, headache, malaise
- To wear sunscreen or large hat because photosensitivity occurs
- To rise slowly, orthostatic hypotension may occur

TREATMENT OF OVERDOSE:

ECG monitoring; lavage, activated charcoal; administer anticonvulsant

☼ Canada only Side effects: *italics* = common; **bold** = life-threatening ⚠
Nurse Alert

immune globulin IM (IMIG/IGIM) (Rx)

Bay Gam 15%, Flebogamma 5%, Flebogamma DIF 5%, Gammagard, Gamunex 10%, Privigen 10%, Vivaglobin 10%

immune globulin IV (IGIV, IVIG) (Rx)

Bay Gam 15%, Carimune NF, Flebogamma 5%, Flebogamma 10% DIF, Gammagard S/D, Gammagard Liquid 10%, Gammaked, Gammaplex, Gammar-P IV, Gamunex, Iveegam EN, Polygam S/D, Privigen, Vivaglobin

immune globulin SC (SCIG/IGSC)

Bay Gam 15%, Flebogamma 5%, Flebogamma DIF 5%, Gammagard 10%, Gammaked, Gammaplex, Gamunex 10%, Privigen 10%, Vivaglobin, Hizentra

Func. class.: Immune serum

Chem. class.: IgG

ACTION:

Provides passive immunity to hepatitis A, measles, varicella, rubella, immune globulin deficiency; contains gamma globulin antibodies (IgG)

USES:

Immunodeficiency syndrome; B-cell chronic lymphocytic leukemia; Kawasaki syndrome; bone marrow transplantation; pediatric HIV infection; agammaglobulinemia; hepatitis A, B exposure; measles exposure; measles vaccine complications; purpura; rubella exposure; chickenpox exposure; chronic inflammatory demyelinating polyneuropathy

Unlabeled uses: IV posttransfusion purpura, Guillain-Barré syndrome, refractory pemphigus vulgaris, West Nile virus, meningitis, myasthenia gravis, thrombocytopenia encephalitis, HIV, cytomegalovirus, neonatal jaundice, RSV infection, primary humoral immunodeficiency, refractory pemphigus vulgaris

CONTRAINDICATIONS:

Coagulopathy, hemophilia, IgA deficiency, thrombocytopenia

Precautions: Pregnancy (C), breastfeeding, children, agammaglobulinemia, bleeding, hypogammaglobulinemia, infection, IV, viral infection

DOSAGE AND ROUTES

Calculator

Immune globulin IM (IMIG, IGIM)

Hepatitis A prophylaxis

- **Adult/geriatric/adolescent/child/infant (unlabeled): IM** 0.02 ml/kg for those who have not received hepatitis A vaccine and been exposed during the prior 2 wk

Measles prophylaxis (exposed during prior 6 days)

- **Adult: IM** 0.25 ml/kg (immunocompetent)
- **Child (unlabeled): IM** 0.5 ml/kg as a single dose, max 15 ml (immunocompromised)

Varicella prophylaxis

- **Adult: IM** 0.6-1.2 ml/kg as soon as possible and if varicella-zoster immune globulin is not available

Rubella prophylaxis in exposed/susceptible individual who will not consider a therapeutic abortion

- **Adult pregnant women: IM** 0.55 ml/kg

Immunoglobulin deficiency

- **Adult: IM** 1.32 ml/kg then 0.66 ml/kg (≥ 100 mg/kg) q3-4wk

Immune globulin IV (IVIG, IGIV)

Primary immunodeficiency Gammagard S/D

- **Adult/adolescent/child: IV** 300-600 mg/kg q3-4wk

Polygam S/D

- **Adult/adolescent/child: IV** 100 mg/kg/mo; initially 200-400 mg/kg may be used

Gammar-P IV

- **Adult: IV** 200-400 mg/kg q3-4wk
- **Adolescent/child: IV** 200 mg/kg q3-4wk

Gamunex

- **Adult/adolescent/child: IV INF** 300-600 mg/kg (3-6 ml/kg) q3-4wk, initial inf rate 1 mg/kg/min (max 8 mg/kg/min)

Iveegam EN

- **Adult/adolescent/child: IV** 200 mg/kg monthly, max 800 mg/kg/mo

Panglobulin NF/Carimune NF

- **Adult/adolescent/child: IV** 200 mg/kg/mo

Gamagard liquid/Flebogamma 5%

- **Adult/adolescent/child: IV** 300-600 mg/kg q3-4wk

Privigen

- **Adult/adolescent/child ≥ 3 yr: IV** 200-800 mg q3wk

Idiopathic thrombocytopenic purpura (ITP)

Panglobulin NF/Carimune NF

- **Adult/child: IV** 400 mg/kg daily $\times$ 2-5 days; with acute ITP of childhood, only 2 of 5 days are needed if initial platelets are 30,000-50,000 mcl after 2 doses

Gammagard S/D/Polygam S/D

- **Adult/adolescent/child: IV** 1000 mg/kg as a single dose; may give on alternate days for up to 3 doses

Gamunex

- **Adult/adolescent/child: IV INF** total dose of 2000 mg/kg divided as 1000 mg/kg (10 ml/kg), give on 2 consecutive days; initial rate is 1 mg/kg/min (max 8 mg/kg/min); if after 1st dose adequate platelets are observed after 24 hr, may withhold 2nd dose

Privigen

- **Adult/adolescent ≥ 15 yr: IV** 1 g/kg/day $\times$ 2 days

Kawasaki disease

Iveegam EN

- **Child: IV** 400 mg/kg daily $\times$ 4 consecutive days or a single dose of 2000 mg/kg over 10 hr, given with aspirin 100 mg/kg/day through 14th day of illness, then 3-5 mg/kg each day thereafter for 5 wk

Gammagard S/D/Polygam S/D

- **Infant/child: IV** 1000 mg/kg as a single dose or 400 mg/kg/day $\times$ 4 days beginning within 7 days of fever onset, with aspirin 80-100 mg/kg/day $\times$ 4 divided doses

Immune globulin SC (SCIG/IGSC)

- **Adult/child >2 yr: SUBCUT INF** 100-200 mg/kg q wk, **Vivaglobin** brand of SCIG 160 mg IgG/ml, **SUBCUT inj** 15 ml/inj site, given at max of 20 ml/hr

Hizentra

• **Adult/child:** 1.53 times previous IGIV dose in grams divided by number of wk between IGIV dose, multiply dose in g $\times$ 5 for dose in ml, adjust by 1.3 trough before last IGIV treatment, give by subcut infusion weekly

Available forms: **IM:** Inj 2-, 10-ml vial (Bay Gam); **IV:** 5%, 10% sol (Gamimune N); powder for inj 1-, 3-, 6-, 12-g vials (Carimune NF); 50 mg protein/ml in 2.5-, 5-, 10-g vials (Gammagard S/D); 1-, 2.5-, 5-, 10-g vials (Gammar-P IV); 500 mg, 1-, 2.5-, 5-g vials (Iveegam); 6-, 12-g vials (Panglobulin); 2.5-, 5-, 10-g vials (Polygam S/D); sol for inj 1-, 2.5-, 5-, 10-, 20-g vials (Gamunex); Human sol for inj: Flebogamma 5%, 10% DIF; subcut inj 10, 16, 20% single use

Administer:

- IM $\leq$ 3 ml at 1 site; use large muscle mass
- Only with EPINEPHrine 1:1000, resuscitative equipment available
- Only within 2 wk of exposure to hepatitis A

IV route

- **Gamimune N:** IV undiluted or dilute with D₅; give 0.01 ml/kg/min; may increase to 0.02-0.04 ml/kg/min
- **Venoglobulin-I:** (50 mg/ml sol) give 0.01-0.02 ml/kg/min; if no adverse reaction within 1/2 hr, increase to 0.04 ml/kg/min; store at room temp
- **Gammagard:** reconstitute with sterile water for inj (50 mg protein/ml); give 0.5 ml/kg/hr, may increase to 4 ml/kg/hr; use inf set provided
- **Gammar-IV:** give 0.01 ml/kg/min (50 mg/ml sol) $\times$ 15-30 min, may increase to 0.02 ml/kg/min, may increase to 0.03-0.06 ml/kg/min

Y-site compatibilities: Fluconazole, sargramostim

SIDE EFFECTS

CNS: Headache, fatigue, malaise

GI: Abdominal pain

HEMA: Thromboembolism (Vivaglobin)

INTEG: Pain at inj site, rash, pruritus, chills

MS: Arthralgia, chest pain

SYST: Lymphadenopathy, anaphylaxis

INTERACTIONS

- Do not administer live virus vaccines within 3 mo of this product

Drug/Lab Test

Interference: glucose testing system

NURSING CONSIDERATIONS

Assess:

- **Exposure date:** this product should be given within 6 days of measles, 7 days of hepatitis B, 14 days of hepatitis A

- **Anaphylaxis:** diaphoresis, wheezing, chest tightness, hypotension

Perform/provide:

- Storage at 36° F-46° F (2° C-8° C)

Evaluate:

- Prevention of infection, increased platelets

Teach patient/family:

- That passive immunity is temporary

- **About the treatment of anaphylaxis:** EPINEPHrine, diphenhydrAMINE, oxygen, vasopressors, corticosteroids

☼ Canada only Side effects: *italics* = common; **bold** = life-threatening ⚠
Nurse Alert

indacaterol

(in-da-kat'er-ol)

Arcapta Neohaler

Func. class.: Beta-2 agonist, long acting respiratory

ACTION:

An agonist at β -2 receptors. These receptors are present in large numbers in the lungs and are located on bronchiolar smooth muscle. Stimulation of β -2 receptors in the lung causes relaxation of bronchial smooth muscle, which produces bronchodilation and an increase in bronchial airflow. These effects may be mediated, in part, by increased activity of adenyl cyclase, an intracellular enzyme responsible for the formation of cyclic-3',5'-adenosine monophosphate (cAMP); has >24-fold agonist activity at β -2 receptors (primarily in the lung) compared to β -1 receptors (primarily in the heart)

USES:

Bronchitis, chronic obstructive pulmonary disease (COPD), emphysema

CONTRAINDICATIONS:

Acute bronchospasm, acute asthma attack, status asthmaticus, acute respiratory insufficiency, monotherapy of asthma, hypersensitivity

Precautions: Ischemic cardiac disease (coronary artery disease), hypertension, cardiac arrhythmias, tachycardia, QT prolongation, congenital long QT syndrome, torsades de pointes history, hyperthyroidism (thyrotoxicosis, thyroid disease), pheochromocytoma, unusual responsiveness to other sympathomimetic amines, seizure disorder, diabetes mellitus, hypokalemia, milk protein hypersensitivity, severe hepatic disease; not indicated for neonates, infants, children, or adolescents under the age of 18 yr, pregnancy (category C), breastfeeding

Black Box Warning:

Asthma-related deaths

DOSAGE AND ROUTES

Calculator

- **Adult:** NH 75 mcg (contents of 1 capsule) inhaled once daily; administer at the

same time every day, max 1 dose in 24 hours

Available forms: Powder for inhalation 75 mcg

Administer:

Inhalation route

- For oral inhalation use only. DO NOT swallow the capsules; always use the Neohaler Inhaler; this inhaler should not be used with any other products. Do NOT use with a spacer
- Use dry hands to remove a capsule from the blister pack immediately before use and place into the capsule chamber of the Neohaler Inhaler; click closed; do not place capsule into the mouthpiece; then, holding the inhaler upright, depress buttons fully once to pierce capsule, a click will be heard; have patient breathe out fully away from inhaler, place inhaler in the mouth with buttons positioned to the left and right (not up and down), close lips around mouthpiece, then breathe deeply, rapidly, and steadily in through the inhaler. A whirring sound should be heard; if no sound is heard, check the chamber because the capsule may be stuck. Gently tap the base of the device to loosen capsule, if necessary. After inhalation, patient should hold the breath as long as comfortable while removing inhaler from the mouth; check the chamber to see if any powder remains in the capsule; repeat inhalation steps until no powder remains. Most patients empty the capsule in 1 or 2 inhalations. After administration, open chamber and discard empty capsule
- Advise coughing after administration is not problematic; as long as the capsule is empty the full dose has been administered
- The gelatin capsule might break into small pieces that pass through the inhaler screen and reach the mouth. Accidental inhalation or ingestion of these pieces is harmless; piercing capsule more than once increases risk of shattering capsule. Do not wash inhaler; keep it dry; a clean, dry, lint-free cloth may be used to wipe out the inhaler.
- Use the new inhaler provided with each new prescription
- To avoid the spread of infection, do not share inhaler

SIDE EFFECTS

CNS: Headache, tremor

CV: Sinus tachycardia, hypertension, QT prolongation and ST-T wave changes, prolonged QTc (an increase of >60 ms from baseline), nonsustained ventricular

tachycardia, supraventricular tachycardia (SVT) episodes, intermittent ectopic atrial rhythm

ENDO: Hyperglycemia

GI: Nausea, dry mouth (xerostomia)

META: Hypokalemia

MS: Muscle cramps/spasm, musculoskeletal pain

RESP: **Paradoxical bronchospasm**, cough, dyspnea, sputum purulence or volume, wheezing, nasopharyngitis, pneumonia, sinusitis and upper respiratory tract infection

PHARMACOKINETICS:

Protein binding 94%-96%, approximately 1/3 of total drug-related AUC over 24 hours, a hydroxylated derivative, glucuronate and dealkylate metabolites are present; metabolized by CYP3A4, CYP1A1, CYP2D6, UGT1A1; elimination multiphasic with terminal half-life of 45.5-126 hours; excreted renally (2%-6%), fecally (>90%); onset 5 min, peak 15 min, steady state 12-15 days

INTERACTIONS:

Increase QT prolongation: Class IA/III antiarrhythmics, flecainide, propafenone some antipsychotics (phenothiazines, pimozide, haloperidol risperiDONE, sertindole ziprasidone), amoxapine, arsenic trioxide, astemizole, bepridil, cisapride, citalopram, chloroquine, clarithromycin, dasatinib, dolasetron, dronedarone, droperidol, erythromycin, halofantrine, halogenated anesthetics, levomethadyl, maprotiline, methadone, some quinolones (ofloxacin, gatifloxacin, gemifloxacin, grepafloxacin, levofloxacin, moxifloxacin, sparfloxacin), ondansetron, paliperidone, palonosetron, pentamidine, probucol, propafenone, ranolazine, SUNItinib, terfenadine, thioridazine, tricyclic antidepressants, troleandomycin, vorinostat, tetrabenazine

Increase hypokalemia: Theophylline, aminophylline, corticosteroids

Increase cardiovascular reactions: MAOIs, furazolidone, procarbazine, rasagiline

NURSING CONSIDERATIONS

Assess

Black Box Warning:

Asthma-related death; not to be used in asthma

- COPD, emphysema, bronchospasm: monitor pulmonary function tests
- **QT prolongation:** monitor ECG, ejection fraction for QT prolongation
- **Paradoxical bronchospasm:** if paradoxical bronchospasm occurs, discontinue product immediately, use a short-acting β -agonist for rescue therapy, as appropriate

Teach patient/family

- To report dyspnea, wheezing, bronchospasm
- Not to use with other products unless approved by prescriber; there are many interactions

Black Box Warning:

Do not use for asthma

🍁 Canada only Side effects: *italics* = common; **bold** = life-threatening ⚠️
Nurse Alert

indapamide (Rx)

(in-dap'a-mide)

Lozide 

Func. class.: Diuretic—thiazide-like, antihypertensive

Chem. class.: Indoline

ACTION:

Acts on proximal section of distal renal tubule by inhibiting reabsorption of sodium; may act by direct vasodilation caused by blocking of calcium channels

USES:

Edema of CHF, hypertension

CONTRAINDICATIONS:

Hypersensitivity to this product or sulfonamides; anuria, hepatic coma, pregnancy (D)

Precautions: Breastfeeding, hypokalemia, dehydration, ascites, hepatic disease, severe renal disease, CCr <30 ml/min (not effective), diabetes mellitus, gout

DOSAGE AND ROUTES

Calculator

Edema

- **Adult: PO** 2.5 mg/day in AM; may be increased to 5 mg/day if needed after 1 wk

Antihypertensive

- **Adult: PO** 1.25-5 mg/day; may increase to 5 mg/day over 8 wk

Available forms: Tabs 1.25, 2.5 mg

Administer:

- In AM to avoid interference with sleep
- With food if nausea occurs; absorption may be decreased slightly

SIDE EFFECTS

CNS: Headache, dizziness, fatigue, weakness, nervousness, agitation, extremity numbness, depression

CV: Orthostatic hypotension, volume depletion, palpitations, dysrhythmias, PVCs, vasculitis

EENT: Blurred vision, nasal congestion, increased intraocular pressure

ELECT: *Hypochloremic alkalosis, hypomagnesemia, hyperuricemia, hypercalcemia, hyponatremia, hypokalemia, hyperglycemia*

GI: *Nausea, diarrhea, dry mouth, vomiting, anorexia, cramps, constipation, abdominal pain*

GU: *Polyuria, nocturia, urinary frequency, impotence*

INTEG: *Rash, pruritus*

MS: Cramps

PHARMACOKINETICS

Well absorbed (PO); widely distributed; metabolized by liver; excreted by kidney (small amounts); onset 1-2 hr; peak 2 hr; duration up to 36 hr; excreted in urine, feces; half-life 14-18 hr

INTERACTIONS

Increase: hyperglycemia—diazoxide

Increase: toxicity of muscle relaxants, steroids, lithium, digoxin

Increase: hypokalemia—corticosteroids, amphotericin B, loop diuretics, thiazide diuretics

Decrease: effects—antidiabetics, antigout agents, anticoagulants

Decrease: absorption—cholestyramine, colestipol

Decrease: hypotensive effect—indomethacin, NSAIDs

Drug/Herb

- Severe photosensitivity: St. John's wort

Drug/Lab Test

Increase: calcium, parathyroid test, glucose, uric acid

NURSING CONSIDERATIONS

Assess:

- Weight, I&O daily to determine fluid loss; effect of product may be decreased if used daily
- Rate, depth, rhythm of respirations, effect of exertion
- B/P lying, standing; postural hypotension may occur
- Electrolytes: potassium, magnesium, sodium, chloride: include BUN, CBC, serum creatinine, blood pH, ABGs, uric acid, Ca, glucose
- Signs of metabolic alkalosis, hypokalemia

- Rashes, fever daily; allergy to sulfa products
- Confusion, especially in geriatric patients; take safety precautions if needed
- Hydration: skin turgor, thirst, dry mucous membranes

Evaluate:

- Therapeutic response: improvement in edema of feet, legs, sacral area daily; decreased B/P

Teach patient/family:

- To consume diet high in potassium; to rise slowly from lying or sitting position
- To recognize adverse reactions: muscle cramps, weakness, nausea, dizziness
- To take with food, milk for GI symptoms; to take early in day to prevent nocturia
- To notify prescriber if urinary output decreases; to monitor daily weight

TREATMENT OF OVERDOSE:

Lavage if taken orally; monitor electrolytes, administer IV fluids; monitor hydration, CV, renal status

☼ Canada only Side effects: *italics* = common; **bold** = life-threatening ⚠
Nurse Alert

indinavir (Rx)

(en-den'a-veer)

Crixivan

Func. class.: Antiretroviral

Chem. class.: Protease inhibitor

Do not confuse: **indinavir**/Denavir

ACTION:

Inhibits human immunodeficiency virus (HIV-1) protease; this prevents the maturation of the virus

USES:

HIV-1 in combination with at least 2 other antiretrovirals

Unlabeled uses: Prevention of HIV-1 after exposure

CONTRAINDICATIONS:

Hypersensitivity, breastfeeding

Precautions: Pregnancy (C), children, renal/hepatic disease, history of renal stones, diabetes, hypercholesterolemia, hemophilia, autoimmune disease, immune reconstitution syndrome

DOSAGE AND ROUTES

Calculator

• **Adult: PO** 800 mg q8hr; 400 mg bid with ritonavir 400 mg bid or 800 mg bid with ritonavir 100-200 mg bid; decrease dose to 600 mg bid when given with lopinavir, ritonavir

Mild to moderate hepatic impairment

• **Adult: PO** 600 mg q8h

Available forms: Caps 200, 400 mg

Administer:

- Do not break, crush, or chew caps
- With water, 1 hr before or 2 hr after meals; may be given with other liquids or small meal; do not give with high-fat, high-protein meals
- Dosage adjustment will need to be considered when given with efavirenz
- Increase water to 1.5 L/day minimum to prevent nephrolithiasis

SIDE EFFECTS

CNS: *Headache, insomnia, dizziness, somnolence*

GI: *Diarrhea, abdominal pain, nausea, vomiting, anorexia, dry mouth*

GU: Nephrolithiasis

INTEG: Rash

MS: Pain

OTHER: Asthenia, **insulin-resistant hyperglycemia**, hyperlipidemia, **ketoacidosis**, lipodystrophy

PHARMACOKINETICS

Terminal half-life 2 hr; 60% protein binding; metabolized liver; excreted <20% unchanged in urine, 83% in feces

INTERACTIONS

⚠ Life-threatening dysrhythmias: ergots, midazolam, rifampin, triazolam, amiodarone, pimozide, alfazosin

Increase: myopathy—statins (atorvastatin, lovastatin, simvastatin)

Increase: indinavir levels—CYP3A4 inhibitors (arepitant, protease inhibitors, azole antifungals, nefazodone, verapamil); phosphodiesterase-5 inhibitors (sildenafil, tadalafil, vardenafil)

Increase: levels of both products—clarithromycin, zidovudine

Increase: levels of isoniazid, oral contraceptives

Decrease: indinavir levels—CYP3A4 inducers (barbiturates, carbamazepine, nonnucleoside reverse transcriptase inhibitors, phenytoins, rifamycins, modafinil)

Decrease: effect of both products—anticonvulsants

Decrease: effect—CYP3A4 substrates (calcium channel blockers, immunosuppressants, benzodiazepines, azole antifungals, macrolides, SSRIs, statins)

Drug/Herb

Decrease: indinavir levels—St. John's wort; avoid concurrent use

Drug/Food

Decrease: indinavir absorption—grapefruit juice; high-fat, high-protein foods

Drug/Lab Test

Increase: AST, ALT, amylase, total bilirubin

NURSING CONSIDERATIONS

Assess:

- Complaints of lower back, flank pain; indicates kidney stones
- Signs of infection, anemia, presence of other sexually transmitted diseases
- Blood/hepatic studies: ALT, AST; total bilirubin, amylase, blood glucose, serum cholesterol/lipid profile, may be elevated
- Plasma HIV RNA, viral load, CD4 during treatment
- Bowel pattern before, during treatment; if severe abdominal pain with bleeding occurs, product should be discontinued; monitor hydration
- Skin eruptions; rash, urticaria, itching
- Allergies before treatment, reaction of each medication; place allergies on chart

Teach patient/family:

- To take as prescribed; if dose is missed, to take as soon as remembered up to 1 hr before next dose; not to double dose
- That product must be taken in equal intervals around the clock to maintain blood levels for duration of therapy

 That hyperglycemia may occur; to watch for increased thirst, weight loss, hunger, and dry, itchy skin; to notify prescriber

- To increase fluids to prevent kidney stones; if stone formation occurs, that treatment may need to be interrupted
- That product does not cure AIDS, only controls symptoms; not to donate blood

☼ Canada only Side effects: *italics* = common; **bold** = life-threatening 
Nurse Alert

indomethacin (Rx)

(in-doe-meth'a-sin)

Indocin, Nu-Indo 

Func. class.: Nonsteroidal antiinflammatory product (NSAID), antirheumatic

Chem. class.: Acetic acid derivative

Do not confuse: Indocin/Endocet/minocin/Vicodin

ACTION:

Inhibits prostaglandin synthesis by decreasing enzyme needed for biosynthesis; analgesic, antiinflammatory, antipyretic

USES:

RA, ankylosing spondylitis, osteoarthritis, bursitis, tendinitis, acute gouty arthritis; closure of patent ductus arteriosus in premature infants (IV)

Unlabeled uses: Bone pain, headache, heterotopic ossification, juvenile rheumatoid arthritis, pericarditis

CONTRAINDICATIONS:

Pregnancy (D) 3rd trimester, neonates, aortic coarctation, bleeding salicylate/NSAID hypersensitivity, ulcer disease

Black Box Warning:

Perioperative pain in CABG

Precautions: Pregnancy (B) 1st trimester, breastfeeding, children, bleeding disorders, GI disorders, cardiac disorders, depression, renal/hepatic disease, asthma, diabetes, acute bronchospasm, ulcerative colitis, seizures, Parkinson's disease

Black Box Warning:

Stroke, GI bleeding, MI

DOSAGE AND ROUTES

Calculator

Arthritis/antiinflammatory

- **Adult: PO** 25-50 mg bid-tid; max 200 mg/day; **EXT REL** 75 mg/day, may increase to 75 mg bid

Acute gouty arthritis

- **Adult: PO** 50 mg tid; use only for acute attack then reduce dose

Patent ductus arteriosus

Longer or repeated treatment courses may be necessary for very premature infants

- **Infant <2 days: IV** 0.2 mg/kg then 0.1 mg/kg $\times$ 2 doses after 12, 24 hr
- **Infant 2-7 days: IV** 0.2 mg/kg then 0.2 mg/kg $\times$ 2 doses after 12, 24 hr
- **Infant >7 days: IV** 0.2 mg/kg then 0.25 mg/kg $\times$ 2 doses after 12, 24 hr

Available forms: Caps 25, 50 mg; ext rel caps 75 mg; inj 1-mg vial; supp 50 mg; oral susp 5 mg/ml

Administer:

PO route

- Do not break, crush, or chew sus rel cap or reg caps
- With food to decrease GI symptoms and prevent ulcerations
- Shake susp; do not mix with other liquids

IV route

- After reconstituting 1-2 mg/ml or more NS or sterile water for inj without preservative; infuse over 20-30 min, avoid extravasation; do not inj/inf via umbilical catheter to avoid dramatic shift in cerebral blood flow

Y-site compatibilities: Furosemide, insulin (regular), potassium chloride, sodium bicarbonate, sodium nitroprusside

SIDE EFFECTS

CNS: Dizziness, drowsiness, fatigue, tremors, confusion, insomnia, anxiety, depression, *headache*

CV: Tachycardia, peripheral edema, palpitations, dysrhythmias, hypertension,

CV thrombotic events, MI, stroke

EENT: Tinnitus, hearing loss, blurred vision

GI: *Nausea*, anorexia, *vomiting*, diarrhea, jaundice, **cholestatic hepatitis**, *constipation*, flatulence, cramps, dry mouth, peptic ulcer, **ulceration, perforation**, **GI bleeding**

GU: **Nephrotoxicity: dysuria, hematuria, oliguria, azotemia**

HEMA: **Blood dyscrasias**, prolonged bleeding

INTEG: Purpura, rash, pruritus, sweating

PHARMACOKINETICS

PO: Onset 1-2 hr; peak 3 hr; duration 4-6 hr; metabolized in liver, kidneys; excreted in urine 60%, feces 33%; crosses placenta; excreted in breast milk; 99% protein binding; half-life 1 hr 1st pass, 2.6-11.2 hr 2nd pass

INTERACTIONS

Increase: hyperkalemia—potassium-sparing diuretics

Increase: toxicity—lithium, methotrexate, cycloSPORINE, zidovudine, probenecid

Increase: effect of—digoxin, penicillamine, phenytoin, aminoglycosides

Increase: bleeding risk—anticoagulants, abciximab, cefamandole, cefoperazone, cefoTEtan, clopidogrel, eptifibatide, plicamycin, ticlopidine, tirofiban, valproic acid, thrombolytics, aspirin, SSRIs, SNRIs

Decrease: effect of—antihypertensives

NURSING CONSIDERATIONS

Assess:

- **Arthritis symptoms:** ROM, pain, swelling before and 2 hr after treatment

Black Box Warning:

Cardiac disease, CV, thrombotic events (MI, stroke) before administration, not to be used in perioperative pain in CABG surgery

- Patent ductus arteriosus: respiratory rate, character, heart sounds
- Renal, hepatic, blood studies: BUN, creatinine, AST, ALT, Hgb before treatment, periodically thereafter; if renal function has decreased, do not give subsequent doses
- Eye/ear problems: blurred vision, tinnitus; may indicate toxicity; audiometric, ophthalmic exam before, during, after treatment if patient receiving long-term therapy
- Confusion, mood changes, hallucinations, especially among geriatric patients
- Asthma, nasal polyps, aspirin sensitivity, may develop hypersensitivity to indomethacin

Black Box Warning:

GI bleeding/perforation: chronic use can lead to GI bleeding, use cautiously in those with a history of active GI disease

Black Box Warning:

MI, stroke: may be greater with longer-term use and those with CV risk factors

Perform/provide:

- Storage at room temp

Evaluate:

- Therapeutic response: decreased pain, stiffness, swelling in joints; ability to move more easily

Teach patient/family:

- To report blurred vision, ringing, roaring in ears; may indicate toxicity
- To avoid driving, other hazardous activities if dizziness, drowsiness occurs
- To report change in urine pattern, increased weight, edema, increased pain in joints, fever, blood in urine; may indicate nephrotoxicity
- To report mood changes: anxiety, depression
- That therapeutic antiinflammatory effects may take up to 1 mo
- To avoid alcohol, NSAIDs, salicylates because bleeding may occur
- To report use to all health care providers

☼ Canada only Side effects: *italics* = common; **bold** = life-threatening ⚠
Nurse Alert

inFLIXimab (Rx)

(in-fliks'ih-mab)

Remicade

Func. class.: Biologic response modifiers

Chem. class.: Tumor necrosis factor modifiers

Do not confuse: Remicade/Renacidin/inFLIXimab/riTUXimab

ACTION:

Monoclonal antibody that neutralizes the activity of tumor necrosis factor alpha (TNF α) found in Crohn's disease; decreased infiltration of inflammatory cells

USES:

Crohn's disease, fistulizing (moderate to severe); RA, given with methotrexate; plaque psoriasis, ankylosing spondylitis, ulcerative colitis, psoriasis

Unlabeled uses: Psoriatic arthritis, Behçet's syndrome, uveitis, juvenile arthritis

CONTRAINDICATIONS:

Hypersensitivity to murines, moderate to severe CHF (NYHA class III/IV)

Precautions: Pregnancy (B), breastfeeding, children, geriatric patients, COPD, hepatotoxicity, hemalologic abnormalities, hepatitis B, Guillain-Barré syndrome, seizures, multiple sclerosis

Black Box Warning:

Infection, neoplastic disease, TB

DOSAGE AND ROUTES

Calculator

Crohn's disease (moderate to severe)/(fistulizing)

- **Adult/adolescent/child ≥ 6 yr:** IV INF 5 mg/kg initially then at 2 wk, 6 wk, q8wk thereafter; may increase to 10 mg/kg/dose if needed (adults)

Rheumatoid arthritis

- **Adult:** IV 3 mg/kg initially then at 2 wk, 6 wk, q8wk thereafter; max 10 mg/kg/dose

Available forms: Powder for inj 100 mg

Administer:

Intermittent IV INF route

- Pretreat with diphenhydramine, acetaminophen, prednisone if a reaction is inf related
- Give immediately after reconstitution; reconstitute each vial with 10 ml sterile water for inj; further dilute total dose/250 ml of 0.9% NaCl inj to a total conc of 0.4-4 mg/ml; use 21G or smaller needle for reconstitution; direct sterile water at glass wall of vial; gently swirl; do not shake; may foam; allow to stand for 5 min, give within 3 hr
- Give over ≥ 2 hr, use polyethylene-lined inf with in-line, sterile, low-protein-bind filter
- Do not admix

SIDE EFFECTS

CNS: Headache, dizziness, depression, vertigo, fatigue, anxiety, fever, seizures, chills, flu-like symptoms, demyelinating disease

CV: Chest pain, hypo/hypertension, tachycardia, CHF, acute coronary syndrome

GI: Nausea, vomiting, abdominal pain, stomatitis, constipation, dyspepsia, flatulence

GU: Dysuria, urinary frequency

HEMA: Anemia, leukopenia, thrombocytopenia, pancytopenia

INTEG: Rash, dermatitis, urticaria, dry skin, sweating, flushing, hematoma, pruritus, keratoderma blenorrhagicum

MS: Myalgia, back pain, arthralgia

RESP: URI, pharyngitis, bronchitis, cough, dyspnea, sinusitis

SYST: Anaphylaxis, fatal infections, sepsis, malignancies, immunogenicity, Stevens-Johnson syndrome, toxic epidermal necrolysis

PHARMACOKINETICS

Distributed to vascular compartment, half-life 9.5 days

INTERACTIONS

Increase: infections neutropenia—TNF blockers (abatacept, anakinra, golimumab, rilonacept), avoid concurrent use

- Do not administer live vaccines concurrently

NURSING CONSIDERATIONS

Assess:

- For RA, ROM, pain
- GI symptoms: nausea, vomiting, abdominal pain
- Periodic blood counts (CBC), ANA titer, LFTs
- CV status: B/P, pulse, chest pain

 **Allergic reaction, anaphylaxis:** rash, dermatitis, urticaria, dyspnea, hypotension, fever, chills; **discontinue if severe, administer EPINEPHrine, corticosteroids, antihistamines; assess for allergies to murine proteins before starting therapy**

Black Box Warning:

Fatal infections: discontinue if infection occurs, do not administer to patients with active infection; identify TB before beginning treatment; a TB test should be obtained; if present, TB should be treated before patient receives product; exercise caution when switching from 1 DMARD to another

- Report suspected adverse reactions to the FDA (1-800-FDA-1088)

Black Box Warning:

For neoplastic disease in those <18 yr, including hepatosplenic T-cell lymphoma, usually occurs in those with inflammatory bowel disease

Perform/provide:

- Refrigerated storage, do not freeze

Evaluate:

- Therapeutic response: absence of fever, mucus in stools

Teach patient/family:

- Infusion reaction should be reported immediately
- If infection occurs, notify prescriber immediately
- Not to breastfeed while taking this product
- To notify prescriber of GI symptoms, hypersensitivity reactions, heart symptoms
- Not to operate machinery, drive if dizziness, vertigo occur
- To avoid live virus vaccinations, bring up to date before use

🍁 Canada only Side effects: *italics* = common; **bold** = life-threatening

Humalog Mix 50/50

insulin aspart mixture (Rx)

NovoLOG 70/30, NovoLOG Mix Flexpen Prefilled Syringe 70/30

Func.class.: Antidiabetic, pancreatic hormone

Chem. class.: Modified structures of endogenous human insulin

Do not confuse: Lantus/lente

NovoLIN 70/30 PenFill/NovoLIN 70/30 Prefilled

ACTION:

Decreases blood glucose; by transport of glucose into cells and the conversion of glucose to glycogen, indirectly increases blood pyruvate and lactate, decreases phosphate and potassium; insulin may be human (processed by recombinant DNA technologies)

USES:

Type 1 diabetes mellitus, type 2 diabetes mellitus, gestational diabetes; insulin lispro may be used in combination with sulfonylureas in children >3 yr

CONTRAINDICATIONS:

Hypersensitivity to protamine; creosol (aspart)

Precautions: Pregnancy (B) lispro, detemir, regular aspart; (C) all others

DOSAGE AND ROUTES

Calculator

Insulin glulisine

- **Adult/adolescent/child ≥ 4 yr:** **SUBCUT** dosage individualized, give within 15 min before or 20 min after starting a meal; **Adult: IV** dilute to 1 unit/ml in inf systems with 0.9% NaCl, use PVC Viaflex inf bags and PVC tubing, use dedicated line

Insulin aspart

- **Adult/adolescent/child ≥ 6 yr:** **INTERMITTENT SUBCUT** Total daily dose is given as 2-4 inj/day just before beginning of meal; in general, 50%-70% of total daily insulin may be given as insulin aspart, remainder should be intermediate-or long-acting insulin; **CONTINUOUS SUBCUT** used with external insulin pump via cont SUBCUT insulin inf (CSII), insulin dose should be based on insulin dose from previous regimen

Insulin lispro

- **Adult/adolescent/child ≥ 3 yr: SUBCUT** 15 min before meals; **CONT SUBCUT INF (external insulin pump):** total daily dose should be based on insulin dose from previous regimen, 50% of total dose can be given as meal-related boluses, remainder as basal inf

Human regular

- **Adult: SUBCUT** 1/2-1 hr before meals

Insulin, isophane suspension

- **Adult: SUBCUT** dosage individualized by blood, urine glucose; usual dose 7-26 units; may increase by 2-10 units/day if needed

Insulin detemir

- **Adult/adolescent/child ≥ 2 yr: SUBCUT** 1-2 $\times$ /day; if 1 $\times$, give with evening meal

Insulin glargine

- **Adult and child ≥ 6 yr: SUBCUT** 10 international units/day, range 2-100 international units/day

Regular insulin (ketoacidosis)

- **Adult: IV** 5-10 units, then 5-10 units/hr until desired response, then switch to SUBCUT dose; **IV/INF** 2-12 units (50 units/500 ml of normal saline)
- **Child: IV** 0.1 units/kg

Replacement

- **Adult and child: SUBCUT** 0.5-1 units/kg/day qid given 30 min before meals
- **Adolescent: SUBCUT** 0.8-1.2 mg/kg/day; this dosage is used during rapid growth

Available forms: *NPH* Inj 100 units/ml; *regular* inj 100 units/ml, cartridges 100 units/ml; *insulin analog* inj 100 units/ml; *isophane insulin* inj 100 units/ml, cartridges 100 units/ml; *insulin lispro* 100 units/ml, 1.5-ml cartridges, *insulin lispro* Humalog Pen sol for inj 100 units/ml; *insulin glulisine* inj 100 units/ml; *insulin glargine* inj 100 units/ml; *insulin detemir* inj 100 units/ml in 10 vials, 3-ml cartridges; *insulin aspart* inj 100 mg/ml (Flexpen, Pen Fill)

Administer:

SUBCUT route

- After warming to room temp by rotating in palms to prevent injecting cold insulin; use only insulin syringes with markings or syringe matching units/ml; rotate inj sites within one area: abdomen, upper back, thighs, upper arm,

buttocks; keep record of sites

- Increased dosages if tolerance occurs
- Premixed insulins, NPH are cloudy suspensions
- Regular human insulin, rapid-acting analogs, long-acting analogs are clear; do not use if cloudy, thick, or discolored **CONT SUBCUT route (insulin infusion CSII)**
- Do not mix with other insulins when using a pump
- Insulin lispro 3-ml cartridges to be used in Disetronic H-TRON plus V100 pump using Disetronic rapid inf sets; inf set and cartridge adapter should be changed q3days; replace 3-ml cartridge q6days

IV route (insulin glulisine only)

- Dilute to 1 international unit/ml in inf systems with 0.9% NaCl using PVC viaflex inf bags and PVC tubing; use dedicated line; do not admix

IV route (regular only)

⚠ When regular insulin is administered IV, monitor glucose, potassium often to prevent fatal hypoglycemia, hypokalemia

- IV direct, undiluted via vein, Y-site, 3-way stopcock; give at ≤ 50 units/min
- By cont inf after diluting with IV sol and run at prescribed rate; use IV inf pump for correct dosing; give reduced dose at serum glucose level of 250 mg/100 ml

Additive compatibilities: Cimetidine, lidocaine, meropenem, ranitidine, verapamil

Y-site compatibilities: Amiodarone, ampicillin, ampicillin/sulbactam, aztreonam, ceFAZolin, cefoTEtan, DOBUTamine, esmolol, famotidine, gentamicin, heparin, heparin/hydrocortisone, imipenem/ cilastatin, indomethacin, magnesium sulfate, meperidine, meropenem, midazolam, morphine, nitroglycerin, oxytocin, PENTobarbital, potassium chloride, propofol, ritodrine, sodium bicarbonate, sodium nitroprusside, tacrolimus, terbutaline, ticarcillin, ticarcillin/clavulanate, tobramycin, vancomycin, vit B/C

SIDE EFFECTS

EENT: Blurred vision, dry mouth

INTEG: Flushing, rash, urticaria, warmth, lipodystrophy, lipohypertrophy, swelling, redness

META: *Hypoglycemia*, rebound hyperglycemia (Somogyi effect 12-72 hr or

longer)

MISC: Peripheral edema

SYST: Anaphylaxis

PHARMACOKINETICS

Rapid acting

Insulin glulisine: Onset 15-30 min, peak 1/2-1½ hr, duration 3-4 hr

Insulin aspart: Onset 10-20 min, peak 1-3 hr, duration 3-5 hr

Insulin lispro: Onset 15-30 min, peak 1/2-1½ hr, duration 3-5 hr

Short acting

Insulin regular: Onset 30 min, peak 2.5-5 hr, duration up to 7 hr

Intermediate acting

Insulin, isophane suspension (NPH): Onset 1.5-4 hr, peak 4-12 hr, duration ≤24 hr

Long acting

Insulin detemir: Onset 0.8-2 hr, peak unknown, duration ≤24 hr (conc dependent)

Insulin glargine: Onset 1.5 hr, no peak identified, duration ≥24 hr

Mixtures

Insulin, isophane suspension and regular insulin (70/30): Onset 10-20 min, peak 2.4 hr, duration ≤24 hr

Isophane insulin suspension (NPH) and insulin mixtures (50/50): Onset 1/2-1 hr, peak dual, duration 10-16 hr

INTERACTIONS

Increase: hypoglycemia—salicylate, alcohol, β-blockers, anabolic steroids, fenfluramine, phenylbutazone, sulfinpyrazone, guanethidine, oral hypoglycemics, MAOIs, tetracycline

Decrease: hypoglycemia—thiazides, thyroid hormones, oral contraceptives, corticosteroids, estrogens, DOBUTamine, EPINEPHrine

Drug/Lab Test

Increase: VMA

Decrease: potassium, calcium

Interference: LFTs, thyroid function studies

NURSING CONSIDERATIONS

Assess:

- Fasting blood glucose; A1c may be drawn to identify treatment effectiveness q3mo
- Urine ketones during illness; insulin requirements may increase during stress, illness, surgery
- Hypoglycemic reaction that can occur during peak time (sweating, weakness, dizziness, chills, confusion, headache, nausea, rapid weak pulse, fatigue, tachycardia, memory lapses, slurred speech, staggering gait, anxiety, tremors, hunger)
- **Hyperglycemia:** acetone breath; polyuria; fatigue; polydipsia; flushed, dry skin; lethargy

Perform/provide:

- Store at room temp for <1 mo (some insulins); keep away from heat and sunlight; refrigerate all other supply; NPH, premixed insulins are cloudy; regular, rapid-acting analogs, long-acting analogs are clear; do not freeze—IV route, regular only

Evaluate:

- Therapeutic response: decrease in polyuria, polydipsia, polyphagia; clear sensorium; absence of dizziness; stable gait

Teach patient/family:

- That blurred vision occurs; not to change corrective lens until vision is stabilized after 1-2 mo
- To keep insulin, equipment available at all times; to carry a glucagon kit, candy, or lump of sugar to treat hypoglycemia
- That product does not cure diabetes but controls symptoms
- To carry emergency ID as diabetic
- To recognize hypoglycemia reaction: headache, tremors, fatigue, weakness
- To recognize hyperglycemia reaction: frequent urination, thirst, fatigue, hunger
- About the dosage, route, mixing instructions, diet restrictions (if any), disease process
- About the symptoms of **ketoacidosis**: nausea; thirst; polyuria; dry mouth; decreased B/P; dry, flushed skin; acetone breath; drowsiness; Kussmaul respirations
- That a plan is necessary for diet, exercise; that all food on diet should be eaten;

that exercise routine should not vary

- About blood glucose testing; how to determine glucose level
- To avoid OTC products unless directed by prescriber

TREATMENT OF OVERDOSE:

Glucose 25 g IV, via dextrose 50% sol, 50 ml or glucagon 1 mg

✳ Canada only Side effects: *italics* = common; **bold** = life-threatening ⚠

Nurse Alert

interferon alfacon-1 (Rx)

(in-ter-feer'on al'fa-kon)

Infergen

Func. class.: Recombinant type 1 interferon

ACTION:

Induces biologic responses and has antiviral, antiproliferative, and immunomodulatory effects

USES:

Chronic hepatitis C infections in those ≥ 18 yr with compensated liver disease who have anti-HCV antibodies or HCV RNA, may use in combination with ribavirin

Unlabeled uses: Hairy-cell leukemia when used with G-CSF

CONTRAINDICATIONS:

Hypersensitivity to α -interferons or products from *Escherichia coli*; decompensated hepatic disease, autoimmune hepatitis

Precautions: Pregnancy (C), breastfeeding, children < 18 yr, geriatric patients, thyroid disorders, myelosuppression, hepatic disease, seizure disorder, alcoholism, hepatitis

Black Box Warning:

Cardiac disease, autoimmune disease, infection, depression

DOSAGE AND ROUTES

Calculator

• **Adult: SUBCUT monotherapy** 9 mcg as single inj 3 $\times$ /wk $\times$ 24 wk; leave ≥ 48 hr between injections; for patients who did not respond or relapsed after discontinuation, give 15 mcg 3 $\times$ /wk $\times$ 48 wk; **combination: SUBCUT** 15 mcg daily with ribavirin 1000 mg/day PO (< 75 kg), 1200 mg/day PO (≥ 75 kg); give in 2 divided doses for up to 48 wks, use stepwise dose reduction of the interferon dose from 15 mcg to 9 mcg to 6 mcg for serious adverse reactions

Available forms: Inj 9 mcg/0.3 ml, 15 mcg/0.5 ml

Administer:

• Premedicate with acetaminophen or ibuprofen

- Do not shake vial; use 1 dose per vial; discard unused portion; use proper injection sites; rotate sites, discard unused product
- Do not miss doses

SIDE EFFECTS

CNS: Depression, headache, fatigue, fever, rigors, insomnia, dizziness, agitation, nervousness, anxiety, lability, abnormal thinking

CV: Hypertension, palpitation, tachycardia

EENT: Tinnitus, earache, conjunctivitis, eye pain

GI: Abdominal pain, nausea, diarrhea, anorexia, dyspepsia, vomiting, constipation, flatulence, hemorrhoids, decreased salivation

GU: Dysmenorrhea, vaginitis, menstrual disorders

HEMA: Granulocytopenia, thrombocytopenia, leukopenia, ecchymosis, aplastic anemia

INTEG: Alopecia, pruritus, rash, erythema, dry skin

MISC: Anaphylaxis, angioedema, flu-like illness

MS: Back, limb, neck skeletal pain; rigors

RESP: Pharyngitis, upper respiratory infection, cough, sinusitis, rhinitis, respiratory tract congestion, epistaxis, dyspnea, bronchitis

PHARMACOKINETICS

Peak 1-4 hr, peak biologic response 24-36 hr

INTERACTIONS

Increase: hearing loss—eflornithine (systemic), consider serial audiograms

Increase: NRTI, use together cautiously

Increase: myelosuppression—myelosuppressives

Increase: toxicity—aldesleukin, IL-2, efornithine, theophylline

Decrease: effect of—antiretrovirals (NNRTs, NRTIs, protease inhibitors)

NURSING CONSIDERATIONS

Assess:

Black Box Warning:

Past or present history of depression, seizures; use with caution with these disorders

Black Box Warning:

Hemolytic anemia: ribavirin may be used with this product and cause hemolytic anemia, cardiac symptoms

- Ophthalmologic status; report periodically
- **Pregnancy:** determine if patient is pregnant before use with ribavirin, pregnancy (X), when used with ribavirin
- CBC, LFTs, ECG, platelet counts, heme concentration, ANC, serum creatinine, albumin, bilirubin, TSH, T₄, triglycerides at baseline and periodically
- Myelosuppression: hold dose if neutrophil count is $<500 \times 10^6/L$ or if platelets are $<50 \times 10^9/L$, monitor for infection
- For hypersensitivity: discontinue immediately if hypersensitivity occurs

Evaluate:

- Therapeutic response: decreased chronic hepatitis C signs/symptoms

Teach patient/family:

- With detailed written information about product
- To report signs, symptoms of infection, thyroid/liver dysfunction, changes in behavior
- To report if pregnancy is planned or suspected (C), when combined with ribavirin pregnancy (X)
- To use OTC analgesics to decrease flulike symptoms
- If patient will be self-administering injection, teach all aspects of product use, administration, disposal, provide medication guide

☼ Canada only Side effects: *italics* = common; **bold** = life-threatening ⚠
Nurse Alert

interferon beta-1a (Rx)

(in-ter-feer'on)

Avonex, Rebif

interferon beta-1b (Rx)

Betaseron, Extavia

Func. class.: Multiple sclerosis agent, immune modifier

Chem. class.: Interferon, *Escherichia coli* derivative

ACTION:

Antiviral, immunoregulatory; action not clearly understood; biologic response-modifying properties mediated through specific receptors on cells, inducing expression of interferon-induced gene products

USES:

Ambulatory patients with relapsing or remitting MS

Unlabeled uses: May be useful for treatment of AIDS, AIDS-related Kaposi's sarcoma, malignant melanoma, metastatic renal cell carcinoma, cutaneous T-cell lymphoma, acute non-A/non-B hepatitis, chronic hepatitis C

CONTRAINDICATIONS:

Hypersensitivity to natural or recombinant interferon- β or human albumin, hamster protein, rotavirus vaccine

Precautions: Pregnancy (C), breastfeeding, children <18 yr, chronic progressive MS, depression, mental disorders, seizure disorder, latex allergy, autoimmune disorders, bone marrow suppression, hepatotoxicity, cardiac disease, alcoholism, chickenpox, herpes zoster

DOSAGE AND ROUTES

Calculator

Interferon beta-1a

Remitting or relapsing multiple sclerosis

- **Adult: IM** (Avonex) 30 mcg/wk
- **Adult: SUBCUT** (Rebif) 22 or 44 mcg 3 $\times$ /wk with each dose 48 hr apart, titrate to full dose over 4-wk period

Chronic hepatitis C (unlabeled)

- **Adult: SUBCUT** (Rebif) 44 mcg 3×/wk × 24 wk

Interferon beta-1b

Relapsing or remitting multiple sclerosis

- **Adult: SUBCUT** 0.0625 mg every other day for wk 1 and 2, then 0.125 mg every other day for wk 3 and 4, then 0.1875 mg every other day for wk 5 and 6, then 0.25 mg every other day thereafter; higher doses should not be used

Available forms: *beta-1a*: (Avonex) 30 mcg (6.6 million international units/vial) (autoinjector pen); (Rebif) 22 mcg, 44 mcg/0.5 ml; *beta-1b*: powder for inj 0.3 mg (9.6 m international units) Kit

Administer:

Interferon beta-1a

- Visually inspect parenteral products for particulate matter and discoloration before use

IM route

- Premedicate with acetaminophen or ibuprofen and give at bedtime to lessen flulike symptoms
- Interferon β 1a (Avonex) 30 mcg is equivalent to 6 million IU
- If a dose is missed, give it as soon as possible; continue the regular schedule but do not give 2 injections within 2 days of each other; all products are for single-use only; do not reuse needles, syringes, prefilled syringes, or autoinjectors
- Injection sites should be rotated to minimize the likelihood of injection site reactions
- Do not inject into an area of the body where skin is irritated, reddened, bruised, infected, or scarred
- The injection site should be checked after 2 hr for redness, edema, or tenderness
- The manufacturer of Avonex offers free training on IM use for patients and health care partners; contact MS ActiveSource for more information (800-456-2255)

Reconstitution and administration of avonex lyophilized powder for IM route

- Use appropriate aseptic technique for preparation of solution

- Sites for injection include the thigh or upper arm
- Slowly add 1.1 ml sterile water for injection, USP, preservative-free (supplied by manufacturer) to the vial; rapid addition of the diluent can cause foaming, making it difficult to withdraw the solution
- Gently swirl the vial to aid in dissolution; do not shake; final concentration should be 30 mcg/ml (6 million IU/ml)
- The reconstituted solution should be clear to slightly yellow without particles; discard if the reconstituted product contains particulate matter or is discolored
- Withdraw 1 ml of reconstituted solution into a syringe; attach the sterile needle and inject IM
- A 25-G 1-inch needle for intramuscular injection may be substituted for the 23-G 1¼-inch needle provided by the manufacturer, if needed
- **Storage:** Use within 6 hr of reconstitution; store reconstituted solution in refrigerator; *do not freeze*; discard any unused solution; both drug and diluent vials are single-use only

Administration of Avonex prefilled syringe

- Patients may self-inject only if provider determines that it is appropriate, and with medical follow-up, and after proper training in IM injection technique
- The first injection should be performed under the supervision of an appropriately qualified person
- If self-injecting, rotate injection site between thighs; with help from another person, may rotate injection site between thighs and upper arms
- Wash hands before handling the Dose Pack
- Remove prefilled syringe from the refrigerator to warm to room temperature (usually 30 min before use); do not use external heat sources such as hot water to warm the syringe
- Hold the syringe so the cap is facing down and the 0.5 ml mark is at eye level; be sure the amount of liquid in the syringe is the same or very close to the 0.5 ml mark; if the syringe does not contain the correct amount of liquid, do not use it and call the pharmacist
- Hold syringe upright so that the rubber cap faces up; remove the cap by bending it at a 90 degree angle until it snaps free
- Attach the needle by pressing it onto the syringe and turning it clockwise until it locks in place; be careful not to push the plunger while attaching the needle

- Use the alcohol wipe to clean the skin at the injection site you choose; then, pull the protective cover straight off the needle; do not twist the cover off
- Inject intramuscularly at a 90-degree angle into the thigh or upper arm as directed by the provider
- Use gauze pad to apply pressure for a few seconds after the injection
- Dispose of used needles and syringes in a puncture-resistant container and discard appropriately
- Instruct patients to contact the health care provider if a skin reaction occurs that does not resolve in a few days
- A 25-G 1-inch needle for intramuscular injection may be substituted for the 23-G 1¼-inch needle provided by the manufacturer, if deemed appropriate by the physician
- Refer to the Patient Medication Guide for detailed instructions for preparing and giving a dose
